Volk's electric railway, running along the base of the cliffs at Brighton, England, has been reconstructed and is again open for traffic. The rails for a portion of the way are under water, and the cars are carried on a steel framework.

The British Compressed Air Tramways Co. has been registered at London, to equip tramways with compressed air motors. Among the directors are A. D. Brown, 31 Reighton Road, Upper Clapton, London, N. E., and P. E. Harris, 34 Wolcott Sq., London, S. E.

We have received a copy of the report of the sub-committee appointed by the County Borough of Cardiff, Wales, to report on a tramway system for the borough. The committee recommends the erection of several district stations and the use of double truck cars.

In order to meet the demand from street railways now building in the provincial towns of England, where the streets are particularly crooked and narrow, the British Thomson-Houston Co. has designed a special narrow-gage motor. It is known as the G. E.-60, and can be used where the gage is as narrow as 2 ft. 11½ in.; the motor is rated at 27 h. p. with a four-turn armature and 19 h. p. with a six-turn armature.

There are now on file in the Bureau of Foreign Commerce, Department of State, Washington, a plan of the city of Vladivostock, Siberia, and the profiles of the streets in which it is proposed to build a 12-mile electric street railway. The city wishes to grant concessions for a railway and lighting system, and the question of providing a water supply will also be brought up in the near future. American bids are desired. No time limit has been set for sending in proposals, nor for the completion of the work. The city will be responsible for payment.

An overhead electric line 8¼ miles long, 3 ft. 6 in. gage, commencing at Hathers and running through Loughborough to Quorn, is now being promoted by the Loughborough & District Electric Traction Syndicate, Ltd., with the support of the Brush Electrical Engineering Co., Ltd., Falcon Works, Loughborough, Leicestershire. The solicitors are Messrs. Le Brasseur & Oakley, of London, and the secretary is Mr. J. McLachlan, Queen Victoria St., London. The population of the district is estimated at 33,500, and the cost of the road, including equipment at \$541,000.

SIGHT FEEDER FOR BOILER COMPOUNDS.

It is nowadays a simple matter to get a boiler compound that is exactly suited to the needs of a steam user, as the makers of compounds generally analyze the feed water and then make the compound to suit the particular water. To get the best results from such treatment, however, it is necessary that the compound be regularly administered in the requisite quantities, and our readers will be interested in the compound feeder, illustrated herewith, that has been developed by the Hall Compound Feeder Co., of Chicago.

The feeder shown is of the company's piston type. It is mounted in any convenient position, and the lower portion of the cylinder connected with the feed-water line; the water thus admitted to the under side of the piston causes it to move up, forcing the compound (placed in the cylinder above the piston) out through the sight-feed glass, whence it is conducted to the suction pipe of the pump. The feeder is guaranteed to feed any liquid compound

and the rate may be varied to give from one to five hundred drops per minute. The other type of this device is a single diaphragm feeder, a flexible diaphragm replacing the piston of the piston type; the principle of operation is the same in both, and both feed through the pump and operate only when the pump is working.

These feeders are extensively used in Chicago, and we have received a very strong testimonial from Mr. Geo. R. Hinds, engineer of the West Chicago Street Railroad Tunnel Co.

MORE ABOUT WIRE THIEVES.

Patrick O'Neil, indicted for stealing copper bond wire from the Oswego (N. Y.) Traction Co. on April 25th, entered a plea of guilty and was sentenced to one year in the Onondaga penitentiary. Frank Champion, indicted for the same offense, was sentenced to the Elmira reformatory.

J. Mack, arrested at Alameda, Cal., with a sack full of copper bond wire taken from the track of the Leona Heights road, was, April 14th, sentenced to six months in the county jail; he had pleaded guilty to the charge of petit larceny.

The Polytechnic Street Railway Co., of Ft. Worth, Tex., has had so many bonds stolen from its track that it has adopted bonds which are placed under the fish plates.

Between midnight and daylight, April 24th, about 4,500 ft. of feed wire was cut from the poles of the Calumet Electric Ry., in Pullman Park, Chicago.

Wire thieves made an attempt to take feed wire from the lines of the Schuylkill Valley Traction Co., near Norristown, Pa., early on the morning of April 20th, but were frightened away by a watchman.

WATER POWER FROM THE ST. JOSEPH RIVER.

Information is at hand relative to the plans of the South Bend (Ind.) Power Co., a corporation organized in Indiana for the purpose of building a 12-ft. dam across the St. Joseph River near the state line between Indiana and Michigan and also erecting a power plant of 3,000 h. p. capacity for generating and transmitting electricity to South Bend and neighboring cities for light, heat and power. One of the principal uses to which this will be put will be the operation of an electric railway to be built from South Bend to Laporte and Michigan City in Indiana, and from South Bend to

Niles and Benton Harbor. The same interests will also put in another dam across the St. Joseph River, to the east of South Bend, where 6,000 h. p. will be developed.

Construction work on both the dams has been commenced and will be finished by fall. Direct connected, alternating generators, three-phase, of 1,500 kw. capacity will be installed at both plants.

The officers of the company are: President, E. A. Saunders; vice-president, M. V. Beiger; secretary, J. Du Shanc; treasurer, Chas. H. Tenney.

SOUTHERN OHIO TRACTION CO.

At the first regular meeting of the directors of the Southern Ohio Traction Co., held at the office of M. J. Mandelbaum & Co., Garfield Building, Cleveland, on April 30th, the following officers were elected for the ensuing year: President, Will Christy, of Akron; first vice-president, M. J. Mandelbaum, of Cleveland; second vice-president, H. Clark Ford, of Cleveland; secretary and treasurer, F. T. Pomeroy, of Cleveland; auditor, Warren Bicknell, of Hamilton, O.; general manager, F. J. J. Sloat, of Hamilton. The president, vice-presidents and secretary will have offices at 1022 Garfield Building, Cleveland, and the operating headquarters, with Mr. Sloat in charge, will be at Hamilton, O.

Mr. Christy writes us that a number of new cars have been ordered and the lines of the Cincinnati & Miami Valley Traction Co., and the Dayton Traction Co., which have been acquired by the Southern Ohio Traction Co., will be thoroughly rebuilt and re-equipped.

A HANDY TYPEWRITING MACHINE.

The Chicago Writing Machine Co., of 94-96 Wendell St., Chicago, makes a light, portable typewriter that, it is claimed, possesses all the qualities of the higher priced machines. It has the standard keyboard, printing 90 different characters, all on one steel cylinder, which can be taken out, cleaned and replaced in a few seconds. The carriage is light and easy running, and by means of a marginal regulator the machine can be adjusted for any width of paper. A lever mechanism enables the keys to be locked, so that an unfinished letter may be left in the roller without danger of interference.

The machine is well adapted to many of the requirements of a street railway office, including general correspondence, mimeograph work and the manifolding of orders and reports. By its use, also, the general manager, after short practice, can relieve himself of much of the inconvenience incident to writing with a pen.

NEW YORK FRANCHISE TAX.

The franchise values as finally agreed upon by the State Tax Commission of New York have been reduced about one-sixth as compared with the tentative values, and the taxes will not be so onerous for the large companies as had been supposed. Thus for the Metropolitan Street Ry. the valuation is \$52,292,317; this is treated as real estate and taxed at two-thirds of the assessed value, which with a tax rate of 2½ per cent (the same as last year), would make the tax about \$871,000. From this all other taxes paid will be deducted, leaving about \$271,000 as the increase. This is about ½ per cent on the capital stock.

It was announced that on May 15th the constitutionality of the franchise tax would be argued at Albany before the Appellate Division of the Third Judicial Division, the case having been brought before the court by the Queens Borough Electric Light & Power Co.

It is said an agreement has been signed by representatives of the Italian provinces of Naples, Caserta, Avellino, Benevento and 23 municipalities, for the construction of an electric railway between Naples and Benevento, a distance of 30 miles.

W. K. SCHOEPF.

On April 9th, Mr. W. Kesley Schoepf, for many years prominent in the management of the traction lines of Washington, D. C., arrived in Pittsburg to assume active direction of the Consolidated Traction Co., of that city, as general manager. Mr. Schoepf comes at the instance of Messrs. William L. Elkins, P. A. B. Widener, Thomas Dolan and Senator C. L. Magee, and will also become general manager of the Union Traction Co., which is now being formed, embracing the Consolidated, United and Monongahela Traction companies, and practically covering all the lines in the cities of Pittsburg and Allegheny; the new company will operate over 300 miles of road.

W. K. SCHOEPF.

Mr. Schoepf is an engineer and has been active in electric railroading since that power was introduced in street railway service. He is a son of the late Gen. Albin Schoepf, of the United States Army, and was born in 1864 at Fort Delaware, while his father was commandant of that post. His father was a Hungarian, who came to America with Louis Kosuth in 1850. Mr. Schoepf's mother was Miss Kesley, of Washington.

Early in 1883 he became engaged on the preliminary engineering work of the South Penn R. R., that was projected by the Vanderbilts as a parallel line to the Pennsylvania. He remained on the South Penn work, both in the preliminary and construction stages, until the settlement of the trouble between the Vanderbilts and the Pennsylvania, the latter agreeing to discontinue the construction of the West Shore road if the former would stop operations on the South Penn. Mr. Schoepf then went to Washington and was engaged for a time in the engineering work of the Government in that city.

In 1890, he became interested in the street railway lines of Washington, as chief engineer of the Rock Creek Ry., now a part of the Capital Traction system. He became associated in 1892 with William L. Elkins, P. A. B. Widener and Thomas Dolan in the development of the Washington systems and remained with them as long as they held control of the roads, or until 1897.

Mr. Schoepf was receiver of the Eckington & Soldiers' Home Ry., the Belt R. R., and the Maryland & Washington Ry., from 1896 to 1899, and still holds the formal receivership of one of the roads. He was prominent in the reorganization and reconstruction of the City & Suburban Ry., Washington, on which he installed the conduit electric system, being at that time vice-president and chief engineer. He holds large interests in the Washington roads, but has not had active management since his retirement, some months ago. He is a member of the Maryland and other clubs in Baltimore.

FAKE "WRITE UPS."

At a recent meeting of the Chicago Trade Press Association, an organization whose membership comprises the most influential trade journals in the West, it was determined to take some action to protect manufacturing and mercantile firms from the depredation of the "fake write-up men."

A number of alleged trade journals, several of them being printed in the Southern states, send out thousands of circular letters to merchants and manufacturers, enclosing proofs of ingeniously prepared write-ups. Each person to whom a letter is directed is led to believe that he has been selected because of the prominence of his firm. The men whom it is sought to victimize are informed that no charge will be made for the printing of this complimentary notice, but that sample copies will be sold at 15 cents per copy, or at 8 cents per copy in thousand lots. These journals have no legitimate standing in the community, and represent nothing except the desire of their managers to extort money from business men. The circular letters are so shrewdly worded and the office

of the publication is usually so far removed from the persons to whom the letters are sent, that many firms have been victimized. Almost every department of industry is represented by one or more reputable journals, and manufacturers and business men generally are advised to communicate with publishers of whom they have some knowledge before being led into fake schemes.

The several papers comprising the membership of the Chicago Trade Press Association have agreed to print this statement, with a view of protecting their patrons, and business men generally, from loss through such deception.

KANSAS CITY PLANS UNCHANGED.

We are in receipt of a letter from Mr. W. H. Holmes, president of the Metropolitan Street Railway Co., Kansas City, in which he says concerning the convention hall destroyed by fire last month: "We all feel the loss keenly, but Kansas City, with its usual spirit and pride, began rebuilding the hall before the fire was out, by subscribing money and employing men and teams to clear away the ruins. We have the National Democratic convention with us on July 4th and expect to have the building ready by that time. We will be ready for the American Street Railway Association this fall."

RUINS OF CONVENTION HALL, KANSAS CITY.

Having heard of rumors among the street railway supply men to the effect that the hotels at Kansas City would increase their rates during the convention in October next, we have made inquiries of Mr. W. A. Satterlee, chairman of exhibits, who writes under date of May 9th as follows: "I have visited the following four principal hotels of this city, and send you herewith the rates charged:

"Midland—(Headquarters)—American, \$3 to \$6 per day; European, \$1 to \$5 per day.

"New Coates—American, \$3 per day and up; European, \$1 per day and up.

"Savoy—American, \$2 to \$3 per day; European, \$1 to \$2 per day.

"Baltimore—American, \$3 to \$5 per day; European, \$1.50 to \$3 per day.

"These are the regular rates, and will not be raised during the week of the street railway convention. These four hotels would certainly be able to take care of all the street railway men who will come."

CEDAR POLES.

The Lindsley Brothers Co., of Menominee, Mich., has issued a small pamphlet entitled "About Cedar Poles," intended for the use of cedar buyers as a guide in estimating and ordering cedar products by car loads. The company conducts an extensive logging business in Michigan and on the Pacific Coast, having an office in Portland, Ore. Cedar poles 20 to 60 ft. long and 4 in. to 9 in. diameter at the top are carried in stock at the yards of the company, of which it has seven in Michigan and Wisconsin, and shipments can be promptly made. Longer poles will be furnished on request. The company also handles posts, shingles and ties.

FIRE AT OTTAWA AND HULL, CAN.

A disastrous fire swept over Hull, Que., and Ottawa, Ont., on April 26th, laying a large area in both cities in ruins and doing damage estimated at from \$15,000,000 to \$20,000,000. The flames broke out in the city of Hull, across the Ottawa River from Ottawa, about 10 o'clock in the forenoon and shortly after 12 o'clock reached Ottawa, nearly a mile distant. Here they extended through the Chaudiere, the industrial district of the city, fanned by a gale blowing 60 miles an hour, and before evening when the fire was

moved to a steam power house of the lighting company to be used in case of emergency, was saved. Power house No. 2, built last winter, adjoining No. 1, equipped with three pairs of Stillwell-Bierce & Smith-Vaile water wheels direct connected with an 1,800-h. p. Westinghouse generator escaped uninjured except slight damage to the water wheel regulator. Our system is now in full working order, the same as before the fire, except the section between the power house and Hull, about half a mile. Here the iron bridges over the timber slides were destroyed and it will take several months to rebuild them. In the meantime a temporary structure is being

RUINS OF POWER HOUSE, OTTAWA ELECTRIC RY.

finally under control, it had reached a point three miles from where it originated.

Through the courtesy of Mr. Jas. D. Fraser, secretary and treasurer of the Ottawa Electric Railway Co., we are able to present

built to accommodate our tracks. The burned power house was valued at about \$100,000, covered by insurance. About three hundred poles, a large quantity of overhead and feed wire, and a number of ties and rails were destroyed. Our loss outside of power

TRACKS OF OTTAWA ELECTRIC RY., HULL.

herewith a group of views taken immediately after the catastrophe. Mr. Fraser also sends us the following information, under date of May 10th.

"Power House No. 1, of the Ottawa Electric Ry., which was equipped with three 400-h. p. and three 100-h. p. Westinghouse generators, was totally destroyed. Fortunately a 700-h. p. generator

house will probably reach \$10,000, on which there is no insurance. We will set to work at once to rebuild the burned station, and the new one will be modern and up to date in every respect, as is No. 2."

Mr. W. R. Taylor, secretary and treasurer of the Hull Electric Co., sends us the following statement of the situation in Hull:

"This company has two-thirds of its electric light lines destroyed

in the city of Hull—poles, wires, transformers, meters, etc.—besides nearly two miles of trolley lines, of which only the rails were left intact. We were fortunate enough not to lose any cars. Our city line in Hull now runs between rows of ruins; our Aylmer line was not affected except where it entered Hull."

STRIKE AT ST. LOUIS.

On the morning of April 29th the gripmen running from the North End car house of the Broadway cable division of the St. Louis Transit Co., refused to take out their cars because of the suspension of a gripman who had refused to break in a non-union man. The matter was referred to General Manager Baumhoff, who directed that the man be reinstated pending an investigation. The principal point at issue was the "recognition of the union," and on May 4th the men presented their ultimatum; President Whitaker explained that the matter would have to be submitted to the directors of the company, and, consequently, the threatened strike was postponed until after the 7th.

The proposition of the union and the letter of Mr. Whitaker to his directors are given in full below.

UNION'S PROPOSITION.

This agreement between the St. Louis Transit Co., of St. Louis, Mo., or their successors, of the first part, and the Amalgamated Association of Street Railway Employes of America, Division 131 of St. Louis, Mo., of the second part, witnesseth:

That in the operation of the street railway lines of the party of the first part, both parties hereunto mutually agree.

Sec. 1. That the party of the first part through its properly accredited officers do hereby agree to treat with the party of the second part through their properly accredited officers.

Sec. 2. That all conductors, motormen and gripmen shall be members of this association and must report for initiation within 30 days from the time they are employed; and when men are put in training they shall take out a card of permission from the association, paying one dollar (\$1.00) for the same.

Sec. 3. That all shopmen, shedmen and power-house men, not members of an organization affiliated with the American Federation of Labor, shall be members of this association.

Sec. 4. That such employes as are specified in sections two and three (2 and 3), who are now in the employ of the company, shall become members of this association within five (5) days after the date of this agreement.

Sec. 5. That all regularly employed trackmen, who may become members of this association shall have the protection of the same.

Sec. 6. That all business arising between the parties hereto shall be transacted directly by the properly accredited officers of the company and the properly accredited officers of the association, respectively.

Sec. 7. That in all cases where men are suspended from service the properly accredited officers of the company shall notify the properly accredited officers of the association within twenty-four (24) hours after such suspension; and within forty-eight (48) hours after such notification the properly accredited officers of the company shall give the properly accredited officers of the association the final decision of the properly accredited officers of the company in such cases; and within forty-eight (48) hours after such decision given by such officers, the properly accredited officers of the association shall give to the properly accredited officers of the company the final decision in such cases of the properly accredited officers of the association.

Sec. 8. That in cases where members of this association are suspended by the company the duly authorized officers of the association shall, upon written request of the members suspended, be permitted to inspect the record of such member as it appears upon the company's record book.

Sec. 9. That the properly accredited officers of the association, together with the properly accredited officers of the company, shall have full power to adjust all differences that may arise between the parties hereto.

Sec. 10. That if such named officers fail to reach a mutual agreement they shall have power to order the case to arbitration at once. The board of arbitration to consist of three (3) disinterested persons; and the finding of a majority of such board of arbitration shall be binding upon the parties hereto. The parties hereto shall each choose one member of such board and the two thus chosen shall select a third; the three members thus chosen shall constitute such board of arbitrators. When a case is submitted to arbitration each party shall name its arbitrators within three (3) days; in the case of the failure of either party to so name its arbitrators, the party so failing shall forfeit its case. It is hereby agreed that the arbitrators appointed by each party shall meet within two (2) days after they have been appointed, for the purpose of selecting a third arbitrator; failing to select the said third arbitrator, they shall meet daily thereafter at a place to be mutually agreed upon between said arbitrators, until said third arbitrator is selected. The failure of either arbitrator to attend one such meeting shall give to the party which has named the arbitrator who attends, the right to ask for a new arbitrator in such cases within twenty-four (24) hours after such failure by such named arbitrator; and in case of the failure of either party to comply with these provisions, such party so failing shall forfeit its case. In submitting matters to arbitration the differences between the parties hereto shall be submitted in writing.

Sec. 11. That any employe or member of said association by act or word interfering with or disturbing the proceedings between the properly accredited officers of the company and the association, upon any subject whatsoever, or interfering with or disturbing the service in any manner contrary to the spirit and condition of this agreement, shall, upon mutual satisfactory proof of the same, be dismissed from the service.

Sec. 12. That in cases where the association suspends a member who is, or

are, an employe or employes of the company for any violation of any properly established rule, said association shall request in writing (signed by its president and secretary) the suspension of such member or members by the company; the properly authorized officer of the company shall suspend said employe or employes at once, without pay, until such time as the association requests his or their reinstatement.

Sec. 13. That if any member of this association under this agreement, who may be suspended is found by investigation to be innocent of the offense or violation with which he is charged, he shall be reinstated in his former position and be paid for the total number of days which he loses on account of such suspension, at the number of hours per day for which his run calls on time schedule; but should he be an extra, he shall be paid an amount equal to the amount of wages paid to the extra who took his place during such suspension, but should he be last extra he shall receive equal to the pay of the man next ahead of him on the list.

Sec. 14. That a day's work for trainmen shall consist as nearly as possible of ten hours' work and be completed within twelve (12) consecutive hours (except where it is absolutely necessary for the accommodation of the company's patrons, men known as tripper-men may be kept out fourteen (14) hours, but no longer. That an accurate account shall be kept of the actual time served and trainmen shall be paid 20 cents per hour for the same.

Sec. 15. That the minimum number of hours which shall constitute a regular run shall be seven (7) hours, and any run of less than seven hours shall be considered an extra run.

Sec. 16. That a day's work for shopmen, shedmen, power house men and track men shall consist of ten (10) hours, and that all employes named in this section shall be paid time and a half for all overtime. Provided, further, that there shall be established a mutually satisfactory wage scale for above said men.

Sec. 17. That where regular trainmen report for work they shall be paid from 10 minutes after the time at which they are instructed to report; and when an extra man is assigned to work he shall be entitled to the same privilege as was the man whose place he has taken.

Sec. 18. That when a regular trainman shall fail to report at the time specified on the schedule he shall be placed at the bottom of the extra list for four (4) days, and when an extra man fails to report at the properly specified time he shall be placed at the bottom of the list for seven (7) days.

Sec. 19. That the company shall place in their several offices where men are required to report an open book in which men can register the particular day or days on which they wish to be excused from duty, and the men who register first for any particular day or days shall have first privilege, provided that members of the executive board and others having business to transact for the association shall be excused in preference to others, provided, further, that no man shall register in such book more than ten (10) days in advance of the day or days upon which he desires to be excused.

Sec. 20. That the conductors are required to clean only the inside of the cars, the platform and the end windows. The company shall clean the outside of the cars.

Sec. 21. That in order to prevent any friction or misunderstanding, all time tables that may be changed or instituted shall be submitted to the properly accredited officers of the association for their approval at least forty-eight (48) hours before going into effect; and shall be posted at the shed of the line for which they are made, twelve (12) hours before they go into effect.

Sec. 22. That extras shall not be required to remain on watch for a longer time in the morning than the time intervening between the reporting time of the first and last a. m. man; nor for a longer time at the time of dinner relief than the time intervening between the reporting time of the first and last p. m. man; provided, however, that on special occasions men shall report for duty at such time as the company may designate; provided, further, that men ordered to report for special duty shall receive pay from 10 minutes after the time at which they are ordered to report; but if not assigned to duty they shall receive half pay from 10 minutes after the time at which they are instructed to report until they are relieved. Provided, further, that regular men shall not be required to do special duty when extra men are available; neither shall regular men be required to make extra trips oftener than every seventh (7th) day.

Sec. 23. That all members of the association in the service of the company shall receive free transportation over all lines operated by said company; and any member abusing this free transportation privilege shall, upon satisfactory proof to the parties hereto, be dismissed from the company's service.

Sec. 24. That men off duty shall be entitled to the same privilege as other passengers while riding on the company's cars. Except that they shall never engage in conversation with an employe who is on duty.

Sec. 25. That any member who shall be elected to any office of this association which requires his absence from the company's service for not more than one year shall, upon his retirement from such office, again have his respective place in the company's employ.

Sec. 26. That this agreement and the provisions thereof shall be and continue in force from the day of its ratification by both parties hereto until such time as it may be altered by mutual consent of both parties through their duly accredited officers.

MR. WHITAKER'S LETTER.

St. Louis, May 7, 1900.

To the Board of Directors of the St. Louis Transit Co.

On May 4, Messrs. T. B. Edwards and others, who had theretofore been acting as a committee representing employes of the company, informed me that the agreement made with them and other employes on March 10, 1900, was abrogated by them, and they proposed that the transit company should make an agreement with the Amalgamated Association of Street Railway Employes of America covering the operation of the transit company's lines of railway in this city.

I urgently recommend that this proposed agreement, a copy of which is herewith submitted, be not made.

The amalgamated association does not own the property or any interest in it, and owes no duties with respect to it. It would be under no obligations to the owners or to the public. If it mismanaged the property, if its operation were inefficient, if passengers were injured as the result of its negligence, it

would be in no wise responsible. The proposed agreement would simply give it all the power of control and impose upon it no liability whatever.

It is provided in the paper submitted that no man shall be employed by the company unless he gets permission from the amalgamated association, for which he must pay the association \$1. This means that the association, which is under no duty or responsibility with respect to the property or the public, selects all employes, leaving the company, which is responsible for the conduct of the men when selected, without any voice in the matter. It also imposes a poll tax of \$1, which may, in the pleasure of the association, be increased, if the principle is once admitted, as a condition of a man's having leave to work.

It also requires that every employe who does not join this association shall be discharged from the service of the company. The same men who now make this demand insisted less than two months ago that all employes should be treated alike, without regard to membership in any organization. Believing them to be right at that time, their request was at once acceded to, and a written agreement was made carrying it into effect. That agreement has been faithfully kept by the company. Now, however, it is abrogated by those who proposed it.

It is clear injustice and oppression to put upon any employe any constraint or obligation which has no relation to the duties of his employment. If he does his work well, if he carries comfortably and safely the men, women and children committed to his care, he has a right to order his political, religious and social relations for himself. He may join any association he pleases, or he may refrain from joining; the company has no right to compel him to one course or the other.

It is further proposed that if the association suspends a member the company must suspend him as an employe. And as every employe is required to be a member of the association it follows that if he is expelled from the association he must be discharged by the company. In other words, the association would be vested with the absolute power of suspending or discharging any employe, however faithful and acceptable his service to the company, and this at the behest of an association which owes no duty to the company or to the public, and which might act from motives having no relation to the good of the service involved.

While the association thus demands the absolute power of suspending or discharging employes, it proposes that the company, which pays the men and is responsible for them, shall not suspend or discharge a man without the consent of the association, with the provision that if the company and the association disagree the matter shall be submitted to arbitration.

The company is made responsible by the law, and properly so, for the safe carriage of its passengers. When it fails in this duty through the negligence or incompetence of any employe, it is answerable in damages to the extent of the injury suffered. What is here involved is not a matter of privilege, but of duty. Matters of mere individual right or privilege, as they may be waived altogether, may be submitted to the decision of others. Matters of duty, as they cannot be waived, cannot be delegated. If the company believed an employe to be incompetent, it could not excuse itself to people who were injured by his neglect or inefficiency, on the ground that the association or a board of arbitrators had decided that he should be retained. The answer would be that the duty of selecting and retaining only careful and competent men was by the law imposed upon the company and upon it exclusively, and that it had no right to evade this duty in any manner whatsoever, or to devolve it upon anyone else.

The sum and effect of the proposed agreement is that the company shall have no voice in the selection or retention of its employes, and that the association may select for the company, and compel it to discharge or retain whomsoever it pleases. It is obvious that under such a system discipline would be impossible. Employed by the association and subject to discharge by it, and only by it, the prompting of self interest would tend to a partisan attachment to the association, rather than to faithful devotion to the duties of the service.

The evils of such a system have already manifested themselves as a consequence of the mere attempt to establish it. That attempt has incited to insubordination and to the impairment of proper discipline, and the service has distinctly suffered in consequence.

Upon the issue thus presented, there is no room for compromise of any kind. The company cannot relinquish the duties it was chartered to discharge. Its obligation to safely carry the three hundred thousand people daily committed to its care, is one of the most serious and important that can be undertaken by men. That obligation is imposed by the law, and by the law it is made single and undivided. It admits of no partition, and it cannot be delegated. And no man is fit to be vested with it who would shirk in any manner or in any degree the duties which it involves.

So long as the company undertakes the conduct of this great work, it must accept all the responsibilities incident to it, and as the proposed agreement involves an entire relinquishment of the powers necessary to the discharge of those responsibilities, I repeat my urgent recommendation that it be unqualifiedly declined.

Let us deal with our employes as such, and not otherwise; let us deal with them as men engaged in a useful, important and honorable calling, and give to them one and all the assurance that whoever has a grievance can in his own right obtain a fair hearing, and full and complete redress for every wrong. A showing of fitness must of itself be sufficient for getting into the service, and tenure of employment must depend upon nothing more than duty faithfully performed. In this way, and only in this way, will the best interests of the company, its employes and the public be promoted. Respectfully yours,

EDWARDS WHITAKER.

The directors failing to "recognize the union" as thus outlined, a strike was ordered and on the morning of May 8th the great majority of the men quit work. With the men who remained loyal about 20 cars were sent out; these were attacked by the strikers and as the police protection was inadequate they had to be withdrawn, making the tie-up complete. Three motormen were seriously injured by stones thrown at them; one striker and one "innocent-by-stander" were shot, the latter fatally.

No attempt was made to run cars on the 9th, excepting mail cars on three lines. No molestation was offered these cars, but one mail train was abandoned by its crew.

It is so difficult to use temperate language in characterizing the action of Mayor Ziegenhein in sending a letter to President Whitaker "urging the company to meet its employes half way and arbitrate their differences," that we content ourselves with recording the fact.

On April 29th a strike was inaugurated on the St. Louis & Suburban, but not enough men went out to cripple the service until after the strike on the St. Louis Transit system on May 8th. About 9 o'clock that morning the strikers gathered in force at De Hodiament station on the Suburban, boarding the cars and forcing the crews to quit work. By 10 o'clock the down-town service of the Suburban was practically stopped.

On the 9th the Suburban attempted to run cars under police protection, but was compelled to desist. The officers on one car fired on the crowd to repel an attack and one man was killed.

On the 10th and 11th cars were run on the Suburban and on several lines of the St. Louis Transit, under heavy police protection. Conflicts were frequent and a number of persons were injured.

A sympathetic strike attempted on the East St. Louis lines proved a failure, only a few men going out.

Governor Stephens on the 12th notified the police commissioners of the city that the lawlessness must be suppressed and said if the commissioners did not have adequate force he would call out the state troops.

As we go to press the situation has not greatly changed from what it was last week.

STRIKE AT KANSAS CITY.

Early on the morning of May 12th a strike was ordered on the Metropolitan Street Ry., of Kansas City, but only about one-third of the men went out. After some slight delays all the cars were running as usual. The company secured an injunction against interference with its cars.

WHISK BROOMS ON CARS.

All of the cars of the South Chicago Street Railway Co. have been fitted with small cabinets in which are carried whisk brooms for the convenience of passengers who are at liberty to step to the rear platform at any time and brush the dust from their garments. The innovation is fully appreciated by the patrons of the road.

A BREAK DOWN IN MILWAUKEE.

A newspaper dispatch states that on May 13th the entire system of the Milwaukee Electric Railway & Light Co. was tied up for 30 minutes by the burning out of the armature of the main generator at the new power house.

NEW LINES FOR CHICAGO.

Three new electric lines tapping the suburban territory northwest of Chicago are contemplated by an ordinance recently introduced into the Chicago council by the Chicago, Milwaukee & St. Paul Railway Co. The plans of the company include the building of 30.7 miles of track, including power stations and equipment at an expenditure of from \$2,000,000 to \$2,500,000. The lines will connect Evanston, Edgebrook and Bloomingdale with the business district of Chicago as junction will be made at the city limits with the Northwestern and Metropolitan Elevated roads and the Chicago Union Traction Co.

A new electric railway between Elizabeth and Plainfield, N. J., charges 20 cents for a single ride, as against 35 cents via a competing steam road. The distance is 12 miles.

Mr. F. W. Oakley, president, and Mr. Geo. H. Shaw, secretary of the Madison (Wis.) Electric Railway Co., were recent visitors at the "Review" office.

PERSONAL.

MR. J. G. WHITE, of New York, is making a business trip to Europe.

MR. J. M. ROACH has been chosen a director of the Chicago Union Traction Co.

MR. L. M. SHELDON holds the position of master mechanic of the Southern Ohio Traction Co.

MR. HENRY HINE on May 1st resigned his position as general manager of the Stanley Electric Co., of Pittsfield, Mass.

MR. FRED SEACORD, president of the Galesburg (Ill.) Electric Motor & Power Co., called at the "Review" office May 9th.

MR. H. A. BENEDICT, electrical engineer of the Hudson (N. Y.) Street Ry., has accepted a similar position with the United Traction Co., of Albany, N. Y.

MR. J. KAJUIRA, an expert electrician in the employ of the Japanese Government, is in this country inspecting telephone, telegraph and electric railway installations.

MR. P. McCULLOUGH, electrician of the Toronto (Ont.) Ry., will leave for Liverpool, Eng., shortly to assume a similar position with the Liverpool Corporation Tramway.

MR. J. F. PFETCH, who has had many years' experience in the management of electric railways, has joined the engineering staff of E. P. Roberts & Co., of Cleveland.

MR. J. Q. BROWN has resigned his office as superintendent of the San Antonio (Tex.) Street Ry., to accept the position of assistant manager of the Oakland (Cal.) Transit Co.

MR. A. A. HILTON, of the St. Louis Car Wheel Co., was a "Review" caller recently. Mr. Hilton reports that business is excellent and the prospects of the brightest.

MR. S. E. WHITTAKER, formerly of Chelsea, Mass., will succeed Mr. L. B. Wheildon as manager of the Portland (Me.) & Yarmouth Electric Ry., Mr. Wheildon having tendered his resignation last month.

MR. E. P. ROBERTS, of E. P. Roberts & Co., engineers of Cleveland, O., on March 27th gave a talk before the Civil Engineers' Club of Cleveland on the controlling factors in interurban electric railway design.

MR. C. F. STEIRLY, of Nashville, Tenn., has been appointed superintendent and chief engineer of power house for the Syracuse (N. Y.) Rapid Transit Co. This is the position resigned by Mr. J. G. McCormack.

MR. RALPH L. SHAINWALD, president of the Standard Paint Co., of New York, and Mr. Frank S. De Ronde, who represents the Standard company in several Eastern states, were "Review" callers last month.

MR. T. E. KENNEY, who has been the McKeesport division superintendent of the United Traction Co., of Pittsburg, for nearly two years, has been transferred to the Glenwood division. He is succeeded by Mr. John Daily.

MR. C. D. SHEPARD last month resigned as superintendent and purchasing agent of the Palmer ((Mass.) & Monson Street R. R. and has formed business relations with F. T. Ley & Co., contractors, of Springfield, Mass.

MR. NORMAN ROWE has resigned as electrical engineer of the Pacific Coast office of the Westinghouse Electric & Manufacturing Co., to become chief engineer of the San Il De Fonzo transmission plant in the City of Mexico.

MR. C. W. FOOTE, general manager of the Cincinnati & Miami Valley Traction Co., which was recently absorbed by the Southern Ohio Traction Co., leaves for Santa Barbara, Cal., where he becomes general manager of the Arrowhead Irrigation Co.

MR. J. R. CARRIER, formerly superintendent of transportation of the Syracuse (N. Y.) Rapid Transit Ry., has received an appointment to the same office with the Connecticut Lighting & Power Co., whose headquarters are at Waterbury, Conn.

MR THOMAS J. NEACY, general manager of the Filer & Stowell Co., Milwaukee, last month presented to St. John's Cathedral and St. Rose's Catholic Congregation the sum of \$1,000 each to be applied to the education of needy students preparing for the priesthood.

MR. JOSEPH SACHS, in a recent paper before the American Institute of Electrical Engineers, on "The evolution of safe and accurate fuse protective devices," discusses the best methods of protecting electrical machinery from excessive currents and describes the various types of enclosed safety fuses now on the market.

MR. HUGH J. MCGOWAN, general manager of the Indianapolis Street Railway Co., at a recent meeting was elected president, succeeding Mr. H. P. Wasson, and will hereafter perform the duties of both positions. Shortly after his election Mr. McGowan stated his company would spend at least a million dollars in reconstruction work this year.

A NUMBER OF CHANGES have been made in the personnel of the St. Louis Transit Co., in addition to those mentioned in the last issue of the "Review." Mr. Joseph S. Minary, superintendent of the Northern Division, and Mr. John I. Pearson, chief engineer, have tendered their resignations to take effect at once. Mr. F. S. Drake, master mechanic, left several weeks ago to take up new duties in the East. Mr. Thomas W. Murphy, claim agent, has also accepted another position.

MR. THOMAS P. EGAN, president of the J. A. Fay & Egan Co., the large wood-working machinery manufacturer of Cincinnati, was recently nominated for presidential elector from the second congressional district of Ohio. Mr. Egan is in no sense a politician, and his selection is therefore a tribute to his high standing in the community and amongst the large manufacturers of the country. Mr. Egan goes to Paris in June to visit the Exposition, where his firm is making a large exhibit, having been requested by the government to represent the United States there, and he will return in time for the election.

OBITUARY.

MR. JOHN LOVE, whose name is prominent in the list of early inventors of electrical apparatus, died last month. He was the patentee of the Love underground conduit system.

MR. A. S. HALLIDIE, the inventor of the cable street railway, died of heart disease at his home in San Francisco on April 25th. Mr. Hallidie was 73 years of age. During the winter of 1869 Mr. Hallidie conceived the idea of a system of traction for supplanting horses on the steep grades of San Francisco streets, and largely through personal friendship succeeded in getting three other men to join him in building a cable line. After a long struggle the line was built and a trip to hold the franchise was made down Clay St. shortly after midnight on the morning of Aug. 1, 1873; a month later regular operation was begun and the road was run by the builders until its sale to the Ferries & Cliff House Railway Co. in 1891. Other lines quickly followed the first one, and within 20 years over 700 miles of cable street railways were in operation in this country.

MR. SALVATOR POTIS was found dead in his room at the Technical Club, Chicago, on the afternoon of April 17th, he having committed suicide with a revolver. Mr. Potis was about 40 years of age, and a native of Caracas, Venezuela, from which country he was sent to the United States when a boy by his father, who was a general in one of the revolutionary armies. He graduated

from the University of Pennsylvania, came to Chicago 15 years ago, and entered the service of the West and North Chicago Street Railroads, where he was soon promoted to the office of chief engineer. In that position he constructed the largest plants of both roads, the Van Buren St. tunnel under the Chicago River, and the large station of the Union Loop elevated. About two years ago he returned to his native country, but a few months since came back to Chicago, taking charge of the work of the Illinois Telegraph & Telephone Co., which is tunneling the business streets with immense conduits. About three years ago Mr. Potis suffered repeated bereavements, losing by death within six months both his parents, his wife and one child. Ever since that time he has been subject to periods of intense melancholia, and it was undoubtedly during one of these that he took his life. He leaves one child, a son, nine years of age, who is living with relatives in Venezuela.

ELECTIONS.

THE BLUE RIDGE ELECTRIC RAILWAY CO., a new company at Hagerstown, Md., has officers as follows: President, B. F. Walty; secretary, Augustus Beck; treasurer, Peter Rouzer.

THE RED WING (MINN.) & TRENTON TRANSIT CO. has appointed the following officers: President, E. H. Blodgett; vice-president, Peter Nelson; secretary, L. C. Smith; treasurer, W. H. Putnam.

THE LOCKPORT (N. Y.) & OLCOTT ELECTRIC RAILWAY CO., at a meeting last month elected officers as follows: President, Henry J. Pierce, of Buffalo; vice-president, F. N. Trevor, of Lockport; secretary and treasurer, W. B. Rankine, of Niagara Falls, N. Y.

THE WEBSTER (MASS.) & DUDLEY ELECTRIC STREET RAILWAY CO., has made a number of changes in its management. The new list of officers is as follows: President, Lyman R. Eddy; vice-president, E. N. Bigelow; secretary, Charles Haggerty; treasurer and superintendent, John Flint.

THE CONSOLIDATED STREET RAILWAY CO., of Grand Rapids, Mich., has been reorganized as the Grand Rapids Railway Co. The officers are: President, Anton G. Hodenpyl; manager, G. Stuart Johnson; secretary, B. S. Hanchett; treasurer, Wm. H. Anderson; directors, L. J. Rindge, Wm. H. Anderson, Wm. Judson, John A. Covode, Thomas F. Carroll, J. Boyd Pantland and A. G. Hodenpyl. The directors are all local capitalists.

METROPOLITAN AND THIRD AVENUE, NEW YORK.

On April 11th the directors of the Metropolitan and of the Third Avenue arranged for a lease of the latter property to the former company for 999 years; the action was subject to the approval of the stockholders of the two companies. The Metropolitan is to guarantee the principal and interest on \$50,000,000 of bonds or so much thereof as may be necessary to fund the floating debt of the Third Avenue and complete the reconstruction work now in progress and other improvements, and all the liabilities of the subsidiary lines; then to pay during the first four years of the lease whatever the net earnings of the Third Avenue system were above the fixed charges and operating expenses; to pay during the next two years 5 per cent on the capital stock of \$16,000,000; to pay during the following four years 6 per cent; that brings it up to ten years; after ten years, and for the remainder of the lease, to pay 7 per cent on the stock.

Kuhn, Loeb & Co. agreed to take the \$35,000,000 of the bonds to be issued at this time, paying about par therefor.

On April 17th the meeting of the Third Avenue stockholders to ratify the proposition to issue the bonds was fixed for May 11th. On May 17th they will meet to vote on the lease. On May 17th also the Metropolitan stockholders will meet to approve the lease and to vote on a proposition to increase the capital stock of the company from \$45,000,000 to \$52,000,000. This \$7,000,000 increase in capital stock has been voted for by the Metropolitan directors. President Vreeland announced some time ago that an increase in

the company's capitalization would probably be necessary in view of various projected improvements.

Under the receivership the operation of the Third Avenue for March showed the following results: Total receipts of \$214,885, disbursements \$82,555, balance \$132,330, interest and taxes \$34,247, and surplus over charges \$98,083.

WHY SOME PARK ATTRACTIONS FAIL.

No matter how attractive a park may be in respect to its natural charms and beauties, after a certain time these are apt to fail as drawing cards in themselves, and must be augmented by new and varied inducements, or the park will soon cease to fulfill the purpose for which it was intended, i. e., the creation of additional traffic.

It is now generally conceded that one of the very best ways of sustaining the interest of the public in a resort of this nature, is by carefully selected and frequently changed vaudeville and light opera performances, held where possible in an open air theater. It is true that there have been cities where attractions of this kind have failed to attract, and money has been lost in the venture; but almost without exception, where such failure has occurred, it has been invited by relying upon inexperienced judgment in the selection of the amusements. A summer park audience is different from almost any other gathering that can be imagined, and usually includes people with all the varied religious, political and social ideas in the community, so that while bright, snappy performances must be furnished at all times, there must be nothing to offend any of the tastes represented. It must be remembered in addition that the larger part of the audience is accustomed to good entertainments at the regular city theaters and halls, and will not be content with mediocre or indifferent attractions, even if they are free. A street railway company can hardly fail of success, however, in its summer amusement investment, when its attractions are in the hands of a proper person, who has had experience in this line and knows how to detect what a community desires, and then is able to properly cater to that demand.

That success is sure when the conditions are properly fulfilled is proven by a few statistics that have been furnished us by a well-known park manager. He writes as follows: "The writer has in mind a city of 35,000 population where the manager of the park will affirm that with a properly selected amusement company on its rustic stage at a comparatively nominal cost, the street railway carried to the park in one week 45,000 paying passengers at 10 cents for the round trip, realizing \$4,500 on the investment. The writer also knows of a city of 30,000 population, where at the end of the season of 14 weeks, the treasurer of the street railway company made a statement that for this period it had averaged 30,000 fares weekly, at 10 cents for the round trip, making \$3,000, and that the reserved seats at 10 cents each had averaged \$300 weekly. This amount, \$3,300, was many times the sum paid for the attractions. These are but instances of many similar experiences and are not exceptional cases."

LARGE ELECTRICAL CATALOG.

The Western Electrical Supply Co., of St. Louis, Mo., this month brought out one of the largest and best arranged general electrical supply catalogs that has ever been issued. It is a book of 1,100 pages, and is divided into departments, a complete line of representative goods being illustrated in each division. It covers direct and alternating generators and motors, lighting supplies of every description, street railway supplies and house goods and telephone supplies.

This company's policy has always been a progressive one, and it is a firm believer in advertising in all forms, holding that "strict business integrity, fair treatment of customers and judicious advertising are a keystone to all business success."

A few of the firms for which the company acts as territorial agents are: John A. Roebing's Sons Co., Ohio Brass Co., Indiana Rubber & Insulated Wire Co., Adams-Bagnall Electric Co., Emerson Electric Manufacturing Co., Ansonia Electric Co., Warren Electric Manufacturing Co., Eddy Electric Manufacturing Co.

Wages of conductors and motormen of the West End Traction Co., of Pittsburg, have been increased from \$2 to \$2.25 per day.

HALF FARES.

A mail service has been authorized on the Cincinnati, Newport & Covington.

Wages of employes of the Richmond (Va.) Traction Co. have been increased 10 per cent.

The Cincinnati, Newport & Covington Street Railway Co. has put sprinkling cars on its lines.

Fifty new double truck open cars have been received by the Cleveland Electric Railway Co.

The power house of the Philadelphia, Morton & Swarthmore Electric Co. has been completed.

Rumor has it that the Chicago Union Traction Co. has offered \$325 a share for the control of Chicago City Ry.

Ira D. Ludington, of Rochester, N. Y., has the contract for building the Rochester & Sodus Bay Electric Ry.

Wages of the 125 men employed by the Duluth (Minn.) Street Railway Co. were increased 10 per cent on May 1st.

The Grand Rapids (Mich.) Ry. has issued a very pretty folder entitled, "Where and How to Go," to advertise its lines.

Employes of Salt Lake City (Utah) Street Railway Co. will hereafter receive 19 cents per hour instead of 18, as formerly.

A cut of 10 per cent in the wages of motormen of the Third Avenue Railroad Co., New York, was made last month.

The oldest street railway conductor in St. Louis is W. D. Hall; he is 80 years old and has been ringing up fares since 1872.

The new cars of the St. Louis Transit Co. have in addition to the lights in the ceiling a single lamp at every alternate seat.

During the winter several fare boxes have been stolen from the cars at Winnipeg, Can., where no conductors are employed.

Power will hereafter be supplied to the United Traction Co., of Albany, N. Y., from the plant at Mechanicsville on the Hudson River.

Earnings of the Chicago Union Traction Co. for April were \$600,952, an increase of \$14,864, or 2.53 per cent over the previous month.

It is reported that the Manhattan Elevated, New York, is considering putting in electrically driven movable stairways at its stations.

A prize of \$5 was offered for the most appropriate name for a new theater at St. Joseph, Mo., owned by the street railway company.

The Consolidated Traction Co., of Pittsburg, has decided not to permit advertisements to be pasted on the windows of its cars in the future.

Work was commenced April 18th, on the Kansas City, Topeka electric line, of which W. E. Winner, of Lawrence, Kan., is the promoter.

It has been stated a committee from the Montreal Common Council will visit New York to investigate the advantages of the conduit system.

An average daily increase of \$1,500 over last year is shown by the report of earnings of the Union Traction Co., of Philadelphia, for March, 1900.

The formal opening of the Elizabeth & Westfield Street Railway Co.'s through line from Plainfield, N. J., to Elizabeth, N. J., took place on April 26th.

The Supreme Court of Alabama in a recent decision upholds the ruling of a lower court that whites and negroes should occupy separate portions of street cars.

The Omaha (Neb.) Street Railway Co. is vigorously prosecuting the two men arrested last November charged with stopping a car and robbing the conductor.

The Wichita (Kan.) Railroad & Light Co. has issued \$300,000 of 5 per cent 20-year bonds. Of the proceeds, \$250,000 will be used for paying construction accounts.

A summer theater will be established at Rock Spring Park, near Alton, Ill., by W. M. Sauvage and J. F. Porter, president of the Alton Railway, Gas & Electric Co.

A handsome brochure describing and illustrating Orchard Beach, a pleasure resort near Manistee, Mich., has been published by Geo. W. Swigart, of 411 River St., Manistee.

A rainfall of 6 in. at Birmingham, Ala., recently, so crippled the lines of the Birmingham Railway & Electric Co. by washouts that travel had to be temporarily suspended.

The franchise granted the Alliance (O.) Sebring & Salem Electric Railway Co. became void on May 2d, as no work had been done upon the line within the specified time.

An ordinance has been passed by the Paducah (Ky.) common council, fixing a license tax on all cars in the city. This will be \$10 per year for motor cars and \$5 for trailers.

Representative Bell, of Colorado, has introduced a bill in the House at Washington limiting the number of passengers on cars in the District of Columbia to the seating capacity.

United Traction Co., of Pittsburg, reports for the month of March, 1900: Gross earnings, \$148,009; net earnings, \$82,814; interest, rentals, taxes, etc., \$59,099; surplus, \$23,714.

Motormen and conductors of the United Traction Co., of Pittsburg, on April 21st, received notice of an increase in pay to 21½ cents an hour. The men do not belong to a union.

The oldest street railway employe in point of service in the state of Massachusetts is said to be Francis A. Herring, of Somerville, who has been in the business for 37 consecutive years.

A through service from Pittsburg to McKeesport has been instituted by the Monongahela (Pa.) Street Railway Co., in competition with the through line of the United Traction Co.

The Atlanta (Ga.) Railway & Power Co. requires all its motormen and conductors to undergo a rigid physical examination which costs them 50 cents each. This rule went into force May 1st.

Capitalists owning the Pittsburg (Pa.) & West End Traction Co. have organized the Carnegie & Rosslyn Park Street Railway Co., to build a new feeder line to the Traction company's system.

A rate war is on between the Kansas City & Leavenworth Electric Ry. and a competing steam road. The former has cut the fare between Kansas City and Leavenworth from 90 cents to 75 cents.

The controversy between William Ziegler and the other security holders of the Lake Street Elevated, Chicago, pending in the courts since 1896 has been compromised; the details have not been made public.

The Lexington (Mass.) & Boston Street Railway Co. gave a banquet commemorative of the opening of its railway at the Town Hall in Lexington, on the afternoon of April 14th. Speeches were

made, mutual congratulations exchanged, and the occasion was thoroughly enjoyed by those who were fortunate enough to be present.

New cars have been received by the Canton-Massillon (O.) Electric Railway Co. to take the place of those recently destroyed by fire. The old service will now be resumed.

A perpetual injunction restraining the Erie (Pa.) Transit Co. from crossing the Nickel Plate tracks was issued on April 16th and will necessitate the Transit company securing some other route into Erie.

The St. Louis Transit Co. is said to have acquired control of the Exposition Building, Music Hall and the Coliseum, in the city of St. Louis, and will establish an elaborate winter and summer garden resort.

Alderman Patterson, of Chicago, proposes that the street railways shall haul garbage from the 35 delivery stations to the crematories or dumps, the garbage cars being hauled between midnight and 5 a. m.

The Winnebago Traction Co., of Oshkosh, Wis., has been incorporated with a capital stock of \$650,000 as a reorganization of the Oshkosh Traction Co., which is owned by Emerson McMillan of New York.

A new freight box car is being built by the Rochester (N. Y.) Railway Co. It will be run as a trailer and is 18 ft. long, 8 ft. wide, has one window in each end, and one in each side, and a sliding door in the center.

We are advised by Mr. Jas. A. Collins, secretary and assistant general manager of the Cincinnati Street Ry. that his company is considering the advisability of installing storage batteries at two or more of its generating stations.

A handsome terminal station will be built at Niagara Falls, opposite Reservation Park, for the Buffalo & Niagara Falls Electric Ry. The Niagara Falls line will be generally improved and several miles of new 85-lb. steel rails put down.

The trolley mail service at Hartford, Conn., has been discontinued temporarily because all the bids received by the postoffice for emptying the boxes on the cars were considered too high. In March last 74,000 letters were collected on the cars.

Extensive preparations are being made by the Brooklyn Rapid Transit Co. for handling the Coney Island crowds next season. Loops will be put in at the terminals and switches will be placed at various points to facilitate the movements of cars.

Contracts for the erection of three generating stations have been let by the Toledo (O.), Fremont & Sandusky Electric Railroad Co. The buildings will be of brick and with the electrical apparatus and machinery the proposed improvements will cost \$100,000.

Among the street railways that have recently increased the wages of their employes are: The Fox Electric Ry., Green Bay, Wis., an increase of from 1 to 3 cents per hour depending on past service. The Decatur (Ill.) Electric Street Ry., an increase of about 12 per cent.

The \$208,000 of 6 per cent North Chicago Street R. R. certificates of indebtedness, issued Jan. 1, 1891, but subject to call at par, have been called for payment. This makes \$413,000 of North and West Chicago debentures retired since the Union Traction Co. secured control.

A verdict for \$1,300 damages has been granted against the Milwaukee Electric Railway & Light Co., to a man who was thrown from a car by its sudden starting. The plaintiff testified he had a large bundle in his arms, which prevented him from catching the railing.

All employes of the Northampton (Mass.) Street Railway Co. who have outside work of any kind to do will hereafter have a working day of nine hours instead of ten. The pay remains the same. This action was voluntary on the part of the company.

The formal opening of the Georgetown (Mass.), Rowley & Ipswich Street Ry., the connecting link between Newburyport and Boston, occurred April 30th. President Barnes of the company was presented with a sterling silver loving cup by the business men of Newburyport.

Owing to a strike of teamsters and laborers the work of rebuilding the street railway lines at Decatur, Ill., was interrupted April 23d. Contractors offered the teamsters \$2.75 a day for 10 hours' work, but the latter demanded \$3.00 for nine hours. Laborers were paid \$1.35 a day for 10 hours, but wanted \$1.50.

Mr. W. S. Ruthell, superintendent of the Citizens' Railway Co., of Waco, Texas, writes us that the reports of damages to his line from the recent wind and rain storm in Texas were greatly exaggerated. He states that two culverts destroyed and a few hundred loads of gravel washed out were the only effects visible.

General Manager du Pont, of the Detroit street railway system, announces that during the coming season a storage battery plant will be erected in Detroit to help carry the heavy loads during busy hours. The company will expend \$150,000 in this improvement, but Mr. du Pont estimates that the saving in fuel will more than make it a paying investment.

The Brooklyn Heights Railroad Co. has sued the Brooklyn City Railroad Co. for \$2,000,000. The latter company in 1893 leased its property to the former for 999 years and the suit is believed to be instituted in a friendly spirit, because the Brooklyn Heights directors did not wish to assume the responsibility for carrying out a contract made by their predecessors.

In 1899 the exports of manufactures from the United States amounted to \$338,675,558, an increase of nearly \$48,000,000 over the preceding year. The manufactures constituted 28.13 per cent of the total exports, which is greater than for any year except 1865, when they amounted to 33.14 per cent; the value of exports of manufactures in 1865 was less than \$86,000,000.

For the first quarter of 1900 the Citizen's Street Railway Co., of Detroit, reports net earnings of \$173,735, as against \$132,205 for the first quarter of 1899; the Detroit Electric Railway Co. shows for the same period of 1900, net earnings of \$54,504, as against \$36,242; the Fort Wayne & Belle Isle Electric Railway Co. shows \$17,978, as against \$16,300. This is a gain in earnings of 30 per cent for the three roads together.

The Indianapolis Street Ry. was recently sued by a colored mind-reader, who alleged she received personal injuries through the negligence of the company. In a demurrer the defendant claimed that being a mind-reader, the plaintiff should have known of the intention of the trainmen to start the car, and showed contributory negligence. Besides this defense, however, the company had witnesses.

The U. S. Board of Engineers on Deep Waterways has been making new measurements of the flow of water in the Niagara River. Taking the mean level of Lake Erie at 572.78 ft. above sea level, the mean flow of the river is given as 221,500 cu. ft. per second. Should 10,000 cu. ft. per second be diverted from the discharge of the Niagara River by the Chicago drainage canal, the effect would be to lower Lake Erie by 0.4 ft.

Action has been brought against the Twin City Rapid Transit Co., of Minneapolis, by the county attorney to collect \$11,000 claimed to be due under the state statute on foreign corporations. The company holds that inasmuch as it simply acts as clearing agent for the Minneapolis Street Railway Co. and the St. Paul City Railway Co., both domestic corporations, it should not pay the foreign tax, even though it was chartered in New Jersey.

NEW PUBLICATIONS.

THE ANNUAL CATALOG of Purdue University for 1899-1900 contains a summary of the different courses and lectures, a description of the laboratories and apparatus, conditions of admission, degrees and other data on the University and its work.

"NOTES ON PARAGUAY" is the title of an interesting pamphlet that is being distributed by the Philadelphia Commercial Museums. It is edited by Enrique Plate, of Asuncion, Paraguay, and deals with the industrial and commercial advantages of that republic, which is rapidly taking a place among the leading countries of South America.

A DESCRIPTION of the natural beauties of Colorado has just been published by Mr. P. S. Eustis, general passenger agent of the Chicago, Burlington & Quincy R. R. To anyone interested in the grandeur of Western scenery and particularly to one contemplating a visit to the country described the book will be indispensable. Copies may be obtained by forwarding six cents in stamps to Mr. Eustis at his Chicago address, 209 Adams St.

"THE FOUR CORNERS," the official weekly organ of the Rochester Railway Co., of Rochester, N. Y., will be published during the summer season of 1900. Volume I ran from May to November, 1899, and Vol. II, No. 1, bearing date of May 4, 1900, reached us a few days ago. In his announcement the editor says: "The 'kickers' column' will be kept up to the standard. During the winter a big lot of awful cute kicks was collected. They will be tersely told without stings, as the editor of the Street Railway Review' would have them."

"PRACTICAL ELECTRICITY," published by the Cleveland Armature Works, Cleveland, O., will prove a valuable addition to the library of any student of electricity. Beginning with the fundamental principles of electrical science, the book takes the reader through the various branches to a point where the careful student can comprehend the complete designing, care and operation of a dynamo or motor. Special features are a list of review questions at the end of each chapter, and a dictionary defining 1,500 electrical words, terms and phrases. The price of the work is \$2 per copy.

"AMERICAN STREET RAILWAY INVESTMENTS," 1900 edition, has been published by the Street Railway Journal of New York, and seems to have been prepared with the same degree of accuracy as in former years. This edition of the "Red Book" contains 289 reading pages, including 29 maps of the principal street railway properties. It is issued about two months in advance of the date of issue in previous years, and includes a large amount of financial and statistical information not to be found elsewhere. Of the 1,252 reports of street railway companies, over 80 per cent have been examined and officially approved by the companies themselves.

A LECTURE on "Mechanical Ventilation and Heating by a Forced Circulation of Warm Air" was delivered at Sibley College, Cornell University, a short time ago, by Walter B. Snow, and is now reprinted in pamphlet form by the B. F. Sturtevant Co., of Boston, from whom copies can be secured on application. The author first presents data on the relative costs of heating and of ventilation for different rates of air change, and the proportional decrease in the necessary temperature of the admitted air, and increase in cost of ventilation, with the increase in volume at the intake. He then describes typical installations of heating and ventilating apparatus with the results secured in each case.

"WONDERLAND," the annual publication of scenery and pleasures to be found along the Northern Pacific Ry., is now being sent out by the general passenger agent, Mr. Chas. S. Fee, St. Paul. This annual has become each year more interesting and attractive, the aim being to present the territory occupied from a different standpoint each time. This year the strong features of "Wonderland" are the history of earliest exploration and settlement, and numerous illustrations contrasting the car and locomotive equipment of the first few years of operation with the splendid rolling stock of today. The covers are from strong designs

modelled in clay, and nearly every page bears a beautiful illustration. The book is a gem. A copy will be sent to any address on receipt of the postage—6 cents.

"COMPOUND ENGINES" is the title of a monograph recently issued by the Power Publishing Co., of New York. The pamphlet comprises 50 pages, 6 x 9 in., and is bound in flexible covers uniform with "Condensers" published by the same company. It is a series of three lectures by F. R. Low, reprinted from the columns of Power; the first deals with the principles governing the cylinder proportions of compound engines; the second is on combining indicator diagrams, and the third treats of receivers. The matter is plainly stated and by the use of concrete examples and diagrams it is endeavored to make the subject clear to every one. We regret to note that the author defines "power" as the "force exerted through space;" there is already quite enough confusion caused by the popular use of this term as synonymous with energy, without misusing it in a technical book. The price of the book is 50 cents.

"DYNAMOMETERS AND THE MEASUREMENT OF WORK," by J. J. Flather, professor of mechanical engineering at the University of Wisconsin, was originally published in 1892. The first edition comprised descriptions of the construction and principles of operation of the various forms of dynamometers used in measuring power, the work being used as the basis of a course of lectures to engineering students. A second edition has just been published and in it the author has added new chapters and greatly enlarged the scope with a view to making the book more useful for shopmen and engineers generally. Four of the new chapters deal with the measurement of electrical power. The measurement of the power of water motors is also fully discussed. In the chapter on the power required to drive machines there have been collated the results of all the reliable tests available; these data fill 50 pages and constitute a valuable reference for a man called upon to design a shop. The work comprises 403 pages with 141 illustrations; 12 mo, cloth binding. The publishers are John Wiley & Sons, of New York. London: Chapman & Hall, Ltd. Price, \$3.

CAUTIONS ON TRANSFER SLIPS.

Beginning with May 1st the Chicago Union Traction Co. has had the customary warnings to passengers, usually seen on placards inside the car, printed on the back of the transfer slips. The notice is in German as well as English, as may be seen from the reproduction shown herewith.

Passengers must not get on or off this car while it is in motion. Many accidents occur from people boarding and leaving the car in motion and facing in the wrong direction.

When leaving the car, step off facing in the direction the car was moving before it stopped.

Passagiere sollten nicht auf diese Car steigen oder von derselben absteigen, während sie im Gange ist.

Viele Unfälle kommen vor, wenn Leute beim Einsteigen oder Absteigen von einer im Gang befindlichen Car sich der falschen Richtung zuwenden.

Wenn man von der Car absteigt, sollte man sich der Richtung zuwenden, in welcher die Car fuhr, ehe sie anhält.

RAPID TRANSIT IN NEW YORK.

The mayor of New York on April 13th approved the bill extending the powers of the Rapid Transit Commission to all boroughs in the city; this bill also gives the commission control over avenue and tunnel franchises.

On April 17th three contracts for material and eight contracts for construction were awarded. The Carnegie Steel Co. will furnish 72,955 tons of structural steel, the Sicilian Asphalt Paving Co., 775,795 sq. yd. of asphalt waterproofing, and the United Building Material Co., of Philadelphia, will furnish the cement.

The construction contracts cover the sections from the Post Office to Great Jones St., from 104th St. to 181st St. (west side), and from 103d St. to 135th St. (east side).

The Galipolis (O.) & Point Pleasant Ry. suspended business on May 14th, and discharged all its employes. The road has not been making expenses.

STANDARDIZING OF STREET AND SUBURBAN CARS.

Editor "Review": Is there a necessity or need for such, or even an advantage in it to railroad companies, car builders or the public? Perhaps, before answering these questions, it should first be determined to what extent cars should be standard, and whose standard is to be adopted.

If by a standard car body is meant that the general dimensions, as to length, width, height and size of platforms, or, in other words, those features governing the general appearance of cars are to be alike, that is one thing, and hardly worth considering. But, if it is intended that the dimensions of sills, crossbars, posts, carlines, rafters, platform knees, sash, doors and all other detail are to be uniform, so that parts of cars from one maker will be interchangeable with similar parts from another, the problem at once becomes complicated, if not entirely impracticable of solution.

It might seem possible that a style of car could be agreed on, drawings and blue prints, covering all details, made and such sent to different manufacturers to work from, and cars interchangeable in all parts be the result, but the experience of the writer leads him to conclude it would not be so in practice, but, even though it was practical, would it be worth the cost? He doubts it.

I am inclined to the belief that it is not feasible to secure standard cars, because:

1. They would be standard in name, but not in fact.
2. It would discourage improvements in design and durability.
3. It would stifle the spirit of enterprise in individual railroad managers and car builders.
4. It would be unsatisfactory and monotonous to passengers.
5. It would encourage procrastination on part of railroad managers and attendant evils.
6. It would entail loss on car builders and their customers.
7. Local conditions are not alike.
8. Conditions and requirements are constantly changing.
9. It would degrade the art of car building.
10. It is against the best interests of humanity, for it would tend towards the suppression of individualism, which should be exalted, if the highest development of the citizen and mankind is to be attained.

CAR BUILDER.

FAULKNER TROLLEY EAR.

The accompanying illustrations show a new type of trolley wire ear known as the Faulkner, recently placed on the market by the Ohio Electric Specialty Manufacturing Co., of Troy, O. The ear consists of three castings, of which back views are shown as well

REAR VIEW OF SEPARATE PARTS.

as a front view of the assembled whole. All of these parts are made of tough bronze metal and they are ground to gage so as to be interchangeable and insure a good fit on the trolley wire. The two lower portions almost completely surround the wire; when the two jaws A and D are in place the thimble or collar C is slipped over the shank and the bolt B screwed in pulling up the lower jaw, while the collar forces the upper jaw down and the wire is firmly clamped.

The Faulkner car is also designed for use with the "Type W" hangers as well as those having insulated bolts. The curved lip on the lower jaw is 1/16 in. thick, but at each end is ground down to an

FRONT VIEW OF HANGER COMPLETE.

edge so that it presents only a slight obstruction to the trolley wheel.

The special advantages claimed for this ear are that it can be quickly put on or taken off, the operation requiring only two minutes; no tools or soldering are required; the ear automatically detaches itself from the wire in case the hanger stud breaks, and thus prevents danger of injury through the wheel or pole striking; spare ears can be carried on the cars and put in place by the conductor or motorman; it rarely gets loose, but has a tendency to become tighter with use; it can be readily adjusted or moved along the wire and new line strung to great advantage; it is equally as well adapted for curves as for straight track; it can be used with all types of hangers having a stud projecting from the insulation; only one piece wears out and it can be replaced, the parts being interchangeable.

SECTION

The standard size is 6 in. long by 2 1/2 in. high, but longer ears are furnished on request; the parts are made to fit any size of wire or hanger stud.

CONSOLIDATIONS AT SEATTLE, WASH.

The Seattle Electric Co. has been organized at Seattle, Wash., and will operate the properties of the following companies: Seattle Traction Co., West Street & North End Electric Ry., Madison Street Cable Ry., Union Trunk Line, Consumers Electric Co., Seattle Steam Heat & Power Co., Third Street & Suburban Ry., Union Electric Co. and Burke Lighting Plant.

The new company has 20 miles of cable and 30 miles of electric railway. The property will be under the management of Stone & Webster, of Boston. The company will have \$1,250,000 of preferred stock, \$5,000,000 of common stock and an authorized bond issue of \$5,000,000, of which \$1,500,000 will be held in treasury.

The officers are: President, Jacob Furth; vice-president, H. B. Sawyer; treasurer, W. C. Forbes; secretary, George Donworth; assistant treasurer, Frank Dabney; assistant secretary, Eliot Wadsworth.

NOT NECESSARY TO "MOVE FORWARD."

The superior court at Milwaukee holds a passenger cannot be ejected from a car for refusing to obey an order of the conductor to move forward. The decision says that the man who stands up in the car, if he does not block the aisle, has as much right to his place as a passenger has to the seat he occupies, and the conductor has no more right to oblige a person to change position than he has to oblige one to give up his seat to another.

Two recommendations were made last month by the Railway Committee of the Ontario Provincial Parliament. One provides for the adoption of fenders on all cars and the other limits the passenger fare to be charged on electric railways to two cents a mile.

General offices of the Houghton (Mich.) County Street Railway Co. will be located at Hancock, Mich. All franchises have been secured and arrangements perfected for immediately commencing work.

STRIKE AT LITTLE ROCK.

On April 28th the Central Trades Council of Little Rock, Ark., sent a committee to Gen. Mgr. W. C. Badger, of the Little Rock Traction & Electric Co., and demanded the reinstatement of a half dozen men recently discharged, "better treatment of employes," and recognition of the union. The reply of the company was as follows: "It is indispensable that the company should at all times have and exercise the right to discharge any employe whenever, in its opinion, such course is necessary or prudent; and it cannot recognize the right of any person to dictate whom it shall take into its employ, or whom it shall discharge."

The men decided to strike and quit work on May 2d. May 5th Pres. Allen N. Johnson petitioned the Federal Court for the appointment of a receiver, and the court named him for the position, and issued an order restraining all persons from interfering in any manner with the operation of the cars.

IMPROVED UNDER FEED STOKER.

The Under-Feed Stoker Co. of America has been organized under the laws of New Jersey and will control the Jones under-feed stoker patents in this country, having general offices at 218 LaSalle St., Chicago.

The stoker consists of a steam cylinder or ram, with a hopper for receiving the coal, located outside the furnace proper, and a retort or fuel magazine inside the furnace into which the green fuel is forced by means of the ram; tuyere blocks for the admission of air are placed at either side of the retort and at the bottom of the

SECTION OF JONES' UNDER-FEED STOKER.

retort, where the fire never reaches, is an auxiliary ram or pusher for getting an even distribution of the coal. The coal is forced underneath the fire, each charge of fuel raising the preceding charge upward until it reaches the fire. The coal is coked before it reaches the fire and as the gases are liberated under the bed of coals and at the same time mixed with air, they necessarily pass through the fire and perfect combustion is secured. Air is supplied through the tuyere blocks by a blower. After the fire is thoroughly started

ELEVATION OF STOKER.

not more than two charges of the ram should be fed at one time, as otherwise green coal will be forced into the fire.

The claims made for this stoker are: Economy of fuel because of more perfect combustion; adapted to any kind of fuel; a smokeless stack; simplicity; easy control; durability; no mechanism exposed to the fire. Comparative tests made by reputable engineers show gains of from 16 to 23 per cent over hand firing.

The officers of the company are: President, George Gooderham; vice-presidents, Charles H. Smyth, Elias Rogers, Henry M. Pellatt; secretary, T. A. Rowan; managing director, Charles H. Smyth; manager, Fred A. Daley; chief engineer, James Miine.

CHANGES AT PITTSBURG.

In addition to the appointment of Mr. W. Kesley Schoepf to the position of general manager of the Consolidated Traction Co., of Pittsburg, as mentioned elsewhere in this issue, there have been a number of changes in the official staff of that company. Among these are the resignation of Mr. Jas. A. McDevitt, secretary of the corporation since its organization, the appointment of Mr. F. Uhlenhaut, jr., of New York, to the office of chief engineer, and the creation of a new office, that of comptroller, with Mr. Samuel E. Moore, formerly of Philadelphia, as the first incumbent. Mr. Uhlenhaut was at one time employed with the Thomson-Houston Co., and has been assistant engineer and also chief engineer of the Philadelphia Traction Co., assistant engineer of the Metropolitan Street Ry., of New York, and expert consulting engineer of the Telephone, Telegraph & Cable Co., of New York, which place he leaves to go to Pittsburg. Mr. Moore is an accountant of reputation, having for years held the position of secretary and auditor of the Carnegie Steel Co., and later auditor of the Philadelphia Co., a corporation controlling a number of gas, electric light and street railway properties.

PRICE OF STEEL RAILS.

Chicago quotations for new steel T rails range from \$35 to \$40 per ton; angle bars are quoted at 2 cents; spikes, \$2.40; bolts, \$3.30. Prices at Eastern mills about the same. Relaying steel rails are \$28 to \$30.

Andrew Carnegie, in an interview telegraphed from London on May 10th is quoted as saying: "I do not believe any serious reduction in prices will occur in the American iron and steel market. The world's demand shows signs of increasing rather than decreasing. The recent drop was merely a transition from fictitious to real values."

GAVE HER HER OWN WAY.

The division superintendent of a certain line in Cincinnati believes in taking a woman at her word. A conductor called him up and asked what to do with a female passenger who had forgotten to ask for a transfer, and after boarding the second car not only refused to pay again but demanded a transfer to a third line, saying she would ride all night unless she obtained it. The superintendent replied to let her ride. She spent the evening making the round trip from Cincinnati to Winton Place but when the car was run into the barn for the night she concluded to find more comfortable quarters.

LACKAWANA RAILROAD.

If one were asked after a dozen or more rides over the main line or branches of the Delaware, Lackawanna & Western R. R., what portion of the route presented the most attractive features, or how the service compared with that on other lines in New York or Pennsylvania, we fancy he would agree with us in saying that the section between Corning and Binghamton was the most to be admired, and that if a comparison were to be instituted no other road surpassed this in comfort, speed, convenience, attention of employes, or even in scenic features.

The advertising circulars sent out by this road call attention in glowing terms to the natural beauties of the rugged region about the Delaware Water Gap, and from there on to the coal regions about Scranton. These pen pictures are not overdrawn, for the scenery is indeed attractive and beautiful, but for a picture of quiet beauty and the mingling of nature with the handiwork of man, the route in either direction between the cities named must bear the palm. The rich fields with growing crops in great variety, including both grains and fruit, the different rivers and the fields backed by comfortable homes, surrounded by flowering lawns, with the grazing land on the hills still farther in the background please the eye and fill the traveler with a sense of beauty and even grandeur that can hardly be outdone by one's ideals of the realms of bliss that the preachers teach are the homes of the blessed beyond the river of time. By day or by night, in summer or in winter, there is a something about the scenery and service of this road that makes one desire to repeat the trip at every possible opportunity.

CHAS. J. MAYER,
President.

A. H. ENGLUND,
Sec'y & Treas.

THE MAYER & ENGLUND CO.

10 SOUTH TENTH STREET,
PHILADELPHIA, PA.

CABLE ADDRESS:
"MAYLUND" Philadelphia.
A. B. C. Code, 4th Ed.

NEW YORK OFFICE:
85 LIBERTY STREET.

Electric Railway Material and Supplies of Every Description.

We are exclusive Territorial Representatives of the following leading Manufacturers of Railway Materials:

R. D. Nuttall Co., Gears, Pinions, Bearings, Trolleys, Etc.	Allegheny, Pa.	The International Register Co., Single and Double Fare Registers.	Chicago, Ill.
Van Wagoner & Williams Hardware Co., Dropped Forged Copper Commutator Segments.	Cleveland, O.	W. T. C. Macallen Co., Standard Overhead Insulating Material.	Boston, Mass.
The Protected Rail Bond Co., "Protected" Flexible Rail Bonds.	Philadelphia.	Bradford Belting Co., "Monarch" Insulating Paint.	Cincinnati, O.
American Electric Heating Corporation, Electric Car Heaters of Every Design.	Boston, Mass.	Sterling Varnish Co., Sterling New Process Insulating Varnish.	Pittsburg, Pa.
Chisholm & Moore Manfg. Co., Moore's Chain Belts.	Cleveland, O.	Garton Daniels Electric Co., Garton Lightning Arresters.	Keokuk, Ia.
New York & Ohio Co., "Packard" Incandescent Lamps.	Warren, O.	D. & W. Fuse Co., Enclosed Non-Arching Fuses.	Providence, R. I.

Special Agents: AMERICAN ELECTRICAL WORKS, Providence, R. I.

We carry the largest stock in this country of Strictly Electric Railway Material.
We are now occupying our entire building, five floors and basement.
Special Attention Given to Export Business.

Send for Catalogues.

ECHOES FROM THE TRADE

THE ATLAS RAILWAY SUPPLY CO., Chicago, has moved from the Monadnock Block to rooms 1523-1524 Manhattan Building.

MR. ROBT. L. McQUAT advises us that on April 25th the firm of Varney & McQuat was dissolved and he succeeded to the entire business.

McGILL, PORTER & BERG., 309 Dearborn St., Chicago, sent to all its friends at Easter a beautiful portrait in colors of a young woman's head.

THE WHITE MANUFACTURING CO., of Chicago, maker of gasoline appliances, has moved into new and larger quarters at 102-104 Michigan St.

WAGENHALS arc headlights are used on cars of the New Jersey & Hudson River Railway & Ferry Co., Undercliff, N. J., and are giving excellent satisfaction.

THE SIEGRIST LUBRICATOR CO., of St. Louis, Mo., is to equip all the plants of the Terminal Railroad Association of St. Louis with the Siegrist automatic oiling system.

THE B. F. STURTEVANT CO., of Boston, has brought out the third edition of its Bulletin "H," describing special types of fans with open and enclosed bi-polar and multi-polar motors.

THE PHOENIX IRON WORKS CO., of Meadville, Pa., has removed its Chicago office to Rooms 202-203-204 Western Union Building. Mr. Cary remains as the company's Chicago representative.

THE KEHIN ELECTRIC RAILWAY CO., of Kawasaki, Japan, placed the order for its trucks with J. G. Brill Co., Philadelphia, and for motors and controllers with the Westinghouse company.

AN ORDER TO SELL the real estate of A. Groetzinger & Sons, of Allegheny, Pa., bankrupts, having been applied for, a hearing in the matter will be held at St. Nicholas Building, Pittsburg, May 22, 1900, at 11 o'clock.

THE MOLONEY-BENNET BELTING CO., of Chicago, announces the removal of its offices to 34-36 South Canal St. This company's motto is "We Lead," usually printed under a picture of a little cupid leading a lion by the mane.

THE BURT MANUFACTURING CO., of Akron, O., furnished the oiling system for the newly opened electric plant of the Compania de Ferrocarrilas del Distrito Federal de Mexico, which owns the street railway lines of Mexico City.

THE LINK-BELT MACHINERY CO., of Chicago, writes that it has sold all the patents, stock and good will of that portion of its business known as the electrical mining machinery department to the Goodman Manufacturing Co., of Chicago.

A. L. IDE & SONS, of Springfield, Ill., have published a supplemental catalog giving data on their new "Ideal Special" engine. This model is the same as the well known "Ideal" with the exception that it has a flat balanced type of valve, driven direct from the eccentric rod, avoiding the use of slides, rocker arms or offsets. No additional stuffing-boxes are introduced, but by the

system of interior connection from valve-rod to valve, the valve seat is brought close to cylinder walls and clearances kept low.

HUNTER ILLUMINATED CAR SIGNS have been adopted for all the cars in Kansas City, Mo., and will be placed in position before the convention in October. These devices have also been ordered for all the open cars at Wichita, Kan.

MR. J. W. HARTY has been appointed western agent for the Detroit Steel & Spring Co., with offices at 1126 Monadnock Block, Chicago. Mr. Harty takes the position made vacant by the death of Mr. G. H. Quinn, which occurred last month.

THE STANDARD UNDERGROUND CABLE CO. announces the removal of its New York offices to more commodious quarters at No. 50 Liberty St. (corner Nassau), and at the new location will be glad to welcome its customers and friends.

THE BUCKEYE ENGINE CO., of Salem, O., through its Chicago agent, H. E. Troutman, recently sold the Illinois Steel Co., of Chicago, one 1,800-h. p., 30 and 60 by 48 in. direct connected cross compound engine for one of its large steel plants.

THE CHASE CONSTRUCTION CO., of Detroit, Mich., is drawing attention to some of its recent work by means of a tasteful wall poster 10 x 8 in. bearing miniature photographs of special features on several roads for which it was general contractor.

CHASE-SHAWMUT CO., of Boston, has a new catalog on its standard "Knock-out" junction and outlet boxes, for which one of the strong claims is that they can be instantly disconnected from the conduit by unscrewing the nipples from the inside of the box.

THE CRANE CO., Chicago, has closed a contract with the St. Louis Transit Co. for all the valves required in its new power plant at Vandeventer Ave.; the company has just completed the installation of the piping in the plant of the Cincinnati, Aurora & Lawrenceburg Electric Ry.

THE BETHLEHEM STEEL CO., of South Bethlehem, Pa., has taken an order for crank-shaft forgings to go to Australia, the purchase having been made through the New York office, by a representative of the Australian engineers who recently visited the United States on a tour of inspection.

H. C. GRAHAM, of 137 Grand Ave., Milwaukee, was on May 5th appointed receiver for the Milwaukee Railjoint & Welding Co. He announced that the company's property in his hands, consisting of three complete cast-welding outfits and a stock of steel and scrap iron, would be sold at public auction May 15th.

E. P. ROBERTS & CO., controlling engineers, of Cleveland, have changed their offices from the Osborn Building to the Electric Building on Prospect St. In a neat booklet recently issued they point out the advantages of employing competent engineers when building new lines, and describe some of the work they have done.

SHEAFF & JAASAD, 85 Water St., Boston, Mass., are building a number of street railway power plants. These include one at Lexington, Mass., for the Lexington & Boston Street Ry. Co.; one of 300 kw. capacity at Medway, O., for the Springfield, Dayton & Urbana Street Ry.; one at Portland, Me., and one at Exeter, N. H.

MR. W. T. VAN DORN, Monadnock Block, Chicago, recently returned from a business trip in the East. He reports trade in excellent condition, orders for couplings having been received last month from 15 different companies. The wide-spread demand for Van Dorn goods is shown by the fact that these orders came from various roads all the way from Chicago to Japan.

THE PITTSBURG REDUCTION CO. has changed its New York office from the Havemeyer Building to the Phelps-Dodge Building, corner Cliff and John Sts., where it will carry a small stock of standard sizes and grades of aluminum ingots, sheets and wire. Mr. Chas. W. Hall has left the employ of the company

and Mr. S. K. Colby, the Eastern sales agent, will assume charge of the New York local business.

THE J. G. BRILL CO., of Philadelphia, is sending out the seventh of its series of circulars relating to its truck No. 27, which it calls the "Perfect" passenger truck. The chief claim made for this type is that it is built with the characteristic properties of a three-legged stool, that is there is always an equal weight on each one of the supports, which in this case are the four wheels.

THE INTERNATIONAL CORRESPONDENCE SCHOOL at Scranton, Pa., has opened a new course known as "Railway Motor Engineering," which is intended for operators and those who wish to become operators of electrical machinery, as dynamos, motors, etc. It has been prepared by Eugene C. Parham, superintendent of the Nassau division of the Brooklyn Rapid Transit Co.

THE STAR BRASS WORKS, Kalamazoo, Mich., maker of the Kalamazoo trolley wheel, has appointed Mr. Geo. E. Pratt as its expert and general contracting agent, with headquarters at Philadelphia. The rapidly growing popularity of the Star company's product has made an eastern office a necessity, and with this and Mr. Pratt's wide acquaintance it will be in better position than ever to vigorously push its specialties.

MR. MAJOR, of the Major Cement Co., of New York, writes us that he considers the enviable reputation enjoyed by his cement to be due to the fact that in its making nothing but the very best materials are used. He states that one of the ingredients costs \$3.75 per lb., and another costs \$2.65 a gal., while a large share of the so-called cements and liquid glues on the market are nothing more than 16-cent glue, dissolved in water or citric acid.

HOHENADEL BROS., of 211-213 Madison St., Chicago, make uniform caps for the Chicago Union Traction Co., the Chicago City Railway Co., the Metropolitan Street Railway Co., of Kansas City, Mo., the Milwaukee Electric Railway & Light Co., the Twin City Rapid Transit Co., of Minneapolis, and several other street railway companies. The firm has recently published a new catalog describing its goods. This will be sent on application.

THE PAIGE IRON WORKS, of Chicago, has sent us its 1900 catalog describing the various types of switches, frogs, crossings, switch stands, rail braces, guard rails, track tools and special work which it makes. At the back of the book are a number of valuable tables. These include weights of flat rolled bars per lineal foot, weights of square and round bars, data for determining dimensions of frogs and turnouts, and a table of middle ordinates.

THE CREAGHEAD ENGINEERING CO., of Cincinnati, is making the second shipment of overhead material for the electrical works of the Boston & Maine R. R. at Portsmouth, N. H. The Creaghead flexible bracket system has also recently been ordered for the Spartansburg (S. C.) Railway, Gas & Electric Co., the Milford, Attleboro & Woonsocket Street Railway Co., and also for a line running from Northampton through East Hampton, Mass.

THE BERLIN IRON BRIDGE CO., of East Berlin, Conn., is erecting at Pittsburg, Pa., an additional manufacturing plant that will have a capacity of from 3,000 to 4,000 tons of completed material per month, and will be one of the best equipped establishments of its kind in the world. Electricity will be the motive power throughout. Over 20 Chisholm & Moore traveling cranes of various sizes and designs are among the labor saving devices that will be installed.

THE COMPRESSED AIR CO., with a capital of \$8,000,000, was incorporated in New York April 9th and will take over the property of the American Air Power Co., of New York, and the Compressed Air Motor Co., of Chicago. The new company will have \$750,000 of 7-per cent, non-cumulative preferred stock and \$7,250,000 of common. President Cooke states that the company has orders for 128 cars from the Metropolitan Street Ry., of New York, for use on the cross-town lines. The directors are: William L. Elkins and Thomas Dolan, of Philadelphia; G. E. P. Howard, Henry D. Cooke, Francis R. Foraker, William C. Duxbury, Charles

CORRESPONDENCE.

We cordially invite correspondence on all subjects of interest to those engaged in any branch of street railway work, and will gratefully appreciate any marked copies of papers or news items our street railway friends may send us, pertaining either to companies or officers.

DOES THE MANAGER WANT ANYTHING?

If you contemplate the purchase of any supplies or material, we can save you much time and trouble. Drop a line to THE REVIEW, stating what you are in the market for, and you will promptly receive bids and estimates from all the best dealers in that line. We make no charge for publishing such notices in our Bulletin of Advance News, which is sent to all manufacturers.

This paper is a member of the Chicago Trade Press Association.

Entered at the Post Office at Chicago as Second Class Matter.

VOL. X.

JUNE 15, 1900.

NO. 6

"The point of a comprehensive set of accounts to be kept so that the condition of business can at all times be understood is a great deal more important than we imagine until we go into it, and the more you get into it the more information you will get."—E. H. Jenkins, in discussing a paper before the Southwestern Gas, Electric & Street Railway Association.

The "Big Four" railroad is having considerable trouble from the competition of the many electric lines running between stations which it serves, but the management announces that no effort will be made to inaugurate a rate war. The general superintendent is quoted as saying, "We might put on trains every hour, make the electric line lose money and lose money ourselves, but when it is all over the electric lines will still be there." This is one of the distinguishing features of electric lines. They are always there.

A new kind of trouble for street railways has appeared, and it is a good deal larger than a man's hand; in fact it is about the size of a fat man. Brooklyn is responsible for the discovery of this strange type of damage claim. A woman in that city has secured a verdict for \$2,300, as a recompense for the great bodily discomfort occasioned by the unceremonious manner in which a certain fat man passenger sat down upon said plaintiff while both passengers were upon a street car.

If the higher courts sustain the award the fat man will become an object of suspicion, to be classed with the grab-handle man and other fiends.

Electricity has undoubtedly worked wonders in the last decade but it is not wise to claim too much as was inadvertently done by Sir W. H. Preece (according to the report of his address as pub-

lished in Engineering of London) in discussing the Relation between Engineering and Electricity." Sir William is quoted as follows: "The waste force of nature are thus within our grasp. The waterfalls of the Highlands may work the tramway of Glasgow; Niagara Falls already work those of Baltimore." The following issue of Engineering contained a letter asking for the publication of complete detail of the Niagara Fall-Baltimore installation. The American reader will at once recognize Baltimore as a slip of the pen for Buffalo.

On another page of this issue is a very interesting paper on station economies, read before the National Electric Light Association by Mr. W. L. Abbott, of the Chicago Edison Co. The sub-heads of this paper are "Oil and Waste," "Cylinder Lubrication," "Hours of Work" and "The Fuel Question" and under each of these the station engineer will find valuable pointers. Mr. Abbott has what might be called a "dispatching" system for assigning the boiler and engine room forces by means of which the number of men on duty is made to correspond almost exactly to the load curve of the station and the maximum economy secured. Stress is laid on the fact a fireman will burn fuel costing from 10 to 15 times as much as his wages, and therefore the importance of cutting down expenses by educating the fireman. The econometer diagrams very forcibly illustrate the value of station records of performance, especially those whereby the quality of the individual man's work can be examined.

In our last issue was published an extract from an address by Professor Rowe of the University of Pennsylvania, wherein he made the point that cities were not the proper political units to control street railways for the reason that the territory served by these transportation lines was even now in many instances far greater in extent than the municipality itself. In the future this condition will become even more marked. In England since the advent of electric traction a great many municipalities, and other local authorities, have embarked in the transportation business and even the comparatively short experience had up to the present shows that local jealousies existing between contiguous towns and boroughs has greatly hampered the legitimate development of the electric railway enterprises along lines that would make them of the greatest benefit to the patrons of the system. The municipalities appreciate the advantages of extending their tramway systems into adjoining towns and villages, what we would call the suburbs, but find that it is next to impossible to make arrangements with these other municipal boards for the joint operation of the lines.

It is interesting to note how the non-technical press of England is following the lead of our own daily papers in printing under scare head lines, exaggerated and distorted accounts of accidents due to the presence of electric tram cars in city streets—a practice, however, that is fortunately not so much the fashion in this country as it was a year or two ago, when the imagined "Juggernaut" qualities of the electric motor car furnished so much material for the enthusiastic but harebrained reporter. As one example of this pernicious habit a leading English newspaper after an accident in which a boy was injured by a motor car, published a long account of the mishap under the headline, "Child Electrocutted" when as a matter of fact from the paper's own account, it is evident that electricity had nothing to do with the accident, which undoubtedly would have occurred had horses been the motive power.

These misguided attempts to block the progress of electric traction will have no more lasting effect than did the effort to prevent the introduction into English cities of the overhead trolley, on the ground of its unsightliness, concerning which scarcely a word is now heard.

A writer in one of our electrical exchanges in discussing the proposed operation at the rate of 60 miles an hour on an interurban road now building is inclined to question the practicability of the plan in some respects. He admits the ability of the motors to drive cars at that speed, but fears there will be little left of the overhead construction after a few trips with the trolley jumping the wire. In our opinion his fears are not well grounded. We agree with him that a trolley off the wire at a mile a minute might work havoc, although devices are in successful service for preventing such catastrophes. With the overhead work in first class condition, as it would necessar-

ily have to be for operation at over 30 miles an hour, and with a smooth track there should be little trouble from this source. Indeed, the speed in question would in itself demand a roadbed of the first order, well graded, surfaced and ballasted. Our observation has been that soft track and inequalities of track surface have quite as much to do with trolleys jumping as any one thing. Curves have always been a favorite place for the trolley to jump, but electric cars would hardly try to enter any but very slight curves at 60 miles an hour, and indeed they have no occasion to do so, as the car is so readily controlled both in reducing speed and taking it up again that the loss of time at such points would be immaterial.

The prime requisite for high speed electric service is substantial and smooth track, and with this and the double trucks which are now built with a special view to fast and safe travel the mile a minute becomes less of an electrical and mechanical problem than was a speed of 25 miles an hour not so very many years ago.

The advertisement in a trade journal does a vast amount of good work, for which the paper in which it appears gets absolutely no credit whatever. In these days the busy manager in a hurry to get information or prices, seldom stops to include in his letter a few words which would have informed the party addressed where the inquiry originated. We have just experienced a case of this identical thing, which leads to these few lines on the subject. The writer was in need of some certain material and hunted up a trade paper devoted to the business in question. From advertisements he selected three names, all of which he saw for the first time, and opened correspondence. The result was an order for over five hundred dollars worth of material from one of these three. It was not for several days after the transaction had been closed and the goods delivered, that the purchaser happened to think he had not thought of telling the seller that the trade was due entirely to having seen his advertisement in a certain trade paper. If one directly interested in the actual work of publishing a trade paper forgets to mention the source of information which was directly responsible for placing an order with a certain party, it is no wonder that the average buyer should forget to give that credit which is so much appreciated by both the publisher and the advertiser.

Throughout Europe the urban transportation companies most generally charge a fare proportional to the length of the ride and the number of passengers is limited to the seating capacity of the car; in some instances a few passengers may be permitted to stand on the platforms, but the number of these is also strictly limited. The effect of these regulations and methods is first to greatly limit the ability of the companies to serve the public, and second to discourage territorial expansion of cities. The graduated fare is perhaps too thoroughly established in Europe to be readily altered for years to come though more and more stress is being laid on the effect of the American system of uniform fares which enables the workman to reach his home in the suburbs at no greater cost for transportation.

As regards standing room on street cars the practice abroad will probably be more easily and quickly changed. The *Tramway & Railway World* says editorially in a recent issue:

"The immoral and unsanitary condition of the slums are almost entirely due to the unnatural and unnecessary crowding of the population into insufficient space. America has found that this can be remedied by giving rapid transit at cheap rates into the suburban districts. This rapid movement of the working population is, however, obtained at the expense of some personal discomfort during the rush hours of morning and evening. From the moral and sanitary points of view the result is infinitely above the cost of obtaining it. * * * * If tramways are to meet the needs of the people as fully as they can do, it is essential that standing room in the cars should be made use of at certain hours of the day."

The announcement at the National Convention of Railroad Commissioners by Mr. Ashley W. Cole, chairman of the New York Railroad Commissioners, that on and after July 1st of the current year the street railways of New York would make their reports to the Commissioners in accordance with the "Standard System" of accounts adopted by Street Railway Accountants' Association is the second public—we may say official—recognition of the excellent work done by the Accountants' Association in the three years since its organization.

The importance of a uniform system of accounting for public service corporations was again forcibly presented in a paper by Mr. J. B. Cahoon, read before the National Electric Light Association at its meeting in Chicago last month. Mr. Cahoon, who is well-known in the street railway as well as the electric lighting field, having been general manager of the street railway, lighting, gas and water companies of Elmira, N. Y., for several years, took the position that the primary necessity for a uniform system of accounting lies in the fact that public service corporations must unite for self-defense against the advocates of municipal ownership. The claims made for municipal plants are improved service, more diffused use, and lower rates, and the greatest of these is lower rates. The managers and city officials reach their conclusions concerning lower rates only through self-deception due to improper accounting; the private company's strongest answer is to tell the truth. Without doubt the salvation of the private companies engaged in operating public utilities lies in convincing the voter that they can furnish a cheaper and better service. This cannot be done more effectively than by exhibiting the true cost of the service under private and under municipal operation. Comparisons imply uniformity of method, and hence the necessity of a standard system of accounts.

Thanks to the work of the Street Railway Accountants' Association the principal street railway companies of this country and the Railroad Commissioners of the various states are in accord as to the method in which the accounts should be kept.

The strike now in progress on the lines of the St. Louis Transit Co. is one of the most remarkable labor disputes of which we have any knowledge; there was no question as to hours of work, rate of wages, or the ordinary details over which friction often, unfortunately, arises between employer and employe. The issue in this case was clear cut: Should the company which is responsible in law for the diligence and competence of its servants, have jurisdiction over the selection and retention of its employes, or must the matter be left to an association of the employes which both individually and collectively are irresponsible? The demands of the men left no room for compromise, and the result is that for more than 30 days the city of St. Louis has been the scene of lawlessness. Bloodshed has been an almost daily occurrence and fatalities not infrequent.

The governor of Missouri spoke thus of the strike: "I am satisfied that the trouble along the street car lines and the whole spirit of anarchy which I find prevails so largely in the city of St. Louis at present is being fomented and extended by the machinations of a certain coterie of politicians, who hope by their course to in some manner make gains in the approaching primaries. This element is sending speakers to meetings held to express sympathy for the strikers all over the city, and if not counseling disorder, it is at least materially encouraging it." If this be the case, the intelligent foreigner need not marvel at some of the other things which the exigencies of politics force our leaders to do.

The management is maintaining a firm and resolute position. It is operating a considerable portion of the system during daylight hours, and has sufficient competent help to restore the usual full service. Nothing but lack of protection prevents this being done.

In the meantime business of all kinds suffers. No merchant could hope to conduct his business under the plan demanded by the strikers, hence the strike has little sympathy from this source. There has never, in our opinion, been so senseless and unjustifiable a street railway strike as this. The men have been well treated. They fail to offer in evidence cases of unjust treatment or discharge, and the very unreasonableness of their demands is sufficient to convince any level headed person of their unfitness to be allowed to do what they ask. As usual the former employes disclaim any part in the attacks upon persons and property; it is noticeable, however, they do not offer to assist the authorities in preserving order, and not a few have been apprehended in acts of violence. It is one of those cases where unprincipled leaders from other cities have worked the men up to a belief in evils which have no actual existence, and where the men otherwise would have taken no part in acts they are engaging in. When the trouble is all over and these same ex-employes have had time to quietly review the part they have taken, they will do so with regret and astonishment that they could have been so misguided.

Interurban Between Bucyrus and Galion, O.

A franchise for building an electric railway from Bucyrus, the county seat of Crawford County, in the northcentral part of Ohio, to Galion, O., was taken out five years ago, and some preliminary work was done, but owing to the stringency of the money market the scheme had to be postponed, and two years later the franchise was surrendered. In the autumn of 1898, however, the Ohio Central Traction Co., incorporated under the laws of Ohio, with \$225,000 capital stock, secured a franchise, and though there have been unavoidable delays, the enterprise has been carried to successful completion.

The active work of construction was commenced in May, 1899, but by reason of difficulty in securing iron and steel, the line was not fully completed until last August. From the opening of the road for traffic the patronage has been entirely satisfactory, giving

utes, though it can be made in much less time, as there are no grades and few curves.

Both the power house and the barns are located on the eastern end of the line. The buildings, which are of modern style and handsome appearance, are substantially constructed of brick and steel, and well adapted to their purposes. The power house is divided into boiler room and engine room, each 60 x 40 ft., giving plenty of space. A coal track runs to the rear of the furnaces, and beyond this there is a fine campus of two acres, with a bountiful supply of water. To provide against delay from possible breakdowns, boilers, engines and dynamos are in duplicate, each set having sufficient capacity to furnish all the power, and light which may be needed under ordinary conditions. Each boiler and engine is rated at 250 h. p. The boilers are the water tube type

POWER HOUSE AND CAR BARN OF THE OHIO CENTRAL TRACTION CO., GALION, O.

promise of a good, permanent investment, and the convenience to the people is thoroughly appreciated, for the trip between the two cities by steam road, although the distance is not great, formerly required transfer and delay with considerable annoyance.

The length of the road is a trifle less than 12 miles, but with side tracks it is somewhat more. As the system was built for permanent operation by its present owners, nothing but the latest and best material and equipment have been used. The roadbed is laid with 60-lb. T-rails; in the cities they are in 60-ft. lengths, and in the country in 30-ft. lengths. Crown bonds, made by the American Steel & Wire Co., were used. The rails are laid on oak ties, 2 ft. c. to c., and ballasted with gravel. All overhead work was furnished by Wm. Wharton, jr., & Co., of Philadelphia.

Four motor cars and four trailers made up the original equipment, but three more cars have been added. These are 36 ft. long mounted on Brill double trucks, and heated with Consolidated electric heaters. Cars leave every half hour from each terminal, the distance between the cities being covered in about 45 min-

made by the Turner Engineering Co., of Bucyrus, and are giving excellent satisfaction. The engines were made by the Slater Engine Co., of Warren, Mass. The dynamos and switchboard, which is of black marble, are from the General Electric Co., of Schenectady, N. Y. The line voltage is kept at about 600 volts at the power station.

The car barns are 35 x 150 ft., with pressed steel fronts, and contain three tracks, with room sufficient for a dozen or more cars. Provision is also made for a repair shop. In the power house building, though separate from the power room, is the general manager's office, consisting of two rooms, one for public business and one for private. Both are comfortable, and neatly, though not extravagantly furnished.

Midway between the two cities, each of which has 8,000 inhabitants, is located Seccaium Park, owned and operated by the company. In addition to being a gem of nature, it is rich in historic traditions; the location makes it one of the handsomest parks in Ohio. It has fine old trees for shade, has an unailing supply of excellent water, presents fine landscapes, and a general

topography of beauty. A commodious theater has been built, with pavilions, dining hall, waiting rooms, band stands, an artificial lake, bowling alleys, museum, etc., and in the short time that the

W. E. HAYCOX.

road has been in operation the park has been thronged day after day by picnic and pleasure parties. During the summer season theatrical entertainments are given every night, the park being on the regular amusement circuit with Columbus, Toledo and other cities. The attractions are changed weekly. Within the boundary of the park once stood the village of Seccaium, celebrated in legends as one of the famous places of Indian history, for it was here that the tribes of the North and South often met and exchanged their furs and wares, and held

their conclaves and pow-wows. On a prominent rise in the park stands a monument erected by the Historical Society, to commemorate and mark the battle ground where Colonel Crawford's men in 1782 fought their last battle with the Indians in Crawford's campaign against the Sandusky tribe. It was in this campaign that Colonel Crawford, after whom the county is named, was captured and burned at the stake.

The management of the railway company is well pleased with the success of the line, and has completed arrangements to extend the eastern end to Crestline and Shelby. Work on this extension

ELECTRIC POWER FOR MONTREAL.

The State Department is advised that it is the intention of the Shawinigan Water & Power Co., of Shawinigan, Quebec, to make available at Montreal by means of an 80-mile transmission line, the power which is being developed at Shawinigan Falls. The necessary works and line construction will be installed with the idea of ultimately transmitting 75,000 h. p. though but 30,000 h. p. will be utilized at present. If the plans are carried out Montreal will soon become the chief Canadian center for cheap power for manufacturing purposes.

NEW INTERURBAN IN MICHIGAN.

A company has been formed at Grand Rapids, Mich., under the name of the Grand Rapids Spring Lake & Grand Haven Rapid Transit Co., with \$500,000 capital stock, to connect the cities named in title by a high speed electric line which will cater to both freight and passenger traffic. A central power station located 12 miles west of Grand Rapids will deliver alternating current to the line at 10,000 volts, which will be reduced at sub-stations and the current converted for direct current motors. The directors are: Justin R. Whiting, St. Clair, Mich.; Geo. W. Carman, Marine City, Mich.; S. L. Merriam, Detroit; I. J. Cilley and E. C. Cilley, of Grand Rapids.

SPARROWS IN CAR HOUSES.

The large car houses of street railways, especially the buildings having truss roofs and high gables, offer particularly inviting quarters for English sparrows, and managers are greatly annoyed by these ubiquitous birds. A few years ago one of our correspondents recommended shooting into the building with fine bird shot whenever necessary and stated that a few shots would suffice to scare the birds away for a considerable time.

Mr. Thomas Farmer, mechanical engineer of the Detroit street

SCENES ALONG THE LINE OF THE OHIO CENTRAL TRACTION CO.

will begin within the next month or two, and it is expected the line will be in operation by September. The company also contemplates building another extension from Bucyrus to Upper Sandusky, a distance of 18 miles, passing through Nevada, and has secured the right of way in Indiana for a 16-mile line from Wabash to Peru, two growing cities of 12,000 inhabitants each. The cars of this line are all equipped with New Haven fare registers. The officers of the Ohio Central Traction Co. are: President, I. A. Kelsey, West Haven, Conn.; treasurer, Samuel Morehead, New Haven, Conn.; secretary, R. W. Johnston, Galion, O.; general manager, W. E. Haycox, Galion, O.; Messrs. Blakesly & Son of New Haven, Conn., were the contractors.

railways advises us that he recently drove the sparrows from one of the car houses of that system by turning an owl loose in the building. As soon as the owl had caught one or two sparrows the others took to flight. To keep the owl inside the windows should of course be covered with netting.

The United Traction Co., of Pittsburg, reports for the month of April, 1900, gross receipts, \$153,382; net receipts, \$79,293; fixed charges, including taxes, \$58,150; surplus, \$21,142.

A verdict for \$100 was last month given in a suit against the Superior Rapid Transit Railway Co., of West Superior, Wis., for ejecting a passenger who presented a transfer that had been incorrectly punched.

The Calumet road, Chicago, will expend \$33,500 in improvements

CONSOLIDATION IN PITTSBURG.

June 20th a meeting of the stockholders of the Consolidated Traction Co., of Pittsburg, will be held and a vote taken on a new proposition to lease the road to the Union Traction Co. for a term of 900 years. As mentioned in our issue for April, page 198, the majority of the stockholders voted in favor of a lease to the Union Traction Co., under which the preferred stock of the Consolidated would receive 7 per cent and the common stock 4 per cent. A suit was at once instituted in behalf of the minority holders of common stock and this action led to the new proposal in which the guaranteed dividend on preferred stock is cut to 6 per cent. The suit mentioned has been withdrawn and it is believed there will be no serious opposition to the new lease.

FINED FOR DEFECTIVE SERVICE.

The Montreal Street Ry. by its contract with the city agrees to furnish a 5-minute service on certain routes and the city magistrates evinced a disposition to exact a strict performance. Six actions brought against the company for neglecting to give the 5-minute service were decided last month. Two cases were dismissed on it being shown that the delays were caused by repairs in the streets undertaken by the city; in two cases where the causes of irregularity were accidents to the brakes or the motors, fines of \$8 were assessed; in the fifth action a fine of \$25 was imposed, and judgment suspended in the remaining case, as it was in fact for the same offence as the fifth one.

TRAMWAYS IN VALENCIA, SPAIN.

As an evidence of the progress being made in electrical matters in Spain, Horace Lee Washington, U. S. Consul at Valencia, makes the following statement to the Department:

"I have to report that the business of the General Tramway Co., of Valencia, embracing some 25 miles of rails, has been taken over by a French company, which is substituting electric power for the steam and horse traction hitherto employed.

"Electric cars are now running between Valencia and the port, a distance of 3 miles. The system employed is the overhead cable and trolley. The cars are of Spanish construction, and the electric machinery and rails are from Belgium.

"The dimensions of cars are 7 m. (nearly 23 ft.) long and 6½ ft. wide. The other lines, which the same company will shortly inaugurate, to connect Valencia with other places, are: Catarroja, 5 miles; Torrente, 4½ miles; Masamagrell, 7½ miles."

POSTAL SERVICE IN MINNEAPOLIS.

The Postoffice Department has been carefully investigating the conditions in Minneapolis and St. Paul preparatory to introducing a railway postoffice on the Twin City Rapid Transit lines. About the first move towards the service proposed will be the abandonment of the three sub-stations on the west side; in lieu of these about thirty drug store stations will be established, at which carriers will be located in groups of from three to six. The government will then place on all lines in the district covered by the new system, specially constructed cars to be used as mail cars exclusively. These will be run on schedule time and will collect and distribute mails to the sub-offices. The mail boxes will be retained as they are now, but carriers will make regular collections and turn their mail into receptacles on the car lines. The greater portion of the mail will therefore have to be handled at the central office in place of the sub-stations; this means that some carriers will be removed, but employment will be given them in other capacities.

Employes of the Spokane (Wash.) Street Railway Co. are prohibited by a rule of the company from smoking on a street car while in uniform, even when off duty.

About a dozen street car conductors at Akron, O., had their pockets picked one day last month by a gang of thieves. The cars were unusually crowded owing to the presence of a traveling show at the Fair Grounds.

JOHN M. ROACH HONORED.

On May 17th, Mr. John M. Roach was elected president of the Chicago Consolidated Traction Co., succeeding Mr. C. T. Yerkes, the change occurring as a result of the recent purchase by the Union company of the Consolidated Traction property, and on May 29th, Mr. Roach was made president of the Chicago Union Traction Co. to fill the vacancy caused by the resignation of Mr. Jesse Spalding. Mr. Roach will continue as general manager of the combined systems, comprising nearly 540 miles of track.

JOHN M. ROACH.

Mr. Spalding's retirement was made necessary through the demands on his time of his extensive private business and in his letter of resignation he urged in the strongest terms the selection of Mr. Roach as his successor. A portion of his letter is as follows:

"The organization of your company has been fully completed and I have become thoroughly satisfied that Mr. John M. Roach, your present general manager and one of your vice-presidents, is in every way fitted and competent to successfully operate your railroads. I feel the time for my retirement, as originally contemplated, has come.

"Upon suggesting this course to my friends it was requested that I remain in the office at least for the current year, but upon reflection I have concluded that my resignation should be tendered now, and that I should insist upon its acceptance. My principal reason for this conclusion is that I believe the interests of your company would be best served by the election in my stead of Mr. Roach, and that if now elected he would have the opportunity of demonstrating to the stockholders of your company before their next annual meeting his entire fitness for the position.

"In the next place, many questions affecting the interests of your company are arriving which cannot be disposed of before the annual meeting and which ought to be taken up and concluded by the same person as the head of your company. In view of these facts, and expressing to each and all of you, as members of the board of directors, my sincere thanks for the cordial, constant and united support I have always received at your hands, I hereby tender my resignation as president of your company and request your immediate action thereon, respectfully requesting and urging that Mr. Roach be elected by your board to fill the vacancy occasioned by my resignation."

The appointment of Mr. Roach to these high offices is a well deserved recognition of his services in the past and is proof of the confidence and esteem with which he is regarded by the stockholders and directors of the Union Traction Co., now in point of mileage the largest street railway property in the world.

The total gross earnings of all the Detroit street railways from January 1st to May 1st, were \$714,270, against \$589,056 during the same period last year.

The Street Railway System of Ithaca, N. Y.

BY H. S. COOPER, GENERAL MANAGER.

The street railway system of Ithaca is unique in several particulars. Lying almost entirely within the corporate limits of a city of 16,000 resident population, it has a 10 minute schedule all the year round on nearly 6 miles of track, often handles crowds of 5,000 to 7,000 people at a time, and has a record of 25,000 fares collected on its cars in one day. On its main line it overcomes an elevation of 400 ft. in a mile, and of over 450 ft. in less than a mile and a half; does this regularly winter and summer with crowded cars, using only standard size electric motors, and although it has been doing this since 1893-4, there has never been a fatal accident, nor one that could be called bad or costly. Its power house is situated at the bottom of a gorge 200 ft. deep, and over 200 ft. above the lowest part of its line.

When it is added that the company's relations with the municipality are, and always have been, of the most cordial nature, that its patrons are its best friends, that the public regards it and treats it as one of the best adjuncts of the city, that Cornell University, notwithstanding the known conservatism of such institutions in regard to their properties, has in a very liberal manner allowed the road to be run through its campus, that many of the employes of the company have been with it since its start in 1888, that no trouble has ever arisen between them and it, and that as a body they work wholly and faithfully for its interests, when all this is said, its claim for uniqueness is pretty fully proved.

Ithaca, the site of Cornell University, is built partly on the so-called "flats" at the head of Lake Cayuga and partly on the surrounding hills. The university is beautifully situated some 500 ft. above the lake on the brow of an abrupt hill, and up this hill, across it, around it and down it the street railway climbs. Starting from its level track in the business portion of the city, it strikes into 400 ft. of 8 per cent grade, then into 700 ft. of 10 per cent, then 400 ft. of 7 per cent, then 700 ft. of 9 per cent, then a curve of 130 degrees, 60 ft. radius and 10½ per cent grade, and then a continuous succession of grades, and curves on grades, until it reaches an elevation of over 450 ft. when it descends by another route, skirting steep hill-sides and crossing deep gorges; the route gives some of the most romantic views to be had from a trolley car anywhere, and especially within the corporate limits of a city. At one point the car runs on a side hill close to the edge of a gorge nearly 400 ft. deep, and at this point a lake view of twenty miles in one direction, and a valley view of ten miles in the other may be had, while the little "Forest City" nestles at the foot of the hill.

An addition to the line has just been completed by which it returns on itself, making a complete loop or belt line around through the best residential portion of the city, the University campus and a new and beautiful residence section, lying on the edge of the main gorge and commanding a magnificent view of the lake and the valley at its head. In addition to this, the company operates a spur, which rises still another 50 ft. to a station on one of the branches of the Lehigh Valley R. R. It also operates a branch about two miles long in the level valley, which reaches Percy Field, the athletic grounds of the University, and has as its terminus, Renwick Park, on the shore of the lake. This has been developed by the railway company, and is now one of the most complete and beautiful pleasure parks in the country. It has a large and elegant amusement pavilion, one of equal size for refreshments, covered waiting station, a high observation tower containing the water tank, a splendid artesian well of clear, cold, pure water, a band stand, a large steamboat dock, fifty private boat-houses, a public boat-house, bath-house, and the usual refreshment booths, swings, merry-go-rounds, etc. Owing to its proximity to the lake it is an ideally cool and refreshing spot, and having abundant shade, plenty of fine green swards and nice gravel drives and walks, it has become quite a popular resort, not only for the students and townspeople, but for excursionists from the surrounding country, and even distant cities. The Ithaca band, a musical organization having an almost national reputation, gives tri-weekly concerts in the park, and with vaudeville of clean character and in reasonable amount, with picture-machines, amusing specialties and its collection of animals, the park constitutes a daily attraction

that profitably increases the receipts of the company. The park is run clean in every respect, no liquor or beer is sold or allowed to be sold or drunk on the premises, and intoxicated or disorderly characters are not permitted to come or stay on the grounds. Everything is kept as clean and neat as possible, the writer having found through long experience that this course not only pays as an attraction, but that the public as a rule is prone to reciprocate; that if a place of public resort is kept in a slovenly and shiftless manner the public will resent it by a slovenly and shiftless behavior, but if it is kept comfortable, convenient and "spick and span," that the public will insensibly aid in maintaining it so.

No charge is made to patrons of the cars for entrance to the park or to any concerts or attractions, but during attractions or concerts a charge of 5 cents is made for every person entering the park otherwise than by the cars. No charge is made for entrance to the amusement pavilion but 5 cents each is charged for reserved seats during the performances.

The cars regularly used on the hill line are 18-ft. closed and 7-bench open cars driven by G. E. 800 motors with Form B 4-turn armatures, and W. P. 50 motors with Form D armatures wound for standard speed; the gear ratio is 14 to 67, the wheels are 30 in. in diameter. The ordinary hand brake with a single shoe to each wheel is used, but all the brake rigging is made extra heavy, and double brake-chains, made of tested chain, are used on both ends of every car. The Phelps form of brake mechanism is used, but so arranged that the heavy or unequal loading of the car does not materially alter the position of the brake shoes relative to the wheel, nor does the breaking of the chains or levers on one end of a car affect the efficiency of its use on the other end. These points of duplication of parts liable to break under stress, permanence of relation between shoe and wheel, and independence of braking on each end, have been found to be vital ones and close attention is paid to them. The brake shoes found most economical as regards both shoes and wheels, and all things considered most efficient in braking effect are made of a medium soft gray iron, have a large surface and cover the flange and entire width of the tread of the wheel. Care is taken in putting on new shoes that the surface is in full contact with the wearing surface of the wheel and a thorough nightly inspection is made of all shoes to see that they continue in this position and that the brake pressure is equalized as much as possible on all four wheels. In conjunction with the hand brake there was used at one time an emergency brake which, upon the tripping of a lever on the platform threw down a "skidding shoe" under both wheels at that end. The lower face of this shoe was filled with carborundum and when it was let down the wheel was supposed to run up on it forcing the carborundum face against the rail and making it act the same as a drag-shoe on a country wagon. The mechanism was, however, so complicated that it was impossible to keep it in order for a single trip in snowy or slushy weather. It was also absolutely useless on sharp curves or at very high speeds, was uncertain at all times and the carborundum filling was only good for one stop, so its use was discontinued this spring. A modified form of this same brake without the carborundum effect and with much simpler and more effective mechanism will be placed on the cars this summer.

Four sand boxes are used on each car and on days when the track is slippery all grades over 7 per cent are sanded by hand. This is done with a long-spouted watering pot, the spout made out of a straight piece of 1-in. heavy brass tubing made perfectly smooth inside. To the end of this spout is attached a small wheel of about 3 in. diameter and 1½ in. face, having a single flange on one side like a car wheel. This wheel is run on the rail and after a little practice the rail can be sanded as fast as a man can run, placing the sand quickly on top of the rail and regulating the quantity as desired by simply elevating the pot or lowering it. The very best of clean, sharp sand is used, as nearly pure silica as can be obtained, it having been found that a very little of such sand goes farther and gives better frictional results than a much larger quantity of ordinary sand containing loam or clay. The silica sand also keeps the rail clean while the common

sand makes it muddy and often causes the very trouble it is intended to obviate. The sand is thoroughly dried and well screened and kept so.

Where steam or hot air is available a very simple and automatic drying and screening arrangement may be used which requires but little labor or attention. The one in use here was made as follows: A heater coil was made with two pieces of 2-in. pipe as headers and the ends capped. Into the sides of these pieces holes were drilled and tapped for 1-in. pipe, right hand in one piece, left hand in the other, the holes spaced so that when the 1-in. pipe is screwed into both headers the result is a gridiron heater coil having 1-in. spaces between the pipes. The cap on one end of one header and the opposite end of the other is tapped for steam supply and exhaust connection and in the case of steam, a trap is placed in the exhaust. This coil is inclined at an angle and resting on it is placed a tray about 12-in. deep with the bottom of $\frac{1}{4}$ -in. wire netting; the netting rests on the 1-in. pipes. Under the coil is placed a screen of proper size for the sand used; this screen is sloped at the same angle as the pipe coil and under the screen is the receptacle for the cleaned and screened sand. In practice, the top tray is filled with the wet sand and as it dries, it falls through the meshes of the screen and between the pipes on to the screen below, where the fine sand falls through into the receptacle for it, while all stones, sticks, straws, etc., either remain on the screen or roll off into a box placed at the end to catch them. We have found no labor necessary except to fill up the top tray with the wet sand and occasionally shake the under screen. Such a drying apparatus, with pipe, coil and screens 2 x 4 ft. will cost less than \$15 complete, and will automatically dry and screen from one to one and one-half cubic yards of sand every 24 hours. The only nice point about it is to set the coil and screens at the right angle for the kind of sand used; this can be arranged only by actual experiment.

Every car is inspected on every trip before being allowed to go up the hill. A trained inspector is stationed at a point on the level near the foot of the hill, and is furnished with a box containing a few simple tools, such as hammer, wrenches, screw-driver, pliers and oil can; he also has a supply of such bolts, nuts, cotter pins, etc., as are found liable to be lost, broken or defective. He sounds the wheels, tests both brakes, examines all brake-chains and shoes and feels all bearings. This is done effectually inside of three minutes, the delay being allowed for in the schedule. Any car which is thought by him to be not safe to run up the hill and which has a defect that he cannot remedy is either run over a pit in the car house adjacent and the repair made or another car run out in its place. This inspection is not allowed to become perfunctory, but is made a bona fide inspection; no exigencies of traffic or schedule are permitted to interfere with it and the decision of this inspector as to the propriety of a car going up the hill is final. This inspection has proved of immense benefit from an operating standpoint as it has greatly lessened the number of small delays and break-downs in actual running; it has been the means of discovering defects that might have caused accidents; it has a strong moral effect on patrons of the road in that it enhances their feeling of safety; it tends to care and attention on the part of the operating employes, and, in the event of an accident, would be a strong point in favor of the company.

Notwithstanding the severity of the grades and the multiplicity of curves on them, the expense of actual repairs and renewals due to operating, will compare favorably with that of level roads, the mileage made by car wheels, gears and bearings is remarkably good and the absence of any abnormal number of flatted wheels, such as might be expected on a road of this character, especially during the winter season, is a feature of which the operatives feel proud. These points are due to a careful selection of the materials best adapted to the conditions, to careful employes trained to operate to the best advantage of the company and to a constant comparison, supervision and inspection of every detail of the system, no matter how small.

In an accompanying article by Mr. E. L. West, the technical details of our use of power are given and the curves show very plainly the conditions under which the road is operated.

An addition to the Cedar Ave. power station of the Cleveland Electric Ry. is under construction; the maximum capacity of the plant will be doubled.

CAR TESTS AT ITHACA, N. Y.

BY E. L. WEST.

A series of tests, extending from Oct. 14 to Nov. 12, 1899, were made on the line and cars of the Ithaca Street Railway Co. for the purpose of obtaining a general knowledge of the condition of the line and the behavior of the cars when in regular service. This road has such a variety of grades and combinations of curves and grades, that the motors are often put to the severest use, so it was of special interest to know the maximum stresses to which they were subjected as well as the average. The variety of conditions under which the feeder system was operated made it also a special subject for investigation.

Six cars were tested on several trips each, over the main line from the Lehigh Valley railroad station up the State St. hill to Cornell Heights, while they were running on schedule time and making stops for passengers.

Two cars were tested over the same portion of the road, while in regular service but running at different speeds, for the purpose of comparing the power required to propel the car at a moderate speed and that necessary to drive it as fast as possible up grade.

During the slow speed trials the controller was operated very carefully in starting, especially on the grade, and the car allowed to accelerate uniformly, the running position of the controller being such as to give maximum field strength to the motors. Then the cars were operated as is occasionally done when they are behind their schedule, every effort being made to gain time. The controllers were handled quite roughly, allowing often three times the normal current to be drawn upon starting. Cars Nos. 5 and 9 were selected for this comparative trial because they were of the same weight and construction, each being equipped with two 25-h. p. W. P.-50 motors, but the armatures in the motors of No. 5 were wound to give 25 per cent higher speed than those on No. 9. The second object of this comparison was to determine the difference in economy of the two when operated under the same conditions.

The cars tested over the main line were 16-ft. closed body cars, built by the Gilbert Manufacturing Co., of Troy, N. Y., and were mounted on Bemis trucks. Cars Nos. 5, 8 and 9 were equipped with two 25-h. p. W. P.-50 motors with G. E. K-2 controllers. No. 3 was driven by two 25-h. p. Wightman motors with Short controllers and car No. 19 had two 25-h. p. G. E. 800 motors and K-2 controllers. The motors were all single reduction geared and the total weight of each car was eight tons.

A few trials of a somewhat heavier car, No. 23, were made over a level portion of the road, known as the Renwick line, to determine the power required to haul trailers. Measurements were made of the electrical horse-power necessary to drive the car alone and when it hauled three trailers, first with them all loaded with passengers and second when they were empty. The results will be discussed presently.

In order to be out of the way of passengers the instruments were put in circuit and observations taken on the roofs of the cars. The electrical energy delivered to the car was measured by means of a recording wattmeter, especially constructed for this class of work, and by a voltmeter and an ammeter. Observations were taken as the trolley poles were passed and the readings recorded by separate observers.

A profile of the main line is shown in the graphical diagrams; the distances along the track are given at the bottom of the figure and the elevation in feet is indicated at the right. The road is nearly level for the first 3,000 ft. from the Lehigh Valley station and rises gradually for the next 3,000 ft. to the foot of State St. hill, which is quite long and steep. Its maximum grade, 11 per cent, occurs near the foot and is about 700 ft. in length, for the next 500 ft. it is a 6 per cent grade and then a 9 per cent grade and so on as indicated by the figures along the curve. The total length of the hill is nearly 7,000 ft. and the average grade 7.8 per cent.

The turnouts and curves have been shown diagrammatically at the bottom of Figs. 1 and 3, and the curvature in degrees and the radius of curvature in feet, indicated.

The road was divided into four sections and the line poles on the hill were numbered before the tests were commenced. Section No. 1 extended from the Lehigh Valley station to the foot of the hill, (see Fig. 1) sections Nos. 2 and 3 included the grade, No.

2 covering the steepest part of it and section No. 4 extended from the summit to the end of the line on the Heights.

RESULTS.

The average results of all the trials are shown in Table I for the separate sections of the road going from the Lehigh Valley station to the Heights, or from left to right as shown in the diagram, and are for cars operated in regular service.

On line 6 in the table is given the electrical horse-power as calculated from the volts and ampere readings and on line 7 is shown the electrical horse-power as calculated from the readings of the recording Thompson wattmeter, the latter having a value about 18 per cent lower than the former. This is no doubt due to the fact that the greatest amount of power is used on starting and the current increases more rapidly than it dies out. The inertia of the rotating parts of the wattmeter prevents it from recording as much power as is used, hence, all results have been computed on a basis of the ammeter and voltmeter readings.

TABLE I.
AVERAGE RESULTS—LEHIGH VALLEY STATION TO HEIGHTS.

	SECTION No.				Av. 1-4
	1	2	3	4	
1. Number of trials.....	7	10	7	7	8
2. Total time less stops, min. & secs.	7:49	6:30	3:43	6:31	24:33
3. Speed, miles per hour.....	8.9	7.3	9.5	11.6	9.3
4. Volts.....	399	427	451	461	435
5. Amperes.....	24	84	53	31	48
6. E. H. P., from amperes and volts.....	12.6	47.2	32.7	18.7	27.8
7. E. H. P., from wattmeter.....	11.6	44.1	24.9	19.7	22.8
8. KW. H., per car-mile.....	1.0	5.0	2.1	0.7	2.2
9. Number of stops.....	6	3	2	2	13

From the kilowatt-hours per car-mile it is seen that five times as much energy as was required to ascend the steepest portion of the grade, as was used on the level, and the speed on the hill decreased 18 per cent. The average for the entire route was 9.3 miles per hour and the average kilowatt-hours per car-mile 2.2.

Table II gives the average results of the trials of each car over section No. 2, the total distance being 4,000 ft., the maximum grade between line poles 11.6 per cent and the minimum 5.3 per cent, the average 7.8 per cent.

TABLE II.
AVERAGE RESULTS ON SECTION 2.

Car.	No. of Trials.	Speed, M.P.H.	Volts.	Amp.	H. P.	KW. H. per Car-Mile.	KW. H. per 10 Miles per Hour.	No. of Stops.	No. of Passengers.
5	2	8.0	447	78	47	3.79	4.74	2	10
9	2	7.2	447	76	49	4.51	6.26	3	17
8	2	6.4	440	74	39	4.90	7.65	2	18
19	1	7.0	340	103	54	7.88	8.40	2	15
3	1	5.4	449	83	43	7.23	13.40	2	25
Av.	8	6.8	419	80	46	5.26	8.09	2	17

The best figures for comparison in this table are the kilowatt-hours per car-mile, but as the cars ran at different average speeds the figures have been reduced to a basis of 10 miles per hour, by dividing 10 by the speed and multiplying by the kilowatt-hours per car-mile for each car.

By referring to the table it will be seen that car No. 5 required about 25 per cent of the power taken by No. 3 to ascend the grade, but allowance must be made for the lighter load of car No. 5, its passengers being only 6 per cent of the weight of the car, while in the case of No. 3 the weight of passengers amounted to 22 per cent. Car No. 5 was equipped with W. P. 50 motors having armatures wound for a higher speed than any of the others. Car 3 was driven by Wightman motors and the controllers were in very poor condition.

Cars Nos. 8 and 9 were similarly equipped and in fair working condition. Car No. 19 had G. E. 800 motors and its being longer and somewhat heavier than the others, accounts for its higher figures.

The results all show that No. 5 was the most economical under the conditions existing during the tests, but its motors were wound for too high a speed for the hill when the rails were wet or slippery, the wheels spinning around without driving the car, while the slower speed motors of the other cars seldom failed to drive them.

The increased loss by friction when the cars were ascending the grade has been calculated as follows:

The average power per car, at a speed of 10 miles per hour on the level was found to be 14.15 e. h. p. and on the 7.8 per cent grade 64.5 e. h. p. The horse power required to simply lift the car, while on the grade, is approximately equal to the weight of car in pounds times the per cent of grade times the speed in feet per second divided by 550, which in this case amounts to 38.6 lift horse-power and by deducting this from the total it leaves 25.9 e. h. p. to propel the car on the grade as compared with 14.15 e. h. p. necessary to drive it on the level. The difference, 11.75 e. h. p., is due mainly to the increased friction caused by the heavier stresses on the gears. Reducing this to a unit basis by dividing by the weight of car and per cent grade, we get 0.16 e. h. p. as the friction loss for each ton for each one per cent grade.

TESTS OF CARS RUN AT DIFFERENT SPEEDS.

Cars Nos. 5 and 9 were run at three different speeds, slow, regular service and high speed. The first trips were made in the morning when the cars were on their way to the Heights, and there being no cars to meet it was not necessary to make schedule time, so they were started very gradually each time and handled as carefully as possible. The second trips were made on schedule time and during the third, the cars were handled very roughly and every effort made to gain time; the time thus gained was lost by waiting on the turnouts.

In Table III are given the average results for the round trips between the Lehigh Valley station and the Heights.

TABLE III.

Speed.....	SLOW.		REGULAR.		FAST.	
	5	9	5	9	5	9
Car No.....						
Total time, less stops.....	46:33	55:39	42:15	52:14	30:10	43:52
Average speed, M. P. H.....	9.0	8.4	10.1	8.5	12.0	10.4
E. H. P. from Wattmeter.....	15.5	14.4	15.6	15.5	17.0	21.1
Total, KW. H.....	8.2	9.6	8.2	9.1	8.7	11.9
Total stops.....	17	21	18	22	25	32

The figures show that there was not much difference between the slow speed and schedule time. In the latter case the time was shortened by about four minutes, the horse-power slightly increased and the total kilowatt-hours remained nearly the same. For high speed as compared with slow speed, the total time was decreased about 35 per cent for car No. 5 and 22 per cent for car No. 9, while the total kilowatt-hours increased 6 per cent for car No. 5 and 19 per cent for No. 9.

In order to show plainly the difference between careful and rough manipulation of the controller, the data taken from car No. 9 have been plotted to a distance base in Fig. 1. The short vertical lines at the base of the diagram indicate the points at which readings were taken and the current, electrical horse-power and speed in miles per hour, for the trials at high and slow speeds were plotted, and the scale for each has been shown at the left. To distinguish between the two sets of curves those for the high speed trial are marked "X" at various points. By referring to the diagram it will be seen that there was a great difference in current and horse-power, especially on the hill, between moderate and forced speed.

Some comparative tests were made over the Renwick line which extends from the main line to Renwick Park, a distance of nearly two miles, and has practically no grades.

An open car (No. 8) equipped with two 25-h. p. W. P. 50 motors and weighing 8 tons, was run over the line while carrying a load of 40 passengers from State St. to Renwick, at a speed of 12 miles per hour, using an average of 11 h. p. On the return trip there were no passengers, the speed was 15 miles per hour and an average of 15 h. p. was used.

A closed car (No. 23) equipped with two 30-h. p. Westinghouse motors and weighing 10 tons was tested over this line while hauling three long trailers, carrying a total load of 258 passengers at a speed of 8.5 miles per hour. It used an average of 56.2 h. p. Then the trailers were pushed empty back over the same route at a speed of 12 miles per hour which required an average of 9.7 h. p. When the motor car alone was tested over the road in the same direction in which the three loaded trailers had been hauled, it consumed 19.7 h. p. at a speed of 15.4 miles per hour and when run in the opposite direction 9.9 h. p. were used at a speed of 14.2 miles per hour.

FIG. 1 RESULTS OF TESTS AT DIFFERENT SPEEDS.

FIG. 2—RESULTS OF LINE TESTS.

FIG. 3—I. H. P., D. H. P. AND LINE LOSS.

By reducing the kilowatt-hours per car-mile to a speed of 10 miles per hour the following figures were obtained and will serve as a fair basis for comparison. Car No. 23 drawing three loaded trailers required 3.28 kw. h. per car-mile and when run without load 0.94 kw. h. per car-mile. No. 8 when run empty over the same route used 0.70 kw. h. per car-mile. These figures show that 2.5 times as much power was required to draw the three trailers as was required to run the car alone and that No. 8 ran somewhat easier than No. 23, the figures being in the ratio of 7 to 9.

LINE TEST.

In order to obtain the resistance of the feeder system from different points to the station, two line tests were made during the night when there was none but the test car on the road. First the total resistance of track and trolley was measured and from the results of the second set of measurements, we were able to separate the resistance of the trolley from that of the track.

The tests were conducted in the following manner: A water rheostat was placed on the platform of the test car and connected through an ammeter, to the trolley pole and truck of the car. The car was then run from point to point on the road and all circuits between track and trolley opened except the one through the water rheostat. Before each set of observations a signal was given by making and breaking the circuit in such a manner that it would be plainly indicated by the ammeter at the station, then simultaneous readings were taken of the pressure and current at the car, and the voltage at the station.

The resistance of the trolley was separated from that of the track by opening the section insulators and drawing current from the station from one side of the insulator, at the same time measuring the pressure of the station from the other side. This gave the drop over that portion of the feeder system through which current was drawn. To obtain the trolley resistance at points between section insulators an arc circuit that was not in use was connected to the railway circuit at the station and used as a pressure wire.

The results are shown graphically in Fig. 2. The resistances of track, trolley and total resistance in ohms have each been plotted to a distance base for the entire route. The drop in pressure, calculated from the total resistance and current taken by one car,

FIG. 4.

is shown and the scale of volts for the latter curve is given at the right.

The feeder system is shown diagrammatically at the base of the figure, the solid lines representing No. 00 B. & S. feeders and the broken lines No. 00 return wires. For the first 5,000 ft. from the Lehigh Valley station the trolley wire alone is used as a feeder and the same is true for the last 2,000 ft. on the Heights.

By combining the results of these tests with those of previous ones made on the cars and power house it was possible to trace the losses of energy from the coal pile to the car wheels.

In Fig. 3 is shown the loss of power in the line, as calculated from the resistance and current, for a car operating under normal conditions in regular service. By making use of the combined efficiencies of the line and generating machinery, curves have been plotted on the same diagram which show the relation between the indicated horse-power at the station and the electrical horse-power delivered to one car. Fig. 4 shows the distribution of energy for the entire system. The energy in the coal is taken as 100 per cent and the sectioned portions of the diagram represent the various losses. At the right of each sectioned block are given

the loss in per cent of the total energy and the efficiency of that part of the system. The energy utilized in propelling the car under average working conditions is 2.8 per cent of the total energy in the coal.

These tests were made under the direction of Prof. R. C. Carpenter, and General Manager Cooper, by Messrs. Gordon, R. B. Blakeslee, C. D. Gray, C. S. West and the writer, E. L. West, fellow in Sibley College.

ELECTRIC RAILWAY IN HAVANA.

Mr. William Doull, who is interested in the Cuban Electric Ry. syndicate having franchises in Havana, has recently returned from Cuba and has unbounded faith in the future of the island. In the course of an interview he said:

"The wonderful manner in which the country has recovered from the effects of the war shows that the possibilities of the country under a stable government are great. The Cuban Electric Ry., an enterprise in which Boston, New York and Montreal men are interested, was formally opened on April 20. The road owns the ferry between Havana and Regla. The latter has about 11,000 population, and is destined to be to Havana what Jersey City is to New York. From Regla the company has constructed an electric railway three miles to the city of Guanabacoa, which has a population of about 25,000.

"A large number of Havana people have residences at Guanabacoa, and the company is laying out a pleasure park there. This park will be electrically lighted, and will contain all possible attractions, the purpose being to make it a popular pleasure resort for the evenings.

"Midway between Regla and Guanabacoa baseball grounds and a cinder path are under construction. This will be the first well equipped athletic ground in Cuba."

MR. VREELAND ON MUNICIPAL OWNERSHIP.

A man may ride eight miles in Glasgow for 2 pence; here he may ride for the same price 50 miles by means of our system of transfers. In Glasgow there are no transfers; here last year we gave away 148,000,000 of them. Therefore, when a man changes cars in Glasgow he pays a new fare, and travel there is quite likely to be dearer than here. It is true that one may ride half a mile for a half penny, but I don't see that that is any advantage, for if one only wants to go half a mile it is healthier to walk—and in Glasgow quicker.

There is small trackage in Glasgow, only a few miles on the most densely crowded streets. They know nothing there of that enterprise which is so familiar among railroad men here, and which causes them to push their lines out into new districts to build them up, operating those lines for years at a loss to themselves and building up sections of the city where there were formerly no houses—thus benefiting the home seeker and the city as well, giving the former cheaper rents and the latter a new area for taxation.

There is another point about this Glasgow comparison which must be taken into consideration if we would be fully cognizant of our own advantages—that is the relative value of money here and there. The purchasing power of 2 pence is more in Glasgow than that of 5 cents in New York, and yet 5 cents will carry one 50 miles here and only eight miles in Glasgow. Wages paid to the employes of the Glasgow road are only two-thirds of what we pay. In England, where they have had much experience with municipal ownership, there is now a decided reaction.

It is the increase of local indebtedness and taxation since the inauguration of municipal trading that has caused the alarm and dissatisfaction now noted in Great Britain. Between 1878 and 1897 the local debt of England and Wales more than doubled, and now represents the enormous sum of \$1,260,000,000, over half of which represents various trading plants, which may or may not be worth the original capital invested therein.

To return to matters nearer home, I notice that last month Mayor Hart, of Boston, discontinued several municipal undertakings, particularly the electrical construction division and the repair division, for the reason, as he states, that in his opinion, "it is cheaper for Boston to buy repairs and electrical construction in the open market than in the offices the members of which owe their appointments to politics."—H. H. Vreeland, in the Independent.

COMBINED CONCRETE MIXER AND TRANSPORTER.

The accompanying illustrations show a concrete mixer that has been in successful use since last summer on street railway construction work in Washington, D. C. From 6 to 15 of the machines have been in use making so far more than 20,000 cu. yd. of concrete.

The mixer is known locally as the "Dromedary." It consists of a one-horse two-wheeled vehicle having a split drum or cylinder mounted to turn on the axle and provided with a pawl and ratchet device so that when in gear the drum is rotated in the same direction as the wheel and at the same speed. The wheels are mounted loose on the axle arms so that they can revolve independently in turning from a straight course. The drum is made of oak which has been treated with "Woodiline" and certain pieces of the lagging are made of steel channels filled with oak, to strengthen the drum. For loading a hinged trap door is provided; this is shown open in Fig. 1, in which position brackets on the door rest on a tail bar and the drum is steadied in the position shown. As the drum is automatically thrown out of gear when the loading door is open the mixer can be moved about at will while loading.

On the way to the dumping place the drum revolves with the wheels and a very moderate haul suffices for mixing the cement

2—Loaded
3—Dumping.

THE "DROMEDARY" CONCRETE MIXER
1—Ready to Load.

4—Dumped.
5—Closing.

thoroughly. In the operation of mixing the charge is not pitched about but the materials are simply carried up a little way by the climbing side of the cylinder to curl over and slide down in thin sheets toward the front, with the effect that the stones appear to have been rubbed into a perfectly mixed mortar. Each load is about 1/2 cu. yd. On reaching the dumping place the driver moves a small lever that can be operated from either side and an unlatching bar thereby released dumps the mixer as shown in Figs. 3 and 4. In the process of dumping, the drum is automatically thrown out of gear at the very end of the movement so that the mixer delivers the load and moves on out of the way without stopping. It should be noted that the dumping is not done through the trap door but that the cylinder splits open, the door remaining closed as in Fig. 3. After dumping the drum is easily closed by a pull backwards on cleats or grab-handles conveniently located as seen in Fig. 5. In closing, the drum automatically locks itself out of gear.

The mixer is adapted for mixing concrete for conduit railways, duct lines, curb and pole setting, paving base, and especially where a thin ribbon of concrete is required with much incidental moving about. Its use dispenses with mixing platforms, wheel barrows, planks, and many of the accessories commonly employed and saves the labor of hand mixing. The device is the invention of I. H. Fisher, of Washington, and is being used on the contract work of E. Saxton, in that city.

EFFICIENCY OF A RAILWAY POWER SYSTEM.

Mr. Edward P. Burch, of Minneapolis, formerly electrical engineer for the Twin City Rapid Transit Co., in a paper recently read before the North West Railway Club on the "Utilization of Water Power for the Electric Railway System of Minneapolis and St. Paul," gave the following data concerning the efficiency of the power system. (This installation was described at length in the "Review" for February, 1899.)

Efficiency of	Maximum.	Ordinary.
Falls (5 per cent loss due to friction in booms, racks, eddies in water, etc.)	.95	.95
Turbines	.80	.78
Generators	.95	.94
Station	.92	.90
Conversion to direct current	.94	.91
Local distribution	.92	.90
Railway motors	.80	.70
Total (exclusive of loss in falls)	.48	.43

Of 10,000 h. p. developed by the turbines the motors could not receive over 6,000 h. p. at highest efficiency, and about 5,400 h. p. ordinarily.

NO PASSES, NO POLICEMAN.

Because the Consolidated Traction Co., of Pittsburg, has cut off a number of city employes' passes, the Department of Public Safety, it is alleged, has notified the various traction companies entering Pittsburg, that hereafter no policemen will be supplied at street crossings to regulate the vehicular traffic and in other ways facilitate the movement of cars. President Magee, of the Consolidated company, has issued a statement declaring that police officers heretofore stationed at crossings were not located there as a matter of favor to the traction company, as they are to be found in the congested districts of nearly every city in the civilized world, for the protection of the traveling public. He adds that his company has issued no free transportation, nor does its management intend to issue any such transportation to secure any favor from any public officials which would reduce in the slightest degree the operating expenses of the company.

Mr. William B. Parsons in Scribner's Magazine states the total number of paying passengers carried on all the surface and elevated railroads in New York City in 1871 was 138,867,000; in 1882, 252,800,000; in 1892, 453,200,000; in 1899, 528,228,437. The total number of passengers carried on all steam roads in the United States for 1898 was 501,066,681, or 5 per cent less than were carried in New York City alone.

IN THE POWER HOUSE

This department is devoted to the construction and operation of electric railway power houses. Correspondence from practical men is specially invited. Both the users and makers of power house appliances are expected to give their views and experiences on subjects within the range of the department.

OPERATING ECONOMIES IN CENTRAL STATION PRACTICE.

Read before the National Electric Light Association by W. L. Abbott, chief operating engineer of the Chicago Edison Co.

In every central station there grows up a characteristic system of practices, good, bad or indifferent, due partially to peculiar environments and partially to the ability of the operating force. Through natural selection the best of these practices are gradually crystallized and become the unwritten code of rules for the direction of the internal affairs of the station.

Some of these practices, while the very best for that station in which they originate, may prove very unsatisfactory when transplanted into other stations, yet it is largely due to the cordiality with which central-station managers impart to, and adopt on trial from, each other new methods, that the present rapid improvements in operating details are being made.

It is in the hope that some of the methods hereinafter outlined may be new and feasible in other places that these suggestions are offered.

OIL AND WASTE.

The saving and renovating of waste and oil is an ever-present and variously handled question in all stations. Some simply use the waste until it is oil-soaked and then burn it under the boilers; others go to the other extreme and use wiping towels, which are carefully saved, washed and used over again. We favor a middle course, using a good quality of waste, first on the finer parts of the machinery, and then for coarser work, after which it is put through a washer consisting of a train of rolls, over which hot water is running. This extracts nearly all of the oil and much of the dirt. The

FIG. 1.

oil and water are caught in a receptacle, the oil separated and passed to the oil purifier, and the waste is put into the drier. This drier consists of a sheetiron box 30 in. square and 6 ft. high, filled with shelves, one above another, made of wire netting and spaced about 10 in. apart, for the reception of waste to be dried. The case stands a few inches from the floor, and in the bottom, which is open, is a steam coil. A door occupies one full side, and to the top is connected an 8-in. galvanized iron pipe leading to the boiler breeching, for the purpose of inducing a draft. The whole thing is quite simple and inexpensive, yet it will thoroughly dry a charge of 200 lb. of damp waste in a few hours. This dry waste is somewhat harsh and knotty, but has better absorbing qualities than new waste, and we use and wash it over and over again.

In practice the oilers are allowed but three-quarters of a pound of new waste on a shift, to keep a 1,200-l. p. engine clean, but they are allowed all of the washed waste they want.

In separating oil from waste it is difficult to say which is the by-product and which the direct product, as from 100 lb. of oily waste we get 40 lb. each of oil and waste, and one product is about as valuable as the other.

The amount of engine oil used at our Harrison St. station has been reduced to the lowest possible minimum, I think, as it amounts to only about 50 gallons of new oil each month. This is obtained by catching and re-refining all the lubricating oil used on our machinery, which is quite readily possible on vertical engines. The drains from our crank-pits are carried down into the oil refiners, and the oil from the waste is all saved and put through a process which makes it better than new oil. This may sound like an exaggerated statement, but I will explain later on why it is better than new oil. I have spoken of oil refiners and of refining the oil, instead of filters and filtering the oil, for the reason that we have no filters and do no filtering, but purify the oil by settling and boiling. Our filters consist, essentially, of three tanks, as shown in Fig. 1, the first of which receives the oil from the engines mixed with cylinder drips and water from journals, etc. When this enters the first tank, which is, say, half-full of water and half-full of oil, the water and oil separate; the water goes to the bottom, where it is drawn off through a trap; the oil goes to the top and is drawn off through an overflow. From the first tank the oil flows to a second tank, in which is a steam coil under a pressure of, approximately, 100 lb. This is for the purpose of heating the oil up to about 250° F., at which temperature the water is driven off in the form of steam. Owing to the surface tension of the oil around the small globules of water which is held in suspension with it, the water will not vaporize at a lower temperature. This tank is of such a capacity that the oil is about two days in passing through it. From the second tank, the oil goes into the third tank, where it is allowed to stand about the same length of time, and where any sediment it may contain will be deposited. From the third tank the oil overflows into a large storage tank, where it is kept until it is drawn off to be used. Few of those who have not looked into the matter would realize how much water will be absorbed and held in suspension by oil which contains a small trace of animal matter, and how difficult it is to break up the combination, once it is formed. Those of you who operate oil filters may have sometimes wondered at the accumulation of grease in them; this grease being a soft, jelly-like substance of the consistency of warm lard, or perhaps even thicker. This grease is no more than a combination of mineral oil, a small trace of animal oil and about 40 per cent water, and if it were placed in a vessel and heated up to about 250°, the water would be driven off, perhaps with explosive force if heated too rapidly, but if the work is carefully done the water can be separated, and what is left would be the best kind of lubricating oil, containing a small trace of animal oil, and in our case all the cylinder oil from which the animal oil is derived; and it is this mixture of the cylinder oil with the engine oil which gives it its heavier body and better lubricating qualities. The oil which is expressed or washed out from the waste apparently contains more cylinder oil than that which comes from the engine drains, and on this account, those who throw away their waste not only lose the waste, but the richest part of the oil, which is contained in it.

CYLINDER LUBRICATION.

The question of cylinder lubrication was once a very perplexing one for us, but after studying and experimenting, we settled the question in such a way that it has not been open for several years. We had great trouble with cylinder oil, and had difficulty in finding an oil which would lubricate all of the cylinders of our triple-expansion engines from one lubricator. We have not found such an oil and do not expect to. We could find an oil which would lubricate the high-pressure cylinder, and we could find an oil that would lubricate the low-pressure, but we could not find a combination which would lubricate all of the cylinders perfectly. We have, therefore, adopted an oil which will lubricate the high-pressure cylinder excellently, the intermediate moderately well,

while the low-pressure shows only a slight trace of oil, but as there is no cutting or scratching in the low-pressure while it runs dry, and as the high-pressure cylinder makes a prompt and vigorous protest if allowed to run dry for a few moments only, we have adopted the oil which will give the best results in the high and let the low be content with what it gets.

The results of our experiments have convinced us that the only oil to use in a non-jacketed cylinder, where it would come in contact with very wet steam, is one which is very highly compounded. It must also be an oil of a high fire test, and the reason why it does not lubricate the low pressure cylinder as well as the high, in our opinion, is that the temperature of the steam in the low-pressure cylinder is so low that the oil will not remain atomized in the steam, but washes down and combines with the water of condensation which has formed in the other two cylinders, and passes through the low in an emulsion with the water. To prove this theory I have tried the plan of mixing a cylinder oil of a high grade and high flash test with a light oil of low flash test, and feeding it through one lubricator through all three of the cylinders. The result shows a fair trace of oil on the walls of the low-pressure cylinder, and we ran our engine with this kind of cylinder lubrication for several months, but finally decided that the best results for the entire engine were obtained with that oil which gave the best lubrication in the first cylinder. We now use a heavily compounded high fire-test oil, fed into the steam pipe near the throttle. We find that a gallon of oil so fed will give good lubrication for a 1,200-h. p. engine for 12 hours. I have seen a compound engine of this capacity fed at the rate of nearly a gallon an hour without obtaining satisfactory lubrication, the whole trouble lying in the fact that the oil was not adapted to the particular conditions under which the engine was working, and I think this may account for the unmeasured praise or unstinted abuse which different brands of good oil receive from different engineers, and I think, furthermore, that the difference between a good oil and a poor oil made from high fire-test stock lies almost wholly in the amount and kind of compounding.

HOURS OF WORK.

In arranging an operating force and the payroll of the central station the superintendent should aim, as in all other matters, to get the maximum of results, and still keep everything harmonious, with the least expenditure of money. To do this he should carefully arrange his force so that he will at all times have men enough to take care of the work on hand, and at no time have a surplus of help over what is required to take care of the work to be done. Also his scale of wages should be carefully graded so that the operatives doing the same class of work should receive the same pay, and that the rate of pay to the different classes of workmen should be in proportion to the skill, responsibility or manual labor required. Further than this, a considerable saving in money can be made by paying the operatives partially in hopes and promises. By this I mean to have a well-defined and well known line of promotion, and each one know his position in that line, and that his chances for promotion depend upon his ability, fidelity and length of time in the service. Any really good, ambitious young man is ready to begin work at the bottom of the ladder, and will work along contentedly on small wages if he is assured that the promotions to come will be awarded upon the above terms, and not by favoritism. The most demoralizing and disorganizing practice that can be introduced into a central station is to put a new man, the relative of some official, or the friend of some politician, into a desirable position over the heads of equally good men who have borne the drudgery and hard work of inferior positions, hoping and expecting that when there was a vacancy in a better position they would have the preference.

In many stations the force is divided into a night gang and a day gang, the day gang going off as the night gang comes on, and vice versa. I do not know that this practice is as general now as it was formerly, but I never thought it was well adapted in central-station work. In the first place, the hours are too long, and in the next place, it does not give the best distribution of labor. The number of men in the station does not vary according to the load. The practice which we instituted several years ago, of bringing the men on one or more at a time an hour or so apart, and letting them off in the same way, we find can be made to exactly meet the requirements of an uneven load, and enables us to rotate the different men of the same class through all the different shifts during the course of one or two months, thus making the work and the hours

of all exactly alike in the cycle. At the end of each week the schedule is made up for the week to come, for each of the different classes of operative interested, and then posted on Saturday night, so that as the men go off work on the following Sunday it is known what shift each will have during the coming week. These schedules are altered from week to week, increased or diminished as regards the number of men, and changed in form to conform to the varying conditions of the load curve.

To illustrate by a set of December schedules: The problem to be solved is to arrange the schedule so that there will be at any time enough men for the work, without having too many men around at other times, and, furthermore, to arrange the shifts so that none will be obliged to go home between the hours of one and six in the morning.

As we are not sure what the load will be from day to day, or a week ahead, we are obliged to provide men enough to take care of what we assume will be the reasonable maximum. It is, of course, impossible to meet the requirements exactly without breaking a man in two and using the pieces in non-consecutive times of the day, but with a little care and study, it is possible to arrange the schedule to very nearly meet the exact requirements. Take, for example, the firemen's schedule for the week commencing December 18, 1899, as shown in Fig. 2. We start at midnight with five firemen; two of these are relieved at one o'clock by two other men who come on at that time. As the load from midnight until six o'clock is quite irregular, owing to the variable amount of charge required by the battery from day to day, we have rather more firemen on during this period for the amount of work done than we have during other times of the day. At six o'clock in the morning

FIG. 2.

the load begins to pick up, and has nearly reached its morning maximum by nine o'clock. To take care of this, our force of firemen is increased by one man each, at six and seven and another at ten o'clock, there being by that time eight men on, and the force is held at that number until one o'clock in the afternoon. During this time several men come on and others leave, but the number at work remains the same. The slight drop of the load at noon is not followed by a corresponding change in the number of men, but it is taken advantage of as a slight breathing spell, and gives the men an opportunity to clean fires and eat their dinners. After the mid-day drop in the load there follows a gradual rise until four o'clock, which we anticipate by bringing a man on at one and another on at two; at four o'clock the load rises abruptly to the maximum shortly before five. We provide for this by bringing three men out at three o'clock to get their fires in good shape ready for this hard pull, and, finally, at four o'clock the last man comes, which brings the total number of firemen on at this time of the day up to 14 men. After five o'clock the load gradually declines, until midnight, when it is only about one-fourth as high as it was at five. Owing to the way in which the men have been brought out, their shifts are finished so that the force is automatically decreased in proportion as the load decreases, and we have during the day worked 21 firemen, who have altogether burned about 210 tons of coal, and have been so distributed that we have at all times had an excess of one or more men for the work, and none have been over-worked. Fig. 3 shows the load curve for December 21st and also what we may term the firemen curve for the same day, which shows at a glance how nearly the size of the firing crew was adapted to the requirements.

Fig. 4 shows the oilers' schedule for the same week, and Fig. 5 shows how nearly the number of oilers were proportioned to the amount of work to be done on December 21st.

THE FUEL QUESTION.

The greatest possibilities for saving or wasting about a steam plant are undoubtedly in the coal pile, but as it is a dirty proposition and many of its features not well understood, the subject does not receive the consideration to which it is entitled.

The average ambitious engineer will spend much time and care on his engine to be sure that the indicator cards are perfectly symmetrical, that the points of cut-off are equal, that the release is in time and that the compression rises to meet the admission in a smooth, rounded curve. This is proper and commendable, yet the same time spent in studying the conditions of combustion in his furnace might show him a way to make a saving in fuel fourfold

qualities the cheapest screenings cost about half as much as the high-grade coal.

Having selected the coal, the next problem is how to burn it properly. It is commonly understood that 12 lb. of air are needed to properly burn one pound of coal. It is also commonly supposed that in practice about twice this amount of air passes through the fire, but just how much actually passes and under what conditions are the best results obtained are impossible to determine without making analyses of the flue gases. Fortunately, this has now become a very simple operation and one which can be performed and understood by anyone competent to take charge of a large boiler room. These tests often show the most surprising and disappointing results. The analyses are made to determine the percentage of carbon dioxide in the flue gases. Under perfect conditions it can run as high as 20 per cent, but it is not unusual to find samples running as low as 2 per cent of dioxide. This brings down

Fig. 3.

Fig. 6.

Fig. 9.

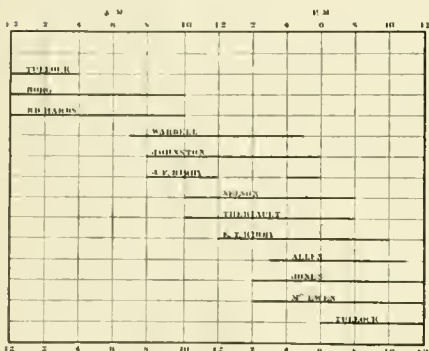

Fig. 4.

Fig. 7.

Fig. 10.

Fig. 5.

Fig. 8.

Fig. 11.

greater than is possible in the final refinements of the indicator cards.

A fireman whose wages amount to, say, 20 cents an hour will burn during that time fuel costing 10 or 15 times as much as his wages. It would not be possible by any sort of driving to save half of the wages, but it is readily possible, by properly watching and instructing the fireman, to save double his wages in coal. In the first place, great care should be exercised in the selection of the coal to be used. I believe that the cheapest coal is that kind which has the greatest amount of combustible for the least amount of money, provided the furnaces are of the proper kind and ample in capacity to make the required amount of steam from them. The very cheapest kind of Illinois screenings, costing less than \$1.50 a ton, will not have less than 10,000 B. t. u. per pound, and the very best of eastern lump, costing \$4 a ton, will not have more than 14,000 B. t. u. per pound. This means, then, that for equivalent heating

the economy, for two reasons: First, the gas in the firebox is diluted with an excess of cold air and cooled down, and, secondly, the amount of gas, being increased in volume, passes through the boiler more rapidly and does not give up so much of its heat. It is almost a paradox that within reasonable limits the more the gases are cooled down in the furnace by the admission of excess of air the hotter they will pass away from the boiler. The two causes of excess of air in the flue gases are, first, running boilers on too light loads, and, secondly, careless firing.

In a station where the load is much higher for a few hours than during the rest of the day, the tendency is to have too many boilers in service during the period of light load. The natural result is that the fires are run thin; the grates get bare in places and a great volume of air is drawn in, and only a small portion of it comes in contact with the fuel.

Careless firing is always a flagrant waste of fuel. An engineer

may be aware that he is not getting the results which his tests lead him to believe he should have, and yet, in a boiler room where several men are working, it is exceedingly difficult to fasten the blame on any one of them unless one can examine the chips the men make, or, in other words, the flue gases.

To follow intelligently the work of the individual fireman, we have installed in our boiler room a device called the econometer, through which is induced a small current of gas from a boiler breeching. The weight of this gas, changing with its composition, moves a pointer across a dial, thereby indicating continuously the varying percentage of carbon dioxide in the flue gas. From this device are run individual pipes to the breeching of each boiler, and all is so arranged that samples may be drawn from several boilers and tested in a few minutes, or a continuous test may be made of the performance of any one boiler.

Readings taken from this instrument at regular and short intervals, when plotted, form a curve which is a very comprehensive record of the conditions of combustion during the time of observation. A few of such curves I submit herewith: Fig. 6 shows the results of a test made to determine the relation between boiler efficiency and percentage of carbon dioxide. The results show that within the limits tested the two are almost directly proportional. Fig. 7 shows the results of skillful and even firing. Fig. 8 shows the result of careless and uneven firing. Fig. 9 shows, first, what occurs when a fire is cleaned in a leisurely manner, the dioxide dropping to one per cent; then followed a charge of coal, which got the furnace in good working condition; but as the fire was not replenished during the next 15 minutes, it burned so thin that it is doubtful if the boiler was making steam at all. The latter part of the curve shows the automatic improvement in the fireman as soon as he observed that he was under surveillance. Figs. 10 and 11 show how the work of a fireman may be improved by giving him intelligent instruction.

The above are a few of the methods we have adopted for reducing operating costs.

Some of them may appear trivial, but when we consider that \$100 saved is \$100 added to the surplus, which is as good as a \$500 increase in the gross earnings, and that to add \$500 monthly to the gross earnings would require an investment of, say \$25,000—when we consider this we may realize what a valuable asset is an engineer who is prolific in methods for keeping costs down or is ready to adopt such methods from others.

FLY-WHEELS.

Fly-wheel accidents and fly-wheel design were discussed in a paper before the Civil and Mechanical Engineers' Society (England) in April last, and after giving a resume of the various articles presented before similar societies in recent years the author, Professor Sharp, reaches the following conclusions:

"From Mr. Longridge's statistics, as given in the annual report of the Engine Boiler & Employers' Liability Insurance Co., it appears that of the engine break-downs coming to his notice 1 in 50 was a fly-wheel accident. This proportion may not seem greater than might be expected. But if it be remembered that a fly-wheel is merely a rigid body, none of its parts possessing relative motion, while the other engine details, such as valve gear, governor gear, pump gear, etc., are much more complex, the proportion of fly-wheel accidents must be regarded as a large one. My opinions on the subject may be briefly summarized thus: When a fly-wheel is small enough to be made in one piece, and when its normal rim speed is not above 40 or 50 ft. per second, cast iron is a suitable material if ordinary precautions are taken in cooling. But when the wheel is so large that for convenience of erection it has to be made in two or more pieces, an element of insecurity is introduced. Built-up fly-wheels of mild steel plate are too costly. Cast iron may be safely employed for the rim and nave. But for the arms of the fly-wheel I consider cast iron a totally unsuitable material. The arms are subjected to bending stresses in opposite directions, and owing to the want of ductility of cast iron the margin of safety may be dangerously small when the normal speed is exceeded from any accidental cause. I submit that a fly-wheel built with cast-iron rim, and tangent spokes of mild steel, offers a perfectly satisfactory mechanical solution of the problem of the design of a safe fly-wheel, and at a price that is little if anything greater than the prevalent design of fly-wheel with cast iron arms fitted to the nave and rim segments.

"I may conveniently finish this paper with a sentence from Benjamin's paper: 'The more the subject is agitated, the less shall we have occasion to mourn the destruction of life and property on account of faults in the design of this most necessary element of the steam engine.'"

REHEATERS IN MULTIPLE-CYLINDER ENGINES.

Dr. R. H. Thurston discussed the results obtained with reheaters in multiple-cylinder engines in a paper presented at Cincinnati meeting of the American Society of Mechanical Engineers, and in closing, says:

Conclusions, probably definite, and sufficiently accurate for practical application, may be drawn from what is already known of this subject, although we are obliged to admit that direct experiment has done little to aid us in their deduction. It is tolerably certain that a reheater, wherever and however employed, can be of little if any value in improving the thermodynamic action of the engine if it has not sufficient power to produce some superheating, and it is no less certain that a properly proportioned and placed reheater will be of comparatively small importance if supplied with wet steam, and its value will be less as the amount of the moisture in the steam entering it is the greater, up to the point at which it ceases to produce superheating of the steam entering the succeeding cylinder.

1. A reheater should be given such area of heating surface as will insure, under the circumstances of its operation, at least moderate superheating.

2. The reheater must, to insure proper action, be supplied with perfectly dry steam, and must usually be accompanied by a separator out of which it may take such steam, or it must itself act as a separator.

3. To be thoroughly effective, the reheater should take steam immediately from a separator, and should deliver its own charge directly into the succeeding cylinder, thus permitting no opportunity for loss of heat and production of saturation before the charge is fairly introduced into the next steam cylinder. The separator may probably often be constructed in one piece with the reheater, with advantage in this respect.

4. Those conditions which control in the application of the superheater apply equally well to the case of the reheater. The latter is properly a superheater placed between cylinders in series; otherwise it becomes simply a separator.

5. With properly proportioned and adjusted superheating and reheating apparatus, multiple-cylinder engines should gain quite considerable economy, and even enough, where high efficiency is demanded, to make their employment financially desirable.

SETTLING BASINS AT NEWPORT.

The Cincinnati, Newport & Covington Railway Co. draws its water supply from the Licking River, a very turbid stream, which made it necessary to build settling basins where a portion of the suspended matter could be deposited before the water was taken to the condensers and heaters. The settling basins are two in number, placed side by side; they are 75 x 60 ft. on top and 11 ft. deep, the sides having a slope of 5 vertical to 4 horizontal. The bottom of each basin is of concrete 8 in. thick and the sides are of well tamped clay 4 ft. thick backed up by earth filling; the side walls are lined with two layers of 1-in. planks. These basins have given no trouble because of leaks.

The pumping station is on the bluff near the settling basins and not far from the power house. A well 20 ft. in diameter and 50 ft. deep with brick and cement walls was sunk and connected with a second or intake well 20 ft. deep near the water's edge. In this station are three Stilwell & Bierce duplex pumps with an aggregate capacity of 1,750,000 gallons per day. Water is drawn from the settling basins through intakes 18 in. from the bottom and delivered either to the power house or to an elevated tank just outside the station.

The total cost of the pumping station, basins, etc., was about \$17,000, but the settling basins and the portion of the pumps and plant necessary to permit the river water to be used for feeding the boilers instead of city water is estimated at \$3,000. The use of river water in the boiler has reduced the water bills from \$200 per month to 60 cents.

TROLLEY WIRES OVER MOVABLE BRIDGES.

When an electric railway lays its tracks over a movable bridge, one of the problems the engineer has to solve is that of designing a suitable arrangement for the trolley wires. In our issue of January, 1897, page 11, we illustrated the trolley connection devised by Mr. J. R. Chapman, for the rolling lift bridge over the Chicago River at Van Buren St., which was occupied by the West Chicago Street R. R., now the Chicago Union Traction.

Another interesting trolley construction is that designed for a movable bridge crossed by the electric tramway at Hull, England, and illustrated in the *Electrical Engineer*, of London. This bridge is carried on wheels and is opened by rolling it back over the west approach.

The trolley wires are suspended from brackets attached to side poles. The line east of the draw span terminates in a pole set at

WIRE OVER BRIDGE, HULL, ENG.

the curb near the opening; two poles fastened to the main girders of the bridge carry the wires on the movable portion, and the last pole for the wires on the west approach is set on top of a pile and braced to a neighboring building.

At the east end of the draw span the stationary and movable sections of the trolley wires are electrically connected by switches consisting of tapered tongues sliding into spring jaws. At the west end the bridge wires are at a slightly higher level than are those on the west approach and there is no electrical connection between them; inclined bars are attached to the terminal bracket to guide the trolley from one wire to the other.

As the bridge when moved back is raised to a slight extent, the bridge wires occupy a position just above the trolley lines on the approach and there is no interference.

CONVENTION OF RAILROAD COMMISSIONERS.

The annual meeting of the National Convention of Railroad Commissioners was held at Milwaukee the last week of May; the business sessions occupied the 28th and 29th and were followed by an excursion to various points in Wisconsin.

The secretary of the Convention had very courteously extended an official invitation to the Street Railway Accountants' Association, and three members of the committee on the standard system of accounts, together with Mr. F. E. Smith, auditor of the Chicago Union Traction Co. had made arrangements to attend. Mr. J. F. Calderwood was unable to be present because called to Columbus, O., by the death of a friend, and the Accountants' Association was represented by Messrs. C. N. Duffy, F. E. Smith and H. C. Mackay. It should be stated that the roll of the Accountants' Association was called as part of the routine business.

In his annual address the president, Cicero J. Lindly, strongly recommended that electric railways be brought under the jurisdiction of the state commissioners. He said in part:

"Electric railroads are becoming an important factor in every state in the Union. Within a few years these railroads will cross and recross almost every state and territory in the United States. There can be no good reason assigned why a railroad carrying passengers, traversing the country and in many instances carrying mail and freight, should not be amenable to the law the same as steam railways, no matter by what power they are propelled, and I believe it to be the duty of every commissioner here to make an effort in his state to see that the railroads propelled by electricity and the street railways in his state should be placed under the jurisdiction of his commission or under the jurisdiction of a commission that will force them to make the same character of reports to the people of the state that steam railways do, so that those investing their money in the stocks, bonds and mortgages of the various street railways in the state may know what those roads

earn, what their capital stock is, the gross earnings of the road, the net income, and for what other purposes his money invested in these enterprises is being expended. There is naught but justice in this, and it appeals to every fair-minded man in the state in which we live."

The Railroad Commissioners have a standing committee to consider the "Classification of Expenses for Electric Railways" and in its behalf Mr. A. W. Cole, chairman of the New York Railroad Commission, said that the committee had little to report since the adoption of the "Standard System", at the Denver meeting in August last. The New York Commissioners, however, had prepared their blanks and the reports of the New York street railways beginning July 1, 1900, would be made in accordance with the requirements of the "Standard System." It will be remembered that Mr. W. O. Seymour, of the Connecticut Railroad Commissioners, last fall made a similar announcement for his state.

The recognition and courtesy extended the street railway accountants by so important a body as this association of Railroad Commissioners, is naturally gratifying in the extreme to those who have worked so hard to make the Accountants' Association what it is. Very few associations have come into as important a position and so readily settled down to earnest work in so short a time, as it. And fewer still have accomplished as good results in 10 years as the Accountants have in three. The excellent work already done will be better realized and appreciated each year, in proportion as it is understood.

AN ENDLESS CHAIN SWINDLE.

An "endless chain" scheme whereby the public may secure street railway tickets at greatly reduced rates has been worked during the past two months at Atlanta, Ga.; Baltimore, Washington, Pittsburg, Kansas City, Mo., and Chicago with the result, as with all something-for-nothing projects, the would-be gainers have suffered considerable loss. At several of these places the promoters of the chain were arrested and forced to leave town.

The plan is not a new one although we do not remember of its having been used in connection with street railway tickets before. In fact the tickets only serve as a blind; people would be more suspicious were \$3.00 cash offered.

The promoters rent a small office for a short term and commence the sale of books of coupons. As the scheme was worked in Chicago the books contained four coupons each and were sold for \$2. The purchaser was to sell three of these four coupons to three different people for 50 cents each, the purchaser of a coupon taking it to the promoters and on turning it in with \$1.50 in cash receiving in exchange a book of four coupons, three of which were to be in turn sold to other parties. When the three persons to whom the original purchaser of a book had sold his extra coupons, had each paid \$1.50 and taken out a new book, the original purchaser received \$3 worth of street car tickets from the promoters; these tickets would cost the recipient but 50 cents, since he retained the \$1.50 for which his three coupons sold. The promoters on the other hand would also have a good thing since they did not issue any tickets to the purchaser of a book of coupons until \$4.50 had been received and three new books of coupons issued. Thus the promoters would make \$1.50 and the purchaser \$2.50 on each \$3.00 worth of street car tickets. On original sales the promoters receive \$2 more per book. The details of the schemes as tried in other cities varied only as to the number of coupons and the price.

The chain is supposed to go on indefinitely, the last set of purchasers of coupons supplying the money to pay the street railway for the tickets and also to pay the 133 1-3 per cent profit divided between the promoters and the preceding purchasers. Unfortunately, however, the progression is a geometrical one and the time very quickly comes when the last purchasers must lose the money invested because of the impossibility of finding new sets of purchasers for the coupons. Estimates of the total wealth of the world place it at less than \$300,000,000,000, yet starting with a single book of coupons and assuming each set of purchasers to dispose of the three coupons as required, the 24th set of purchasers would have to invest even more than this sum.

The element of fraud in the transaction is that since the commodity dealt in has a fixed value and the promoters and early purchasers make a profit, the loss is certain to be borne by the later purchasers.

The Indianapolis, Greenwood & Franklin Interurban.

BY CLOYD MARSHALL.

The promise of Indianapolis being the center of a number of extensive interurban systems seems near fulfillment. For several years Irvington, the seat of Butler College and a fine residence district, has been connected to the city by one of the lines of the Indianapolis Street Railway Co. The Indianapolis & Broad Ripple line has been a favorite route for pleasure seekers during the summer and fall seasons. On Jan. 1, 1900, the Indianapolis, Greenwood & Franklin Electric Railway Co. ran the first interurban car over its tracks. The lines of the Indianapolis & Greenfield Rapid Transit Co. are practically completed and will be opened for traffic

Indianapolis in a southeasterly direction through Southport and Greenwood to Franklin. Franchises for 50 years permitting the company to carry passengers, baggage and freight were secured through the towns, but the line for the rest of the route is over a private right of way, paralleling the Jefferson, Madison & Indianapolis R. R. At one point about five miles south of the city it was necessary to make a deep cut to avoid a heavy grade. A farm of 30 acres was purchased by the company and a pit of fine gravel opened. An excellent roadbed has been constructed at little expense and the company still has a valuable and almost inexhaustible gravel pit. There are no grades or curves of any consequence on the entire line. The route is through a good farming district for which Indianapolis furnishes a splendid market.

There will be a large amount of pleasure riding over the line this summer. When the road is extended to Franklin, the county seat of Johnson County, the contributory population outside of Indianapolis will be large and a regular business traffic of good proportions will result. The map shows the towns and cities connected and the part yet to be constructed. This map also indicates the electric lines running out of Indianapolis, and by the dotted lines, those projected.

TRACK AND OVERHEAD CONSTRUCTION.

An agreement has been made between the Indianapolis Street Ry. and the Indianapolis, Greenwood & Franklin company whereby the cars of the latter company can run over the tracks of the Shelby St. line from the city limits to the business center, with a terminus on Meridian, near Washington St.

Last October the first rail was laid and in less than three

INTERURBANS ABOUT INDIANAPOLIS, IND.

in the immediate future. Interurbans have been projected, franchises and rights of way secured for roads connecting the capital city with Kokomo, Martinsville and other cities in central Indiana, and the electric railway work of greatest magnitude now developing in Indiana is the extension of the lines of the Union Traction Co., which will soon connect with Indianapolis.

During the past decade the Indiana gas belt, comprising Grant, Madison and Delaware Counties, has been the scene of great industrial activity; Anderson, Muncie, Marion and Elwood have grown from country towns to manufacturing centers. The lines of the Union Traction Co. connect these cities with over 100 miles of track and the mileage will be almost doubled with the extension to Indianapolis and elsewhere. A power station to cost \$750,000 is in the process of erection at Anderson to furnish current for this great system. This, together with the dearth of materials, has occasioned some delay in the construction of the Indianapolis branch. It will thus be seen that the electric interurbans, already past the paper period, will make the capital of Indiana the hub, with many of the secondary cities of the state directly contributory to it.

The experience of the Indianapolis, Greenwood & Franklin Electric Railway Co. is indicative of success for the other roads, as the traffic this spring has taxed the capacity of the equipment to the utmost. After some six years of fruitless litigation, last July the company came into the control of Charles F. Coffin, a prominent lawyer of Indianapolis, and W. G. Irwin, a banker of Franklin, and it was reorganized on a working basis and the construction of the road pushed with vigor.

The line was surveyed from Garfield Park at the city limits of

250-H. P. BUCKEYE ENGINE.

STATION BUILDINGS.

months a single track extended from Indianapolis nine miles south to Greenwood, with turn-outs at four different points equidistant along the line. A 60-lb. rail is laid on oak and cedar ties, 6 in. x 7 in. x 8 ft., spaced from 15 in. to 2 ft. apart. The rails are electrically connected by No. 0000 Washburn & Moen bonds. The line crosses a number of streams which are substantially bridged.

Two No. 00 trolley wires are strung over the track, these acting as feeders and avoiding frogs and switches. Aluminum wire of 300,000 c. m. section has been supplied by the Pittsburg Reduction Co. and will serve as a feeder from the power station six miles towards Indianapolis.

Span wire construction, suspended from 30-ft. cedar poles with 7-in. tops, is used along the public highway, but along the private right-of-way Craghead brackets hold the trolley wire. The Ohio Brass Co. furnished the rest of the overhead material except the wire which came from Washburn & Moen."

A private telephone line parallels the track, with instruments in the superintendent's office and in telephone stations located at each of the turn-outs. If a car is off schedule time the conductor unlocks the box and calls up the office to receive running orders, or should any accident or break-down occur, the superintendent is notified.

Outside the towns points at which the cars can be hailed are indicated by stop signals, of which there are 30 along the line.

CARS.

As may be seen from the illustrations, the cars of this company are large, handsome and well equipped for fast interurban operation. They were made by the Laeledge Car Co., of St. Louis, and are of the open type with tightly fitting windows so that they can

style of ticket is shown herewith, the fare, direction and destination being indicated by punches. Commutation tickets of 50 rides, good for one family for one month, are sold for \$6.25. Account of the local fares collected in Indianapolis is kept on a fare register.

The large freight car shown in one of the illustrations is home made, and is used for construction work and hauling gravel. In ballasting the roadbed the gravel was costing 50 cents per cu. yd. for transportation by teams. This car was designed and constructed for this purpose, and the cost of transportation has been reduced to one-sixth. It has a capacity of 15 cu. yd. of gravel and averages 10 trips a day. The car body is 8 ft. 4 in. wide and 36 ft. long, with side beams 10 x 10 in. and a center beam 6 x 8 in. In the middle of the platform there is a trap door for dumping the gravel between the rails. The car is mounted on Peckham trucks with two Steel motors, each of 50 h. p.

POWER PLANT.

A general view is given in the illustration of the office, power station and car barn located at Greenwood, midway between In-

GRAVEL CAR.

PASSENGER CAR.

be comfortably heated in winter, but the window space is so large that with the window down the effect is the same as a summer car. Electric heaters made by the Consolidated Car Heating Co. are placed under the seats. On either side of the center aisle are double, reversible, rattan-covered seats and above are package racks. The interior is handsomely finished in cherry.

Three of the cars are mounted on Brill double trucks and three on Peckham 14 A trucks with a 6-ft. wheel case. Each truck carries a 50-h. p. steel motor made by the Johnson Co. The Christensen air brake system is used with a small motor-compressor in the front vestibule. An air whistle is on the car roof above the vestibule and a warning is sounded by the motorman just before each cross road is reached.

As will be seen from the illustration, the cars are equipped with "Providence" fenders, made by the Consolidated Car Fender Co.

Each car is equipped with a Wagenhals arc headlight. This throws a remarkably brilliant light along the track for several hundred feet, and in Indianapolis the contrast is very marked between the Greenwood and the city cars with their little incandescent headlights. The carbons are fed by hand and will burn in one position for about one and a half hours. At the end of each trip at night the motorman releases the clutch, which allows the upper carbon to drop down to the lower one.

Two of the cars have baggage compartments for carrying parcels and light freight. At present the freight traffic consists chiefly of dairy products, and each morning on the early run 300 gallons of milk are delivered into the city. The freight business is as yet undeveloped, but will receive attention as soon as the passenger traffic can be taken care of.

On week days an hourly schedule is maintained from 5 a. m. to 12:15 at night, and on Sundays the cars run every 35 minutes. Tickets are on sale at Greenwood, Southport and several stores in Indianapolis, as well as on the cars. The fare one way from terminus to terminus is 20 cents, and for the round trip 30 cents. The

dianapolis and Franklin. The power house is a brick building 47 x 94 ft., of which the engine room occupies 56 and the boiler room 38 ft. of its length. A 250-h. p simple Buckeye engine is belted to a 600-volt, 333-ampere Westinghouse generator. The fact that there has not been a shut-down of sufficient duration to throw the cars off schedule time speaks well for the engine and generator as well as for the careful attention given them. The Buckeye Engine Co. has built a 350-h. p. engine for this station which will be belted to a 300-kw. Siemens & Halske generator. The Siemens & Halske Electric Co. made the white marble switchboard upon which the mounted Weston ammeters and voltmeters.

There are three 100-h. p. horizontal tubular boilers, made by

SAMPLE ROUND TRIP TICKET.

Chandler & Taylor, carrying steam at 95 lb. pressure. A Hoppes exhaust feed water heater is mounted on top of the boiler setting. One hot water pump and one cold water pump, each 6 x 4 x 6 in., made by Dean Bros., of Indianapolis, keep the boilers supplied from a deep well and maintain the pressure on a system of water works. The boiler room equipment is to be duplicated in the im-

mediate future. Indiana slack coal is used and the daily consumption is about 12,800 lb.

Three tracks enter the car barn, which is a brick building 50 x 100 ft., with a repair and inspection pit under one of the tracks. With the arrival of the cars now ordered the building will be of inadequate size, and plans are ready for an extension of 75 ft. in length. Water plugs with about 100 ft. of 3-in. hose are located at convenient points about the plant for fire protection.

Mr. A. B. Hogue, superintendent of the company, is a man of long and varied experience in electric railway work. Previous to his engagement in Indianapolis he was superintendent of construction on the Cleveland & Chagrin Falls Electric R. R., and had charge of its operation for 15 months. He superintended the

C. F. COFFIN.

A. B. HOGUE.

electrical construction of the Niagara Falls & Suspension Bridge Ry., when it was rebuilt to use current from the water power. Later he was superintendent of construction of the London (Ont.) Street Railway Co., until called to a similar position with the Canton-Massillon Electric Railway Co. For a year he was superintendent of the Worthington, Clintonville & Columbus Street Railway Co. The results of his experience are apparent in the operation of the present line; everything is in first-class working order, and not a stop of 15 minutes has been occasioned since the cars began running.

The company is capitalized at \$150,000 and has no indebtedness. Charles F. Coffin is president and secretary; W. G. Irwin, general manager, and A. B. Hogue, superintendent. The office of the president and counsel is at 525 Lemcke Building, Indianapolis.

STREET RAILWAYS AND THEATRICAL ATTRACTIONS.

In our May issue, page 259, was published Mr. H. F. MacGregor's paper on the "Operation and Maintenance of Street Railways," read before the Southwestern Gas, Electric & Street Railway Association, and we give here a portion of the discussion which this paper elicited:

Mr. Jenkins: I am interested in the question of summer theatricals, and I am inclined to think that Mr. MacGregor has set the proper pace, 10 cents admission and 10 cents for reserved seats. I have had numerous applications every week from big aggregations who want to come and show us how much money they can make, but as a rule the making of money is on the other side. I have found so far that the money it takes to run a thing of that kind has more than taken up the gross receipts.

Mr. MacGregor: As to the amusement business, if there are those who would like to get into the circuit there is no reason why they should not do so, if they are willing to guarantee what the railway towns are willing to guarantee. The trouble I see about these associations there is no agreement of sentiment on any proposition.

Mr. Boyd: I don't know a thing about the entertainment business, but I have my office in the store of the manager of the local theatre, and I have asked him leading questions, and what I find is that they never get a guarantee from any street railway men who are not entirely novices in the line of entertainments; they get a percentage of the receipts, to 50, 60 or 70 per cent.

Mr. MacGregor: Here in Waco they prefer to hire troupes outright and take all the money and pay them so much for their services. At San Antonio they haven't any building where they could make a charge. What they did there was to run free on a concert basis. At Laredo there was a charge for entertainments and a charge for reserved seats, and a percentage, and a guarantee only of board and transportation. That is all the guarantee we propose to make; to allow \$5 for each person and their transportation around the circuit. Whatever loss there was on that would have to come out of the 5-cent-fares if they failed, and sometimes we would have a profit on our percentage of 10 and 10. For instance, in railroad towns we would be willing to give them as much as 80 per cent; we would have our profit, but then we might lose it on the next show. One wants it one way because he has educated his people to have something for nothing. What I would like to do is to agree on some plan. If we could all adopt it I think we could do something in the way of summer amusements.

Mr. Yeager: I started in this business last year. I engaged a troupe on the lines that we talked of last year at Austin. After two weeks I found that we were getting it in the neck. They were asking everything; just simply laid themselves down, and I had to get everything, so I went through the season with other troupes and wound up with a big opera troupe in which I charged 50 cents admission and 15 cents reserved seats and had my house full; played two weeks. I corresponded with theatrical agencies throughout the country and managers, and in that way got a good deal of information which changed my ideas in regard to running summer entertainments so as to make it profitable to the company. After playing the troupes two weeks on the admission plan, I noticed that there were certain nights people went out and I had larger crowds than other nights, and it was always the same way. After playing these people two weeks the third week I gave three nights free; in fact gave a better show than I had before. I didn't have half as many people as I did the nights I charged 25 cents to get in to see the same thing, including car fare, because the society people which make up the big crowd would not go. They had the idea that as it was free everybody would be there. In Houston that would be the negroes and others. With us it is the Mexicans and negroes. And I didn't make enough to pay the musicians and expenses. I guarantee nothing. I say to them that I have a place on which I have spent \$4,000 to make it first-class, that I will do everything to bring crowds and can do it better even than they can if they came on their own responsibility. I give them the place. They have no license to pay. I do the advertising and pay the expenses. I will give you all the gate receipts and all the reserved seats excepting 10 or 15 per cent, according to your attraction. I reserve that much to pay the expenses of the door-keeper, stage hands and to clean up after the performances. They take the risk. They give a good show, because they are on their metal, and if they do not give a good show people will not patronize them.

Mr. Strickland: Mr. Yeager bears out my position that the people of Texas, at least those who patronize the street railway and lighting plants, do not want something for nothing. I would like to ask Mr. MacGregor as to the legality of street railways conducting those summer entertainments.

Mr. MacGregor: We have a right to do anything that promotes our business.

Mr. Yeager: I had this matter investigated by some attorneys at Austin, and I found there was a way of getting around it so not to have any risk, so I didn't charge admission. I have nothing in my franchise to say whether I should charge 5 cents or any other sum, so I have no entertainment at which I sell tickets at the gate. Whatever we have there is included in the car fare. You buy car tickets which entitles you to a coupon to go and see what you can. After you get in if you want a good, comfortable seat you can pay additional for it. We take out a license, pay \$10.50 a year. I don't think there are any legal objections, but I took this course in order to be on the safe side.

The United States District Court at Galveston, Tex., has allowed the claim for \$30,000 brought by the city of Galveston against the Galveston City Street Railroad Co., for the value of the company's stock held by the city and has decreed this to be a prior lien to that of the bondholders, and it must be paid out of the proceeds of the sale of the road.

SOME EARLY ELECTRIC RAILWAY INSTALLATIONS.

When and where the first successful electric railway was built in this country is a matter of considerable dispute, several cities claiming the honor of having been the first to prove the mechanical and commercial feasibility of applying electric traction to street railway transportation problems. Prior to 1880 there is no record of an electric railway embodying the essential features as we know them today, that is an electric motor on a moving car taking current from a central station through electric conductors by means of a sliding or rolling contact, although models had been built and experiments carried on along this line by Thomas Davenport at Springfield, Mass., in 1835-37, Thomas Hall at Boston in 1860, Van Depoele at Detroit in 1874, Stephen D. Field at San Francisco in 1877, and others. Experiments had also been made with battery cars propelled by current taken from Grove battery cells carried under the seats, and in Europe several models of electric railways had been built, employing a third rail or an overhead wire, but in this country no practical demonstration of electric traction principles as now generally applied had been attempted.

Thomas A Edison can probably claim on good grounds to have constructed the first mechanically successful road in America, although his was purely an experimental line. This was built in 1880 near his laboratory in Menlo Park, N. J., and on it cars were run, drawn by a locomotive taking and returning the current through the rails.

In 1882 Joseph R. Finney exhibited in Allegheny, Pa., an electric car for which current was supplied by an overhead copper wire. A small trolley fitted with grooved wheels running on the wire as on a track and connected with the car by a flexible conducting cord served to convey the current to the motor. It was not, however, until 1887-88 that a road was actually built on Finney's plan.

In 1883 Leo Daft equipped and operated successfully an electric system on the Saratoga & Mt. McGregor R. R. at Saratoga, N. Y. This line was about 15 miles long with several severe grades. A locomotive receiving current from a third rail between the track rails drew several trail cars, often attaining, it is said, a speed of eight miles an hour. In the same year Chas. J. Van Depoele placed in operation in Chicago an experimental track about 400 ft. long having a 5 per cent grade. The rails were used for one side of the circuit, while the other consisted of a copper wire supported in a wooden trough in the center of the track and passing over two brass wheels suspended from the bottom of the car. As the car passed it lifted the cable and then allowed it to again drop into the trough. The car was fitted up with a 3-h. p. motor and could ac-

ONE OF THE EARLY INSTALLATIONS.

commodate about 25 people. During this year Field also exhibited at Chicago an electric locomotive that successfully drew one car and took its current from a conductor laid on the ground.

On July 27, 1884, an electric car made scheduled trips over a mile track in Cleveland, and this is probably the first electric car in regular operation on a street railway track in the United States. The motor was placed between the wheels and supported from the car body, and geared to the axles by belts or spring wire cables.

The current was conveyed to the car by conductors supported on insulators in a small wooden conduit, and connections made with the conductors by means of a plow extending through the slot in the conduit. This was the initial installation of the Bentley & Knight system. The road was abandoned in 1885.

In the same month, July, 1884, Van Depoele made arrangements to run an electric railway at the Toronto (Ont.) Annual Exhibition, using an underground conduit. This road was a complete success mechanically and financially. The conduit was built as follows: A wooden box was fixed in the center of the track and kept in place by means of iron brackets screwed fast to the cross ties. A narrow opening ran the entire length of the box, both sides of this opening or slot being protected by iron strips to prevent the wood from wearing. The inside and outside of the

VAN DEPOELE SYSTEM AT SCRANTON, PA.

box was painted with asphaltum. Two copper strips placed on opposite sides of the box were used as conductors, one positive and the other negative, and from the under side of the car extended two insulated conducting brushes for collecting the current. An electric locomotive equipped with a 30 h. p. motor was used, and drew three heavy cars carrying about 200 people each trip. The speed attained ranged from 20 to 30 miles an hour—a noteworthy achievement.

All of these lines had used a conductor either under or on the ground. The years 1885 and 1886 marked the beginning of installations employing an overhead conductor, and in these years roads were built on this system at Minneapolis, Minn., Montgomery, Ala., Detroit, Mich., Windsor, Ont., Appleton, Wis., Scranton, Pa., and other cities by Van Depoele; and at Kansas City, Mo., by John C. Henry. The following description of these early Van Depoele systems is taken from an old catalog, of which there are probably only two or three in existence, published by the Van Depoele Electric Co., in 1887, and loaned us through the courtesy of Mr. Chas. Flynn, general manager of the Easton (Pa.) Consolidated Electric Co.

At Minneapolis a portion of the Minneapolis, Lyndale & Minnetonka R. R. was equipped electrically. A 3-10 in. copper wire was used for the overhead conductor and the return current was made through the rails. A 6-ton motor car equipped with a 50-h. p. motor weighing 3,500 lb., was used and drew at regular intervals three loaded cars, up a 6 per cent grade 1,500 ft. long. For several months it made 47 trips per day, working 18 hours, the coal consumption for this period averaging 3,500 lb. per day of 18 hours. A slide valve engine belted to a 60-h. p. generator, and a boiler without heater or economical arrangement for fuel supplied the power.

The Montgomery, Ala., installation included an overhead wire from which current was taken by means of a flexible cable suspended from a traveler. The return circuit was made through the rails. The weight of the cars was 3,500 lb. and of the motors about 700 lb. The grade for a long distance was over 7 per cent.

The Detroit road was 1¾ miles long and owned one motor and one generator. The motor car pulled a train of three trailers, and it is said attained a speed of 27 miles per hour.

At the Appleton installation current was generated by water

power, a 60 h. p. generator being driven by a turbine water wheel. Double overhead conductors were used and no current was carried on the rails. The rolling stock consisted of five 12 ft. motor cars built by the Pullman Co., equipped with 6 h. p. motors, and these made regular trips over a 4½ mile line, on which all curves were 45 to 50 ft. radius, with grades running as high as 9 per cent.

The line at Scranton was two miles long, laid with Johnson steel rails and three Pullman cars, each equipped with a 15 h. p. motor, were operated. Steam power was furnished by a lighting station for driving the 60 h. p. generator that supplied the street railway line.

In the early Van Depoele system the motor was carried on the front platform, and horse cars were often re-equipped for this service by running two strong beams through the whole length of the car below the floor, and in addition extra cross beams were put into the floor framing to sustain the added weight. The motor was connected with the front axle by a chain and sprocket wheel gear.

The following table of costs, with the explanation is taken from the early Van Depoele catalog mentioned above, and will be of interest in this connection.

Approximate cost of running 50 street car motors of 6 h. p. each for a period of 16 hours per day:

400-h. p. steam engine at \$.02 per hour per h. p.	\$128 00
Two engineers at \$3.00 each per day.....	6 00
Two firemen at \$1.50 per day.....	3 00
Oil and waste per day.....	2 00
Interest on capital invested.....	8 00
Depreciation and sundry items.....	3 00

Total cost of 50 cars running 16 hours per day...\$150 00

Cost per car per day of 16 hours.....\$ 3 00

The above gives cost of running up to full power at all times, but it can safely be estimated that never more than two-thirds of the power is used on an average through the day, which will reduce the cost of steam power by one-third, making \$85.34, instead of \$128.00, as figured above, or \$2.06, instead of \$3.00 per car per day. With horses it is estimated the cost per car per day of 16 hours would be \$5.60.

These figures are for a road having 14-ft. cars and grades of 3 per cent.

In order to show that electricity is economical, even with a small plant the following figures are given for a four-car plant, each car equipped with a 5 h. p. electric motor, running 14 hours per day:

30-h. p. steam engine at \$.03 per hour per h. p.	\$12 60
Engineer and fireman.....	3 00
Oil and waste.....	25
Interest on capital	80
Depreciation	25

Total cost of running four cars per day of 14 hours.\$16 90

Or \$4.22 per day per car if full power is used all the time. Taking two-thirds of the power as the average requirement the expenses for steam would be reduced to \$8.40, instead of \$12.60, making \$3.17 per day per car.

The Kansas City road designed by Mr. Henry had double overhead conductors and current was supplied by compound wound dynamos. The motor fields were wound with a multiplicity of parallel wires, and the resistance was varied by connecting more or less of these in parallel by a switch. The armatures ran constantly and the connection to the car axle was made by a combined differential gear and clutch running in oil. The trolley wheels which were 3 in. in diameter, engaged the sides and bottom of the trolley wire, running in a horizontal position, and were held to the wire by strong springs. Connection was made to the car by flexible wires, enabling a traveling contact to be kept up at all times with the wire, which in some places was 15 ft. to the side of the track.

The years 1887-88 saw the real awakening of promoters and capitalists to the possibilities of the new method of traction and electric railways were built within twelve months in many sections of the country, notably at Richmond by Sprague, at Allegheny City by

Bentley and Knight, and at Washington, D. C., by the Thomson-Houston Co. In 1888 the officials of the West End road at Boston decided in favor of electricity to the exclusion of cable and horses.

On Jan. 1, 1888, as nearly as can be ascertained, there were in the United States and Canada 13 electric roads, with 48.25 miles of

EARLY VAN DEPOELE INSULATOR AND TROLLEY HEADS.

track and 95 cars. It seems hard to realize that in 12 years this number has increased to nearly a thousand roads, operating about 19,000 miles, and more than 50,000 cars, and whose capital liabilities aggregate \$1,500,000,000.

AIR AS A LUBRICANT.

An interesting experiment to show the practicability of air for lubricating journal bearings has been made by Professor Albert Kingsbury, of the Worcester Polytechnic Institute. A steel shaft 6¼ in. long and 6 in. diameter, weighing 50½ lb. was placed in a cast iron bearing about 1-2000 in. larger than the shaft; the shaft was provided with a handle at one end for turning it.

It is said that at starting the shaft can be turned with difficulty at first, and the harsh grating sound of metal rubbing on metal will be heard. With an increase of speed, however, this grating ceases, and the force required to turn the shaft is materially decreased until, after a few revolutions, the shaft becomes entirely free from the cylinder, and rotates on the film of air between. Set rotating at, say, 500 r. p. m., it will continue to rotate four or five minutes. If allowed to run, the speed gradually decreases from the start until suddenly the piston breaks through the intervening layer of air, and a few more revolutions suffice to bring it to a sudden stop.

The center of the shaft when in motion is below, and in advance of the center of the bearing, and the inclination of plane passing through the center lines of shaft and bearing will vary slightly with the speed of rotation.

The pressure existing in the film of air between the shaft and bearing varies. For the upper half of the bearing it is below atmospheric pressure, the minimum being at a point about 20° above the left end of a horizontal diameter when looking at the shaft revolving in a clockwise direction; the point of maximum pressure (in one case as much as 3 lb. above the atmosphere) is about 50° below the left end of a horizontal diameter, the rotation being clockwise. At the ends of the bearing the pressure is of course atmospheric and varies as the middle of the bearing is approached. If both ends are left open, it is found practically impossible to level the cylinder with sufficient precision to prevent the piston traveling axially when rotating on its air lubricant—another proof of the small amount of friction. A few drops of oil allowed to run into the bearing will cause sufficient friction to stop the shaft in a very few revolutions, likewise a little rust or slight abrasion on one of the surfaces will cause the experiment to fail.

The three street railway companies at Youngstown, O., of which Mr. A. A. Anderson is manager offer to give better schedules on certain of their lines, and issue interchangeable transfers at a number of points if the authorities will repeal the slow speed ordinance and grant the extension of franchises for the three roads for 25 years.

PRESERVATIVE TREATMENT OF TIMBER.

Abstract of a paper read before the Western Society of Engineers by Octave Chanute.

A report presented to the American Society of Civil Engineers in 1885 gave data concerning 147 experiments in the preservative treatment of timber; of these 16 were in kyanizing (corrosive sublimate); 30 in burnettizing (chloride of zinc); 39 in creosoting (dead oil of tar); 18 in the Boucherie process (sulphate of copper); 44 miscellaneous.

The great timber users are the railroads, the principal consumption being for cross ties; it is generally estimated that about 100,000,000 ties are required annually. A number of railroads began experimenting with processes for preserving cheap woods in 1885 and 1886, and all of them (save one whose plant was burned) are continuing the process. The Atchison, Topeka & Santa Fe has two plants using the zinc-tannin process. The Southern Pacific has two burnettizing plants, and the Chicago, Burlington & Quincy recently built a tie treating plant at Edgemont, S. D., using the burnettizing process. The Chicago, Rock Island & Pacific in 1886 contracted with Card & Chanute, now the Chicago Tie Preserving Co., to erect works at Chicago and treat 100,000 to 200,000 ties annually; this contract was in 1891 extended for three years and the number of ties increased to 300,000 and in 1894 contracted for 10 years more for an output of from 400,000 to 500,000 ties annually. The Chicago Tie Preserving Co. is also operating a movable plant at Mt. Vernon, Ill., treating ties for the Chicago & Eastern Illinois R. R.

Mr. W. W. Curtis, in a paper on the use of zinc chloride for tie preserving, read before the American Society of Civil Engineers in 1899, stated that the Santa Fe road was getting 11 to 12 years' service from mountain pine, which had a natural life of about 4 years, while getting but 6 years from natural white oak in heavy main line service and 10 years from cedar under light service. The Southern Pacific, with ties having a natural life of only 3 years, had 93 per cent of ties treated in 1889 in service after 8 years; of ties treated in 1888, 63 per cent were in use after 9 years, and those treated in 1887 gave 10 years' service. Other roads had satisfactory results from the treated ties.

The writer acknowledges that the average life in the track of ties treated at his own works prior to 1895 has not been satisfactory to himself. He expected these ties to last 12 to 15 years, and they have averaged but 9 to 11 years. In 1896, after a great many experiments, he modified the mode of treatment by using three solutions instead of two, and he now injects 2½ times as much chloride of zinc as was done in 1886, so that he anticipates that his original expectations will be realized. He has found, however, a great many anomalies in the injection of various woods. Some of the ties take two or three times as much solution as others; various kinds of wood behave differently; ties cut in summer average far less absorption than those winter cut; modifications in the period of steaming, in the time and amount of vacuum, as well as in the strength of the solution and the duration of the pressure, produce different results, some of which were puzzling; so that after 14 years of experience the writer felt the need of going to Europe, where the preservation of wood has been carried on since 1835, in order to study "the state of the art," and to avail himself of the best methods of carrying on a work which did not prove to be as simple as was at first imagined.

The countries visited were England, France and Germany, these being the regions where wood preserving is done upon the largest scale, and the following account of the information obtained will be confined to the preservation of cross ties, as this is the principal application of processes abroad.

The Europeans are obtaining much more service out of their wooden ties than we do in this country. In England the average life is at least 15 years under very intense traffic. For instance, the London & Northwestern Railway Co. reports an average service of 16 to 20 years for its sleepers, all of which are creosoted at a cost of about 25 cents each. The London, Tilbury & Southend Railway Co. says that its sleepers last 25 to 30 years, but this is a road with very light traffic. Other lines report the life at 12 to 15 years, one road alone, the Southeastern, reporting the service at 8 to 9 years, and the cause of failure to be "wear." All ties laid in England, or practically all, are creosoted with varying quantities of tar-oil, but

generally with 28 to 30 lb. per tie. The sleepers are of imported Baltic red-wood, procured in Russia, Sweden and Norway, are generally 8 ft. 11 in. long, 5 in. thick and 10 in. face, and cost from 90 cents to \$1.12 apiece delivered at the dock, so that it is good economy to treat them with creosote to lengthen their life.

In France, speaking generally, still better work is done than in England, and better results are obtained. Formerly chloride of zinc and sulphate of copper were injected, but now practically all the ties are creosoted (except by one road) and they last from 15 to 20 years. One road, the "Ligne de l'Est," obtains 25 to 30 years service out of beech ties, and there is no question as to the fact, for accurate records for 27 years prove it, but then this road injects 60 lb. of tar-oil per tie, after long seasoning and further drying in ovens, at a total cost of 64 cents each. Other roads inject lesser quantities and obtain inferior results. The increased life of the wood seems to be nearly in direct ratio to the amounts of creosote injected. The French ties are of oak, beech and pine, about three-quarters of them being produced in the country, and about one-quarter imported. The average renewal upon the French railways is now about 4½ per cent annually of all the ties in the tracks, so that the yearly depreciation in the United States is about twice and a half as much as in France. In the latter country one railway system, that owned by the State itself, employs the "zinc-creosote" process, which will be further mentioned when giving the data for Germany; all the other roads have practically gone over to creosoting, with some modifications as to the mode of injection.

In Germany three processes have been in vogue until recently. These consisted, first, in straight burnettizing, or the injection of chloride of zinc alone, such as is now practiced at some of the works in the United States, which have been mentioned; second, in the "zinc-creosote" process in which both substances are simultaneously injected in an emulsion; and, third, in straight creosoting, in which tar-oil alone is injected by one of several methods. In 1897 straight burnettizing was abandoned, it having been abundantly recognized that the chloride of zinc leaked out of the wood in time, and at present only the other two processes remain in practical application upon an extended scale. There are other methods still lingering of very limited application, and there are some new processes now coming forward which will be noticed further on.

The reason why burnettizing continued so much longer in Germany than in England or in France appears to be mainly climatic. Not only is the rainfall less in Germany, but its character is different, consisting, as the writer was informed, mainly of long drizzling rains, which do not wash the ground and the ties like the heavy downpours in the other countries, which are so often followed by fierce evaporating suns. Be this as it may, the service hitherto obtained from burnettized ties in Germany has been from 9 to 12 years in the track; the timber injected has chiefly been pine and beech, and the cost of injection for first class ties, 8 ft. 10 in. long, 10.2 in. wide and 6.3 in. thick, has been 15.6 cents each for pine and 18.8 cents for beech, which latter wood absorbs more solution. These woods are obtained locally, as the State owns some 31 per cent of the forest area of Germany, makes this a source of profit, and discourages importation.

The price paid for the injection with "zinc-creosote" of first class ties is 19.2 cents for pine, 20.4 cents for beech, and 15.6 cents each for oak, inasmuch as this last wood is very refractory and absorbs much less of the solution. The service obtained has been from 12 to 18 years in the track, but the most convincing evidence of the value of the process consists in the guarantee which the contractor, Mr. Julius Rutgers (who first introduced this method), has given in some cases. He first excludes 5 per cent of all the ties treated, as damaged by hidden defects and rotten spots which cannot be detected in inspection, and guarantees that of the remainder 95 per cent shall still be fit for service in 10 years, 80 per cent in 11 years, and 70 per cent in 12 years. If less than the above remain, and are proved to have been properly taken out for decay, he makes the deficit good by refunding the price paid for treatment or treating another tie gratis, at his option. In point of fact, inasmuch as a premium of 2.4 cents a tie is charged for this guarantee, the Prussian State Railways prefer to pay the regular price above mentioned for treatment, and to protect themselves by the issue of elaborate specifications, which have been revised several times, making them more and more stringent, and by placing inspectors at the works.

In Germany, as elsewhere, straight creosoting gives the best results, but it is expensive. The price paid for the impregnation of

first class ties is 53.76 cents each for pine, 56.64 cents for beech and 26.88 cents for oak, the latter being in consequence of the smaller absorption, if the creosoting is done after drying in special ovens. The price is 56.64 cents each for pine, 59.28 cents for beech, and 28.80 cents for oak, if boiled and impregnated in heated tar oil. The service obtained is 20 to 23 years for pine, 30 to 34 years for beech, and 24 to 28 years for oak; these figures as to life being taken from the report of the Union of German Railways for 1896, published in organ of railroad progress, Weisbaden, 1897. The results must seem astonishing to our American railroad managers, but then, very great care is taken of the ties after they get into the track, the mode of fastening to the rail is superior to our own, and all the inspections are rigid.

Nothing impressed the writer more forcibly than the extreme care, and the particular precautions enforced, in Europe in order to do the best kind of work. The ties are minutely inspected when first received, and the German specification would appal an American tie contractor; the amount of waney is elaborately specified, and a single rotten spot, or red heart, in beech, condemns a stick. If there are incipient cracks at the ends, sharpened straps of heavy tapering hoop iron, bent into the shape of an S, are driven in, or a hole is bored with an auger, and an iron bolt is inserted and screwed up against washers. The ties are then seasoned from 6 to 12 months before they are impregnated. They are cribbed up in isolated square piles of about 100 ties, with some 4 in. air spaces between the sticks, so that they may dry thoroughly in the yards adjacent to the treating works. Some of these yards can contain 600,000 ties, and the writer saw one in which 250,000 ties were piled up for this year's treatment. The piles are examined from time to time to determine when the wood reaches the best condition; if more cracks are developed, more S-straps are driven in. This careful seasoning, the result of long experience, constitutes one of the principal differences from American practice, in which the ties are treated within three or four months from the time of their cutting, and it accounts in a great degree for the inferior results which we have hitherto obtained. After the ties are treated they are again piled up and allowed to dry before being put into the track, although this precaution is less strenuously insisted upon, and emergencies are met by laying freshly treated ties.

It is the work of impregnation which is subjected to the greatest care. It is carried on by experts, and to elaborate specifications. While carrying on the work inspectors are in attendance to test the strength and purity of the substances injected, and for this purpose a chemical laboratory is attached to each treating plant; the ties are weighed by buggy loads before and after treatment, and the amounts absorbed are thus checked. If a buggy load proves deficient it is treated over again. To ensure uniform work, automatic gages with clock-work attachment register the amounts of vacuum and pressure obtained in the treating cylinder, as well as their duration, and a record diagram is taken and preserved of each treatment. Thus is obtained a uniform absorption of the chemicals in the prescribed quantities, and thus are produced the satisfactory results in service which have already been mentioned.

Much of the credit for the careful work done in Germany is due to Mr. Julius Rutgers, a contractor, who has been in the business for just 50 years. He is a man 70 years of age, and now controls some 20 plants which do most of the tie treating for Germany. The Royal Prussian State Railways, which comprise practically all in Prussia, have four tie treating plants of their own, but several of the state officials told the writer that Mr. Rutgers was so thoroughly equipped and through his long experience enabled to do so much better work than the state itself, that the latter preferred to contract with him rather than to enlarge the present railway plants. He is in no wise protected by patents, but simply by his known skill and honest work.

Further care is exercised in laying the ties in the track, and the mode of fastening to the rail is decidedly superior to our own. In Europe ties are generally adzed and bored for spikes by machinery before being treated. The adzing provides a smooth seat for the chair, tie plate or rail, which latter is generally laid on a "cant," and the boring not only obviates the crushing of the fibres of the wood by a spike, were such a primitive mode of fastening still generally used, but it also assures thorough chemical treatment at this dangerous spot. In point of fact it may be said that the spike has now been abandoned in the three countries which have been above named. In England, the standard is the "bull-head" rail, a rail

with two heads, and it is laid in cast iron chairs, which are fastened to the tie by round iron dowel pins and wooden tree-nails, driven into bored holes. In France and in Germany the foot rail is generally used, together with tie plates, and the latter are fastened to the tie by lag screws of various designs. In some cases spikes are used on the outside, and the spike is used on both sides in side tracks, but the lag screw, which the French call "tirefond," is considered the standard. In France holes for these are bored by machinery, but the Germans now generally bore for these by hand when laying in the track. They admit that it would be cheaper and better to bore before treatment, so as to impregnate thoroughly around the hole, but they are now experimenting with so many patterns of tie plates and rails that they cannot tell before treatment to which pattern the tie is to be fitted. The French have been using not only iron tie plates, but also some of felt, and claim that the latter last 6 to 10 years, at a cost of 1.6 cents each, but these are now being superseded by creosoted poplar tie plates, cut from the lower gnarly portion of the tree, to about the thickness of a shingle, which are said to be more economical than either iron or felt tie plates. The argument made is that the iron tie plate wears both the rail and the tie, while the poplar tie plate takes all the wear to itself, and, as it costs but about .8 cent, proves most economical.

But the great, the radical improvement in tie fastening consists in the discarding of the barbaric spike, which when driven, crushes the wood into a spongy mass, collects moisture to rot the tie, gets loose and allows the rail to flap up and down so as to cut the tie at each stroke. The sooner we set about to supersede this with some form of lag screw appropriate to our rails, the better it will be for track economy. In Europe the lag screw is conceded to be as much of an improvement upon the spike, as the fish plate proved to be upon the old fashioned chair.

It will be realized from the foregoing that great care is exercised in the preservative treatment of timber in Europe. The timber is closely inspected, it is thoroughly seasoned, it is impregnated upon scientific principles, and it is laid in well drained ballast with track fastenings superior to our own. It is, therefore, not surprising that much better results as to service are obtained than in this country.

The question which now occurs is how much of the European practice can profitably be adopted in the United States? It has been abundantly proved by over fifty years of experience that creosoting is the best preservative of timber, but also that it is the most expensive, and it is now yearly growing more expensive, as the price of tar-oil is advancing year by year with the recognition of its merits. In consequence of the high price paid for stumpage the Europeans start with a much more expensive tie than we do. In England, for instance, a pine tie untreated cost 90 cents to \$1.12, in France it cost about \$1.00 and in Germany from 82 to 90 cents; hence more money can be spent upon it profitably to prolong its service. It would cost, at the present price of creosote, about 45 cents each to impregnate ties according to the English practice, and about 85 cents to inject it with the quantity prescribed by the "Chemin de Fer de l'Est" in France, where the process involves the baking of the tie for 72 hours in a drying oven before injection. It is hardly to be expected that our railroad managers will feel justified in incurring this expense to preserve a tie which costs but 20 to 40 cents in the first place. We must, therefore, resort to cheaper processes, recognizing them as inferior, and yet more appropriate to the cheaper timber which we are still so fortunate as to possess.

Now what shall that process be? Opportunely for us European experience has made the choice of the substance to be used more limited than it was a few years ago. Sulphate of copper and bichloride of mercury, although excellent antiseptics, have proved to be, on the whole, less available for timber preserving than chloride of zinc, and although the latter when injected alone, has now been abandoned in all the three countries mentioned, some modifications of burnettizing may profitably be employed in this country. Indeed, in the more arid regions of the United States chloride of zinc alone will probably give satisfactory results, but there must be plenty of it injected, certainly more than is the practice at present at some of the works; for it has been well established that it leaches out during the alternate soaking and drying which the ties undergo.

The German specifications require that a pine tie, for instance, which contains 3.96 cu. ft. absorbs 35 kilograms, or 77 lb. of the solution; as this solution is specified to be at 3.5 degrees Beaume,

which contains 2.63 per cent of dry zinc-chloride, it follows that the amount of the latter substance carried in by the aqueous solution is 1.92 lb. per tie, or at the rate of .49 lb. to the cubic foot of wood. This corresponds to the present practice of the writer, who has been injecting, as closely as possible, .50 lb. to the cubic foot for the last three or four years, with what practical results we shall not know to an absolute certainty for 8 or 10 years to come. As the ties reach him much worse seasoned than is the practice in Germany, and as he cannot inject as many pounds of solution, he is making the latter 5 degrees Beaume strong, containing 3.9 per cent of zinc chloride, and he thus puts in as much dry chloride as the Germans. This refers to the first solution employed, which is followed by two others. The second consists of gelatine or glue, and the third of tannin, the peculiarity being that these two latter substances, which are both soluble, form, when brought into contact with each other, an insoluble compound, an artificial leather in fact, the pellicles of which lodge in the sap cells of the wood and obstruct the ingress and egress of moisture, but not of vapor. The wood being already nearly filled by the first solution, the last two do not penetrate very far, say about three-quarters of an inch, but this is sufficient to act as a rough plug, and it has been proved to retard materially the leaching out of the zinc. It has, moreover, been found important to allow the ties so treated to dry somewhat before being put into the track, in order to allow the pellicles of artificial leather to harden. It has also been found that the ties last better in some soils than in others; limestone ballast and coal mine refuse, or culm, being seemingly the most injurious. For regions of considerable rainfall, the writer entertains no doubt that this "zinc-tannin" process is superior to straight burnettizing when equal amounts are injected.

The German method of retarding the leaching out of the chloride of zinc (for they say that it washes out even then), has been to mix therewith a certain quantity of tar-oil, which by lining the sap cells of the wood and hardening therein shall prevent the intrusion and the exit of moisture. The measure of success which they have accomplished has already been given, and this success seemed, by report, to be so much greater than that with ties treated by the "zinc-tannin" process, from 1886 to 1896, at the works of the writer, that he devoted great scrutiny while abroad to the "zinc creosote" process, with a view to adopting it should it clearly be superior. As a result of that scrutiny he believes it to be very good, but he is not now certain that the results will warrant the increased expense, which will be 3 or 4 cents a tie, inasmuch as a part of the increased service in Germany, as compared with the United States, is attributable to other causes, such as the more thorough seasoning of the wood, the better track fastenings, the character of the rainfalls, etc. It is a significant fact that the Germans report a life for untreated white oak of 10 to 16 years, with an average of 13.6 years, while we can only obtain a life of 8 to 10 years for that wood in this country. Moreover, while for straight creosoting only 10 per cent of tar-acids are required in the tar-oil, for the "zinc-creosote" process a peculiar quality of tar-oil, containing 20 to 25 per cent of tar-acids is required, which quality is not now produced in the United States. The introduction of this process therefore requires material changes in the distillation of coal tar in this country, or the importation of foreign tar-oils, which are just now very scarce and high.

Be this as it may, the writer deems it desirable that the "zinc-creosote" process shall be introduced in the United States, and it is his intention to do so, but it will require some time to investigate the best sources of supply, and to make chemical analysis of the products, and it will perhaps be necessary to erect a tar-oil refinery, as the process has to be carried on with great nicety, and some of the foreign plants are found to do much better work than others.

The question also occurs whether there are not other cheap processes which might be profitably introduced in this country. The writer learned of three new methods now being promoted in Europe. One is the "Hasselmann" process, which consists in boiling the wood in a solution of the sulphates of copper and iron, with alumina and "kañit," a salt mined at Stassfurt, Germany, consisting chiefly of sulphate of potassa and magnesia, and the chloride of magnesia. The process has been experimented with about three years in various parts of Germany, but of course the time is too short to be sure as to the results. Another process, now being experimented upon by a Berlin chemist, may be termed the "water-creosote" process. It consists in mixing intimately tar-oil with water in varying proportions; the rationale of which is that the tar-oil will be thereby

much more uniformly distributed throughout the wood, and hence a less quantity will suffice. The writer saw a number of specimens prepared by this process in Berlin, and they seemed to be quite uniformly impregnated. Still another process is being worked up in Russia, where some skillful chemists say that they have obtained an antiseptic element from the refinement of petroleum, and are studying its practical application to the preservation of timber.

In the discussion following the paper Mr. Chanute stated that he had examined side tracks at Titusville, Pa., used for loading crude petroleum, and found the ties well preserved after 10 or 11 years' service; in tracks laid at the same time, but not used for some years the ties were badly decayed, indicating that petroleum is a preservative only as long as it continues liquid. In tropical countries creosote is the only preservative that has proved effective; in India ties cut in Russia and creosoted in England are used almost exclusively, where any wood is used.

Mr. Chanute would not recommend mineral salts for bridge timbers subjected to tensile or shearing stresses; Burnettizing if overdone makes the ties very brittle. Mr. W. W. Curtis said that while this was the general opinion, he was very doubtful whether the chemicals injured the wood, and the heat was no higher than in the creosoting process; there have been few tests made on the strength of burnettized timber, and the matter should be investigated.

In further description of the three solution zinc tannin process Mr. Chanute said: "There is a fact well established from hundreds of experiments with an experimental plant which we have, that the addition of gelatine to the chloride of zinc solution made the latter less fluid, rather viscid, and that the solution therefore did not enter into the wood in the same quantities, nor penetrate as far; therefore I changed the process, which was still, however, under the original patent, as the specification covered fully the change I made. This was to inject first a solution of chloride of zinc, and that we make just as limpid as water, so that when held up in a glass it is as clear as the Chicago water is now. That is injected as a first solution, after the wood has been prepared first by steaming and then by vacuum in order to clear the pores of the dead air as far as possible. The injection is done under a pressure of 100 lb. and a temperature of 150° F. I would say that we find we can extract more sap from a partially seasoned tie than from one fresh cut; the one fresh cut has three times as much sap, but we cannot get it out, and I attribute that to the fact that when the tie is fresh cut, it is impracticable to heat the interior of it sufficiently to change the watery portions of the sap into steam. We are therefore not placing motive power behind to push the sap out of the sap duct; while, after it is partially seasoned, air has flown in, and by heating that air it acts in expansion and pushes the sap out, so that after a period of steaming (in order to heat the timber and the air inside of it) we create a vacuum, during which steaming and vacuum we find that the sap comes off abundantly."

TRADE JOURNALS AND BOOKS.

Tecumseh Swift, writing in the American Machinist, makes the following comparisons between trade papers and technical books: The book writer deals mostly with what has been, while the trade journal has to do much more with what is and what is coming. The trade journal cannot be made by one writer, as the book can, but needs the active co-operation of the many, and it must be in touch with many more. I can understand much better how a live mechanic can get along without many technical books than I can his living and thinking he can know what he ought to know without his trade paper. I have an idea that the trade papers are to become more important and useful and necessary as the years roll on, and that no one can keep the run of progressive development and attainment without them.

The United Traction Co., of Albany, N. Y., has secured a fine fireproof building at Broadway and Columbia St., Albany, where it has located all its business offices.

Thirty horses were required to haul a new cable for the Metropolitan Street Railway Co., of New York, from the depot to the power station. The truck on which it was carried had wheels with 8-in. tires.

POINTS FOR THE MANAGER.

In discussing Mr. A. E. Judge's paper before the Southwestern Gas, Electric & Street Railway Association, Mr. E. H. Jenkins, president of the San Antonio Traction Co., said in part:

"Mr. Judge says in regard to the manager, 'he should intelligently study the men under him and employ those who are trustworthy and capable of performing well the specified duties assigned them.' I have a little fellow in the office in San Antonio only fit for one thing, and that is to collect bad bills. He is an expert on that. In that particular he is almost invaluable to us. That same thing can be looked after all the way through the plant. You will find somebody just a little bit better suited for a certain position than anybody else, and you can well afford to pay him a salary to keep in that particular place.

"I think every laboring man you have that has any intelligence at all and employed in any particular office where intelligence is required, should understand that he is in the line of promotion. It is an incentive to him that will redound to the company's benefit. It will create a kindly feeling between the management and the man.

"In regard to the question of employes. I try to impress upon the employes that the reputation of the company is made by the men who come in contact with the public. The meter reader, the

I have had the question raised that it took too much time. After you have once gotten into it it don't take any more time than it did a year ago to make out your monthly report, and you can get out by the 5th of the month a detailed statement, and you can see any little difference as to where your expenses are increasing or decreasing."

RUSTIC THEATER AT MERRYMEETING PARK.

Merrymeeting Park is situated near Brunswick, Me., on the Lewiston, Brunswick & Bath Street Ry. It is well equipped with the usual attractions for resorts of this nature, including a casino, and an open-air theatre. The basement of the casino is devoted to a kitchen and storeroom, the ground floor to a general waiting room and a large ball room. On the second story are ladies' parlors, a smoking room and private and public dining rooms.

The rustic "theater" consists simply of a strong, but cheaply constructed stage placed in the center of a natural amphitheater formed by a ridge of ground, the sides of which were smoothed off and seats and stairways placed in position. This economy in construction brings up an interesting point. We do not believe that, with the possible exception of a few of the larger systems, conditions justify the erection of a street railway park of an expensive building exclusively for theatrical purposes, for the money can be invested

AFTERNOON AUDIENCE AT MERRYMEETING PARK.

service man, the meter man, the collector, all of these make the reputation of the company. If they are courteous and gentlemanly in their treatment of your customers you will have a reputation of being a gentlemanly manager, and if they are not it will be the hardest work in the world to prove to your community that your manager is anything but the same class of man that his representatives are.

"The manager of a public service industry has a great deal of prejudice to contend with. He has got to be a man that is commonly called a mixer. He has got to be a man that can go to a Sunday school and be at home. And on the other hand, if there happens to be a German picnic on a Sunday afternoon it won't hurt him to go out and let them know he is living. He has got to be a man to adapt himself to almost any situation.

"The point of a comprehensive set of accounts to be kept so that the condition of business can at all times be understood is a great deal more important than we imagine until we go into it, and the more you get into it, the more information you will get. I spent a year in San Antonio in just getting into that work, or getting the San Antonio people into it, and after six months, a man who had never attempted to do any detail work before said that it was the most interesting work he ever got into. And we are trying to be able to tell the details of the cost of producing a kilowatt-hour all the way from the time the coal leaves the car until the consumer pays for it, and in that we have something like thirty different departments or places that we find what the cost is. That looks at first as if it was uncalled for, and

with very much better results in raising the standard of the performances than in the building itself. For instance, instead of putting up a theater costing from \$10,000 to \$15,000, as has frequently been done, an outdoor stage surrounded by chairs, the entire affair costing from \$500 to \$800 would have afforded all the accommodations the public could desire, and the owners could then have the interest, say \$400 to \$600 a season, on what an elaborate theater would have cost, to apply toward securing talent of a higher grade for the performances.

The one objection to this arrangement, that is the danger of sudden showers, may easily be met by building an inexpensive pavilion near the stage, where the audience can find shelter in emergencies. This pavilion should soon pay for itself by the renting of a portion of the floor for refreshment privileges. It has been argued that an enclosed theater enables performances to be given on rainy days as well as fair, but experience has shown that people will not seek pleasure at a park, whatever the attraction, if it is raining, or even threatening, so it is not probable the fact that the entertainment was to be given in an enclosed building would have much influence, and when the weather is pleasant, there is no question about the outdoor stage proving more agreeable to the public than an enclosed building, no matter how well ventilated.

The accompanying engraving shows a typical afternoon audience at the open-air theater at Merrymeeting Park, for which all the attractions are furnished by the J. W. Gorman Amusement Co., of Boston.

REPORT OF MASSACHUSETTS STREET RAILWAYS.

The Massachusetts Railroad Commissioners' report for the year ending Sept. 30, 1899, has just been issued and contains the returns from 116 companies, 13 more than for the previous years. Of these 116 reporting companies, 81 were operating their own railways; the properties of 13 companies were operated by other companies under lease or contract; 10 companies had organized and were constructing their lines; 3 had paid in a portion of their capital stock, but not yet commenced construction work; 9 had been consolidated with other companies during the year.

During the year the additions to the street railways aggregated 201.05 miles measured as single track; 162.43 miles of main line, 35.13 miles of second main track and 3.49 miles of side track. The total owned by Massachusetts companies is 1,845.71 miles; 1,401.80 of main line, 243.65 miles of second track and 110.17 miles of side track. All of this, except 21.06 miles (in Rhode Island) is in the state. Of the 1,735.54 miles of main track 4.76 miles are operated by horse power only, and on 2.60 miles additional horse power is used as an auxiliary. In 1889 there were 46 companies operating 574.17 miles of main track, of which 50.52 miles were equipped for electricity.

The average cost of the street railways of the state per mile (including the cost but not the length of side track) was \$22,863 for construction, \$8,518 for equipment, \$11,598 for lands and buildings; total, \$42,979. The average capital investment per mile was \$45,040; for the ten largest companies of the state the total cost per mile averages \$64,507 and the capital investment \$65,479.

The gross assets were \$85,764,845, an increase for the year of \$8,157,519; the gross liabilities were \$83,279,891, an increase of \$7,390,266; the surplus was \$2,484,954, an increase of \$767,253; the sinking and other special funds were \$942,221, an increase of \$556,572. The percentage of the surplus to capital in 1899 was 6.01 as against 4.41 for 1898 and 3.60 for the last 10 years.

The gross earnings from operation were \$18,151,550; income

Capital Stock, Net Income and Dividends, 1890-1899.

YEARS.	Capital Stock.	Net Divisible Income.	Cash Dividends Declared.	Percentage on Total Capital Stock.
1890,	\$14,879,130	\$1,430,116	\$963,154	6.47
1891,	19,553,952	1,299,153	1,100,015	5.63
1892,	23,590,536	1,905,680	1,582,697	6.71
1893,	25,883,575	1,993,399	1,716,637	6.63
1894,	26,971,275	1,812,668	1,610,856	5.97
1895,	27,906,685	2,257,355	1,606,196	5.76
1896,	80,727,818	2,280,776	1,802,847	5.87
1897,	32,670,273	2,593,147	1,965,243	6.02
1898,	38,933,917	2,534,002	2,076,233	5.31
1899,	41,380,143	2,502,942	2,318,398	5.60
Averages,	\$28,249,730	\$2,660,923	\$1,674,231	5.93

from other sources brought the total income up to \$19,519,338. Operating expenses were \$12,378,487; interest, \$1,622,688; taxes, \$1,188,735; rentals of leased lines and other charges on incomes, \$521,809; dividends, \$2,318,398; surplus for the year, \$184,544.

The total of cash dividends for the year was \$242,165 more than in the preceding year, and the surplus for the year was \$273,225 less than in 1898. Only 54 of the 116 companies paid dividends; 17 paid 8 per cent; 1 paid 8 per cent on preferred and 7 per cent on common stock; 1 paid 7 per cent; 11 paid 6 per cent; 1 paid 5½ per cent; 5 paid 5 per cent; 3 paid 4½ per cent; 4 paid 4 per cent; 2 paid 3¾ per cent; 1 paid 3½ per cent; 3 paid 3 per cent; 3 paid 2½ per cent; 1 paid 2 per cent; 1 paid 1½ per cent. These 54 companies paid an average rate of 6.68 per cent on \$34,704,100, as against a corresponding rate of 6.17 per cent the preceding year.

* Operation wholly by horse power.

Ten railways of the state have 65 per cent of the entire capital, operate 47 per cent of the total mileage and carry 81 per cent of the whole number of passengers.

Data as to earnings, expenses, employes, equipment and accidents are given in the tables.

SINGLE TRACK ROADS VS. BELT LINES.

"How shall we lay out our system to secure the best results under the conditions before us?" is one of the first questions that presents itself to the promoters of a new street railway enterprise, and also oftentimes to older companies contemplating new extensions to a neighboring suburb, or into a different section of the city. The point is one that should be considered even before attempt is made to secure franchises, for the entire success or failure of the project will often turn on the way in which it is decided.

In our opinion there is no doubt about two things, i. e., a tributary population of less than 30,000 to 45,000 population will not ordinarily support a double track road, with both tracks in the same street, and for a population of less than 25,000, a single track line with turnouts will secure the best results. The relative advantages of the belt system, by which cars go up one street and down another a short distance away, over the single track line for places having from 25,000 to 45,000 inhabitants, are to be decided by the distribution of population and the layout of the streets.

We print herewith several opinions on this question, received in response to a letter of inquiry sent to managers in a few of the smaller cities, ranging from 10,000 to 25,000 population.

Mr. A. P. Southworth, president and general manager of the Adrian Street Railway Co., of Adrian, Mich. (population, 12,000): "Our line is to be re-constructed this season and re-equipped and looped on each end, with one turnout between loops. I do not believe a city of 12,000 inhabitants will justify a belt line unless exceptional conditions exist. For certain reasons, such as exist here, it may be policy to loop either one or both ends to bring your road in touch with certain manufacturing, railway or park districts, but I do not think the local resident traffic justifies the building of any line in a city of this size. By looping the east end of our line, it brings us in touch with two freight houses, two depots, several large manufacturing plants and car shops. By looping the west end we pass in front of the Adrian College and gain the advantage of having the cars run in the same direction all the time."

Mr. W. M. Roberts, jr., superintendent of the Cumberland Electric Railway Co., of Cumberland, Md. (population, 16,000): "Our road is single track with turnouts. The question, in my opinion, depends upon local surroundings or the layout of streets. In this town, I think a belt line to the suburbs just half-way to our park, and single track with turnouts the rest of the way, would have been to our advantage, as the only two streets running through in that direction are nearly parallel, and are not over 300 ft. apart at beginning, gradually coming together and meeting about half way out on our line. The line to South Cumberland is all right with single track and turnouts, although there is a possibility that another single track road in another direction and connecting at Cumberland with the one now built would be of advantage."

The Menominee Electric Railway & Power Co., of Menominee, Mich., (population, 15,000): "We believe a single track road with turnouts the best for a small town. The difference in cost between a belt line and a single track road is more than would be gained by the advantages of the former."

Mr. W. A. Foote, receiver of the Jackson Street Ry., of Jackson, Mich., (population 25,000): "The cost of a belt line is more than for a double track road, and in so small a town as ours no one could afford to put down a double track. If you want and can afford a double track, then the belt line is best, if you do not separate the tracks more than a block."

Mr. J. C. Hubinger, president of the Keokuk Railway & Power Co., of Keokuk, Ia., (population 18,000): "In reply to your letter would say, in building a street car line, you cannot always adopt the same method in one place that you could in another, and I believe that one plan will work better in one town than it will in another. In this city, our line is a single track road with turnouts. On one portion of our line at one time, we found that it would only require us to extend our line three blocks in order to connect with another track, which would give us a circuit from our city park back to Main St., but we only operated that portion of the track a very short time, as we found that we received no more revenue than we did on the old plan and therefore we are now operating our line with turnouts. The manner in which a city is built would in my judgment have a great deal to do with the laying of track, and if a city was scattered out a great deal, so that the distances were such that it was necessary for people to ride, I

would think that the belt principle would be the better, but where a city is compactly built, as is Keokuk, we find the single track with turnouts serves our purpose better."

Mr. H. F. MacGregor, vice-president and general manager of the Houston Electric Street Railway Co., of Houston, Tex., (population 45,000), in a paper presented at the recent meeting of the Southwestern Gas, Electric & Street Railway Association, favors the belt system for cities in the class with Houston, giving as his reasons that it covers greater territory for the same operating expenses and affords greater protection against accident over a double track system, and is less liable to delays and annoyances than a single track with switches.

ELECTRIC RAILWAYS OF SAXONY.

(From the U. S. Consular Reports.)

The statistics of the electric railroads of Saxony, compiled by the royal bureau of electric railroads at Dresden, show a large increase in travel, as well as very considerable growth in the number of electric-power plants in this Kingdom.

Besides the network of city roads, the Lossnitz line, the road to the "Weissen Hirsch" and Buhlau, the Meissen street railroad, and the Niedersedlitz-Leuben-Laubegaster road have been built.

The following table explains itself:

Names of lines	Length of lines		Passengers carried	Motor cars	Trailers
	Kilometers	Miles			
Dresdner Strassenbahn (including leased Lossnitz road of 8 kilometers)	46.638	28.981	25,472,755	219	81
Deutsche Strassenbahngesellschaft in Dresden	29	18.021	16,351,759	139	43
Grosse Leipziger Strassenbahn	53.166	33.056	42,187,543	121	60
Leipziger Electriche Strassenbahn	52.914	32.881	17,763,102	119	59
Allgem-Local & Strassenbahngesellschaft Chemnitz	23	14.277	8,574,966	60	47
Zwickauer Strassenbahn-Actiengesellschaft	5.96	3.704	1,295,887	16	2
Sächsische Strassenbahngesellschaft Plauen	1.861	1.156	1,334,766	15	15
Schandauer Electriche Strassenbahn	8.3	5.158	144,611	6	6
Meissner Strassenbahn	4.655	2.893	51,958	4	4
Total in 1899	239.226	147.441	113,564,399	731	289
Total in 1898	177.457	110.272	90,576,266	591	238

Many new contrivances and equipments have been introduced upon the roads of Saxony during the past year. Among them are the triple brake on the cars of the Weissen Hirsch line, as an extra precaution on heavy grades; the heating of the cars by electricity on the Weissen Hirsch and the Lossnitz lines, and the introduction of a device for preventing the strong acid smell in the accumulator cars. The magnetic brake which operates simultaneously on any number of cars, which was first introduced in Dresden at the instigation of the commissioner of electric roads, has been generally adopted throughout Saxony and introduced upon some of the roads, of the neighboring states.

AN OPINION ON ELECTROLYSIS.

The members of the city council at Kalamazoo, Mich., are greatly agitated over the question of electrolysis. Franchises were some time ago granted for a new interurban line from Battle Creek to Kalamazoo and the rails were being laid in the latter city when someone suddenly discovered that stray currents from the new road would probably cause the destruction of all the water and gas pipes in the city within a few months. The question was referred to a committee, which now has it under discussion. The opinion expressed in an interview by Mr. H. C. Hoagland, superintendent of the Kalamazoo Valley Electric Co., which owns the electric light plant is of interest. He says: "Whenever a city has some old rusty pipes give out, the city officials immediately begin to talk electrolysis. Of course there is more or less of electrolysis. There can be no doubt of that, but it is not responsible for much that is laid to it. As a matter of fact the soil in Kalamazoo is strongly impregnated with sulphuric acid, an analysis of water from a drive well showing that there are about 2½ grains of the acid to a gallon of water, and that is strong enough in itself to do considerable damage to pipes. The injury from electrolysis has been greatly exaggerated and the Battle Creek line will not affect the pipes at all."

A WESTERN CAR.

The Portland Railway Co., of Portland, Ore., has recently built in its own shops the double-truck vestibuled car shown in the accompanying illustrations, for which we are indebted to Mr. J. F. Batchelder, secretary of the company. The car was designed by Mr. J. E. Thielsen, general superintendent, and Mr. Hugo Von der Werth, master mechanic.

CAR BUILT BY PORTLAND RY.

The car is 34 ft. 4 in. long over all, the body being 25 ft. long, and is mounted on "Eureka" maximum traction double trucks with G. E. 800 motors. It is finished in quarter-sawed oak, has accelerator doors as shown in the interior view, and is provided with the Gold street car heaters, electric bells for stopping the car and the Meaker

INTERIOR VIEW.

stationary register. Curtains are provided for all the windows, including the end windows and glass in the door in order to cut the light of the car off from the motorman's end of the car.

The car is strictly up-to-date, and is very much appreciated by the patrons of the company.

ONE MORE 100-MILE LINE PROPOSED.

We are informed by Mr. J. T. McNary, of Logansport, Ind., that the recently organized Logansport, Rochester & Northern Traction Co. intends to build an electric line, 101 miles in length, with Logansport and Kendallville as terminals, via Rochester, Ind., Warsaw and Albion, touching at Winona and Wawasee lakes.

The officers are: President, J. T. McNary; vice-president, L. W. Welker, Albion, Ind.; secretary and general counsel, G. W. Holman, Rochester, Ind.; treasurer, B. F. Keesling, Logansport.

RECENT STREET RAILWAY DECISIONS.

EDITED BY J. L. ROSENBERGER, ATTORNEY AT LAW, CHICAGO.

CARE REQUIRED OF PEDESTRIANS.

Killen v. Brooklyn Heights Railroad Co. (N. Y.), 62 N. Y. Supp. 927. Mar. 6, 1900.

Persons walking upon or across highways, the appellate division, second department, of the supreme court of New York holds, are not bound to exercise the highest possible degree of care. They meet all of the requirements if they exercise a reasonable degree of care, such as persons of ordinary prudence would exercise under the same circumstances.

INJURY TO PERSON STANDING NEAR TRACK AND SUDDENLY ATTEMPTING TO CROSS IT.

Knoker v. Canal & Claiborne Railroad Co. (La.), 27 So. Rep. 279. Feb. 5, 1900.

Where a pedestrian is standing near a car track at night, upon a frequented thoroughfare, giving no indication of an intention to cross, and attempts to cross only when a rapidly moving car is so near him as to render it practically impossible for the motorist to prevent its striking him, the supreme court of Louisiana holds that there can be no recovery of damages for the injuries sustained.

INCIDENTAL SIGNIFICANCE OF OMISSION TO SOUND GONG.

Kleiner v. Third Avenue Railroad Co. (N. Y.), 56 N. E. Rep. 497. Feb. 27, 1900.

Evidence of omission to sound gong, the court of appeals of New York holds, is admissible as a part of the history of the transaction, and as bearing upon the degree of care exercised by the defendant's employes, and upon the question of the plaintiff's contributory negligence, in an action brought to recover damages for injuries caused by an alleged negligent collision of a street car with a coach, and this although the law may not have required the gong to be sounded at that place.

SHOULD HAVE OPPORTUNITY TO TAKE THE TWO STEPS ON TO CAR IN SAFETY.

Baltimore City Passenger Railway Co. v. Baer (Md.), 44 Atl. Rep. 992. Nov. 24, 1899.

The court of appeals of Maryland says that it is desirable, in order to facilitate rapid transit in large cities, that passengers should be prompt in entering and departing from street cars, but those operating the cars must take every reasonable precaution for the protection of the passengers. It is a well-known fact, it goes on to state, that the footboard running along the side of the ordinary open trolley car is narrow, and that both the step from the pavement to the footboard and the one from the latter to the floor of the car are high. A fair opportunity of taking these two steps in safety, it then declares, should always be afforded to the passengers before starting the car.

JUDGMENT FOR PASSENGER ATTRIBUTING INJURIES TO BELL ROPE BEING IN WAY.

Sweeny v. Union Railway Co. of New York (N. Y.), 62 N. Y. Supp. 1034. Mar. 2, 1900.

In this case, where the plaintiff alone testified in her own behalf as to the circumstances of the accident, it being conceded that in attempting to board an open car that was stationary she had a fall, receiving injuries, and her contention was that the bell rope interfered with her ingress to such an extent as to cause her to slip and fall backward and off the car, the general term of the city court of New York affirms a judgment in her favor, notwithstanding that her narrative of how the accident occurred was not in accord with the statements in that behalf of any of the witnesses produced by the company, the case having been properly submitted

to the jury, and the latter having found, apparently without prejudice, in her favor.

MUST SHOW PERMISSION OF ALL THE BOROUGHES TO HAVE RIGHT TO DO ANY WORK.

Wheeler v. Pennsylvania Railroad Co. (Pa.), 45 Atl. Rep. 338. Feb. 5, 1900.

Under the Pennsylvania act of 1889, which provides that, before the railroad to be built by any trolley company incorporated thereunder shall be begun, the permission of all the boroughs and townships through which the road passes must be obtained, the supreme court of Pennsylvania holds that authority to build the road must be shown by showing compliance with this condition in order to give the company or contractors under it the right to so much as dig a trench, and that the latter could not maintain an action of trespass for the filling up of a trench by an abutting owner on the mere showing of having the permission of the borough within which the trench was dug, as on that showing alone they would simply make themselves out trespassers in digging the trench.

INJUNCTION TO PREVENT CONSTRUCTION UNDER ALLEGED INVALID ORDINANCE.

General Electric Railway Co. v. Chicago, Indianapolis & Louisville Railway Co. (C. C. A.), 98 Fed. Rep. 907. Jan. 2, 1900.

The doctrine of the supreme court of Illinois to the effect that a court of equity will not enjoin the construction of a railroad at the suit of an abutting property owner alleging that the ordinance claimed to authorize it is illegal, the United States circuit court of appeals, seventh circuit, holds applies only when the remedy at law is clearly adequate, and that when full protection of all property rights is not possible in an action at law, and irreparable injury will otherwise result, an injunction may be had to prevent the construction of the road under an ordinance void, for example, because passed without the requisite petition of the owners of one-half of the abutting properties.

WHEN DRIVER OF VEHICLE HAS RIGHT TO CROSS TRACK, THOUGH CAR IS APPROACHING.

Piercy v. Metropolitan Street Railway Co. (N. Y.), 62 N. Y. Supp. 867. Feb. 23, 1900.

From the authorities, the appellate term of the supreme court of New York deduces this rule, which it applies here, that, at the intersection of two streets the driver of a vehicle has a right to cross the tracks of a street surface railroad, notwithstanding a car is in sight, provided there is a reasonable opportunity so to do; and if, for that purpose, it is necessary for the person having charge of the motive power of the car to check its speed, or even to entirely stop such car for a short period, it is his duty to do so, and the person crossing the track has the right, without being necessarily chargeable with contributory negligence, to assume that that duty will be performed; that the rights of the driver of the vehicle and of the person in charge of the motive power of such car, under these circumstances, are reciprocal; and that the question whether it is negligence on the part of the driver of a vehicle to cross the track when a car is approaching is dependent upon the circumstances of each case.

EXCESSIVE SPEED CANNOT BE PROVED FROM PRIOR INSTANCES OF IT.

Wade v. City & Suburban Railway Co. (Ore.), 59 Pac. Rep. 875. Feb. 5, 1900.

Without stating its view on the admissibility of evidence of the customary or habitual rate of speed that cars were operated at a certain place prior to the occurrence of an accident there made the basis of an action for damages, a question upon which the authorities are in conflict, the supreme court of Oregon holds that,

whatever the rule with regard to that may be, there can be no doubt that proof of particular instances in which the cars were operated at a given speed is not admissible to prove speed in an action charging negligence in the operation of a car at a dangerous and reckless rate of speed at a certain time, for from such detached cases it declares no inference whatever could be drawn as to the speed of the car at the time of the accident.

GETTING CHARTER LIMIT OF FARE REMOVED AFTER SECURING CONTRACTS FOR BONUS.

Jasper County Electric Railway Co. v. Curtis (Mo.), 55 S. W. Rep. 222. Feb. 5, 1900.

Where the original charter of an electric railway company limited the fare which might be charged, and the city council was afterwards prevailed upon to change it by striking out the limitation in the franchise, leaving it optional with the company, how much it would charge, the supreme court of Missouri, division No. 1, holds that, if the change in the franchise was made after the execution of contracts for right of way and bonus, it would have no effect upon the rights of the persons making such contracts, even if the latter as drawn up were silent on the fare to be charged, where that was a material and essential element in the benefit the people were to get in return for their gifts to further the enterprise. For, says the court, it could not be tolerated that a company could procure rights of way and bonus from the people for its road upon the faith of a charter which limited the rate of fare which the company could charge, and then procure a repeal of the limitation on the fare, and hold on to the benefits it had received from the people, and at the same time charge whatever fare it saw fit.

TRANSFERS CAN BE USED ONLY ON CARS OF LINES DESIGNATED.

Keen v. Detroit Electric Railway Co. (Mich.), 81 N. W. Rep. 1084. Mar. 6, 1900.

Where it would appear that a street railway company had cars running on a certain street, some of which turned off at a certain cross street, and some did not, and the company changed its regulations so as not to give transfers from the cars that did not turn off to those which did, but to give transfers from the cars that did not turn off only to cars running on said cross street only, or to cross town cars, as they were called, the supreme court of Michigan holds that a passenger could not maintain any action for damages for being ejected from the car when he got from the conductor of a car that did not turn on the cross street a transfer punched for a cross town car only, and, instead of taking the latter, boarded one of the cars that turned on the cross street and tried to ride on same on the transfer. It appearing from the evidence that his transfer, on its face, did not entitle him to ride on the car which he entered, but was good only on a cross town car, the court quotes from *Frederick v. Railroad Co.*, 37 Mich. 347: "There is but one rule that can safely be tolerated with any decent regard to the rights of railway companies and passengers generally. As between the conductor and passenger and the right of the latter to travel, the ticket produced must be conclusive evidence."

EXPENSE OF REBUILDING POWER HOUSE DOES NOT TAKE PRIORITY TO MORTGAGE.

Maryland Steel Co. v. Gettysburg Electric Railway Co. (U. S. C. C.), 99 Fed. Rep. 150. Jan. 27, 1900.

Whoever has dealings with a company whose property is mortgaged, the United States circuit court, eastern district of Pennsylvania, holds, must be assumed to have dealt with it on the faith of its personal responsibility, and not in expectation of subsequently displacing the priority of the mortgage liens through the interposition of a court of equity; and the necessity for the supplies furnished does not entitle to preferential payment, unless the supplies are for current expenses in the ordinary course of operation. More particularly does the court here hold that where an electric railway company's power house was destroyed by fire, after it had mortgaged its property, claims of creditors for materials furnished for the construction of a new power house could

not be awarded preferential payment from a fund produced by a sale of the mortgaged property under an order of court in a proceeding to foreclose the mortgage. In other words, it holds that the expense of rebuilding a power house is to be classed with one for a virtual reconstruction of the road, and not among current debts for operating expenses, made in the ordinary course of continuing business.

MAY PROVE BY BYSTANDERS INTOXICATION OF PASSENGER THROWN FROM CAR.

Donoho v. Metropolitan Street Railway Co. (N. Y.), 62 N. Y. Supp. 523. Feb. 8, 1900.

The party bringing this action claimed to have been injured by being thrown from a crowded car, while standing upon the rear platform. Upon the trial the street railway company attempted to show that at the time the accident was alleged to have occurred the party was in a state of intoxication. For that purpose it called several witnesses, who were present and saw him, and who were asked whether they would characterize his acts at the time of the accident as the acts of a man under the influence of intoxicating liquor, or as those of a sober man. These several questions were excluded, under objections taken thereto, upon the ground that such witnesses were not shown to be experts. But the rejection of such testimony, the appellate term of the supreme court of New York holds, was clearly error. It says that had it been shown that the party was intoxicated at the time he received the injuries he complained of, whether such intoxication contributed to the accident or not, would have been a question of fact for the jury to determine, and the company had a right to show, if it was possible to do so, that such was his condition. Neither, it continues, does it require the testimony of an expert to give an opinion upon that question. The evidence of a witness in characterizing the action of a person as that of an intoxicated person is admissible.

WHERE DRUNKEN PASSENGER MAY BE LEFT.

Bageard v. Consolidated Traction Co. (N. J.), 45 Atl. Rep. 620. Mar. 6, 1900.

A passenger on a street car, who, as he testified, was sick, but whom the carrier's servants supposed to be under the influence of liquor, was helped from the car at the terminus of the route, and by the conductor of the car was led to the front of the station, at or near to the public street, and left at a place where his way was open in the direction in which he wished to go; the conductor then leaving on his outward trip. The passenger turned and went back, and 20 minutes later slipped down between the front and rear wheels of a car moving on a track that lay between where he was then standing and the place where he was left. For the resulting injury, the court of errors and appeals of New Jersey holds, no cause of action was established, to recover damages from the street railway company, by this showing. It says that there should have been a nonsuit, or a direction of a verdict for the company.

Now, if a drunken man is accepted as a passenger, the court says that the carrier should not leave him in a place of danger; but it adds that it knows of no rule that requires the carrier to follow up the drunken man, if left in a place of safety, though on the carrier's premises, and see that in his wanderings he does not get into danger.

When one, by reason of his own voluntary intoxication, exposes himself to danger and receives injuries which he could, and by the exercise of ordinary prudence would, have avoided if sober, he is guilty, the court holds, of contributory negligence, and cannot recover for such injuries.

NOT REQUIRED TO GIVE TRANSFERS FROM FIRST-ACQUIRED TO LATER-ACQUIRED ROAD.

Mendoza v. Metropolitan Street Railway Co. (N. Y.), 62 N. Y. Supp. 580. Feb. 9, 1900.

The appellate division, first department, of the supreme court of New York says that the right of one road to enter into a contract for a lease and joint operation of another road is one given by statute, and is subject to the conditions upon which such right

is conferred. One of these conditions is that the road operating another road by lease shall carry passengers, who may have taken passage on the leased road, over the lines owned, controlled, or operated by the road to whom the lease is made at the date when it acquired by contract the leased road. In other words, the right of a passenger to a continuous trip for a single fare extends, not alone to the routes or lines of the leased road, but also to such routes which, at the time of the lease, were owned, controlled, or operated by the corporation to whom the lease was made. The language of section 104 of the railroad law is that every such corporation shall, upon demand, give to each passenger paying fare a transfer "entitling such passenger to one continuous trip to any point or portion of any railroad embraced in such contract." These words, the court maintains, necessarily exclude roads subsequently built or acquired, for they cannot be said to be "embraced in such contract" when they are not then in existence. Thus, for example, the court holds, in this case, that, under and pursuant to said section 104 of the railroad law a passenger on a road acquired by the defendant company by lease on a certain date was not entitled to be transferred over a road which that company acquired at a later date, or which it must be assumed on demurrer was so acquired, in the absence of any allegation to the contrary.

RELATIVE TO SETTLEMENT OF CROSSING QUESTION.

In re West Jersey Traction Co. (N. J.), 45 Atl. Rep. 282. Jan. 4, 1900.

It cannot be said that, because there is an element of danger in a grade crossing of a steam railroad by a trolley road, some other method is to be provided. The question, the court of chancery of New Jersey holds, is whether, taking into account the degree of such danger in the particular instance, and also the facility and economy with which such danger may be avoided by adopting some crossing other than at grade, the latter method should be required. For example, where there were 72 regular and sometimes 30 special trains running over the steam road, and an undergrade crossing could be built, 14 feet in width, for \$12,653, the slope of the street favoring an undergrade crossing, as there was a rise towards the steam railroad tracks from each side, the court holds it reasonably practicable to avoid a grade crossing, and that public safety required it. As to the map of the route filed by the petitioner asking the court to fix the manner of crossing the steam railroad, the court holds it sufficient that the map showed that its route ran across the right of way of the steam road at the point where the mode of crossing was to be defined, without exhibiting any indication of a crossing. And the petition being over the seal of the traction company, and signed by its secretary and solicitor, the court holds that this raised the presumption that the seal was affixed by proper authority. But whether it was or not, it holds that any defect in this regard was cured by a subsequently passed resolution that the act was done with the acquiescence of the directors, who ratified it.

INJURY TO PEDESTRIAN NOT "LOOKING" AND "LISTENING."

Farrar v. New Orleans & Carrollton Railroad Co. (La.), 26 So. Rep. 995. Jan. 9, 1900. Rehearing refused Jan. 22, 1900.

The supreme court of Louisiana says here that it is not inclined to give much importance to the rule that requires of the pedestrian that he should "stop, look, and listen." It is to be expected only exceptionally that a pedestrian should stop, and then look and listen. It would be, ordinarily, requiring too much of the pedestrian; i. e. to "stop, look and listen." But where a pedestrian heedlessly steps in front of a coming car without at all "looking" and "listening" and then stopping in case of danger, the court holds that he omits observing one of the rules laid down in a number of decisions which should be complied with by a pedestrian when he is about to cross a track; i. e. to "look" and "listen."

Moreover, while the failure to observe this rule does not relieve those in charge of the car from the necessity of being careful at all times, none the less, in order that a plaintiff may recover damages, the court insists that it must appear that the danger was not seen by the motorman at a time when he should have seen it, and that he did not make every exertion to avoid the accident.

And the court holds that a motoneer, while manning his car, has a right, to some extent at least, to be governed by the belief that a pedestrian, even of advanced age, will not seek to cross the track unless his strength is sufficient to enable him to cross before the arrival of the car, where there is nothing to show the motoneer that he cannot do it.

SMART MONEY ALLOWED FOR CAR TURNING INTO WRONG STREET AND VIOLENTLY COLLIDING WITH VEHICLE.

Nashville Street Railroad v. O'Bryan (Tenn.), 55 S. W. Rep. 300. Jan. 27, 1900.

This was an action for damages for personal injuries resulting from a collision of a street car with the vehicle in which the plaintiff in the lower court (O'Bryan) and a companion were riding. The collision occurred at or near the corner of Cherry and Cedar streets, in the city of Nashville, and in the nighttime. A bright light, however, was burning, which lit up all the surroundings. As the two approached Cedar street, going north on Cherry, they noticed coming towards them very rapidly a large, open street car labeled "South Cherry Street," which, the supreme court of Tennessee says, in this connection, was an indication of its proposed route.

Now at the point of collision there was a curve and switch to turn passing cars into Cedar street when desired, and, just as this vehicle was proceeding along the street at that point, the car was suddenly and violently turned out of Cherry street on to the curve leading into Cedar street, coming into collision with the vehicle with much violence, and throwing it against a post in the margin of the sidewalk, and throwing the occupants out over the dashboard, where they fell beneath the horses, which were frightened and plunging. It appears that the car at this point left the proper track and route, and turned into Cedar street, when it should have continued on Cherry, and, if it had gone its proper route, the accident would not have happened. There was a conflict of evidence as to what was the condition of the switch, but the testimony was very clear that the car was being run at a high rate of speed, and that the place of the accident was one unusually full of danger and peril.

For the company, it was insisted that the accident was one which could not be avoided, and was not due to carelessness or recklessness. But not only does the supreme court not agree with that, but it holds that, under the facts above detailed, it was a proper case for punitive or vindictive damages. It says that there was evidence of recklessness and gross negligence which would justify such damages.

Furthermore, the court holds that it was allowable on the theory of punitive damages, to allow testimony to show the wealth and assets of the defendant company.

AS TO DRIVER OF WAGON LOOKING BACK FOR CAR.

Schilling v. Metropolitan Street Railway Co. (N. Y.), 62 N. Y. Supp. 403. Feb. 2, 1900. Hill v. Metropolitan Street Railway Co. (N. Y.), 62 N. Y. Supp. 596. Feb. 8, 1900.

In the first of these cases, where it appeared that the driver of a covered delivery wagon, who had good eyesight and unimpaired hearing, had taken the precaution to look out for an approaching car before entering upon a street railway track, at midday, the appellate division, second department, of the supreme court of New York holds that it cannot be said as a matter of law that he was guilty of contributory negligence in not looking behind during the time that it would take to drive a single block, or that it was not negligence on the part of the street railway company to run him down. Both parties, it says, were charged with the duty of exercising reasonable care, and it was for the jury, taking all of the facts and surroundings into consideration, to determine whether, in the proof of these facts and that his wagon had been run into from behind by a car, he had sustained the burden of proof which the law demands in cases of this character; and that a nonsuit was improper.

Furthermore, the court holds that the conduct of the street railway company, unexplained, in running into the wagon from the rear, in broad daylight, at a street intersection, was sufficient to justify the jury in finding that the company was guilty of neg-

ligence; and it was proper that the jury should determine whether the driver of the wagon, after looking in both directions, was guilty of contributory negligence in driving one block without looking back to see if a car was approaching, and whether he was justified in assuming, under the circumstances, that the company would give him warning in time to allow him to get out of the way.

In the second case, where a man had driven some 300 feet along a track, between 10 and 11 o'clock at night, when he was overtaken by a car and his wagon was struck, the appellate term of the supreme court of New York holds that it was his duty not only to avoid collision, but also to cause no needless delay to the street railway company, and he might not wait to hear a signal of the approach of a car, but he had needs at intervals to look backward for it. And because he did not do this, it reverses a judgment rendered in his favor, and orders a new trial.

CASE WHERE CHILD WAS STRUCK BY CAR AND MOTORMAN WAS NOT CALLED AS WITNESS.

Hicks v. Nassau Electric Railroad Co. (N. Y.), 62 N. Y. Supp. 597. Feb. 3, 1900.

It is a familiar doctrine, says the appellate division, second department, of the supreme court of New York, that the failure of an employer to call a witness who was in his employ at the time of the accident, and is presumed to be friendly, and to have some knowledge of the accident, without any attempt to explain the reason of the failure, raises a strong presumption that the testimony of the employe would be damaging to such party. Wherefore, it declares that in this case, which was one of a child, a girl 9 years of age, attempting to cross a street at a walk, after seeing a swiftly approaching car, 127 feet distant, with no evidence that she again looked or paid any further attention to the approaching car, it must be assumed that the motorman made no effort to check the speed of the car until the moment the child was struck by the fender, no witnesses having been called by the company to show any effort having been made to stop the progress of the car before the accident occurred.

The child, the court holds, was *sui juris*, or capable of acting in her own right, she having testified on cross-examination that on stepping from the curbstone she looked up and down for the car, because she knew it was a dangerous thing, and that she might otherwise get run over, but thought that she could get across before it came, and walked "not too fast, and not too slow; just right."

But the court does not think that there was any error in refusing an instruction to the effect that there was nothing in the situation to justify her in the belief that the car, which was coming at a high and dangerous rate of speed, would be brought under control, when she was at a cross walk where she had a right to assume that especial care would be taken by those in charge of an approaching car to prevent injury to persons crossing, and when there was evidence that when the motorman saw her he actually did bring the car to a standstill within 10 or 15 feet of the cross walk where she was struck.

Nor does the court consider that it could be said, as a matter of law, that, under the evidence, the child was guilty of contributory negligence. While she was *sui juris*, she could only be held to such a degree of care as a child of her years and character would reasonably be expected to exercise. So it holds that the question of contributory negligence was properly submitted to the jury; and affirms a judgment for damages against the company.

BRAKEMEN MUST LOOK OUT FOR KNOWN SAGGING TROLLEY WIRES.

Danville Street Car Co. v. Watkins (Va.), 34 S. E. Rep. 884. Jan. 18, 1900.

This was an action instituted by a brakeman to recover damages for injuries sustained by being knocked from a railroad car by a sagging trolley wire. He knew the position of the wire, which was 4 feet 8 inches above the step upon which he stood. That he knew the position of the wire, is made a distinguishing point in the case. Moreover, in reversing the judgment which he obtained, the supreme court of appeals of Virginia says that it is indisposed to entertain at this day, when electricity is so generally applied as a motive power to machinery, a plea of ignorance of

its dangerous properties. It points out, too, that ignorance of the peculiar danger attending contact with an electric wire would not extenuate or excuse the brakeman's fault in failing to exercise that reasonable care which would have enabled him to pass beneath the wire with entire safety. It holds that it was his duty to exercise ordinary care to prevent any injury whatever to himself, and that he was guilty of contributory negligence if he was himself the author of any part of the injury of which he complained, or if, by the exercise of reasonable care upon his part, he could have avoided the consequences of the negligence ascribed to the street car company sued.

Furthermore, the court holds that it was error to refuse to give an instruction to the effect that, although the jury might believe from the evidence that the street car company was guilty of negligence in the manner of constructing or maintaining its electric wire over and above the track of the railroad on which this brakeman was employed, still the brakeman had no right to pass from one car to another while the cars were passing under the wire, if in so doing he increased the danger of an accident from the wire; and if, from the evidence, the jury believed that he did attempt to pass from one car to another while passing under the wire, and by so doing did increase the danger and chance of the accident, he could not recover in this case, and the jury must find for the street car company. This, the court maintains, correctly propounded the law.

True, the brakeman stated that he was in the performance of a necessary duty at the time of the accident. He had set one brake, and was passing to another, in order to facilitate the disposition of the train, and prevent the blocking of the street, which it seems would have subjected the railroad company to a fine. But this duty, the court insists, was not so urgent and imperative as to justify any unusual risk, and certainly was not sufficient to excuse the brakeman for his failure to take proper precaution for his own safety, or to warrant the assumption on his part of an additional hazard.

DUTY WHERE HUMAN BEING IS SEEN ON TRACK BUT IS NOT RECOGNIZED AS SUCH.

Stelk v. McNulta, receiver of Calumet Electric Street Railway Co. (C. C. A.), 99 Fed. Rep. 138. Jan. 18, 1900.

A locomotive driver has a right during the passage of his train upon the right of way of the company to assume that an object which he reasonably believes to be inanimate, if animate, will leave the track upon hearing the coming train. But the United States circuit court of appeals, seventh circuit, holds that it is quite a different matter where railway trains, whether propelled by steam or electricity, pass along the crowded thoroughfares of a populous city. The care to be exercised is relative, and must be proportionate to the dangers reasonably to be apprehended.

In this case, at about 10 o'clock at night, an electric car was proceeding on an open prairie, in the outskirts of the city of Chicago, where a street had been platted, but there was no roadway for teams nor street lights, and no houses on the westerly side of the railway, while along the easterly side there was a sidewalk of some sort and a few houses, besides which there was a ditch on either side of the railway. The motorman, on reaching the crest of an incline there, saw at a distance of 65 feet an object upon the track, which both he and a messenger boy standing with him upon the platform of the car took to be a dog. He immediately applied the brake, checking the speed of the car, and sounded the gong to arouse the supposed animal, and cause it to leave the track. When the car had gone a little further seeing that the object did not move, the motorman applied the reverse, but being on the down grade the reverse did not act, and the car struck the object, which, when the car had almost reached it, the motorman discovered to be a human being lying partly across the space between the rails.

Under these circumstances, the court pronounces certainly reasonable a stipulation of fact that the motorman had no reason to expect the presence of a human being upon the track. And such being the case, it does not think that the duty was imposed upon him, upon perceiving an object, to bring his car to a stop to discover the nature of the object. It says that he did no less than his duty required of him to check the speed of the car and sound his gong, and so soon as he perceived that the object did not respond to the signal to reverse to bring the car to a standstill. But having

done that, the court declares that it cannot perceive that the motorman was lacking in any degree in the exercise of that prudence and care which, under the circumstances, the law imposed upon him, and so it holds that with respect to this accident negligence could not properly be imputed to the motorman in charge of the car.

THE USE OF ALUMINUM LINE WIRE AND SOME CONSTANTS FOR TRANSMISSION LINES.

Abstract of a paper by F. A. C. Perrine and F. G. Baum read before the American Institute of Electrical Engineers, May 16, 1900.

The authors first describe the construction of the transmission line of the Standard Electric Company of California, which extends from the Blue Lakes plant on the Mokelumne River to Stockton, a distance of 43½ miles. The standard poles were of square sawn redwood 30 ft. long, 7 x 7 in. at the top and 12 x 12 in. at the butt. The poles were galled ¾ in. deep for three cross-arms spaced 20½ in. on centers; the arms were of Oregon pine, 4 x 4 in., the top and bottom arms being 3 ft. and the middle one 4 ft. long. The six wires of the two three-phase circuits would thus be at the vertices of a hexagon 24 in. on each side; the two circuits have their wires at the vertices of equilateral triangles 41 in. on the side. The insulators used were a flat topped glass triple petticoat type 5 in. high and 7 in. in diameter with a wire groove of .35 in. radius; the insulators were mounted on eucalyptus pins long enough to bring the bottom of the insulator 4 in. above the top of the cross-arm. The cross-arms were creosoted, 10 lb. of dead oil of tar to the cubic foot being injected; the pins were boiled for eight hours in a compound of coal tar and asphaltum at a temperature of 225° F. The arms were braced by a bent angle iron but this precaution is believed to be unnecessary for arms less than 5 ft. long. Also, for high potentials the braces should be of wood.

The line as erected carried only four wires arranged on the top and bottom cross-arms, thus taking their location at the corners of a rectangle 24 in. on the short side and 41 in. on the long side. This arrangement was adopted for the purpose of making temporary use of some two-phase machinery which was in place and underloaded, allowing certain new customers to be taken on quite a year in advance of the contemplated completion of a three-phase plant for which the pole line was really designed.

It was at first feared that this arrangement of the wires would result in inductive disturbances between the phases, as the wires took their positions in the diagonally opposite corners of a rectangle, in place of the corners of a square, as is necessary for complete absence of mutual induction, but the anticipated trouble was not found. Careful measurements were made with one phase short circuited, and the other carrying about 20 amperes with a periodicity of 60 cycles per second, both with a Weston 75-volt voltmeter and a Rowland electro-dynamometer, with the result that no deflection was observable on the voltmeter, while the current read on the electro-dynamometer amounted to only about .001 ampere, the resistance of the dynamometer being 25 ohms and of the line 90 ohms. Only one additional question of installation needs attention, which is the presence on the tops of the poles of a barbed wire stapled to the wood of the pole and grounded at every fourth pole by a galvanized iron wire leading down along the pole and soldered to an iron plate 18 in. square and ½ in. thick, set in the pole hole immediately under the foot of the pole itself. This wire was intended as a lightning guard, and it has apparently done very effective service in discharging the line in all weather.

The wire used was intended to be equal to No. 3 B & S copper wire in its electrical resistance, and the manufacturers were required to furnish this conductivity in a wire not weighing more than 420 lb. per mile. All the wire supplied was carefully inspected by Mr. A. E. Kennelly, and his reports give the following averages for the total quantity:

Diameter	293.9 mils.
Wt. per mile	419.4 lb.
Resistance per mil-ft.	17.6 ohms at 25° C.
Resistance per mile at 25° C.	1,007.73 ohms.
Conductivity compared with copper	50.0 per cent by dimension.
Tensile strength of wire	1549 lb.
No. of twists in 6 in. for fracture	17.9
Tensile strength per sq. in.	32898 lb.

Comparing this with copper it is seen that the wire is approximately the same as copper in the following sizes:

Size of aluminum wire equal No. 1 B&S copper.

Resistance of aluminum wire equal No. 3 B&S copper.

Tensile strength of aluminum wire equals No. 5 B&S copper.

Weight of aluminum wire equals No. 6 B&S copper.

Therefore, on the basis of the same conductivity the aluminum compares with copper as follows:

Diameter for the same conductivity 1.27 times copper.

Area for the same conductivity 1.64 times copper.

Tensile strength for the same conductivity .629 times copper.

Weight for the same conductivity .501 times copper.

The mechanical properties of this wire present some well marked characteristics. In the first place, the number of twists necessary for fracture varies considerably, although the ductility test of wrapping six times around its own diameter, unwrapping and wrapping again is well sustained. This irregularity in the twisting test is generally a mark of impurity in wire, but we know so little as yet of the exact characteristics of aluminum in particular, and the twisting test is in general so unreliable that it is unsafe to base any exact statement on this one test, particularly as the same after erection proved reliable. In carefully performing the test for tensile strength no exact point could be assigned for the elastic limit, as the metal seemed to take a permanent set almost from the first, but at a stress of from 14,500 lb. to 17,000 lb. per sq. in., there is a marked increase in the permanent set which indicates that the safe working load lies somewhere in this region. In this the characteristics of the aluminum do not differ materially from those of copper or other similar metals, and while this is a disadvantage it is not a singularity.

The fact that the wire will permanently elongate if seriously strained makes it necessary to use the utmost care in the erection of lines, and also the known high coefficient of expansion with temperature changes taken in conjunction with this property renders care in line stringing especially important and difficult.

Instructions to line foreman in stringing wires:

1. All spans are to be strung with deflections and tensions as specified.
2. Up and down hill spans to be sprung to correspond with level spans. In case level spans cannot be used, then employ dynamometer, and ease all wires over cross-arms.
3. All ties are to be made at one time by signal.
4. All ties are to be made crossing wires around insulator serving three times around wire, and twisting behind insulators; the ends of the tie-wires are not to be cut but bent back toward insulators.
5. Tie all wires on the outside of the insulators, except at corners where all are to be tied so that the strain is against the insulator.
6. Joints are to be made by means of sleeves twisted two and a half times, the ends of the wires being given one turn by hand around the wire, no tools being used, except in twisting the sleeves, and cutting off the ends of the wires. Before inserting the wire in the sleeve, the ends of the wire must be roughened by draw filing.
7. Barb wire is to be laid along the roof of the pole and held by three staples driven in tightly, but without kinking the wire. Ground wires are to be soldered to the barb wire, and at the bottom of the pole to the wire leading from the ground plate. All soldering acids must be carefully washed away after the soldering is done.
8. Beginning between poles 1 and 2, all wires are to be barreled by shifting one pin, and same to be repeated between poles 21 and 22 and 41 and 42, and so on. Barreling always in the same direction of twist every 20 poles. A record must be kept of the location of every wire and every pole.

The greatest care must at all times be taken against kinking or scarring the wire; wherever the wire is accidentally kinked or scarred it must be cut and spliced.

The targets consisted of light sheet iron strips about 2 ft. long and 2 in. wide, with an aluminum hoop bent into an eye at the top, by means of which they could be hung from the line wire. These targets were painted in three or four colors, with bands 1 in. wide. In use the captain of the linemen would hang his target on the wire to which a man on the next pole had also hung a target; then, as the wire was being pulled into place, he would sight from a band on his target to the same band on the adjacent target, and when the wire came into line with these two bands the signal would be given for all the linemen to tie at once. As a result of this method of

stringing, an exceedingly uniform line, and one strong in accordance with the temperature was obtained.

One of the most serious problems in connection with the use of aluminum is in the choice of a proper joint. This metal is so highly electro-positive that it is unsafe to expose it to the elements in contact with any other material, as electrolytic corrosion is almost sure to follow such construction. Many of the failures which have been reported of this metal have been due to a neglect of this fact, as notably in the case of the plates on the yacht *Defender*, where the plates have been corroded at the contact with the bronze rivets used in fastening them to the frame. Whenever this metal is soldered or used in contact with any other metal, the joint should be thoroughly water-proofed to prevent such action. After discussing many joints, it was finally determined to abandon any attempt to solder or clamp the wire in any manner, and the joints were made by slipping the ends of the wire into an oval aluminum tube about 9 in. long, which was then twisted with a pair of clamps similar to those employed in twisting the McIntire connector. After twisting the tube a turn was taken by hand of the loose ends, and the wire cut off close. The joint produced proved practically equal to the original wire in both tensile strength and electrical conductivity.

This wire was erected during the winter of 1898-99, which was an unusually open winter over the whole state of California, allowing practically continuous construction work, though the temperature varied all the way from about 30° F. to 80° F. at times when the wire was being strung. After it was finally erected it remained about three months on the poles before the machinery was delivered and put in place. During the first month of that time three breaks occurred which were all apparently due to flaws in the material, but after these breaks were repaired the line wire gave absolutely no trouble whatever, though various accidents occurred to other parts of the construction. Many insulators were shot at and broken, bale wire and bale rope were thrown over the line, a twig short-circuited one phase and fell down burned, a large bird was killed by contact with the wires, and finally several porcelain insulators with porcelain pins were broken off and hung suspended by the wire. In January and February of the present year this whole line was taken down to give place to a much heavier one of the same material, an opportunity for an entire change having been found after the total destruction of the power house by fire last November.

During the past two years other lines of aluminum wire have been erected on the Pacific coast, all but one of which have given a considerable amount of trouble from causes that are not entirely apparent.

One line in Nevada County, erected at about the same time as that we have been describing, and for which the wire was of practically the same lot, has given no trouble whatever.

The power transmission lines of aluminum wire about Seattle have broken a few times, but have not given serious trouble. The breaks in this line, so far as the writers have been informed, seem to have been due to not allowing enough sag at the higher temperatures, and a consequent overstraining of the wire in cold weather.

The most serious difficulties have been encountered by the telephone company in Washington and Oregon, and by the Yuba Power Co. In all of these cases it seemed almost impossible to keep the wires on the poles in certain sections, and in these portions the lines have been finally taken down and replaced by other wire of either copper or aluminum. The writers have examined many breaks from these lines, and would judge, from the appearance of the fracture, that the cause, whatever it may be, was similar. In those breaks there are many small flaws, but by far the greatest majority are clear, sharp fractures, with but a slight reduction of area, and that entirely on one side, a break very characteristic of improperly mixed and brittle alloys. Partially from the appearance of the fracture, and partially from the facts that the breaks occur only in certain sections of the line, the writers are of the opinion that this trouble is due to the presence of impurities in the material. This view is strengthened by the fact when measurements were made on the line of the Yuba Power Co., the resistance of the whole line was found to be 10 per cent greater than it should have been if it were made of the quality of material described in the earlier part of this paper. Furthermore, in one-half of this line there were no breaks at all due to defects in the wire itself.

As a general conclusion, it is the opinion of the writers that aluminum can be safely used in place of copper where the proper precautions are taken in inspecting the wire before it is erected, and

in erecting it with due consideration of its peculiar properties of low and indefinite elastic limit, high coefficient of temperature expansion and active electrolytic power.

Indicating our faith in this opinion, it may be noted that for the new line soon to be erected an aluminum strand $\frac{3}{4}$ in. in diameter has been ordered. This strand will be spliced with aluminum sleeves, and in the whole construction about one million pounds of aluminum will be employed.

OPENING OF THE NORTHWESTERN ELEVATED, CHICAGO.

May 31st the Northwestern Elevated R. R. of Chicago, was opened for traffic. The occasion was celebrated by running two special trains, which entered the Union Loop at 12 noon, and were hoarded at the loop stations by the 500 guests whom the company had invited to be present; the party was then carried to the northern terminus at Wilson Ave. where luncheon was served. Among those present were: C. T. Yerkes, D. H. Louderback, Clarence Buckingham, B. E. Sunny, George H. Weston, H. N. Brinkerhoff, assistant general manager of the Metropolitan Elevated; M. B. Donald, M. H. Hopkins, general superintendent of the South Side Elevated; James Morrison, superintendent of the South Side Elevated; J. R. Chapman, A. S. Littlefield, John M. Ryan, J. E. McGrath, W. L. Kelly, J. S. Dunham, R. J. Dunham, Theodore P. Bailey, of the General Electric Co.; Charles Henrotin, Judge Brentano, L. E. McGann, George Higginson, jr., secretary and treasurer of the Metropolitan Elevated; the officers of the Northwestern and members of the city council.

Immediately following the guests' train, trains for the general public were put in regular service, the intervals between trains being as follows: From 9 a. m. to 3:32 p. m., 6 minutes; 3:32 to 6:36, 4 minutes; 6:36 to 11:00, 6 minutes; 11:00 to 12:00 midnight, 8 and 12 minutes; midnight to 5:15 a. m., 35 minutes; 5:30 to 6:00, 5 minutes; 6:00 to 9:00 a. m., 4 minutes. One-half of the stations were opened to the public on May 31st, and the others will be opened as rapidly as they can be completed.

It will be remembered that the first train was run over this road on Dec. 30, 1899, and that for a time one train was run each day until the controversy between the company and the city was amicably settled and the company given till May 31st to complete its road. The opening of the line was followed by a large traffic, as it serves a territory that was sadly in need of better transportation facilities. An express service is promised within the month.

The expected volume of business has been more than realized, and has averaged over 45,000 daily since the opening, and is increasing daily. The first Sunday showed 60,000 passengers, and this with only 10 out of 20 stations in use.

Physically the structure is the best built and arranged of any in the world, advantage having been taken of all previous experience. Its successful completion in the face of unusual difficulties of depressed financial times and opposition of city officials covering a period of six years, is a monument to the ability and strength of Mr. Yerkes. Few men could or would have endured the strain and annoyances to which he was subjected.

The officers of the Northwestern Elevated R. R. are: President, D. H. Louderback; vice-president, C. D. Hotchkiss; secretary and treasurer, Howard Abel; general superintendent, Frank Hedley; superintendent, Robert B. Stearns.

HISTORY REPEATS ITSELF AGAIN.

A local paper in Xenia, O., says: "Xenia has had nearly six months of electric roads, and it would seem that with two lines running from that city to Dayton, if there would be any disadvantage to the smaller city, Xenia would certainly feel it more acutely; moreover, the time when such a condition is apt to be felt most is when the roads are new and the people most prone to try the novelty of riding to Dayton to buy goods. Yet the merchants of Xenia, along with everybody else, are enthusiastic in their praise of the new roads and say that it has helped business. Every car that comes to the town is filled with people, and on the streets strangers are constantly seen."

A man at Kansas City was recently fined \$1.00 for expectorating on the car floor in violation of a city ordinance.

AN IMPROVED GAS ENGINE.

The importance of the gas engine as a prime mover has been rapidly increasing of recent years, because of the improvements that have been effected in the construction, and the gas engine of today is a reliable machine of very low fuel consumption. Mr. Alton D. Adams in a recent article on the "Future of Electrical Supply," gives interesting data on this latter point and states that in a small plant containing a gas producer and two engines, each under 100 h. p. in capacity, tests showed the consumption of anthracite buckwheat coal to be only 1.03 lb. per i. h. p. per hour. In large steam plants with compound condensing engines, about the best figure obtained with a high-grade coal is 1.5 lb. per i. h. p. per hour. With larger gas engines even higher fuel economy is reported, one 320-h. p. gas engine using .81 lb. per i. h. p. and 1.03 lb. per brake h. p. per hour. Mr. Adams further says these reductions in fuel consumption have been obtained without a corresponding increase in fixed charges; the first cost of gas engines is given as not far from the cost of compound steam engines with condenser, and the combined cost of feed-water heaters, boilers and attachments is but little less per unit than the fuel gas producers used with the gas engine plant.

The accompanying illustration shows a 250-h. p. gas engine built by the Standard Automatic Gas Engine Co., of Oil City, Pa., and installed in the power plant of the Oil City Street Railway Co. The generator which it drives gives 350 amperes at 550 volts, and the speed variation between no load and full load is given as only

250-H. P. STANDARD AUTOMATIC GAS ENGINE, OIL CITY, PA.

1 per cent. The "Automatic" engines are built after the designs of J. W. Raymond, whose name is well known in connection with the Raymond and improved Raymond gas engines.

The company builds three types; single cylinder engines of from 15 to 40 nominal h. p., single acting tandem engines of from 30 to 160 h. p., and double acting tandem engines of from 200 to 1,000 h. p. The special features to which the maker directs attention are the perfect balance of the engine, its noiseless operation, the automatic starter used on all sizes which enables the engines to be easily started from a state of rest, reliability of the ignition apparatus, the electrodes of which revolve and have a wiping contact so that the sparking points are kept clean, and the compactness, simplicity and durability of the whole mechanism. The guaranteed consumption of natural gas is less than 15 cu. ft. per brake h. p. per hour, or 1-10 gallon of 74° gasoline, when between three-fourths and full rated load.

IMPROVEMENTS AT DECATUR, ILL.

The Decatur (Ill.) Traction & Electric Co. is practically rebuilding its system, taking up the old roadbed and replacing it with new 62-lb. 6-in. steel T-rails on an 8-in. bed of gravel, with new curves, switches and cross-overs complete. The special work was made by the Paige Iron Works, of Chicago. The company has also purchased 10 new car bodies with double G. E. 62 equipments, and is erecting a new power station with 600 h. p. capacity, which will contain Bates Corliss engines, Stirling water tube boilers and Siemens & Halske generators.

UNIFORM ACCOUNTING AND MUNICIPAL OWNERSHIP.

(Abstract of a paper read before the National Electric Light Association by J. B. Cahoon.)

The author, in introducing the subject, mentioned the haphazard way in which the discussion of uniform accounting had heretofore been brought before the association, and his reflections when a year ago the League of American Municipalities had been challenged to a comparison of the costs of production in private and in municipal lighting plants. (It may be said in passing that this challenge has never been accepted.) He predicted that all public utilities must accept public regulation, and continuing, said in part:

We cannot take the stand that it is against public policy that this should be done; it would simply be a case of kicking against the pricks. There lie open before us the two paths. Municipal ownership or private ownership under state regulation. We certainly do not want municipal ownership; therefore let us prepare to accede gracefully to the other course; and not only that, but let us help it along. In that lies our salvation.

To do that we must be prepared, when the question of state regulation is raised, to meet the committee half way—to say to them: "Here is our system of accounting. It is one in which we believe the true costs to be stated. All the factors that enter into the cost are here. We are not a single company using this system.

We are one of a great body, all of whom follow the same method and use the same system of accounts in determining the cost of production. We are perfectly willing to hand in once a year a complete statement of everything, costs as well as receipts, and show you gentlemen, and, through you gentlemen, the great public that is behind you, just what legitimate profit there is in this business. It is not great, and we are willing to have you know what it is and how it is computed. We believe that the introduction of electric lights and gas into a city is a public improvement in the strictest sense of the term. We hazard our money, our reputations, and enter on a somewhat venturesome risk. We believe we are entitled to, and we think the public will sustain us in having, a fair return for our labor, our venture and our capital. We are not only willing that the public should know our profits, but we feel that if the public does know them it will concede that we are holding the right position; and instead of taking away our franchises, letting competition in on us from all sides, and trying to squeeze us to the wall in every way, it will realize that we are what we claim to be, a public improvement, and that we deserve fair treatment." And we shall get it.

From a financial point of view, it matters little to this association what system of accounting its individual members may follow. If they are deceiving themselves in regard to costs, we, as an association, should not be warranted in interiering. We, at most, can only recommend the adoption of any system of accounting; we cannot compel our individual members to accept it, but we can at least ask them to do so.

The necessity, therefore, for a system of uniform accounting lies primarily in the fact that we must unite for self-defense, and

we must be able to ascertain the true cost of our productions, and at the same time show to the advocates of municipal ownership that, to get the true costs, they must follow our system. In unity only shall we have strength to resist the attack that is coming upon us.

Of the accounts themselves entering into the cost of the product, I do not think any question will be raised until we come to the class known as capital accounts. It has not been the custom, heretofore to class these as, strictly speaking, operating-expense accounts, but in order that the true cost of the product may be ascertained, I hold that it is necessary to include these as part of the operating expenses, and not to classify them as deductions from income.

By the Street Railway Accountants' Association, taxes are considered as not a part of the operating expenses, but as something extraneous thereto, which should be a deduction from income, as should also interest on investment, interest on current liabilities, investment insurance and reserve for sinking fund.

I take this stand, open as it is to criticism, for the following reasons: We are not private companies in the strict sense of the word. We are operating public utilities; and the public is going to demand, and is demanding at the present time, to know what it costs us to deliver our product to the consumer, and what our profits are. Certainly, a part of our cost is taxes; and, again, before we can declare a dividend, we must take care of the interest on our bonds, and also on our current liabilities. In regard to investment insurance, or depreciation, as it is often termed, this is truly a factor of cost. Every plant undergoes depreciation from year to year, and in order that the value of the plant may not be depreciated, certain renewals must be made and minor extensions or betterments added.

If we do not charge off each year, and expend as an investment in renewals and minor extensions and betterments, a certain portion of the original investment, the time comes, in the course of 7 to 10 years, when we have got to borrow thousands and thousands of dollars to renew the plant, and it may be at a time when that will be very inopportune. The best policy for ourselves, laying aside the whole question as to whether or not it is better as a source of protection from the public, is to recognize this factor, and include it in our cost of operating expenses.

A certain depreciation, determined on by experience, varying according to location and according to class of manufacture, we find will occur every year. Let us take, then, the yearly proportion on the basis of lasting so many years, and place it each year under the head of investment insurance, and use that in our business for minor extensions or betterments and renewals sufficient to keep our plant intact and in as good operating condition as when first purchased; or, in other words, maintain our plant in such a manner that if a question of being compelled to sell it comes up, we can show that we have maintained it in such a way that the original investment is not impaired in the slightest.

Again, as regards a reserve for sinking fund. Many have held to the idea that if they issue bonds for a term of 50 years, we will say, and pay the interest right along, that is all they can be asked to do; that when the time comes they can refund them, and therefore it is unnecessary to make any provision for a reserve sufficient to redeem the bonds at maturity. Others, again, say that by the time the bonds become due, our income will have increased so materially that we shall have no difficulty in taking care of them; they will be only a minor charge at that time; part of them can be redeemed and part renewed.

Neither of these views is the true economic way of looking at the subject. The only true way is to recognize the fact that the bonds must be redeemed at maturity, and to make provision for their redemption by setting aside each year such a reserve as will take care of the bonds at their maturity, charging this reserve as part of the operating expenses, or, in other words, as one of the factors of the cost of production. We may thus see that the cost of our product is legitimately represented by the four groups of accounts, manufacturing, distribution, general and capital.

The number of agitators that are crying municipal ownership of public utilities is constantly and rapidly increasing; they are attacking us in all parts of the country even now, and the attack will be stronger and stronger as time goes on. Our plan of defense must lie in the correct determination of costs, and in showing that while we are exercising the functions of a monopoly, we are

only attempting to realize therefrom a legitimate profit for the capital we have invested in the enterprise. To do this we must have uniformity of accounting, in order that we may present a solid front and be able to disarm the agitators by showing to the people at large that we are following fair business methods and only obtaining a fair return on our investments. If we are able, then to convince the people of this, they in turn will support us in our rights, will see that we are given the privilege of exercising the functions of a monopoly under proper laws, and will realize the necessity of granting us exclusive franchises in order that the best economy of operation may be affected.

The remarks of Mr. Samuel Insull in the discussion which followed Mr. Cahoon's paper were principally on the question of depreciation; he said in part: "I drew attention to this subject in my address as president of this association two years ago, and took the ground that if we were publicly controlled we should have advantages in the way of exclusive franchises. The first step in this matter is to take our own members, and if we can educate them to a uniform system of accounting, so that they will state in their accounts precisely what their cost is, and stop them, as far as moral suasion will stop them, from working their construction accounts; and if moral suasion will not stop them, if we can get copies of their reports kept on a uniform system of accounting and bring them up here in the convention and ask them to explain their accounts, if we could do that, it would be the first step toward public accounts. There is not the slightest objection to public accounts. We have everything to gain and nothing to lose by the publication of our accounts. We are not in a business that yields an enormous return on the investment; it yields a comparatively small return over ordinary interest rates as they rule in this country. If we can do anything toward getting our own people to submit their accounts to us here in convention, or to a committee that would report on them; and when some company shows an abnormal profit as the result of immoral accounting, fooling itself, we could get that matter straightened out. That would go a long way toward stopping the agitation of the question of municipal ownership. If we cannot stop this agitation of the municipal ownership question, this system of public reports would go a long way toward giving us protection in the enjoyment of our business, and put municipalities in the position that if they want to go into our line of business they must do it by the exercise of the right of eminent domain and condemn our property and purchase it on a fair valuation.

"I have made the remark at different times that the public has to pay for any duplication of investment in any public-service business. The more we can educate the people to our exact position—the fact that if there are two companies in the same city, the interest on the investment made has finally got to come out of them—the more solid we can make our investment and incidentally the less chance there will be of municipal ownership."

SALE OF THE MT. LOWE ROAD.

On June 1st, after negotiations lasting for several weeks, the Mt. Lowe & Pasadena Ry. was transferred to the Los Angeles Ry. The property includes the electric plant at Altadena, the Alpina Tavern, the "Chalet" and the observatory. While the Los Angeles Ry. is the owner, the newly acquired line will be operated in connection with the Los Angeles & Pasadena Electric Ry. and the Pacific Electric Ry., of Los Angeles. Mr. W. H. Smith, manager of the Los Angeles & Pasadena, was recently elected secretary and manager of the Pacific Electric Ry.

The main feature of the franchise tax bill recently passed by the New Jersey Assembly is a provision that in lieu of the franchise tax which corporations now pay to the state, they shall pay a flat tax of 2 per cent to the municipalities in which they have property.

The council of Scranton, Pa., has taken a quite unusual action in reducing the tax on the Scranton Railway Co. to 1 per cent of the gross receipts. The original ordinance provided that in 1901 and until 1904 the tax should be 3 per cent; in 1904, 4 per cent; and in 1905 and thereafter, 5 per cent of the gross receipts, and this is reduced to 1 per cent for the whole term.

his information. Also, the costs of repairs to cars that have been rebuilt or given a general overhauling are entered on a separate sheet 21 in. wide by 5½ in. long; the headings are the same as in the book.

The company is unable to run cars with side steps because of the clearances at the bridges over which it operates. The standard type has double cross seats, with reversible backs and a center aisle, passengers entering and leaving at the platform as on closed cars. The right hand side of the car is also (because of the bridges) protected by a wire screen to prevent accidents at the bridges. The cars used in winter service have the sides closed by a 20-in. panel at the floor, and above that by frames with two panes of glass, a wooden cross bar being put across where the arms and shoulders of passengers strike the frame. In summer these panels between the posts are removed, and the car is then practically an open one. The bodies used only in summer, some 20 of which have just been given an overhauling in the shop, have only the low side panel, and this is placed 1 in. above the floor to facilitate cleaning the cars. The present equipment consists of 127 cars and 15 new ones have been ordered from the St. Louis Car Co.

The officers and operating staff of the Cincinnati, Newport & Covington Railway Co. are: President, J. C. Ernst; vice-president, Julius Fleischman; secretary and treasurer, George M. Abbott; superintendent, J. R. Ledyard; electrical engineer and superintendent of power station, A. C. Harrington; storekeeper, R. W. Phillips; master mechanic, John A. Kreis, jr. Those of our readers who have noted the reports from this company that we have published from time to time, fully appreciate the work done by Mr. Ernst since his connection with the road. The net income, after deducting taxes and fixed charges, has increased from \$28,000 in 1897, to \$94,000 in 1899, with an increase of only \$75,000 in gross receipts, and notwithstanding expenditures for improvements that increased the fixed charges \$150,000 per annum.

The name of the operating company is that given on the blanks, the South Covington & Cincinnati Street Railway Co.

McGUIRE TRUCKS FOR FRANCE.

We illustrate herewith the No. 35 truck made by the McGuire Manufacturing Co., of Chicago, a number of which have been ordered for the Western Railway of France, to be used on its sub-

urban line between Paris and Versailles. The matter was placed in the hands of Mr. Frank J. Sprague, president of the Sprague Electric Co., of New York, who placed the order after a critical examination of all the trucks on the market. It is estimated that the Western Railway will require 900 motor trucks.

The side frames of this truck are of solid steel. Over the journal boxes are helical springs; this feature is covered by the Cloud-McGuire patents. The bolster rests upon a combination of helical and elliptical springs adjusted to give an easy-riding motion, and the combination is suspended from the transom by heavy links. Each truck will have two G. E. 55 motors, 150 h. p. each, and including the motors will weigh about 21,000 lb. The wheel base is 6 ft.

The McGuire company feels that in building this truck it has successfully solved the difficult problem of securing easy riding, simplicity of construction and ample strength. The compliment paid to American builders, and the McGuire company in particular, is fully appreciated. The company has a number of these trucks in operation on the Brooklyn Elevated lines, where they are said to give the best of satisfaction.

A NEW CAR WHEEL PLANT.

The Keystone Car Wheel Co. has been organized at Pittsburg with a capital of \$200,000 to make and sell car wheels. The company's financial backing is of the strongest, and it is the intention to erect near Homestead, Pa., a plant equipped with modern labor-saving devices, pneumatic hoists, automatic carriers, etc., and having a capacity of 350 wheels a day, which will ultimately be increased to 600 wheels a day. The main building will be of brick, 110 ft. wide by 300 ft. long, and so arranged that extensions can be made from time to time by merely taking out one end and adding to the length of the structure. Wheels will be turned out under the Barr and Faught patents, for both steam and electric railway service, a specialty being made of the latter.

The personnel of the new company includes Charles V. Slocum, formerly treasurer and manager of the Pennsylvania Car Wheel Co.; W. L. Elkins, of Philadelphia; William W. Lobdell, president of the Lobdell Car Wheel Co., of Wilmington, Del.; L. B. Whitney, formerly of A. Whitney & Sons, of Philadelphia, and Charles A. Otis, jr., of Otis, Hough & Co., iron and steel merchants of Cleveland. John G. Holmes and Nathaniel Holmes, prominent bankers of Pittsburg, will also be interested.

Mr. Slocum, the organizer of the company, will be general manager, his many years of experience in the making of car wheels well fitting him for the place. At the age of 25 Mr. Slocum was business manager for Frederick Stearns & Co., which firm he left to become treasurer of the New York Car Wheel Works, of Buffalo.

300-H. P. MOTOR TRUCK FOR WESTERN RAILWAY OF FRANCE.

He resigned this position in January, 1898, to organize the Pennsylvania Car Wheel Co., of Allegheny, and became its treasurer and manager, holding these offices until last November, when he and his associates sold their interests in the company to the Pressed Steel Car Co. Mr. A. W. Slocum, brother to Mr. Charles V. Slocum, will probably be made superintendent of the new works.

The side frames of this truck are of solid steel. Over the

FOREIGN FACTS.

Additional electric tramways will be laid down by the Manchester (Eng.) Corporation.

The Dublin Tramways Co. is endeavoring to find a suitable speed indicator for use on its cars.

The District Council of Hales Oliver, England, will apply for a provisional tramways order.

A royal order was recently issued authorizing the construction of electric tramways in Almeria, Spain, and vicinity.

The Batley (Eng.) Town Council has secured a Board of Trade provisional order for an electric tram system.

Definite action has been taken looking to the introduction of electricity on the Calcutta (India) Tramways.

The gas tram cars at Blackpool, Eng., are now drawn by horses pending a change to the overhead trolley system.

Kirkealdy, Scotland, is to have a municipal electric lighting and tramway system. A tramway committee has been appointed.

Steps have been taken to introduce electric trams at Bath, Eng. Sir James Sivewright and Mr. Leopold Hirsch are interested.

Mr. W. G. Bingham recently obtained a concession for an electric tramway from the city council of Adelaide, South Australia.

The Tramways Committee of the Manchester (Eng.) Corporation is receiving bids for the overhead equipment of three new routes.

The electric tramways established at the popular resort of Boulogne, France, are very prosperous and further extensions are projected.

Tenders for electric railway supplies are asked for by the new tramways committee of the Corporation of Newcastle-on-Tyne, England.

At a meeting of the Bolton (Eng.) tramways committee recently it was decided that all motormen and conductors on electric cars must take out a license.

A Board of Trade order recently granted sanctions the working of the trams at Carlisle, Eng., by electricity. The lines are owned by the Carlisle Tramway Co.

Electric tramways at Madras, India, have not been over-successful, as it will probably be necessary to sell the lines in order to pay the contractors for building them.

A Board of Trade inquiry was held last month on the application of the Plymouth (Eng.) Corporation for power to borrow £20,000 for the extension of its electric tramways.

The tramways of Cape Town have 25 miles of track; the employes number 300 men, and 15 single-deck motor cars, 32 double-deck motor cars and 8 trail cars are in use.

At Sydney, N. S. W., the New South Wales Tramways carry about 17,000,000 passengers a year. The power house is not now large enough to supply the necessary power, and its capacity is to be increased.

The Southport (Eng.) & District Tramway's bill for powers to construct an electric railway from Southport to Lytham has been reported favorably to the House of Commons by a special committee.

A contract for converting the local tramways of The Hague, Holland, to electric traction, was given last month to the Elektriciteits Actien-Gesellschaft Schuckert, of Nuremberg, Germany.

The Leicester (Eng.) Corporation is sending a sub-committee to Paris, Brussels, Berlin and Budapest in order to inspect different systems of electric traction and make recommendations for a system at Leicester.

A special committee appointed by Parliament has reported adversely on the Manchester & Liverpool Electric Express Ry. bill by which the promoters sought powers to build a high speed road between the cities named.

A company entitled the Societe des Tramways de Jaroslaw has been formed at Silessin, Belgium, under the auspices of the Compagnie Generale de Traction et d'Electricite, to construct electric trams at Jaroslaw, Russia.

The Cork (Ireland) Electric Tramways & Lighting Co. is promoting a bill in Parliament for the extension of its lines from Ballintemple to Blackrock. An order has been secured authorizing an extension of the line along the Western Road.

Pearson & Son, contractors, of London, are making preparations for introducing electric traction at Vera Cruz, Mexico. They hold valuable franchises for this purpose and Sir W. Pearson of the firm is now in Vera Cruz perfecting arrangements.

The strike of street railway employes at Berlin, Germany, in which 5,000 men were involved, was last month declared settled, the company agreeing to reduce the working hours and arrange wages on a sliding scale according to the term of service.

The Thompson Houston Co. is negotiating for the lease of 12 miles of street railway at Valencia, Spain. It proposes to equip these lines for electric traction. Horace Lee Washington, U. S. Consul at Valencia can give additional information.

Residents of the Western London suburbs will soon be given better transportation facilities by the London United Tramways Co., whose bill for electric tramway extensions has been reported favorably by a committee of the House of Commons.

A prospectus recently issued by the British Electric Plant Co., with headquarters at Alloa, Scotland, states the new concern intends to engage in the manufacture of electrical machinery, including dynamos, motors, transformers, rotary converters, etc. The capital is £100,000.

As an example of the heavy increase in the prices of tramway material in England, the large boilers which were recently purchased by the Sheffield Corporation Tramways at a cost of £2,850 each, 18 months ago could have been bought for £1,950 each, and five years ago they would have cost but £1,450 each.

The Government of Belgium has provided in its annual appropriations for the construction at a cost of 40,000,000 fr. (\$7,720,000), of a high-speed electric railway between Antwerp and Brussels, so built as to be entirely free from grade crossings. Bids for the construction of such a system will be received by the Government officials. Geo. W. Roosevelt is the U. S. Consul at Brussels.

A signalling device for communicating orders to the engineer or other station attendants is in use at the Coventry (Eng.) Corporation Electricity Works. It consists of a frame fitted with transparencies, behind each of which is a glow lamp. The signs read, "Shut Down," "Slower," "Start," etc. and by lighting the proper lamp everyone in the station is acquainted with the order that is being given.

U. S. Consul Bergh writes from Gothenburg, Germany, as follows: The city council has decided that the city itself shall build and run the new electric street railway. In all probability the proposed lines will be extended considerably, and more rolling stock and other material will be needed than at first estimated. American firms should address Figge Blidberg, Esq., engineer and manager, City Tramways, Gothenburg, Germany.

E. W. ASH.

Mr. E. W. Ash, until recently general manager of the Schuylkill Traction Co., of Girardville, Pa., will henceforth represent the Atlas Railway Supply Co., of Chicago, in the East with headquarters in New York. Mr. Ash took his position with the Schuylkill Traction Co. in the fall of 1893 and continued until June 1st of this year; he also had the management of the Lakeside Ry., of Mahanoy City, which was consolidated with the Schuylkill Traction Co. in April last. Before entering the street railway field he was for nearly 25 years connected with various steam railroad companies. He was an active member of the Pennsylvania Street Railway Association and was also treasurer of "The Syndicate." On resigning his position with the Schuylkill Traction Co. the employes presented Mr. Ash with a handsome Elk watch charm as an expression of their appreciation of the pleasant relations existing between them for so long.

R. W. ASH.

The Atlas Railway Supply Co. which Mr. Ash now represents makes the well-known "Atlas" rail joint and also the "I-X-L Composition." The composition is a surfacer for cars which is extensively used in railway paint shops. The "Atlas" rail joint has been adopted as standard by several of the large street railways and at present there is also a large demand for the joints for new construction; they are adapted for both girder and T-rails.

INTERNATIONAL TRAMWAYS EXHIBITION.

We are in receipt of a circular giving the conditions and regulations for exhibitors at the International Tramways & Light Railways Exhibition, to be held at the Royal Agricultural Hall, London, from June 23d to July 4th, under the auspices of the Tramway & Railway World. Exhibits will be divided into a number of classes, including the following: Working models of various electric, compressed air, gas and steam motor systems; track material; power station equipment; rolling stock and equipment; trucks and wheels, and brakes. Consignments of goods must be marked "Tramways & Light Railways Exhibition, Agricultural Hall, London, N.," together with the name and address of the exhibitor.

Among the companies that have taken space and are planning to make extensive displays are the following American firms: Babcock & Wilcox, J. G. Brill Co., Harold P. Brown, Christensen Engineering Co., Consolidated Car Heating Co., Lorain Steel Co., Ohio Brass Co. and Smith of New York.

The patrons of the exhibition include the lord mayor of London, the chairman of the London County Council, the lord provost of Glasgow, mayors of 25 additional cities, and the chairmen of about 50 prominent tramway companies.

INSULATED ELECTRIC WIRES AND CABLES.

In October last the Hazard Manufacturing Co., of Wilkes-Barre, Pa., well-known as the maker of wire rope for cable railways, enlarged its plant and commenced the manufacture of covered wires and cables. The capacity of the plant was increased by the erection of a new four-story brick building, 150 x 60 ft., and by an increase of engine capacity, aggregating 250 h. p. The company makes a specialty of rubber covered wire for all purposes and also other waterproof wires and magnet wires. It claims to make the most perfect rubber covered wires in the country, both solid and double cover. For this purpose it imports large quantities of crude rubber and employs the spewing process for applying the rubber to the wire. It also makes a specialty of waterproof Randell wire, in the manufacture of which the wire is first covered with cotton fiber and is then braided over; this makes a cable that is very flexible and more perfect in insulation than can be obtained by the ordinary method of covering. The company's submarine wire is made in

continuous lengths up to 20 tons in weight. Both lake and electrolytic copper are used, the wire being drawn from the rods purchased from the large copper mills. All the braiding and covering machines are of modern design and many of the new machines differ materially from those employed in other wire covering establishments.

THIRD AVENUE RECEIVER DISCHARGED.

The stockholders of the two companies having ratified the acts of their respective boards of directors for the lease of the Third Avenue R. R. to the Metropolitan Street Railway Co., of New York, the United States Circuit Court on May 23d ordered the receiver of the Third Avenue to transfer the property to the lessee. Mr. Grant having been notified that the Metropolitan company had deposited money with the Morton Trust Co., \$23,343,885.88, to pay all debts against the Third Avenue company, he turned over the property on May 24th. The formal transfer was made in a car of the Third Avenue company on the loop near the post office, in order to comply with the law that such acts take place on the company's property.

Mr. Vreeland that night issued the following order: "The Metropolitan Street Railway Co., having acquired control of the Third Avenue R. R. property, has this day taken possession of same and will, hereafter operate the property as the Third Ave. division of the Metropolitan Street Ry. system.

"The authority of the officers and the heads of departments will be extended over this division as follows:

"Orren Root, jr., assistant to the president; F. D. Rounds, general superintendent; Henry A. Robinson, attorney; H. S. Beattie, treasurer; R. Warren, secretary; D. C. Moorehead, auditor; A. C. Tully, general purchasing agent; M. G. Starrett, chief engineer; Thomas Millen, general master mechanic; W. B. Reed, engineer of maintenance of way."

LORD'S BOILER COMPOUNDS.

These compounds which are for removing scale from steam boilers, are known throughout the industrial world, and the name of George W. Lord is a familiar one to steam users, for he has probably been longer engaged in the study and manufacture of compounds of this character than any other person in this line of business, having begun more than 35 years ago.

In order to meet the deservedly large demands for this class of goods, Mr. Lord last summer built for himself an extensive plant at 2238 to 2250 N. Ninth St., Philadelphia. The buildings are of brick, a three-story building 175 x 122 ft. and a wing extending back from the street 100 x 112 ft. The offices for the clerical force occupy part of the first floor of the main building and these are large and tastefully finished and furnished. The machinery equipment includes 14 sets of burr mill stones for grinding the materials, with bolting machinery much like that employed in flouring mills; this is driven by a 65-h. p. engine. Conveniently located are storage bins with automatic chutes and all the necessary appliances for packing the compounds in kegs, barrels and casks. There are elevators and weighing devices as well as appliances to facilitate shipping. Some idea of the amount of the compound used can be had when we are told that an average of 80 packages are shipped every week day which go to all parts of the world. The compounds consist of both vegetable and mineral elements, and are made and shipped as dry powders only. While the compounds are made of chemicals of a similar nature, there are over 50 preparations which are designed to act upon impurities that may be found in feed water in different localities. A department for chemical analysis is maintained, Mr. Lord himself being an expert chemist, and waters from different localities are analyzed and a compound that will suit the particular conditions is shipped to that locality.

In a recent conversation with Mr. Lord, it was learned that his attention was first turned to the study of boiler scale before the Civil War, he being at the time a locomotive engineer, and afterwards chief engineer of some large boiler works in Pennsylvania. At the outbreak of the Civil War he enlisted in the Fifth Pennsylvania Cavalry; after being mustered out in 1865 he returned to his laboratory and began the manufacture of boiler compounds, which business he has pursued ever since with marked and increasing success.

CAR FOR THE CENTRAL LONDON RY.

The Central London Ry., which is an underground electric road extending from near the Bank of England to Shepherd's Bush in West London, is approaching completion, and will soon be opened for traffic. In our issue for July, 1897, page 478, we published a map of the road, showing the location of the stations, and in April, 1898, page 238, illustrated the locomotives, station apparatus and interesting details of construction. The company has 13 miles of track, which occupies twin tunnels laid about 75 ft. below the street surface. The power house is at Shepherd's Bush, and is equipped with Babcock & Wilcox boilers, Allis engines and alternating current generators built by the British Thomson-Houston Co. Current is transmitted at 5,000 volts and reduced to 500 at four sub-stations. Operation will be on the third rail system, the cars being run in trains of seven drawn by electric locomotives.

By courtesy of the Brush Electrical Engineering Co., Ltd., 49 Queen Victoria St., London, E. C., we have received a photograph of one of the cars it has furnished to the Central London Ry. These cars are 46 ft. 3 in. long over the buffers, 39 ft. over

CAR FOR THE CENTRAL LONDON RY.

the body, 8 ft. 6 in. wide at the panels, 7 ft. 5 in. high in the middle. The underframing is of rolled steel channels, connected by knees and gusset plates, and the body framing of well-seasoned teak, the side frames being trussed with diagonal bracing, strap bolts and vertical tie rods.

The trucks have a wheel base of 5 ft. and are spaced 29 ft. 6 in. between centers, giving a total wheel base of 34 ft. 6 in. The axles are of Siemens-Martin steel, 4 in. in diameter in the wheel seats, and with journals 6 x 3 in. The wheels are 29 in. in diameter, with steel tires 4½ in. wide by 2 in. thick. The gage is 4 ft. 8½ in. The truck frames are of steel; they were made by the Leeds Forge Co.

The platforms at each end are 3 ft. 3 in. long and fitted with Gold automatic locking platform gates on each side; also, across the ends are iron screens 4 ft. 6 in. high, and the cars are connected by collapsible gates to prevent passengers stepping between the cars. The cars all have Westinghouse quick-acting air brakes.

Each car seats 48 passengers; four rows of cross seats are placed at the center with longitudinal seats at the ends, this arrangement being adopted to permit the wheels to swivel, under the end seats. Brass luggage racks and hat and coat hooks are provided in the interior of the cars. Ventilation is had by means of "hit-and-miss" ventilators fitted to the sides of the clerestory, hinged ventilators directly over the windows, and 10 "Torpedo" air extractors along the roof.

The seats and backs have Wood's woven wire frames and are upholstered in blue and crimson moquette velvet. Ten incandescent lamps, eight inside and one on each platform, are provided; also two oil lamps for emergencies. The exterior is painted in purple lake and white, with gold stripes.

The end coaches of each train are arranged as smokers, being upholstered in hair cloth instead of velvet.

Mr. S. L. Nelson, general manager of the Wichita (Kan.) Railroad & Light Co., writes in regard to the re-rolled rails, of which his company recently purchased 300 tons, that the rails have not been in use long enough to warrant a positive opinion regarding them, but it is believed they will prove entirely satisfactory and will be equal in every respect to new rails.

ELECTRICAL BONDS FOR PIPES.

In the abstract of Mr. E. H. Jenkins' paper on "Electrolysis" published in our May issue, page 260, reference was made to an article by Mr. A. A. Knudson in which he stated that the electrical resistance of the joints of water and gas pipes and Edison tubes increases with age because of the galvanic action between the metal of the pipes and the lead of the joints, and that the effect of this increase in joint resistance is to cause electrical currents that may flow in the pipes to shunt around the joints through the surrounding earth or (in water pipes) the enclosed water, and pit the pipes.

As a preventive of this destructive action Mr. Knudson proposes to electrically bond the iron pipes and has secured patents on such bonds. The bonds are tinned copper rivets; under the head of the rivet is a washer made of a spiral of copper wire which can readily be made to conform to the curvature of the pipe. At the bell end the rivet is driven into a hole drilled in the interior of the pipe, and at the spigot end driven in a hole and the end riveted on the inside of the pipe. One or more pairs of these contacts are to be used at each joint. Connection between the rivet contact pieces

is made by the lead of the joint, or if desired the wires of the spiral washers of the rivets may be uncoiled and twisted together.

Tests made on 8-in. pipes showed resistances of .0035 to .0097 ohm for unbonded joints and of .00008 to .00011 ohm for similar joints having the Knudson pipe bonds.

STREET RAILWAY BAND AT HARTFORD.

Hartford, Conn., has a street railway employes' band, modeled after a similar organization formed among the employes of the Toledo (O.) Traction Co., and which has frequently been mentioned in the columns of the "Review." The success of the Hartford band is due to the efforts of Mr. Thomas Davis, barn foreman of the Hartford Street Railway Co., whose attention was attracted to the idea through reading an account of the organization at Toledo. He made inquiries and found there were a number of musicians among the men employed by the Hartford road and a meeting of those interested was called, resulting in the formation of a musical club. The Employes' Mutual Benefit Association donated \$150 for the purchase of instruments and later when the success of the organization was assured, this association furnished the money with which to buy uniforms. The band has a membership of 25 and has given a number of creditable entertainments.

NEW OHIO COMPANY.

Mr. John P. Martin, of Xenia, O., is actively engaged in promoting the construction of an electric railway from Xenia to Springfield, O., a distance of 20 miles. The company is the Clifton Scenic Railway & Power Co. On the route are Oldtown, Goes Station, the works of the Miami Powder Co., Yellow Springs, Riverside Park and Clifton. The regular business traffic in this territory should prove remunerative and in addition the picturesque scenery and historical associations would prove very attractive for pleasure riders.

The shareholders of the Southern Ohio Traction Co., of Hamilton, O., have authorized a bond issue of \$2,000,000 to retire prior liens of the companies recently absorbed.

AN IMPROVEMENT IN TRUCK BUILDING.

Rather more than eight years ago the J. G. Brill Co. placed on the market its first No. 21-E trucks having solid forged side frames. The construction of these frames was a difficult mechanical problem and for over a year they were sold for less than the cost of production. The company was convinced that the advantages which a solid forged side frame offered in the way of lightness combined with strength and stiffness, convenience when once made, durability, and the entire absence of the troublesome and expensive repairs attendant upon a built-up riveted construction, fully justified the expense of developing processes for more economical pro-

IMPROVED BRILL TRUCK FOR PARIS.

duction. The strongest part of a forging being the outer skin which has been condensed under the hammer it is evident that the best results are to be expected with a forging so finished under the hammer that it will not be necessary to machine it and thus remove the skin. The Brill company undertook to produce side frames that would require no machine work except the drilling of a few holes and the facing off of the seats that received bolted members. By the ingenious combination of drop forging with blacksmith work pure and simple two important steps have been achieved, the 21-E side frame previously mentioned and the forged side of the maximum traction truck shown in the accompanying illustration.

The frame consists of two jaws of unequal size connected by a heavy bar on which are two spring seats surrounded by bosses and brackets for the attachment of braces; projecting from the top of the main jaw is an arm in which are two large holes surrounded by suitable enlargements, and on the outer side of this jaw an arm with a broad palm at the end for receiving the cross tie bar. An inspection of this frame makes the difficulty of the work apparent and remembering that the blacksmith's "hair line" is about $\frac{1}{4}$ in. wide, the accuracy of workmanship which enables the side frame to go in place without finishing except in the jaws, will be appreciated.

The truck illustrated is one of a number made for an electric line in the city of Paris; it has all the general features of the No. 22 type of maximum traction truck. The cars will be operated by storage batteries within the city limits, and the batteries weigh 10,000 lb., bringing the weight of the body with 60 passengers up to 38,000 lb. The space under the center of the car occupied by the batteries made it necessary to place the trucks far apart with the pony wheels under the platforms. One truck for each car has an angle passing from jaw to jaw of the pony wheels, as shown in the illustration, to which an axle driven air compressor is attached. The other trucks are without this angle. The axles are $4\frac{1}{2}$ in. at the center and $3\frac{7}{8}$ in. at the journals.

A STREET RAILWAY MENU.

In a Chicago restaurant patronized chiefly by street railway employes the bill of fare is made up in terms with which they are familiar. The roasts and substantial served daily are called "regulars"; entrees are termed "trippers"; ice cream and cake are known as "extras," and tea and coffee are "trailers." The check is called a "transfer" and the waiters are dubbed "spotters." Oysters and clams are "fenders" because they come ahead of everything. The owner of the restaurant is always referred to as "Yerkes."

EXPRESS WAR IN CONNECTICUT.

May 19th the Adams Express Co. announced that the Bridgeport Steamship Co. would accept no New York express matter that had reached Bridgeport over the lines having agreements with the Trolley Express Company of Connecticut. This latter company is the successor of Cole's Express which began business two years ago between New Haven and Woodmont; with the consolidation of electric lines effected by the Young syndicate the trolley express service has been extended and this season is operating over 50 miles of track.

ENJOINED FROM SELLING TRANSFERS.

The Chicago City Railway Co. last month secured in the Superior Court of Cook County an injunction against 150 newsboys by name, restraining them from buying or selling street railway transfers or giving newspapers in exchange therefore. The action was considered necessary as the only means of stopping the illegitimate traffic in transfer tickets, which in spite of all the companies could do has grown to enormous proportions in Chicago. June 11th two of the boys were brought before the court for contempt of this order; after a reprimand they were released.

EXHIBITS AT THE ELECTRIC LIGHT CONVENTION.

The Splice & Terminal Co., of 15 Cortlandt St., New York, for which the Morris Electric Co. is general sales agent, demonstrated in one of the Auditorium parlors, a radically new process of splicing wires and cables by compression alone and without the use of heat or solder. The method is as follows: The ends of the cable are stripped of insulation and inserted into a sleeve of copper, 3 in. long. Then by means of a portable hydraulic press, this sleeve is swaged down around the cable ends, consolidating the wires of the cable into a compact, substantially homogeneous mass of copper free from internal voids, and forcing the metal of the sleeve into the external crevices of the cable. Tests on the new splice show it has greater conductivity and greater tensile strength than the cable itself.

The portable press or cold hydraulic welding press, as it might be termed, is illustrated herewith, and is capable of giving pres-

HYDRAULIC WELDING PRESS.

sure up to 100,000 lb. per sq. in. When making a splice the cable ends, with the copper sleeve in place, are inserted between tool-steel dies. The work can be performed at some distance from the press if necessary, as in conduit work, hydraulic connection being made between the compression cylinder and the press by means of strong copper tubing.

Another interesting exhibit was made by H. W. Johns Manufacturing Co., of New York, through its Western representative, the Manville Covering Co., of Chicago. The display consisted of samples of the many styles of the Sachs "Noark" safety fuse, ranging in size from 110 to 20,000 volts. Mr. Sachs, of Hartford, and Mr. S. H. Finney, who represents the electrical department of the Manville Covering Co., were on hand to explain the safety reliability and economy of enclosed fuses.

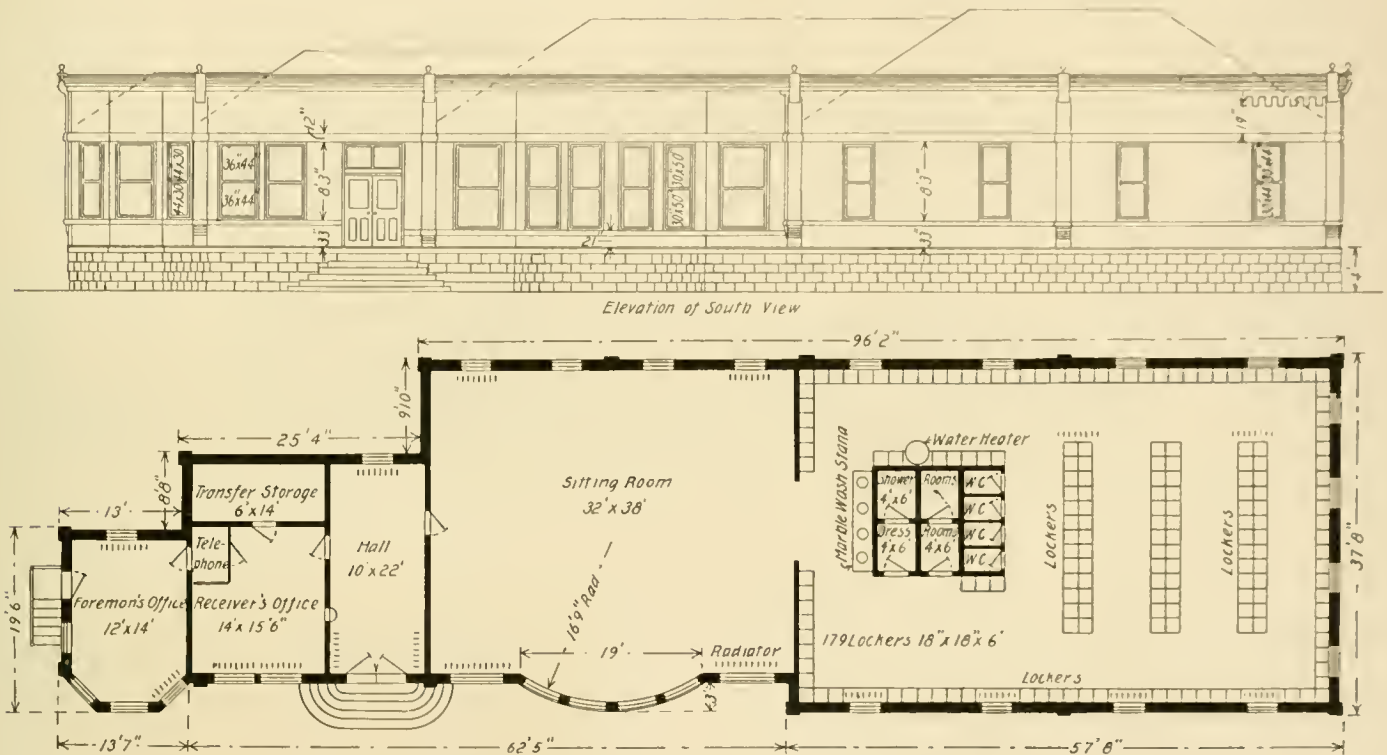

NOTES FROM CINCINNATI.

The Cincinnati Street Railway Co. is at present operating five electric power stations, four of which are within two or three miles of Fountain Sq., which is passed by all the cars. Of these four stations one is on the Ohio River, 3¼ miles northeast of Fountain Sq., one 2¾ miles due west, one (Hunt St.) 2¼ miles north-northeast and one (Brighton) 2½ miles northwest from Fountain Sq. The fifth station is at Cumminsville 4½ miles north-northwest from the square. This arrangement was adopted in order that the stations might be near the heavy grades (from 6 to 13 per cent) and thus reduce the amount of copper required for feeders, an important feature because the double overhead system is used everywhere. The Brighton power house was built in 1889, being the first electric station erected by the company, and at the present time has a capacity of 4,000 h. p. The development of the system has been such that three of the other stations each about two miles distant from it feed into the territory almost up to the Brighton station, and the company is now contemplating removing the generating machinery and making a storage battery station

Knoxville marble; a shower and tubs with hot and cold water are provided. Each man has a locker for his clothes; these lockers are 18 x 18 in. x 6 ft., the doors having two panels, 12 x 30 in., of wire netting for ventilation. Three other such buildings are contemplated, one of which is to be two stories high.

In the shops at Chester Park (which were illustrated and described in our issue for March, 1897, page 186) the new work now under construction comprises 30 open cars and 4 special or private cars. The company already has seven of these handsomely furnished special cars which are very extensively used to carry private parties, schools, tourists, etc. That they are popular is shown by the fact that four more of them are building. During the meeting of the American Society of Mechanical Engineers in Cincinnati, last month, the company placed a number of the special cars at the disposal of the Society and thus enabled the visitors to see much of the city in a most pleasant manner, a courtesy which was greatly appreciated.

The 30 open cars now building are of the company's standard type, adopted three or four years ago. They are 29 ft. 6 in. over all with a 23-ft. body; from the bottom of sills to top of roof is 8 ft

ELEVATION AND PLAN OF STATION FOR EAST END DIVISION.

of it. The company now operates 260 miles of track, making about 53,000 car-miles per day.

A contract has recently been closed with the Pittsburg Reduction Co. for 40 miles of insulated aluminum feeder cable, which is believed to be the first large order for the insulated aluminum that has been placed. The cables are to have 37 strands, aggregating 795,000 c. m. in cross-section, which is about equivalent in conductivity to a copper cable of 500,000 c. m. The joints are to be welded. The new feeders when installed will constitute about one-tenth of the feeder system.

Last Christmas the company opened the club rooms which had been fitted up for the employes of the Vine & Clifton division, and since then has prepared plans for similar stations at the other operating car houses. We show herewith the floor plan of a building, now approaching completion, which is for the accommodation of the employes of the East End division. The building is located at Eastern Ave. and St. Andrews St., opposite the car house. It is one story high, of pressed brick with stone trimmings, and contains offices for the division foreman and receivers, and a room for storing transfers, as well as the employes' rooms. On the interior the walls are wainscoted to a height of 3 ft., and above that are painted. The floors are of hard pine quarter-sawn. The bathrooms are particularly complete and are finished in gray

4 in.; the width over the sill plates is 6 ft. 8 in.; and at the sash rails 7 ft. 4 in. The sills and bottom framing are of long leaf yellow pine, the timber being painted before the parts are assembled. Steel plates 7 x ½ in. extending the entire length of the sills are bolted to the outer sides of the side sills, and cross tie rods ½ in. in diameter extend through the car bottom. The posts and ventilator rails are of ash, the window and desk sash are of cherry, the ceiling of three-ply birdseye maple veneer, and the floor of quarter-sawn hard pine. There are nine cross seats, two against the bulk heads and seven with reversible backs. The fittings include electric push buttons on all the posts, the automatic curtain replacers invented by Mr. Kilgour, president of the company, three Robinson patent sand boxes, safety gates, and striped duck curtains mounted on Hartshorn spring rollers.

The framing of these cars is apparent from the accompanying illustrations. We also show a drawing of the standard open cars, 30 of which were built at the company's shops last fall.

One of the departments of the shops of the Cincinnati Street Ry. which always excites the interest and often the surprise of visitors is the armature and controller repair shop. The company has about 1,000 double motor equipments, and of these 700 are in regular service, making 1,400 motors in constant use; all the armature and controller repairs for these cars are made by two men and two

boys. The work includes the winding and taping of the armature coils, the winding of field coils, and the making of commutators. A boy winds 20 field coils per day. By aid of the taping machines designed by Mr. B. L. Kilgour, electrical engineer, a boy can tape a full set of armature coils in a day. This device is driven from the line shaft and consists of an outer stationary ring and an inner rotating ring which carries a bobbin of tape paid out through a tension clamp. The copper commutator segments are cast in the

For cutting the groove a special cutter is mounted on a 1-in. shaft supported in a suitable frame in front of the trolley wheel which is mounted on a lathe head. The cutter is shaped as shown in the sketch and is rotated by a worm which meshes with a gear on the end of the tool shaft. The cutting edge of the tool being in the position a b the trolley wheel can be slipped past it and mounted on the lathe head. Then the tool is rotated in the direction of the arrow and as the cutting edge advances the grooves

STANDARD OPEN CAR, CINCINNATI STREET RY.

foundry from scrap copper wire. The armature repair shop is under the supervision of Mr. B. L. Kilgour and the other departments are under Mr. P. Leen, master mechanic.

For finishing trolley wheels two special machines are used, a turret lathe for boring and reaming the hole and facing both ends of the hub at one chucking, and a special cutter for turning the groove. There are four tools in the turret of the lathe; first, a flat drill for roughing out the bearing; second, a flat drill for giving it the finishing cut, and this is provided with shoulders at right angles to its axis for facing the front end of the hub; third, a reamer; fourth, a special tool for facing the rear end of the hub. None of these require any special description save the last which is shown in the accompanying diagram. The cutting-off tool is at the end of a shaft which is eccentric to the tool body and may

be first cut the flange of the wheel and when in the position c d on the line joining the centers, the maximum depth of cut is reached. With these two machines about 100 wheels can be finished per day, an unskilled workman only being required; the capacity of the turret lathe is about twenty-five and of the groove cutter about seventeen per hour.

For cutting keyways in the car axles Mr. William Wilson, foreman of the machine shop, some years ago designed a portable machine tool which has been used ever since. Some difficulty had been experienced in getting the keyways at the proper point if the work was done before the wheels were mounted on the axle and

SPECIAL CUTTING-OFF TOOL.

be rotated through an angle of 180° by a handle (not shown in the cut) which is movable in the slot shown in the enlarged portion of the tool body. When the turret is moved up the projecting stud of the tool body is thrust through the bearing of the trolley wheel, and the eccentrically mounted shaft turns so that the cutting tool assumes the position shown by the dotted line in the end elevation.

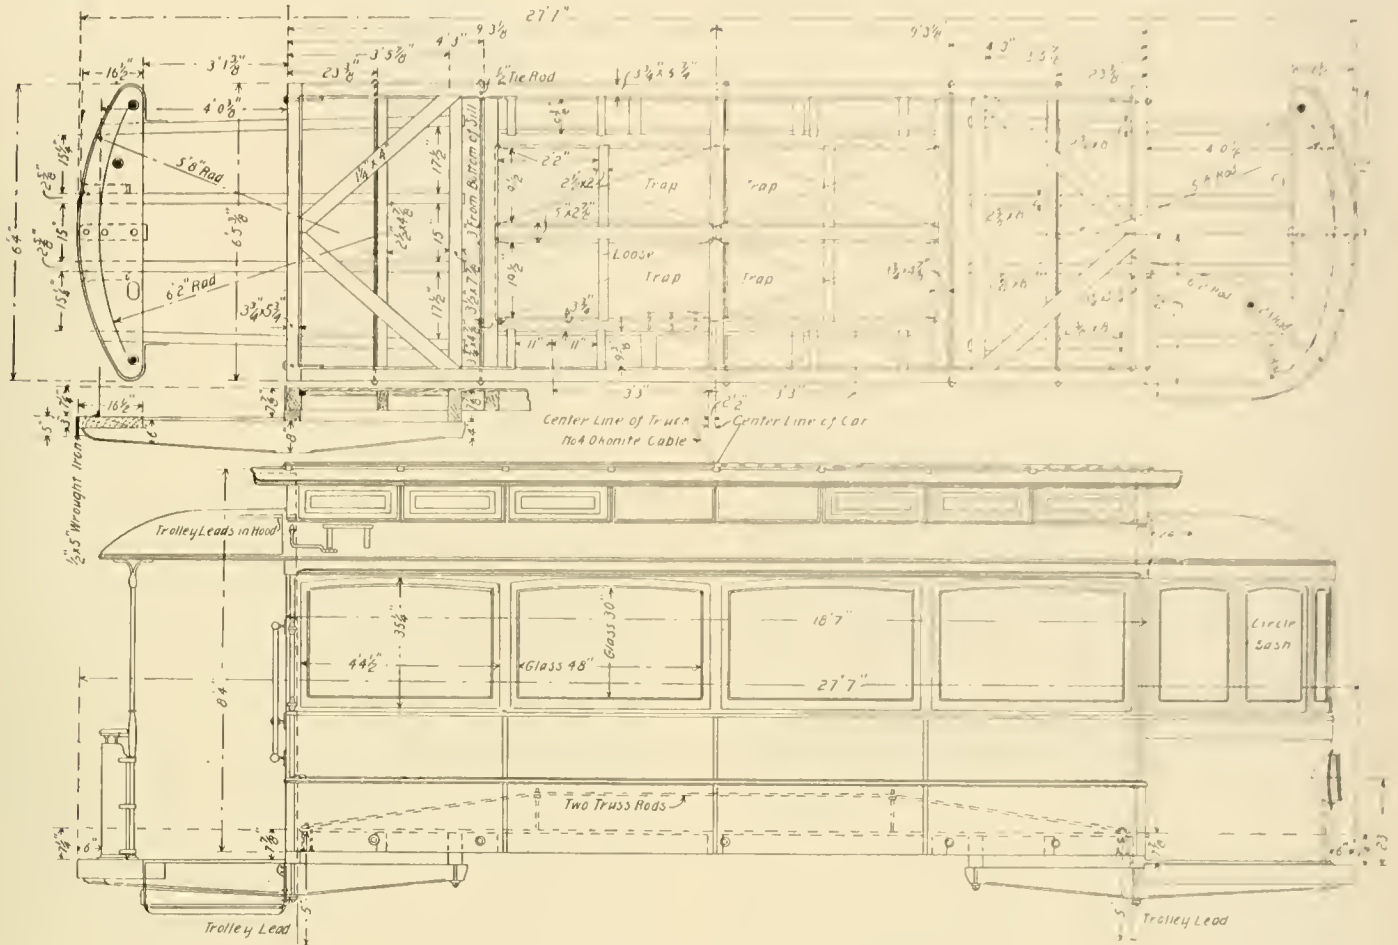

SPECIAL CUTTER FOR TURNING TROLLEY WHEELS.

the tool was designed to cut the keyway after the wheels had been pressed on. The machine, which is about 18 in. long by 12 in. high, has a bed similar to that of a lathe that is clamped on the axle at the proper point. Above the bed is a shaft having at one end an 8 in. pulley to receive a driving belt, and at the other end a bevel gear meshing with a gear on the shaft of the tool

which is an end-milling tool mounted vertically. The driving shaft has a spline so that the bevel gear may be moved along it by a feeding device. The tool also has a vertical feed. There are several types of motors used on the road and for convenience in locating the keyways a template bar is used; one end of this is placed against the hub of the wheel and at the other end is a series of steps

The oak form is bolted to two pieces fastened to the floor which serve to raise the form off the floor and at the same time support the pulleys over which the tension rope run. In bending, the steamed rail is laid against the form with a piece of 2 1/4 x 3/4 in. strap iron along the outside edge, and wedged at two or three points along the middle portion of slight curvature. Levers are then in-

STANDARD CLOSED CAR, CINCINNATI STREET RY.

each of which indicates where the keyway for a given type of motor should be located. The template bar can be thus used because the inner sides of the wheel hubs are faced up to gage so as to be the same distance from the flange.

One of the sketches shows the form used for bending the dash

sorted in the links and the ends bent around as shown in the sketch; ropes are led over pulleys to a differential chain block for drawing the levers around.

For drying light work after steaming a hot table made of steam piping is used. This consists of 10 sections of 1-in. pipe, 21 ft. long, supported on wrought iron frames spaced 18 in. apart

FORM FOR BENDING DASH RAILS.

HOT TABLE.

rails. The sharp curves of 6 1/4 in. inside radius extending over nearly 90° make this a difficult piece to bend and with one form only one pair of rails can be bent per day; a single piece 2 1/2 x 2 1/2 in. is bent and then sawed in two to make the two rails for a car.

The fire regulations adopted in these shops may be of interest to other roads having large shops. In each building is a large gong mounted in a prominent place, with a rope depending, and on a sign board near the gong is the following notice in large letters:

"In case of fire pull rope attached to gong. All employes must respond."

Sections of hose are located at various points about the shop, being laid upon flat shelves at such a height that the covering shell which is placed above the hose to protect it from dust can also serve as a desk; the hose shelves are painted red, and draped with red curtains. Instructions to employes are contained in the fire regulations which are framed and posted at various points throughout the buildings, and read as follows:

"I. Any employe detecting a fire in any part of the buildings will rush immediately to the nearest fire gong and sound same a number of times in rapid succession; wait a moment, and then sound the number of the building in which the fire is according to the following code of signals, repeating the number three times:

Paint shop	1-2	Blacksmith shop	2-3
Erecting shop	1-3	Machine shop	2-4
Cabinet shop	1-4	Armature shop	3-1
Mill shop	2-1	Stock storeroom	3-2
Power house	2-2	Car storage barn	3-3

"II. Any employe hearing the fire alarm from another building than the one in which he is employed will rush immediately to the nearest fire gong and sound one stroke on same,—then wait till he hears the signal indicating location of fire, when he will immediately repeat the signal.

"III. All other employes in the building where fire is discovered than the one at the fire gong, will rush immediately to the nearest fire plug and get the hose ready for at once throwing water.

"IV. Employes in other buildings where extra hose is kept will as soon as the signal locates the fire, rush at once to the spot where the extra hose is stored and proceed with it as rapidly as may be to the fire.

"V. Extra hose is stored for convenience in the cabinet, paint and machine shops.

"VI. Above everything else keep a cool head and avoid loss of time by doing unnecessary things.

"VII. In handling hose, see that the nozzle is so directed that the water goes either on the fire or in close proximity, and avoid indiscriminate deluging of valuable stock, material or machinery.

"VIII. The object of the above is to secure the subjugation of the fire at the earliest possible moment."

The officers of the Cincinnati Street Railway Co. are: President and general manager, John Kilgour; secretary and assistant general manager, James A. Collins; treasurer, R. A. Dunlap; general superintendent, John Harris; electrical engineer, B. L. Kilgour; auditor, W. R. Avery.

REPORT OF SPECIAL EXPERTS AT CLEVELAND.

The two experts, Mr. Richard Tregaskis, and Prof. John W. Langley, appointed by a committee of the Cleveland city council to examine into and report upon the financial and physical condition of the Cleveland City Railway Co., have finished their work and filed their report. They find the state of the property to be substantially as was reported by the officials of the company before the examination.

The authorized capital stock is \$8,000,000, issued \$7,600,000. Dividends paid in the past seven years have averaged 2 per cent per annum.

The experts find the actual operating expenses, excluding all interest, have averaged since 1894, 2.98 cents per passenger carried. Including interest the average has been 3.335 cents per passenger.

RAILS BY EXPRESS.

It is not often that a railway finds it necessary to order its rails and other heavy supplies shipped by express, but last month the Larchmont (N. Y.) Horse Ry. in order to fulfill franchise requirements had three carloads of rails, poles and wire sent from Reading, Pa., by express at a cost of \$400. The Pennsylvania R. R. furnished new cars for the shipment. After the material had arrived the village board made changes in the franchise which rendered this expensive haste unnecessary.

NEW AUTOMATIC BAND RIP SAW.

The accompanying illustration shows the new automatic band rip saw just brought out by the Egan Co., of 322-342 West Front St., Cincinnati. It is stated that this saw will do the work of several circular rip saws, and that it is much safer to use because there is no danger of the material being thrown back and striking the operator. The saw blade is very thin, and removes only a slight kerf, which is an important item in ripping fine lumber. Lumber from 1 to 9 in. thick

may be sawed without changing blades, and the adjustments are quickly made.

The column is made heavy so as to be free from vibration; the table is of ample size, always level, and has at the front a plainly marked index. The straining device is of a new design, with forward, backward and side adjustment, and is quite sensitive. The feed is powerful, and as the feeding-in and feeding-out rolls are close together, short stock can be worked to advantage. The machine will be found to have a number of convenient devices not possessed by rip saws heretofore placed on the market.

ELECTRIC FANS.

The ceiling and desk fans shown in the accompanying illustrations are two of the latest patterns from the factory of D. L. Bates & Bros., of Dayton, O., a concern that has been making electric fans for over nine years. These are wound for direct current at various voltages, including 500 and 550 volts, and are

BATES ELECTRIC FANS.

largely used in street railway general offices and in waiting rooms, as they can be easily operated from the trolley circuit. The fans are finished in nickel, oxidized copper, polished brass and the ordinary Japan finish for cheaper grades.

Bates & Bros. also make 12-in. and 16-in. water motor fans of the buzz type, for which they report an increasing demand.

"REFORM" IN CONNECTICUT.

Last year the street railways of Connecticut paid taxes aggregating 4.9 per cent of their net earnings, which is equivalent to over 13 per cent of the amount remaining after deducting operating expenses. Yet, as if this were not enough, a reformer proposes that the state laws be so amended that the street railways be required to pay license fees of \$100 per passenger car and \$50 per freight car per year, and to furnish current to light all streets on which they operate cars, the municipality to fix the number of lights needed in each case.

EXPERIMENTAL THIRD RAIL INSTALLATION AT LONDON.

The directors of the associated Metropolitan and District Railway companies, of London, in February, 1899, voted £20,000 to be used in building an experimental electric line for the purpose of demonstrating whether electricity could be utilized for operating their systems, and also for determining if the change from steam to electric traction could be made without interfering with the regular daily traffic. The branch selected to be equipped is a double-track division, 5,000 ft. in length, running from Earl's Court to High St., Kensington, numerous gradients and sharp curves making this section a particularly good one for the purpose. The steepest grade is one 450 ft. long having a rise of 1 in 43; two others each 600 ft. long have a rise respectively of 1 in 47, and 1 in 62; and one other 900 ft. long is 1 in 67.

On May 21st the line was opened to the public, a third-rail system having been successfully installed without stoppage or delays to the regular travel.

As the engineers in charge, Sir John Wolfe Barry and Sir W. H. Preece, were instructed to equip the line in such a way that no current would be permitted to pass through the track rails or the sub-soil, lest it should interfere with the electrical signalling arrangements, it was necessary to provide outgoing and return conductors for each track. The conductor rails, consisting of inverted steel channels, weighing 75 lb. to the yard are placed 7½ in. outside the track rails and are carried on double-petticoat porcelain insulators, between which and the conductor rails, pieces of leather are interposed to deaden vibration and noise. At intervals of 100 yd. a special anchoring insulator is placed to prevent creeping of the conductors. The insulators are fastened to the ties by steel bolts.

At switches and crossings the continuity of the current-carrying rails had to be broken, leaving in several instances long gaps, which are bridged by insulated cables laid in conduits or protected by iron plates. The channel rails are bonded at joints with heavy copper strips, hydraulically riveted to the steel. Conductor rails for each track are cross-connected at intervals with the conductors of similar sign for the other track, though disconnecting links are provided whereby one track may be electrically isolated from the other.

At the generating station, which is of a temporary character, are installed two Belliss engines known as the T E C 4 type, giving normally 300 i. h. p. at 380 r. p. m., and having a rated maximum load of 360 i. h. p. The engines are direct connected to two Belliss-Siemens generators of the two-pole H B type, with armatures 27 in. in diameter and 40 in. long. The dynamos are compounded to give 500 volts at no load and 550 volts at full load of 385 amp. In the boiler room are two Babcock & Wilcox boilers, each capable of evaporating 9,000 lb. of water per hour at 160 lb. pressure.

SECTION SHOWING CONDUCTOR RAILS.

The single train at present in operation consists of two motor cars, one placed at each end with four ordinary coaches between, all the cars being mounted on two four-wheel trucks. Each motor car is equipped with four series-wound motors, of the Siemens four-pole type, with the armatures rigidly mounted on the axles of the driving wheels. Each motor develops a normal drawbar pull of 4,000 lb. and is rated at 110 b. h. p., the maximum power being 200 b. h. p. The controller is manipulated by an up-right wheel resembling the steering wheel of a yacht. The controller connections are arranged as follows: On notches 1, 2 and 3, all motors are in series and resistance is in series; notch 4, all motors in series, without resistance; notches 5, 6, and 7, two series of two motors in parallel, with resistance in series; notch 8, two series of two motors in parallel, without resistance; notches 9, 10 and 11, all motors in parallel, with resistance in series; notch 12, all motors in parallel, without resistance. Notches 4, 8 and 12 are the ordinary service positions.

To make connection at the long gaps in the conductors and obvi-

ate the necessity of coasting, a positive and negative collector shoe is carried on each car so that some of the shoes are always in contact with the live rails. Each shoe is fastened to the truck by insulated suspension bolts, and all the positive shoes on the train are interconnected, as are also the negative, by cables and special couplings. The train is fitted with Standard air brakes.

As soon as this experimental line has been thoroughly tested, and the system proved feasible, it is said the order will be given for the complete electrical equipment of London's "Inner Circle" of underground transportation lines.

STORAGE BATTERY TRUCK FOR SINGLE-RAIL TRAMWAY.

We are indebted to the Scientific American for the accompanying illustration showing a storage battery truck built by a Glasgow firm for operation in India on an Ewing single rail tramway; the Ewing road and the ox-drawn vehicles as used in India were illustrated in our February issue, page 81. In the truck here shown

STORAGE BATTERY TRUCK FOR SINGLE RAIL TRAMWAY.

the motor is placed between the two wheels, and carries on its spindle a double pulley, which is belted directly to a pulley on to each of the axles. The storage batteries are grouped around the motor and the whole is boxed over to form a carrying platform. The truck is designed to carry a load of a quarter of a ton, and is capable also of drawing two other trucks, each carrying a ton, at a speed of eight miles per hour.

LAKE STREET ELEVATED LITIGATION ENDED.

On June 3d it was announced that all litigation between the Lake Street Elevated R. R., of Chicago, and Wilham Zeigler, of New York, had been ended; the original bill in this case was filed in December, 1895. Settlement was effected out of court and Mr. Zeigler received par and accrued interest on his \$605,000 of bonds, which were bought by a syndicate in which Blair & Co. were interested; this firm was active in financing the Northwestern Elevated. The syndicate will deposit the Zeigler bonds with a trustee under the scaling agreement made in 1895, taking out 60 per cent of the face in collateral trust debenture bonds and 15 per cent of the face in income bonds. It was the refusal of the Zeigler interests to accept the scaling agreement that brought about the litigation.

It is believed that the compromise now effected is preliminary to a consolidation of the Lake Street and the Northwestern Elevated.

The different offices of the United Railways & Electric Co., of Baltimore, now scattered in various parts of the city, will be concentrated on one floor of a new building at Baltimore and Calvert Sts.

The fare on the Penn Yan (N. Y.) & Keuka Park Electric R. R. will shortly be reduced to 10 cents between Penn Yan and Branchport.

SOME NEW ENGLISH ROLLING STOCK.

The Waterloo & City Ry., about 1½ miles long laid in two 12-ft. tunnels connecting the Waterloo and the Liverpool St. railroad stations, which are on opposite sides of the River Thames, was opened for traffic in August, 1898. During certain hours morning and evening there is more traffic offered than can be well handled and four-car trains are run. At other times during the day a four-car train is much too large and to secure greater economy of operation with light traffic the company recently ordered five motor cars to run

NEW CAR FOR WATERLOO & CITY RY., LONDON.

singly. These were built for Dick, Kerr & Co. by the Electric Railway & Tramway Carriage Works, of Preston, Lancashire, and exterior and interior views are shown herewith. The length over all is 47 ft., the body being 45 ft. long; the width over panels is 8 ft. 6 in.; the width at roof line, 8 ft. above the rail, is 7 ft. 9 in.; the height from rail to top of roof is 9 ft. 8 in., and to the floor 4 ft. 10½ in. The trucks were built by the Leeds Forge Co.; they are standard gage, 5 ft. 6 in. wheel base, and placed 31 ft. between centers.

INTERIOR VIEW.

The cars are divided into two compartments, one for smokers. The framing is of steel and the side and end walls are also of steel for the most part.

The motors were designed by Mr. S. H. Short, technical director of the English Electric Manufacturing Co., of Preston. These are known as the 15 L. type and tests showed the efficiency to be 88 per cent at 40 h. p., 92.5 per cent at 100 h. p. and 88 per cent at 165 h. p.; the rated power is 75 h. p.

All the offices of the Chicago Consolidated Traction Co. have been moved to the second floor of the Union Traction office building at Clark and Division Sts.

At Grand Rapids, Mich., a passenger for 20 cents can ride 21 miles on the street cars, visit three park resorts, and attend a free vaudeville show.

PROTECTION OF PENSTOCKS FROM CORROSION.

This subject was before the American Society of Mechanical Engineers for general discussion at its Cincinnati meeting. Mr. H. de B. Parsons said:

"It has occurred to me that it would be of interest to the members if information could be elicited as to the most satisfactory steps to be taken to preserve the metal feeder pipes and cases of turbine water-wheels.

"There is an increasing demand for the utilization of water powers, and it frequently happens that such problems will involve the bringing of water under a considerable head through a pipe from the foot or base of a masonry dam to the power house. In connecting this steel or other plate metal pen-stock to the face of the dam, it is usual to embed a metallic flanged ring or extension of the pen-stock proper, either part way into the masonry or else to carry such pen-stock clear through to the upper face. In either case, this pen-stock will be embedded in the masonry under water and difficult to inspect or replace; and will furthermore be exposed to the corrosive action of such water, as well as to the erosive action which may result from the movement of grit or sediment carried forward by the flow of the water.

"What is the best material for coating this pen-stock both outside and inside with a view of prolonging its life under the conditions of its exposure? Can it be done with any known form of paint, or is the only safeguard some form of the methods which have been proposed for a coating or enamelling, which shall be a metallic oxide in such union with the metal as to be in effect part of it?"

Mr. D. J. Lewis, jr., of South Orange, N. J., related his experience with a pen-stock erected in 1847 and which he had examined in 1893. The interior was covered with barnacles (as large as 2 in. high and 1½ in. in diameter) and on their removal the metal was found badly pitted, as deep as 3-16 in. in places. He had dried the pen-stock by building wood fires in it, as soon as the water was shut off (water being shut off only from 5 p. m. on Saturday until 5 p. m. Sunday) and the next day applied a coat of enamel paint such as he knew to be extensively used in England for painting the bulkheads and coal bunkers of ships. Before painting the wheel developed only 1,000 h. p.; after painting the output was 1,150 h. p. Two years later an examination showed the paint to be in first class condition. Since that time he had recommended this paint for similar structures. In answer to questions he stated that the paint was known as "Bitumastic Enamel"; it was expensive, costing about \$2 per gallon; it dried in two hours. When thus painting this pen-stock he had painted a ring at the mouth with red lead, also a ring with boiled coal tar. Both were badly scored after a year, while the enamel paint adjoining it showed no abrasion; the coal tar had remained soft after a year.

CHANGE IN NEW HAVEN (CONN.) ROAD.

The owners of the Fair Haven & Westville R. R., of New Haven, Conn., have secured a controlling interest in the New England Street Railway Co., which by ownership of stock controls the Winchester Avenue Railroad Co., of New Haven. Changes have been made in the directorate, and new officers elected; they are: President, Henry S. Parmelee; vice-president, Samuel Hemingway; secretary and treasurer, A. E. Pond. Messrs. Parmelee and Hemingway hold similar positions with the Fair Haven & Westville.

There is now pending a suit to determine whether the option secured on the Winchester Avenue road by I. A. Kelsey for the Connecticut Lighting & Power Co. can be enforced.

All controversy over the consolidation of the Dayton (O.) Traction Co. with the Southern Ohio Traction Co. has been satisfactorily settled out of court.

An illustrated guide to Columbus, O., and the nearby pleasure resorts is published by the Columbus Railway Co. The book in addition to a map of the street railway lines, contains handsome half-tone engravings of the principal buildings in the city and views in Olentangy and Minerva parks. Mr. J. W. Pickens is excursion agent for the company.

MECHANICAL DEPARTMENT

SOME CAR PAINTING AND CLEANING KINKS.

A cheap but very convenient adjustable scaffolding used at the West Side shops of the Chicago Union Traction Co., for cleaning and painting the cars, is shown in Fig. 1. It consists simply of two upright ladders having three or four rungs to support the cross plank at any desired height, and can be made in half a day by the shop carpenter out of scrap stock. One of its advantages is the little room it takes when not in use.

FIG. 1—SCAFFOLDING FOR PAINT SHOP.

A more elaborate portable scaffolding, used by the Kansas City, Fort Scott & Memphis R. R., but which is equally well fitted for street railway work is illustrated in Fig. 2. This is a barrow-like contrivance, the frame of which is a permanent combination of platform and horses, and has at one end a pair of light wheels in place of legs. As will be seen it is provided with a tank or receptacle for carrying sponges, cleaning materials or paints, and it will be found particularly convenient for open-air work, as where cars are washed at the terminals instead of in the shops. This staging can also be made in the carpenter shop out of waste material and of

FIG. 2—PORTABLE SCAFFOLDING.

suit the various classes of work to be done, and in addition the angle blade may be set at an angle to the handle. The handle has extending through its length a rod screwed into the cap, which forms the outer end of the handle proper, the cap having a squared interior projection fitting into a recess in the handle, whereby the two turn together. The opposite extremity of the rod is flattened for a short distance back from the end to enable it to pass through a slot in the blade. At the same end is a hinged button which presses the blade against the extremity of the handle whenever the latter is given a quarter turn in the proper direction, which is done by grasping the blade in one hand and the handle in the other. To set the blade at an angle a wedge-shaped button, with a slot corresponding to that

of the blade is inserted between the bearing surface of the handle-end and the blade, giving the latter any desired inclination. The parts are clamped in place as before by a quarter turn of the handle. This adjustment is useful on account of the varying degrees of hardness in the wood upon which the scraper is used and prevents tearing up the grain on soft woods. For the cuts and description of the barrow-scaffolding and the paint scraper we are indebted to the Railway Age.

We are in receipt of three letters giving a short summary of the practice followed in repainting and cleaning cars at Birmingham, Ala., Los Angeles, Cal., and Waterloo, Ia.

Mr. J. B. McClary, general manager of the Birmingham Rail-

FIG. 3—PAINT SCRAPERS.

FIG. 4—BLADES FOR PAINT SCRAPERS.

any size that will best suit the dimensions of the cars to be cleaned or painted.

A useful tool invented by Mr. Frank Crocker, master painter of Kansas City, Fort Scott & Memphis R. R., for lessening the labor of scraping off paint and varnish after burning is shown in Fig. 3, and a few of the blades designed for use with the tool are illustrated in Fig. 4. The principal feature of the scraper is that the same handle can be used with as many forms of blade as may be desirable to

way & Electric Co. states that for cleaning, his company uses Ivory soap only, except on certain interurban cars where MODOE soap is used. For repainting, Masury's paints and Valentine's and Masury's varnishes are used. Cars should have three coats of paint and two of varnish and should be run through the shops for repainting once every year. He considers orange the most durable color and states that he finds it costs from \$50 to \$80 to properly repaint a car.

Mr. C. W. Smith, manager of the Los Angeles (Cal.) Railway Co., writes as follows: "For cleaning the surfaces of cars preparatory to revarnishing we use the best grade of laundry soap, and prepare a cleaning mixture in the following manner: soap 10 lb., water 9 gal., wood alcohol $\frac{1}{2}$ pt., turpentine $\frac{1}{2}$ pt. The soap is shaved thin and boiled until thoroughly dissolved, the mixture being stirred constantly while boiling. The other ingredients are mixed in after the soap has cooled down somewhat. This preparation is applied with a brush and used only for scrubbing prior to revarnishing. It is not used by car washers or on cars in service, except in extreme cases where some foreign matter cannot be removed with the air blast or water. We use gasoline for removing grease spots, and clear water only for washing cars in service which are not badly stained.

"Compressed air is used for cleaning out the interior of our rolling stock. We have a pipe line running between two tracks with outlets at convenient points, to which may be attached a $\frac{3}{4}$ -in. hose, with a throttling valve and $\frac{1}{8}$ -in. nozzle opening. We use an air pressure of 50 lb. direct blast; the compressors deliver air to a large chamber where the moisture is precipitated and drawn off so that there is no dampness to the air when in use.

"In this peculiar climate we apply eight coats of paint for cars in light colors and seven for dark colors; this includes three coats of rough stuff. Two coats of varnish are put on when cars are varnished every 10 months and three coats when they are varnished at intervals of from 12 to 18 months. Cars will run here about seven years before it is necessary to repaint them; they should be varnished every 10 months.

"I consider chrome yellow and colors made therefrom the most durable in service. For repainting we use Harrison Bros. special carriage lead and Valentine's and Masury's colors; for revarnishing, Murphy's varnish is used."

Mr. L. S. Cass, president and manager of the Waterloo & Cedar Falls Rapid Transit Co. states that nothing but white laundry soap is used on his road for cleaning. Cars are given three coats of paint and two of varnish and are passed through the shops twice a year for revarnishing and once in two years for repainting. Yellow is the color selected for city service and green for interurban cars.

THE PAINT ON A STREET CAR.

By Gorham B. Coffin, General Salesman, Heath & Milligan Manufacturing Co.

"Painting, Sir, I've heard say, is a mystery."

—Measure for Measure.

Many people have an idea that painting a street car is easy enough but the fact is that it still remains a problem as to which is the best and most economical method of preserving the cars, after coming from the maker or the railroad companies' shops.

The varnish or finished surface of a car will soon perish if it is allowed to remain any length of time in an atmosphere permeated with ammonia or other gases resulting from stabling horses in a building adjoining the car house or upon any of the floors in which the cars are stored, and when the varnish once begins to perish either by cracking or losing its luster, it may be taken for granted that in a short time the color will disappear, and a general destruction of all under coats will be the result.

The cleaning of cars is a very important matter and affects all those who have furnished the supplies for the building and equipment of the rolling stock, and yet the exercise of a little care day by day will keep the cars in perfect condition for a long time. By a little care is meant daily washing with cold water. A street car is not like a steam railway coach, and does not usually require a solution of chemicals to properly clean it.

"How to paint a street car" is the question propounded, so the writer can only express his own opinion in offering a few suggestions as to the proper colors and the best surface for the color and his ideas as to ornamenting, lettering and striping.

The paint shop (a homely phrase) is often the most abused portion of a railway plant. Painting should, however, be considered as important as any part of the car construction. We have seen the stock or mixing rooms of some of the finishing departments of the largest railroads that are a credit to the foreman and as tidy as the president's office, and this is the way they should always be kept.

The cars as they come from the car builder or the company's car shops, by the beauty of their exterior usually excite the admiration of the public and the officials of the road, but in a short time they often become faded and unsightly; the reason for the disappointment is that someone has blundered, either the foreman painter did not understand his business or the varnish and paint makers deceived the railroad company. There is no necessity for this. From the manufacturer's standpoint as good colors and as good varnish can be obtained today as ever were used. Do not try to buy cheap paint or cheap varnish. Select the most responsible makers of these goods that you know anything about, then buy their products and hold them responsible. But you say, suppose the manufacturer furnishes the best colors and the best varnish and still the result is not satisfactory. What then? Why then your workmanship is at fault and an investigation will oftentimes reveal the true condition of affairs.

In painting your cars do not hurry the work. The priming or first coat that is applied should be given at least 48 hours to dry. On the third day apply the gray coat (S. P. white lead) treated with lampblack; the fourth day putty up the openings, and on the fifth day put on the rough stuff, giving the work a coat each day until three coats are applied. Then rub down with pumice. The car is now ready for the first coat of color.

To select a rich color that is permanent seems to be a problem. This depends entirely upon the application. Even a lake color that is transparent can be made effectual and durable if the painter is skilled in the use of colors. Tuscan red, green, yellow, olive or white are most commonly used and can be had ground impalpably fine in coach maker's japan. They are made ready for application by thinning with turpentine so that when applied the surface has a dead finish like a piece of velvet. If yellow is used, either lemon or orange chrome, the color should be tempered with linseed oil especially the orange shade which is produced by the use of lime. A green should not be used chemically pure but any of the standard brands of chrome green are reliable. If an emerald shade is desired a glazing coat of paris green produces a brilliant effect. Vermilion is a color of dense body and can be made lasting by the use of hard rubbing varnish added to the thinner; the subsequent coat should be rubbed flat. A glazing coat of French carmine produces the most brilliant and permanent red known. So-called economy, however, has dispensed with the use of carmine almost entirely, the artificial vermilion being used as a substitute.

The olive shades of body color, such as the Pullman shade and others, have come into general use on account of their being susceptible to ornamentation. A dark color for a car in the writer's judgment is not desirable. The bright yellows that have been used for years cannot be improved upon. The white panels of a car are usually worked up with the best white lead, and no improvement can be suggested. A very white surface is made by using flake white in japan for the finishing coat.

As to varnishing or finishing the car—"Ah! There's the rub." The old way was to apply one or more coats of hard rubbing varnish, stripe or ornament on the rubbed surface, then apply two coats of railway finishing varnish. This consumes time, as work with good rubbing or finishing varnish cannot be hurried. The temperature at the time the work is being done is also a very important factor. The best varnish applied in a humid atmosphere is a total failure. Assuming proper care in the paint shop, the problem of furnishing a satisfactory varnish is one for the varnish-maker.

The new methods such as the repeating process in varnishing and the rapid systems of surfacing are some of them excellent, and worth at least a trial, for the time required is what makes painting cars expensive. It is the practice in many shops to allow only 10 or 12 days for repainting and varnishing, but this is not enough time. Good and perfect work cannot be hurried, and 20 days is the minimum period that should be taken for finishing a car from the bare wood to varnish.

We have not touched upon the interior work. The plainer it is the better, and the new idea of simply making the ceiling of veneer without decoration is good. So far as the lettering and ornamentation of a street car is concerned, the judgment and taste of the superintendent must prevail. Scroll and fancy ornamentation is a thing of the past. Good, plain lettering and striping that will assist the harmony of colors and effect a perfect symmetry is all that is necessary.

The Strikes.

LITTLE ROCK.

The strike at Little Rock, Ark., begun May 2d, was settled on May 11th. The matter was briefly mentioned in our May issue but the following account of the causes, taken from a letter prepared for publication by Mr. Allen N. Johnson, president and receiver, will be of interest. April 28th a committee of 16 men, of whom the chairman and a majority of members had never been employed by the company, presented a peremptory demand that six men recently discharged be reinstated. This was refused, and on May 1st a committee of employes presented six demands, four relating to matters of detail in operating cars and two to wages. The following day the president, at the request of the men, met a committee of citizens and discussed the matters at issue. Mr. Johnson proposed a basis of settlement which met the recommendations of the committee, but this was refused by the men unless an amendment were added providing for the reinstatement of men discharged for cause and for the discharge of certain other men employed. Mr. Johnson, declining to accept this amendment the strike was ordered.

May 10th a verbal proposition from Mr. Johnson was considered. This assured the employes of an increase of wages, the minimum to be not less than 10½ cents per hour, the exact amount to be fixed by the court in which the receivership is pending. The rates paid before the strike were: motormen, 12 to 15 cents; conductors, 9½ to 12½ cents.

The men returned to work on May 11th. In making up the lists of men who would have regular cars in the future preference was given to the men who had stood by the company during the strike. The men who had not struck were continued in the places they had occupied before the strike. The new men who had been employed to operate cars during the strike were next and as many as were competent were given regular runs. About six of the new motormen, who had been at work only four or five days and did not fully understand the duties of motormen, were placed at the head of the extra list and will be thoroughly instructed in their duties that they may be given a chance for regular runs in cases of vacancies. The motormen who had struck were placed next in order on the extra list, except those who had applied for work before the strike was called off. With the conductors the same plan was followed.

KANSAS CITY.

The strike on the lines at Kansas City was a failure from the start. On only a few lines were there any delays, and at midnight on May 12th, the day the strike was declared, President Holmes said: "So far as the Metropolitan Street Railway Co. is concerned the strike is over. We have as many men as we need and are turning away applicants for places. No more of the strikers will be taken back. It is hard on some of them, but we must draw the line, and we have no need of their services anyhow. We are not expecting trouble, but we are amply able to deal with it if there should be any. We are prepared to protect our employes and property and protect the passengers from any annoyance and insults by strikers or delays of the trains. Practically all of our men are now deputy marshals, authorized to carry weapons, and I think a good many of them do."

The United States District Court, Judge W. C. Hook, issued two interlocutory injunctions, one at the request of the Kansas City Elevated Railway Co., and one at the request of Metropolitan Street Railway Co. and the Central Electric Railway Co. The two orders were directed to a score or more of persons by name and to all other persons combining with them.

DAYTON.

The men of the Peoples Railway Co., Dayton, O., struck on May 14th. The manager had secured motormen from Cincinnati but was not willing to send cars out until assured of what he believed was ample police protection. The men had asked for 20 cents an hour and a 9-hour day which the company was quite willing to give; the fight was made on recognition of the union. May 19th a settlement was effected on the following basis:

"It is agreed that in all matters involving discharges, pay-offs or alleged offenses by the employes the employe suspended or discharged shall, upon the recommendation of a hearing by three of

the People's railway employes, have his grievance submitted to arbitration; one arbitrator to be selected by said employes, one by the company, and a third by the two. Decisions reached by such arbitration shall be final. The party in the wrong shall bear whatever expense might ensue, said expense, however, not to be more than \$20. It is understood that there shall be arbitration only in the event that the company and the committee cannot adjust the difference.

"Any employe of the People's Railway Co. may join any organization without prejudicing his relation to the company."

ST. LOUIS.

The strike of the employes of the St. Louis & Suburban Railway Co., begun April 29th but practically ineffective until after the St. Louis Transit men went out on May 8th, was settled on May 14th.

On April 6th the following agreement had been entered into between the management and the employes:

1. All men, who claim to have been discharged on account of connection with the union are to have a fair and impartial hearing, with a view to reinstating them, if their charge is true.
2. Company will arrange straight runs of not more than 10 hours when it is possible.
3. Bulletin board will show when a man is assigned to duty, and he will be immediately notified if his services are not required. If his services are required, and he is obliged to remain on duty until assigned a run, he shall be paid for the time.
4. Men will work in two shifts, and will be paid extra when working outside their shift.
5. Company will treat with committees from employes at all times.
6. The union is recognized. But it must be open to all employes of the Suburban, and there must be no restrictions to the membership.

The strike of April 29th was because of the alleged failure of the company to fulfill these conditions; the management on the other hand claimed that the last clause had been violated by the men.

The agreement of May 14th provided that the question of whether the men had violated clause 6 of the former agreement be submitted to arbitration, the decision of the board to be final. If this decision should be against the company it would then also submit to arbitration the cases of men discharged between March 21st and April 29th.

In our issue for last month we gave an account of the causes of the strike of the employes of St. Louis Transit Co., and a brief account of the events attending it up to May 12th. Since that date the greater portion of the lines of the company have been opened but a great deal of rioting has resulted from the inadequate police protection afforded. The situation, day by day, has been as follows:

May 13.—No cars were run, the police commissioners withdrawing all the patrolmen to give them an opportunity for rest. A number of new men to take the places of strikers arrived and were quartered at the company's barns. In the evening one of the waiting stations (an old car) of the Transit company was burned.

May 14.—Slight disturbances followed the opening of the Chouteau Ave. line and several rioters were slightly injured.

May 15.—Nine lines of the Transit company were partially opened with much rioting. A car being attacked by a mob the conductor fired on the crowd, wounding two men, one mortally. The crew of a repair wagon also fired on a mob wounding one man. A strike sympathizer wounded in a riot on the 11th died.

May 16.—Cars ran as on the previous day. Sixty-two men arrived from Cleveland to take the place of strikers. A number of indictments were returned against men charged with obstructing the tracks. One striker was wounded. The strikers rejected an offer to compromise by taking back union men and treating with the union men as such, leaving it optional with employes whether they join the union.

May 17.—There were numerous small riots in which both strikers and employes were injured.

May 18.—Two non-union men were shot while on their cars, one probably fatally. The House of Delegates made a political play by

passing an ordinance annulling the franchises of all St. Louis street railway companies.

May 10.—The postmaster made complaint to the district attorney who on behalf of the United States petitioned the United States Circuit Court and secured a temporary injunction against interference with the street railway postal routes or cars. Some 50 of the strikers were named as defendants.

May 20.—Cars were operated on five lines. The strikers and their sympathizers had a parade.

May 21.—About 300 cars were operated. Five persons, two of them women, were injured in riots; one of the women died later.

May 22.—Three policemen were indicted for neglect of duty. One employe was shot. Twenty-four lines were in operation, nine of them having the full complement of cars.

May 23.—A special policeman was killed during a riot.

May 24.—The governor of Missouri in an interview charged that the strike was fomented by designing politicians.

May 25.—A striking motorman was fatally shot during an attack on a car.

May 26.—No cars were run after 10 a. m. as the police had been withdrawn from the car lines and transferred to the polling booths during the Democratic primaries.

May 27.—Cars were operated under police protection till 6 p. m. In the course of the day one man was killed. In the evening three strikers and one woman were shot by unknown persons.

May 28.—General Manager Baumhoff stated that cars were operated over the whole or portions of all but three lines. A car on the Bellefontaine division was blown up by a dynamite bomb placed on the track, the crew and two policemen on board being more or less injured. The state labor commissioners endeavored to arrange for arbitration.

May 29.—Cars were run much as on the preceding days. Numerous disturbances occurred in the course of which 11 persons were wounded by pistol shots. At midnight an explosion at 15th and Chambers Sts. tore up a section of the street railway track.

May 30.—The mobs continued the plan of campaign begun the previous day of assaulting persons patronizing the street cars, particularly women. Three men were reported shot, one fatally. An attempt was made to wreck the power house at Prairie and Easton Aves. The police commissioners directed the sheriff to summon a posse comitatus of 2,500 men.

May 31.—A striker was killed after fatally wounding a policeman who attempted to disarm him. The sheriff proceeded to raise his posse of citizens. There was less rioting than on previous days but wire-cutting and other obstructive tactics were continued.

June 1.—Strikers continued their attacks on passengers, especially women. Only one man, a non-union motorman, was reported injured; he was shot in the arm by a bullet fired from a building along the line. About 11 p. m. an attempt was made to blow up one of the brick car houses of the company.

June 2.—More cars were operated than on any day since May 8th. The sheriff continued the work of enrolling citizens for his posse.

June 3.—The situation was practically unchanged save that the attacks on persons using the cars were more violent.

June 4.—All but two or three divisions of the Transit company operated cars. About 900 of the citizens posse were armed.

June 5.—A special car containing 54 deputies was wrecked by explosives on the track, two men being slightly injured. The crowd was dispersed without casualties. A committee of citizens telegraphed the governor asking that the state militia be ordered to St. Louis.

June 6.—There was but little change in the situation; one more line was operated than on the previous day. No cars have been run at night since the strike began.

June 7.—Three policemen and a boy were shot, two of the policemen seriously, during riots. Cars were run over the main line of the Lindell division in the evening; these were the first cars run at night since the strike was begun.

June 8.—Three women who participated in an assault on a woman patron of the street cars May 20th, were each sentenced to two years' imprisonment in the reform school. Four cases of assault on women patrons of the cars by mobs of women were reported; teachers were visited in their school-rooms and threatened if they rode on the cars. Two strikers were seriously injured in an attack on car. Some 200 new men from Eastern cities arrived in St. Louis and went to work.

June 9.—Little change in the situation was reported.

June 10.—A procession of strikers came into conflict with a company of deputy sheriffs about 6:45 p. m. near Washington Ave. and Sixth St. Pistol shots from the strikers drew a volley from the sheriff's posse which killed three men and wounded many others. One other man was killed in a riot in a different part of the city. During the day four cars were derailed by explosives and two lines temporarily crippled by cutting the overhead wires.

June 11.—This was one of the worst days since the strike began, the populace being very much excited over the killing of four men by deputy sheriffs on Sunday, and attacks on cars and cases of cutting overhead wires were very numerous. The mayor issued a proclamation warning all persons against gathering on the public streets or other public places, engaging in disputes, discharging fire-arms, etc.

June 12.—All lines were operated, many of the cars being without guards; but little rioting occurred.

June 13.—The president of the local street railway union was stabbed in the throat by a man giving his name as Edward Cantry.

DETROIT & NORTHWESTERN RY.

The Detroit & Northwestern Railway Co. is now operating its line from Detroit to Farmington, Northville, Orchard Lake and Pontiac. The distances from Detroit to the different points are as follows: Power house, 18½ miles; Farmington, 20 miles; Northville, 27 miles; Orchard Lake, 28 miles; Pontiac, 29 miles.

At the present time only a single track is operated, but it is expected to have the other track completed soon. The grading has been done for a double track from Detroit to Farmington and rails are now being laid. The country is very level and the road has few curves so that high speed can easily be made the whole length of the line. The new power house is one of the finest and best equipped in the country; the equipment comprises three E. P. Allis 400-h. p. engines, each of which is direct connected to a Siemens & Halske generator, and six Babcock & Wilcox boilers arranged in three batteries of two each, with patent stokers. The buildings are all of brick, including the car shed, and are as near to being fire-proof as it was possible to get them. The cars were made by the G. C. Kuhlman Co., of Cleveland, and are as fine as any that have been built. Each car is equipped with four Westinghouse motors of 50 h. p. each.

As this is to be a high speed road, only the very best material has been used in its construction; oak hewn ties are used on the entire system; the rails are 70-lb., A. S. C. E. section rolled by the Carnegie Steel Co. The joints used are what are known as the "American Standard" made by the Chisholm & Moore Manufacturing Co., of Cleveland, O. This is a boltless joint with no bolts or nuts to get loose, and makes practically a continuous rail. It is impossible for the ends of the rail to settle, as there is 3-4 in. of metal under the ends, and when riding over it, there is not the usual noise heard where angle plates are used. The ballasting is done with gravel of which there is plenty on the line.

On June 9th a party of electric railway men and engineers spent a good portion of the day inspecting the system. They were unanimous in their belief that the entire equipment was strictly up to date and was as good as could be secured, and there was no question but what the speed of the cars would be second to none in the country. The boltless joints were a new thing to most of them and they were surprised at the fact that there was no jar or noise in passing over them; they were all of the opinion that the joint was a success and came nearer to making the continuous rail than anything they had before seen.

SERIOUS ACCIDENT NEAR PROVIDENCE.

On the morning of Sunday, June 10th, a head-end collision occurred on the Oakland Beach line of the Rhode Island Suburban Street Railway which resulted in the death of 4 persons and the injury of 28 others, a number of whom are believed to be fatally hurt. Among the injured was C. D. Kimball, lieutenant-governor of Rhode Island.

The Suburban company is controlled by the owners of the Union R. R., of Providence, and operated in connection with the latter road. The Oakland Beach line was purchased from the New York, New Haven & Hartford last year; it extends down the west side of Providence Bay to Buttonwood, 16 miles from Providence.

PERSONAL.

MR. C. C. HOWELL, manager of the Knoxville Traction Co. suffered a severe attack of illness last month.

MR. J. H. CARSON, of New York, president of the Sterling Meaker Co., was a "Review" caller last month.

MR. HARRY W. FULLER has been made assistant general manager of the North Jersey Street Ry., of Jersey City.

MR. C. G. BALLENTYNE, general manager of the Honolulu Rapid Transit & Land Co., is in St. Louis to purchase cars.

MESSRS. JOHN C. DOLPH AND H. LEE BRAGG, of the Sterling Varnish Co., of Pittsburg, were "Review" callers recently.

MR. EDWIN S. HARTWELL was last month made vice-president of the Chicago Consolidated Traction Co., succeeding Mr. I. S. Owsley.

MR. H. J. WILSON HUMBERD has been elected a director of the Cumberland (Md.) Electric Railway Co., succeeding Mr. Lloyd Lowndes, resigned.

DR. H. S. PRITCHETT of the United States Coast and Geodetic Survey has been elected president of the Massachusetts Institute of Technology of Boston.

MR. F. P. UNGER, formerly of Charlestown, W. Va., has been appointed manager of the Schuylkill Traction Co., of Girardville, Pa., succeeding Mr. E. W. Ash.

MR. HERSCHEL A. BENEDICT, electrical engineer of the Hudson (N. Y.) Street Ry., has been appointed chief engineer of the United Traction Co., of Albany, N. Y.

MR. B. W. GRIST, formerly with the Pennsylvania Iron Works, has been appointed general superintendent of Richle Bros. Testing Machine Co., 1424 N. Ninth St., Philadelphia.

DR. G. M. STILES, of Williamstown, Pa., has been appointed superintendent of the Lykens & Williams Valley Railway Co., of Harrisburg, Pa., succeeding Mr. W. O. DeWitt.

MR. J. N. CONNOLLEY, formerly of Memphis, Tenn., has been appointed superintendent of the Little Rock (Ark.) Traction & Electric Co., succeeding Mr. Andrew Collins, resigned.

MR. J. P. E. CLARK, general manager of the Binghamton (N. Y.) R. R., will probably be nominated for New York state senator at the Republican convention to be held on June 26th next.

MR. T. C. PENINGTON, treasurer of the Chicago City Railway Co. recently made a trip to Washington, D. C., with a delegation from Medinah Temple of the Mystic Shriners of Chicago.

MR. O. D. HENRY, formerly superintendent of installation for the Lorain Steel Co., has been appointed general superintendent of the Kansas City-Leavenworth Ry. with headquarters in Kansas City, Mo.

MR. F. D. WARD, who has heretofore been general foreman of the Lake Street Elevated shops, has been appointed general master mechanic of the Lake Street and Northwestern Elevated system, Chicago.

MR. ROBERT HARDIE, chief engineer of the recently organized Compressed Air Co., of New York, and one of the best authorities on compressed air apparatus in the country, was a "Review" caller last month.

MR. E. G. LONG, vice-president of the Peckham Truck & Motor Co., sailed for England on the Laconia, on June 2d, with the intention of spending two months at the Paris Exposition, and in making a continental trip.

MR. A. C. HEIDELBERG, formerly assistant superintendent of the Chicago City Ry., with the Metropolitan Street Railway Co., of Kansas City, Mo., and at present in charge of special construction for that company.

MR. THOMAS ELLIOTT, chief engineer of the Atlanta Railway & Power Co., of Atlanta, Ga., spent several days in Chicago in the early part of June after having made a somewhat extended tour through the north central states.

MR. F. C. RANDALL, who has represented the Christensen Engineering Co., of Milwaukee, in the East for several years, has opened an office at 135 Broadway, New York, in order to better handle the increasing business of the company.

MR. JOE S. MIXARY recently resigned a division superintendent of the St. Louis Traction Co. to take a needed rest during the summer. He will return to St. Louis in the fall to take charge of a manufacturing plant in which he is interested.

MR. C. W. FOOTE, formerly general manager of the Cincinnati & Miami Valley Traction Co., writes us that he will take up his residence at San Bernardino, Cal. Mr. Foote has accepted the position of general manager of the Arrowhead Reservoir Co.

MR. SAMUEL GIBSON, for 10 years superintendent of the Madison Street Cable Ry., of Seattle, Wash., resigned May 31st, having decided to retire. The employees of the company took this occasion to present Mr. Gibson with a watch chain and locket.

MR. J. C. BONNER, of Toledo, O., inventor of the Bonner rail wagons for facilitating the handling of freight on electric railways, has been appointed by President McKinley collector of customs for the district of Miami, O., with headquarters at Toledo. Mr. Bonner is a staunch Republican.

MR. L. H. FLANDERS, who has been an instructor in the mechanical laboratory of the Armour Institute of Technology, Chicago, has accepted a position in the Gas Engine Testing Department of the Westinghouse Machine Co., Pittsburg. The vacant instructorship will be filled before the opening of school in September.

MR. LOUIS H. MOUNTNEY, superintendent of the Portsmouth (Va.) Street Ry., resigned on June 1st to take a similar position with the Springfield (O.) Railway Co. Just before leaving Portsmouth the employees of the road presented him with a handsome dress suit case, as a testimonial of their kindly feelings and good wishes.

MR. S. S. NEFF has resigned as superintendent of the Union Elevated Railroad Co., of Chicago, (the Loop) to accept a position with the Boston Elevated Railway Co. Before entering elevated railway work Mr. Neff was with the Great Northern as division superintendent of the Pacific Coast lines, and more recently chief engineer and superintendent of the Lake Superior & Ishpeming Ry.

MR. H. P. WELLMAN has been appointed general superintendent of the Ohio Valley Electric Railway Co., which is a consolidation of the Ironton (O.) Electric Light & Railway Co., the Ashland (Ky.) & Catlettsburg Street Railway Co., and the Consolidated Light & Railway Co., of Huntington, W. Va. His headquarters will be at Ashland, Ky. Mr. Wellman is the inventor of the electric headlight that bears his name.

MR. J. B. CAHOON, who has just been elected president of the National Electric Light Association, is also a street railway manager of prominence. He left the employ of the General Electric Co. in 1895 to become general manager of the electric light, gas, water and street railway plants at Elmira, N. Y., and was engaged for the next five years in developing these properties at an expense of over half a million dollars. He is now located at Syracuse, N. Y., as a consulting engineer. Mr. Cahoon is a veteran companion of the Military Order of Foreign Wars, by reason of service during the Spanish-American War.

MR. W. G. M'DOLE, auditor of the Cleveland (O.) Electric Railway Co., on May 19th accepted an appointment to the vacancy on the Street Railway Accountants' Association's permanent committee on the "Standardization of Construction and Operating Expenses;" this vacancy occurred on the withdrawal of Mr. H. J. Davies from street railway work, and was to be filled by the other members of the committee. Mr. McDole has an enviable reputation as a hard worker and has been a regular attendant at the conventions of the association; he is thoroughly familiar with all the details of street railway accounting and will add to the strength and influence of the committee. This committee now consists of Messrs. C. N. Duffy, W. F. Ham, H. L. Wilson, J. F. Calderwood and W. G. McDole.

OBITUARY.

MR. G. E. HERRICK, of Cleveland, died in New York on May 28th of pneumonia, aged 72 years; he was interested in the first street railways of Cleveland.

THE FRIENDS OF Mr. Charles S. Leeds, president of the Suburban Construction Co., Chicago, will regret to learn of the death of his wife on June 5th, which resulted from an explosion of gasoline at her home.

MR. H. J. TERMOHLEN, electrician and shop foreman of the Rockford (Ill.) Railway, Light & Power Co., was instantly killed while getting off a train on the C. & N. W. R. R. near Freeport, Ill., on May 15th. He leaves a wife and one child.

DR. TRUMAN W. MILLER, one of the foremost surgeons and physicians in the Northwest, died at his home in Chicago on May 31st. He was connected with a number of medical institutions and was surgeon in chief for the Chicago Union Traction Co.

MR. F. W. WOOD, manager of the Los Angeles (Cal.) Railway Co., died of consumption on May 19. Mr. Wood was born in 1853, being a native of Wisconsin, and when 16 years old entered into railroad work, being with the Kansas City & Memphis Ry. and the Chicago & Northwestern Ry. In 1873 he removed to California and since 1874 has resided in Los Angeles. His street railway career began in 1886 with the Temple Street Cable Ry., of Los Angeles, of which he was soon appointed manager. From that time until his death Mr. Wood has been connected with the street railways of Los Angeles.

NEW PUBLICATIONS.

DIRECTORY OF GRADUATES from University of Pennsylvania.—This book includes the names of all graduates from the civil, mechanical, electrical and chemical engineering courses, since their establishment at the University and will be sent on application.

CATALOG OF THE RAILWAY DEPARTMENT, of the International Correspondence Schools, at Scranton.—The course described in this pamphlet is under the management of Mr. W. N. Mitchell, Manhattan Building, Chicago, Ill., and is intended for all grades of railroad employes who desire to secure for themselves higher positions than they are now able to fill. The catalog contains a number of fine colored plates reproduced from illustrations in the instruction papers of the International Schools and showing sections through the air-pump, and valves of an air-brake system.

THE APPLICATION OF MECHANICAL DRAFT TO STATIONARY BOILERS. A paper read before the New England Cotton Manufacturer's Association by Walter B. Snow.—This paper has been reprinted in pamphlet form and may be obtained of the B. F. Sturtevant Co., Boston, with the engineering staff of which company Mr. Snow is connected. The author points out the low efficiency of chimneys as devices for moving bodies of gases and then takes up the various methods of applying mechanical draft as a substitute for, or auxiliary to, the chimney, with discussion of the method of arrangement and the cost. Drawings and the financial results of a number of installations add to the value of the paper.

INVESTOR'S MANUAL. Issued annually by the Economist Publishing Co., 115 Monroe St., Chicago. Free to subscribers to the Economist; single copies 50 cents.—In 1896 the Economist published its "Street Railway Supplement" which gave complete histories of the street railway corporations of the city, together with maps of their respective systems. The following year it began the annual publication of its "Investor's Manual" which presented in convenient form all the important facts and statistical tables relating to the principal corporations of Chicago whose securities were listed on the Chicago Stock Exchange. The succeeding issues of the Manual have been enlarged in scope and that for 1900, in addition to the usual full treatment of Chicago companies, includes data for the principal corporations of Kansas City, Omaha, Milwaukee, Minneapolis and St. Paul, and also a number of others. The total number indexed is about 400. The data are particularly full on the Chicago street railways, and include maps.

A BRIEF HISTORY OF MATHEMATICS. Authorized translation of Dr. Karl Fink's *Geschichte der Elementar-Mathematik*, by Wooster Woodruff Beman, professor of mathematics in the University of Michigan, and David Eugene Smith, principal of the State Normal School at Brockport, N. Y. The Open Court Publishing Co., Chicago. Cloth, 333 pages. Price, \$1.50.—This book, as explained in the author's preface to the German work which was published in 1890, is intended to give students of mathematics a historical survey of the elementary parts of the science and enable teachers to review connectedly points already familiar for the purpose of utilizing them in suitable comments. The English title given by the translators gives a better idea of the scope as the work contains much that is not included in the elements as generally understood. The work is divided into five chapters treating, respectively, of Number-Systems and Number-Notations, Arithmetic, Algebra, Geometry, and Trigonometry. Each of these branches is dealt with separately with the view of enabling the reader to get a quicker and surer general survey of the subject. Dr. Fink's book is believed to be the most systematic attempt yet made to write a compendium of mathematics suitable for the use of those who have not time or the knowledge of foreign languages necessary to study larger treatises, and this translation will be welcomed by English readers. Unlike most recent works of this character it does not contain a store of anecdotes which, while interesting to read, are of no historical value. The biographical notes, constituting an appendix, have been arranged alphabetically, making them more convenient for reference. A well-arranged table of contents and a complete index make the book easy to use.

REORGANIZATION AT LITTLE ROCK, ARK.

May 24th the stockholders of the Little Rock (Ark.) Traction & Electric Co. held their annual meeting and effected a reorganization, electing J. A. Woodson, Oscar Davis, Charles F. Penzel, A. Brizzolari, W. W. Dickinson, J. W. Blackwood and S. W. Fordyce as directors. The following day the directors chose officers as follows: President, J. A. Woodson; vice-president, Oscar Davis; secretary, George B. Rose; treasurer, Charles F. Penzel. The secretary and the treasurer were re-elected.

The new president states that in event a renewal of its franchises can be secured the company will at once expend about \$100,000 in improvements and renewals.

A WELL-KNOWN PAINT HOUSE.

The paint and varnish business of the Heath & Milligan Manufacturing Co., 170-172 Randolph St., Chicago, has been established since 1851. The company makes paints of the highest grade and its coach color department is one of the most complete in the United States. The house makes a specialty of catering to the street railway trade direct, and its wholesale distributing agents in every large city from New York to San Francisco have occasion to supply many of the largest street car companies in America with colors, etc. These materials have proved very satisfactory. The various departments are under the management of men who have been associated with the firm for many years and experience means a great deal in the making of paints.

SPECIAL ATTRACTIONS FOR JULY 4th.

The Fourth of July is usually regarded by street railway managers as the red letter day of the year as it is essentially the family outing day of the calendar with all classes of American citizens and it has become a custom with many companies to arrange for this occasion special programs at their parks and pleasure resorts to cater to and encourage this desire of the people to go somewhere and have a good time. Of course a display of fireworks in the evening, more or less elaborate as fits the size of the crowd to be expected, is the main feature of the day, but it is possible to arrange other attractions for the morning and afternoon hours in such a way as to sustain interest for a longer period and in some instances encourage double riding.

Mr. Chas. Rosencrans, manager of Pleasure Bay Park, Long Branch, N. J., sends the following good program which will be carried out at his resort. From 2 p. m. to 3 p. m. free vaudeville; 3 to 4, grand musical concert; 4 o'clock, balloon ascension and parachute leap; 8 to 10, grand vaudeville entertainment; 10:30 p. m., grand fireworks display.

Balloon ascensions, parachute leaps, high diving and tight rope walking always interest a crowd for a short time and will prove profitable drawing cards. Exhibitions of this nature can be repeated at intervals of say three or four hours during the day with satisfactory results. Bicycle races are good but require a special track. Grounds for foot races and amateur athletic contests are

A capital idea for a combination fireworks display and illuminated water parade will be carried out by Mr. W. B. Baker, manager of the Waupaca (Wis.) Electric Light & Railway Co. At his park is a beautiful body of water and on this a small steamer will be anchored about a quarter of a mile from the shore. Around this steamer will circle a dozen or more private steam and naphtha launches, decorated with lanterns and each towing three row boats, also decorated and illuminated. The movement of the parade will be controlled by signals from a flagship. Men will be stationed on the steamer and in each row boat with colored fire, roman candles, flower pots, skyrockets, etc., and at a given signal the display of fireworks will commence. A band will be placed on the steamer.

It is a good idea to give the exhibition of fireworks on the water, in some such way as this wherever it is possible. Without much extra expense a fight between two home-made battle-ships, a "Battle of Manila" or the "Destruction of Cervera's Fleet" can be easily arranged and these panoramas can be made as elaborate as desired. Blowing up the Merrimac is something of a chestnut but would probably bear a revival for this occasion.

Where water is not available the same amount of fireworks will make a much more telling effect if advertised as a "Battle of San Juan," "Storming a Block House in the Philippines," or some other similar event.

A street railway company can make a very good impression on the citizens of a town by a liberal display of bunting and flags on the cars, and the occasion can be made an object lesson to the peo-

SUGGESTIONS FOR DECORATING CARS.

more easily procured and when the participants are locally known, such events will not fail to bring crowds. It is often possible by means of a little tact and engineering on the part of the manager to take advantage of the good natured rivalry existing between two local schools or societies, or between two neighboring towns and arrange contests of this kind by approaching the proper parties and offering inducements in the shape of grounds free or even prizes for the victors. Novelty contests as three-legged races, backward walking races, steeple-chases and tub-races will arouse interest especially when the contestants are students from rival schools or rival classes in the same school. If it is thought advisable to attempt something of this kind every means should be taken, by posters in the cars and in other ways to appeal to and arouse the local spirit.

A good suggestion is made by Mr. J. F. Porter, president of the Alton (Ill.) Railway, Gas & Electric Co. The population on his line does not exceed 20,000 people so no effort will be made to furnish expensive attractions, but his company has granted the privileges of its park for the day to a local organization which will give a picnic, advertising the event throughout the town and surrounding country. The company is to furnish a brass band and fireworks.

ple to prove that the corporation does occasionally think of other things than the declaring of dividends. Cases are on record where a showing of patriotism or interest in local or national events on the part of the company in some such way as this has been instrumental in creating a more friendly public sentiment toward the road and its managers.

Where bunting is used at the parks or on the cars precautions should be taken against possible fires. Most draping of this nature can be rendered practically non-inflammable, without injury to the fabric or color, by dipping in a solution composed as follows: Phosphate of ammonia, 1 lb.; chloride of ammonia, 2 lb.; water, 1 1/2 gallon.

The extent to which the decorating of cars is carried will of course depend on the taste of the individual manager and also the state of the company's treasury. Two or three tastefully decorated cars run over the lines at frequent intervals during the day, and two small flags on all the other cars will in many cases serve the purpose.

We give herewith a few suggestions that may help the manager in dressing-up rolling stock for this occasion. When decorating in

this way it should be remembered that a pleasing effect can be secured by placing on top of the cars, boys and girls in tableaux, as for instance a little girl in red, white and blue and seated on a throne as Columbia, with boys dressed to represent the U. S. army and navy on either side. Three boys with fife and drum as in the famous painting "Yankee Doodle" make another good group. Boys or men made up to imitate prominent characters connected with the Spanish war or American history, as Dewey, Sampson, Washington, Lincoln, etc., will usually awaken enthusiasm. Disguises of this kind are obtainable at wig-makers or costumers in almost any enterprising city.

The Owosso (Mich.) & Corunna Electric Co. writes us as follows concerning plans for July 4th: "We have found by experience that to call the masses out for a Fourth of July celebration, the old fashioned sports are the best; a 10-cent bowery dance all day; games such as a tub race (our park is situated on a pretty river) or catching geese let loose in the water; having a greased pole extended from river bank out over the water with flag tied to the end and giving a prize to the one climbing out and getting the flag; a watermelon or pie eating contest; day fireworks in the afternoon and night fireworks in the evening; also a good vaudeville show in the evening."

NEW ELECTRICAL PLANT IN QUEBEC.

Commercial Agent Johnson at Stanbridge, Que., writes the State Department as follows:

"The Chambly Water & Power Co., located 25 miles northwest of Stanbridge, is about to add very largely to its present plant at Chambly. It intends to develop additional power at St. Therese Rapids, some 3 miles farther up the river. At the present time, the Chambly works have 7,500 h. p., but they will be made capable of developing 20,000 h. p. The works at St. Therese will give an additional 10,000 h. p. The extension of the old works will, it is expected, be completed this summer, while the new works will take some 18 months to finish."

SPECIAL CAR IN CLEVELAND.

The Cleveland Electric Ry. has recently put in service a beautifully finished special car intended for the use of private parties who wish to take pleasure rides about the city or for theater parties, receptions and other entertainments. The prices are as follows: Per day on the Cleveland Electric Ry. tracks, \$18; per afternoon, \$12; per evening, \$15. Special arrangements will be made for excursions to points out of the city that can be reached over the interurban lines. The special car business of the company is in charge of Mr. C. F. Bates.

A ROAD WANTED IN MICHIGAN.

A dispatch from Ionia, Mich., states that an electric line connecting that town with Crystal Lake would prove a profitable investment. The lake is in Montcalm County, seven miles from the nearest railroad station and about 18 miles from Ionia. It is about three miles long and one mile wide in the widest part. Many people have cottages near the lake and hundreds of others camp there during the summer.

The road would pass through a thickly settled farming country and four small towns, three of them having no communication with the outside world except by wagon road. As all goods are teamed to these towns the freight business of this electric road would be a large item and the summer travel would be large.

A regular coal carrying service will be a feature of the Saginaw Southern Electric R. R., which is to be built from Detroit to St. Charles, Chesaning and Durand, Mich., touching about a dozen coal mines en route.

About 50 linemen and repairmen employed by the United Railways & Electric Co., of Baltimore, are out on strike for higher wages. The company has succeeded in filling practically all the places of the old men and is suffering but little inconvenience.

THE COLOR LINE IN GEORGIA.

The city council of Augusta, Ga., has passed an ordinance requiring the street railway company to seat colored passengers in the two rear seats, reserving the rest of the car for white passengers, but allowing whites to occupy one or both of the rear seats if there be more white passengers than can be accommodated in the seats reserved for them and one or both of the rear seats be vacant at that time, and also of allowing colored passengers to occupy more than the two rear seats if the two rear seats are filled and there are vacant seats in the front, but on no account whites and colored passengers to be allowed to occupy the same seats. Provision is also made to allow the street car company to reserve the two rear seats for smokers, in which case the two seats immediately in front are to be reserved for colored people.

Employees of the company are authorized by the state laws to assign passengers to seats and have police powers to carry out the section. The company already had regulations differing but little from the ordinance recently passed. This rule as to seating passengers does not work smoothly as was shown by the arrest, recently, of a white passenger who refused to take the seat assigned to him because his clothes were soiled and he did not wish to sit near ladies.

The present agitation of the question is due to the fatal shooting of a white man by a negro because the former would not give up his seat to a colored woman; the negro was lynched.

Negroes have boycotted the cars and the public sentiment is in favor of entirely separate cars for the two races.

NEW ROAD IN MASSACHUSETTS.

A new electric line is approaching completion in Massachusetts and it is hoped to have it open by July 1st. The road extends from Lawrence to Reading, 10½ miles; the track is laid with 60-lb. rails. The cars are of the 15-bench open type equipped with G. E. 67 motors. The power house has Cahall boilers, two 350-h. p. engines made by the Slater Engine Co., Warren, Mass., and two 225-kw. General Electric generators. The officers are: President, C. F. Woodward; vice-president, M. J. Warner; superintendent and purchasing agent, C. D. Shepard.

NORTHWESTERN ELEVATED, CHICAGO, TO EXTEND SERVICE.

There is now under consideration by a committee of the Chicago city council a plan whereby the residents of Evanston and other northern suburbs of Chicago can have rapid transit. An agreement has been reached by the Northwestern Elevated and the Chicago, Milwaukee & St. Paul companies by which the former can use the suburban tracks of the latter north of Wilson Ave., the terminus of the elevated line. There is an incline at this point to reach the surface yards of the company and it would be a very simple matter to connect with the St. Paul tracks.

President Louderback, of the Northwestern Elevated, says concerning the plan:

"We are anxious to have a complete express-train system through Evanston finished as soon as possible. Citizens along the north shore are anxious to have this system and we want to give it to them. We will do anything to accommodate the people. This extension would prove of immense benefit to north-shore citizens, who would get rapid transit and cheap fares, instead of being obliged to depend upon the suburban train service which they now have."

QUOTATIONS ON TRACK MATERIAL.

Steel rails of standard sections in lots of 200 tons and over are quoted f. o. b. Pittsburg, \$35. Chicago prices for T-rails in 60 ft. lengths, \$37; in 30 ft. lengths, \$35. Angle bars are quoted at \$1.80; spikes, \$2.20; bolts, \$2.90. Relaying T-rails are selling at Pittsburg at \$28 per ton. Girder rails are quoted at \$42 to \$44 for 30-ft. and 60-ft. lengths.

Cedar ties may be purchased at Menominee, Mich., at the following prices: 5 x 5½ in. x 7 ft., 25 cents; 5 x 6 in. x 7 ft., 28 cents. Yellow pine ties are sold at New York as follows: 7 x 9 in. x 8½ ft., 65 cents; 6 x 9 in. x 8 ft., 60 cents; 6 x 8 in. x 8 ft., 55 cents.

HALF FARES.

The Johnstown (Pa.) Passenger Railway Co. will build a new line to Windler.

The Denver City Tramway Co. is now having to fight the news-boy-transfer evil.

It is confidently predicted that the Grand Rapids (Mich.), Holland & Lake Michigan electric line will be in operation by October 1st.

Thirty-five new open cars were delivered to the Syracuse (N. Y.) Rapid Transit Co. last month.

Construction work on the line of the Dunkirk (N. Y.) & Point Gratiot Traction Co. was begun June 4th.

The Syracuse (N. Y.) Rapid Transit Railway Co. has commenced building a theater at its park; it will seat 1,200 people.

Construction work was finished last week on the Montville (Conn.) Street Ry. between Norwich and New London.

The name of the Collins Park & Belt Railway Co., of Atlanta, Ga., has been changed to the Atlanta Rapid Transit Co.

The Toledo Traction Band on Decoration Day surprised the inmates at the infirmary by giving a concert for their benefit.

About \$180 worth of ground return wire was stolen from the tracks of the Northern Ohio Traction Co. at Akron, on the night of May 18th.

An effort is being made by a few dissatisfied citizens of Columbus, O., to have the common council revoke the franchises of the Columbus Railway Co.

The property of the Toledo (O.), Fremont & Norwalk Electric Railway Co. has been appraised for taxation at \$1,000 per mile in its unfinished condition.

The trial of the persons charged with conspiring to depress the market value of Brooklyn Rapid Transit securities has been postponed until June 18th.

The Grand Rapids (Mich.) Railway Co. will cast-weld its track joints, and is now building a sand blast machine for cleaning the rail ends, and a portable cupola.

Three men were convicted last month on a charge of stealing from the Chicago Consolidated Traction Co. several rails that had been piled along the tracks.

A Chicago street car recently collided with and overturned a wagon loaded with 17 carboys of sulphuric acid; the fire department was called out to flush the street.

An effort is being made to have the Toledo Traction Co. carry firemen free, but this the company refuses to do unless the city makes certain desired concessions.

The students of the Kentucky State College at Lexington have completed a survey for an electric railway to connect Nicholasville and Lexington, a distance of 12 miles.

Several altered bills have been passed on Cleveland street car conductors. The bills are U. S. treasury notes of \$2 denomination, which have been cleverly raised to \$5.

The General Electric Railway Co., of Chicago, has again been enjoined from laying its tracks in Plymouth Place and across the tracks of the Chicago & Grand Trunk Ry.

Thieves at Cleveland last month stole six gongs from a number of new street cars that had been left standing on a railroad siding. They also stripped the cars of brass trimmings.

Gross passenger earnings of the Chicago Union Traction Co. for May were \$647,347, an increase of \$25,465 over the earnings of the North and West Chicago systems in May, 1899.

Owing to an accident on the lines of the Beaver Valley Traction Co., of Beaver Falls, Pa., a coroner's jury recommends that fenders be placed on all cars belonging to the company.

The Columbus (O.) Street Ry. has a rule that only two policemen may ride free of charge on any one car; this does not apply to members of the force above the rank of patrolman.

Mr. A. G. Grant, owner of the Grove City & Green Lawn Street Ry., of Columbus, O. has obtained permission to change the name of the road, and alter the gage to make it 4 ft 8½ in.

On May 23d, a freight train on the Baltimore & Ohio R. R. crashed into a Philadelphia electric car, containing more than a hundred workmen. Four of the passengers were injured.

The Plattsburgh (N. Y.) Traction Co. reports for the quarter ending Mar. 31, 1900: Gross receipts, \$2,319; operating expenses, \$2,674; deficit, \$355; fixed charges, \$1,470; net deficit, \$1,825.

Earnings of the Market Street Railway Co., of San Francisco, for the year ending Dec. 31, 1899, were: Gross receipts, \$3,674,127; total expenses, \$3,178,006; dividends paid, \$446,808; surplus, \$49,312.

President Fricke, of the Pennsylvania & Ohio Railway Co., Ashtabula, O., recently entertained the city officials of Ashtabula and Conneaut; after a trip over the line they were his guests at dinner.

On the queen's birthday the Montreal Street Ry. had one of the busiest days it has ever experienced. The total receipts were \$6,000, an increase of nearly \$2,000 over the corresponding day last year.

Conductors and motormen of the Decatur (Ill.) Traction & Electric Co. last month received handsome new uniforms. On the collar of each coat in bright gold letters are the initials "D. T. & E. Co."

Through the courtesy of the Metropolitan Street Railway Co., of New York, 100 members of the New York Electrical Society on May 25th inspected the new power house at 95th St. and the East River.

At a recent meeting of the United Railways & Electric Co., of Baltimore, it was decided to pay the semi-annual interest of 2 per cent on the income bonds, and a dividend at the same rate on the preferred stock.

At the opening of the Ocean Electric Ry. from Far Rockaway, Long Island, to the ocean, citizens insisted upon drawing the first car themselves, in order to express their satisfaction over the completion of the line.

Richmond, Va., proposes to levy a graduated tax on the gross earnings of electric railways, 3½ per cent up to \$200,000, 5 per cent up to \$300,000, 7 per cent up to \$400,000, and 10 per cent when in excess of that sum.

A motor car that was pushing a gravel car up a steep hill at Akron, O., in some unaccountable way became unmanageable and ran down the hill, causing the death of three men and serious injuries to three others.

The Supreme Court of Pennsylvania decides the city of Pittsburgh has the right to exact bridge tolls from traction companies under old contracts, even though the bridge has been made free to the general public.

On Sunday, May 13th, nearly 2,000 people were carried by the Columbus, Grove City & Green Lawn electric line between Columbus and Grove City, the occasion being the opening of Buelah Park at the latter point.

Two companies are endeavoring to secure franchises for roads from Grand Rapids, Mich., to Grand Haven. One company is promoted by T. F. Carroll, of Grand Rapids, and the other by J. J. Cilley, of the same city.

The Newark (N. J.) & Hackensack Traction Co. on the night of May 23d stole a march on the North Jersey Street Railway Co. by building tracks across a strip of disputed land during the hours between midnight and dawn.

A committee has been appointed by the Little Rock (Ark.) common council to report upon the charge that the Little Rock Traction & Electric Co. had, during the recent strike, violated certain provisions of its charter.

The Toronto Elevated Railway Co. has been organized to build elevated roads in the city of Toronto, Ont. It is hoped in this way to nullify the exclusive franchises for the surfaces of the streets owned by the Toronto Street Ry.

The commissioners of Madison County, O., have granted a franchise to the National Traction Co. Objection to the action was made by the Columbus, London & Springfield Railway Co. which already has franchises for Franklin County.

The Louisville (Ky.) Ry. is enjoying the most prosperous period in its history. It is earning 7 per cent on its common stock and is paying but 4 per cent dividends, the surplus being held in reserve or turned back into the property in improvements.

Mr. John E. Mills, of Port Huron, Mich., informs us that the Lansing (Mich.), St. Johns & St. Louis Electric Railway Co. in which he is interested, has satisfactorily arranged all preliminary matters and the road will be completed this summer.

A street railway company in Ohio advertises its park in the local papers as follows, the notice being run in the reading columns:

FREE! FREE! FREE!

Bring your baskets and spend Sunday at Cascade Park.

Contracts for the erection of a power house and car barn at French Village, Ill., have been let to C. H. Way, of East St. Louis, by the Mississippi Valley Transit Co., a new company recently formed to build a road from French Village to Collinsville.

The Metropolitan Street Railway Co., of New York, reports gross earnings from passengers for the quarter ending Mar. 31, 1900, at \$3,268,200, an increase of \$418,365 over the first quarter of 1899; operating expenses were \$1,572,436, an increase of \$101,799.

Plans for an extensive electric railway system which will connect all the towns of the Monongahela Valley in western Pennsylvania have been perfected. Among the promoters are L. G. Woods, J. H. Gross, John Hoffman, J. H. Mellon, all of Pittsburg.

A "Street Railway Stake" was one of the features at the Nashville (Tenn.) race tracks recently. The Nashville Railway Co. donated a portion of the prize money as a matter of advertisement for bringing the street railway lines prominently before the public.

As soon as a franchise is secured from the British Columbia parliament, work on a tunnel through Chilcoot pass will be begun by the Chilcoot Co., which it is said, will expend \$2,000,000 in the work of building an electric railway from Dyea to Whitehorse.

Because the Niagara (Ont.), St. Catharine's & Toronto Ry., recently operated by steam, has equipped its lines with electricity, the Michigan Central R. R. will no longer exchange passenger and freight traffic, it being the company's policy not to deal with trolley lines.

Rumor has it that the North Jersey Street Railway Co. is negotiating for the purchase of the Camden, Gloucester & Woodbury Ry., the Elizabeth Street Ry., and other street railway properties in Eastern New Jersey. The officials interested have thus far denied the reports.

The Bay City (Mich.) City Council contends that cheaper fares would increase the gross receipts of the local street railway company. The Bay City Consolidated Railway Co. in order to test the truth of the statement will sell six tickets for 25 cents, for a limited period.

The Chicago City Railway Co. will issue \$500,000 new capital stock on October 1st. Stockholders of record September 15th will have the privilege of subscribing at par for the new shares. The directors of the company have also declared the quarterly dividend of 3 per cent, payable June 30th.

The Grand Rapids (Mich.) Railway Co. has issued a 16-page folder entitled "How to See Grand Rapids." A map of the lines occupies two of the pages, which are $3\frac{1}{2} \times 6\frac{1}{2}$ in., and on each of the other pages is a half-tone cut, $4 \times 2\frac{3}{4}$ in., showing views at the resorts reached by the company's routes.

President Roach, of the Chicago Union Traction Co., has rescinded two important rules of the company. One of these required employes to take out an indemnity bond. The men hereafter may go where they please for uniforms and the money paid in by each man as an indemnity bond has been returned.

By the recent completion of a short stretch of track between Roselle and Elizabeth, N. J., it is possible to make the trip from New Brunswick to Jersey City by trolley in 4 1-3 hours, the fare being 55 cents or 35 cents cheaper than the Pennsylvania R. R. charges for the same trip. The distance is 32 miles.

NEW SUPPLY HOUSE.

The firm of Fowler & Robert, with headquarters at 149 Broadway, New York, reports that it is now making and selling all the supplies formerly made by the Lewis & Fowler Manufacturing Co., and the reorganized corporation, the New York Street Railway Supply Co., of Brooklyn. One of its leading specialties will be the Lewis & Fowler registers, new and repair parts for same including dials, register drums, springs, castings, pawls, register locks and keys, and ringing devices (strap or rod). The firm will also rebuild Lewis & Fowler registers, incorporating the numeral totalizer recording up to 100,000.

Other supplies carried by the new house will include repair parts for Lewis & Fowler electric snow sweepers; Lewis & Fowler car heaters, grates, fire brick, etc.; all styles car trimmings, curtains, etc., for Lewis & Fowler and other cars; ratchet brake handles; upper and lower brake guides, car gongs, bronze nuts for dash and body grab handles, roller sheaves and brackets, gray iron castings, brake shoes, etc. The members of the firm are J. W. Fowler and L. E. Robert, formerly of the Lewis & Fowler Manufacturing Co. Both of these gentlemen have had 20 years' experience in the making and handling of street railway supplies and specialties.

RECEIVER FOR CHICAGO ELECTRIC TRACTION CO.

June 13th the United States Circuit Court appointed Mr. Charles Henrotin receiver for the Chicago Electric Traction Co. The application was by the Manhattan Trust Co., of New York, and United States Senator John Kean, of New Jersey, trustees for the holders of \$650,000 of gold bonds issued in 1889. Attorneys for the company concurred in the petition and we understand the proceeding is agreeable to all parties in interest. The receiver will complete the substitution of the overhead trolley for the storage battery system of traction and operate the road.

MIDNIGHT FLYER TO ST. LOUIS VIA THE WABASH ROAD.

On and after June 3d a new Wabash train will leave Chicago at 11:30 p. m. and arrive at St. Louis 7:56 a. m.; returning this train will leave St. Louis 11:30 p. m. and arrive Chicago 8:00 a. m. Two other fast trains via the Wabash if this does not suit you. All equipment up-to-date. Write or call for maps and time schedule. City Ticket Office, 97 Adams St., Chicago.

ECHOES FROM THE TRADE

THE SPEER CARBON CO., of St. Marys, Pa., believes that good carbons can be sold at reasonable prices, and it is putting its belief into practice.

THE PECKHAM TRUCK & MOTOR CO. has an exhibit at the Paris Exposition comprising six types of single and double trucks and two types of the Price friction brake.

THE R. WOODMAN MANUFACTURING & SUPPLY CO., of Boston, Mass., reports that it is now filling some very large orders for punches and badges for the street railway trade.

WELLS PORTABLE LIGHTS are being used in large numbers by the British army in South Africa, and at St. Helena, for lighting up the enclosures where Boer prisoners are kept and in construction work.

THE ELECTRIC RAILROAD SYNDICATE, capital \$1,000,000, has been incorporated in Iowa to build and equip electric lines. Stephen H. Emmens and Newton W. Emmons, of New York, are two of the directors.

THE BURT MANUFACTURING CO., of Akron, O., has made recent shipments of Cross oil filters to the Carnegie Steel Co., the American Steel Hoop Co., American Sheet Steel Co. and the American Tin Plate Co.

THE ELECTRIC TRIPARTITE STEEL POLE CO., of Newark, N. J., with a capital of \$100,000 has been incorporated to build steel poles for electric railways. W. E. Page, of Franklin, and S. C. Martin and G. V. A. Conger, of Belleville, are interested.

THE EDWARD P. ALLIS CO., of Milwaukee, reports among its large orders received last month, one from the Cleveland Electric Railway Co. for a 3,000-h. p. vertical cross compound engine, and one from the Midvale Steel Co. for a horizontal cross compound engine of 1,000 h. p.

MR. CHARLES AUSTIN BATES, the well-known advertising expert, is sending out a small pamphlet in colors, illustrating the Charles Austin Bates Building to be erected at Longacre Sq., New York. The building will be 17 stories high and will be devoted entirely to Mr. Bates' advertising business in all its branches.

THE INTERNATIONAL CORRESPONDENCE SCHOOLS at Scranton were first thoroughly organized and placed upon a permanent basis in 1891 with about 1,000 enrolled scholars. In the short period of nine years, the schools have enrolled 175,000 students, which number is increasing at the rate of 9,000 per month.

M'INTOSH, SEYMOUR & CO., of Auburn, N. Y., announce a change in the copartnership. Mrs. J. Elizabeth McIntosh has sold her interests and severs her connection with the firm. It is also announced that Messrs. William B. Morrison and William I. Ferrey have each purchased an interest in the business and have become active partners.

THE HYDRAULIC PUMPS made by the Watson-Stillman Co., 204-210 East 43d St., New York, are described in a new catalog issued by the company. A special feature of these styles is the placing of all valves above the cistern top, where they may be examined or repaired without displacing any other parts than the bonnets over each one.

KOHLER BROTHERS, of Chicago, have the contract for installing 48,000 ft. of 1,500,000-c. m. copper feeder cable for the South Side Elevated R. R. This constitutes an additional feeder line from the power house to the Union Loop and to the terminus at Stony

Island Ave. and 63d St., and was necessary because of the larger number of cars operated. G. W. Knox, manager of the railway department for Kohler Bros., has charge of the work.

THE GREEN ENGINEERING CO., of Chicago, has recently closed orders for Green traveling link grates as follows: Metropolitan Street Railway Co., Kansas City, Mo., 3,000 h. p.; St. Louis Transit Co., 7,000 h. p.; Sharon Steel Co. (second order), 5,000 h. p. During the last eight months the company has made sales of grates for 40,000 h. p. of boilers.

THE NEW PROCESS RAW HIDE CO., of Syracuse, N. Y., has just published an interesting booklet on its gears, pinions and bushings which are the result of 10 years of experience and experiment. The catalog contains a number of very strong testimonials and bears the company's motto: "As is steel to iron, so is 'New Process' raw hide to all other raw hide."

A. L. IDE & SONS, of Springfield, Ill., have closed contracts with the Pueblo (Colo.) Traction & Electric Co. for a 350-h. p. four-ported tandem compound Ideal engine to be direct connected to generator. The firm of Ide & Sons is publishing several new catalogs and pamphlets on Ideal engines that will be of interest and value to all engineers and steam users.

THE SIMONDS MANUFACTURING CO., of Pittsburg, reports that its gear business has grown to such proportions as to make it necessary to run the works day and night. The company is now installing new and improved gear cutting machinery, which will increase its factory output 30 per cent, and enable it to take still better care of its customers than it has in the past.

THE JACKSON & SHARP CO. has made the first delivery on an order for 40 42-ft. open cars from the United Power & Transportation Co., of Philadelphia. The company has also made the final shipment of an order for 20 cars to Seattle, Wash. To protect these latter cars en transit, they were each enclosed in a specially constructed box resembling an ordinary box freight car.

THE INTERNATIONAL BOILER COMPOUND CO., maker of solid, liquid and powdered boiler compounds, claims that its compositions prevent and remove scale, preserves the iron, increase the capacity of the boiler, and save a large percentage of fuel. It is also guaranteed that International compounds are free from all acids or other materials effecting a corrosive or injurious reaction on the boiler metallic surfaces.

THE MICA INSULATOR CO. has branch offices where its goods are carried in stock at Cincinnati, under the management of the Monroe Brass & Wire Co.; at St. Louis, under the management of A. S. Partridge; at Cleveland, with the George Worthington Co.; and at San Francisco, under the management of the Brooks-Follis Electric Co. These connections enable the company to quickly and easily distribute its materials in the respective territories.

THE GREEN FUEL ECONOMIZER CO., of Matteawan, N. Y., has been awarded a contract for what will be the largest installation of economizers ever attempted. The order is given by the Manhattan Railway Co. for its 100,000-h. p. plant in process of erection at 74th St., and East River, New York City. This order speaks well for the confidence held by the Manhattan engineers that the Green Fuel Economizer Co. is able to live up to all its guarantees.

J. A. FAY & CO., of 557 to 577 West Front St., Cincinnati, makers of wood-working machinery, have just issued a very handsome and complete illustrated catalog of 394 pages, showing the different machines they build, and they will be pleased to forward on application a copy to any firm or individual who is interested in this

class of machinery. A large number of the machines described have been patented in 1900, and embody the latest designs and inventions in the wood-working industry.

MR. THOS. G. GRIER, for a number of years advertising manager of the Western Electric Co., Chicago, has resigned and taken offices in the Williams Building, 200 Monroe St., Chicago, where he will represent several well-known houses, including the Nungesser Electric Battery Co., of Cleveland, the Wirt Electric Co., of Philadelphia, and the Dicke Tool Co., of Downer's Grove, Ill. The "Review" joins with Mr. Grier's many business acquaintances in wishing him complete success in his new work.

MR. F. J. DOWN, founder of the firm of Laing, Wharton & Down, of London, has severed his connection with this concern to establish a business of his own in London, for supplying electric traction and lighting specialties. Mr. Down has been connected with the electrical industry for 17 years and has the credit of first introducing into Europe, the Thomson-Houston system, and Okonite cables. He also obtained for Laing, Wharton & Down the European agencies of J. G. Brill Co., the Walker Co., and the Forest City Electric Co. His many friends in America and Europe will wish him every success in his new undertaking.

THE J. G. BRILL CO. has recently issued a circular, No. 65, descriptive of its sprinkling cars. The principal advantages of sprinkling the tracks are three in number: the increased pleasure riding which follows with abatement of the dust nuisance, the decreased wear of bearings by keeping the grit and dust out of them, and the improved electrical contact between wheels and rails when the latter are washed clean or are damp. These have been widely recognized by the managers of both urban and interurban roads. The Brill company is now making single truck sprinkling cars of 1,800 or 2,500 gallons capacity, the latter being the standard, and double truck cars of 5,000 gallons capacity.

MR. C. J. SMITH, known as Smith of New York, maker of car head lights and lamps, returned last month from a three months' trip abroad, having visited in order, Italy, Germany, France, England and Ireland, and secured substantial orders for his line of goods. Mr. Smith reports increased activity in street railway building in all these countries. He says that in Rome and throughout France the street railway business is being developed largely by Belgian engineers and very much of the equipment is of Belgian make. The office and shops of the Smith lamp works, at 350 Pearl St., have recently been improved by the placing of plate glass fronts on two sides of the ground floor; new floors have been laid and new machinery of modern design has been installed in place of part of the old equipment.

AN ENGINE BUILDERS' ASSOCIATION has been formed among the prominent builders of automatic cut-off engines in the United States. The objects of the organization are the promotion of the interests of the engine trade by the advancement of engineering knowledge among steam users; cultivating a better acquaintance among members of the engine building fraternity; co-operation in matters of mutual interest; comparing and standardizing methods; and improving the condition of employes and the service to the public. The officers for 1900 are: President, J. E. Sweet, Straight Line Engine Co., Syracuse, N. Y.; vice-president, W. M. Taylor, Chandler & Taylor Co., Indianapolis; treasurer, H. L. Ide, A. L. Ide & Sons, Springfield, Ill.; secretary, S. F. Bagg, Watertown Engine Co., Watertown, N. Y.

THE MORRIS ELECTRIC CO., 15 Cortlandt St., New York, has within the past few weeks received orders from foreign countries for electrical equipments and supplies aggregating \$500,000 in value. These include the contract from the Havana (Cuba) Electric Railway Co. for feed wire to the value of \$200,000; 45,000 ft. of iron stranded wire and 100,000 ft. of plain wire; 2,200 iron trolley poles, valued at \$85,000; 60 carloads of terra cotta conduits; and all the brackets and other supplies for 54 miles of overhead work. Other orders have been received from the Mexico City Electric Ry., the Lisbon Tramways Co., of Lisbon, Portugal, I. & O. Braniff & Co., of Mexico, Sao Paulo (Brazil) Electric Light & Power Co., Buenos Ayres (A. R.) Electric Tramway Co., Laing, Wharton & Down, Ltd., of London, and from South Africa and Italy.

SANS SOUCI PARK OPENED.

Sans Souci Park, Chicago, was opened for the summer season on May 27th. Although the weather for the first week was stormy the average attendance since the opening day has been very satisfactory, proving that this South Side resort is as popular as ever. The attractions for the first part of the season include light vaudeville, Chicago Marine Band, a camp of Indians, shooting galleries, temple of palmistry and others. The most noticeable change about the park is the removal of the circular band stand that was formerly located near the front of the Casino and the erection of a new one at the west side of the grounds. This arrangement greatly improves the general appearance of the park. The park during the coming season will be under the management of Mr. Alfred Russell. Sans Souci was described in the "Review" for Mar. 15, 1899, page 202, and June 15, 1899, page 422.

INCREASED WAGES FOR EMPLOYEES.

The Milwaukee Electric Railway & Light Co. on June 1st voluntarily increased the pay of motormen and conductors approximately one cent an hour. Under the old scale the men for the first six months received 15 cents per hour; for the second six months, 16 cents; for the second year, 17 cents; and an increase of one cent per hour for each succeeding year until after the fifth year of their service when they earned 20 cents per hour. The new rule gives the men 17 cents per hour during the first year, 18 during the second, 19 during the third and 20 during the fourth year and thereafter. About 600 men are affected by the change.

Employes on the Albany division of the United Traction Co., of Albany, N. Y., will hereafter receive the same wages as are paid to the Troy division men. The scale is 20 cents an hour for regulars and 18½ cents for all trippers.

The Columbus (O.) Railway Co. on May 23d raised the wages of its 400 motormen and conductors as follows: the three-months men from 15 to 15¼ cents per hour; the nine-months men from 15¾ to 16¼ cents. Employes that have been with the company for one year or over will receive 17¼ cents per hour.

A new scale of wages has been put in force by the receivers of the Superior Rapid Transit Co., of West Superior, Wis. The men formerly received 14 and 15 cents per hour according to the term of service, but will now be paid 17 and 18 cents per hour.

The Sacramento (Cal.) Electric Street Ry. on June 1st increased the wages of its trainmen. Hereafter, men who have been in the service less than two years will receive 18 cents per hour; those who have served for more than two and less than five years, 19 cents; for from five to eight years, 20 cents; more than eight years, 21 cents.

The Pawtucket Street Railway Co., of Providence, R. I., has reduced the number of hours of work required of employes from 12 to 10½ per day. No reduction is made in wages.

C., H. & D. HOMESEAKER'S EXCURSION.

On June 19th the C., H. & D. Ry. will sell special excursion tickets to those desirous of seeking homes in the West, South and Northwest. Call on nearest C., H. & D. agent for particulars.

THROUGH COLORADO.

The "Scenic Line of the World," the Denver & Rio Grande R. R., offers to tourists in Colorado, Utah and New Mexico the choicest resorts, and to the trans-continental traveler the grandest scenery. Two separate and distinct routes through the Rocky Mountains, all through tickets available via either. The direct line to Cripple Creek, the greatest gold camp on earth. Three trains each way daily with through Pullman palace and tourist sleeping cars between Chicago, Denver, San Francisco and Los Angeles, and Denver and Portland. The best line to Utah, Idaho, Montana, Oregon and Washington via the "Ogden Gateway." Dining cars (services a la carte) on all through trains. Write S. K. Hooper, G. P. & T. A., Denver, Colorado, for illustrated descriptive pamphlets.

CHAS. J. MAYER, President. A. H. ENGLUND, Sec'y & Treas.

THE MAYER & ENGLUND CO.

10 SOUTH TENTH STREET, PHILADELPHIA, PA. NEW YORK OFFICE: 85 LIBERTY STREET.

CABLE ADDRESS: "MAYLUND" Philadelphia. A. B. C. Code, 4th Ed.

Electric Railway Material and Supplies of Every Description.

We are exclusive Territorial Representatives of the following leading Manufacturers of Railway Materials:

R. D. Nuttall Co., Gears, Pinions, Bearings, Trolleys, Etc.	Allegheny, Pa.	The International Register Co., Single and Double Fare Registers.	Chicago, Ill.
Van Wagoner & Williams Hardware Co., Dropped Forged Copper Commutator Segments.	Cleveland, O.	W. T. C. Macallen Co., Standard Overhead Insulating Material.	Boston, Mass.
The Protected Rail Bond Co., "Protected" Flexible Rail Bonds.	Philadelphia.	Bradford Kelting Co., "Monarch" Insulating Paint.	Cincinnati, O.
American Electric Heating Corporation, Electric Car Heaters of Every Design.	Boston, Mass.	Sterling Varnish Co., Sterling New Process Insulating Varnish.	Pittsburg, Pa.
Chisholm & Moore Manfg. Co., Moore's Chain Bolts.	Cleveland, O.	Garton Daniels Electric Co., Garton Lightning Arresters.	Keokuk, Ia.
New York & Ohio Co., "Packard" Incandescent Lamps.	Warren, O.	D. & W. Fuse Co., Enclosed Non-Arching Fuses.	Providence, R. I.

Special Agents: AMERICAN ELECTRICAL WORKS, Providence, R. I.

We carry the largest stock in this country of Strictly Electric Railway Material.

We are now occupying our entire building, five floors and basement.

Special Attention Given to Export Business.

Send for Catalogues.

NEWS NOTES.

FRANCHISES ASKED.

COLUMBUS, O.—The Central Market Street Railway Co., which has been newly organized, has filed an application for franchises through Columbus streets with the city clerk. The application is signed by Dr. S. B. Hartman, who is the principal promoter of the enterprise.

CAMDEN, N. J.—F. R. Hamsell, G. H. B. Martin and W. F. Eidell have incorporated the United States Electric Railway & Light Co. to construct and equip electric railways. The company is capitalized at \$125,000.

FOND DU LAC, WIS.—The Wisconsin Rapid Transit Co. has been incorporated with a capital stock of \$25,000 by H. G. and C. D. Smith and R. S. Wilkins. Its principal promoter, C. D. Smith, of Fond du Lac, is also interested in the proposed electric line to connect Fond du Lac with Algoma.

EAST LIVERPOOL, O.—J. F. Spence and H. G. Folts of Lisbon and Morris French of East Liverpool are reported to be promoting an electric line to connect East Liverpool with Salem by way of Lisbon. Surveys of the proposed route have already been made.

KENOSHA, WIS.—It is reported from Kenosha that Alderman John Serhson of the street railway committee of the City Council has been authorized by Patrick Maynes and Gustave L. Clauson, of Chicago, to make an offer of \$25,000 for the street railway franchise through the city. It is believed that if the company will give proper bonds the proposition will be accepted. It is also reported that the Milwaukee Electric Railway & Light Co. and the Chicago & Milwaukee Electric Co. beside others not yet named, will be contestants for the franchise.

GEORGETOWN, MASS.—The Essex County Street Railway Co. petitions for a franchise to make extensions of its line in South Georgetown, thereby connecting with the Haverhill, Georgetown & Danvers line, the ultimate purpose being to furnish direct service from Haverhill to Salem.

DES MOINES, IA.—The Des Moines & Northern Iowa Railway Co., capitalized at \$50,000, has been incorporated to build an electric railway from the southern to the northern boundaries of Iowa, through Des Moines. Incorporators are Arthur Reynolds, N. E. Coffin, J. H. Blair, J. H. Phillips and I. K. Wilson, all of Des Moines.

PERU, IND.—Nat Covington of Peru has applied for a franchise for an electric line 20 miles long to connect Peru and Converse, by way of Peoria, Santa Fe, McGrawsville, Amboy and North Grove. The project is said to meet with popular approval and will be pushed rapidly to consummation. The plans include a summer resort at the Cliffs, midway on the route. Mr. Covington until recently was the owner of the local electric lighting plant.

SPRINGFIELD, MASS.—Articles of incorporation for the Hartford (Conn.) & Springfield (Mass.) Street Railway Co. will be applied for. The company has been organized under the laws of Massachusetts with a capital stock of \$50,000. A temporary board of directors has been chosen, comprising John Oldroyd, of Agawam; H. Stacy, C. F. Munder and H. S. Anderson, of Springfield; Thos. C. Perkins, of Hartford; Fred Hines, of Newton, Mass., and

Charles H. Wilson of Brookline. Franchises will be applied for at once in Springfield and Agawam.

KANSAS CITY, KAN.—The Kansas City & Olathe Electric Railway Co., capitalized at \$1,000,000, has been incorporated and projects an electric railway between Kansas City and Olathe. F. R. Ogg, H. C. Livermore, J. S. Pettijohn and H. G. Hodges, of Olathe; James E. Tyron and G. T. Moore, of Kansas City, and D. B. Dyer, of Augusta, Ga., directors. The main office of the company will be located at Lenexa, half way between Kansas City and Olathe.

HEMPSTEAD, L. I.—Articles of incorporation have been filed by the Queens Borough & Nassau Electric Railway Co., which proposes to operate a seven-mile electric line from Hempstead to the former village of Queens. The capital stock is \$150,000. Daniel Noble, Long Island City, and Henry P. Keith, of Hempstead, are among the directors.

COLUMBUS, O.—The Columbus, Mechanicsburg & Urbana Railway Co., through H. A. Axline and Colin McDonald has made application for a franchise from Columbus, through Dublin to the county line. The application stipulates that work on the line shall be commenced before Sept. 15, 1901.

HAVERHILL, MASS.—Col. Charles F. Woodward, of Wakefield, is interested in the organization of the Haverhill & Andover Street Railway Co. with a capital stock of \$80,000. It is proposed to build an electric railway from Haverhill to Andover via North Andover, connecting with the Lowell, Lawrence & Haverhill Street Ry. at the three points mentioned, as well as the new line being built between Andover and Reading.

LIGONIER, IND.—Hon. P. A. Randall of Fort Wayne, Ind., is promoting a project to build an electric railway to connect Ligonier and Fort Wayne. It is reported that the project receives the support of the business men of both cities.

BEATRICE, NEB.—It is reported that the Beatrice Electric Co.'s street railway in that city will again be put in operation. E. J. Sullivan, manager. The Kansas City & Oklahoma Construction Co., having headquarters in Kansas City, also projects building a street railway in Beatrice. A franchise has been applied for.

ROCKVILLE, MD.—The Rockville & Washington Electric Railway Co. proposes to extend its line into the corporate limits of Rockville. A franchise will be applied for by the company's attorney, H. Maurice Talbot, of Rockville.

NEWARK, N. Y.—The Newark & Marion Railway Co. has been incorporated with a capital stock of \$100,000, to construct an electric railway from Newark to Marion. The road will be eight miles in length. The directors of the company are: Ernest V. Pierson, Frank D. Burgess, W. H. Nicholas, William H. Kelly, of Newark; Caleb L. B. Tylee, William C. Snow, Clinton N. Tylee, of Penn Yan, and Henry R. Sil, of Bluff Point, N. Y.

LENOX, MICH.—An electric railway, 44 miles long, is projected to be built from Lenox through Memphis, Emmett, Brockway, Yale and Peck to Sanilac Center. Franchises have been applied for. G. R. Lovejoy, of Lenox, is the principal promoter.

WHITINSVILLE, MASS.—The Uxbridge & Blackstone Street Ry. is being organized and will apply for a franchise to build an electric line from Whitins-

ville to Millville, a distance of nine miles. The company is capitalized at \$80,000. John E. Sayles, of Uxbridge; M. P. Burbank, of Whitinsville, and T. S. Johnson, of Worcester, are interested.

NIAGARA FALLS, ONT.—The Falls View & Chippewa Electric Railway Co. is being organized, and proposed to build a line between the cities named. B. R. Paine, Niagara Falls; Martin Comstock, Buffalo; and Edward Baxter, Fort Erie, are the promoters.

POTTSVILLE, PA.—The Pennsylvania Railroad Co. projects the building of an electric branch from Pottsville to Primrose and from Minerville to Forestville, a total distance of 12 miles.

KANSAS CITY, KAN.—The projected Kansas City, Rosedale & Argentine electric railway is being promoted by ex-Congressman Mason S. Peters, who will apply for a franchise.

RUSHVILLE, IND.—The Indianapolis, Morristown & Rushville Traction Co. proposes to parallel the Cincinnati, Hamilton & Dayton Ry. between Indianapolis and Rushville with an electric line. J. H. Mahoney, ex president of the Indianapolis city council; Edward W. Little and Dr. J. N. Navin are interested. The company has a right of way to Rushville and will put surveyors to work as soon as the franchise is granted.

AMSTERDAM, N. Y.—The Amsterdam & Haganan Traction Co. has been incorporated with a capital stock of \$200,000 to build a five-mile line from Amsterdam to Haganan. Among the directors are William K. Archbold and Robert R. Reid, of New York; Robert E. Drake, of Syracuse, and Lewis E. Harrower, of Amsterdam.

MANCHESTER, ME.—It is reported that A. F. Gerald, of Fairfield, who has just completed the Togus, Me., street railway, is promoting a project to connect Bangor, Manchester and Winthrop by an electric line.

VALLEJO, CAL.—J. N. Patterson has petitioned for a franchise for a street railway, to be operated by electricity or other power, in Vallejo. Application for a franchise was made through L. G. Harrier, attorney.

HOMESTEAD, PA.—The Homestead Belt Line Street Railway Co. has been organized and will apply for a franchise to build a four-mile electric line through the city. T. L. Parry, president; Louis Rott, secretary; H. P. Wiggins, John E. Jones and J. F. Milliken, directors.

FLORENCE, TENN.—The Florence Street Railway, Lighting & Power Co., capitalized at \$150,000, has been incorporated and proposes to build an eight-mile electric line in Florence, three miles of which will be completed and in operation within 15 months. A franchise has been granted E. A. Schubert and others, of Fostoria, O.

HOT SPRINGS, ARK.—The Commercial Club of Mena, Ark., is promoting an electric line to connect Mena and Hot Springs. J. H. Hamilton, N. M. Terry, and J. D. Shaver, of Mena, have been appointed as a committee to make preliminary arrangements for the road's construction.

DAYTON, O.—The Dayton & Northern Traction Co. has been incorporated with a capital stock of \$400,000 and proposes to build an electric line from Dayton via Brookville & Arcanum to Greenville. Dr. L. E. Lowes, of Dayton, is the principal promoter.

TOLEDO, O.—The Valley Electric & Power Co., capitalized at \$100,000, has filed incorporation papers, application being made by W. B. Taylor, G. K. Detwiler, A. K. Detwiler, H. E. King and T. H. Tracy.

FAIRMONT, W. VA.—H. S. Sands, of Wheeling, and C. S. Sands, of Clarksburg, W. Va., are promoting an electric railway to be built in Fairmont.

RICHMOND, VA.—J. H. Mulholland, of Richmond, is securing capital for the construction of a seven-mile double track electric line to be known as the Westhampton Park Ry.

COLUMBUS, O.—The Suburban Electric Railway Co., of Columbus, capitalized at \$150,000, has been incorporated by P. Jones, G. W. Dunn, E. Denmead, A. L. Thurman and A. W. Field.

COPENHAGEN, N. Y.—A. L. Stoddard, of Whitesboro, N. Y., is reported to be promoting an electric railway from Copenhagen to Lowville, the power to be furnished from High Falls.

ELIZABETH, N. J.—Henry H. Isham is promoting a new electric railway in Elizabeth to be known as the Suburban Line. Mr. Isham was the organizer of the Elizabeth street railway, subsequently acquired by United States Senator John Kean.

NEW YORK, N. Y.—The Elm Street Connecting Railway Co., capitalized at \$20,000, has been incorporated and proposes to build a line 6,000 ft. long in Elm St. Any power but steam may be used. Charles E. Warren, Sharon Graham, William A. Dibbs, Mark J. Martin and Henry L. Jeffries, of New York City, and D. E. Clifford Moorehead, of Jamaica, L. I., are among the directors.

PROVIDENCE, R. I.—The Providence & Fall River Street Railway Co. has been incorporated with a capital stock of \$200,000, fully subscribed, and proposes to build an electric line between Providence, R. I., and Fall River, Mass., a route which will aggregate 14 miles of railways in Massachusetts. The promoters are James T. Shaw, of Brookline, Mass., E. P. Shaw, of Newburyport, and E. P. Shaw, Jr.

BANGOR, ME.—It is reported that the Penobscot Central Railway will be extended this summer to Pushaw and other neighboring resorts. E. J. Emery, purchasing agent.

WASHINGTON, D. C.—The Washington City Transportation & Power Co., capitalized at \$5,000,000, has been incorporated in West Virginia by M. A. Nobles, Samuel M. Hineman, John J. Boardman, Thomas W. Jenkins and Herbert McCann, all of Philadelphia. It is proposed to build a rapid transit system in the city of Washington and suburbs.

CAMDEN, N. J.—The project of the Camden & Suburban Railway Co. to extend its line in Haddon Ave., thus affording a direct service from Camden to Haddonfield, has been revived and franchises for a double track extension have been applied for. Property owners along the route have also presented petitions to the city council praying that the franchise be granted. W. E. Harrington, manager.

BALTIMORE, MD.—The United Railways & Electric Co. has an application before the city council for certain extensions within the city, and the right to double track a portion of its route. William A. House, manager.

ROHERSTOWN, PA.—William F. Sadler, Jr., secretary of the Trenton (N. J.), Lawrenceville & Princeton Railroad Co., represents a New York syndicate which proposes to build a number of electric lines through Lancaster County, Pa. Application for franchises has been made, and the routes partially surveyed. The first of the projected railways will connect Rohers-town, Silver Springs, Mount Joy, Elizabethtown, Columbia and Marietta.

CLEVELAND, O.—The Portage Lake Traction Co., of Cleveland, has been incorporated with a capital of \$10,000, by David M. Glasscock, Carl H. Nau, Henry Laneefield and Charles L. Stocker. An electric line will be built to connect Cleveland, Ravenna and Kent.

COLUMBUS, O.—Hon. Paul Jones, whose connection with the newly incorporated Suburban Electric Railway Co. was noted in the "Review" bulletin June 4th, is reported to be also promoting a new interurban line to extend from Hilliards to Columbus by way of Arlington.

TOLEDO, O.—The Victory Park Railway Co. has been incorporated with a capital stock of \$50,000, to operate an electric railway on Put-in-Bay Island. Frank Caughlin, Charles W. Ryan and Frank J. Arbuckle, Toledo, incorporators.

HAMILTON, O.—The Hamilton & Lindenwald Electric Transit Co. proposes to operate a line through East Hamilton, and has applied for the necessary franchises. Consents of property owners have been secured. Ira S. Milliken, purchasing agent.

JOLIET, ILL.—The Joliet Railroad Co. has petitioned the city council for franchises through certain streets of Joliet and the right to locate additional switches, tracks and turnouts, for which privileges it proposes to pay the city \$5,000. F. E. Fisher, general manager.

WAUKEGAN, ILL.—The Waukegan, Fox Lake & Western Railway Co., capitalized at \$100,000, has been incorporated. R. D. Wynn and Richard Cole, of Waukegan, are believed to be promoting the line.

CHICAGO, ILL.—The Illinois & Rock River Railway Co., capitalized at \$1,000,000, has been incorporated by Ephraim Banning, Thomas Banning, T. C. MacMillan, A. F. Milliken and G. E. Plumb, all of Chicago. It is the immediate intention of the company to build a 64-mile railway along the Rock River from Sterling to Rockford, which will later be extended into Wisconsin through Beloit and Janesville, to aggregate about 125 miles. Either the overhead trolley system or compressed air will be used, and if the former, motors of unusual size will be purchased. The transportation of freight will be an important feature of the business, and it is desired to have the Sterling-Rockford line in operation by early spring. Surveys of the route have already been made. It is announced that G. E. Plumb will be president and Ephraim Banning counsel for the company. Mr. Plumb may be addressed at 205 La Salle St., Chicago.

LIBERTYVILLE, ILL.—The Chicago, Fox & Geneva Lake Electric Railway Co., capitalized at \$100,000, has been incorporated by F. V. Bissell, Oak Park, Ill., and Clayton Cunningham, Charles A. Hill, K. S. Holmes, Albert A. Patterson and George D. Hale, Jr., Chicago, who also comprise the board of directors. An electric railway will be constructed from the east line of Lake County, Ill., to a point in McHenry County on the Illinois-Wisconsin state line. Headquarters of the company will be established at Libertyville.

OGDEN, UTAH.—The Ogden Rapid Transit Co., capitalized at \$100,000, has been incorporated to build street railways in Ogden and suburbs, using electricity, compressed air or other motive power. D. Dee, George H. Matson, J. W. F. Volker and David Eccles are promoters.

RIGHTS OBTAINED.

LANCASTER, PA.—The Conestoga Traction Co. has secured all rights of way for a 15-mile extension of its line from Lancaster to Ephrata and construction will be commenced at once. It is estimated that the line will cost \$200,000. Frank S. Given, manager.

DUQUESNE, PA.—A charter has been issued to the Duquesne & Dravosburg Street Railway Co., capitalized at \$12,000, to build an electric line two miles long from Duquesne through the borough of Dravosburg. The promoters are L. G. Woods, Pittsburg, president; J. H. Gross, John Hoffman, J. H. Miller and John F. Rodgers, all of Pittsburg.

SALT LAKE, UTAH.—The Salt Lake Valley Railway Co., whose incorporation and project to build an electric railway to Ogden, Utah, were noted in the "Review" bulletin February 16th, has secured a franchise from the city council at Salt Lake to operate the proposed line in that city. T. W. Naylor and William P. Hemphill of Salt Lake are concerned.

ALLEGAN, MICH.—The township board has granted a franchise to David Cornwall of Monterey and Milton D. Owen of Allegan for an electric railway through the township. The projectors also hold franchises through Monterey and Salem, and have applied for rights through Ottawa County. They propose to build a 21-mile line to connect with the projected Grand Rapids-Holland Ry., to carry both passengers and freight, through a populous district remote from steam railways. The franchises include the right to establish electric light and telephone lines through the same territory.

LEAVENWORTH, KAN.—A franchise has been granted the Leavenworth Electric Railway Co. to make several extensions of its system in Leavenworth for the purpose of bringing the Kansas City-Leavenworth Railway Co. into the business district of the city. E. E. Coombs, manager.

HARRISON, N. Y.—The Larchmont (N. Y.) Horse Railway Co. has been granted a franchise to extend its line through Harrison to connect with the Port Chester Ry. on the east. It has been announced that the Larchmont lines will be operated by electricity in the place of horses. E. F. Campbell, superintendent, Larchmont.

WALTHAM, MASS.—The Waltham Street Railway Co. has been granted a location of tracks through South Weston, Main, Prospect, Crescent, Maple, Moody and High Sts. to the Newton line. The road is to be completed before Dec. 1, 1900.

CORRESPONDENCE.

We cordially invite correspondence on all subjects of interest to those engaged in any branch of street railway work, and will gratefully appreciate any marked copies of papers or news items our street railway friends may send us, pertaining either to companies or officers.

DOES THE MANAGER WANT ANYTHING?

If you contemplate the purchase of any supplies or material, we can save you much time and trouble. Drop a line to THE REVIEW, stating what you are in the market for, and you will promptly receive bids and estimates from all the best dealers in that line. We make no charge for publishing such notices in our Bulletin of Advance News, which is sent to all manufacturers.

This paper is a member of the Chicago Trade Press Association.

Entered at the Post Office at Chicago as Second Class Matter.

VOL. X.

JULY 15, 1900.

NO. 7

The Brooklyn Rapid Transit Co. is to be congratulated upon its success in securing the conviction of three of the men charged with conspiring to depress the market value of its securities by circulating false reports. While the sentences imposed on the men were very light, and their punishment in no sense commensurate with the damage done by them, yet the example will probably deter others from similar conduct.

The decision of the Supreme Court of New York, mentioned in our issue of March, 1899, dismissing an action brought to prevent electric lines on Long Island from running freight and express cars, has been affirmed by the Court of Appeals. In the decision of the Supreme Court Judge Marcan used this language: "The public having discovered that the transportation of freight can be made more economically than by former methods there is no meritorious reason why it should not enjoy that advantage."

Apropos of Mr. Lindley's recommendation that electric railways should be brought under the jurisdiction of the state railroad commissioners and required to file periodical reports, as are the steam railroads, it is stated that in those states where this has been done—Massachusetts, Connecticut, Rhode Island, New York and Pennsylvania—the electric railways are prosperous, the relations between the railways and the municipal and state authorities most amicable and the agitation for municipal ownership less violent.

Our English contemporary, *Lightning*, of London, discusses the comments in our April issue on the reduced rates put in effect by the Hamilton & Lindenwald Electric Transit Co., of Hamilton, Ohio, and also our review of the decisions of the United States courts in the various cases where they have passed upon the validity

of law for compelling a reduction in street railway fares. The editor of *Lightning* unfortunately made the error of locating the Hamilton & Lindenwald road in Ontario instead of Ohio, and consequently his strictures on the ultra conservatism of Americans are misplaced. We really have no desire for Canadians to regulate their conduct in accordance with the "intricacies of the much vaunted American constitution." Ohio companies have to do this, however.

The daily press of Detroit is full of comments on the fact that the street railway companies of that city which wanted to sell to the Pingree commissioners for \$16,800,000 now object to the valuation of \$10,247,000 placed on the property by the assessors. The valuation for taxation last year was \$2,600,000 and the value as reported by the companies' officers in March last was \$1,101,115. Of course if the properties were worth the price asked for them a year ago they are worth as much now, but it must be remembered that the company has debts as well as assets. The bonds issued by the three "Johnson" companies aggregate \$15,465,000, so that when this sum is subtracted from the selling valuation of \$16,800,000 the difference, \$1,335,000, is not far from the valuation as returned. The assessment of \$10,247,000 is an attempt to tax the company on its debts, an unreasonable proceeding since the owners of the bonds are also subject to taxation on the same property.

About once every so often we see that a legislature or a city council has a bill under consideration providing that passengers in street cars who cannot find seats shall only pay 2½, or 3 or 4 cents as the case may be. Such bills seldom get farther than a committee, and it is not often that the street railway men find it necessary to present arguments to show the absurdity of such plans to meet the conditions they are supposed to remedy. The "low rate for standing passengers" idea appears to have taken a firmer hold on the San Francisco supervisors than is usually the case and Mr. Clayton, secretary of one of the companies affected, considered the passage of the ordinance so imminent that he appeared before the committee having it in charge and presented a long argument against it. The main points Mr. Clayton made are abstracted on another page of this issue and will prove of value to others who may be similarly situated in the future.

There is only one remedy for the crowded street car, and that is to adopt the European practice of limiting the number of passengers permitted to board the car. But this remedy is worse than the disease, as the more progressive English companies are beginning to realize.

The paper on "The Functions of Modern Tramways" read before the gathering of English tramway managers at the exhibition in London, throws an interesting side light on several conditions on the other side. Mr. John Young, who is the manager of the Glasgow system, refers to the democratic tendency of the modern tramway and predicts the same solution of social evils resulting from tenement crowding as has been worked out here. He pointedly remarks the lack of consistency on the part of city authorities which allow the speed of a hutch's cart to be restricted only according to the judgment of a policeman, while gentlemen may drive their dogcarts at 12 miles an hour and autos at 14 to 16 miles, while the electric car, by far the most easily controlled of any of these, is restricted to eight miles an hour. He rightly states that under this condition the modern tramway cannot confer its greatest benefits.

He also combats the popular idea over there as to the congestion of streets by the running of cars, and describes Broadway in New York under the system of bus transportation and with its present improved transit. In Glasgow electric cars stop at points designated by signs which are on an average of 600 feet apart.

In reference to the increasing of American trade abroad much has been said concerning the necessity of sending letters, catalogs and other printed matter in the language of the country it is desired to canvass, but too much emphasis cannot be laid on this requirement, as United States consuls continue to report they are constantly receiving for distribution from American firms handsome and expensive catalogs, which are absolutely worthless for the reason that they are printed in the English language. Makers of electric railway materials desiring to extend their foreign trade

should particularly consider this point and put forth every effort to approach foreign tramway managers under the conditions to which they are accustomed, for English and European dealers are making strenuous endeavors to regain some of their lost prestige in this field and secure for themselves the business that has been coming to America. The Germans seem to be taking the lead in this respect and are exhibiting an activity that would do credit to Americans. The German way, when introducing goods into a new district or country, is first to mail to every possible buyer letters and attractive catalogs in the proper language; and they invariably send a representative to complete the work. It is the necessity of taking this latter step that prevents many of our medium sized supply houses from enjoying an export trade which they unquestionably would have if their goods were better known by foreign managers.

The difficulty has been partially overcome in a number of cases by making agency connections with established dealers in the countries it is desired to reach and by various commercial bureaus, but arrangements of this kind, while good if they are the best that can be made, are never as satisfactory as direct personal representation by special agents. To secure this personal representation, it has been suggested that a few of the smaller houses not in direct competition with each other could with profit club together to support one good traveling representative speaking Spanish, French and German, who would carry samples and be able to explain fully the merits and advantages of the goods he was handling. Some pooling of interests in this way could be made of advantage to all concerned and especially so when dealing with territory where the possible business has not yet reached large proportions.

Again, it should be remembered that it is usually hard for a foreigner to understand the somewhat complicated American system of discounts and when prices are quoted in letters or catalogs they should always be given net. It is also well to add as full information as possible relative to the cost of shipment in order that the enquirer may compute just how much the material will cost delivered at his door.

It must also be remembered that foreigners usually expect long credit, often from four to six months, and if a firm is not prepared to give this it is almost useless for it to attempt an export business. Ratings may be secured through the consular service or from any one of a number of established rating agencies.

It is usually considered that the discussion of political questions is entirely outside the province of a technical journal and this is true of the ordinary political issues. Silver is not an ordinary issue. It is a matter of small moment to the street railway man, as such, whether the United States retains the Philippines or annexes Cuba, though doubtless he has convictions on those subjects. The tariff was defined by General Hancock to be a local issue, and many of both parties now agree with him though the statement lost him many votes at the time it was made. Pensions and militarism and the Boer war may furnish much good campaign material from the politician's standpoint, but they are outside our field. It may even be said that any or all of the issues between the two great political parties of this country, with the single exception of the silver question, might be decided either way and after a comparatively short time for the country to become adjusted to the new conditions the street railway industry would not be in the least affected. But this is not true of silver.

The avowed objects to be secured by the free coinage of silver at the ratio of 16 to 1 are two: First to enable debtors to scale debts contracted on a gold basis. Second, to increase the prices of all commodities. The merchant, the manufacturer, and the farmer, in event they succeeded in weathering the financial panic that would surely follow a change from our present gold basis, might not suffer from the appreciation of prices, because they could get more for the commodities they have to sell. How different is the street railway company, which would have to pay increased prices for all it bought and could only demand the old rate for the rides it had to sell. We all know how Milwaukee, Cleveland, Detroit, Indianapolis or San Francisco would look on a proposition to permit their respective street railways to charge a 10-cent fare.

The problem of paying the company's gold bonds would interest the officers and stockholders and cause them many sleepless nights, but the employes would suffer even more. The nominal sum available for wages, by far the largest item in the cost of operation, would be reduced because of the appreciation of materials and sup-

plies, and its purchasing power would be decreased. The street railway employe would surely suffer in two ways—he would be paid nominally less than at present and what he did get would be worth less in proportion than it now is. For these reasons we say that the great issue of the coming campaign as far as street railway men—from the president down to the track greaser—are concerned, is the silver question.

A few days ago the Democratic party declared its position in the following language:

"We reaffirm and indorse the principles of the national Democratic platform adopted at Chicago in 1896, and we reiterate the demand of that platform for an American financial system, made by the American people for themselves, which shall restore and maintain a bimetallic price level, and as part of such system the immediate restoration of the free and unlimited coinage of silver and gold at the present legal ratio of 16 to 1, without waiting for the aid or consent of any other nation."

The foregoing might be considered ridiculous were the advocates of these principles not in so deadly earnest. The silver plank quoted may be considered a symptom of the disease; the cause is hinted at in the following extract from an address delivered at Stevens Institute in 1898 by Col. H. G. Prout:

"For more than a century we have been taught that a capacity to do things fell upon us like a mantle with the Declaration of Independence, that the American does not need to be trained or disciplined to rule a nation, command an army, edit a paper or preach the gospel. * * * * This provincial conceit, born of ignorance and nursed by wrong teaching, is the greatest peril of the republic. If it is not restrained and cured it will ruin us.

"The Kansas farmer sits on his fence and spits and thinks and produces a system of finance, and his neighbors gather around, ignorant that the same thing has been tried and failed over and over again in the last five thousand years, and they shout, 'Behold the Kansas idea; behold the great American idea;' and they proceed to ruin the credit of the State, and one result is Bryanism."

After 56 days an agreement was concluded between the St. Louis Transit Co. and its former employes on July 2d which terminated the strike, but the settlement thus effected was only permitted to stand for a week and on July 9th the strike and boycott were renewed, but with no prospect of success as we go to press.

The agreement of July 2d was short, consisting of but six sections. The first section provided that the agreement made March 10th, last, and abrogated by the employes on May 4th, was to be continued in effect. The agreement of March 10th was that men who may have been discharged solely because they were members of the employes' union should be reinstated; that 10 hours, completed within 12 consecutive hours, should constitute a day's work, to be paid for at a uniform rate of 20 cents per hour; that men required to report at a specified hour should be paid from that time until relieved, those not put on duty receiving half pay until relieved; that shopmen, greasers, etc., shall be paid for overtime.

The last section of the new agreement related to the hiring of men by the company and provided that additional men as needed should be selected from a list of the men in the company's service on May 7th last; the men at work July 2d were not to be interfered with, and persons who had been guilty of any acts of lawlessness or violence were not eligible to this list. The fifth section provided that the company should meet any employe or committee of employes representing themselves, other employes, or an association of employes regarding matters of mutual interest. The other three sections recited that employes should be free to join or refrain from joining any association of employes, and provided that employes who should by threats or officials who should in any manner seek to induce a man to join or refrain from joining the union should be immediately discharged.

This agreement except in so far as it provided for what most persons would call merely a recognition of undisputed rights was nothing more than was secured by the agreement of March 10th. It is interesting to compare it with the demands made on May 4th, which were 26 in number. Four of these were covered by the agreement of March 10th; 7 related to minor questions of arranging work that could easily have been settled without trouble had they been presented separately; 1 provided for the submission of proposed time tables to the union for its approval; and the other 14 made membership in the employes' union compulsory and provided means for enforcing the agreement.

On the face of the agreement, therefore, neither the men nor the company had gained anything, unless the provision that while an employe might not use threats or force, an official might not use any influence whatever, be considered as a victory for organized labor. On the other hand the loss to both parties was enormous. The loss in wages alone to the men on a very conservative estimate amounts to more than \$200,000; the loss in gross receipts by the company is over three-quarters of a million, which means a loss of earnings from operation of over \$300,000. When there are added the cost to the city and county of maintaining order, or rather of trying to maintain order, and the losses suffered by business men, the cost of this strike becomes a matter of millions.

The total net income of the United Railways Co. (the lines operated by the St. Louis Transit Co.) for the year 1899, after deducting interest charges, amounted to only \$267,000. The directors of the company fully appreciated what a strike would mean to the stockholders, but the demands of the men left no choice but a fight and the loss had to be accepted, and it amounted to more than a year's profits.

The second strike—that of July 9th—has been ordered because it was alleged that the company had refused to keep faith as to re-employing the strikers. The company stated that no men other than those on the union's list had been put to work since July 2d, except those who had been contracted for and were virtually employes. This question the company offered to submit to the attorney for the strikers. Notwithstanding the protestations of the company that it had lived up to the agreement in spirit and letter, the strike and boycott were renewed.

The controversy having been thus unfortunately renewed, it is to be hoped that there will be no repetition of the disorder and violence accompanying the first strike.

A FEW HINTS ON CREATING PLEASURE TRAFFIC.

By J. W. Pickens, Excursion Agent, Columbus (O.), Ry. Co.

In conducting a successful street railway pleasure resort I do not think the manager should depend upon the population along his line alone for patronage, but he should endeavor to make his park draw from towns within a radius of 50 miles or even more. An excellent way to do this is to engage a man who has had experience in the railroad business and have him visit the surrounding towns and cities, calling on the secretaries of societies, superintendents of Sunday schools and other persons apt to be interested in giving picnics and outings, explaining to them the advantages of your park and booking their excursions wherever possible. The terms you can make will of course vary with different conditions. If the excursion is going to give you a large crowd that will patronize the street cars you can afford to give the use of your grounds free, but oftentimes societies will be glad to pay a reasonable amount for certain exclusive privileges at the park. A good scheme is to quote a lump sum for the grounds and for transporting a definite number of people in special cars from a railroad depot or other central point to the park and return. The Columbus Railway Co. is able to offer special inducements to out-of-town parties by an arrangement with the various steam railroads centering in Columbus, whereby special excursion rates are given to all fraternal orders, Sunday schools, churches and parties desiring to have an outing at either of our two parks.

It is best to have your traveling agent take the road not later than January 1st, and by the time of the opening of your resort he should have considerable business booked for the season. A great many managers make the mistake of opening their parks too early. Parks should not be opened before the first or middle of June, as the weather is not usually settled before that time, and a week of bad weather at the start is very discouraging.

In advertising for excursion business, illustrated booklets, setting forth the beauties of the park can be used with excellent results, but in getting out a book do not fill it with miscellaneous advertising matter. I have seen fine pamphlets in which the park illustrations were completely lost by reason of the number of advertising pages included. Of course, if you want to make your pamphlet earn money from the advertisements you can obtain for it, well and good, but if your idea is to advertise your park, then devote the book to the park, with possibly a few pages of local advertisements at the back to help pay the cost of cuts and printing. If you only

have 10 or 12 cuts, it is best to make your book of the size alone than to have 48 pages with twice the number of cuts, and fill the rest of the pamphlet with advertising matter.

Our attraction consist of a casino, merry-go-round, dancing pavilion, baby rack, cane rack, knife rack, bowling alleys and a toboggan slide. Our slide last year earned \$33 per day for three months. The cost for bath house, slide, toboggan and bathing suits was \$1,100.

Great care should be taken in the selection of attraction for the casino. I have found that vaudeville performances are the most profitable drawing cards I can obtain. Light opera will pay in a city of 200,000 population or over, but for summer resorts near small cities and towns vaudeville will prove the better investment. In order to conduct a park properly, and cater to the largest number of people, intoxicating liquors should not be permitted on the grounds.

NO STRIKE AT CINCINNATI.

After several conferences, the Cincinnati Street Railway Co. and its employes last month reached an agreement on all questions in dispute between them, and in view of the many strikes and boycotts that have been declared by street railway employes' unions during the past few weeks it is a pleasure to record this instance where a spirit of frankness and good will on the part of the company has been met with a like spirit on the side of the employes, and as a consequence, questions that threatened serious disturbances have been settled to the satisfaction of all concerned without straining the relations existing between the two parties.

Considerable dissatisfaction has of late arisen among the employes of the Cincinnati company, but the men decided against taking violent measures and to bring the questions at issue before the company, with the understanding that they did not desire to strike, but wished to have the points discussed and an amicable adjustment reached. President Kilgour courteously received his men and told them it had always been the policy of the company to do everything in its power for its conductors and motormen in the matter of compensation and lightening the burdens of their services, to an extent not inconsistent with the obligations and interests of the company. He then pointed out the injustice of one or two of the demands, but promised to give the matter the fullest attention. On June 9th he issued a long letter, of which the following is an abstract:

The Cincinnati Street Railway Co., after carefully looking over its business for the past fiscal year, terminating June 30, 1900, and comparing it with the year 1899, is satisfied that it can in justice to all parties in interest make an increase to its conductors and motormen in the matter of compensation. This increase will be in the form of a reduction of time of the working hours. Whereas heretofore and at the present the working hours have been 12 hours per day and compensation 16 2-3 cents per hour, with relief in the middle of the day for dinner and in the evening for supper, hereafter, the number of hours will be reduced to 10 1/2 hours, making the compensation 19 cents per hour. This will necessitate engaging 300 additional men to maintain the present service.

The company also modified its rules so as to permit employes to ride free on the cars when not in uniform by showing their badges. In addition to these changes it is said the company promised to arrange a system whereby employes will be paid a regular dividend on an amount equal to their annual wages at the same rate as the stockholders receive on their stock.

Shortly after the letter was issued President Kilgour received an appropriate testimonial from the men as an expression of their appreciation of his efforts in their behalf.

NEW ROAD IN COLORADO.

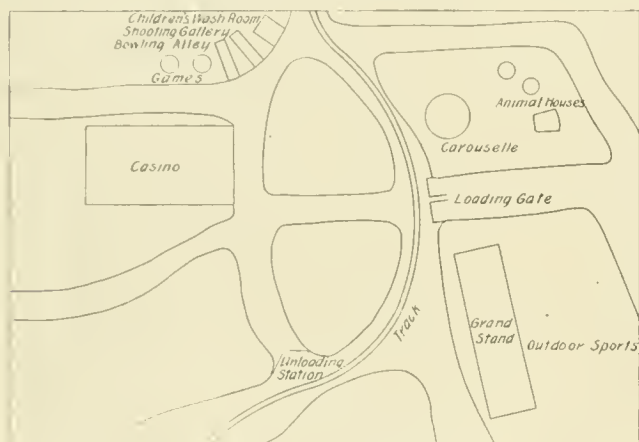

Mr. Thomas Carlon, of Denver, gives us the following information concerning the proposed Leadville (Col.) Street Ry.: It is the intention to connect Leadville with Stringtown, Bucktown, Malta and a noted pleasure resort at Evergreen Lakes; a good service will also be maintained in the city of Leadville. The road as now contemplated will be about eight miles long but will be extended later. A company will be incorporated in July and it is hoped to commence construction work by August 1st. Mr. Carlon's Denver address is No. 2737 Decatur St.

PARK ATTRACTIONS AT NASHVILLE, TENN.

The Nashville Street Ry leases 50 acres of fine park property situated seven miles out on one of its lines, and the company has gone extensively into the park attraction business, this department being under the supervision of a special manager, who engages all the vaudeville and musical attractions, and arranges special features for special occasions. The company does not deal with theatrical agencies exclusively, but advertises for and makes terms with suitable independent attractions wherever they can be found.

The resort, which is known as Glendale Park, is laid out as shown in the accompanying diagram. It contains a large two story casino, in which is a restaurant, a theater having seating capacity for 1,000, ice cream parlor, soda water fountain, etc. There are also ball grounds with grand stand which will seat 2,000, a carousel pavilion, a small zoo, shooting galleries and other side issues. Flower beds, rustic benches, shady walks, swings and good drinking water at convenient places add to the general attractiveness of the place.

The company engages for the season a brass band of 14 pieces, which gives free concerts every afternoon and evening, and an orchestra of 10 pieces for the vaudeville performances, which are given every evening, with matinees Tuesday, Thursday and Satur-

OUTLINE PLAN OF PARK.

day afternoons. The vaudeville attractions are changed at frequent intervals. Prices for reserved seats in the evening are 10, 20 and 30 cents, and for the matinee 10 and 20 cents. A number of free outdoor attractions are also given through the season, these consisting of high tight rope and trapeze acts, balloon ascensions, etc. The summer season opened April 15th and closes October 15th. The carousel was made by G. A. Dentzel, of Philadelphia, and has proved one of the best paying investments at the resort.

All correspondence in connection with the park and theater is written on special letter-heads, at the top of which appear the words in red ink, "Glendale Park," and just below in black ink are two or three lines describing the place. Down one side of the stationery is printed in display type the following notice, which gives an idea of the rules under which attractions are engaged:

"All parties contracting to play at this park are required to send billing and photos 10 days in advance. If this is not done you will consider your contract canceled.

"If you are in doubt of coming, do not write for time, as there are others who will be glad to come.

"Number of photos required—Enough for two frames, also lithos, etc., if you have them.

"If your act is not up-to-date you will be closed after the first performance, without pay."

The company operates a double track line to within one mile of the park, where the tracks separate into a large loop, on which the resort is situated, this arrangement giving excellent facilities for handling large crowds, as there is no delay in switching cars or turning the trolley pole. Mr. Yeatman C. Alley is manager of the park.

Mr. E. L. Sternberger and others of Jackson, O., are endeavoring to lease the bank of the Toledo canal, on which they propose to build an electric railway.

COPPER SAVING BY THE JOINT TRANSMISSION OF DIRECT AND ALTERNATING CURRENT.

Dr. Frederick Bedell presented a paper at the New York meeting of the American Association for the Advancement of Science, June 26th to 30th, in which he discussed the question of systems for the joint transmission of direct and alternating currents from the point of view of copper saving. The author states that no engineering obstacles arise to detract from the practicability and desirability of such a system. The requirement is a system of line distribution whereby independent alternating current and direct current generators may supply current to independent alternating and direct current apparatus, the alternating and direct currents being independent in their generation and utilization, and combined in their transmission.

That the two unlike currents may be transmitted over the same wire and in no wise interfere is thus explained: Suppose we have a direct current of 10 amperes and add thereto an additional ampere of like (direct) current. The whole current is now 11 amperes, which flows with uniform density in the conductor, so that the original current of 10 amperes has only 10/11 of the conductor for its use. An additional current of like kind, therefore, interferes with the original current. Let us now suppose that with an original direct current of 10 amperes, we have an added ampere of alternating current. Half the time this is of the same polarity as the direct current, and increases the current density in the conductor; but half the time the alternating current is opposite in polarity to the direct current, and during this time makes the total flow of current less and the current density less than for the direct current alone. In other words, the additional ampere of direct current interferes all the time with the original direct current; whereas the additional ampere of alternating current acts as a detriment for half the time, and as an assistance for half the time, these two effects tending to cancel.

Each current acts as if it had the whole conductor to itself, and hence the line loss depends on the sum of the squares of the two currents and not on the square of their sum. In a given conductor of resistance equal to R and two unlike currents I and i the losses are $R I^2 + R i^2$. If they were two like currents, the losses would be $R I^2 + 2 R I i + R i^2$.

Dr. Bedell presents tables showing the saving in line drop or in copper, showing that either may be as much as 50 per cent.

The conclusion is that since direct current can be transmitted on the whole more economically jointly with alternating current than separately, it follows that the radius of economic transmission of direct currents can be thus extended.

CONSPIRATORS FOUND GUILTY.

July 2d Alfred R. Goslin, Eugene L. Packer and Charles T. Davis were convicted in the criminal branch of the New York Supreme Court on the charge of conspiring to depress Brooklyn Rapid Transit stock. Henry Bogart, indicted for the same offense, was acquitted. It is alleged that one of the jury was offered a bribe of \$25,000 to hold out and prevent an agreement. The three men found guilty were sentenced on July 3d: Goslin was given six months in jail and a fine of \$500, and Packer and Davis each three months in jail and a fine of \$250.

FREIGHT ON STREET RAILWAYS.

The New York Court of Appeals has affirmed the decision of the Supreme Court rendered over a year ago in the suit brought by Mr. A. A. DeGrauw to prevent the Long Island Electric Railroad Co. from running special cars for freight and express. This is a victory for the railway company, whose plans are to transport freight over the trolley lines of Brooklyn, to and from the warehouses, factories, docks, and the like. The tracks will be used at night for that purpose.

A representative of the company states: "It is contemplated to extend the service over to Greater New York eventually. It is not possible to say when the project will go into operation, but work upon it will be rapidly progressed."

Power Station of the Northwestern Elevated Railroad, Chicago.

The power plant of the Northwestern Elevated Railroad Co., of Chicago, now approaching completion, is the sixth of the great stations for generating electric power which have been built by the Yerkes interests in developing the urban transportation systems of the north and west divisions of the city, and is no exception to the others in embodying the latest and best practice in all that is conducive to economical operation. The original plans for the mechanical features of this station were drawn by the late Mr. Salvador Potis, jr., who also designed the other Yerkes plants; the electrical

boiler rooms are at the same level, and the height from the floor to the bottom of the roof trusses, 38 feet 4½ inches, is the same in both rooms. The basement under the boiler room contains the smoke flues and the blow off piping, and the ash conveying machinery will also be placed there.

The three boiler feed water pumps, which are of the vertical duplex admiralty type made by the Henry R. Worthington Co., are in the basement just west of the stack.

South of the stack in the boiler room are two 2,000 horsepower Berryman feed water heaters; the condenser is between the stack and the partition wall of the building. The exhaust from the feed and air pumps is taken to these heaters, which may be connected in series or in multiple, one or both used, or both cut out.

One of the most interesting features of the boiler installation is the steam header which is shown in plan in Fig. 9. This header consists of six lengths of 28 inch wrought iron lap welded pipe

FIG. 1. EXTERIOR OF STATION.

equipment of the station was designed by Mr. J. R. Chapman, electrical engineer for the Yerkes elevated roads and for the Chicago Union Traction Co., and he has made some changes in the plans as first adopted. The engineer in charge of the work was Mr. Z. E. Knapp.

The building is on Fullerton Ave., near Southport Ave., about 3,000 feet west of the elevated structure and about midway between the two extremities of the line. It is of yellow brick with concrete roof and checkered steel floor. The outside dimensions of the building are 254 feet 10 inches by 112 feet; a longitudinal wall separates the boiler and engine rooms. The basement floor is 9 feet 4 inches below and the coping of the side walls 49 feet 6 inches above the street level. The basement is 12 feet 4 inches high, and extends under the entire building; it is finished in granitoid with a concrete floor. At the south end of the building the basement extends out to the curb line.

The boiler room is 50 feet 2 inches wide inside; it contains 12

FIG. 2. SWITCHBOARD.

with the flanges welded on; it is divided into three sections each about 50 feet long, and each of these sections is anchored near its middle point as indicated in the drawing.

The space between two sections is about 14 feet and across this is the expansion connection made of four U's of 8-inch steel pipe. The four U's enter a multiple cross-header at each end, and these cross-headers are each connected to the adjacent section of 28-inch pipe by a 16-inch Chapman gate valve. The branches to the engines are 8-inch for the small engine and 12-inch for the large ones. An auxiliary steam header 6 inches in diameter and tapping each

FIG. 3. PLAN AND ELEVATION OF STATION.

Babcock & Wilcox water-tube boilers set in batteries of two, with extended-front Murphy automatic smokeless furnaces. From the furnace front to the west wall is 13 feet, and behind the boilers is a passageway 4 feet 7 inches wide. The floors of the engine and

section of the main header is provided for the auxiliary machinery.

The feed water supply pipes are in duplicate and are carried on top of the boilers. The stems of those valves which are to be used habitually are connected through universal joints to long rods

which extend down to the front of the furnaces where they are within reach of the boiler room attendants.

The flue dampers being at the rear end of the boiler settings, Mr. Chapman designed an ingenious arrangement for manipulating

FIG. 4.—SECTIONS OF STEAM SEPARATOR.

them from the furnace front. The damper shaft from each boiler projects through the wall of the setting, and is fitted with a quadrant of gear teeth; meshing with the teeth of the quadrant is a worm, the shaft of which extends through the extended combustion chamber and in front of the boilers terminates in a handwheel.

The center line of the stack is 215 feet from the south wall of the building; when the extension ultimately contemplated is com-

FIG. 5.—ELEVATION OF WEISS CONDENSER.

pleted the building will be 430 feet long, with the stack in the center. The stack is 27 feet square at its base and rests on a foundation of piling, driven 30 inches between centers, on top of which is a concrete footing 31 feet square and 5 feet thick.

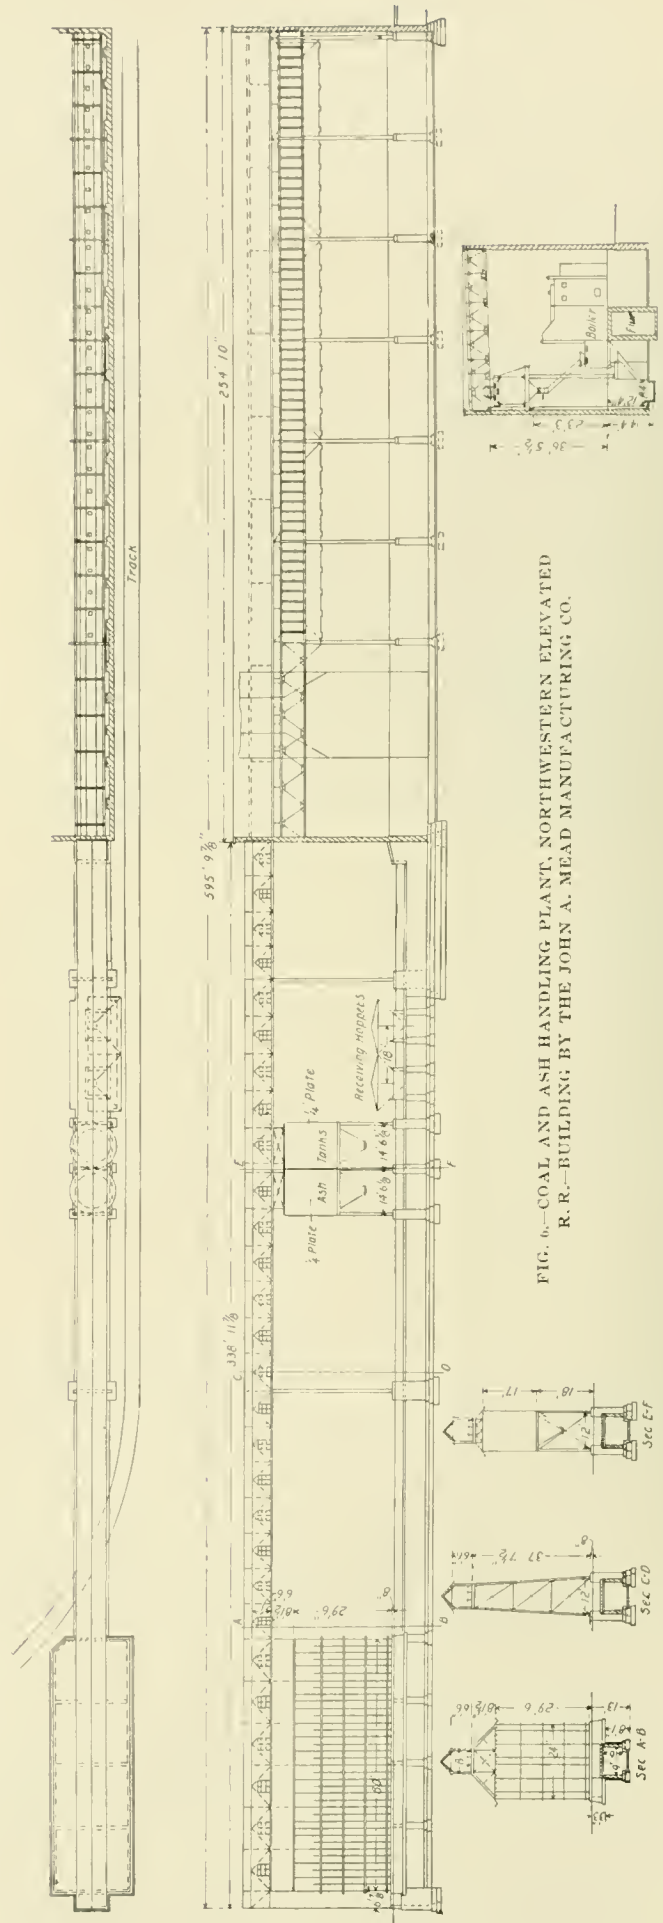

FIG. 6.—COAL AND ASH HANDLING PLANT, NORTHWESTERN ELEVATED R. R.—BUILDING BY THE JOHN A. MEAD MANUFACTURING CO.

At 35 feet above the ground the external outline of the stack becomes octagonal. The thickness of the walls is gradually reduced from 41 inches at the base to 13 inches at the top. The top has a cast iron hood; the internal diameter at the top is 16 feet and the short diameter of the external octagon 21 feet 3 inches. The total height of the stack above the street level is 203 feet and from the

forated plate which prevents the current of steam from coming in direct contact with the water accumulated in the separator. This horizontal plate is of $\frac{1}{4}$ inch steel in three pieces, and perforated with 120 holes $\frac{1}{8}$ inch in diameter; it is 16 inches from the bottom of the separator. The exit to the engine is a 10 inch pipe located with its center 19 inches from the top of the separator.

FIG. 7.—ALLIS-CORLISS ENGINE WITH 1,500-KW. SIEMENS-HALSKE GENERATOR.

bottom of the smoke flue is 217 feet 6 inches. For the first 110 feet there is an inner shaft of fire brick, 16 feet internal diameter, and decreasing in thickness from 17 inches at the base to 9 inches near the top. A curved partition wall divides the stack for the first 20 feet; the flue inlet is 16 feet high by 4 feet wide.

The building as it now is contains room for five units, one of 750 kw. and four of 1,500 kw. capacity. Only three of the large units are now installed. The engines were all built by the E. P. Allis Co., of Milwaukee, and are of the cross compound condensing corliss type direct connected to Siemens & Halske generators. The engine room is 57 feet 7 inches wide by 250 feet long.

The large engines have cylinders 30 and 60 inches by 60-inch stroke, and are designed to run at 75 r. p. m. The center lines of the high and low pressure engines are 24 feet 8 inches apart; the fly-wheel is 25 feet in diameter. Each engine has two governors; one regulates the working cut-off in both cylinders and the other trips a safety cut-off valve when a safe speed is exceeded.

The smaller engine has cylinders 23 and 46-inches by 48-inch stroke and runs at 80 r. p. m. The fly-wheel for this engine is 20 feet in diameter.

The shafts for these engines were made by the Bethlehem Steel Co. and are of fluid compressed open-hearth steel hollow-forged over a mandrel. For the large engines the shafts are 28 inches in diameter at the fly-wheel and 22 inches at the bearings; the axial hole is 8 inches in diameter.

In Fig. 4 are shown two vertical sections of the separator for one of the large engines. The shell is of $\frac{1}{2}$ -inch steel, 42 inches inside diameter, and the heads are of 5-8-inch flange steel bent to a spherical surface of 42-inch radius. The length of the separator over the head is 9 feet 4 $\frac{1}{2}$ inches; it is supported on a castiron base, which brings the top 9 feet 11 inches above the floor. The longitudinal seam of the shell is a double strap, double-riveted butt joint with $\frac{7}{8}$ -inch rivets 4 inches on centers; the transverse joints are single riveted. All rivet holes are drilled. The steam enters the separator at one side at a point 53 $\frac{1}{4}$ inches below the center and impinges on a shield in front of which are battle plates arranged as shown in the drawing. The pocket at the lower part of the shield is provided with a pipe to carry the intercepted water below the per-

The receiver and separator for each unit are located in the basement between the foundations of the high and the low pressure engines, and this permits all of the piping, both steam and exhaust to be placed under the engine room floor and arranged compactly. Fig. 4 shows the piping for engine No. 2. It will be noted that the supply pipe, 12 inches in diameter, as brought from the boiler room

FIG. 8.—BASEMENT OF ENGINE ROOM.

is about 5 feet above the inlet to the separator, and in the vertical section is a safety stop valve; this valve is of the sector type, similar to the corliss engine valve, and is normally open with the operating lever weighted. It is held in this position by a pawl con-

FIG. 9. PLAN OF STEAM HEADER

nected to a slow-running governor on the engine; when the engine speed rises above the maximum limit as set, the pawl releases and the suspended weight closes the valve by gravity.

The receiver is 61 inches in diameter and 10 feet 6 inches high. The 14-inch exhaust from the high pressure cylinder and the 20-inch supply to the low pressure cylinder open into the receiver 2 feet 6 inches from the top. The exhaust pipe from the low pressure cylinder is 22 inches until it is clear of the engine foundation and a 22-inch Wainwright joint 2 feet 6 inches long; thence it is 28 inches in diameter to the exhaust main. The live steam lines are all extra heavy lap-welded wrought iron pipe and the exhaust piping of cast iron. The live steam valves are extra heavy-ribbed, bronze-seated gate valves of the Chapman make. The working pressure is 100 pounds.

the Southwark Foundry & Machine Co. and is large enough to take care of the ultimate capacity of the plant, 14,000 h. p. It is very interesting to know that the installation of this central condenser instead of the independent condenser first contemplated made a saving of over \$10,000 in the cost of the piping and enabled the building to be made about 30 feet shorter.

The auxiliary machinery at present installed is for 7,000 h. p. of engines only. It consists of a steam engine driving the air pump tandem and belted to the circulating pump, the latter being in the basement. The air pump is an air compressor of improved type, with a Weiss positive slide valve, and works free from water, the intake of the pump being from the top of the condenser. The circulating pump is of the Bibus rotary type and handles only the cold injection water.

FIG. 11. STEAM HEADERS AND FEED PIPING.

The city of Chicago has a 12-foot brick tunnel in Fullerton Ave., through which water is drawn from the lake to flush the north branch of the Chicago River, and the company has arranged to take its supply of condensing water from this tunnel. The intake is a 30-inch pipe, which is carried along the east wall of the building, just below the level of the basement floor; the return to the tunnel is a 36-inch pipe along the longitudinal partition wall of the building, also below the basement floor. The original design of this station contemplated the use of a separate condenser for each engine, but this was changed and a central condenser of the Weiss counter-current type was installed. This condenser was built by

Fig. 5 shows the Weiss condenser in elevation. The exhaust main, which is in the basement of the engine room between the engine foundations and the dividing wall, increases in size from 22 inches for the small engine to 55 inches after passing the fourth one, and joins an immense elbow in which the openings are 65 inches in diameter. The vertical 65-inch pipe is carried up and opens into the enlarged head of the condenser 10 feet in diameter; from this head a pipe extends down to near the bottom of the hot well, and constitutes a water leg or barometric tube. The condensing water is handled by the Bibus pump and delivered to the condenser through a 22-inch pipe at a point about 6 feet above the steam inlet.

NORTHWESTERN ELEVATED STATION.

From the top of the condenser a pipe is taken and carried down to the bottom of a smaller well, where it opens under water, forming a second barometric tube. Near the top of this smaller barometric tube is placed a separator, from which a 9-inch suction pipe leads to the air pump.

A small pipe connecting the main condenser vessel with the small barometric tube insures, at all times, a sufficient quantity of water in the small auxiliary hot well to seal the tube. The water from

tenant adjusts the quantity of injection to meet the increased demands, and all without a total loss of vacuum.

Two 28-inch pipes, with a Blake back-pressure valve in each, connect the 65-inch exhaust riser to a 40-inch free exhaust pipe opening above the roof. The boiler feed is drawn from the condenser hot-well at practically the same temperature as the exhaust steam entering the condenser

FIG. 10.—SECTION OF STEAM HEADER.

the auxiliary hot well flows over a weir into a bucket (marked B in the drawing), the latter having a hole in the bottom which allows the normal flow to escape. But in the event of a sudden and heavy overload, when the supply of water has been adjusted for a light load, causing the temperature of the discharge to reach the boiling point, an abnormal quantity flows over and down the small barometric tube filling the bucket, thus by the increased weight opening a free air valve into the condenser. This reduces the vacuum to just below the boiling point, and maintains it there until the at-

FIG. 12.—BASEMENT OF BOILER ROOM.

The advantages claimed for the Weiss central condenser, aside from the simplification in the piping and economy of room already mentioned, are the less power required to drive the machinery, the less amount of cooling water (one-half to two-thirds) required as compared with the ordinary jet condenser, the lesser head on the circulating pump, and the higher temperature of the hot-well.

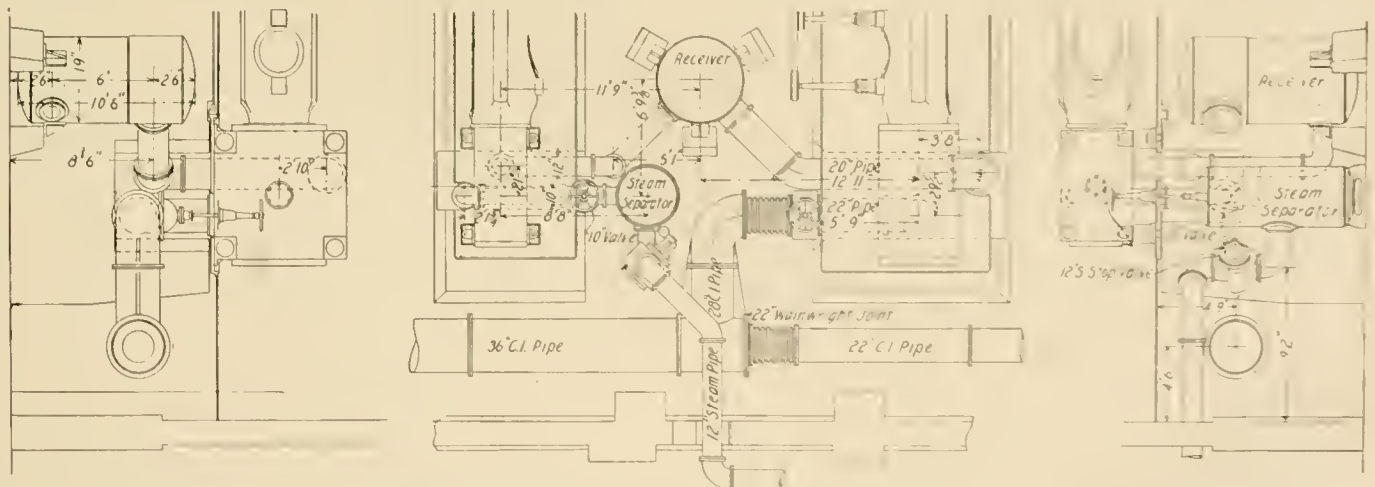

FIG. 13.—PLAN AND ELEVATIONS OF ENGINE PIPING.

Since the supply of injection water is constant and independent of the vacuum, a sudden increase of load or a leak does not act to reduce the vacuum when it is most needed, and hence the condenser is very reliable in its action.

The station has been in partial operation since June 1st and the

opposite the stack. It is built in two decks, the station panels being placed below and the feeder panels above. The construction of the switchboard is apparent from Fig. 14, and Fig. 15 shows the arrangement of the panels, and Fig. 16 the details of a feeder panel.

As arranged at present, current from three of the generators

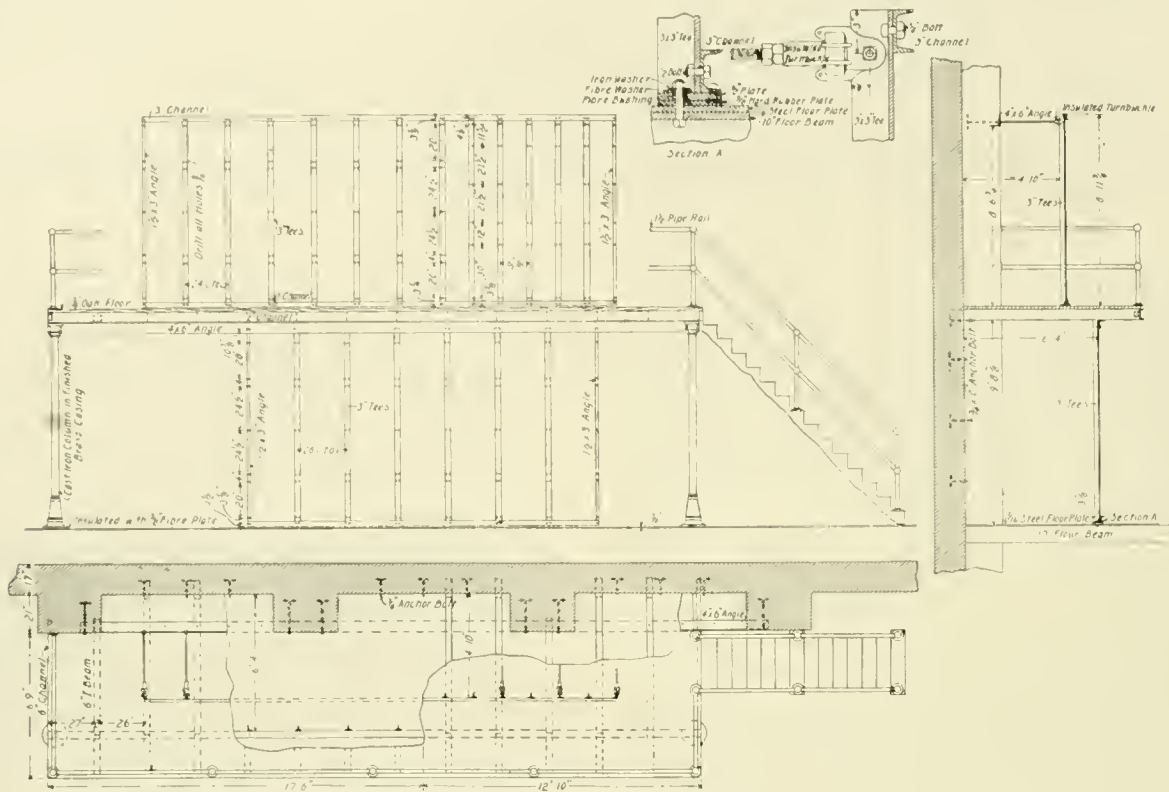

FIG. 14.—SWITCHBOARD.

performance of the condenser has been all that could be desired; the temperature of the exhaust has been between 115 and 118 degrees F.

In addition to the live steam and exhaust piping and the engine separators and receivers, the engine room basement also contains the electric cables to and from the switchboard. These are placed overhead along the east wall of the building. Turner oil filters and pumps for forcing the oil to the engines are also in the engine room basement. For feeding cylinder oil an oil pump, made by

passes through the upper of the two Thomson wattmeters and that from the fourth unit through the lower one. On the feeder board an extra or emergency panel has been provided; it is the one immediately over the wattmeter panel of the lower board. An auxiliary bus bar (the upper one in Fig. 15) connects all the feeder panels, including the emergency one; the regular feeder panels have two single throw switches, one for connecting to the station bus and one for connecting to the auxiliary bus, and the emergency panel but one switch. In event of an accident to the circuit breaker or

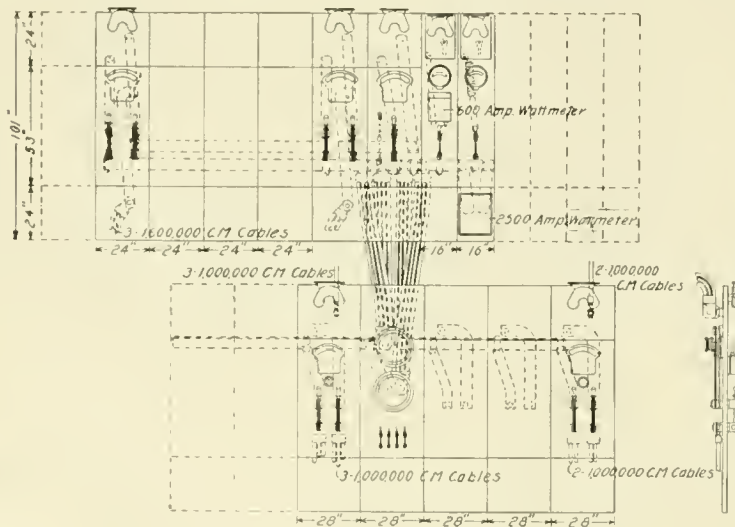

FIG. 15.—ELEVATION OF SWITCHBOARD.

FIG. 16.—DETAILS OF SPARE FEEDER PANEL.

the Phoenix Metallic Packing Co., is attached to each of the low pressure engine cylinders and is driven from the reciprocating parts of the engine; sight feed lubricators of the usual type are used on the high pressure engines.

The switchboard is located along the east wall of the engine room

other apparatus the panel affected is disconnected from the main bus, connected to the auxiliary, and the switch on the emergency panel thrown in. General Electric circuit breakers, Thomson wattmeters, and Weston ammeters and voltmeters are used.

The company has contracted with the John A. Mead Manufactur-

ing Co., of New York, for the construction of a complete coal and ash conveying plant, which will not be completed for some months yet. Temporarily the coal is wheeled into the building on a wooden platform built in front of the furnace and level with the tops of the hoppers.

The lot owned by the company is 595 feet 10 inches long, and the present building 254 feet 10 inches. The coal-storage building is 24x80 feet, 29 feet 6 inches high at the eaves and 46 feet 7½ inches at the ridge, and is at the extreme north edge of the lot. This storage building is to be connected with the boiler room by an overhead passage way for the conveyors and by a tunnel. The overhead way is 38 feet 3½ inches above the ground, and its internal dimensions are 6 feet 6 inches by 8 feet; the tunnel is 6x9 feet inside and the foundations are 14 feet 6 inches below grade.

About 50 feet north of the power station are located the receiving hoppers into which the coal is unloaded directly from the freight cars. Just north of these are two ash tanks which can be discharged into cars or wagons. The coal crushing machinery is at the hoppers and from here conveyors take the coal to the elevator at the north end of the storage building, and thence to storage hoppers, or to the bunkers in the boiler room. Ashes are taken by a conveyor from the basement of the boiler room up and around and finally dumped in the steel ash tanks.

The capacity of the conveying system is 50 tons per hour. The coal storage building holds 1,500 tons and the bunkers in the boiler room hold 300 tons.

The chief engineer of the station is Mr. John Wright.

THE ST. LOUIS STRIKE.

After fifty-six days of lawlessness and riot the St. Louis street railway strike, in many respects one of the greatest clashes that has ever occurred between capital and labor, was formally declared off on July 2nd, when representatives of the company and the executive committee of the employes union signed the following agreement:

1. The provisions of the agreement of March 10, 1900, as to rates of pay and hours of service will be continued in force by the company.

2. Every employe of the company to be free to join or not to join any organization, and no discrimination to be made for or against him because of the manner in which he exercises his freedom.

3. Any attempt on the part of any employe to induce another employe by intimidation or threats to join or not to join any union shall be cause for the immediate discharge of the person guilty of such attempt.

4. Any attempt to influence any employe by an official of the company to join or not to join any union shall be cause for the discharge of such official.

5. The company will meet any employe or committee of employes, whether representing themselves, other employes or an association of employes, regarding any matter of mutual interest.

6. For the purpose of filling vacancies which may now exist or hereafter arise, the committee of former employes, of which T. B. Edwards is chairman, shall prepare a list of the men who were in the company's service, May 7 last, and as the company now or hereafter needs additional men it will select them exclusively from this list until it is exhausted, not interfering, however, with men now in the service. No person shall be eligible to this list who has been guilty of any acts of lawlessness or violence.

In the two preceding issues of the Review will be found an account of the causes of the strike and the principal events occurring in connection with it up to June 13th. For the purpose of making the record complete we give herewith a summary of events after that date.

June 14. There were no disturbances of any kind during the day or night. All divisions in the city were operated on regular schedules and save for the presence of members of the sheriff's posse comitatus at the car barns and power stations there was very little outward evidence that a strike was in progress. A coroner's jury brought a verdict of homicide against a member of the posse who had shot and killed a rioter on June 10th. The deputy sheriff was not arrested, however.

June 15. No rioting took place. The strikers submitted a new agreement to the company as a basis of settlement of the controversy. The sheriff continued to add new members to his posse.

June 16. President Whitaker, replying to the proposition submitted by the strikers on the 15th, stated he could not accept the suggestion to arbitrate the matter of the reinstatement of former employes as the company intended to keep faith with its new men and retain them in the places assigned them. There were no serious disturbances during the day.

June 17. A car on Euclid Ave. was slightly damaged by an explosion of dynamite and a woman was roughly handled by a mob of shop girls for riding on a car.

June 18. General Manager Baumhoff stated that many applications for reinstatement had been received from strikers, and he was taking the old men back at the rate of fifteen or twenty a day. Both day and night cars were running on former schedules without police protection. A few slight outbreaks occurred in various parts of the city, but none of them were serious. Judge Spencer rendered an important opinion, holding that all persons convicted of placing obstructions on the street railway tracks during the present strike came under the provisions of the state law making the penalty for obstructing the operation of a "railroad," imprisonment in the penitentiary for a term not exceeding twenty years.

June 19. The situation remained practically unchanged; Governor Stephens in an interview stated that the backbone of the strike had been broken.

June 20. The day passed without event worthy of record, all cars running as usual, although not carrying as many passengers as they had before the strike.

June 21. The situation continued as on previous days. The sheriff granted furloughs of two days to several of the companies in his posse, which at this time numbered about 1,500 citizens.

June 22. The board of police commissioners decided that the posse comitatus should be reduced to 500 men, but special provision was made for recalling 1,000 of the deputy sheriffs for special duty on July 4th, if necessary, as it was feared the general discharge of firearms and fireworks on that day might occasion acts of violence.

June 25. A temporary injunction was issued against the strike leaders restraining them from interfering with the operation of United States mail cars on any of the lines of the St. Louis Transit Co.

From this time on until the end of the strike there was very little of importance to record. Small outbreaks occurred more or less frequently, but were quickly quelled by the police or special deputies. Occasionally a wire was cut or a torpedo exploded under a car, but the men evidently had begun to realize the hopelessness of forcing the Transit company into granting their unjust demands, and were only waiting an opportunity to obtain their old jobs on the best terms they could make. An attempt was made to institute a general boycott against the company, but this was practically a failure from the start.

July 9th the strike and boycott were renewed, it being alleged that the company had taken on new men in violation of section 6 of the agreement. The company replied that all the new men complained of had been contracted for prior to July 2d and were virtually employes at that time; it was offered to leave this question to the attorney for the men.

Reports indicate that neither the strike nor the boycott will prove successful. On July 12th officials of the company stated that so far as it was concerned there was no strike, and traffic on the cars was increasing daily.

A new electric railway between Quebec, Can., and La Bonne Ste. Anne was opened June 27th.

A new and extensive system of transfers has been put into effect by the United Railways & Electric Co., of Baltimore, in order to comply with a recent act of the General Assembly requiring the company to carry a passenger from any point on its system to any other point within the city limits for a 5-cent fare.

The inventor of a new car fender offered to prove to the officials of the Camden (N. J.) & Suburban Railway Co., the value of his device by standing in front of a car fitted with it, and letting it pick him up while the car was going at high speed. The officials succeeded in persuading him to try it on a dummy instead and at the first test the dummy was ground to pieces under the wheels of the car.

The English Tramway Exhibit.

AS SEEN BY A MEMBER OF THE "REVIEW" STAFF.

First Exhibit of its Kind Abroad—A Splendid Success—Fine Displays Well Arranged—Large Attendance of Tramway Officials—American Exhibitors Praised for Enterprise.

The International Tramways & Light Railways Exhibition, the first ever held in Europe, was formally opened at the Royal Agricultural Hall, London, June 22nd, and will close July 4th. It was the first occasion on which municipal and private tramway interests have cordially co-operated toward a mutually desirable object, and it is expected that the informal meetings of leading officials of municipal tramway committees and companies, which have taken place during this exhibition, will do something to smooth the path of tramway progress in Britain.

England is on the verge of a complete tramway conversion. London to-day is the most backward in its tramway system—the omnibus and little "bob" horse car being the typical Londoners' ideal mode of travel—but scarcely will the doors of this exhibition

way men, who have not "missed a meeting in the past ten years," agree that this London exhibition of tramway equipment is the largest and most complete ever held.

The exhibition was open for private view June 22d, when it was declared formally opened by W. H. Dickinson, Esq., chairman of the London County Council, in the presence of 300 guests of the management, the patrons of the enterprise and many members of various city corporations; a very dainty luncheon was served and much speechmaking indulged in. One hundred and eighty-five guests sat down to the beautifully decorated tables. Among the American visitors present were: Harold P. Brown, New York, of the Edison-Brown Plastic Rail Bond Co.; W. J. Clark and Mr. Rice, New York, General Electric Co.; D. C. Warren, Chicago,

INTERNATIONAL TRAMWAYS AND LIGHT RAILWAYS EXHIBITION, LONDON.

have closed before the new installation of the London United Tramways Co., of which Mr. J. Clifton Robinson is managing director, will be put in operation on the West London lines.

In reviewing the different exhibits that were displayed the visitor, if he were acquainted with the origin of various tramway materials, would certainly be impressed by the predominance of the American product and ideas. Many American manufacturers have come forward with large and creditable displays, indicating that they are well aware of the immense future business to be obtained in this market.

The Tramway Exhibition was conceived, promoted, and managed by the owners of the Tramway and Railway World, of London, to whom great credit should be given. Many old street rail-

"Street Railway Review;" W. A. Parker, Milwaukee, Christensen Engineering Co.; Geo. A. Harwood, Mansfield, Ohio, Ohio Brass Co.; F. C. Green, Albany, N. Y., Consolidated Car Heating Co.; E. P. Thomas, Lorain (O.) Steel Co.; G. W. Wallaston, Jersey City, N. J., Dixon Crucible Co., and J. G. White, New York.

Mayors and other officials of large English cities and representatives of the army and navy were present in large numbers.

As the list of exhibitors and description of the hall were published in the "Review" for April, they will not be repeated here; suffice to say the display was extremely gratifying to all concerned, and will doubtless become an annual feature in English traction events. There were 91 exhibits, some of which were even larger than any seen at the conventions of the American Street Railway

Association. One company is credited with having spent \$30,000 on its exhibit. The illustrations tell how complete and attractive many of the displays are.

Agricultural Hall was ample for all requirements, and allowed a liberal space for each company's display. The British Westinghouse Co. has the largest exhibit, followed closely by Dick, Kerr & Co., the British Thomson-Houston Co., R. W. Blackwell & Co., the J. G. Brill Co., the Ohio Brass Co., and others. All of the exhibits were well arranged to show their respective merits, and many neat advertising souvenirs were to be had for the asking.

I have been much impressed with the fact that while American ideas largely predominate, at the same time it is very evident that there is a strong disposition on the part of tramway companies to give the preference to home manufacturers or to American companies manufacturing here. Next in order come American goods sold by English agents. Strong competition has developed between these various interests and there is great activity on the part of all the sellers to capture the big orders in prospect, one of the largest of which is the London County Council's contract. Railway material and equipment here are sold largely upon the recommendation of the various city councils or corporations, and it is a sure thing that they will award their contracts to English concerns if the matters stand anywhere near equal.

Without attempting to describe in detail each exhibit, I will briefly mention our American displays and a few of the more notable English concerns.

SOME EXHIBITS.

British Westinghouse Electric & Manufacturing Co., London.—This exhibit extends over the entire length of the Agricultural Hall, and is an actual electric tramway in practical operation, complete in all details from the power house to the moving car. The line on which the car runs is 310 feet long. The current is obtained from a Westinghouse underground conduit, built on this company's sectional system. Each end of the exhibit is paved so that the conduit and rails present the appearance that they would have in a street. The intervening portions are open so that they can be readily inspected. The power station, which is at the main entrance of the hall under the east gallery, is equipped with a gas engine, electric generator and switchboard, all of Westinghouse make. Motors of the same build are shown mounted on trucks and dismounted for inspection. A handsome double-decked tram car, specially designed for this exhibit and fitted with every modern improvement, including electric signal bells at each seat outside and inside the car in order that passengers may easily signal the motorman to stop, runs on the line, carrying passengers. A conspicuous feature of the exhibit is the Westinghouse electro-magnetic brake (Newell patents), which is operated electrically by the motors that drive the car. Another important feature is the Westinghouse electro-pneumatic control system whereby all the railway and other motors on a train, can be simultaneously operated from one point. This exhibit may be said to represent an outlay of about £6,000, and is of British construction entirely.

The British Insulated Wire Co., Ltd., of Prescott, shows a full line of cables, section pillars, tee and disconnecting joint boxes. Mr. G. H. Nesbitt is in charge.

Miller & Co., Edinburgh, are well represented with one of their directorate, Mr. W. Gordon, in charge. Their exhibit consists of chilled car wheels, wheel presses and switch points.

The Ohio Brass Co., Mansfield, O., shows a large variety of articles in a very attractive manner. The exhibit is in the charge of Mr. Geo. A. Harwood, the company's general foreign agent, assisted by Mr. L. K. Cameron, of the Toronto (Can.) office; it consists of head lights, gongs, flexible pole brackets, railbond material, track brushes and cleaners, and overhead material in great variety.

The Christensen Engineering Co., Milwaukee, has one of the large exhibits, showing in operation several of its air-brake equipments. Mr. W. A. Parker, European manager of the Christensen company, is in charge.

The Consolidated Car Heating Co., Albany, N. Y., displays a large line of electric heating apparatus under the supervision of Mr. Francis C. Green, general superintendent.

OPENING THE EXHIBITION.

The gentleman facing the steps with his hat in his hand is W. H. Dickinson, Esq., Chairman of the London County Council.

Chas. Churchill & Co., Ltd., London, have a large line of American planers, shapers, lathes and general machine tools, the Q & C Co.'s pneumatic hammers and riveters, track drills, jacks, rail saws, fenders, etc.; also the Stanwood car step.

The Lorain Steel Co., Lorain, O., has a large display of rail joints, electric welded joints, portable crossovers and Dupont car trucks, and an exhibit of special track construction, similar to that used in several cities in Northern England which have recently adopted electric traction. The special feature to be noted is the solid piece construction, and the extreme length of the points, one open point and one crossing. The points are 12 feet and the crossing 9 feet 6 inches. Messrs. E. P. Thomas and Carroll Burton in charge.

Electric Tramway & Equipment Co., Birmingham, shows a full line of overhead material. This company makes this line to sell

OHIO BRASS CO. EXHIBIT.

direct to the supply trade, as it does no contract work itself. It is also agent for Nuttal's (Pittsburg) gears and pinions.

Dick, Kerr & Co., Ltd., London, the Electric Manufacturing Co., Ltd., and the Electric Railway & Tramway Carriage Works, Ltd., combined their exhibit, which comprises a complete line of tramway appliances from the rails and overhead materials to the

rolling stock. The special features of their exhibit are several new types of cars—first, the bogie vestibuled top seat car for heavy city service, with Bellamy reversed stairway; second, a bogie cross-bench car for high speed, summer suburban service; third, a wheel single deck car, seating capacity 20 persons, equipped with air brake, with axle driving compressors. Mr. W. Rutherford and Mr. C. Armstrong are in charge.

J. G. Brill Co., Philadelphia, has a Brill convertible car made for the Leeds (Eng.) Corporation and several types of car trucks. This display attracted a great deal of attention and much favorable comment. The Brill cars and trucks are almost as well known here as at home and are much liked.

Brush Electrical Engineering Co., Ltd., London.—This exhibit is in charge of Mr. King and is large and of a very attractive nature. The Brush company is very particular to state that it is the actual manufacturer of the entire line of railway equipment. The exhibit shows a bogie vestibuled car, such as constructed for the Swansea Tramway Co. This motor car is arranged to seat 44 persons and has two compartments, which can be used for separate classes or for smoking. The car runs on bogie maximum traction trucks and is consequently able to go round very sharp curves. In the exhibit are also tramway motors and controllers, electrical service brakes, and many other articles of the well-known Brush make. The

The British Thomson-Houston Co., Ltd., London.—This exhibit consists of cars and motor equipment. Among the cars shown is a full equipped car built by Messrs. Hurst-Nelson, and mounted on Brill trucks, also a car similar to what the British Thomson-Houston Co. is supplying to the London United Tramways, mounted on Peckham trucks and equipped with B. L. motor brake equipment.

The Pearson Huggins Co., Ltd., Bristol, is the maker of uniforms, and has a very attractive display in exhibit No. 47. Mr. Arthur House is in charge.

The Weston Electrical Instrument Co., of Newark, N. J., is represented by Ellicott Bros., its London agent, who showed a full line of Weston apparatus.

The British Griffin Chilled Iron & Steel Co., Ltd., London.—This company has a very complete exhibit of wheels, electric motor wheels, and axles shown in various stages of use, and some that have been put under a test to show the durability and tensile strength of the metal.

Bergtheil & Young, London.—This firm is European agent for the H. W. Johns Manufacturing Co., of New York, and the Johns-Pratt Co., of Hartford. They show a full line of electric car heat-

DICK, KERR & CO.—ENGLISH ELECTRIC MFG. CO.
ELECTRIC RAILWAY & TRAMWAY CO.

ROBT. W. BLACKWELL & CO.

Brush company is to be congratulated on its exhibit, which compares favorably with any American or Continental competitors.

Robert W. Blackwell & Co., Ltd., London.—The Blackwell exhibit ranks with the very best shown in the hall, and the variety of traction materials exhibited is probably the greatest. The exhibit is under the direct charge of Mr. J. Pringle, and associated with Mr. Pringle are many gentlemen connected with the various firms of which the Blackwell company is European agent. Mr. Long, the vice-president of the Peckham company; Mr. Scott, of the Cutter company, Philadelphia, and Mr. Harold P. Brown, of the Edison-Brown Rail Bond Co., of New York, are among the Americans in attendance at the Blackwell stand. The Blackwell company shows a large variety of American made goods, prominent among which are the Crane Co.'s steam specialties, the Griffing Co.'s Bundy separators, the Peckham Co.'s various types of tramway trucks, McGowan pumps, etc. The exhibit of Harold P. Brown, No. 120 Liberty St., New York, deserves special mention. Mr. Brown has fitted up a booth adjoining the Blackwell stand, in which he practically demonstrates his system of bonding rails. His tests are very interesting and comprehensive and the means he has taken of demonstrating his article cannot fail to produce good results.

Smith, of New York.—This exhibit is in the charge of Mr. Edwin Lansing, the European manager of this house, and Mr. Lansing is able to tell all that is worth hearing about headlights, signal lamps and torches.

ers and the well-known Johns asbestos coverings. The gentlemen in charge are Mr. Pell, Mr. A. H. Berry, manager of the electrical works of the H. W. Johns Co., of New York, and Mr. H. H. Luskomb, secretary of the Johns-Pratt Co.

Joseph Dixon Crucible Co., London and Jersey City.—This exhibit is in charge of Mr. G. W. Wollaston, manager of the European branches of the Dixon company, with a full line of Dixon graphite paint, dynamo brushes and resistance rods.

The Babcock & Wilcox Co., Ltd., London, exhibits a model of its water tube boiler.

The Worthington Pumping Engine Co., London, has a very prominent stand in the main entrance, composed of pumps, heaters and condensers.

The Hale & Kilburn Manufacturing Co., of Philadelphia, shows a line of car seats and seat materials. Mr. S. A. Walker, of Philadelphia, is in charge.

NOTES OF THE EXHIBITION.

The catalog of the Tramways Exhibition is a book of 180 pages and most admirably arranged. Sufficient space is devoted to each exhibitor to allow him to state the exact nature of his product, his cable address and any other information that would be useful to the visitor. A plan of the exhibition is also arranged so that each

booth can be located easily. The catalog is bound in cardboard, with a very tastefully designed cover.

As fast as the deputations of the various city councils and corporations arrive in the hall a typewritten announcement of the fact is made, stating who they are, and from which city they may have come, and these announcements are distributed at the various booths, so that the exhibitor is kept posted at all times as to the responsible tramway men that may be in the hall.

In glancing through the exhibition hall one would be much impressed by the great predominance of American goods. A great many of such goods while shown under the name of an English or Scotch firm, and to all appearances made in Great Britain, still they have the stamp of an American origin plainly on them. There is no need of concealing the fact that the English municipal corporations are loyal to their own manufacturers, and if circumstances are anywhere near equal they will award their contracts to their home concerns. This does not to any very great extent prohibit the American manufacturer from this market, as the American-made goods as yet, have many points of advantage over those of home construction.

Mr. Francis C. Green, superintendent of the Consolidated Car Heating Co., of Albany, N. Y., is attending the exhibition, and in

WESTINGHOUSE EXHIBIT.

charge of that company's exhibit. He states that the company has already equipped about 250 cars in England and on the Continent, with its electric heaters.

Mr. G. A. Harwood, general foreign agent of the Ohio Brass Co., is making an extended trip throughout the world, which will be of about two years' duration. Mr. Harwood expects to keep continually among the European agents of the company.

Mr. W. Gordon, director of Miller & Co., Ltd., Edinburgh, is in charge of that company's exhibit. Mr. Gordon took quite an extended tour in the United States about a year ago, and is a warm admirer of American business methods in general. Miller & Co. are the oldest makers of chilled wheels in Great Britain, and have until the last few years supplied the greater part of the demand for such articles.

The promoters of the Tramways & Light Railways Exhibition offered at the suggestion of several tramway managers a prize of £25 for the best invention for securing a dry seat on the tops of tramcars and omnibuses, in all conditions of weather, and a second prize of £25 for the most practical and efficient life-saving guard or fender for tramcars. There were about fifty competitors for the dry-seat prize and five or six tried for the fender award. The judges awarded the seat prize to Peter Burns, of Birmingham, who showed a seat which automatically reversed itself when not in use, allowing the underneath seat to be used for posters or advertisements. The competition for the fender award was very

keen, and several very efficient devices were shown. The judges gave the award to Wilson & Bennett, of No. 123 Market Street, Hyde, who showed an automatic life guard that was placed far under the car.

The Westinghouse Electric & Manufacturing Co., Ltd., of London, is erecting a large plant at Manchester, England, capable of employing 5,000 British workmen.

Mr. Lawrence Fulton Braine, general manager of the Continuous Rail Joint Co., of Newark, N. J., was in attendance at the exhibition.

London, July 1, 1900

D. C. W.

CHICAGO UNION TRACTION EARNINGS.

The statement of gross earnings of the first fiscal year that the Chicago Union Traction Co. has operated the lines of the old North and West Side companies shows a gain for the year of 5.2 per cent. The month of June was the only one that did not show an increase for the combined system; in this month the West Side gained \$8,000 and the North Side lost \$32,000. Of this about \$21,000 is believed to be due to opening the Northwestern Elevated and the balance to cool weather and the labor troubles.

The comparative figures are as follows:

	1899-1900.	1898-1899.	Increase
July	\$ 653,811.60	\$ 612,320.19	\$ 41,482.41
August	672,049.55	612,764.02	59,285.52
September	633,253.80	605,000.28	27,353.52
October	679,039.80	623,194.15	55,845.65
November	608,836.45	563,710.43	45,126.02
December	621,614.99	587,070.11	33,935.79
January	587,020.70	531,657.21	65,362.99
February	520,593.70	483,896.20	36,696.99
March	580,420.90	575,041.20	5,379.70
April	600,952.40	586,088.35	14,864.05
May	647,347.20	621,882.11	25,465.09
June	614,952.65	639,166.10	* 24,213.54
Total	\$7,412,770.00	\$7,043,608.00	\$369,162.00

* Decrease.

TEN-CENT FARES SAID TO BE ILLEGAL.

For several years it has been the practice for the Brooklyn Rapid Transit Co. to increase the fare on one of its Coney Island lines to 10 cents during the summer season. The object of this was to provide one route on which the cars would not be so crowded and thus better accommodate those patrons to whom the higher fare was no hardship.

This year the usual increase of fare on one line was followed by an application for an injunction by one Peter H. McNulty. The Supreme Court, Justice W. D. Diekey, on June 10th refused the injunction restraining the collection of a 10-cent fare, but stated that an action through the attorney-general to forfeit the charter of the company would lie.

SYRACUSE, N. Y., BENEFIT ASSOCIATION.

In our March issue, page 141, we gave some particulars concerning the Employes' Mutual Benefit Association of the Syracuse (N. Y.) Rapid Transit Co., and among other things stated that the membership was at that time 148. Since Mr. E. G. Connette has been general manager of the company he has taken considerable interest in this association and persuaded the trustees that it would be advantageous to remit the initiation fee of \$1 to applicants for a short period. The result of this action and of the active work of the trustees has been to increase the membership to 250. The total number of employes of the company is about 350, but many of those who have not joined the association are ineligible because of age.

The United Traction Co., of Albany, N. Y., has filed a protest with the State Board of Tax Commissioners against the valuations placed upon its property which were increased from \$225,671 in 1899 to \$864,500 in 1900.

ATTRACTIVE FOLDER FROM TOLEDO.

The Toledo (O.) Traction Co. has issued a 16-page folder, 30 $\frac{1}{4}$ x 8 $\frac{1}{4}$ in., on one side of which appears a colored lithographed map showing the location of all the traction company's lines. Two of the pages on the reverse side are devoted to the latest time-tables of the company, and in the remaining space is given a description of the growth and commercial prosperity of Toledo, a history of the Toledo Traction Co., a description of Lake Erie Park and Casino, and the plans for the Ohio Centennial and Northwest Territory Exposition to be held at Toledo from May 1 to Oct. 30, 1902, and for which nearly \$3,000,000 has been practically pledged from various sources.

FREIGHT CAR ON MAXIMUM TRACTION TRUCKS.

The Winston Salem Railway & Electric Co., of Winston, N. C., has recently had the J. C. Brill Co. build for it a car which is well worthy of the attention of street railway men, especially those connected with roads where there is much transportation of heavy freight. It is a 30-ft. flat car mounted on Brill maximum traction

ELECTRIC FREIGHT CAR.

trucks. The framing of the car is of the usual freight car type with truss rods and needle beams. Both ends are fitted with dashers and brake wheels, and stake pockets are placed along the sides. The body is 7 ft. 6 in. wide at the sills. The trolley stand is supported on four posts at one end of the car. The trucks have a wheel base of 4 ft., the driving wheels are 33 in. in diameter, 3-in. tread and $\frac{3}{8}$ -in. flange. Each truck has one G. E. 58 motor. There are two Brill sand boxes and two pedal gongs.

CHEAP FARES FOR WORKINGMEN IN ENGLAND.

At a conference last month between the chairmen of committees in the House of Lords and the House of Commons, and representatives of the British Board of Trade, it was decided to adopt a model clause to be inserted in all tramway bills providing for cheap fares and special cars for working people. The provision is as follows:

"The company, at all times after the opening of the tramways for public traffic, shall, and it is hereby required to, run a proper and sufficient service of carriages for artisans, mechanics, and daily laborers each way every morning and every evening (Sundays, Christmas Day, and Good Friday always excepted), at such hours, not being later than 8 in the morning or earlier than 5 in the evening respectively, as may be most convenient for such workmen going to and returning from their work, at fares not exceeding one halfpenny for every mile or fraction of that distance. On Saturdays the company, in lieu of running such carriages after 5 o'clock in the evening, shall run the same at such hours between noon and 2 o'clock in the afternoon as may be most convenient for the said purposes. If complaint is made to the Board of Trade that such proper and sufficient service is not provided, the Board, after considering the circumstances of the locality, may by order direct the company to provide such service as may appear to the Board to be reasonable. The company shall be liable to a penalty not exceeding £5 for every day during which it fails to comply with any order under this section."

The endless chain scheme for selling street car tickets has reached Cincinnati.

DRAINAGE CANAL TRIP.

The members of the Chicago Trade Press Association, on June 25th, made an inspection trip down the drainage canal and visited the controlling works at Lockport. The party consisted of about 60 gentlemen and ladies and was escorted by President William Boldenweck, of the Sanitary District Trustees.

While appreciating what has already been done, the members present were unanimous in the hope that the District would be successful in its efforts to have the Chicago River deepened and widened, allowing vessels of greater beam and draft to pass through the river and into the canal. This work is absolutely necessary if the commercial supremacy of Chicago is to be retained.

SALE OF THE STEPHENSON CAR WORKS.

On June 12th, the John Stephenson Car Works at Elizabeth, N. J., were sold at public auction to J. C. Willetts and Adolph Wumpfheimer, of New York, representing a creditors' committee. The plant, which comprises seven buildings and 80 acres of land, brought \$177,000, and material on hand sold for \$49,283. The original cost of the works was \$400,000; of the material, \$143,960.

It is said the new owners will re-open the plant at once and will build high-grade street cars for all conditions, as formerly.

TRACKS PAVED WITH GOLD.

It has been discovered that large quantities of stone which the Denver City Tramway Co. has been using for paving between its tracks, contain gold ore in paying amounts, some of the specimens assaying at \$5 and \$7 to the ton. The stone was taken from quarries in Boulder County, and it is said thousands of tons have been used in Denver's streets.

The discovery was made by an expert miner, who recognized traces of the precious metal in a small piece of the paving stone picked up in the street.

LABORATORY TRAINING.

In discussing operating work as a feature of electrical laboratory training at the meeting of the Society for the Promotion of Engineering Education, Prof. W. S. Aldrich, of the University of Illinois, lays down these principles:

"Training in handling electrical machinery is quite as essential as training in electrical measurements. The one should be done and the other not left undone. If with all of his familiarity with galvanometer work the young electrical engineer is left to the mercy of the wireman or the operating engineer his laboratory training has been incomplete. A knowledge of the behavior of electrical machinery and confidence in handling electric circuits is becoming more necessary with each widening use of electricity. The utilization of alternating currents and the operation of alternating current machinery constitute today a most interesting and important field, one with which the electrical student cannot become too familiar. It is the result of experience that students who have been given a course of electrical laboratory training involving study, inspection, illustration and operation, have a better understanding of testing work than if they had been put at once into the latter without attention to the former."

IMPROVEMENTS ON ST. LOUIS & SUBURBAN.

It is announced that the St. Louis & Suburban Railroad Co. has in contemplation improvements and betterments to its system that will cost over \$500,000 and possibly \$1,000,000. The roadbed will be thoroughly overhauled, new switches and curves put in, and it may be decided to cast weld joints on all divisions. New rolling stock will also be purchased and the overhead work improved and strengthened.

But the principal changes will be made at the DelHodiamont power house. This station has become inadequate to handle the rapidly increasing traffic of the road, and it will be necessary to add new machinery or else build an entire new station. Which course will be followed has not yet been decided.

THE STREET RAILWAY AT DERBY, CONN.

The pioneer electric road of New England is that owned and operated by the Derby Street Railway Co., of Derby, Conn. The charter was granted in 1887, and on the night of Apr. 30, 1888, the first car was run over the four miles of track. Electric roads at that time were hardly more than a theory, and in consequence the Derby line has passed through all the vicissitudes attendant upon the development of a new idea. Looking over the 13 years of the company's existence an excellent conception of the development of electric railroading may be had.

The first power house was built at the Derby Docks and was equipped with one 175-h. p. boiler, one 100-h. p. engine and one 75-h. p. Van Depoele generator, with the necessary "exciter," and one throw-over switch. Originally the road was intended for freight but upon the completion of the plant, the freight motor had not been received and the passenger cars, equipped with the Van Depoele 15-h. p. motors, were put into service. These motors were set up in a cab in the front of the cars and were geared to the axle by sprocket chains.

These crude motors were used until the fall of 1889, when the passenger service, having grown beyond all expectations, the General Electric F-20 under-running motors were given a trial and, proving very satisfactory, all cars were finally equipped with them; they were used until 1894, when the G. E. 800 under-running motors were put in and are being used today.

The Van Depoele generator was used until 1892, when it was replaced with an Edison bi-polar 150-kw. machine. This proved satisfactory until 1894, when a new station was built on Main St. in Derby. The general dimensions of the present power house, which is of brick and stone, are 60 x 55 ft. The boiler room is 28 x 55 ft. and 30 ft. high, and is equipped with three 600-h. p. Bigelow & Co. boilers, National feed water heaters, Chapman & Kennedy valves, Davidson condensers and pumps, and Sellers injectors. The steam pressure carried on the boilers is 100 lb.

The engine room is 30 x 55 ft. and 20 ft. high, and is equipped with two 600-h. p. Allis-Corliss engines and two direct-connected General Electric generators of 400 kw. capacity. The switchboard has six panels, with a Thomson recording wattmeter, two Weston voltmeters and two Weston ammeters. The current is generated at 525 volts.

The completion of this power house marked a point in the development of the road for which the company had scarcely dared to hope. At the beginning the almost superstitious opposition of the people to an electric road and the fight of a bob-tail horse car company to secure travel, raised obstacles hard to overcome. With-

are the McGuire "Columbian" and the motors are the G. E. 800 and G. E. 1200. The car equipment includes steel gears and pinions made by the United States Projectile Co., 2¼-lb. trolley wheels made by the H. A. Osborne Manufacturing Co., New Haven fare registers, Consolidated electric car heaters, "Standard" air brakes, Corning brake shoes, 33-in. 300-lb. car wheels made by the Boston Car Wheel Co. The bearings are all babbitted.

Nine regular and 10 extra conductors and the same number of

FIG. 1 BOILER IN FIRST POWER HOUSE.

motormen are employed; 11 hours constitute a day's work, the average wages paid being \$55 per month.

The overhead construction consists of No. 0 trolley wire and three No. 0000 feeders five miles long, made by J. A. Roebling's Sons. The overhead fittings were made by the General Electric Co. and the Ohio Brass Co. The poles are of wood. The overhead construction is maintained by the repair shop employes, six men being employed, who work 10 hours a day and are paid \$50 a month. The repair shop is located on Main St., Derby, and is 125 x 25 ft.

The company has two car houses, one on Main St. and the

FIG. 2—ENGINE IN FIRST POWER HOUSE.

FIG. 3—VAN DEPOELE GENERATOR.

in a short time the electric road became the popular one, however, and eventually absorbed the horse car line, equipping that with electricity and making a belt line between Ansonia and Derby.

From three cars the rolling stock of the company has grown to 12 open and 12 closed motor cars, and 5 open and 2 closed trailers. The cars were made by Brill and Jackson & Sharp; the closed cars are 18 ft. long and the open cars are 10-bench. The trucks

other at Lake Housatonic Park. The former is 35 x 125 ft., built of brick and will shelter 14 cars. The latter is 65 x 130 ft., built of iron, and will shelter 16 cars. Hydrants with hose attached are conveniently located in the buildings for use in event of fire; one watchman and one inspector are employed.

The company operates about 10 miles of single track, an extension of about two miles, having been opened on Sunday, May 27th.

The heaviest grade on the road is $7\frac{1}{2}$ per cent and 400 ft. long. The track is laid with 90-lb. girders and 60-lb. T-rails, made by the Lorain Steel Co., the Johnson Co. and Wm. Wharton, jr. & Co. The ties are of chestnut 6 x 7 in. x 6 ft. spaced 2 ft. between centers. The joints of the 9-in. rails are made with 8-hole fish plates and the 6-in. with 6-hole fish plates. "Crown" bonds are used. The streets are for the most part paved with macadam, but there are $1\frac{1}{2}$ miles of Belgian block.

In the operation of the road four tons of George's Creek, pea

FIG. 4—ERECTING BOILERS AND STACK OF NEW PLANT.

and dust coal are burned daily, the cost per ton running from \$1.50 to \$3. The average car-mileage per day is 625.

The cost of power per kilowatt-hour is 1.56 cents, distributed as follows: Fuel, .8654; labor, .5717; supplies, oil, waste, etc., .0450; water, .07892.

FIG. 5—600-H. P. ALLIS ENGINES IN NEW PLANT.

The operating expenses in cents per car-mile are as follows:

General expense	1.576
Transportation	5.962
Maintenance of overhead construction, way and buildings....	.604
Maintenance of equipment.....	1.835
Power station	2.368
Losses by damage459
Total	12.804

The maximum speed of the cars is nine miles an hour, the schedule speed being 7.25.

The officers and operating staff were: President, H. Holton Wood, Boston; vice-president and treasurer, Charles E. Clark, Derby; secretary, F. W. Wallace, Ansonia; general manager, B. W. Porter; superintendent, George N. Kennedy; chief engineer, H. Schmitz; attorneys, Wooster, Williams & Gager, Derby. The authorized capital stock is \$250,000, of which \$150,000 has been issued, and the authorized funded debt is \$250,000, of which \$150,000 has been issued. Early in June of this year the Derby Street Ry. was acquired by the Connecticut Lighting & Power Co., of New York, otherwise known as the Young syndicate, which has recently secured control of a large number of other street railways in Massachusetts and Connecticut. The consideration is stated to have been \$350,000.

A few years ago the company purchased a tract of land a short distance north of Derby on Lake Housatonic, and opened a pleasure resort. Pavilions and baseball grounds were provided and

FIG. 6—CURVE AT NAUGATUCK BRIDGE.

launches put on the lake. This park proved a delightful place for the people of this section to spend the warm summer days and evenings, and has been a profitable investment.

There is one point in track building, overlooked in the first construction, in 1887, which experience disclosed was a very important one—a good joint. The hasty and imperfect work at the joints caused endless trouble. The joints were soon improved, however, and the resultant change brought the road into the popular favor it has since enjoyed.

Figs. 1, 2 and 3 of the illustrations show the boiler and engine rooms of the original power plant, and when these views are compared with Fig. 5 which shows the direct-connected unit now used, the progress made in building machinery for railway power plants is very evident. Fig. 4 is a view of the stack of the new station when in course of erection and Fig. 6 shows the big curve at the Naugatuck River bridge.

PETITION AGAINST CHEAP FARES.

Residents of Evanston, a northern suburb of Chicago, have presented to Mayor Harrison one of the few petitions ever drawn protesting against a reduction in car fares. It now costs 10 cents to go from Chicago to Evanston by street car, but it has been proposed to connect the Chicago, Milwaukee & St. Paul Ry. with the newly opened Northwestern Elevated and run express trains into the city, charging a 5-cent fare. The delegation that called on the mayor urged him to disapprove of the plan as it is feared the reduced rate would bring to Evanston an undesirable class of residents and turn the suburb into a popular excursion resort.

The Ohio Board of Public Works has granted permission to T. N. Fordyce of Detroit, Mich., to build and operate an electric tow line along the Miami & Erie canal for the purpose of drawing canal boats.

Electrical Measuring Instruments.

BY J. FRANKLIN STEVENS.

Mr. Stevens is president of the Keystone Electrical Instrument Co., of Philadelphia, and this paper was read at a stated meeting of the Franklin Institute.

PART I.—The author touches briefly on the history of the subject and the success with which instrument makers have met the demands for new types of instruments. Next the instruments needed in making ordinary electrical measurements are enumerated, and the requirements of a practical and satisfactory instrument for measuring voltage, current or power defined. The different types of instruments in common use are then classified and their respective advantages, disadvantages and limitations for various classes of work discussed. The six types of instruments considered are: Hot-wire, Electro-static, Tangent galvanometer, Dynamometer, D'Arsonval galvanometer, Electro-magnetic.

PART II.—After completing the discussion of the characteristics and limitations of the different types, the questions of specifications and installation are taken up. The importance of selecting a manufacturer who has learned the "trick" of making an instrument properly, is dwelt upon and suggestions are made as to the way of avoiding the troubles that arise between the maker and the purchaser and his engineer because the instruments are carelessly or ignorantly handled by the switchboard contractor. The permissible errors in instruments, the definitions of the ohm, ampere and volt, and remarks on testing and calibrating follow next, and the conclusion deals with special forms of indicating instruments.

Since we have available a very extensive literature bearing on the subject of laboratory testing instruments, in which can be found descriptions of the instruments employed, their construction, application and approximate laws, I shall pass over that portion of the subject and confine myself to commercial direct reading indicating instruments, such as are to be found in every-day use.

The history of the art embodied in the commercial manufacture of indicating instruments is extremely interesting, but shows many analogies to the development of other branches of electrical engineering, with the single exception that practical data in published form are extremely scarce. Every one entering this field is compelled to master some of the most intricate problems known to the profession, and must learn for himself how best to apply theoretical deductions to practical mechanical devices. Until very recent years, our sole guide has been the study of early and primitive types which in their time were useful and valuable, but which today fail to reach the high standard we have learned to demand of an instrument whose function is to indicate the input or output of our many and varied electrical devices. Every new device put before the public has meant a new condition to be met by the instrument manufacturer, requiring of him a new design or modification of an existing design. Two rather recent examples of this occur to me: one, the increasing tendency to employ high voltages in commercial work, reaching frequently 12,000 volts in the case of series constant-current arc light systems and 33,000 volts in long-distance power transmissions; the other, the rapid development of the electric automobile, which requires a volt-ammeter of as high a degree of accuracy as the portable laboratory instrument, yet able to withstand the roughest usage ever accorded an instrument of precision, coupled with restrictive specifications as to size and weight. In every instance instrument manufacturers have met the demands made upon them better, I think, than many of our fellow-workers have in some other lines. Much yet remains to be done, and much, I am confident, will be done in the matter of perfecting existing instruments in the near future. Gradually inefficient or unreliable types are being relegated to oblivion and the remaining ones brought closer and closer to standard uniform construction.

The great majority of measurements required today can be made with a voltmeter, ammeter and wattmeter, and, while it might be thought that the wattmeter is merely a combination of the voltmeter and ammeter mounted in one case, this is not true in all classes of measurement. While it is true that the reading of the wattmeter represents the product of the readings of the voltmeter into the ammeter in the case of direct current measurements, it is not true in the case of alternating current measurements, save in the very exceptional case of a circuit possessing neither capacity nor inductance or a balance of the two. When either inductance or capacity exist there is a consequent lag or lead of the current wave relative to the pressure wave, and, since the instantaneous readings of the volts and amperes represent the mean effective or virtual values, that is, the square root of the mean square, their product differs from the reading of the wattmeter, which indicates the integrated values of two curves, the maximum and minimum values of which occur at different times. To obtain an agreement between the values obtained by volt-ampere readings and watt readings, it is necessary to multiply the volt-ampere readings into the cosine of the angle of lag or lead, so that the ratio of the watt readings, as given by a properly constructed wattmeter, to the volt-ampere readings gives us the power factor of the circuit, and from the two sets of readings we can readily determine the angle of lag or lead and the so-called wattless current. Probably this is well known to all of

you, yet scarcely a week passes but I have to explain the matter to one or more customers who cannot reconcile the difference in the two sets of readings and are inclined to believe that some, if not all, of their instruments are indicating erroneously.

Before touching on the different types of indicating instruments which are most commonly found in commercial use, let us consider for a moment the essential requirements of a practical and satisfactory instrument for measuring voltage, current or power. To start with, the instrument must be direct reading. We have no time today to convert angular deflections into true values by means of tables of constants, but insist that the pointer shall indicate directly in definite units the value of the passing load or the impressed electro-motive force. We must next be assured of the accuracy of the calibration, and for that depend principally upon the reputation of the maker or check the indications by comparison with a secondary standard. Beyond this we must know that the accuracy of the indications is not affected by the influence of ordinary external fields or by normal variations of temperature, due either to heating within the instrument, by means of the passage of the current to be measured, or to variations in the temperature of the room in which they are installed. All instruments should be mounted in dust-proof cases, and the systems carried in jewelled bearings; the movement of the pointer should be aperiodic or dead-beat, and, so far as possible, the system should contain nothing subject to change or deterioration, and should be constructed so that it will withstand successfully the ordinary rough usage liable to be accorded it in practice. The question of gradual change of accuracy, due to the change in some constituent part of the system, has led me to strongly advocate the use of electro-magnetic instruments with gravity control for switchboard use whenever the conditions render them applicable, and I fully expect to see this type of instrument become more popular as its advantages become more widely appreciated. Such a system is not applicable for portable instruments, save the dynamometer system for alternating currents, and even then a spring control must be used; nor is the series electro-magnetic ammeter practical above about 1,500 amperes, due to the structural difficulties involved in carrying the bus bars directly to the instrument terminals. The one objection most commonly urged against the electro-magnetic instrument for direct current switchboard use is the unequally divided scale, for, as a rule, the scale only covers a range starting at 10 per cent of the total up to maximum. In most cases, however, this objection is purely captious, for a switchboard voltmeter is seldom used to indicate more than 10 per cent above or below the normal voltage; and the ammeter indications are of principal importance in the higher ranges to prevent a possible overload of the circuit or generator. In alternating current circuits an equally divided scale is an impossibility, so why should we sacrifice constancy in direct current measurements for the sake of an equally divided scale when the lower registers are so seldom used? In portable direct current instruments the proposition is somewhat different, as we desire to cover the maximum limits of possible measurement on a single scale instrument; therefore, an equally divided scale is desirable and practically necessary.

Taking up now the different types of instruments which are in most common use, we find they may be roughly divided into six classes, depending on the principle by means of which measurements of voltage, current or power are made: (1) the hot-wire; (2) the tangent galvanometer; (3) the electro-static; (4) the dynamometer; (5) the D'Arsonval galvanometer and (6) the electro-magnetic.

The hot-wire instrument is designed to operate by the expansion

of a fine wire or strip of conducting material due to the heating produced by the passage of the current to be measured, and, therefore, the indications are proportionate to the square of the current. This type of instrument possesses the advantage of indicating with equal accuracy the current flow on either direct or alternating current circuits and is independent of the frequency of the circuit or of the shape of the current wave; it is, further, unaffected by the presence of external fields. These advantages, however, are all that can be claimed for this system, and to offset them are many serious disadvantages. Since the instrument operates by virtue of temperature differences, it is extremely susceptible to variations of external temperature, and such variations must be compensated either by mechanical means, which provide for bringing the pointer to zero by increasing or decreasing the tension on the working wire, or by providing auxiliary heating strips which are supposed to automatically adjust the tension of the working wire on the general principles of a thermostat. This may seem a small matter to most observers, but to me it signifies an error in principle, and reminds me of one of our early types of arc dynamos which, by reason of incorrect construction, we found to spark badly; so, in place of correcting the design, an air blast was provided to blow out the spark. Another point of objection is the constant change of zero, due to the fact that until the wire has been stretched to its elastic limit it will fail to return to the same point after having been stretched by the heat applied and will always show a slight residual strain. To attempt to correct this prior to installation in the instrument means, judging by my own experience, that at least 90 per cent of the wires will break during the preliminary stretching process, and the remaining 10 per cent will stand but a very slight overload in service. As overloads are quite common, this would constitute a serious objection, for it means the return of the instrument to the manufacturer for the insertion of a new wire and recalibration. Another very serious objection is the amount of current required to operate the instrument. The average resistance of a modern hot-wire voltmeter is 4 ohms per volt, which means a current flow of .25 ampere. This low resistance effectually bars this type of instrument for accurate testing, since the amount of power abstracted from the circuit to be tested vitiates the accuracy of the results obtained and introduces serious errors, which must be allowed for in all calculations. Recently an attempt has been made to introduce the hot-wire instrument as a shunt ammeter, particularly for alternating current measurements. As a shunt ammeter, the hot-wire instrument is a distinct failure, for, while the manufacturers claim it can be operated on a drop of .3 volt for full scale, my personal experience has shown a drop of 6 volts to be necessary. On the makers' figures, 300 watts would be required to operate a 1,000 ampere ammeter, nearly .4 horse-power per instrument, while on the sample I have tested 6,000 watts, or 8 horse-power, would be required. Again, it has been shown that these ammeters when calibrated on direct current are not accurate within 10 per cent when used on alternating currents, unless the reactance in the shunt is exactly equal to the reactance in the instrument, a condition almost impossible to obtain, even with the most careful design.

A modification of the hot-wire system has been proposed, consisting of an enclosed chamber containing a fixed resistance wire, one end of the chamber, which is made air-tight, consisting of a flexible diaphragm operating the pointer through a system of levers. In this case, the heat supplied to the wire by the passing current causes the air in the enclosed cylinder to expand and, consequently, puts the diaphragm under tension, very much on the principle employed in the aneroid barometer. I find by actual experiment that such a system could be applied to voltmeters, and could be so made that it would be accurate in its indications and would possess a reasonably high resistance. The feature, however, which renders this system impracticable is the slowness with which the readings can be taken. The pointer will not come to rest until after the heat supplied the air enclosed within the chamber is equal to the heat radiated by the walls of the enclosing chamber, and from one and a half to two minutes are required before the pointer will come finally to rest at the part of the scale marked to indicate the impressed e. m. f. This is true no matter how small the air chamber is made; and while it is possible to shorten this time by carefully covering the sides and one end of the cylinder by a heat insulating jacket, still it cannot be constructed so as to give an in-

stantaneous reading, and every attempt to shorten the time by covering the walls of the chamber results in a corresponding increase of the time required for the pointer to come back to zero after current has been shut off. In other words, the instrument is similar in its action to an ordinary thermometer, which, as you know, cannot be made to respond instantly to changes of temperature.

Electro-static instruments, which depend for their action on the mutual attraction of two plates connected to the opposite sides of the line, are still used, but not extensively, for high tension measurements. They will indicate correctly on either direct or alternating current circuits, but are limited to measurement of voltage. It is impossible with this type of instrument to obtain a low reading, as the attraction of the plates toward one another varies approximately with the square of the potential difference between them. I say "varies approximately" advisedly, as the capacity of two plates varies directly with the square of the voltage only when the distance between the plates is maintained constant, which in this case is an obvious impossibility. As a rule, these instruments cannot be made dead-beat without introducing elements liable to seriously interfere with their accuracy; and, while there are no errors due to temperature changes, and while they are also extremely efficient, requiring no current flow at all, they are affected very considerably by external influences, particularly by static charges, which are almost invariably present in power stations or dynamo rooms, and, as you probably know, it is practically impossible to provide a shield for static effects.

Instruments employing the principle of the tangent galvanometer are still employed, and for certain classes of measurements are extremely useful. They can be particularly recommended for use as ground detectors or differential voltmeters, where the actual value of the indicators is of small moment, the particular object being to show a balance of two opposing voltages or the presence of a ground by deflection. In this system the magnetized needle is suspended vertically, and is acted upon by two equally and oppositely wound solenoids; that is, the solenoids are wound with two wires in multiple and then cross-connected, so that we have two circuits equal in effect but opposite in action. I might say in passing, that if the proper proportions of solenoids to magnetized needle are employed, and the length of the magnetized needle properly proportioned to its area, the tangent galvanometer instrument may be made extremely accurate and also quite permanent. Care must be taken, however, that under no conditions can the direction of the lines generated by the solenoids oppose the lines existing in the magnetized needle, otherwise the value of the calibration is almost instantly destroyed.

For measurements of alternating current voltage, and also for the measurement of the watt output of any alternating current source of energy, the dynamometer system, in one of its many modifications, is unquestionably the best type of instrument that can be used. This instrument indicates directly the mean effective voltage of the line to which it is connected, and is equally accurate for direct current measurements, provided readings are taken with the direct current flowing through the instrument in one direction, then the direction of the current flow reversed and a second reading taken, the mean of the two readings being the correct value of the impressed electro-motive force. This for the reason that the instrument is extremely susceptible to the influence of external fields. Further, the dynamometer type of instrument is only properly adapted for use in portable instruments. The fact that two readings are necessary on direct current prohibits its use as a switchboard instrument on direct current circuits, and its delicacy, coupled with its field of low intensity and its susceptibility to error, due to the presence of iron in its immediate neighborhood, whether used on direct or alternating current circuits, renders it impracticable as a switchboard instrument for alternating current circuits. As an ammeter, it cannot be successfully employed for measurements above .5 ampere, due to the difficulty of providing perfectly flexible contacts capable of carrying large currents. When you attempt to convey a current into a moving coil beyond the carrying capacity of a flexible conducting spring, recourse must be had to mercury contacts, and a mercury contact should never be employed in a portable or enclosed type instrument. In the dynamometer instrument great care must be taken to have the moving coil as light as possible; and to render the instrument aperiodic, or dead-beat, an aluminum air vane, moving in a partially enclosed chamber, must be employed. Manu-

ally operated brakes acting on the delicate moving system should be avoided, as their continued use results in a serious derangement of the moving parts.

Instruments based on the principle of the D'Arsonval galvanometer are very extensively used today for both switchboard and portable instruments on direct current circuits; they can be calibrated so as to show an equally divided scale, and, if properly constructed, are an extremely efficient instrument. Further, they are very well adapted to the measurement of resistances and grounds. In the construction of this type of instrument the important factor is the permanency of the permanent magnet fields employed. It is essential, in the first place, that the proper grade and quality of steel shall be employed, which means a steel possessing high permeability and a high degree of retentivity; then this steel must be carefully worked within definite limiting temperatures and must be treated

CAR BARN AT QUINCY, ILL.

Through the courtesy of the Quincy Horse Railway & Carrying Co. we are able to reproduce herewith plan and elevation drawings and a group of photographs of a well-designed and substantially built car barn that has recently been completed by this company at a cost of \$11,000.

The building which will be used mainly for storage purposes is 130 ft. long by 80 ft. wide at the ground, with side walls of hard machine bricks laid in brown mortar, and footings of concrete. Measuring over the foundations which are of rubble range work the dimensions are 130 ft. 4 in. by 80 ft. 4 in.

Two rows of steel columns resting on concrete foundations spaced 16 ft. c. to c. and 24 ft. from the side walls, extend the length of the building and support the steel roof trusses shown on the rear eleva-

with great care and skill in the processes of magnetizing and ageing. Further than this, the moving coil should be extremely light and the whole system carefully shielded from the influence of external fields, and yet so shielded that the moving coil will not be robbed of an appreciable number of lines of force, due to the presence of the shielding iron. The greatest field for this type of instrument is in the measurement of heavy currents; that is, for currents of 1,000 amperes and upwards, due to the fact that it can be operated as a shunt instrument, requiring an extremely small drop of potential, full scale being obtained with a drop of from .03 to .05 volt. This means a relatively high efficiency, and, while the instrument does not possess all of the advantages of a series ammeter, yet it is far easier to install, and, where a high degree of accuracy in current indications is not demanded, will be found very satisfactory in practice.

(To be continued.)

tion and in the interior view. The construction of the column foundations is also shown in one of the drawings. The roof is 18 ft. from the ground at the sides and is formed of 1½-in. iron sheeting, on which are placed four coatings of tar and gravel. An ornamental terra cotta coping extends along the edge of the roof at the front and back of the structure.

The front wall for the entire width of the building is fitted with sliding doors on upper hangers so that at least one-half of the entrance may be thrown open at one time, this feature greatly facilitating the ingress and egress of cars. The front wall above the doorways is supported on two 20-in. I-beams. Seven tracks extend the full length of the interior.

In designing the barn special care was taken to secure good ventilation, lighting and heating. Twenty-four small ventilators along each side of the raised portion of the roof and numerous windows and doors in the sides and ends of the building as shown in the ele-

ELEVATIONS AND PLANS OF CAR BARN, QUINCY, ILL.

vations insure plenty of fresh air and light, and a steam heating system keeps the repair pits and the interior of the barn at a nearly constant temperature in winter regardless of the outside temperature. A low pressure steam heating system is used and the generating plant, consisting of an Haxton boiler, is housed in a separate

HINTS ON SEEKING FOREIGN BUSINESS.

An expert salesman writing in the Engineering Magazine for June gives some excellent advice to American manufacturers on what to do and particularly what not to do if they are seeking foreign markets for their goods. A brief summary is as follows:

Write to customers in their own language; in default of this write to the Frenchman, Belgian, Italian, Russian and Scandinavian in French and to the German, Austrian and Dutch in German.

Do not mimeograph letters.

Give full and concise answers to letters asking questions.

Pay an agency similar to the Bradstreet or Dun companies to advise you as to the standing of would-be customers; do not expect the American consul to do this work.

Solicit foreign business just as you would the home business by employing competent salesmen.

Do not think that foreigners are dishonest or unwilling to pay for goods ordered.

Do not neglect the export trade because the domestic business is good.

The Pueblo Electric Street Ry. has been reorganized, the new name being the Pueblo Traction & Electric Co.

A conductor in the employ of the Buffalo, Kenmore & Tonawanda Electric Railway Co. caused the arrest of a noted criminal recently. He saw the man drive past his car in a carriage in the direction of the depot, and immediately telephoned the police.

PIER FOUNDATIONS.

building 150 ft. from the barn. The installation is of sufficient capacity to heat not only the car house but also a work shop that the company intends to erect shortly. The figure, \$11,000, given as the cost of the building does not include the expense of putting in the heating system.

The cable conduit and tracks on Grand avenue, Kansas City, Mo., have been moved bodily to one side of the street to make room for new tracks. Greased skates running on rails were inserted beneath the yokes and the conduit forced over by jacks.

RECENT STREET RAILWAY DECISIONS.

EDITED BY J. L. ROSENBERGER, ATTORNEY AT LAW, CHICAGO.

MUST LOOK OUT FOR CARS HIDDEN BY TREES.

Kelley v. Wakefield & Stoncham Street Railway Co. (Mass.), 56 N. E. Rep. 285. Mar. 1, 1900.

There is, the supreme judicial court of Massachusetts says, no absolute rule of law requiring a traveler to look and listen before crossing the tracks of an electric railway in a public highway. It also says that his conduct is not to be judged of in the light of what has happened, but in the light of the circumstances as they at the time presented themselves to him, and he cannot fairly be charged with the result of arithmetical calculations after the event, by persons not confronted with the necessity of action. Yet, notwithstanding this, it holds guilty of contributory negligence a driver of a grocer's wagon who looked for a car only once, and that when he had reached, on a cross street, a point about 80 feet from the track which he was approaching, and neither looked nor listened at all at any time for any car that might when he did his looking be temporarily hidden behind an impenetrable row of pine trees so placed that he could see beyond its further end, but coming from behind which such car would reach the crossing just about the time he did.

OPERATING CAR IN UNUSUAL MANNER AND INJURING PASSENGER ON RUNNING BOARD.

Citizens' Street Railroad Co. v. Hoffbauer (Ind.), 56 N. E. Rep. 54. Jan. 9, 1900.

It is a well-settled rule, says the appellate court of Indiana, that a carrier of passengers is held to the highest degree of care and diligence for the safety of passengers consistent with the mode of conveyance employed. But the duties imposed by the law upon those who operate steam railways are not the same as those imposed upon those who operate street railways. And the principles of law which govern these two systems of transportation are not altogether the same, although many general rules are applicable to both.

A street railway engaged in the carriage of passengers, the court goes on to state, is not an insurer. But it must use every reasonable precaution in the management and operation of its cars. And its duties in this regard are not the same when it is operating its cars in the usual manner as when in an unusual manner. If the car is run in an unusual manner, and a danger arises therefrom which does not ordinarily exist, it is the company's duty to warn passengers of such danger. A passenger has the right to presume, in the absence of knowledge or warning to the contrary, that all necessary precautions have been and will be taken for his safe transportation. The care and vigilance required in operating an open car may be greater than that required in operating a closed car. If a danger approaches of which the passengers are ignorant, they should be notified, so they may take steps to avoid it.

Take this case. A man, anxious to get to the city to keep an appointment, boarded, as it was growing dark, an open car running, where there was but a single track, towards the center of the city. But the car was at the time going backwards. Soon the man found that the car was carrying him away from his destination, and was running head end first, as cars usually run. The conductor was at the rear end of the car. He had paid his fare to the city, and wanted a transfer. Having had no warning of danger, he left his seat and stepped upon the running board to go to the conductor to get the transfer. Unfortunately, however, the car was not then running upon the track which he supposed, but upon a track which brought the side of the car he was on near the poles along the track, which was here double, and he was struck by one of the poles.

Now the court says that it is evident that a passenger might leave his seat in the car, and go upon the running board, under circumstances which would require a court to say, as matter of law, that he was guilty of negligence, and assumed the risk of contact with things outside the car. But under such conditions and circumstances as here stated it declares that it cannot say, as matter of law, that the passenger's own negligence contributed to his injury. It was a question for the jury, which, in this case, not only answered it in his favor in the general verdict, but, in answer to an interroga-

tory, said that, under all the circumstances, the passenger, at the time of the injury, exercised such care as would be exercised by an ordinarily prudent person under like circumstances.

Furthermore, the court holds that there was no error in permitting witnesses to testify that the usual and ordinary use of the running board was for passengers to go from one part of the car to another, and that passengers used the running board for that purpose. The company could not daily permit a certain part of its car to be used for certain purposes by passengers, and then be heard to say it was not liable for an injury to a passenger so using the car because that particular part was constructed for another purpose.

When this passenger went upon the foot board, the court holds, he took upon himself the duty of looking out for himself against the usual and obvious peril of the place, as long as the car was operated and managed in the usual manner. But the danger of being hit by a trolley pole while on the foot board was not such a danger as he was bound to anticipate when the car was running in the unusual manner of having the foot board next to the trolley poles, and he had no knowledge that it was so running. In the absence of knowledge, he had the right to assume that the car was properly managed, and was running with the foot board away from the poles, and that there was no danger from trolley poles while on the foot board. His failure to look ahead was not necessarily negligence, unless he had reason to anticipate danger. He had the right to assume that the company was running the car in the usual manner, and that it would perform its duty in guarding the safety of its passengers.

However, the court reverses a judgment which the passenger obtained because of what it considers the too great breadth of an instruction which told the jury that if it found the two facts, namely, that the car was on the wrong track, with the running board next to the poles, and that the passengers were not warned, negligence was shown, which, it holds, was taking from the jury the question which the latter should have decided from all the facts and circumstances existing at the time.

LIABILITY WHERE PASSENGER IS THROWN THROUGH WINDOW WHEN WHEEL BREAKS AND OTHER PASSENGERS TESTIFY TO EXCESSIVE SPEED.

Johnsen v. Oakland, San Leandro & Haywards Electric Railway Co., Consolidated (Cal.), 60 Pac. Rep. 170. Feb. 21, 1900.

Where a passenger upon an electric street car was thrown across the car, against and through the window on the opposite side of the car from where he was sitting, the supreme court of California holds that the jury may well have said from the evidence that this would not have happened if the car had been traveling at a proper and lawful rate of speed, and holds that it was justified in finding that the proximate cause of injury was the excessive rate of speed, notwithstanding the flange of one of the wheels of the car may have broken, while it was upon a curve, and the car left the track. In other words, the court holds that it cannot be said, as matter of law, where such an accident happened, that, if the speed of the car had been but eight miles per hour, the passenger would still have been precipitated through the window of the car, and have received the injuries suffered.

Moreover, having thus settled that the defective wheel was not necessarily the sole cause, or to any degree the direct and proximate cause of the injury, the court holds that, even conceding a latent defect in the wheel, and the exercise of the proper amount of care in selecting and using the wheel by the defendant company, still, the passenger's cause of action might be full of merit, and presented a proper case to go to the jury upon the question as to the proximate cause of the injury.

Then it was argued that the various other passengers who were riding on the car at the time the accident occurred, who were introduced as witnesses by the plaintiff to show the rate of speed the car was traveling, were not competent to give an opinion upon that question. But, in view of the fact that they were regular travelers upon this line of cars, and that the schedule and statutory time was eight miles per hour, the court holds that there could be no question

but that the testimony given by them to the effect that the car was going very fast, and at an unusual rate of speed, was proper evidence to go to the jury. And, indeed, the court says, the law recognizes a very broad and liberal rule in the reception of opinion evidence of nonexperts as to the rate of speed cars may be traveling. To this it adds that the fact that these witnesses were passengers upon the car, rather than bystanders, did not bar them from testifying in this respect, they having only given an approximate opinion as to the rate of speed the car was going at the time, while they were fairly intelligent, and had at least made casual observation as to the speed of the cars at other times.

EXTREME CARE MUST BE EXERCISED TO PROTECT WORKMEN ON TRACK.

Bengivenga v. Brooklyn Heights Railroad Co. (N. Y.), 62 N. Y. Supp. 912. Mar. 6, 1900.

An employe of an asphalt company, who was carrying a shovelful of hot asphalt ready for deposit between the rails of the track of the railroad company, waited for a car to pass, which came along just in time to prevent its deposit, and then stepped between the tracks to deposit the asphalt, when he was struck by a freight car, which followed the passenger car. The evidence also tended to establish that the car which struck the man gave no signal of its approach. He got judgment for damages, against the railroad company, which the appellate division, second department, of the supreme court of New York affirms.

Under ordinary circumstances, the court says, it is quite probable that upon the evidence the man would have been held to be guilty of contributory negligence, as matter of law, had he been a traveler upon the highway. But the court does not think such result should follow under the peculiar circumstances of the case. It holds that the railroad company was chargeable with notice of the fact, both by its contract to repair the street and its actual condition, it being torn up, that workmen were upon the track at this point, and were required to be, in order that the work might proceed.

It is evident, the court goes on to say, that the operation of the cars created a condition in which this man and those engaged upon the improvement were required to work in the intervals between the moving cars upon the track, and, under such circumstances, would remain thereon many times until the car came very close upon them. The condition was one where the person operating the car was required to exercise extreme care for the protection of the workmen, and it is evident that abundance of warning was required. The car was also required to be under such control as that it could be stopped practically upon the instant. A finding being authorized that no warning of any description was given of the approach of this car, the railroad company's negligence was established.

Whether the man should have observed the car, or not, became a question of fact for the jury. Yet, as the condition was one where he had the right to assume that warning would be given, and as the prosecution of the work required that the asphalt should be deposited while hot, the court says that it is quite evident that the operation of the car was to be had with regard to the man's being between the rails of the track; and it thinks that he might rely upon the fact that the operator of the car would stop the same when it reached the point where he was upon the track. But whether, under such circumstances, he ought to have immediately looked, after the passage of the first car, or whether he was justified in relying upon the assumption that the railroad company would discharge its duty to give warning of the approach of the car, and stop the same before working an injury, was, the court holds, a question of fact for the jury. The returning of a verdict in his favor, shows the latter's view of it.

CASE MADE WHERE PARTY DRIVES INTO UNNOTICED SAGGING WIRE ON STREET.

Lloyd v. City & Suburban Railway Co. (Ga.), 35 S. E. Rep. 170. Mar. 2, 1900.

As a physician and his servant were going along in a vehicle drawn by two horses at an ordinary gait,—a slow trot,—the servant driving, they encountered, at a cross street, a wire, belonging to the street railway company, which had sagged from the poles and was swinging at about the height of the horses' necks from the ground.

The wire touched the horses' necks as they were driven under it, and caused them to jump, and to move forward more rapidly. Then, passing over the horses, it struck and caught the doctor and the driver, and injured them, as well as cut off the top of the vehicle.

Both of the men testified that they did not see the wire until it had struck the necks of the horses. The driver testified that he was looking straight forward along the street, as it was his duty to do, but did not see the wire until the doctor made an exclamation and threw up his hands, the wire then being within twelve inches of his face, yet that he could have seen it 100 yards, if his attention had been directed to it. The doctor, according to the evidence, was not looking ahead, but, as was his custom, relied upon his driver to look out for obstructions, etc., on the road or street. There was no evidence as to the length of time the wire had been allowed to remain swinging across the street. Nor was there any evidence as to what caused it to sag from the poles. Moreover, the evidence disclosed that, from the time the wire was seen by the doctor until the time it inflicted the injuries, the occupants of the vehicle could not stop the horses or avoid running against the wire.

Under this state of facts, the supreme court of Georgia holds, it was error to grant a nonsuit in the actions brought by the doctor and his servant, respectively, to recover damages.

It is a general rule, the court says, that, when a person sees that he is in danger in consequence of the negligence of another, he is bound to avoid that danger, if he can do so by the exercise of ordinary care; or, if he has reason to apprehend danger occasioned by another's negligence, he must exercise ordinary care to avoid it. But whether a person who is in the habit of traveling the streets of a city day after day, and these streets are clear of obstructions, ought to see a wire the size of the little finger, when he is looking straight ahead in the direction of the wire, and, could have seen it a much greater distance, if his attention had been called to it, is, the court thinks, a question for the jury, and not for the court. And, assuming that the jury would find that the plaintiffs in these cases ought, by the exercise of ordinary care, to have seen the wire, this, the court holds, would be conclusive that there was negligence on their part; but still, if the defendant was also negligent, and the plaintiffs' negligence was less than that of the defendant, they could recover damages, if, after seeing or having reason to apprehend the danger, they could not then have avoided it by the exercise of ordinary care.

MAY EXPECT ONE WILL CEASE TURNING TOWARDS TRACK WHEN GONG IS SOUNDED.

Cawley v. La Crosse City Railway Co. (Wis.), 82 N. W. Rep. 197. Feb. 27, 1900.

A motorman has a right to expect, the supreme court of Wisconsin holds, that a person in a buggy turning towards the track in front of his car will respond to the gong and cease such movement, and is bound, as an ordinarily careful man, to exert efforts to stop his car only after the contrary becomes apparent.

FRANCHISES ARE NOT LIKE PROPERTY HELD IN TRUST.

State v. Superior Court (Wis.), 81 N. W. Rep. 1046. Feb. 27, 1900.

In holding that a court of equity has no jurisdiction to restrain a city council from exercising a discretionary legislative power vested in it to grant corporate rights and franchises, the supreme court of Wisconsin makes the point that such corporate rights and franchises are not like a fund or property held in trust for the citizens and taxpayers of the city.

FAILURE TO GIVE TIMELY SIGNALS EVIDENCE OF NEGLIGENCE.

Dennis v. North Jersey Street Railway Co. (N. J.), 45 Atl. Rep. 807. Feb. 26, 1900.

It is not error in a trial judge, the supreme court of New Jersey holds, to charge the jury that, if the motorman operating on the public streets an electric street railway car, on which a bell or gong is maintained to be rung or sounded as a signal of danger, fails to give timely signals of danger in approaching a street crossing which he intends to cross, such failure is evidence of negligence on the part of the motorman.

CONTRIBUTORY NEGLIGENCE OF PASSENGER INJURED ON RUN BOARD BY OUTSIDE OBJECT.

Flynn v. Consolidated Traction Co. (N. J.), 45 Atl. Rep. 790. Feb. 26, 1900.

There was evidence in this case from which the jury might infer that the plaintiff, a passenger on a trolley car, had notified the conductor of his desire to alight; that the car had slowed down; that the passenger had got upon the run board, in preparation to alight; that the car then increased its speed, and that the passenger, in endeavoring to again signal the conductor, leaned over so far that his head was brought into contact with the handle of the door of a milk wagon proceeding in the same direction with the car; and that he thus received the injuries for which he brought suit.

In making absolute a rule to show cause why a new trial should not be granted, after verdict for the plaintiff, the supreme court of New Jersey holds that on taking such a position the passenger was under a duty to use his powers of observation, and observe and avoid dangers ab extra, as it calls them, or from without, and that the evidence that he leaned over so far as to be carried against a passing vehicle, which he did not observe, and which, if he had used observation, he could have observed and avoided, established his negligence contributing to his injury.

It does not decide, but propounds as a query, whether, in respect to dangers ab extra, or from without, not created by the carrier, nor the result of the construction or operation of its road, it is negligence per se, or in and of itself, in the passenger to take a position on the run board of a car. And yet it does intimate that the true rule might be that a passenger who is invited to take passage in a street car so full of passengers that he is obliged to stand on a run board, is not to be considered as negligent with respect to dangers arising from the construction of the car, or its operation by the carrier and its servants, but that the passenger may be considered negligent with respect to dangers which may be said to arise ab extra.

APPERTAINING TO FORECLOSURE OF TRUST DEED AFTER A DEFAULT.

Rumsey v. People's Railway Co. (Mo.), 55 S. W. Rep. 615. Dec. 19, 1899.

In a suit to foreclose a trust deed on the property of a street railway company, the supreme court of Missouri holds that where there is no pretense that bondholders not made parties have any interest in the bonds which the trustee named in the deed does not represent, or that he is not acting in good faith, whatever forecloses the trustee, in the absence of fraud or bad faith, forecloses them, without their being made actual parties. But where the petition to foreclose is in behalf of all the bondholders who may desire to become parties to the suit, it holds that it is their right and within the province of the court to permit them to intervene.

It also holds that a clause in such a trust deed declaring the bonds due on default of payment of one coupon for 30 days is self-executing, as it is termed, valid, and will justify a decree for the full amount of the bonds.

Nor does the court consider that a decree of sale under foreclosure proceedings is vitiated because, while it provides that the property be sold to the highest and best bidder for cash, it also provides that the bonds and coupons secured by the mortgage deed of trust may be put up, to amount which they may be proportionately entitled to, in payment by the purchaser or purchasers. It maintains that if the purchaser has the requisite bonds, in payment of which the proceeds arising from the sale of the property are to be applied that there is no reason to go through the useless ceremony of paying cash on the bid, and then taking up the bonds with the same cash.

Neither does the court think that such decree can be said to be erroneous in ordering the sale of the property by a special commissioner, the statute not prohibiting it and it not being an unusual way for the conducting of such sales when made under decrees of courts of chancery.

An appointment of a receiver having been acquiesced in by all the parties to a suit for more than a year after it was made, the court holds that they must be held to have waived any irregularity if any there was in the appointment. One reason given for

this is that an application for the vacation of an order appointing a receiver must be made in a reasonable length of time.

Evidence touching the relations of the president with, and influence over the board of directors of the street railway company, the court pronounces mere matter of opinion, and not admissible for any purpose.

CONSTRUCTION OF INHIBITION AGAINST CONSOLIDATIONS INJURIOUS TO COMPETITION.

Trust Co. of Georgia v. State (Ga.), 35 S. E. Rep. 323. Feb. 27, 1900.

That portion of paragraph 4, section 2, article 4, of the constitution of the state of Georgia which denies to the general assembly "power to authorize any corporation to buy shares or stock in any other corporation," the supreme court of Georgia holds is not absolute in its terms, but was designed only to prevent the general assembly from authorizing one corporation to purchase shares of stock in another when doing so "may have the effect, or be intended to have the effect, to defeat or lessen competition in their respective businesses, or to encourage monopoly."

This clause of the constitution, the court goes on to say, applies to and includes all corporations, and consequently is applicable to street railway companies, and enforceable as to them whenever they directly or indirectly violate its provisions.

However, in interpreting what is meant by "competition" in this connection, the court suggests that it is well enough to bear in mind that there is a vast difference between the business of street railway companies, constructed generally simply for the purpose of passenger travel from one portion of a city to another, and steam railroad companies, whose business is the transportation of freight and passengers for long distances, and involving business in extensive territory. And it does not consider it violative of the constitutional provisions for a consolidation of street railway lines to be effected where it will probably lead to granting the public generally along their routes greater and less expensive facilities and conveniences of transportation. Such a case it maintains was one where, with the disconnected lines, a passenger, by paying the usual fare of five cents, could go only in one direction, and only to a point on the line which he first took; but, with the separate lines connected, one could start upon any line of the system, and for the same fare, by procuring a transfer to any other line in the system, he could reach at the same expense any point upon any of the lines that were controlled by the entire system.

LIABILITY FOR INJURY TO EMPLOYEE FROM DEFECTIVE CAR.

Murdock v. Oakland, San Leandro & Haywards Electric Railway Co. (Cal.), 60 Pac. Rep. 469. Mar. 6, 1900.

To furnish a car for the use of the public, or even for the use of the motorman and conductor, which is in such defective condition that it starts with a jump or jerk, or will make sudden lunges, so that if started before passengers are seated they must be steadied by the conductor, and the employes must brace themselves to escape injury, the supreme court of California holds, is clearly negligence. Indeed, in one part of its opinion it says that it was gross negligence to send out such a car for the patronage of the public.

Nor does the court consider that a nonsuit was justified where a conductor went to work upon such a defective car, not knowing at the time it was defective, but soon after discovered the defect, and that the use of the car was surrounded with some danger, and thereupon continued work for the period of an hour or more until he was injured. It says that if the employe, upon the discovery of the defect, had at once made complaint to the company, and had been promised that it should be remedied, clearly he would have been justified in continuing work for a reasonable time in expectation that the promise would be kept; and what would be a reasonable time is a question of fact for the jury. Again, the employe clearly had a reasonable time in which to make complaint to the company of the defect, and that, too, would be a question of fact for the jury. So the court holds that whether the conductor had been guilty of that which would defeat his recovery in this case was a question of fact, and not of law.

The employe, the court goes on to say, certainly was not bound to stop and leave the car at the moment he discovered the defect, regardless of the number of passengers, and regardless of the lo-

cation of the car upon the track as to its distance from the power house or other cars. The dangers surrounding its further use by the employe should be great in order to justify such a course of action. There was no such great danger here. These being the principles of law bearing upon a state of facts like those in this case, the court holds that it was a question of fact for the jury to say whether the conductor should have made complaint at once, or, as a reasonably prudent man, might have waited until noon to make complaint, or delayed until night, or still have delayed an additional length of time.

It will thus be seen, adds the court, that an employe is not barred from recovering damages in every case, as matter of law, when he knows a defect exists in the appliance, and that there is a certain amount of danger surrounding its use. He is not bound, as matter of law, to stop work instantly in all such cases. If the exercise of ordinary prudence demands that he stop work at once, he must stop, but, if otherwise, he should make complaint to the employer of the defect, and for a reasonable time thereafter cannot be held as matter of law to have assumed the risk.

Judgment for defendant, upon motion for nonsuit, reversed.

LIABILITY WHERE ATTORNEYS' FEES ARE ASSUMED ON COMPROMISE.

Pilkington v. Brooklyn Heights Railroad Co. (N. Y.), 63 N. Y. Supp. 211. Mar. 13, 1900.

A party who claimed to have a cause of action against a street railroad company made a written contract with his attorneys, by which he agreed that they should receive for their services one-third of any sum for which the case might be adjusted, and that neither party should settle the case without the consent of the other. Accompanying the summons and complaint was a notice to the company, signed by the attorneys, that they claimed a lien in accordance with this agreement. The company effected a settlement with the party for \$2,600 and agreed with him, in writing, "to adjust any claim for costs or for any lien upon the cause of action which the said attorneys may be able lawfully to establish."

In this latter feature, particularly, the case seems to be different from most, or all, of the cases in the books. In deciding it, the appellate division, second department, of the supreme court of New York holds that the attorneys were entitled to one-third of \$2,600; that their client was still under a valid obligation to pay them that sum, and that what the company contracted to do was to assume his liability, and so assume it as to finally release and discharge him, and that it could not be assumed that the company intended only to agree to pay or adjust such lien as the attorneys should be able to establish against it by a continuance of the litigation or otherwise.

But this being settled, the court does not consider that the performance of the agreement could be enforced by a summary order, disobedience of which could be punished as for a contempt. Nor does it think that this was made otherwise by the amendment to section 66 of the code of civil procedure to the effect that "the court upon petition of the client or attorney may determine and enforce the lien." That, it holds, does not confer power to determine and enforce a stipulation in the action not between attorney and client, although relating to the former's lien.

To sum up, the court says that the attorneys have their claim against their client, who has a fund of \$2,600 on which they have a lien for their compensation; and in addition they have the company's written agreement, made for a valuable consideration, binding it to pay and discharge this claim and lien, and which is enforceable by action. Or they have the undoubted right, supported by numerous and uniform decisions, to proceed to judgment in this action for the protection and enforcement of their liens, either by default in case no answer has been served, or in the usual way if the action is at issue.

REQUIRED SALE OF TICKETS OUTSIDE OF CORPORATE LIMITS AND USING COUPON TICKETS.

Rice v. Detroit, Ypsilanti & Ann Arbor Railway (Mich.), 81 N. W. Rep. 927. Feb. 20, 1900.

By the terms of a village franchise the duty was imposed to sell five tickets for 50 cents, good between a certain point outside of said village and any point in the village. The franchise further provided, "All such tickets shall be kept for sale upon each and

every car operated by it." The company contended that the franchise was in force only within the territorial limits of the township, and did not cover territory in other townships. But the supreme court of Michigan does not think that this contention can be sustained.

The court holds that the franchise was in the nature of a contract, and imposed obligations upon the company which those having the right to ride between the points mentioned in it had a right to enforce. It says that the company saw fit to contract with the village for a rate outside the limits of the village, and to agree that tickets should be sold on its cars, and that this contract it could not repudiate. The tickets must be kept for sale on the cars at any point on the line, intermediate as well as terminal.

To illustrate, the tickets which the company was accustomed to sell consisted of two parts, applying to and from a point in a township intermediate between the two terminal points stated. A passenger asked to buy a strip of the five tickets at this intermediate point, having ridden on a part of ticket that he had up to such point, and the court holds that his right under the village franchise in question was not different than it would have been had the franchise of the intermediate township been silent on the subject of fares, and that he was entitled to buy the tickets at such point.

But it was urged that no damage was shown, for the reason that the tickets which the company was accustomed to sell, consisting, as they did, of two parts, were not the kind of tickets required by the franchise, and that the company was not required to accept the strip or coupon from the intermediate point to the village, but was only required to furnish a through ticket. The court replies that it might be a sufficient answer to say that a failure to sell the tickets to the passenger when demanded entitled him to nominal damages, at least, and that no more than nominal damages were awarded in this case; but, it goes to state, a further answer was that the company had placed its own construction on the requirements, and had provided tickets to suit itself. The passenger was entitled, by means of such tickets, to a ride between the two terminal points for 10 cents. He sought to obtain it by means of the only tickets kept by the company for sale. One part of such a ticket had been given up, and, if he had been able to obtain the tickets requested, the remaining portion could have been paid for with the other coupon. Hence, the judgment given for 5 cents, the amount sued for, and costs, was affirmed.

PHYSICAL EXAMINATION OF PLAINTIFF IN CASE IN UNITED STATES COURT.

Camden & Suburban Railway Co. v. Stetson (U. S.), 20 S. C. Rep. 617. Apr. 9, 1900.

It is settled in the supreme court of the United States that no power to make an order for the surgical examination of the plaintiff in an action to recover damages for injury to the person exists at common law; in other words, that the court has no inherent power to make it. But the supreme court now holds that where the state in which the United States court trying such a cause sits has a law which provides for the making of an order for the examination of the person of the plaintiff in a case of that character, the law of the United States (section 721 of the Revised Statutes) applies that law to that case; in fact, to all cases of such a nature on trial in Federal courts sitting in that state. Moreover, such a statute as the New Jersey act of May 12, 1896, on the subject, it does not think violates the federal constitution. Nor does it consider that the citizenship of the plaintiff at the time of the injury is material, so long as the United States court that tries the case has jurisdiction thereof and the parties at the time of the commencement of the action.

THE COLOR LINE IN NEW ORLEANS.

The railroad committee of the Louisiana Legislature has reported favorably a bill compelling all street railway companies in New Orleans to provide separate cars for whites and blacks. It is said the companies will offer no opposition and the bill is expected to pass both houses.

An ordinance has passed the Kansas City Board of Aldermen requiring all street railway companies operating in the city to sprinkle between their tracks.

The Functions of Modern Tramways and What Glasgow is Doing Towards Their Fulfillment.

BY JOHN YOUNG.

This paper was read at the meeting of the Tramway and Light Railway Association at the International Tramway and Light Railway Exhibition, June 27, 1900. Mr. Young is general manager of the Glasgow Corporation Tramways, and is largely responsible for their satisfactory development and operation. In his introduction the author touches upon the backwardness of the rulers and proprietors of the British Isles in road building, and reviews the development of road transportation up to the time of the modern tramway, which means an electric tramway. The most perplexing question for municipalities and boards of health, is the housing problem, and for this the electric tramway offers a ready solution. Electric tramways are safe and comfortable means of transport, but to fulfill their functions properly the unjust speed restrictions should be removed. One of their greatest benefits is that they economize the streets as the author illustrates by the experience of New York. The paper concludes with a brief resume of the history of Glasgow tramway lines and the results obtained from their operation.

Tramways are practically the latest development of road-making. It took the inhabitants, or perhaps I should say the rulers and proprietors, of these islands long centuries to realize the enormous importance of roads for the development of the country. Their backwardness in this regard seems the more inexcusable when we consider the object lesson given by the Romans during their occupation. At any rate, the fact remains that it was only about the middle of last century that the construction of roads for carriage traffic was really undertaken. I believe the first carriages or coaches seen in this country appeared in the latter half of the 16th century. The pack horse, however, continued as general goods carrier until a couple of centuries later, and it was only in our own grandfather's time that the horse track was being developed into a road for carts and wagons, and the beast of burden into a draught horse.

I presume the metropolis would, in the earlier times, have the best roads in this country. This makes it all the more difficult to realize the recorded fact that "so late as 1736, the roads in the neighborhood of London were so bad that in wet weather a carriage could not be driven from Kensington to St. James's Palace in less than two hours, and sometimes stuck in the mud altogether."

I need not follow closely the process of road-making. Now in our county and suburban districts we have the improved roads of Telford and macadam, perfected by the steam roller; and for our city streets, the cobble stones have been superseded by square dressed sets, wooden blocks and asphalt. In order to get the fullest use of the streets, however, something more has been found necessary than simply to improve their surface. In this age of unprecedented progress, people had become impatient of the old means of locomotion. They had become so accustomed to fast, comfortable, and even luxurious railway traveling that something on rails, smoother, as well as faster, than coaches and buses, was demanded. Hence the introduction of tramways, or street railways as they are more appropriately called in America.

Although to this country belongs, I believe, the credit of the first tramways, their adoption and rapid development in America have given our enterprising cousins the right to claim that their country is the real home of tramways. I do not wish in any way to detract from their rightful claim, but there is one simple reason why tramways "caught on" so rapidly in America. It is in the fact that, the country being comparatively new, the paving of the streets was in most cases so primitive and rough that, once our friends got the idea of the "street railway," it became evident that to lay rails on wooden sleepers was the readiest way for them to arrive at smooth riding on their streets, and they did not hesitate.

But it is of modern tramways that I have more particularly to speak. In the ordinary acceptance of the word "modern" it is the opposite of ancient. In this country we are apt to think of anything ancient as belonging to the dark ages. When we speak of Ancient Britain we mean Britain about the beginning of the Christian Era. This comes of our living in a country with a history. It is rather different in the new countries where so many of the brightest and best of the sons of these isles have made their homes. There you hear men talking in fatherly tones of the "old days" when referring to matters which occurred half a dozen years ago. It is when the visitor, whose hair may happen to be turning gray, looks at the speaker and finds him to appearance not far gone in the twenties, that he realizes that he is from home. When tramways or street railways are spoken of anywhere, what happened six or eight years ago is ancient history. That being so, the term "Modern Tramways" must be taken to mean tramways that are quite up-to-date.

It is only now that the people of this country are awakening to

the important part which modern tramways are calculated to play in catering for the wants and requirements of communities. The object lessons on electric traction, which have recently been given in a good many of our cities and towns have worked wonders. The men who took part in the pioneer reporting and working in favor of it had to exercise both persistence and patience, but what they foresaw has now come with a vengeance.

Even with horse traction the usefulness of tramways on the public streets and highways for carrying the people from point to point was fully demonstrated, especially in a few of the larger cities. The limits of such a system were, however, very apparent. The cost of a horse tramway service and its speed necessarily limit it to districts closely populated. It can scarcely be said that steam cars or oil motor cars have been more successful or more popular than horse cars. Some eight or ten years ago the cable system was strongly advocated in this country, but even then electric traction had taken such a strong hold in America that the revolution in street railways and street railway interests had already begun, just as it has here now. From that time cable cars have been gradually disappearing in favor of the bright, flexible, and universally popular electric cars. We may, therefore, take it that when we speak of modern tramways we practically mean electric tramways.

What is it that we expect modern tramways to do for us? Obviously their great function is to provide the best and cheapest possible facilities for conveying the inhabitants of populous places from one point to another on the public streets or highways. Tramway traffic is necessarily local, and for comparatively short distances. You have only to give the facilities, however, and the whole population seem eager to take advantage of them, some for business, some for pleasure, and many for both. Modern tramways are, perhaps, the most democratic of all modes of transportation. They are practically brought within the reach of and are used by the whole community without distinction, just as the public streets are.

During my time no question has been more perplexing to large corporations and boards of health than the housing problem. I look upon electric tramways as a godsend to them. No other agency has come to their hand which can be made so powerful and effective for spreading population and lessening that congestion which had wrought so many evils in our cities. Surely it is a great boon if we can, upon any or all of the leading thoroughfares, convey the workers in our cities comfortably, expeditiously, and at a merely nominal fare for any distance up to say five or six miles, and so give them and their children a chance of living in homes where they can have fresh air and healthy surroundings.

Railway companies—all credit to them—have done much in the direction indicated, and there is still room for them to do more. Railway passengers, however, are chiefly those who travel some considerable distance, and tramways act both directly and indirectly as feeders to railways. We undoubtedly must look to electric tramways as the chief means of handling the great local highway traffic of a city population.

The prizes offered by the promoters of the present exhibition point to two of the requirements of a tramway service. A "fender" suggests safety, and a "dry seat" comfort.

Electric cars may be generally considered quite as safe as horse cars. When any mistake or accident takes place, however, there is greater chance of the consequences being serious. We certainly want the best fender we can find, and all the car equipments must be day by day maintained in perfect order, but for safety we must rely very much upon the competence, the sustained alertness, and the good judgment of the drivers.

With regard to comfort, I think our electric cars, running on

well-constructed permanent way with well-jointed 60-foot rails, do not leave much to be desired. On the question of seats, I do not approve of upholstery. A well-formed inside seat is quite comfortable for a short distance without a cushion, and is much better from a sanitary point of view. Top-seated cars may now be looked upon as standard in this country, and I hope the competition at the present exhibition will hasten the adoption of a top seat which is otherwise satisfactory and always dry.

It is, of course, essential that tramway fares should be as low as the operators can reasonably afford. I shall have occasion to refer to this point further on, when speaking of what Glasgow is doing.

City people nowadays look upon it as a calamity if they have to wait more than a couple of minutes for a car. The service must, therefore, be as close as the traffic will justify, and at regular intervals. Of course, the other requirements of an expeditious service are that there should be the least possible delay in stopping and starting, and the cars should run as fast as well-regulated street traffic will safely permit. The modern electric car in the hands of a trained motorman, is a perfect marvel in its flexibility and elasticity of movement.

The speed at which a tramway car should be permitted to run should depend upon the power you have of controlling and stopping it, and also upon the nature and amount of the other traffic on the street. On this point I would, with all due respect, make a remark on the restrictions placed upon the operating of tramways in this country by the Board of Trade. In my opinion they are unnecessarily stringent in the matter of speed. The maximum speed allowed—eight miles an hour—is all right in the busy central parts of a city, but with a clear headway on a good street or suburban road, such a restriction for an electric car, which is so completely under control, is quite unnecessary to secure safety. Surely a car on grooved rails should be allowed to run faster than a vehicle which, having no such guide, can go meandering all over the street to the danger of the lieges. But it is not so. The speed of a butcher's cart seems only to be restricted by the possible pace of the horse, or at best by what a policeman may consider reckless driving. A gentleman may drive at the rate of twelve miles an hour in his dogcart; a motor car may go whirring along at 14 or 16 miles an hour, or a bicyclist as fast as he likes; but an electric car—the safest and best carriage for the general public ever invented—must not go faster than eight miles an hour. Under the present regulations, electric tramways cannot, in my opinion, confer upon the people the fullest benefits of which they are safely capable.

One great benefit of modern tramways is that they economize space upon the streets. This is not so fully realized as it should be. Some people still seem to retain the idea that the opposite is the case. It is quite clear, however, that even horse cars economize space as compared with the buses and cabs necessary for the same traffic. Very much more is this the case with electric cars, which make better time and save the whole space occupied by the horses.

Perhaps the best proof of this is to be found in Broadway, New York, which is a very busy, though not a very wide thoroughfare. It so happened that my first visit to New York was in 1885. In the beginning of May of that year I had the privilege of traveling upon the rather primitive omnibuses which almost literally covered Broadway at that time. They were single deckers, as the cars are now. There was no conductor. The passengers simply dropped their "nickel" fares into a box upon the upper end of the bus, or passed them up for the nearest passenger to put them in. A small window admitted of the driver seeing into the bus when he chose to turn around, and there was a hole through which he could pass change to anyone who asked for it. The driver's duties were rather complicated, but he got along somehow. Although at the time I speak of there was no outward appearance of any change being contemplated, I found on my return from the Pacific Coast six or seven weeks later that the buses had entirely disappeared from Broadway. A double line of tramways had been laid during the interval, and horse cars had superseded the omnibuses. It was smart work. It must be remembered, however, that the practice in America is simply to close the street against all traffic for the time being when the lines are to be constructed or altered. In this way the whole street can be attacked at once with as many men as can find room to work. In this instance the change seemed very gratifying. Instead of buses spread all over, there was in both directions the regular and systematic line of car traffic, and it was

quite noticeable that the general traffic of the street was being conducted with greater regularity and much less appearance of crowding than before.

When I next saw Broadway, in 1896, the car traffic had greatly increased, and was being operated by the cable system, which had been installed at very great cost. Now, however, the fourth stage has been reached, and the cable is giving place to electric traction. The traffic is now enormous, but I have never seen Broadway look so crowded as it did fifteen years ago when the omnibuses had possession. And what applies to Broadway would equally apply to a similar street in any other city.

I shall now state, shortly, what Glasgow Corporation has been and is doing towards fulfilling the functions of modern tramways.

The Glasgow Corporation tramways system dates from 1871. The corporation originally constructed, and have always owned, the tramways. They have also, under the Glasgow Act of 1870, possessed powers to operate them. In the first instance, however, they leased them for twenty-three years, from 1871 to 1894. Since July 1, 1894, they have operated them as a municipal department. Twenty-two per cent of the original corporation tramways lay outside the then city boundary, traversing half a dozen suburban burghs and districts. The majority of these places were annexed to the city in 1891. Govan is the only adjoining burgh which owns tramways. This burgh owns four miles of double track, which, by an amicable arrangement, is leased and operated as a part of the Glasgow Corporation system. When the extensions sanctioned by the Glasgow Act of 1890 have been completed, the system will extend to 121 miles, calculated by single track. The lines are practically all double. Of the total of 121 miles, 34 miles or 28 per cent are outside the city boundary. In every case, the outside extensions have been undertaken by the Glasgow Corporation, with the concurrence of the respective burgh and county authorities, and at the call of the inhabitants. The authorized system now extends to Paisley on the southwest, a distance of about six miles from the center of the city, and to Barachnie on the northeast, almost a like distance. Under an arrangement with the county councils, and at the request of the inhabitants, the corporation has undertaken to ask powers next session for other extensions within the same radius. All the tramways constructed by the corporation beyond the city boundary are their property, to be maintained by them in perpetuity. The obvious policy of the corporation is to ensure facilities, such as they alone can give, for the transit of the overflow population of the rapidly growing city, and for a community which is really one, notwithstanding certain arbitrary lines of demarcation, which, sooner or later, are sure to disappear. The population served by the corporation tramways may be put down at about 850,000.

Glasgow Corporation started the municipal working of the tramways on July 1, 1894, by horse traction. They had practically no option. Electric traction was certainly in their minds, and in 1892-93 offers were taken to convert and equip some eight miles of double track for the overhead system. But the corporation had no effective powers to alter or interfere with the track before the expiry of the lease. Besides, other complications and uncertainties were so great, and the time for preparation so short, that it was only with horse traction that the corporation could be in a position to give a full service of new cars on the morning after the lessees had withdrawn their cars.

The new municipal service of horse cars proved so very popular and successful in every way that the corporation could afford to wait further developments of electric and other forms of mechanical traction. In 1896, however, representatives were sent to the most important cities in Europe and America to inspect and report on the subject. The result was that by the autumn of 1898, by way of demonstration of the overhead electric system, a small temporary power station for about fifty cars had been erected, and the Springburn section had been equipped. It was opened for traffic on October 13th of that year. So quickly was its success established that two months later (on December 28th) the corporation decided to adopt overhead electric traction for the entire system. Mr. H. F. Parshall, who was some time after called in to report, considered all the circumstances, and recommended that the tramways department should have for its own purposes one central high generating station and five substations. His scheme, which he is now retained to carry out, was based upon starting with 600 cars, but provision is made for working 1,000 cars later on. The site secured for the generating station is in many respects an ideal one. It has a long

frontage to the canal, which will be used for condensing purposes. The two leading railways, which command the coal supplies, have each a branch entering the station, and the coal receiving and handling arrangements will be very complete and economical in working. There will be four 4,000 horsepower engines and generators, with room for two more within the building, and all the necessary auxiliary and subsidiary plant and accessories.

Five of the existing district depots are suitably situated and are being adapted for the substations. The laying of ducts and the renewal and conversion of the track is already well advanced. The first of the large engines is expected to be running early next year, and we anticipate that the bulk of the system will be operated electrically when our forthcoming Glasgow International Exhibition is opened in May next. Of course, we expect everybody to be in Glasgow at that time. As regards tramway men, we are glad to see them at any time.

At present, in operating the five miles of double track from our present temporary power station, I think we are fairly fulfilling the functions of modern tramways.

So far as we have gone we have had no more serious accidents than with the horse cars. I am sure the dense crowds through which our cars operated while our novel illuminated car was being displayed over the route on two successive nights after Pretoria was occupied by our troops, will bear witness to the ease and safety with which the electric cars can be handled.

The comfort of our standard double-decked electric cars seems to meet every reasonable want. We are now turning out from three to four, and will soon be increasing the number to five of these new cars per week from our own car works, besides doing all our own repairs. Next spring we hope to convert and equip over 100 of our horse cars for electric traction.

As regards expedition, we are doing our best under the restrictions already referred to. We only stop the cars when required at fixed stopping places, which are indicated by a plate on the side pole. These are on an average about 200 yards apart. This plan is safer as well as more expeditious than stopping anywhere, and passengers now take quite kindly to it.

The greatest attraction of our tramway system is its cheapness. We started in 1894 with halfpenny fares on every route in the city, and thus developed an entirely new short-distance traffic. In this way the greatest good of the greatest number seems to be effected. Practically all our cars run through the central district of the city from one extreme to another. In that central area there is necessarily a very close service on all the routes. At some points three cars pass each way every minute. With such opportunities given them, people naturally step on and take their halfpenny worth to save them walking even a very short distance. The halfpenny fare has also developed a large meal-hour traffic. Thousands now go home for meals who formerly did not. The present average halfpenny stage is rather over half a mile (.58), and any three consecutive halfpenny stages, or about 1¾ miles, can be traveled for 1d. We can well afford this, even with horse traction. In point of fact, the lowering of fares seems to have increased our net revenue. The average fare taken per passenger is ¾d. Every third passenger (30.3 per cent) pays only ½d., and there are 23 who pay 1d. for every one who pays over 1½d. The passengers carried and traffic receipts during the six years (the first being only eleven months) have been as follows:

	Passengers.	Receipts.
1894-1895	57,104,647	£222,121
1895-1896	86,462,594	328,827
1896-1897	98,966,658	365,761
1897-1898	106,344,437	389,216
1898-1899	118,775,668	433,128
1899-1900	127,628,484	464,786

During these six years of municipal working we have accumulated a reserve fund amounting to £169,733 after paying all working expenses, interest, statutory sinking fund, common good payment in lieu of wayleave, etc., maintenance and depreciation. (The interest and sinking fund amount to over 5 per cent on the capital we have employed in the undertaking.) This reserve will be used for the purpose of meeting expenditure in any loss on the renewing of the track, and horse line equipments caused by the change of traction. In addition to this reserve fund we have accumulated a permanent way renewal fund now amounting to £69,600.

Our experience with the small installation is that the total working expenses (including maintenance and renewals) with electric

traction is 6¼d. per car mile—it will be under 6d. with our large installation—as compared with 9d. with horse traction. There is, of course, interest on the greatly increased capital to provide for. But the anticipated saving in expenditure of 2d. per car mile is assured, and there is also a substantial gain in additional receipts. In point of fact, after deducting working expenses from gross receipts, our net revenue for the year ended May 31 last has been 2.63d. per car mile with horse traction, and 7.63d. with electric traction—a difference of 5d. per car mile in favor of electric traction; but I consider the electric routes rather more remunerative in any case than the average of the horse routes.

Electric tramways are therefore practicable where horse tramways would be commercially impossible. I have no doubt next year with the adoption of electric traction generally, our fares will be further reduced. In point of fact, my committee have had before them for some time a proposal for next year to extend the ½d. stage, which is our unit, to three-quarters of a mile. Three of these stages, with a central area which it is proposed to throw in, would make the penny stage about three miles.

The policy and object of the Glasgow Corporation is to carry the people at as low fares as possible, always keeping a safe margin for a reserve. They cannot fall back on the ratepayers for any deficit. On the other hand, there is no attempt at relieving ordinary city rates with tramway profits. The rates are imposed to pay for necessary work of various specific kinds performed for the community, and the work of each department is accounted for separately. Glasgow Corporation makes its own gas. It does not, however, ask the consumers of gas to pay more than the cost of its production, in order to lessen the police, or sanitary, or any other rates. The same with the tramways. The benefits go to the users in cheaper fares, and a better service.

INTERESTING OVERHEAD WORK.

The accompanying illustration shows an interesting piece of overhead work at one of the car houses of the Cleveland Electric Railway Co. Ten tracks are provided, and it will be noted that after passing the switch shown in the foreground only one additional switch must be thrown to reach any desired berth in the barn. The

OVERHEAD WORK. CLEVELAND ELECTRIC RAILWAY.

storage tracks branch from a main track, the switches being normally open, instead of being reached by the continued branching of Y's, which arrangement necessitates the throwing of a greater number of switches, one at every junction.

EMPLOYEES' ROOMS AT CAMDEN, N. J.

On the evening of June 11th the management of the Camden & Suburban Railway Co., of Camden, N. J., opened a club room for its employes, Mr. Walter E. Harrington, general manager of the company, making the presentation speech. The room was accepted

ment is 36 min. 49 sec., the succeeding chords of 10 ft. subtending angles of 2, 3, 4, 5, and 6 times that amplitude.

The values of x and y are found by taking the chord into the sine and cosine respectively of the angle it makes with the tangent, and adding the respective products to the sums of the preceding x's and y's, thus:

$$\begin{aligned}
 x_1 &= \text{chord} \times \sin \frac{1}{2} \Delta_1, \\
 y_1 &= \text{chord} \times \cos \frac{1}{2} \Delta_1, \\
 x_2 &= \text{chord} \times \sin (\Delta_1 + \frac{1}{2} \Delta_2) + x_1, \\
 y_2 &= \text{chord} \times \cos (\Delta_1 + \frac{1}{2} \Delta_2) + y_1, \text{ etc.}
 \end{aligned}$$

The equations for finding a and b are readily apparent from inspection:

$$a = x - R(1 - \cos S); \quad b = y - R \sin S.$$

Where the same transition is used on both ends of the curve the tangent is equal to $(R^2+a) \tan \frac{1}{2} I + b$, I being the intersection angle between the tangents.

For convenience in putting in points in the field, values of x, y, D, and the angle marked "Ang." in the diagrams and tables are calculated for points 3 ft. from the gage line of the rail, and tabulated under the head of "Data for 3 ft. offset lines."

Table No. 2 is for curves of from 100 to 120 ft. radius; the value of Rx for the 8th arc being less than 115 ft., only 7 chords of the compound curve are used with that radius. No. 3 is for curves of from 160 to 200 ft.; No. 4 for 220 to 320 ft.; No. 5 for 340 to 400 ft.; No. 6 for 425 to 550 ft.; No. 7 for 650 to 1,200 ft.

Of course other central radii can be used when found necessary, but the ones given are used for convenience when practicable.

Transition curves Nos. 8, 9, 10 and 11 have recently been tabulated and are used instead of Nos. 1, 3 and 4 in streets where the change of direction is slight. Nos. 8 to 11 occupy less of the intersection angle than do the transitions Nos. 1, 3 and 4.

Tables Nos. 13 and 14 are for approaches to curves of less than 100 ft. radius and therefore it is necessary to locate points less than 10 ft. apart. In these tables the co-ordinates for the rails, and the chords are given for each arc of the transition curve. The values of a and b for the several values of R' and Rx are given in the additional tables.

TRAMWAY AT TERNI, ITALY.

The Societa per le Tramvie Elettriche di Terni advises us that it is now building an electric railway from Terni, Italy, to the water falls of the River Nera, a distance of about 5 miles, which will be in operation before the end of the year. The overhead trolley system will be used. The company will have lines in Terni, a town of about 20,000 inhabitants, but the principal object is to connect the town with the various manufacturing establishments in the valley of the Nera. The available power at the main falls is estimated at 90,000 h. p. of which only about one-half is at present utilized. Lower down the river are lesser falls with 40,000 h. p. available, and the company expects to develop the electrical power industry in this vicinity. The company's main office is at Rome, No. 148 Via del Pozzetto.

The street railway companies of Cleveland and the city officials have reached an agreement whereby the question of the city's right to reduce fares will be taken into the Supreme Court and a decision secured with the least possible delay.

STATISTICS RELATING TO POWER PRODUCTION.

Mr. Philip Dawson has recently contributed to Engineering, of London, a series of articles giving interesting statistics relating to electric power production, from which the accompanying tables are reproduced.

TABLE I.—DATA OF SOME KEYED ELECTRICAL POWER TRANSMISSIONS

IN THE POWER HOUSE

This department is devoted to the construction and operation of electric railway power houses. Correspondence from practical men is specially invited. Both the users and makers of power house appliances are expected to give their views and experiences on subjects within the range of the department.

The idea that all the heat rendered "latent" when water is evaporated into steam is necessarily wasted was once a very common one, and perhaps this is yet the case. Many of the inventors and their financial backers who have wasted time and money in trying to develop substitutes for steam have been misled by this erroneous belief. A recent inquiry suggested a method of demonstrating that the so-called latent heat of steam as well as the sensible heat is effective in doing work, and it may be of interest to give it here.

Take as a concrete example the results of the test of a tandem compound condensing engine in a street railway plant in Detroit made some years ago. The boiler pressure was 126 lb. per sq. in. absolute, the vacuum gage showed a pressure of 2.3 lb. per sq. in. absolute, and the engine used 24.55 lb. of water per i. h. p. per hour.

The total heat of 1 lb. steam (measured from the freezing point of water) at 126 lb. absolute is given in the steam tables at 1187.1 B. t. u., and the total heat of 1 lb. of steam at 2.3 lb. absolute is 1121.9 B. t. u. That is, if 1 lb. of steam be taken into the engine cylinder at 126 lb. and exhausted at 2.3 lb. it will have lost only $1187.1 - 1121.9 = 65.2$ B. t. u. of heat. Multiplying 65.2 B. t. u. by 778 the number of foot-pounds in a heat unit we get 50,725.6 ft. lb. per lb. of steam. This multiplied by 24.55, the number of pounds of water actually used by the engine per horsepower per hour, gives 1,245,313 ft. lb. Now a horsepower-hour is equal to 1,980,000 ft. lb., which is nearly 60 per cent more than appears available on the assumption that no latent heat was converted into work. Further the figure 1,245,313 ft. lb. was obtained without making any allowances for wastes and losses due to cylinder condensation, radiation and friction of the steam in the pipes and other passages.

The explanation is that a portion of the steam is condensed in the cylinder and gives up its "latent" heat, and when discharged into the condenser the working fluid is partly water and partly steam.

Prof. Osborne Reynolds has recently communicated to the Royal Society, of England, the results of some experiments on the specific heat of steam. He found that the specific heat of steam at constant pressure is independent of the pressure and varies nearly as the fourth power of the absolute temperature. At atmospheric pressure the specific heat between 230 deg. F. and 246.5 deg. F. was found to be 0.4317 and between 295 deg. and 311.5 deg. to be .6482.

Heretofore, we believe, the only determinations of the specific heat of steam that have been published were those of Regnault whose experiments were for steam near the boiling point under atmospheric pressure. The values commonly taken have been 0.475 or 0.48, and in the practical application of throttling calorimeters it has been assumed that this value of the specific heat was constant for all temperatures.

In the throttling calorimeter a sample of the steam to be tested for moisture escapes through a small orifice, usually into the atmosphere; the total heat of the steam at the initial pressure being greater than the total heat of saturated steam at the lower pressure, the excess first vaporizes the water entrained in the sample and then superheats the whole. This method is not available where the entrained water in the sample is in excess 2 or 3 per cent because the difference in the total heats at the two pressures is not sufficient to vaporize more than this quantity of water.

The formula for calculating the quality of steam by means of a throttling calorimeter is $w = 100 \times [H - h - k(T - t)] \div L$, where w is the percentage of moisture in the steam, H = total heat, and L = latent heat of a pound of steam at the pressure in the steam pipe, h = total heat per pound of steam on the discharge side of the calorimeter, k = specific heat of superheated steam, T = temperature of the throttled and superheated steam in the calorimeter, and t = the temperature due the pressure on the discharge side of the calorimeter. Taking, as is usually the case, $t = 212$ deg. F. and $k = 0.48$, the formula becomes $w = 100 [H - 1146.6 - 0.48(T - 212)] \div L$.

Taking T as 280 deg. F. and the pressure in the steam pipe at 185 lb. per gage, this formula gives the moisture in the steam as 2.35 per cent. With the value of k taken as 0.54, which is the mean of Professor Reynolds' determinations for the upper and lower limits of range of superheating, we get the moisture as 1.86 per cent.

ADVANTAGES OF RECORDING WATTMETERS ON SWITCHBOARDS.

Read Before the Northwestern Electrical Association by W. Worth Bean
General Manager of the St. Joseph & Benton Harbor (Mich.)
Electric Railway & Light Co.

For the past three years recording wattmeters have been used on the switchboards of the St. Joseph & Benton Harbor Electric Railway & Light Co., and the following advantages may be given as resulting from their use:

In the first place, it enables the central-station manager to make contracts with the coal dealers and mine-owners in an intelligent manner, because the output from the station in kilowatt-hours is shown every 24 hours, thereby giving each grade or quality of coal an equal test. No coal dealer can laud the virtues of his coal above that of his competitor. It puts at rest all vague statements concerning the quality of the coal, making it stand upon its actual merits and test, and showing to the central-station manager whether it is best to use mine run, screen lump or slack, and proving which can be used to the best advantage in each particular station.

Next, the fireman understands before using the coal that the meters on the switchboard are going to give actual results of his firing, making superfluous any statements of the fireman with regard to inferior coal or heavy loads.

It will further show that the employe who produces the best results with the least amount of coal consumed is the one who should draw the most money. Then, given the proper fuel and firing, a test for engines is necessary, in order to show that the engineer is not responsible for any possible waste.

The electrician must see that the proper speeds in his generators and dynamos are kept up by having a sufficient steam pressure at all times, the engineer furnishing it to him for the varying loads. Then, with the proper connections from machine to switchboard current is furnished at the most economical price to the meter. The given amount of current leaving the switchboard being known to the station manager, he is enabled to tell if his current is wasted in motors, transformers, lamps or wire connections.

A further advantage to be derived from meters would be to have all central-station switchboards equipped with them, where records could be taken monthly, and comparisons made with plants in that locality, for the purpose of showing still greater economy, if possible.

I consider the meter on the central-station switchboard a most indispensable instrument, because properly looked after it is conducive to the greatest economy in fuel, in firing, in engine and dynamo, all of which, combined, will produce the necessary economy at the meter.

The cost of meters is a mere bagatelle, as compared to the saving in coal alone.

After my experience with them, I would strongly advise that all central stations adopt meters on their switchboards, for their own advantage and economy.

In the course of the discussion which followed his paper Mr. Bean said that the plant being a combination one and the company having flat lighting rates as well as meter rates, he could not give information as to the discrepancy between the wattmeter on the

switchboard and the combined wattmeter on the system. A wattmeter is on each of the machines, which include a 50-light Thomson-Houston machine, a 75-light Thomson-Houston machine, a 120-light Brush machine, all arc; one 1,000-light alternator, two 2,000-light alternators, three 250-horsepower compound condensing engines. Two engines are connected to the 57-ft. line shaft. One of the engines on the end of the line shaft is connected to a multipolar 90-kw. generator, old-type, and one 225-kw. generator, new-type, running at 425 revolutions, and a meter for each circuit is on the switchboard, showing the output in current from the station.

STORAGE BATTERIES FOR SMALL STATIONS.

Abstract of a Paper Before the Northwestern Electrical Association by Louis A. Ferguson.

The adoption of storage batteries for use in central stations will depend upon the character of the load curve of the station, and the principles which apply to the use of batteries in large stations will hold true, to a large extent, in the stations of moderate or small capacities.

In considering the question of the use of a storage battery we must take into account, first, the relative cost of the battery as compared with that of engines, boilers and dynamos to provide for equal capacity. The cost of capacity in steam and electrical generating equipment is dependent solely upon the maximum power to be generated at any one time, and is not dependent upon the number of hours of use per day of the equipment. In the case of the storage battery, however, the cost is dependent not only upon the maximum energy to be supplied at any one time, but also upon the length of time that the battery is required to do this maximum work. In other words, the cost of steam and electrical generating equipment is dependent upon the maximum kilowatt capacity, whereas the cost of a storage battery is dependent upon the kilowatt-hour capacity.

This being the case, we must consider carefully the load curve of the station, and if the characteristic of the curve is such that the average width of its peak is more than 1½ hours, then the initial cost of steam and electrical generating equipment to provide capacity for this peak will be less than that of the necessary storage battery equipment, at the present market prices, to do the same work. If the curve has an average peak width of less than 1½ hours, then the initial cost of the storage battery will be less than that of the steam and electrical generating equipment to take care of this peak.

The diagram shows the capacity of a battery at various rates of discharge. This curve represents the discharge capacity, at from one to eight hours, of a battery having a capacity at the eight-hour rate of 11,200 ampere-hours. The discharge capacity of this battery at the eight-hour rate is 1,400 amperes, while at the one-hour rate it is 5,600 amperes; or, in other words, the discharge capacity of the battery in amperes at the eight-hour rate is one-quarter of what it is at the one-hour rate, the total capacity in ampere-hours of the battery at the one-hour rate being equal to one-half of its capacity at the eight-hour rate. The curve shows the rate of discharge for

various hours' use of the batteries of other sizes, following the same general characteristics.

The cost of a storage battery of moderate size, taking, for instance, one having a capacity of 500 amperes at the one-hour rate, would be, at the various rates of discharge, approximately as follows: One hour, \$80 a kilowatt; two hours, \$116 a kilowatt; three hours, \$160 a kilowatt; five hours, \$249 a kilowatt; eight hours, \$320 a kilowatt. These figures include switchboard, end-cell switches and the battery erected complete, not including building investment. (These costs are based on the present price of lead and are higher than those obtaining two or three years ago.)

The cost of a steam and electrical generating plant will, of course, vary widely with the class of apparatus employed. Assuming, however, \$100 a kilowatt as a reasonable price for boilers, engines, steam piping, generators, stack and switchboard, we find, by referring to the curve of costs that, as I before stated, where the average width of the peak of the load which is to be taken care of by the storage battery is 1½ hours, the cost of installation is the same for the storage battery as for the steam plant.

In these figures the cost of the building has been excluded, as it may be assumed to be the same for either installation.

The question of first cost, however, is not the only thing to be considered. The question of depreciation on the two classes of

CURVES OF COST AND DISCHARGE RATE.

apparatus, economy of operation and the value of each class of apparatus as a reserve or guarantee to the customers of uniformity and reliability of service must also be taken into account.

We have all had sufficient experience in the use of steam and electrical generating equipment to determine to our own satisfaction what might be considered a reasonable depreciation on this class of apparatus. This, however, is perhaps not as easily determined in the case of the storage battery, as the question of its life in central station use is as yet to some extent uncertain. The principal battery companies, however, have guaranteed to maintain some batteries sold by them up to the original standard of capacity and efficiency for a term of years, upon payment by the purchaser annually of a sum equal to a certain percentage of the original cost of the battery. I am not certain, however, that these

battery companies are prepared to make such guarantees in all cases, as there are many conditions surrounding the use of the battery which must be considered; and the effect of these various conditions upon the life of the battery is perhaps as yet undetermined.

The operating expenses incident to the use of the storage batteries are comparatively small. In very large and important installations it is desirable to have in charge a special man thoroughly experienced in the maintenance of a storage battery, but in moderate sized stations it is unlikely that any additional labor would be required on account of the use of a battery beyond that ordinarily employed in the station. The amount of material necessary is almost negligible. Distilled or filtered water is the principal item, and perhaps once or twice a year additional acid will be required.

A storage battery operated under favorable conditions would show upon test an energy efficiency of 75 per cent and an ampere-hour efficiency of 90 per cent. The yearly energy efficiency of a storage battery operated under ordinary central-station conditions, would, in all probability, not exceed 65 per cent.

The rest of the paper discusses the application of storage batteries to lighting systems.

OPERATING ECONOMIES IN CENTRAL STATION PRACTICE.

In our last issue, page 314, we published Mr. Abbott's paper on this subject, read before the National Electric Light Association, and below will be found an abstract of the discussion of this paper.

Replying to a question, the author said that automatic stokers show better results than hand firing. They can be made to show any kind of results, but it does not require as much skill to operate an automatic stoker and get good results as it does to get good results in hand firing.

Professor Goldsborough considered the matter of adjusting the number of boilers in a station to the work which the boilers have to perform as very important, and stated he had noticed as one of the prime defects in station management the heating up water and boiler iron without getting any return for the coal so expended. In some cases it has been demonstrated that several thousand dollars could be saved each year by simply giving attention to this one matter of adjusting the boiler capacity to the load upon the station.

Mr. H. L. Doherty said that in about 100 central stations with which he was familiar, there is not one in which they make an analysis of flue gases at regular intervals, and if they ever analyze them at all it is a very unusual thing. He would like to see some of the members of this association put on a committee to tell how to operate boilers and analyze the flue gases. In one plant he knew of the flue gas is analyzed by the firemen, or, at least, determinations are made for carbon dioxide, and from this it is concluded that there are other conditions. The method in general is simply to draw off a certain portion of the flue gas and pass it through an alkaline solution, which absorbs the CO_2 , and the difference in volume before and after this treatment represents the amount of carbonic-acid gas which was produced. He had not seen the econometer Mr. Abbott spoke of, but had for several years adopted an old gravity balance, which he had used for that purpose, going a little further and making it a recording instrument.

Continuing Mr. Doherty said: "In the smallest central stations I doubt if any great effort ought to be made to economize in the matter of oil and waste. It often forms almost an insignificant item. Boiler fuel has always been believed to be the most important thing we should economize on, and it certainly represents the biggest part of our actual operating expenses, and Mr. Abbott, in calling especial attention to the boiler results, not engine results, has done a service to the entire electrical fraternity. The amount of saving engineers can make on engines is small, compared with the amount of saving which can be made on the boilers. Where no effort is made to determine the efficiency of the average boiler, it is apt to run below 40 per cent; but with a load curve such as Mr. Abbott enjoys, he should be able to get a boiler efficiency of over 70 per cent. His statement that the coal having the greatest heating value per financial unit of value should be selected is a point in which I can hardly agree with him. I think he must go back and take that class of coal which will give the greatest amount of steam for a given financial value; and I have found that you cannot make a calorimeter test of your coal, and be sure that you are

going to get the same volume of heat, that is, that you are going to transfer a given percentage into useful heat. Many coals which are not high in quantity of heating value are much higher in their efficiency, because you get a much higher flame temperature and produce a great activity in your furnace, which enables you to reduce the over-ventilation. Mr. Abbott did well when he tried to impress on the members the great source of loss in over-ventilation. If just the correct amount of air could be used, so that the gases could have contact with it without absorbing the surplus of it, we could probably double the temperature that they now furnish."

Prof. D. C. Jackson said that even in a small station a good fireman could readily get 8 per cent of carbon dioxide in the flue gases, but that in most cases it did not average 5 per cent; this is because the fireman does not know, and the manager has not yet recognized the advantage of teaching him. If coal is fired properly and the right amount of air admitted a great saving can be effected. He had seen some plants of 1,000 h. p. or less with automatic stokers where there was not more than 2 per cent carbon dioxide shown by analyses of the flue gases, and it was not unusual to find less than 5 per cent in plants equipped with automatic stokers, where the supervision was not careful.

Mr. Bement described the working of the econometer mentioned by Mr. Abbott as follows: "If the conditions prevailing are those of a thin fire or a strong draft and the indication of carbon dioxide shown by the econometer is low, it is an indication of an excess of air. If, on the other hand, the fire is thick or the draft low, and the indication is low, it is proof of incomplete combustion. In the first case the total volume of gases is increased, owing to the large amount of air present and which is not used, causing the carbon dioxide to be small in amount in relation to the total volume; second, the carbon dioxide is less with incomplete combustion, because carbon goes to carbon monoxide instead of to carbon dioxide. If the indications of the instrument are irregular, it shows an uneven condition which may be, and usually is, accompanied by both an excess of air and incomplete combustion. If the highest carbon dioxide obtainable in a furnace is 15 per cent, and the instrument indicates less than this, it is apparent that something is wrong, and any change in firing conditions is immediately and automatically indicated.

"For a chemical analysis we use the absorbing econometer, the Orsat apparatus—a modified or improved form of the Orsat—which I consider has some advantages. I have also used a method by which it was possible to gather a gas sample and make analysis for carbon dioxide and carbon monoxide at two-minute intervals. I found, however, that the method, which is excellent where there is little oxygen present, is not satisfactory when oxygen exceeds about three per cent. The absorbing econometer is a very simple instrument; it is used for carbon-dioxide determination, and is employed where the gravity instrument is not available. The gas is pumped into a measuring and absorbing chamber, where it is confined, and by the movement of a partition the gas is brought in contact with the reagent and the reduction in volume is indicated on a graduated tube by a water column at atmospheric pressure. This is the most rapid of all chemical instruments. I have been able, by its use, to determine carbon dioxide at one-minute intervals, while riding on the front end of a locomotive, and also to make 75 analyses and 75 observations of temperature of escaping gases, and make a record of each in 75 minutes.

"We employ the more elaborate methods of analysis where it appears that such are the best means to obtain the desired information, and these investigations would not be confined to the two carbon oxides and oxygen if there were occasion to go further, but would be extended to hydrogen and hydrocarbon compounds. The only rapid method of determining carbon monoxide that I am aware of is that which I employ. It is very expensive and rather difficult, and the cost of the apparatus was about \$200, and while very interesting, I consider that it can have no industrial application. The simplest methods are always to be desired, and if such give the best results, they are preferable to more elaborate laboratory methods."

Mr. Doherty briefly described the Delwick gas process which has been developed in Europe and somewhat disturb our theories on the combustion of fuel. They start in with a fuel body of about 44 in., and find that by determining the velocity of the blast they can drive air through the incandescent fuel and produce more than 90 per cent of the carbonic-acid gas which we would theoretically

figure. This is apt to surprise any man who confines his work to boiler firing. There is no question they have obtained results with this system that have never been equaled in boiler firing.

Mr. Abbott in conclusion said: "The recording steam gage is a great thing, but if we had a device which would check up the efficiency of the fireman as well as the pressure, there would be no steam plant which would be without it. The average plant which will burn \$500 worth of coal in a month could, by such a device, save not less than 20 per cent of it. One speaker complimented me on the load curve we are able to show and suggested we have an efficiency of possibly 70 per cent. While I think we have a good efficiency, as far as efficiency goes, speaking candidly, when anyone asks me what it is, I am ashamed to tell them, because efficiencies are so little understood—the actual results you get in 24 hours are so little understood—that if you would tell anyone candidly what the results actually obtained are, they would set you down at once as a very poor manager. I do not think the average results in the plants throughout the country, as someone suggested, are over 40 per cent of the efficiency of the coal. By careful valve setting, you might be able to make an addition of 5 per cent in the extreme in the results obtained by an analysis, or by selection of transformers, at considerable expense, you might save an equal amount; but there goes on, from day to day, unobserved, and without causing any concern, a loss at a place where there is a possibility of saving not less than 30 per cent in many cases, 20 per cent in the average case, which is in the form of fuel consumed and the labor which it costs to handle that fuel. This does not cause anyone any anxiety, but if it occurred where it could be seen, as in the case of losing a couple of gallons of oil a day, or in the throwing away of a few pounds of dirty waste, it would set the manager to work at once to make a saving. It is a great illustration of the saying, 'saving at the bung-hole and wasting at the spigot.'"

DAMAGE BY LIGHTNING.

The severe thunder storms of last month caused considerable damage to electric power stations in different parts of the country. At Appleton, Wis., on June 22d, lightning entered the auxiliary power house of the Fox River Valley Electric Ry. and burned out the armature of the railway generator, causing the road to shut down for a few days till it could be replaced. June 11th, lightning entered the Dunlaps station of the Indiana Railway Co. and discharged heavily into a tank arrester, which did not take care of the full discharge, however, and a portion passed through one of the armatures. June 27th the switchboard of the South Bend station of the same company was slightly damaged by lightning.

Lightning also entered the sub-station of the Chicago & Milwaukee electric at Winetka, burning out one transformer.

STORAGE BATTERY MEN MEET.

The executive staff of the Electric Storage Battery Co. held its annual conference at Hotel Walton, Philadelphia, from June 4th to 7th inclusive. The meeting was attended by over 40 representatives from the company's various departments and agencies. Papers were presented during the convention covering a wide range of subjects relating to the making and operating of storage batteries and the business of the Electric Storage Battery Co., and valuable discussions followed the reading of each paper.

The subjects treated were as follows: "The Sales Department," by Chas. Blizard; "Preliminary Engineering," by J. Lester Woodbridge; "Results Obtained from Installations," by Hugh Lesley; "The Relation of the Construction Department to the Sales Department," by Jos. Appleton; "Some Details of Construction Department Methods," by R. H. Klauder; "Characteristics of Standard Cells," by Bruce Ford; "The Use of Boosters," by J. B. Entz; "The Law of Contracts," by Aug. B. Stoughton; "Street Railway Business in New England," by Frank J. Stone; "The Application of Chloride Accumulators in Isolated Plants," by Albert Taylor; "The Operation of Batteries in Connection with Long-Distance, High-Speed, Railway Service," by R. C. Hull.

The delegates were entertained at several elaborate luncheons and dinners during their stay in Philadelphia.

TWO WIRE THIEVES.

By the courtesy of Mr. John F. Dolan, chief of police, Wilmington, Del., we are enabled to show the accompanying portraits of Charles McAteer and George F. Walsh, now in prison at New

CHARLES McATEER.

GEORGE F. WALSH.

Castle, awaiting trial on a charge of stealing copper bond wire from the Wilmington & Brandywine Springs Electric Railway Co. McAteer was arrested in Philadelphia with a quantity of the wire in his possession.

IMPORTANT CONSOLIDATION IN OHIO.

We are indebted to Mr. F. T. Pomeroy, treasurer and general manager of the Cleveland, Elyria & Western Railway Co., for the following facts concerning the merger of three important inter-urban lines near Cleveland.

The Cleveland, Elyria & Western Railway Co. was incorporated June 20, 1900, as a consolidation of the Cleveland, Berea, Elyria & Oberlin Ry., which runs from Cleveland to Linndale, Puritas Springs, Berea, Elyria and Oberlin; the Lorain County Ry., which connects Elyria, North Amherst and Lorain; and the Oberlin & Wellington Ry., now building from Oberlin to Wellington, O. When this line is completed the Cleveland, Elyria & Western Ry. will comprise 65 miles of track.

The officers of the new company are: President, A. H. Pomeroy; vice-president, A. E. Akins; secretary, E. F. Schneider; treasurer and general manager, F. T. Pomeroy. The capital stock of the company is \$2,000,000, and \$1,500,000 in first mortgage bonds have been authorized.

In the articles of consolidation provision is made for the extension of the system to Norwalk, a distance of 20 miles, which will bring the total mileage of the consolidated properties up to 85 miles.

ACCIDENT AT HUTCHINSON, KAN.

A fatal grade crossing accident occurred at Hutchinson, Kan., June 13th, when a car of the Hutchinson Street Ry. was struck by a freight train while crossing the Santa Fe tracks. The time was 11:45 p. m. The street car slowed up before coming to the railroad, but seeing no train and hearing no warning, the motorman started to cross; when almost over the track the car was struck by a train consisting of an engine pushing four stock cars. Three women were killed, one very seriously injured and six other passengers more or less hurt. The street lights were not burning, it being moonlight, and the view of the railroad was somewhat obstructed by cars on a side track. The statements of passengers are to the effect that the crew of the freight train did not ring the bell nor blow the whistle, and that there was no watchman at the crossing and no brakeman on the front of the train.

TEST OF TRUCK FRAME.

The Peckham Truck Co. is now building 60 motor trucks for the South Side Elevated Railroad Co., of Chicago, and Mr. J. F. Morrison, superintendent and chief engineer for the Elevated company, recently had a transverse test of a side frame of one of these trucks made at the Peckham works, under his supervision.

The results are as follows:

Stress in Tons.	Deflection in Inches.
20	1-8
30	3-16
35	1-4
40	7-16
45	5-8
50	15-16
55	Broke in yoke

The fractured yoke when examined was found to be uniformly malleable throughout and showed no flaws.

As there are two side frames in the truck it appears that the ultimate breaking stress per truck is about 110 tons, which is eight or ten times the weight of half the car body and passengers.

ADVERTISING PLEASURE RIDES.

Commencing the latter part of June the Chicago Union Traction Co. has been advertising rather extensively in the daily newspapers the attractions it can offer in the way of pleasure rides. These advertisements were the idea of Pres. J. M. Roach and are novel in arrangement and wording, and four of them are reproduced here with the expectation that they will prove suggestive to the managers of other roads. On the first five week days the space

USE AND ABUSE OF TRANSFERS.

A liberal system of free transfers is generally recognized by street railway managers as an advantageous thing for the company; people are taught to ride more than they otherwise would and this traffic results in a direct gain to the company. A liberal policy and the absence of what appear to be arbitrary rules and restrictions assure the public that the company believes in fair treatment and such a belief disseminated in a community should do a great deal toward taking the wire edge off of unreasonable demands proposed by councilmen who like to pose as friends of the people and enemies of corporations.

But no matter how much the manager may wish to avoid cumbering his transfer system with restrictions that may irritate patrons, he must endeavor to protect his company against that class of persons who appear to believe that it is no wrong to cheat a corporation, particularly if it is a transportation company. This class is entirely too numerous.

What is probably the principal abuse of transfers, the traffic in them by newsboys, is to be found only in the larger cities, but where it does exist it is a veritable thorn in the manager's side and often causes a serious loss of income. It is rather a difficult matter to punish the boys for dealing in transfers because of their youth; the courts are inclined to be lenient, and public opinion endorses the policy. It may have some effect to cite the offenders for contempt of court, as was recently done by one of the Chicago companies, which had secured an injunction restraining the traffic in its transfers; but the moral effect upon a street arab of even a chancellor is doubtless not as lasting as could be wished. In the Chicago case, while a number of offenders were brought before the court, none was punished except by a reprimand.

The only effectual methods of preventing this abuse, it appears

OUTINGS For a DIME

On The Trolley Car

CHAPTER I.

To all believers in Teddy's theory of a "Fretful Life"—
Go in Elston-av. to Irving Park to-day:
You'll get action for your money all the way;
Change of scenery every minute,
For there's not a dull block in it.
You'll believe it when you are riding

On The Trolley Car.

Cars start at State and Randolph. Round trip, 36 minutes; cost, 10 cents.

OUTINGS For a DIME

On The Trolley Car

CHAPTER III.

For Rest, Recreation and "Blind Pigs"—Go to Evanston.
Solid comfort, healthful enjoyment and pure air served without extra charge on the Evanston Trolley Cars to-day. The scenery changes every minute and there is always something to please. At Evanston notice the fine trees, the University buildings, Rest Cottage, and the "Blind Pigs"—if you can find them. Take the babies along; this is great weather for babies and they all like to go—

On The Trolley Car.

Cars start at Clark st. Limits Station. Round trip 30 minutes; cost 10 cents.

OUTINGS For a DIME

On The Trolley Car

CHAPTER V.

For good Chinamen
Go to Rose Hill.
When reading about John Chinaman, his "Boxers" and their cruelty, remember that all "Chinks" are not bad. There is a colony of them in Rose Hill cemetery which never causes trouble to missionaries and diplomats. Their surroundings are interesting and worth a visit from all who desire an outing for fresh air and a pleasant ride to-day

On The Trolley Car.

Use Lincoln-av. cars, transfer to Robey-st., round trip from Monroe and Dearborn two hours; cost 10 cents

OUTINGS For a DIME

On The Trolley Car

CHAPTER VII.

For relief from the heat,
Go up Halsted Street.
When the nights are hot and everything is sizzling on the West Side, board a Halsted-15th-st. trolley car and go to Sheridan road. There and near the lake, is surrounded by beautiful houses and lawns, and is within a few blocks of the Marine Hospital. The lake front and Sheridan road is a good place to cool off while watching the ever-changing throng on the boulevards. Notice the hundreds of queer sights along Halsted-st. as you go by

On The Trolley Car.

Cars start at Halsted and 21st-st. Round trip 120 minutes, cost 10 cents.

A FEW CHAPTERS FROM PRES. J. M. ROACH'S NEW BOOK.

occupied is small, one column wide and about three inches long, and contains one "chapter" of the serial publication entitled "Outings for a Dime." We show four of these chapters. Saturdays and Sundays the advertisements take more space—about four columns wide and six or eight inches long, and are illustrated with a park or country scene; the reading matter is longer, but the refrain is the same—all about what one can see "On the Trolley Car."

COMPROMISE AT WESTFIELD, MASS.

The employes of the Woronoco Street Railway Co., of Westfield, Mass., last month presented a petition for an increase of wages from \$1.75 per day to \$2 per day, or to 20 cents an hour. The company could not see its way clear to grant this, but decided to pay its men 20 cents an hour from April 1st to December 1st, of each year, and 17½ cents from December 1st to April 1st, and if in any year the receipts enable the company to declare a dividend of 6 per cent on its capital stock, it will pay the higher rate throughout the 12 months. The employes are satisfied with the compromise.

to us, are those which will reach the man who sells or gives away his transfer check and the man who buys and uses it.

The Board of Supervisors of San Francisco, Cal., recognized the injustice of the transfer traffic and passed an ordinance requiring passengers to use transfers within the time limit and prohibiting their selling them or giving them away, under penalty. The ordinance was attacked on the ground that it was a violation of the guaranty of personal liberty contained in the Federal and state constitutions. The Supreme Court of California has recently held the ordinance valid.

The St. Joseph Light, Heat & Power Co., of St. Joseph, Mo., last month decided to make a trial of what is known as the Smith system of transfers, the invention of Mr. W. D. C. Smith, of Kansas City. The abuse here sought to be remedied is the use of transfer checks a longer time after issue than the rules permit, and the aim is to restrict the use of transfers to continuous passage on the first train leaving the transfer point. The system is as follows:

All trains are numbered consecutively, the number of each train displayed both on the front and rear car. The first conductor to go on duty on a train is provided with a bunch of transfer checks sufficient for the use of the train during the entire day. These

checks are numbered to correspond with the number of the train, and require only the punching of the hour which follows the time on which the ticket is punched. For instance, if the transfer is issued at 9:30 a. m. the hour of 10 is punched.

There are two perforated corners, on each ticket, one marked "in," and the other "out," and the conductor clips off the corners in accordance with the direction in which the car is moving at the time the transfer is issued. At each junction point a box is provided where the conductor of each train, when he arrives at that point, deposits a duplicate of the transfers he has just issued, one for each connecting line. These checks are fac similes of those he has issued to his passengers, but they bear also two punch marks near the top to distinguish them from transfer checks. Each conductor, when he hangs his duplicate transfers on the hooks in the box, takes up those left by other conductors for him. Passengers who get on his car at the junction point must be provided with transfer checks which correspond in number, color and hour punched with the duplicate checks which he takes from the box.

In case passengers alight from a car at a junction point and are required to run for a car which is pulling out before the conductor has come into possession of the duplicate check, it is the duty of the conductor to look out for the train number and honor the transfer. Whenever a train is crowded beyond its capacity so that all of the passengers in waiting cannot board the train, the conductor does not remove the duplicate or guide check from the box, but leaves it for the next conductor. He, however, honors the transfers of all those who are able to board his car.

CROWDED CARS.

An ordinance providing that passengers on street railways who are unable to secure seats shall pay a fare of 2½ cents only, and requiring the companies to sell "no seat" tickets in books of 10, being under consideration by the Board of Supervisors of San Francisco, Mr. W. Clayton, secretary of the San Francisco & San Mateo Electric Ry., some weeks ago appeared before the street railway committee and presented his objections at length.

Our readers are well acquainted with the facts that there are "rush hours" on street railway lines and that patrons will habitually board a crowded car in preference to waiting a few minutes, and we need not give Mr. Clayton's analysis of the condition at San Francisco. His objections to the proposed ordinance are interesting and we give a brief abstract of his arguments, which are:

To reduce the rate for standing passengers will aggravate the evil instead of alleviating it, because patrons who have bought "no seat" ticket books will prefer to board a crowded car and save the 2½ cents.

In case a car has some seats vacant and a greater number of passengers, who wish to take standing room only, board it, either an injustice is done the company or incessant and bitter disputes will arise between the conductor and the passengers as to who shall occupy the seats and pay full fare. On wet days outside seats are not available and if "no seat" passengers can ride for 2½ cents, the question of the degree of wetness will also cause disputes.

The ordinance provides that transfers shall be given on the 2½ cent tickets and that these shall give all the rights that 5-cent passengers have excepting the privilege of a seat on the first car boarded. This evidently entitles the 2½-cent passenger to a seat on the second car he boards and works an injustice to the 5-cent passenger whom he displaces as well as to the company.

The company (San Francisco & San Mateo) in order to give seats to all passengers would have to operate three times as many cars during the busy hours as is now the case, which is not physically safe on the heavy grades, because of the short headway that would be necessary, nor financially practicable. Even if it were practicable to operate the cars, it would not be possible to get men to operate them; the extra men would work only two hours a day at most, and could not expect a day's wages for two hours' work. Again, the receipts of the company not being increased, the total sum available for wages would be the same, which means a decreased rate for the men now employed.

The low "no seat" rate would depreciate real estate in the suburbs by making it to the financial advantage of persons using the street cars to live nearer the heart of the city, where they would always be sure of getting a crowded car to ride in.

THE BAKER CAR HEATER.

The well-known Baker system of heating cars by hot water circulated from a heater within the car itself, was introduced by the inventor, Mr. W. C. Baker, in 1866, and its good features of reliability and uniform heating led to its very wide adoption by steam railroad.

This heating system may be truthfully said to have been an important factor in the growth of the luxury which is now found in railroad travel. Numerous improvements have been made as experience showed them to be needed and the latest designs of heaters are fire-proof, non-freezing and self-regulating. The fire is enclosed in four cylindrical casings, the outer one of soft flexible steel, and the inner one a jointless close wound water coil, which is the generator coil of the heater.

For street cars there are two types of these heaters made. The one illustrated herewith is known as the "Mighty Midget" and embodies all of the latest improvements; it is made in various sizes. This heater has a generator coil equivalent to 25 ft. of 1¼ in. pipe, which is over 50 per cent more than in older designs, yet it is 7 in. smaller in diameter than the "Perfect"

BAKER HEATER FOR STREET CARS.

or the "Old Style" heaters. The hot water pipes are carried around the car and are at the feet of every passenger, while the heater proper may be located in the vestibule, in the car, or projecting into both, as may be desired.

Among the street railway companies using the Baker heaters are the Detroit, Ypsilanti & Ann Arbor, the Detroit, Lake Shore & Mt. Clemens, the Waterloo & Cedar Falls, the Milwaukee Electric Railway & Light Co. and the Twin City Rapid Transit Co. The Twin City company has quite recently placed an additional order for 75 heaters.

For small cars the "No. 6" heater, 16 in. outside diameter and 26 in. high to the base of the smoke pipe, is made; this is as small as it is practicable to make a hot water heater.

The Baker heaters are now made by W. C. Baker, successor to the Baker Heater Co., No. 143 Liberty St., New York.

TAX DECISION IN DETROIT.

A decision was handed down on June 29th, by the Circuit Court at Detroit denying the Detroit street railway companies' application for a mandamus to compel the common council and city assessors either to change their tax assessment or to give the companies another hearing. The court holds that the assessors acted in good faith; that franchises are taxable; and that the assessors did not have to separate the franchise assessment from the assessments on other property. The case will be carried to the Supreme Court.

The tax valuation which the companies are endeavoring to have set aside amounts for all roads in Detroit to \$10,247,000 as against \$2,600,000 valuation last year.

A bill apportioning the expenses of abolishing grade crossings in the state has been reported favorably to the Massachusetts Legislature by the railroad committee. Not more than 65 per cent is to be paid by the steam road, 25 per cent by the state, 10 per cent by the city or town, and not more than 5 per cent by the street railway, the exact proportion to be settled in each case by a special commissioner.

PERSONAL.

MR. JAMES BROWN recently resigned as superintendent of the Rome (N. Y.) City Street Ry.

MR. G. P. MAGNER has resigned the office of treasurer and general manager of the Newport (R. I.) Street Ry.

MR. C. L. HANY was last month appointed general manager of the Jackson (Miss.) Electric Railway Light & Power Co.

MR. PHILIP W. MOEN, of the American Steel & Wire Co. Worcester, Mass., has gone on a five months' European tour.

MR. W. D. SARGENT, general manager of The Sargent Co. Chicago, returned from Europe on June 23, after a two months' trip.

MR. W. J. CLARK, manager of the foreign department of the General Electric Co., is in England, where he expects to remain until August.

MR. C. F. LUTHER, secretary and general manager of the Pawtucket Street Ry., of Providence, R. I., tendered his resignation last month.

MR. GORDON ABBOTT has been made president of the Massachusetts Electric Cos. to fill the vacancy caused by the death of Mr. Amos Breed.

PROF. GEORGE W. BISSELL, of the mechanical engineering department of the Iowa State College, Ames, Ia., was a "Review" caller recently.

MR. PETER KLING has resigned his position as general manager of the St. Louis Car Co. to accept a similar position with the John Stephenson Co., of New York.

MR. C. B. BEEBE, of Syracuse, N. Y., having purchased an interest in the Oswego (N. Y.) Traction Co., has been made a director, succeeding Mr. G. P. Turnbull.

MR. WILLIAM B. McVICKER, of the Dearborn Drug & Chemical Works, of Chicago, has been making an extended Eastern trip. He reports business in excellent condition.

MR. HARRY DE STEESE, who was formerly with the Western Electric Co., and is now representing the Sturtevant Engineering Co., of London, is making an extended European tour.

MR. EDWIN R. CASE, of Jersey City, N. J., will accept the office of president of the New Paltz (N. Y.) & Poughkeepsie Traction Co., made vacant by the resignation of Mr. W. L. Supplee.

MR. H. C. SPAULDING, Exchange Building, Boston, has severed his connection with the H. W. Johns Co. to become the New England representative of the Craghead Engineering Co., of Cincinnati, O.

MR. C. P. WILSON has resigned as chief engineer of the Milwaukee Electric Railway & Light Co., owing to poor health. He was at one time general manager of the Sioux City (Ia.) Traction Co.

MR. CHARLES W. FORD, recently with the Galveston (Tex.) Electric R. R., will be manager of the Marlin (Tex.) Electric Light & Power Co., recently purchased by Mr. F. W. Fratt, of Jefferson, Texas.

MR. EDWARD QUIRK, of Oswego, N. Y., was on June 23, appointed receiver of the Fulton & Oswego Falls division of the Lake Ontario & Riverside Ry. This position was formerly filled by Mr. F. H. Tidman.

MR. W. C. GILES, president of the Newark (N. J.) & Hackensack Traction Co., has commenced suit for libel against the proprietor of the Bergen County Herald and others as the result

of an article printed in the Herald making certain charges against the traction company.

MR. E. TAYLOR, assistant engineer at the tramway electric power station, Sheffield, England, has been appointed chief assistant engineer for the Birkenhead (Eng.) Corporation Tramways to supervise the installation of electrical equipment.

MR. F. S. STEVENS on June 21st, succeeded Mr. George Truesdell as president of the Washington (D. C.) Traction & Electric Co. On the same day Mr. George H. Harries was elected vice-president in place of Mr. C. A. Lieb, resigned.

MR. CHARLES OLIVER, one of the railroad commissioners at Sydney, New South Wales, is visiting America in order to inspect a number of street railway systems with the view of making improvements in the tram lines at New South Wales.

MR. EARL POOLER was last month elected president of the Onalaska (Wis.) & La Crosse Street Ry., succeeding his father who recently died. Mr. Pooler has just attained his majority and is probably the youngest street railway president in the country.

MR. EUGENE KLAPP, who has been connected with the elevated roads of Chicago, was last month appointed division engineer to the New York Rapid Transit Commission and will supervise the construction of the viaduct for the rapid transit railway.

MR. JOHN W. TAYLOR, chief engineer of the East St. Louis (Ill.) Electric Street Ry., will hereafter also fill the office of chief engineer of the Terminal Railroad Association of St. Louis. Mr. Taylor is a young man of considerable reputation both in street railway and steam railroad circles.

MR. L. D. MATHES is general superintendent of the Norfolk (Va.) & Atlantic Terminal Co. which expects to open its new electric line from Norfolk to Old Point Comfort, Hampton and Newport News before August 1st. The company will also operate a line of twin screw steamers on Hampton Roads.

MR. H. G. MADDEN, representing the Bridgeport Brass Co., of New York City, spent several days in Chicago early this month. Mr. Madden is planning an extensive Western trip in the interests of his company and will devote a considerable portion of his time to the introduction of a new composition trolley wire that has recently been brought out.

MR. H. J. SOMERSET, formerly general manager of the Winnipeg (Can.) Street Ry., has entered upon his new duties as manager of the electric tramway at Perth, West Australia, to which office he was appointed last January. Mr. Somerset succeeds Mr. S. W. Childs, who is about to return to the United States. The Perth Tramways were built by J. G. White & Co. of New York City.

MR. YUTARO SASAKI, of Osaka, Japan, assistant general manager of the Nankai Ry., spent several days in Chicago. He is on his way home from a trip of study and inspection round the world. His system is forty miles in length, extending from Osaka to the ocean; it is operated by steam and does an exclusively passenger business. He reports a growing interest in electric traction and that the line in Tokyo is doing a good business. In most Japanese cities the narrow streets render track construction difficult.

 OBITUARY.

MR. GEORGE T. SMITH, secretary and cashier of the San Mateo & San Francisco Electric Ry., died at his home last month. At the funeral employees of the company acted as pall bearers.

MR. ISAAC ENGLE, who has been chief engineer of the City Ry., of Dayton, O., for the past six years, died on June 14th. He was a member of the Stationary Engineers' Association, and was honored and esteemed by his employers and associates.

MR. WILLIAM BACON CRITTENDEN, vice-president of the Duplex Car Co., of New York, died at his home in Brooklyn on June 6th, aged 44 years. Mr. Crittenden has been a regular attendant at the conventions of the American Street Railway Association for some time past and it is mainly to his efforts that the successful introduction of the Duplex car is due.

ELECTIONS.

THE SANDUSKY (O.), MILAN & NORWALK ELECTRIC RAILWAY CO. has chosen directors as follows: T. B. Taylor, Jas. D. Parker, Henry Kelley, Jacob Kuebler, John Whitworth, Howard J. Curtis, Wm. H. Gilcher, S. E. Stokes, Reuben Turner, A. Streck, Abram Lebensburger. All but Mr. Taylor were on the old board; Mr. G. H. De Witt, formerly president, disposed of most of his holdings and retired. The officers are: Truman B. Taylor, president; Henry Kelley, vice president; Jas. D. Parker, manager and secretary; Otto Stuerzinger, assistant manager; Howard J. Curtis, treasurer; John D. Mack, assistant secretary; Jay D. Parker, M. D., surgeon.

THE KANSAS CITY-LEAVENWORTH ELECTRIC RAILWAY CO. has made a number of changes in its operating staff. Mr. H. W. Wolcott who has been manager of the interurban division will be made general manager of the entire system. Mr. O. D. Henry, formerly with the Lorain Steel Co., of Johnstown, Pa., has taken the office of general superintendent of the interurban line. Mr. H. S. De Neefe will be train dispatcher at Wolcott. Mr. E. E. Combs, superintendent, and Mr. Z. T. Herndon, chief engineer, have severed their connection with the road.

THE TIFFIN (O.), FOSTORIA & EASTERN ELECTRIC RAILWAY CO. elected the following new officers: President and general manager, S. B. Sneath; vice-president, C. F. M. Niles; secretary and treasurer, R. D. Sneath; superintendent, A. Kaup.

NEW PUBLICATIONS.

MODERN ELECTRIC RAILWAY MOTORS. By George T. Hanchett. Published by the Street Railway Publishing Co., of New York City. Price \$2. This book relates entirely to the description, design and management of electric railway motors, the author assuming from the first that the elements of electricity and magnetism have been previously understood. All the standard types of the modern street railway motor are described and their theoretical and practical advantages compared and discussed. The book will be of the greatest value to students and motor repair men.

THE MECHANICAL EQUIPMENT OF THE NEW SOUTH STATION, Boston, Mass. Sent free on request by the Westinghouse Co., of Pittsburg, Pa. This is a reprint of a paper presented at the New York meeting of the American Society of Mechanical Engineers by Mr. Walter C. Kerr of the engineering firm of Westinghouse, Church, Kerr & Co., which designed, constructed and completely equipped this great terminal. The subject matter is treated under twelve headings as follows: Power-house, interlocking switch and signal system, the electric plant, heating and ventilating, disposal of drainage from waterproofed structure, roof drainage, ice-making, refrigerating and water-cooling plants, car-heating in train shed and yards, air-brake charging, steam and hot water supply to head-house, fire protection, elevators, baggage and express lifts.

STREET RAILWAY TAXES AT CINCINNATI.

The following table of taxes paid by the Cincinnati Street Railway Co. to the city for the year 1899 is published by City Government:

Car license, at \$4 per lineal foot for cars in service, \$24,869.60.
 Five per cent on gross earnings for the year, \$144,283.55
 State excise tax of 1/2 per cent on gross earnings, \$14,428.35.
 Eighth St. viaduct rental, \$1,000.
 Eden Park right of way, \$234.
 Vehicle licenses, \$185.
 County taxes for 1899, \$48,268.94.
 Total taxes paid during the year, \$233,269.44.

JOHN BLAIR MAC AFEE.

Mr. John Blair MacAfee, vice-president and general manager, and one of the organizers of the Railways Company General and the American Engineering Co., of Philadelphia, was born in Canada, but moved to the Quaker City when a child. He was educated at private schools, and at the University of Pennsylvania, becoming a member of the Philadelphia bar upon his graduation from the latter institution. He immediately began the practice of law, acting as attorney for several railway corporations. In addition to his legal work he gradually became interested in street railway construction work, one of his early achievements being the building of a 2 1/2-mile electric road in 24 hours. He is now

J. B. MAC AFEE.

building and equipping the Ohio River Electric Ry., extending from Middletown to Racine, O., and which will be operated by electric locomotives for heavy traction service.

The Railways Company General controls the following street railway and lighting companies: Michigan Traction Co., of Kalamazoo and Battle Creek; Elmira (N. Y.) & Seneca Lake Railway Co.; Lewisburg, Milton & Watsonstown Passenger Railway Co.; Montoursville Passenger Railway Co.; Philadelphia & Bristol Passenger Railway Co.; Milton Electric Light & Power Co.; Montoursville Electric Light Co. The American Engineering Co. during 1899 and up to the present time has constructed about 100 miles of electric railways in different parts of the United States and expects to commence work on a number of foreign tramways in the near future.

THREE-PHASE LINE IN ITALY.

One of the exhibits at the Paris Exposition is a model of the 3,000-volt three-phase electric railway system which the Adriatic Railway Co. is installing in the vicinity of Colico, Italy. The railways connecting Colico with Lecco, Sondrio and Chiavenna, three towns located at the vertices of a triangle of which Colico is the center, are at present operated by steam and will be converted for electricity; the aggregate length of the three lines is about 65 miles. Power will be derived from a 98-ft. fall in the River Adda, where 10,000 h. p. will be available; the power house is 10 miles from Colico. The station is to be equipped with three 2,000-h. p. units generating a three-phase current of 20,000 volts potential and a periodicity of 15. Transformer stations will be located 6 1/2 miles apart, and at these the current will be stepped down to a potential of 3,000 volts for the trolley wires; both primary and secondary lines will be on the same poles. Both the motor cars for passenger service and the locomotive for freight service will have four 150-h. p. motors; passenger trains will be run at a maximum speed of 38 miles per hour and freight trains at 19 miles per hour. It is intended that but two of the motors will be used on ordinary grades to attain the maximum speeds, the other two being thrown in circuit on grades over 1 per cent which are surmounted at half speed; when the four motors are in use two take current from the trolley and these supply the other two motors, which reduces the speed to one-half without loss of energy. The line is to be divided into blocks, the switches interlocked with the signal so that when a signal indicates stop the section next ahead is not supplied with current.

The company is said to be already contemplating the equipment of even larger lines for electricity.

The mayor of Chicago in his Fourth of July proclamation made the following special provision: "The placing upon the car tracks of any street railway or upon the rails of any railroad within the limits of the city of Chicago any torpedo, bomb or other thing containing any substance of an explosive nature, is hereby absolutely prohibited under penalty of \$10 for each offense."

CALIFORNIA TRANSFER DECISION.

On Apr. 30, 1900, the Supreme Court of California rendered its decision in the case of Henry Lorenzen, who had been convicted and sentenced for the misuse of a street railway transfer check and sued out a writ of habeas corpus. Four of the five members of the court concurred in sustaining the ordinance; one justice "while favoring many of the views of the majority dissented from the conclusion."

The main opinion is given below:

The petitioner was convicted of the violation of a penal ordinance in the city and county of San Francisco. He sued out this writ of habeas corpus, alleging that the ordinance under which he was convicted and sentenced is void. The ordinance in question is as follows:

"Order No. 2992. Providing regulations in the operation of street railroads and prohibiting the issuance or delivery of transfers to passengers except upon or within the car from which the passenger is transferred.

"The people of the city and county of San Francisco do ordain as follows:

"1. Every person, firm and corporation operating street cars within the city and county of San Francisco that issue transfers to passengers to enable them to transfer to other cars operated by the same or different owner, shall issue and deliver said transfers upon or within the car from which the passenger is transferred, and not elsewhere.

"2. Every person, firm and corporation operating street cars within the city and county of San Francisco that receives transfers as fare from passengers shall take said transfers from the passengers who received the same within or upon the car to which the passengers are transferred, and not elsewhere.

"3. No person, except a duly authorized conductor or agent of a person, firm or corporation operating a line of street railroad within the city and county of San Francisco, shall within said city and county issue, deliver, give or sell, or offer to issue, deliver, give or sell, to any other person whatsoever, any transfer, transfer check or ticket, issued or purporting to be issued by such person, firm or corporation so operating such line of street railroad, for passage on any street railroad car or line.

"4. Every person, firm or corporation violating the provisions of this order shall be deemed guilty of a misdemeanor, and upon conviction thereof shall be punished by a fine not exceeding five hundred dollars, or by imprisonment in the county jail not exceeding six months, or by both such fine and imprisonment."

Lorenzen was charged with having given and disposed of a transfer in violation of section 3 of the ordinance.

Against the validity of this ordinance it is urged that it violates the guaranty of personal liberty contained in the Constitution of the United States and of the State of California (Constitution United States, Amendment XIV, Sec. 1; Constitution State of California, Article 1, Sec. 1); that it is an unconstitutional interference with a right of private property; that it is arbitrary, oppressive and unreasonable; and, finally, that it is an illegal attempt to enforce the obligations or assumed obligations of private civil contracts by penal legislation.

As to the nature of the "transfer," it is well recognized and admitted that the street railroads of the city and county of San Francisco have provided that passengers upon their cars who have paid the usual fare may receive transfers entitling them to leave the car at a certain designated point, and there within a limited time and without further payment of fare, but upon presentation and delivery of the transfer check, pursue their travels upon the connecting line. It is, then, a part of the passenger's contract with the company that he may thus transfer to and ride upon the connecting road. As conditions of this privilege, it is further a part of the contract that the passenger shall board the cars of the connecting line at a designated point, and within a time limit after the issuance to him of the transfer indicated by a punch mark upon its face, and that the transfer shall not be transferable or assignable to another, but, if used at all, shall be used by the person to whom it is issued. The paper slip or ticket designated a transfer, when in the hands of the passenger, thus serves a twofold purpose: First, to the passenger as an evidence of his contract by which he is entitled to continue his journey upon the connecting road; and, second, to the company as a means of identification afforded to its conductors and

servants by which they may know that the passenger presenting the transfer is entitled to ride without further payment of fare.

Such being the nature of the contract between the company and its passenger, consideration may be paid to the objections raised against the validity of this ordinance. The power of the general legislature, acting within constitutional limitations to make penal an act theretofore indifferent, or even innocent, may not be doubted. *People vs. West*, 106 N. Y., 293. This, however, is not a statute of the general legislature, but a municipal by-law, and while it is true that article XI, section 11, of the Constitution of this State, expressly confers upon a city the power to make and enforce within its limits "all such local, police, sanitary and other regulations as are not in conflict with general laws," this language is not to be construed as enlarging the powers which municipalities theretofore enjoyed in these respects; but it is merely an express grant of a power which formerly they possessed by implication. *People vs. Wiltshire*, 96 Cal., 607. The ordinance in question, then, is to be scanned and judged like any other municipal ordinance. So judging it, regard is to be had to the end sought to be accomplished—whether that end be a reasonable one, and one within the powers of the municipality to accomplish; and regard is also to be had to the question whether the mode adopted to accomplish the end is itself reasonable or unreasonable.

Street car companies are public utilities, which are almost necessities to our present mode of life. While in one aspect their ownership is private, and they are operated for private gain, in another they are servants of the people, and the law-making powers reserve and freely exercise the right to regulate and control them in their operations. It is upon the theory, and only upon the theory, that they may be operated for the public good that a franchise permitting their existence may be given; and the power to pass reasonable regulations for their operation and management is expressly granted by section 503 in our Civil Code. It is strictly within the power of the municipal authorities of the city, and properly within the exercise of their duties, to pass any reasonable regulations affecting street car lines, to remedy a threatened or actual interference with the comfort, convenience and general welfare of the traveling public. It is urged against this ordinance that it is an attempt by penal legislation to enforce a private civil contract; in other words, that it is an attempt to compel the passenger who has received his transfer to use it within the limits of his contract, and not to violate that contract by giving it to a person who may make improper use of it. Could it be perceived that this was the only purpose, or even the main purpose, of the ordinance in question, we should be inclined to hold that the objection was fatal; but we cannot perceive that its main object or design was to accomplish this result. Rather we think it clear that its primary object is to protect and advance the convenience and welfare of the traveling public. For if to the legislative mind an abuse of the transfer system has grown up, the inevitable result of such unrestricted abuse must be one of two things: either that transfers would be discontinued entirely, to the material injury of the community, or the transfer system would be hedged and safeguarded by onerous conditions and requirements for the protection of the company, which would work great inconvenience to the passengers. It was certainly right for the supervisors, if they saw or anticipated the existence of such an evil, to destroy or avert it by proper legislation tending to correct the abuse, and it is no objection to the validity of an ordinance designed for this purpose that it may incidentally tend to prevent frauds and compel men honestly to abide by their contracts. It is concluded, therefore, upon this point that the purpose of the legislation to promote the convenience and welfare of the traveling public in regulating the business of the street car companies of San Francisco in their dealings with their passengers, is legitimate and within the scope of the powers expressly granted to the municipal authorities.

But are the means adopted to accomplish this end unreasonable or oppressive, or in violation of any constitutional rights of the citizen? It is here first insisted by petitioner that the transfer issued to him by the company is his property, and that an essential and inalienable right to the enjoyment of property is the right to sell, give it away, or otherwise dispose of it. This, however, is but partially true. A man may not be deprived of his property or of his property rights for any private considerations whatever, nor for considerations of public good, without compensation first made; but the legislature has the unquestioned right, and every day exer-

cises it, of restricting the use to which private property may be put. As is said in *Burdick vs. The People*, 149 Ill., 600: "The franchises of railroads acting under charters or acts of incorporation are of a public nature so far as the safety, convenience and comfort of passengers are concerned. The reasonable regulations affecting the conduct of such public employments are fit subjects for legislative action. The law-making power may provide means for remedying such evils as in its opinion may exist in the management of these public agencies of transportation, and in doing so it may sometimes impose restrictions which are deemed to be necessary upon the use and enjoyment of property. A man is not deprived of his property unless it is taken away from him so that he is divested of his title and possession. To limit the use and enjoyment of property by legislative action is not to take it away from the owner, when the property whose use and enjoyment are so limited is invested in a business affected with a public use, or used as an accessory in carrying on such business." But, aside from this, in the case of this ordinance it cannot be perceived that its terms limit or circumscribe any of the just and legal rights which a passenger receiving a transfer theretofore enjoyed. In receiving it he took it under the conditions above set forth. It was a part of his contract that, if used, he alone would use it, and if he sold it or assigned it, or gave it to another to the end that that other might use it, he clearly violated his contract, and put a fraud upon the company. A court will not hear with much patience one insisting upon his right to violate his contract and consummate a fraud. The ordinance in question, therefore, so far as the passenger is concerned, leaves him all the rights which theretofore he enjoyed under his contract, and interferes in no way with any legal or legitimate use which at any time he could have made of the transfer. At the most, so far as he is concerned, it has but made penal what before was illegal and against good morals.

Finally, it is urged against the ordinance that by the generality of its terms it is unreasonable and oppressive; that every person who taking a transfer shall hand it to any one other rather than the person authorized to receive it, no matter how innocent the act may have been in fact or intent, is guilty of a misdemeanor. In illustration of the position it is said that if the conductor should give to the father traveling with his family three or four transfers, and he in turn should hand them over to his wife and children, he would at once become amenable to the ordinance; that so, too, would be the passenger who handed his transfer to another upon the car to be delivered to the conductor; so, too, would the witness in court who gave the transfer to the judge for inspection, or the judge who in turn might deliver it to the clerk. To some of the objections thus presented answer may be made that the life of the transfer ends with the passage of the time indicated upon its face. It ceases then to be a transfer, to have any value at all other than that which may attach to it as a bit of paper. But for the more substantial objection that the ordinance by its terms would oppress and lead to the conviction of persons guilty of no fraudulent act, it is to be remembered that the letter of a penal statute is not of controlling force, and that the courts, in construing such statutes, from very ancient times have sought for the essence and spirit of the law and decided in accordance with it, even against express language; and in so doing they have not found it necessary to overthrow the law, but have made it applicable to the class of persons or the kind of acts clearly contemplated within its scope. The rule was thus early expressed in Bacon's Abridgment: "A statute ought sometimes to have such an equitable construction as is contrary to the letter." The oft-recited instance of the Bologna law, which enacted that whoever drew blood in the streets should be punished with the utmost severity, was wisely held not to apply to the barber who opened the veins of a sick man to aid in his cure. The statute of Edward II, declaring guilty of a felony any person who broke prison, was held upon considerations of the most ordinary common sense not to apply to one who did so to escape from a burning jail. The law declaring it a felony to lay hands upon a priest, by the same principles of common-sense reasoning, was held not to apply to one who did so by way of kindness or warning, but only to those who acted with illegal or improper intent. In *U. S. vs. Kirby*, 74 U. S., 482, the act provided: "That if any persons shall knowingly and willfully obstruct, or retard the passage of the mail, or of any driver or carrier, etc. * * * for every such offense shall pay a fine not exceeding one thousand dollars." A mail carrier was arrested by a state officer on an indictment for

murder. The act came within the letter of the law. Mr. Justice Field, delivering the opinion of the court, discusses the exemption of mail carriers from detention under civil process, but declares that they are liable to arrest and detention under criminal process for acts *malum in se*. Therefore, notwithstanding the fact the defendant had "knowingly and willfully" retarded the mail carrier, it is said: "When the acts which create the obstruction are in themselves unlawful, the intention to obstruct will be imputed to their author, although the attainment of other ends may have been the primary object. The statute has no reference to acts lawful in themselves, from the execution of which a temporary delay to the mail unavoidably follows. * * * All laws should receive a sensible construction. General terms should be so limited in their application as not to lead to injustice or oppression or an absurd consequence. It will always be presumed that the legislature intended exceptions to its language which would avoid results of this character. The reason of the law in such cases should prevail over its letter." In *Donnell vs. State*, 2 Ind., 654, a statute prohibiting the retailing of spirituous liquors without license contained no exception in favor of a druggist selling for medicinal purposes. A druggist who had so sold liquor was discharged after conviction as being clearly excepted from the intent, though not the letter of the law. In *State vs. Clark*, 29 N. J., 96, the statute made it a misdemeanor for any one to willfully open, break down, injure or destroy any fence. It was held not to apply to the destruction of a fence by one who was in its lawful possession, and it is said that the literal import of the terms and phrases implied will be controlled by the objects which the act was designed to reach. In *Holmes vs. Paris*, 75 Me., 559, it is said: "It has been repeatedly asserted in both ancient and modern cases that judges may in some cases decide upon a statute even in direct contravention of its terms." In all of these cases the apparent defect of the statute is cured by making it apply according to its spirit to the act in its nature illegal or fraudulent. So here, notwithstanding the generality of the language, no lawful or innocent use of the transfer would subject the passenger to the penalties of the ordinance.

It is concluded, therefore, that the ordinance is valid and the prisoner is remanded.

The dissenting opinion objects to the concluding portion of the main opinion and discusses the cases cited therein, the Bologna "blood-letting law" and others. The objection of the justice is that the decision injects the words "with intent that it shall be used by some other party" into section 3 of the ordinance, which the justice contends is inadmissible.

NEW LINE AT FLORENCE, ALA.

Mr. E. A. Schubert, of Fostoria, O., writes us as follows concerning a street railway line projected in Florence, Ala.: "The system will comprise eight miles of track laid with 60-lb. steel rails. The power house will be of brick, 50 x 90 ft., with three engines, two of 600 h. p. and one of 300 h. p.; the larger engines will have direct connected generators of 400 kw. capacity, and the small one will be belted to a lighting generator. The cars will be of the double truck type with separate compartments for the two races; at least ten cars will be operated. The organization has not yet been perfected and the plans and specifications will hardly be completed before July 25th; as soon as possible thereafter construction work will be commenced. It is the intention to develop interurban lines in connection with the Florence road, and the company will also light the city streets and furnish light for commercial purposes. At present mail should be addressed to E. A. Schubert, Fostoria, O."

New club rooms with pool and billiard tables, a library and other attractions are being fitted up by the employes of the Birmingham (Ala.) Railway & Electric Co.

Suit was brought last month to set aside the sale of the Capital Ry., of Washington, D. C., to the Washington Traction & Electric Co., and have a receiver appointed for the first named company. The complainants were injured in an accident on the Capital Ry., July 10, 1898, and claim that judgments for damages have never been paid.

FOREIGN FACTS:

Colchester (Eng.) Corporation has decided to apply for a tramway provisional order.

Devonport, Eng., is to have electric trams. Mr. C. Furness is borough electrical engineer.

It is proposed to change the horse tramway at San Luis Potosi, Mexico, into an electric line.

La Compagnie des Tramways Electriques d'Hanoi has been formed to build electric trams at Hanoi, Tonquin, Indo-China.

The Cardiff (Wales) Tramways Committee is about to invite tenders for 1,000 tons of rails, fishplates, bolts, copper bonds and other track material.

The Pietermaritzburg (Natal, S. A.) Corporation is seeking powers to construct electric tramways within the borough at an estimated cost of £75,000.

The Havre (France) Tramways are to be extended several miles by the Compagnie Generale Francaise de Tramways, 60 Rue de la Chaussee d'Antin, Paris.

A syndicate of New York and Philadelphia capitalists has incorporated the Uva Commercial Co., to build electric railways in Honduras, Central America.

Gas tram cars at Blackpool, Eng., are to be displaced by the overhead electric system. The Blackpool, St. Anne's & Lytham Tramways Co. owns the lines.

The town section of the electric tramways at Southampton, Eng., was formally opened to traffic last month. It is hoped the entire system will be completed by August.

A bad tramway accident occurred near Buda-Pesth lately when an electric car filled with passengers ran down a hill, overturning at a curve near the bottom and killing four persons.

The Glasgow (Scotland) Corporation Tramways report for the year ending May 31, 1900, gross receipts of £464,763, as compared with £433,128 for the previous year, an increase of £31,635.

A bill granting the Croydon (Eng.) Corporation powers to construct electric tramways and borrow £170,000 for the purpose has been reported favorably by a House of Commons committee.

The Italian Government is encouraging capitalists to undertake the building of electric tramways in that country and within the past three months has granted a number of tramway concessions.

The corner stone of what it is said will be the largest street railway car barn in Europe was laid at Manchester, Eng., last month by Mr. D. Boyle, chairman of the Manchester Tramways Committee.

A company has been formed at Gijon, Spain, with the title, El Credito Industrial Gijones, to develop coal mines, construct narrow-gauge railroads and exploit electric tramway concessions in Spain.

Electric cars have now been substituted for the old horse cars on all the tramways of Nice, France. The tram lines have been extended to Villefranche, and will ultimately be extended to Monte Carlo.

The work of equipping the Newcastle (Eng.) Tramways for electric traction is proceeding at a rapid rate. At a recent meeting of the Tramways Committee it was decided to lay down several additional lines.

Tampico, Mexico, is to have a new street car line. This town had a mule tramway years ago, but it is said that the very first car sent out ran over an Indian and the natives raised such a row that the entire project was abandoned.

The first annual report of the Blackburn (Eng.) Tramways since their purchase by the municipality shows a net loss of \$4,500. Half of the line is operated by electricity and half by steam. Under private ownership the road earned a surplus.

The Societa delle Strade Ferrate del Mediterraneo has proposed a scheme for changing the Naples (Italy) Castellammare trunk line, a 22-mile steam road, to electric motive power with a third rail. Power will be derived from the river Tusciano.

The citizens of Buenos Ayres know how to deal with scheming politicians. The City Council has persisted in blocking electric tramway enterprises contrary to the wishes of the inhabitants and now the people have about decided to abolish the City Council.

It is estimated at least a score of towns in South Africa will demand electric tramway systems as soon as hostilities cease, and this country promises to become a rich field for dealers in electrical supplies. Mr. J. G. Stowe is the United States consul general at Cape Town.

Mr. William Doull, of Montreal, Can., an officer of the Cuban Electric Ry., which runs from Regla to Guanabacoa, Cuba, states that the new enterprise has fulfilled all the expectations of the promoters, the net receipts for the first month having been between \$5,000 and \$6,000.

The Kingdom of Saxony, Germany, has 143 miles of electric railways in operation, according to statistics prepared by the Royal Bureau of Electric Railroads at Dresden. The equipment of the roads includes 731 motor cars and 289 trailers. During the year 1899 there were 113,592,390 passengers carried.

The city of Halle, Germany, has been negotiating with the company owning the street railways of that city for their purchase. The company, whose concessions run till 1929, was willing to sell for \$678,000, and after an examination of the property by experts the city offered \$595,000. The matter is as yet undecided.

The Leeds (Eng.) Corporation Tramways makes the following report for the year ending Mar. 25, 1900: Total revenue, £129,138; operating expenses, £99,110; earnings from operation, £30,028; interest on loans, £12,051; sinking fund charges, £11,809; net income, £6,167, an increase of £2,278 over the previous year. Several additional routes will be equipped for electric traction during the summer.

A London paper prints the following: "There was to be a bull fight at Seville, Spain, and, the tramway directors refusing to stop the cars, the running of which would have interfered with the sport, the people rose in a riot, quelled only with bullets. In order to preserve their property from utter destruction, the directors hoisted the German flag, and this, according to the Herald, had something to do with the rigor with which the riot was put down."

The House of Commons has passed the following bills: Blackpool (Eng.), Lytham & St. Anne's Tramways, Ipswich (Eng.) Corporation Tramways, Baker St. (London) & Waterloo Ry., Charing Cross (London) & Strand Electricity Supply, Wirrall (Wales) Ry., Hamilton (Wales) Motherwell & Wishaw Tramways, Aberdeen (Scotland) Corporation Tramways, South Lancashire Tramways, London United Tramways, Cork Electric Tramways. Bills have recently been passed by the House of Lords granting powers to build electric tramways to the following: Aston Manor (Eng.) Tramways, Stockport (Eng.) Corporation Tramways, Charing Cross (London), Euston & Hampstead Ry., Aberdeen (Scotland) Corporation Tramways, Cork (Ireland) Electric Tramways, City & South London Ry., Wellingborough (Eng.) & District Tramroads, London County Council Tramways (Bill No. 2).

MECHANICAL DEPARTMENT

HOW TO PAINT A STREET CAR—FROM THE STANDPOINT OF A PAINT MAKER.

By Edw. W. Williams, Sales Manager, Railway Department, The Sherwin-Williams Co.

To treat satisfactorily in a short article a subject on which so much can be said is hardly possible. To lay down hard and fast rules by following which good work will be assured, without reference to differing conditions of weather, temperature, surface and facilities is still less possible. It is quite practicable, however, to offer certain general suggestions, by following which, with such modifications as conditions necessitate, any intelligent painter may turn out work which for appearance, durability and economy will be gratifying to his company and creditable to himself.

No effort will be made in this article to take up any of the numerous methods of "cutting in," "touching up," etc., of old cars. Suffice it to say that when the paint and varnish on a car have perished beyond a certain point or show cracks which go below the varnish into the paint, a good job of repainting can not be done without first burning or scraping off all the old paint and starting anew. It will cost a little more to do this, but the added expense will be made good twice over by the better appearance of the car and the much longer time during which it can be kept in service without repainting. Let us then take up a system of painting a new car or one which has been burned off.

In the first place the shop should be one which can be kept dry at all times and in which the temperature may be maintained fairly constant. Good car painting can not be done in a cold and damp shop nor under hot sun. If shop facilities in this respect are not entirely satisfactory, the work should be planned for such seasons as offer the best conditions of weather, but a company operating a large number of cars can as a measure of economy, well afford a paint shop that is properly lighted, heated and ventilated.

Painting material should be bought only from a reputable house and one that has made a particular study of the conditions and methods of street car painting. Such a house, having a wide acquaintance with street railway officials through its representatives and experts, is able to avail itself of the experience of many of the best painters, and with its own facilities for independent investigation and research is better able than others to suggest what is good in materials and methods.

The foundation coats are the first and all important ones. A proper surface must be obtained before the color and varnish coats can be safely applied. A good schedule is about as follows: First day, one coat of primer; second day, putty; third day, first coat of surfacer; fourth day, second coat of surfacer; fifth day, third coat of surfacer; sixth day, rub to surface. This schedule applies particularly to the surfacing system of the company with which the writer is connected, and will have to be modified to suit the materials of other makers.

The primer should be well brushed in, especial care being taken to see that it gets into all cracks, joints, nail holes, etc. It should be allowed to stand two days before the first coat of surfacer is applied, but the second of these days may be used for puttying. When the car has been primed and putted, not less than three coats of surfacer should be applied.

When the last coat of surfacer is dry, that is, the day after it has been applied, the car is ready to be rubbed. Care must be taken not to rub through to the wood. It is safer to apply what is termed a "guide coat" before beginning to rub. This is generally just a thin stain which gets into all the depressions, brush marks, etc., and serves as a guide to prevent rubbing too far. Where the guide coat is used an extra day is of course necessary.

The best way to get a surface is with the use of block pumice

stone and water. Satisfactory work, however, can be done with sandpaper if that method is preferred.

The car is now ready for the color coats. The method of procedure from here on depends largely on the character of the color to be used, both as regards shade and also more particularly as regards the way the material is made and put together.

In the first place japan color should be used. A common way in the past has been to give one or two coats of flat (japan) color, a coat of the same color mixed in rubbing varnish, which last coat is mossed or rubbed for striping and lettering and then one or more coats of finishing varnish. Although much good work has been done and probably will be done in this manner, it is now generally admitted that a great part of the difficulties of the car painter are due directly or indirectly to the use of rubbing varnish. Practically all of the large steam railroad companies have discarded its use, either as a thinner for japan color in small proportion to turpentine or as a color varnish and also as a coat of clear varnish.

A much safer and more durable way is that now in vogue in the most up-to-date shops, which is as follows: Having rubbed to a surface, apply two or more coats of flat color, the number depending on the opacity of the paint, which varies with different shades. Stripe and letter directly on the last coat of flat color and then finish with finishing varnish. Two coats will answer, more will give better results.

In the case of cars finished in a bright red shade the first coat of flat color should be what is known as "red ground." This is a red varying in shade according to the character of the bright red which is used in finishing. The bright red gets its brightness from the use of carmine or certain lakes which although necessary in order to secure the beautiful tone are more or less transparent. It is therefore best to use under a coat of the brightest red one coat of a red which is not so bright perhaps, but which is of good opacity and which is chosen as well calculated to bring out the best results in the finishing coat of the rich, bright red.

This covers the best method for finishing the bodies, including side panelling or sheathing, letter boards, running boards, door and corner posts and dashes, whether of metal or wood.

Now as to trucks. It has been the custom in the past to use japan color with a liberal percentage of oil or varnish or color ground in oil in paste form which is thinned so as to dry flat or semi-flat. Striping is done on top of this and then the work is given the varnish coats. This manner is gradually being discarded as too expensive for this part of the car. A cheaper way by far and one much better is to buy the truck color ready for use and ground in varnish.

In my opinion it is not desirable to go to any expense in striping or ornamenting the trucks. These parts are so near the ground and so quickly gather the dirt and become worn by the friction of sand and gravel that a car can run but a few trips before the effects of any fancy work on the trucks is entirely effaced. Why then go further than to give the trucks a coat of paint which will stay on, will protect the metal and wood parts and will give a surface that is easily cleaned.

It is customary in some shops to use slush, that is, the odds and ends of paint and varnish for mixing up paints for the floors and roofs. From an economical standpoint the less mixing in the shop and therefore the less varied the paint stock, the better it is. Get a paint for each part made to serve the purpose for which it is intended. The paint stock can then be limited to about the following: Car primer, car surfacer, car body color in japan, trimming color in japan, letter color in japan, truck color in varnish, roof paint in liquid form, floor paint in liquid form, varnish, oil and turpentine.

Of course there will be need of other things, but it will be found that by adopting standard shades and buying the material matched to the standards, a greater degree of economy and convenience will be obtained.

BAKING ARMATURES.

Inquiry among shop superintendents and electricians of street railways shows that it is the general, though not universal, practice to bake motor armatures after they have been rewound.

In the opinion of some this is an unnecessary precaution since with motors of the more modern types the coils are wound and painted with shellac or other insulating compound and then dried before being inserted in the core. We may assume that the core and the paper insulating shells are themselves dry, so that there should be very little moisture in the armature when wound. It may be argued that there is no necessity for baking the completed armature because even if the insulation should not be perfectly dry when the armature is put in service the heat generated will quickly dry it out. If the motors receive a heavy starting current when in service it is considered better to thoroughly dry them in a baking oven though, as stated, the precaution would be needless if the current were fed slowly at starting.

The present practice on the North Side division of the Chicago Union Traction Co. is not to bake armatures. Mr. V. T. Lynch, superintendent of the North Side shops, states that until about a year ago the rewound armatures were baked for from two to five days before being returned to service. It was found, however, that the heat had a detrimental effect on the insulation, as when taken from the ovens, the varnish and shellac on the windings would be as dry as chips, and in a condition best described as "lifeless." Noting these defects, it was determined to try the experiment of putting the armatures back into the motors, just as they came from the winding room, without baking or drying. The results were so satisfactory that this has been made the regular practice, and it is found the number of faults in the windings has decreased, and the life of the armatures has been materially prolonged. The company still uses its oven, however, for drying out armatures that have been subjected to an unusual degree of moisture, as in sweeper and snow ploy service, etc. The armature varnish that has always been used is orange shellac cut with wood alcohol; for fields "P & B" electrical compound is used. No change in varnish has been made since discontinuing the practice of baking.

The oven is on the second floor of the "Limits" shops, and is about 7 x 12 ft., and 7 ft. high, with walls of Holstein clay. Two narrow gage tracks are laid the full length of the oven, and on these run low trucks which carry the armatures. At one end of the oven is an ordinary steam radiator, and along each side are electric heaters.

The Indianapolis (Ind.) Street Ry. for some time past has not baked rewound armatures for the reason that the electric heaters in the oven were not of sufficient capacity to raise the temperature to the point desired for baking.

At the West Side shops of the Chicago Union Traction Co., armatures are baked for about three days after rewinding. The oven used for this purpose is 7 ft. wide, 10 ft. long, and 6 ft. high, inside dimensions, and has 8-in. walls of ordinary brick. The roof consisting of a layer of sheet iron on which is laid 4 in. of brick, is supported from the side walls by I beams. An iron sliding door is placed in one side. The oven is heated by live steam circulating through 12 coils of pipes running the full length of the interior. The temperature is maintained at about 175° F.

The practice of the Boston Elevated Railway Co. is to bake all armatures rewound in its shops. The coils after being wound are dipped in "Armalac" and air dried; the coils are not baked because it renders them less pliable for winding. After the armatures are rewound they are baked for 9 or 10 hours at a temperature of 90° C. (194° F.). The oven 10 x 12 ft. and 7 ft. high, heated by steam pipes arranged on three sides. Concerning the method of heating to be used, Mr. C. F. Baker, superintendent of motive power and machinery, says: "In my opinion steam is the best mode of heating, especially when the oven can be situated near a steam plant, for the steam pressure can be regulated by pressure regulating valves and the condensation can be returned to boilers by trap or pump. Also, I think this method would require less care to give the coil an even temperature than would be required if using coal, coke, coal gas, or even electricity, although all of these could be regulated by automatic dampers or devices controlled by thermostats, and in

some places might be used more advantageously than steam. In some cases this would depend on local conditions."

Mr. J. B. McClary, general manager of the Birmingham (Ala.) Railway & Electric Co., writes that his company bakes all armatures and considers the baking necessary even when the coils have been covered with shellac or insulating paint and dried before being put in the armature. The armatures are baked by putting them in a box 2 x 2 x 4 ft., lined with asbestos, in which are 20 16-c. p. incandescent lamps. This method of heating is the only one the company has ever used and has been found perfectly satisfactory. The time of heating is 36 hours.

Mr. M. M. Martin, superintendent of the Oakland (Cal.) Railroad Co., writes us as follows: "We have just commenced rewinding our W. P. 30 armatures after a service of nearly eight years. We intend baking them and will use an electric heater. The temperature and length of time of baking will have to be determined by experiment, also the kind of insulation to use."

Mr. C. W. Smith, general manager of the Los Angeles (Cal.) Railway Co., in answer to our inquiry states that it is the practice on that road to bake all rewound armatures for not less than 12 hours at a temperature of 180° F. It is not considered absolutely necessary to bake armatures that have been wound with insulated coils, but it is a good precaution; the superintendent is governed by the insulation test after the armature is completed. The oven is 4½ ft. wide, 6 ft. long and 6 ft. high; the outside is of 1-in. flooring and next come 2 in. of mineral wool, a layer of red fiber ¾ in. thick, 2 in. of magnesia, and sheet asbestos ¾ in. thick, in the order named. The oven is heated by steam, which method, taking into consideration fire insurance rates, is regarded as better than the use of coal, coke, coal gas or electricity.

The Chicago City Railway Co. in its repair shops has an armature oven built of brick, 12-in. walls, with double doors of sheet iron; the roof is of corrugated iron. This room is 6 ft. wide, 15 ft. long and about 9 ft. high. Along both sides and across the closed end of the oven 30 steam pipes, 1-in. diameter, are fastened to the walls; the supply of steam, exhaust from the power station, is regulated by a valve located outside the door. A thermometer is placed inside the oven and the steam regulated so as to give a temperature of from 160° to 180° F. It is found that in practice the oven is opened at intervals of 30 to 45 minutes to put in or remove armatures and this inspection of the thermometer is frequent enough to keep the temperature approximately constant. The armatures are subjected to the temperature mentioned from 12 to 24 hours, never longer than the latter period.

For handling, outside the armature repair shops, which includes removal to and from the oven, and then to the car houses, etc., each armature is placed in a frame which keeps the winding from abrasion by coming in contact with the floor or walls. These frames are rectangular, made of 2-in. oak, 28 x 14 in. inside measurement and 9 in. deep; the corner joints are made with square tongues and mortises. Each end piece has a semi-circular notch cut in the top to receive the armature shaft and prevent the windings from coming in contact with the side pieces. For the convenience of the men in handling the loaded frames, in lifting them on and off trucks, etc., a hole is bored near each corner and a loop of ½-in. rope put through. The loops serve as handles.

Mr. M. O'Brien, master mechanic of the Chicago City, states that when he was with the National Railway lines of St. Louis the same practice of baking armatures for from 12 to 24 hours at a temperature of from 160° to 180° F. was followed. The oven he then used was of brick 10 x 12 ft. built in one corner of the armature repair shop. It was lined with a 1-in. layer of asbestos which had previously been used as a boiler covering. For heating the oven an ordinary car stove was set up inside, with a rod for manipulating the damper extending through the wall. A small window with glass was located in one wall and a thermometer hung before it, so that the temperature could be observed without entering the oven. The stove required no attention after being filled with coal once each day. The use of a stove such as this would perhaps not be deemed desirable in some cases because of the increased insurance rates. It has also been suggested that gases escaping from the stove might injure the insulation and even the copper.

One of the most novel methods of "baking" of which we have read is one described by Mr. J. F. Hobart. The method is only applicable to the coils before they are placed in the armature, and consists of burning out the alcohol of the shellac. The coil having been covered with shellac, applied preferably before being removed from the form, it is heated over a gasoline torch or bunsen burner until the shellac ignites. It will blaze fiercely and at the proper time—determined by experience—the blaze is extinguished, after the shellac has become hard but before it burns. The object of this method is to quickly dry a coil when needed for immediate use.

From the foregoing it will be remarked that the use of steam is regarded as a very satisfactory mode of heating armature ovens, the ease of regulating and the low fire risk being the principal advantages. The use of incandescent lamps as described by Mr. McClary, is also a simple and convenient method of heating.

While there is a general uniformity as to the temperature, 180° to 200° F., at which the armatures are dried, one cannot fail to note the wide differences in the length of time they are subjected to this temperature. On the roads mentioned the time varies from 9 to 72 hours. This is quite surprising, even allowing for a variety of types, since no good results can be expected from baking the armature longer than is necessary to thoroughly dry it; on the contrary the continued heating would naturally injure the cotton of the insulation, and perhaps the shellac as well, as found by Mr. Lynch.

CLEANING CARS.

At the meeting of the American Railway Master Mechanics' Association one of the subjects for topical discussion was: Good methods for terminal cleaning of passenger cars, and is it advisable to have oil in the cleaning mixtures?

Mr. A. M. Waitt, of the New York Central, described the two kinds of terminal cleaning—temporary cleaning, which is done every day. It consists, in some cases, of washing the car down with a large Turk's head brush and water, and the wiping of the trucks. The latter is done in most cases by going over them with waste saturated with kerosene oil, and in some cases ordinary car oil, although that is rather expensive. Then the trucks are wiped off in good shape or indifferently; if indifferently, making a good foundation for the trucks to be well painted with mud at the time they get to the end of the next run. Then the inside of the car is generally swept out, and the wood-work dusted once a week, or sometimes oftener in dusty countries.

On some roads it has been considered inadvisable to wash cars at all except in weather when it is impossible to dry-wipe them. A large number of roads during the past few years have abandoned in dry weather the washing of cars on the outside, because it is considered that ordinary water is as injurious to varnish almost, as anything that can be put on it.

On the New York Central the success met with in dry-wiping cars has been very gratifying and the company has done away with the washing of cars with water at terminals, except during damp weather, when there are cinders on the car which can not be wiped off because the surface is moist. The varnish has stood better and the equipment looks better. There are times after three or four months, or it might be after three or four days, if the car goes through a great many tunnels, when it is necessary to treat them in a different way and give them a thorough scrubbing in some manner. Various methods of doing this have been adopted, some of which are satisfactory and some others are not. Some methods are diametrically opposed, and yet they are suited to the respective roads using them.

The question is brought up in the topic as to the advisability of having an oil-cleaning mixture. The idea of the introduction of oil in cleaning mixtures as it has been introduced by several roads during the last year, is to put in something which will give a little polish; a little renewal of the life of the varnish. Different kinds of oils are used, and it is probably due to this fact that the difference in results is obtained. If an oil, such as linseed, is used, which by the action of the sun will dry and leave a skin on the surface of the car, any dirt there may be in the cracks or grooves is impossible to get out until the car is scraped with soap or pumice stone or something of that kind. Other oils may be used which will not dry with anything like a skin or surface at all. With these oils the difficulty just stated is entirely avoided. The considera-

tion as to what oils shall be used in a cleaning compound, is worth looking into.

Mr. H. M. Pflager, of the Pullman Co., stated his company cleaned cars by dry-wiping and also by using water, and found very little difference in the appearance of the car after twelve months as to which method is used. In some cases the dry-wiping seems to be best, but in other cases the washing serves best; and on the whole it seems to make very little difference.

Mr. W. S. Morris, of the Chesapeake & Ohio, said that for light colored cars his road used a cleaner in which was a sufficient quantity of evaporating oil combined with the linseed oil to neutralize the alkali in the quantity of soap deemed necessary for the composition. This cleaner is used about once a week on light cars. On darker cars the dry cleaning can be used longer without introducing the liquid cleaner.

AUTOMATIC SAW GRINDING MACHINE.

The machine illustrated herewith is especially designed for sharpening circular saws for metal sawing machines, and is entirely automatic in its action, requiring no attention when once adjusted to properly grind the blade.

The arbor carrying the saw blade is given a reciprocating movement to and from the emery wheel by a crank and connecting rod, actuated by worm gearing driven by the emery wheel spindle. This movement is varied to suit the blade by changing the position of a stud on the slotted crank disk. The length of the connecting rod is adjusted by means of thumb nuts, and the blade can be brought

AUTOMATIC SAW GRINDING MACHINE.

forward to lightly touch the emery wheel at each movement of the disk, insuring true work under all conditions. The saw blade is held in position by a friction collar and nut and its motion is limited by a pawl at the side, which engages each tooth in turn and holds the blade until the emery wheel spindle has completed the revolution and the connecting rod has returned the friction collar to a position ready for the next stroke. The pawl has a fine adjustment and may be set to give exactly the movement required.

The machine is made by the Q & C Co., of Chicago. It weighs 130 lb., occupies 36 x 48 in. of floor space, and will grind saws up to 36 in. diameter, and having teeth with 2½ in. pitch or less.

NEW WORK AT INDIANAPOLIS.

Last year, shortly after the reorganization of the company, the shops of the Indianapolis Street Railway Co. were remodelled, the brick floors being replaced by wood, a fire wall put in between the paint shop and machine shop, the machinery rearranged, skylights placed in the roofs, and new woodworking machinery installed. These changes were made under the direction of Mr. Charles Remelius, who assumed charge of the shops as master mechanic in July last.

The most extensive addition to the shop equipment was the woodworking machinery, which comprises 1 planer, 2 mortising machines, 1 rabbitting machine, 1 molding machine, 1 universal wood worker, 1 shaper, 1 boring machine, 2 rip saws, 1 cross-cut saw, 1 jig saw, 1 band saw. All of these machines were furnished by the

J. A. Fay & Egan Co., of Cincinnati. This machinery is driven by an electric motor. The wood shop is 53 x 314 ft. with two tracks along one side; of the remaining floor space one end is occupied by the machines and the other by benches. About 95 men are at present employed in this shop.

The paint shop is a room 100 x 125 feet with six tracks. Under the same roof, but separated by a fire wall are the machine, forge and armature repair shops. The equipment of the forge shop comprises 3 forges, 1 power hammer, 1 hydraulic wheel press, 1 drill, bending rolls, and thread cutting machine. In the machine shop are 1 milling machine, 1 planer, 4 lathes, 1 drill press, 3 sensitive drills, 1 power hacksaw and 1 tool grinder. Including the men in the car shop about 200 men are at present employed.

Near the other shop buildings is a wash house for cleaning the cars. This is a narrow brick building with cement floor and is long enough to receive two cars. At each side is a gallery supported by

FRONT END OF INDIANAPOLIS CAR.

rods depending from the rafters; the gallery floor is on a level with, and quite close to, the edge of the car roof as it stands on the track, so that the men can direct a hose on the roof at short range or can easily reach it with a brush or broom.

The remodelling of the shops was completed early in November last, and since then 30 box cars and 65 open cars have been built, and the force last May began rebuilding 65 of the old cars.

In the new rolling stock built in the Indianapolis shops Mr. Remelius has embodied a number of features he developed while in charge of the shops of the Detroit Citizens and allied roads. Thus the closed cars built last winter have vestibules at the front end, as shown in the cut. All the cars run one way only (being turned on Y's or loops) and this arrangement of the front end provides a closed vestibule for the motorman in which he cannot be disturbed, and at the same time affords a practicable entrance for passengers at the front of the car. The rear platform is 6 ft. wide inside the dash and has the gas pipe rail as illustrated in our May issue, page 266. Steel side panels are also used. These cars are mounted on du Pont single trucks, with a wheel base of 7 ft. 6 in.

The open cars recently completed are 33 ft. 10 in. over all, 28 ft. between bulkheads, and have 11 benches, all inside the bulkheads. The width is 7 ft. at the floor and 7 ft. 10 in. over the side posts. The front platform is only 31 in. inside the dasher, while the rear platform is 42 in.; none but the motorman is permitted on the front platform. The cars running only one way, a running board is placed on one side only. The front bulkhead is closed with sash and the rear bulkhead is open above the level of the seat backs. The side sills are of Southern pine, 5½ x 7½ in., with a steel plate 5¼ x 8 in. bolted to the outer side. The plates are 8 in. wide up to 7 ft. from each end, from which point they taper down to 4 in. at the end; the total length is 32 ft. The plates are peened till they have a camber of 3 in. The cross sills, nine in number, are of oak 4 x 6½ in. The special feature wherein these cars differ from the general practice is in the use of joint bolts instead of dowells; all the posts, rails and carlines are joint-bolted.

The old open cars now being rebuilt were originally 24 ft. over all. The floor and underframing are removed, the car body being swung from rods overhead until the new floor is ready for it; after the body is let down on the new floor the additional new posts are put in, the rails and roof extended, and new hoods added. The rebuilt cars will be 32 ft. 6 in. over all and in general appearance quite similar to the new open cars.

The signs placed on the Indianapolis street cars are admirable in being few in number, conspicuous, legible from a distance, and simple in wording. Each car carries four signs, one at each end and one at each side of the monitor in the roof; each route is named for two of the streets over which it runs and the end car signs bear the name of one of these and the side signs the name of the other. The signs are of ½-in. poplar wood with the letters 5½ in. in height sawed out; the width of each element of the letters is 1 in. The boards are painted black, with white stripes ¼ in. wide around the edges of the letters; on the back is a sheet of white celluloid. At night the car lights shining through the celluloid backing show white letters on a dark background. In addition to these signs there are smaller signs made of sheet steel stencils with white celluloid backing, which are placed at the edges of the hoods to distinguish such of the cars as only run part way to the terminus of the route. On these smaller signs the letters are 3 in. high. Both types of signs are mounted in brackets and are quickly interchangeable.

The Indianapolis Street Ry. has this spring made a number of extensions to the city parks that increased its track by 12 miles, making the total 120 miles. The new work was laid with 9-in. 90-lb. girder rails, cast-welded by the North American Railway Construction Co. At the power house there is being installed a large direct connected unit consisting of a cross-compound Buckeye engine and a Siemens-Halske generator.

ELECTRIC LINE TO HACKENSACK, N. J.

The accompanying illustration is reduced from a copy of the circular issued to announce the opening of the Hackensack extension of the New Jersey & Hudson River Railway & Ferry Co. The original was printed in two colors on a sheet 12½ x 19 in. and made a very attractive advertisement.

There was considerable rivalry as to which of several electric

JUNE 21, A.D. 1900

THE PUBLIC is hereby notified that on the afternoon of the above date

THE FIRST ELECTRIC CAR

to enter the town of

HACKENSACK

will cross the new *Hackensack River drawbridge*, arriving at the terminus at *River Street*, one block east of the *Susquehanna Station*.

THE NEW JERSEY & HUDSON RIVER RAILWAY & FERRY COMPANY announce that following this car, cars will be run in regular service, leaving HACKENSACK every half-hour for ENGLEWOOD and for the 130th Street

FERRY, NEW YORK CITY. IT IS the endeavor of our management to furnish the best of transportation facilities, and at all times to provide for the accommodation of its patrons and the convenience of the travelling public.

THE "HUDSON RIVER" LINE

railways would be the first to complete a line to Hackensack. The officers of the New Jersey & Hudson River company are: President, A. Merritt Taylor; first vice-president, W. H. Clark; second vice-president and general manager, Frank R. Ford; secretary and treasurer, W. N. Barrows. The manager's office is at 149 Broadway, New York.

A rate war has been declared by the Southern Pacific and the Santa Fe Pacific railroads against the Los Angeles (Cal.) Pacific R. R. operating an electric line to Santa Monica. The steam roads have started the fight by cutting the round trip fare from 50 cents to 30 cents.

WARM WEATHER FANS.

For moving air to or from buildings or through ducts, the B. F. Sturtevant Co., of Boston, is now building the type of electric ventilating fan shown in the accompanying illustration, which has been found to meet the requirements. The fan wheel is carefully designed to act against reasonable resistance and to move the air in lines parallel to the axis of the shaft. It is contained within a special circular frame casing which is conoidal in its form as it approaches the circumference of the wheel; this offers low resistance to the entering air. The frame carries a tripod support with annular center within which is accurately centered a bi-polar motor, consisting of a circular field ring to which the pole pieces are attached. Extending out from either side of the field ring is a yoke with the ring oiler bearings. The bearings are self-aligning and self-oiling, and fitted

STURTEVANT VENTILATING FAN.

with composition sleeves which are removable from the outer end of the boxes.

Hard carbon brushes carried in holders of a modified reaction type are employed and permit of easy adjustment when it becomes necessary to reverse the direction of rotation of the motor. Special light end casings with removable centers are provided, which when applied and bolted in place entirely enclose the motor, protecting it from dust. This is a most important feature in a machine of this type where the air, possibly laden with dust, is drawn directly across it. The movement of this air is of great service in maintaining a low temperature of the surface, while the motor itself is designed with the utmost care to avoid excessive heat. This motor is capable of continuous operation for 10 hours with a maximum temperature rise which does not exceed 60° F. The entire apparatus is ordinarily shipped complete and may be bolted directly to an opening in the wall through which the air is drawn or forced. These are built in sizes from 18 in. to 120 in. in diameter with capacities ranging from 2,000 to 175,000 cu. ft. per minute and driven by motors ranging from 1-6 h. p. to 14 h. p.

Corsicana, Tex., is having difficulty in securing a street railway system. A franchise granted Mr. M. M. Bright and others has just been declared forfeited by the city council owing to the failure of the promoters to fulfill its conditions.

A check for \$12,153.42 was paid into the Chicago city treasury last month by the Union Loop Co., this being the 5 per cent of the gross receipts for the years 1898 and 1899 claimed by the city as its due. The money was paid under protest, the company claiming that the contract on which the city bases its demand is void.

NO ELECTROLYSIS FOR BRISTOL, ENG.

To prevent all possibility of electrolytic action by stray currents from its tracks, the Bristol (Eng.) Tramways Co. has taken the following precautions: Five plates are placed at each joint and firmly bolted together, one on each side of the web in the usual manner, one covering the entire under side and two strips on the upper side of the bottom flange. The rails are double bonded at each joint with copper bonds 7-16 in. in diameter and in addition Edison plastic bonds are placed beneath the fish plates. As a further precaution the rails are cross connected every 120 ft. by double copper wire bonds 7-16 in. in diameter and capable of carrying the full current should any individual joint bond fail. Not less than \$1.75 per single joint was spent for bonds by this company.

In addition to this elaborate bonding a sucking dynamo or negative booster is placed at the power station for the purpose, states the Electrical Review, of London, "of retaining the return current and making the rails the way of least resistance."

PAINTS AND VARNISHES.

The Sherwin-Williams Co., of Cleveland, which claims to be the largest grinder of paint in the world, has a special department devoted to the street railway trade. In addition to primers, surfacers, paints and varnishes for car bodies, it carries a full line of materials for special purposes, including wood and metal fillers, stains, enamels, graining colors, bridge paints, building paints, japan colors, colors in oil, varnishes and dryers, truck paints, etc. The company has branches in Chicago, New York, Montreal, Boston, Toronto, San Francisco and Kansas City, Mo.

In another column of this issue will be found an article by Mr. Williams, sales manager, railway department, The Sherwin-Williams Co., containing a number of valuable suggestions on car painting and the management of the paint shop.

BOILER FEEDER.

The accompanying illustration shows a simple and substantial feeder for boiler compounds which is made by the International Boiler Compound Co., No. 47 Market St., Chicago. The feeder is adapted for use with pumps, injectors or inspirators; it may be attached to the feed line on either side of a pump, but if used

INTERNATIONAL BOILER COMPOUND FEEDER.

with an injector it should be placed between the injector and the boiler. The reservoir of the feeder is 6 in. in outside diameter and 12 in. high. To fill it with the compound the valves 1 and 3 are closed and the plug C removed. Where it is desired to feed a considerable quantity of the compound into the boiler at one time the valve 2 is closed and 1 and 3 are opened, in which case all the water injected is carried through the reservoir. For gradual feeding 1 is left open, 2 nearly open, and 3 throttled so as to allow only the desired flow of the compound.

Newspaper booths will be built under the approaches to the elevated stations in Chicago.

NEW PENNSYLVANIA LINE.

On July 7th an electric railway between Ashland and Centralia, Pa., was opened for traffic. This line connects the system of the Schuylkill Traction Co., of Girardville, with the system of the Centralia, Mt. Carmel & Shamokin Ry., and gives an electric line over fifty miles long in the middle anthracite coal region of Schuylkill, Columbia and Northumberland counties, connecting the towns of Mahanoy City, Shenandoah, Girardville, Ashland, Centralia, Mt. Carmel and Shamokin. The line is a great convenience to the inhabitants and the traveling public.

The Schuylkill Traction Co., of which Mr. Dallas Sanders is president, on May 1st leased the Lakeside Electric Ry. for a term of 990 years. The latter line is six miles long, connecting Mahanoy City and Shenandoah; the Schuylkill Traction Co. at that time operated 22 miles of track.

ANOTHER VICTORY FOR THE AURORA & GENEVA RY.

In 1897 the Aurora (Ill.) & Geneva Ry. sought to condemn a right of way for about a mile through private property in order to get a safe and practicable route to Geneva and avoid some steep grades and dangerous railroad crossings. After long litigation the right of the company to condemn a right of way was affirmed by the Illinois Supreme Court. (This decision was given in full in the "Review" for March, 1899, page 252.) The result was accepted by all save two of the abutting owners, Messrs. Pope and Peckham, and the case was thought settled.

These two gentlemen, however, persuaded the council of Geneva to pass an ordinance purporting to debar the street railway from the right to enter the limits of the corporation upon the private property and streets intended by the company.

New proceedings having been brought the Circuit Court held this ordinance void; the case was carried to the Supreme Court, which on June 21st rendered a unanimous decision to the effect, "That a city has no power to locate a street railway and that the ordinance in litigation is void because it attempts to prohibit the street railway from taking a certain route, and because it further attempts to locate a route for the company."

This is believed to remove the last bar to the completion of the road, though the defendants may petition for a rehearing and delay matters for a short time longer.

MILE A MINUTE BY ELECTRIC CARS.

The New York, New Haven & Hartford R. R. has been experimenting with high-speed electric cars on its New Canaan branch and on July 1st the record of a mile a minute was made with some cars intended for use between Providence and Fall River. The New Canaan branch extends from Stamford, Conn., to New Canaan, and is operated on the overhead electric system. The car tested was fitted with four 80-h. p. motors. The highest speed reported was 60 miles per hour. Officials of the Metropolitan Street Ry., of New York, the Brooklyn Rapid Transit Co., and the Boston Elevated Ry. were present at the tests.

ELECTRICITY IN BOMBAY.

Mr. William T. Fee, U. S. consul at Bombay, India, writes the State Department that he has many inquiries from American electrical manufacturers for the names of agents to act for them in Bombay, but cannot answer these requests because the names of suitable persons are not to be had at the consulate. General merchants and dealers are not sufficiently acquainted with electrical goods to make good agents, and the demand is also quite limited.

It is believed that electric railways must soon be introduced in the city to relieve the overcrowding. The Bombay Tramway, an American company with its principal office in New York, has made application for the privilege of converting its lines for electricity, but this has not been granted as yet.

The city of Little Rock, Ark., has decided to petition the Federal Court in charge of the road to order the receiver to make improvements in the physical condition of the property.

FATAL ACCIDENT AT TACOMA, WASH.

On July 4th one of the most appalling street railway disasters that has ever taken place occurred at Tacoma, Wash., where a car loaded with nearly 125 passengers plunged from a trestle into a gulch 125 ft. deep, killing 44 persons and injuring 70 others.

FIG. 1—VIEW OF THE BRIDGE.

The ill-fated car left South Tacoma and Spanway Lake filled to its utmost capacity with a holiday crowd going to Tacoma to view the Fourth of July parade. Both platforms were crowded and passengers were hanging on from the rear dash and step. As the car was descending a grade approaching the trestle at 26th

FIG. 3—BOTTOM OF GULCH.

and C Sts., the motorman in some way lost control and the car rushed on until it struck a sharp curve on the bridge approach, when it swerved to the right, left the rails and plunged over into the ravine. Its momentum caused it to overturn so that it fell top first with the passengers penned inside, till it struck the side of the gulch, 75 ft. below, where the framework of the car was

smashed to pieces and the wreck crashed on down the steep side of the gulch, grinding and tearing its way through the brush and stumps until there was little left of it but kindling wood. Many of the passengers were killed or injured by jumping before the car left the bridge, others were thrown from the windows and platforms while the car was falling, and many were buried under the timbers, motors and trucks.

A few moments after the accident occurred fully a thousand people were at the scene to aid in the work of rescue. Policemen, firemen and citizens joined in the work of passing the injured and dead up the side of the gulch, which was so steep as to require the use of ropes. Every physician in the city was called on for help, and ambulances, patrol wagons, express wagons, and public and private carriages were pressed into service to carry the scores of injured to hospitals and their homes.

Eye-witnesses state that the spectacle immediately after the accident almost baffles description. A volunteer soldier just returned from the Philippines, who was the first to arrive at the scene, declared that he had never witnessed a battlefield that presented a more heartrending sight than did the side of this ravine just after the car had rolled down leaving in its path heaps of battered, mutilated humanity. Women and children had formed the greater part of the car's load, and the cries of these for other members of the family in the wreck, with the cries of the wounded and dying as they lay on the side of the gulch or at the bottom, it is said, could be heard for blocks away.

A subscription list was immediately started for the benefit of the bereaved families. This was headed by the street railway company with \$1,000, followed by the mayor of Tacoma with \$100, and several thousand dollars were quickly raised.

Our illustrations are from photographs taken a short time after the accident. Fig. 1 shows the bridge from which the car dropped;

FIG. 4—BRIDGE FROM BELOW.

it rolled off the structure at about the point where the car is shown in the illustration.

Fig. 2 is a view of the wreck as it appeared below the bridge. Fig. 3 is the bottom of the gulch near the scene of the accident; the building is one of the city pumping stations; dead bodies are in the foreground.

Fig. 4 shows the bridge from the bottom up. In point of the number of persons killed, this is among street railway accidents

FIG. 2—THE WRECK.

second only to that at Victoria, B. C., May 29, 1896, when a car broke through the Point Ellice bridge and 63 passengers were drowned. Among other accidents now recalled are the following: Nov. 1, 1893, a car went through a drawbridge at Portland, Ore., 6 persons being drowned. Feb. 4, 1895, a car at Milwaukee went through a draw into the river and 3 persons were killed. Nov. 16, 1895, a car ran into an open drawbridge at Cleveland, 17 persons being killed. July 7, 1897, a car on the Inter-Urban Ry. of Saginaw, Mich., went through an open draw into the river and 7 persons were drowned and 5 injured. Aug. 6, 1899, a car of the Milford Street Ry. fell from a trestle near Bridgeport, Conn., killing 29 persons and injuring 12 others.

CLEANING WATER TUBE BOILERS.

The Union Boiler Tube Cleaner Co., of Pittsburg, has sent us copies of the reports of tests made on boilers before and after cleaning which show that in one case the effect of cleaning was to increase the equivalent evaporation from 7.8 lb. to 9.1 lb. of water per pound of coal, and in the other to increase the equivalent evaporation from 5.9 lb. to 7.9 lb. per pound of coal. Expressed in percentages these gains due to cleaning are 16.3 and 24.8 per cent, respectively. This company makes apparatus for cleaning water-tube boilers and will either sell or lease the apparatus, or take the contract for cleaning the boilers at a fixed price per tube. The company states that it has never taken its cleaning device away from a plant where it has been given a trial. The device and the method of operation were described in the "Review" for June, 1899.

FRANCHISE EXTENSION ASKED AT CLEVELAND.

The Cleveland City Railway Co., the Little Consolidated, has asked for a 25-year extension of its franchises. The company agrees to sell six tickets for 25 cents, replace its cable system with electric lines, pave and sprinkle its tracks, and to pay a percentage of the gross receipts to the city. This percentage is 1½ to July 1, 1908; 2 to July 1, 1913; 3 to July 1, 1918; 4 to July 1, 1923; 5 thereafter.

HOT WATER HEATERS FOR ELECTRIC CARS.

The hot water heating system shown in the accompanying illustrations is intended to provide an economical and safe method of keeping the interior of long electric cars at an agreeable and uniform temperature. As will be seen from Fig. 1, the heater comprises a coil of heavy piping, supported on a cast iron base, and enclosed in a double iron casing, between the walls of which is an air space to prevent the outside casing from becoming overheated and injuring the woodwork near by. Coal is put in at the top; the lower part of the heating coil constitutes the fire pot.

The grate is shaken without opening the ash pit door, thus avoiding all dust or dirt in the interior of the car. The gas damper at top is of special design and prevents gas from entering the car when the top door of the heater is opened. After leaving the coils the hot water enters a small tank, from which it is led through pipes along the floor under the seats, returning to the heater after hav-

FIG. 1.—SMITH CAR HEATER.

FIG. 2.—CAR EQUIPPED WITH THE SYSTEM.

ing made the circuit of the car. A floor space 22 inches in diameter is all that is necessary to accommodate the heater, which may be placed in one corner or in the vestibule as desired. It is claimed the consumption of coal never exceeds 75 pounds for 24 hours in the coldest weather.

The system is furnished by the Peter Smith Heater Co., 337 Montcalm St., East, Detroit, Mich., and is in use on a number of the interurban roads entering that city, including the Detroit & Pontiac Ry., the Rapid Ry., Detroit & Northwestern Ry., Detroit, Lake Shore & Mt. Clemens Ry., and Detroit, Wyandotte & Trenton Ry.

SUGGESTIONS TO EMPLOYES.

On July 10th, Mr. J. M. Roach, president and general manager of the Chicago Union Traction Co. issued a letter to his motormen, gripmen and conductors, calling their attention to some of the criticisms that have reached him regarding the actions of the employes towards the public and making a number of suggestions as to the best ways of bringing about a more cordial relation between the patrons of the road and the company's servants. At the same time he notified the men that a substantial increase in their wages would be made on August 1st.

Mr. Roach's letter will be of interest to other managers, and we reprint it herewith in full:

To the employes of the Chicago Union Traction Co. Gentlemen: In the management of great interests like the Chicago Union Traction Co., and in order to successfully meet all the requirements of the public, it is necessary that the management and the employes thoroughly understand each other. With this object in view, it is my desire in this communication to call your attention to the many criticisms which are being passed upon your actions, principal among which are the alleged ungentlemanly treatment of passengers and general carelessness which results in accidents.

Before taking unnecessarily harsh measures, it is the desire of the management to better present conditions and also retain the employes who are now in its service; therefore I especially and most earnestly request that conductors, gripmen, motormen and all other employes so conduct themselves in every act that their

conduct towards the public may be such that it will commend both the employes and the management to the entire community. In other words, an employe of this company must be a gentleman under any and all circumstances.

An impression seems to be prevalent that the employes are aggressive toward the public instead of conciliatory as they should be. It is my sincere desire that this feeling be changed, and in order to bring it about, I appeal to you to consider your own welfare as well as that of the company. A close observance will be kept upon the conduct of employes and strict compliance to the above expected.

In reference to accidents, I wish to say that there are conductors, gripmen and motormen who have been in the service of this company for a number of years and have never had a serious accident, at the same time running upon streets where others meet constantly with annoying and expensive accidents, caused by lack of attention and forethought to see impending danger.

I wish to state most emphatically that avoidable accidents must be stopped. I am of the opinion that this can be brought about without the dismissal of men, and call upon you to demonstrate, by your actions, commencing this day, that accidents may be materially reduced. If this cannot be accomplished by mild measures, the management will be forced to act more severely.

I am positive that if each employe should devote himself to the faithful performance of the duties assigned him and avoid the unnecessary things, there will be a great improvement. There are a few things to which I wish to again call your attention.

Be gentlemanly at all times. Remember that deportment is considered in the general standing of an employe, and neatness of person and attire is as much necessary to success in the railroad business as elsewhere.

Elderly persons and women with children should have assistance when getting on or off your car.

Don't start your car before your passengers are safely on or off. Don't follow wagons too closely. Many accidents happen through anticipating their getting out of the way when they do not do so.

Don't run by passengers without good reason for doing so. The use of a little judgment in this will save much unfavorable criticism. Remember you are on the street to accommodate the public and not simply to run a car from one end of the line of the other.

Don't be in too much of a hurry at transfer points. Wait for passengers wishing to catch your car. Many complaints are being made of conductors purposely failing to see passengers hurrying to catch their car from the side or rear. Wait for them.

Conductors should look out for passengers alighting from their car when another train is approaching from the opposite direction. Be particularly careful at transfer points.

Look out for your passengers and your car on rough tracks, when passing vehicles, crossing bridges and viaducts and places where there are obstructions.

When a passenger asks for a transfer and is entitled to one, he should receive it without question or display of temper on the part of the conductor, even though he had been offered one before and had refused it. Transfer rules differ in different cities and strangers to the regulations here should be cared for properly.

Chewing tobacco is offensive to many persons and numerous complaints have been made of careless expectorating by employes

while on the cars. This lowers you in the estimation of the general public.

Don't approach street crossings at a high rate of speed. Stop for boulevard crossings and intersecting lines.

Don't sit carelessly on the dash board or seat of your car. Stay in your proper place when not otherwise engaged. Watch your trolley at crossings and overhead switching points.

Don't hold unnecessary conversation with fellow employes, passengers or others while on duty. When questioned, give the desired information, if you know.

Look to the comfort of your passengers; keep the seats and floor of your cars clean and adjust the curtains or windows so as to offer protection from sun, rain, or cold winds.

Handle your controller so as to get the greatest efficiency from the least amount of current.

Remember that in the railroad business as well as elsewhere, gentlemanly deportment, neatness of person and good common sense will sooner or later meet with their proper reward. Each day you are on trial before the public. Your work will become easier and your life more pleasant if you so conduct yourself as to gain the good will of those with whom you come in contact.

Next month you will meet with thousands of strangers from all parts of America, here to attend the annual encampment of the Grand Army of the Republic. I wish to particularly request that each of you take pains to act in so gentlemanly a manner that any visitor who patronizes our lines will carry away with him a pleasant memory of courteous treatment at your hands. Give them any assistance in your power so as to make their visit to Chicago a pleasant one.

As further evidence of the close relations existing between employer and employe, the management has concluded (at a time when no demands are being made) to pay all trainmen in the service of the Union Traction Co. a uniform rate by the hour. On and after August 1, 1900, the employes of that part of the system known as the old North Chicago Street R. R., will, if they prefer this system of payment, receive the same rate of wages as now paid to those of the West Side lines of this company, as follows: Gripmen, 23 cents per hour; motormen, 21 cents per hour; cable grip car conductors, 23 cents per hour; cable trailers and electric car conductors, 21 cents per hour.

TRACK MATERIAL QUOTATIONS.

There has been no change in prices for steel rails since last month. Standard T-sections are quoted f. o. b. Pittsburg or Chicago, \$35 to \$37 according to lengths. Girder sections are quoted at \$42 to \$44. Good relaying steel T-rails can be purchased in Pittsburg at \$27.50 with splices. Spikes are selling at \$2.15 (Tidewater); splice bars at \$2.00 (Tidewater); angles, \$1.80 (Pittsburg).

Cedar ties are quoted f. o. b. Menominee, Mich., 25 cents; hemlock, 20 cents. At New York yellow pine ties are selling as follows: 7x9 in. x 8½ ft., 64 cents; 6x9 in. x 8 ft., 59 cents; 6x8 in. x 8 ft., 54 cents.

Newspapers print the following dispatch under date of June 20th: A big drop in the price of structural steel was announced today. The price of beams and channels was cut several dollars per ton; of angles \$9 a ton and of bars \$10 a ton. There has also been a decline in the price of steel plate of \$14 per ton within the past four or five weeks. No big sales have yet been reported at the reduced prices, yet the booking of large orders is looked for.

Among the theses presented by the graduating class of Lehigh University were two on plans and estimates for electric railways by L. B. Abbott and J. P. Martin, and one on an electrical survey of the electrical railway earth currents of the Bethlehems.

The Denver (Col.) City Tramway Co. has made a proposition to spend \$45,000 in remodeling its old power house on Lawrence St. and lease it to the state of Colorado for the period of 20 years to be used as an armory.

The assessment made against the Indianapolis Street Railway Co. for 1900 is \$2,500,000, as against \$3,000,000 for 1899. The county board of review justifies its reduction of \$500,000 by asserting that at the time the state board raised the valuation to \$3,000,000, last year, there was prejudice against the company.

INGENIOUS TROLLEY CATCHER.

Mr. D. A. Hegarty, general superintendent of the Railways Company General, of Philadelphia, sends us the following description of a simple method of keeping the trolley pole from damaging itself or the overhead span wires when the trolley wheel leaves the wire. A weight 2 lb. greater than the upward pull exerted by the springs at the base of the pole, is attached to the trolley rope and is hung on a hook fastened to the rear dasher, as shown in the sketch. Enough slack is left in the rope to allow for inequalities in the height of the wire above the ground. When the pole jumps from

INGENIOUS TROLLEY CATCHER.

the wire the first jerk lifts the weight over the hook, but the weight being the heavier it pulls the pole back and prevents it from springing upward, until the weight is raised.

As an extra precaution a short piece of rope may be fastened to the signal-bell cord and to the trolley rope by means of snap catches so that when the pole pulls off and the weight drops the bell rope will be given a jerk, signalling the motorman to stop. Mr. Hegarty states he has been using these contrivances with great success on a number of the roads owned by his company.

A SUMMER TRIP UNSURPASSED ON THIS CONTINENT.

The trip to Salt Lake City or the Pacific Coast via Salt Lake City by way of the Rio Grande Western Railway in connection with the Denver & Rio Grande or Colorado Midland roads is the grandest in America. No European trip of equal length can compare with it in grandeur of scenery or wealth of novel interest. Then Salt Lake City itself is a most quaint and picturesque place and well worth the journey to see. Its Mormon Temple, Tabernacle, Tithing Office and Church Institutions; its Hot and Warm Sulphur Springs within the city limits; its delightfully temperate sunny climate and its Great Salt Lake—deader and denser than the Dead Sea in Palestine—are but a few features of Salt Lake City's countless attractions. There are parks, drives, canyons and beautiful outlying mountain and lake resorts. Imagine, if you can, a bath in salt water, a mile above sea level and in water in which the human body cannot sink. Inquire of your nearest ticket agent for low tourist rates to Salt Lake City or write for information and copy of "Salt Lake City—the City of the Saints" to E. Copland, General Agent, 215 Dearborn St., Chicago, or Geo. W. Heintz, General Passenger Agent, Salt Lake City.

Milwaukee had a parade of electrically operated floats running on the car tracks last month, similar to the one recently held in New Orleans and described in the "Review" for March 15th last.

Orders have been issued to conductors of the Detroit Citizens' Street Ry. not to issue transfers on 3-cent tickets. Conductors are also told not to allow large dogs on the cars.

HALF FARES.

The Providence (R. I.) & Taunton Street Ry. will equip all its cars with air brakes.

Governor Crane of Massachusetts has signed the bill requiring street railway companies in the state to vestibule their cars.

Several new combination open and closed cars, 29½ ft. long, are being built in the shops of the Colorado Springs (Col.) Rapid Transit Co.

The Manufacturers' Gas Co. has filed a suit against the Indianapolis Street Railway Co. asking \$50,000 damages, alleged to be due to electrolysis.

The Springfield (O.) Railway Co. last month was compelled to have one of its car house employes arrested for stealing brass and copper from the scrap heap.

The Newburg (N. Y.) Electric Ry. has been placed in the hands of W. H. Pouch, receiver, pending foreclosure proceedings instituted by third mortgage bond holders.

In order to bring its cars alongside the lake steamers landing at Buffalo and save passengers a long walk, the International Traction Co. is building a spur track to the lake front.

The new Medfield (Mass.) & Medway Street Ry. was opened last month. Guests were taken over the road in special cars, after which they were entertained at an open-air clam bake.

By failing to deposit \$1,000 in cash the promoters of the Milford (Mass.), Upton & Grafton Street Railway Co. have forfeited the franchise recently granted by the selectmen of Milford.

The Chicago city council last month passed an ordinance granting the Metropolitan West Side Elevated Railway Co. permission to extend its Garfield Park and Douglas Park lines.

The Fond du Lac (Wis.) Street Railway & Light Co. has recently installed a 500-h. p. unit at its power house. It consists of an Allis-Corliss engine and Westinghouse generator.

The vice-chancellor of New Jersey in a recent decision follows the ruling now generally accepted that electric railways on public highways do not impose additional servitude on the land.

An anti-trust bill will probably be passed by the Louisiana Legislature. The bill not only prohibits the formation of combinations in restraint of trade, but forbids alien trusts to operate in the state.

Thieves carried off a mile of wire from the Ogden Ave. line of the Chicago Union Traction Co. on the night of June 26th, the loss preventing all traffic on the line for six hours the following morning.

A storm on June 28th blew down a number of poles on the Brighton Beach line of the Brooklyn Rapid Transit Co. resulting in stalling a long line of closely filled cars. The blockade commenced at 9 p. m.

The city council of Jacksonville, Fla., recently granted a franchise of a street railway, the cars on which "shall be automotor cars, and the road to be constructed without wires or poles to mar the streets."

An attempt last month to wreck a car on the Kingston, Portsmouth & Cataraqui Electric Ry., Kingston, Ont., by placing a large stone on the track failed to result in serious damage, though the car left the track.

The consolidation of the Chicago Consolidated and the Chicago Union Traction Cos. has been attacked by Sutro Bros., of New York, who have filed a bill in equity against the two companies

and the officers and former directors of the Consolidated, praying for the cancellation of the consolidation agreements and the appointment of a receiver for the Consolidated.

An incident of the St. Louis strike is a suit brought against a bakery company by another bakery company because parties interested in the former stated that the latter had sold bread to the St. Louis Transit Co.; \$15,000 damages are asked.

A young woman clerk employed in the auditing department of the Union Traction Co., of Philadelphia, has been detected stealing uncanceled exchange tickets. When arrested she put in the plea that she had been hypnotized into committing the act.

Numerous attempts to wreck cars have occurred on the lines of the Conestoga Traction Co., of Lancaster, Pa. Last month a pile of fence rails was discovered on the tracks near Rossmore just in time to prevent the last car over the line at night from being thrown from the rails.

The Duluth (Minn.) Street Railway Co., which is defending a suit for damages brought by a man who was injured while riding in a car during the strike last year, contends that as the passenger must have known of the existence of a strike, he rode at his own risk and was guilty of contributory negligence.

The board of directors of the Toledo Centennial Association on June 29th decided to close its office except one room which will be kept open for 30 days to settle up all business. This course was adopted because the Supreme Court had decided that the centennial appropriation was not available to meet current expenses of the board.

Some stockholders of the Chicago & South Side Rapid Transit Railroad Co., the property of which was acquired by the South Side Elevated Railroad Co. after a foreclosure sale, have secured the appointment of a receiver, Mr. Robert M. Wells, and propose to attack the reorganization. No opposition was offered to the application for a receiver.

Conductors employed by the United Traction Co., of Albany, are said to be dissatisfied with the present system of spotters, as they think it is humiliating to them to have their honesty questioned before the public. They forget that in every body of men there are always a few that need watching, and honest men should never object to being watched.

WYMAN LEAVES NEW ORLEANS.

Mr. C. D. Wyman, general manager of the New Orleans City Railroad Co., resigned on July 11th, and will leave the company August 1st. He will become a member of a well known firm of street railway promoters in the East, and will make his home in Boston. Mr. Wyman has had some such connection in mind for several years past, and will now be able to carry out his wishes. His large acquaintance and popularity among street railway managers, together with a long and practical experience in the railway field particularly, will qualify him for great success in his new work.

During his four years' management at New Orleans, Mr. Wyman has brought about many improvements, both in the physical and operative conditions of the property, and has maintained the most cordial relations between his company, employes and the public.

Mr. Wyman will identify himself with the firm of Stone & Webster, and will still be actively connected with street railway interests.

TWO MORE FATAL ACCIDENTS.

A fatal collision between a freight train and an electric car occurred at Webb City, Mo., on July 4th. The car, crowded with passengers en route for the Carthage fair, was crossing the Missouri Pacific tracks, when the freight train, which was being backed onto a siding, struck it, killing one passenger and seriously injuring a dozen more.

On the same day a car on the recently opened Cincinnati, Lawrenceburg & Aurora Electric R. R., while going at a speed of 30 miles an hour, left the rails and plunged down a 10-ft. embankment, landing on its side at the bottom and killing two men. The cause of the derailment is not known, but newspaper reports state it was due to the breaking of the rear truck.

MR. OWSLEY PRESIDENT OF NORTH-WESTERN ELEVATED.

Mr. L. S. Owsley has been elected president of the Northwestern Elevated R. R., of Chicago, succeeding Mr. D. H. Londerback, who resigned to take a year's vacation in Europe.

L. S. OWSLEY,

Mr. Owsley was born in Chicago in 1870 and received his education in the Chicago public schools and at Yale University. Upon his graduation he returned to Chicago, and at the age of 21 became connected with the city's traction interests as secretary and treasurer of the West Chicago Street R. R. Since that time his advancement has been rapid, his ability to understand and solve the difficult financial problems that are constantly arising in the management of large corporations rendering his services of great

value to his business associates, who have not hesitated to place him in important positions of responsibility and trust.

Mr. Owsley, in addition to his connection with the West Chicago company, has filled the offices of assistant treasurer of the Union Traction Co., president of the Suburban Railroad Co., and vice-president of the Consolidated Traction Co.

AMERICAN ECONOMIZER CATALOG.

Messrs. Broomell, Schmidt & Co., Ltd., of York, Pa., the well known manufacturers of the American fuel economizer and the induced draft system, have just issued a new illustrated catalog describing their economizers in detail, which will be greatly appreciated by those contemplating the installation of such apparatus. That the advantages of the American economizer are appreciated by steam users is indicated by the number of large orders now in hand and the fact that the firm now has under consideration the erection of additional shops. A special feature of the induced draft apparatus, to which attention is directed, is the heavy construction of the fans. Parties interested may secure copies of catalogs on application.

Among orders now under way are economizers as follows: One of 224 pipes for the Bemis Bros. Bag Co., Jackson, Tenn.; one of 320 pipes for the Marine City Sugar Co.; one of 400 pipes for the New York Steam Co.; two of 536 pipes for the Lehigh Valley Coal Co., Lost Creek, Pa.; one of 144 pipes for the Nagoya Electric Light Co., Yokohama, Japan. Complete installations are building for the Port Huron Salt Co. and for the Tracy Engineering Co., San Francisco; the former has two 240-in. induced draft fans in connection with two economizers of 704 pipes, and the latter one fan and one 120-pipe economizer.

FAST TRAINS ON THE WABASH.

A new Wabash morning train for Detroit now leaves Chicago at 9:25 a. m., and arrives Detroit 6:30 p. m. Through cars. Other trains for Detroit via the Wabash leave Chicago at 12:40 noon, 3:15 p. m. and 11:00 p. m.

One may spend the evening at home or at the theater—leave Chicago at 11:30 p. m. and be in St. Louis before 8 o'clock next morning. Try this popular train.

Commencing June 27 the Continental Limited leaves Chicago at 12:40 noon, instead of 12:02, and arrives New York 3:15 and Boston 5:20 the following afternoon. Through sleepers to both points.

STEAM PLANT FOR AUSTIN, TEX.

Mr. Frank E. Scovill, general manager of the Austin, (Tex.) Rapid Transit Railway Co., spent last week in Chicago, combining business with calls upon his many acquaintances. Mr. Scovill returns to erect a power house and install the machinery for a steam plant to operate his lines, which have been dependent on mules since the loss of the big dam. Mr. Scovill has been in electric work from the start, and is one of 23 men who at one time constituted the entire manufacturing force of what is now the General Electric Co.

The Austin company will now abandon its use of water power, as it is doubtful when the big dam will be rebuilt. The new steam plant will run condensing direct connected engines, working one unit, with one always in reserve. At present the cars are being drawn by three mules each, requiring 18 mules per car per day.

Water for condensing will be carried in an 8-in. pipe 1,500 ft. from the river to the new structure, and the laying of the pipe involves some difficulty, as it must be laid 38 ft. below the surface and all the distance through loose sand.

GEORGE M. BRILL.

Mr. George M. Brill, who a few months ago resigned as assistant manager of the construction and mechanical departments of Swift & Co., has opened offices at No. 1143-4 Marquette Bldg., Chicago, to engage in practice as consulting mechanical and electrical engineer. Mr. Brill's technical education, he was graduated at Cornell University in 1891, has been supplemented by nearly ten years' experience in designing and building power houses, shops, transmission and refrigerating plants. During the greater portion of this time he has been with the Solvay Process Co., of Syracuse, N. Y., and with Swift & Co. He was in responsible charge of the construction of the Detroit works of the Solvay company, a particularly large plant; those familiar with the mechanical features of the Swift plants at Kansas City and Chicago will appreciate the important character of the work in which Mr. Brill has been engaged and the large interests involved. Among designs recently completed by him was one for an extensive electric railway system, and in his practice he expects to devote considerable time to this branch of engineering.

CINCINNATI, NEWPORT & COVINGTON.

Mr. J. C. Ernst, president of the Cincinnati, Newport & Covington Ry. sends us the following condensed statement for May, 1900:

	MAY.		FIVE MONTHS.	
	1900.	1899.	1900.	1899.
Gross receipts	\$94,424 02	\$59,434 69	\$293,511 21	\$262,450 90
Operating expenses	26,948 51	25,538 59	118,546 69	114,470 01
Net earnings	37,475 51	33,896 10	174,964 52	147,980 89
Tolls, damages, taxes, etc.	12,479 00	7,993 48	61,737 40	67,466 02
Net profit	24,996 51	25,902 62	113,227 12	80,514 87
Ratio of expenses to earnings:				
With tolls	52%	55%	55%	59%
Without tolls	41%	42%	46%	47%

THROUGH COLORADO.

The "Scenic Line of the World," the Denver & Rio Grande R. R., offers to tourists in Colorado, Utah and New Mexico the choicest resorts, and to the trans-continental traveler the grandest scenery. Two separate and distinct routes through the Rocky Mountains, all through tickets available via either. The direct line to Cripple Creek, the greatest gold camp on earth. Three trains each way daily with through Pullman palace and tourist sleeping cars between Chicago, Denver, San Francisco and Los Angeles, and Denver and Portland. The best line to Utah, Idaho, Montana, Oregon and Washington via the "Ogden Gateway." Dining cars (services a la carte) on all through trains. Write S. K. Hooper, G. P. & T. A., Denver, Colorado, for illustrated descriptive pamphlets.

TRADE CATALOGS.

PNEUMATIC TOOLS. Issued by the Q & C Co., of Chicago; 50 pages.—These tools are designed in various shapes and sizes for clipping, calking, beading, riveting, drilling, wood-boring, flue rolling and stone cutting. Many of them are well adapted to street railway repair and construction work.

EXHAUST FANS. Issued by the American Blower Co., of Detroit, Mich.—These blowers are for removing and conveying shavings and dust, elevating and distributing cotton and wool, removing smoke and fumes, and for use in connection with special heating and drying plants.

ST. LOUIS CORLISS ENGINES. Issued by the St. Louis Iron & Machine Works, of St. Louis. The catalog contains descriptions and illustrations of each separate part of the standard St. Louis corliss engine together with half tone engravings of a few of the engines installed by this company.

"METAL SAWING MACHINES." Issued by the Q & C Co., of Chicago; 40 pages.—This catalog illustrates and describes Q & C power sawing machines, portable rail saws and shop saws, of both arbor-driven and blade-driven types. The Q & C rail saws are convenient and economical, as by their use rails of any section, weighing from 60 to 100 lbs. per yard, can be cut in from 10 to 18 minutes by two men without unreasonable exertion.

ELECTRIC RAILWAY CATALOG. Issued by the Western Electric Supply Co., of St. Louis; 227 pages.—In this catalog all the pages relating to electric railway supplies appearing in the general electrical catalog of this company mentioned in the May issue of the Review have been bound together, bringing the information interesting to street railway managers into more convenient shape. A complete index at the back enables the description of any desired article to be quickly found.

IMPROVED APPLIANCES FOR ENGINES AND BOILERS. Issued by the Sherwood Manufacturing Co., of Buffalo, N. Y.—The Sherwood specialties include injectors designed to work with any pressure from 15 to 200 lbs., and which under proper conditions will handle water at 150 deg. F. The company also makes boiler tube cleaners and scrapers for any water tube boiler in use, gage cocks, lubricating cups and cylinder lubricators. The catalog closes with a long list of companies using the Sherwood "Niagara" water tube boiler cleaner; the following are a few of the more prominent concerns mentioned: Babcock & Wilcox, New York; Standard Oil Co., New York; Brooklyn Rapid Transit Co., Syracuse Rapid Transit Co., Baldwin Locomotive Works, Philadelphia; Union Traction Co., Philadelphia.

THE ARNOLD SYSTEM OF POWER STATION CONSTRUCTION. Issued by the Arnold Electric Power Station Co., Marquette Building, Chicago; 19 pages.—This is a reprint of a paper read before the Chicago Electrical Association, Jan. 19, 1900, by B. J. Arnold on his well-known system of electric power station construction, which aims to combine all the points of merit of a direct connected plant and a belted plant, without the disadvantages of either. The pamphlet is profusely illustrated with drawings and reproductions of photographs of the plants of the University of Michigan, Chicago Board of Trade, Imperial Co., St. Louis, Chicago Electric Traction Co., Chicago & Milwaukee Electric Ry., and many other important installations for which the system has been adopted. It is the third of a series of bulletins being published by the Arnold Electric Power Station Co. descriptive of its work.

THE BURT MANUFACTURING CO., of Akron, O., has just received an order for the complete equipment of the Imperial Steel Works in Japan, with "Cross" oil filters. As these works are among the most important in Japan, and the contract was given after examination of other European and American filters, the Burt company feels justly proud of the order.

The Knoxville (Tenn.) Traction Co. has offered a reward for the conviction of any person stealing copper from its line.

ILLUMINATED CAR IN GLASGOW.

The capture of Pretoria was fittingly celebrated by the city of Glasgow, and the municipal buildings facing George Sq. were elaborately decorated and illuminated for the occasion. The tramway department scored the hit of the evening with an illuminated car, decorated by Mr. Nelson Graburn, superintendent of rolling stock, and Mr. John Young, manager. Our London contemporary, Electrical Engineering, to which we are indebted for the accompanying illustration, says that "the car was a triumph of artistic treatment; and whatever may be said against the trolley by those whose esthetic taste is over-developed, it cannot be denied that it lends itself, pole and all, to artistic illumination in a manner which

GLASGOW CAR "PRETORIATING."

any other system could not even approach. It says much for Mr. Graburn's efforts that the whole was practically completed in about 20 hours."

The car was draped in khaki and Union Jacks, while round the railings and up the pole were variously colored lamps. On one side were the words "Orange River State," and the other "Vaal River State," brought out most effectively against the dark background. One end had the word "BOBS" in letters alternately clear and electric blue, while the other end had the Royal monogram and a St. Andrew's Cross. In all 456 lamps were employed on 76 circuits of six lamps in series, 83-volt lamps being used.

CHANGES AT EL PASO, TEX.

The four mule-car lines operating a belt line between El Paso, Tex., and Ciudad Juarez, Mexico, have been consolidated under the name of the El Paso & Juarez Traction Co., and it is the intention of the owners to substitute electricity for mule power this fall, or as soon as the necessary supplies can be obtained, and the bridges spanning the Rio Grande strengthened.

UNION PASSENGER STATIONS.

The Lake Shore & Michigan Southern Ry. is a line noted for its union passenger stations. At the principal junction points the traveler will find it occupying the same station with leading connecting lines, a convenience very much appreciated, insuring prompt and reliable connections. For the convenience of patrons of the Lake Shore & Michigan Southern Ry., it is arranged so that uniformed agents of the Frank Parmelee Omnibus Co., at Chicago; Toledo Transfer Co., at Toledo; Cleveland Transfer Co., at Cleveland; C. W. Miller's Omnibus & Baggage Express, at Buffalo; the Westcott Express Co., at New York City, and the Armstrong Transfer Co., at Boston, will be found on all trains via the Lake Shore, New York Central and Boston & Albany route, approaching their respective cities. It is their duty to carefully exchange transfer checks and arrange for the transfer of passengers and baggage to stations of other lines, hotels or steamer docks, and also to furnish any requisite information about their city. Vehicles of these companies are in waiting upon the arrival of all passenger trains.

CORRESPONDENCE.

We cordially invite correspondence on all subjects of interest to those engaged in any branch of street railway work, and will gratefully appreciate any marked copies of papers or news items our street railway friends may send us, pertaining either to companies or officers.

DOES THE MANAGER WANT ANYTHING?

If you contemplate the purchase of any supplies or material, we can save you much time and trouble. Drop a line to THE REVIEW, stating what you are in the market for, and you will promptly receive bids and estimates from all the best dealers in that line. We make no charge for publishing such notices in our Bulletin of Advance News, which is sent to all manufacturers.

This paper is a member of the Chicago Trade Press Association.

Entered at the Post Office at Chicago as Second Class Matter.

VOL. X.

AUGUST 15, 1900.

NO. 8

A Daily Edition of the "Street Railway Review" will be issued at Kansas City during the conventions of the American Street Railway Association and the Street Railway Accountants' Association. The unqualified success of the Daily Edition last year, in Chicago, renders unnecessary any remarks as to the demand for such a publication. This year the first number will appear on the morning of the second day, and continue on Thursday, Friday and Saturday mornings.

Each morning at 7 o'clock the Daily will be distributed free to all convention attendants, and a copy mailed to every subscriber to the monthly edition of this publication at home and abroad.

Our arrangements for furnishing an absolutely complete verbatim report of the proceedings in the two conventions, arrivals up to midnight of the previous day, and reporting all the other interesting features of the conventions are already arranged and of the most extensive and detailed character possible. The Daily Edition of the "Review" will be one of the strong features of the annual gathering.

In this connection it is proper to note with satisfaction the prospects for a large attendance and a fine display of exhibits. The street railway men of Kansas City, with characteristic Western enterprise, are leaving undone nothing which can contribute to the success of the meeting, and when the delegates arrive, those who for the first time visit this young giant of the Southwest will be astonished at the city and its facilities. The hotels are excellent, and of ample accommodation, and the exhibit hall is the largest ever occupied by a street railway convention.

The program this year contains subjects of vital importance to every manager, and we look for a large and enthusiastic attendance.

There was a strike of the motormen on the street railway at Dallas, Tex., two weeks ago, and while it did not last long or amount to much as a strike, there was one especially interesting side light. The strike had only been on two days when the president of the company received a telegram from St. Louis offering

the service of 300 idle motormen. Now the strike in Dallas was of union men, and it was ex-union men in St. Louis who applied for the places just vacated. Experience is a thorough teacher, though sometimes the lesson is a sad and costly one.

There have recently been two interesting decisions in Illinois on the power of a municipality to direct where a street railway shall be located. One case is that mentioned on page 414 of the "Review" for July where the city of Aurora undertook by ordinance to prevent the entrance of the Aurora & Geneva Ry. into the city over a right of way secured by condemnation of private property, and the ruling was that the city could not locate a route for a street railway. In the other case, reported in our legal department this month, a village attempted to force a street railway to condemn private property for its location; the ruling was that a street railway properly belonged in the streets and that authority for taking private property could not be conferred by ordinance.

The riding public has never suffered to any alarming extent from a lack of modesty in its demands upon street railways. Many requests are perfectly reasonable it is true, and some which are not are made in good faith, through a want of knowledge as to the difficulty or impossibility of granting them.

In some places, however, where interurban lines of one company connect with the city lines of another company at considerable distance from the business center, demand is being made for transfers. In one case we have in mind the city council refused entrance to the suburban road, and the city company would not allow the suburban cars to use its tracks. Yet the public is demanding transfers.

Even where the outside road secures traffic arrangements with the city road there is no good reason why some compensation should not be paid for the additional city service rendered, and where the distance is of any consequence it should be the full fare.

Mr. Gompers remarked the other day at St. Louis that the strike had not failed there as it had caused the people to think of the wrongs of workingmen (we presume he meant the wrongs to workingmen), and had aroused them and opened the way to something better.

The St. Louis strike as a success for the Gompers followers reminds us of an incident in the erratic career of the Marquis de Mores who spent several million dollars trying to establish packing houses in the Bad Lands of Dakota. The cattlemen declared it impracticable to raise sheep on the range on account of the severe winters. The marquis resolved to demonstrate that it could be done, and accordingly shipped in ten thousand head one fall. In the spring there were only a dozen or so alive. When his secretary remarked on the dismal failure, the marquis indignantly retorted: "Failure, failure! Why it is a success. I have demonstrated it cannot be done."

Mr. Gompers has certainly succeeded in demonstrating that when he is radically in the wrong, as in the St. Louis strike, "it cannot be done."

In our issue for April last, page 210, brief reference was made to the report of Mr. William Brophy, chief electrician of the wire department of the city of Boston, in which he recommended that the electrical construction division be discontinued, because the work done by it was costing the city a great deal more than the bids of reliable and responsible contractors. Since that time considerable has been written and printed concerning these business ventures of Boston, inaugurated under Mayor Quincy's administration, and the hope is expressed that our friends, the socialists, will now quote the results obtained with municipal ownership and operation in Boston, rather than go to Europe for data. Some of the specific examples of costly work are these: Estimates based on current prices showed that certain electrical work on some of the city's ferry-boats should cost \$6,800; it did actually cost \$10,200. The electrical work on a city building for hospital nurses should have cost \$1,528; it really cost \$4,754. The work on a city armory should have cost less than \$2,600, but the city had to pay nearly \$6,700 for it. Some work on a public school, estimated as likely to cost \$1,471 if done under contract, cost the city about \$3,600. The ice used in the city drinking fountains cost \$60 a ton made at the

city's ice plant, and could have been bought for \$3 a ton from private companies.

There have been no charges of dishonesty. The results were due to inefficient management, largely the result of loading down the pay rolls with incompetent men, who were given employment because they had political "influence."

Many of the cars built during the past year or two are fitted with electric push buttons by which passengers from their seats may signal the conductor to stop the car, but from opinions expressed by a number of managers it would appear that these have not been entirely satisfactory. In fact, we know of a number of instances where the use of the buttons has been discontinued and the batteries taken out of the cars.

In Chicago it has been found that passengers very seldom signal in this way, seeming to prefer the old fashioned method of notifying the conductor by raising the hand or by word of mouth when they desire to alight. In this connection President Roach of the Union Traction company is quoted as saying: "Push buttons for signals on street cars have been tried several times in Chicago and invariably have proved failures. They are taken as a joke by the traveling public, and would cause much annoyance were they in general use. So much frequently depends on the proper use of signals that they should be kept under control of trained employes. From an every-day, practical standpoint the push buttons are undesirable."

The same objections have been raised in New York and other of the larger cities. Many passengers appear to have the idea that the push button signals the motorman instead of the conductor and as they do not allow sufficient time for the conductor to transmit his signal they miss their corner and ill-feeling against the trainmen and company is liable to arise because of the misunderstanding. Another source of trouble has been the interference with the buttons by children and irresponsible persons who often cause delay and annoyance by ringing the signal when the car is crowded or the conductor's back is turned. Taking it all in all, the signal button seems to be an unappreciated improvement.

We publish this month a lengthy abstract of a paper on "Electrolysis of Underground Metal Structures" by Mr. Dabney H. Maury, engineer for the Peoria Water Works Co., of Peoria, Ill. While it is not so stated we infer that this paper embodies much of the evidence presented in behalf of the water company in its suit against the Central Railway Co., of Peoria, to recover damages for the alleged injury of its pipes by electrolysis due to the railway return currents. Mr. Maury makes a strong showing as to the fact that the water pipes suffered injury because of electrolysis, but the question of the liability of the railway company, which is not discussed in the paper, is of quite as much interest and importance as is the fact of the injury.

It must not be forgotten that there are two sides to the question. The suit has been pending in the United States Circuit Court for over two years, and the evidence for the water company was heard in December, 1898; the street railway presented its case last summer, but the report of the special master who heard the testimony has not yet been filed, and no other complete presentation of the railway company's contentions has been made. Among the witnesses for the railway company examined last summer were Albert B. Herrick, of New York; Oscar Stiles, of the Omaha Street Railway Co.; William Hand and J. C. Noe, of the General Electric Co.; Edwin M. Burch, then electrical engineer for the Twin City Rapid Transit Co.; Professor Seaver, of Columbia College, and I. N. Lovett, electrical engineer of the Omaha & Council Bluffs Railway & Bridge Co. As before stated, a comprehensive review of the evidence given by these gentlemen has never been made public, but from abstracts which we have seen we believe that one line of defense was that the water company was largely to blame for the trouble by reason of placing a great many of its gate boxes in metallic contact with the rails of the railway company.

All the facts which might thus have affected the extent and character of the injuries described in Mr. Maury's paper will have to be known before any conclusions can be drawn as to whether similar results are to be expected in other cities.

We would suggest as a subject for the consideration of the street railway commissions which have been appointed by various municipi-

palities, How can the municipality aid the street railways in giving the public a better service?

Street railways are permitted to occupy space in the streets because they enable the public to use the streets to better advantage than would otherwise be the case, and it is the duty of the municipality to see that so important an agency is not needlessly hampered in carrying out its purpose. In all large cities there is a district where street traffic is much congested, and one of the recognized problems is how to arrange the railways in such districts that the public may enjoy more rapid transit. For years Tremont St. and Washington St. in Boston were held up as horrible examples of congested thoroughfares, and the subway was built at a cost of \$4,000,000 to relieve it. New York is building an underground line, and in Chicago a system of subways is proposed as a solution of the question. While the delays to car traffic are more marked in the down-town districts there is a vast amount of time lost on the less frequented streets, because the general wagon traffic, and particularly loaded wagons make use of the better road afforded by the car tracks.

In the article by Mr. Williston Fish, which we publish this month, it is pointed out that the history of streets shows a constant tendency to specialization, the most marked result of which is the setting apart of the sidewalks for the exclusive use of pedestrians, and it is urged that there be a similar provision made for street cars. There is no necessity for setting aside whole streets for the exclusive use of the cars as the boulevards are reserved for light vehicles, but it is quite practicable to exclude other vehicles from those portions of the street occupied by the car tracks, save, of course, at street crossings. To do this would vastly increase the efficiency of the street railways and result in an enormous saving of time to the general public.

The substitution of a T-rail for the tram rails so extensively used in cities would do more than perhaps any one thing towards preventing the usurpation of the car tracks by coal wagons and heavy trucks.

NEW YORK STREET CAR BRAKE TESTS.

On another page of this issue will be found an extended abstract of the report of a competitive test of street car brakes made under the direction of the Board of Railroad Commissioners of New York in 1899. These tests are the only official tests of the kind of which we have knowledge, and as they will doubtless be given wide currency it is important that the results thus obtained be estimated at their proper value.

After an examination of the report a number of criticisms suggest themselves:

1. Sufficient data as to the brake leverage and the dimensions and material of the brake shoes are not given. Both of these factors radically affect the length of the stop, and while the conditions may have been strictly comparable the matter is certainly sufficiently important to make an explicit statement desirable.

2. As stated in the report nearly all the contestants labored under the disadvantage of not having opportunity to properly adjust their brakes through actual service operation of the car, which is much to be regretted.

3. Exception may be taken to using the formula $ws^2 \div d$ for comparing the various brakes, because it does not take account of the time that may elapse between the signal to apply brakes and the actual application. To make a strictly accurate comparison the formula should have two terms, one depending on the speed only and the other upon the weight of the car and the square of the speed. For a further discussion of this point see the "Review" for May, 1899, page 336. The formula $ws^2 \div d$ is probably better than the one it was at first proposed to use, $ws \div d$.

4. Also, it might properly be urged that if the formula $ws^2 \div d$ were to be used it should have been applied to each test separately or at least to the average of those at the same initial speed, instead of averaging all the results on the brake and then applying the formula.

5. The allowances made for the skidded wheels seem to be very arbitrary; also it is unfortunate that these distances could not have been measured, and the cars weighed instead of both being estimated.

These points are of minor importance when compared with the defects in the recording apparatus disclosed by the curves. It is

stated in the report of Mr. Barnes, the electrical expert of the Board of Commissioners, that "the standing of the respective brakes, as shown in the foregoing tables, is only the result obtained by the automatic recording instrument, and the record of skidding of wheels as noted." We may therefore look to the diagrams published in the report when endeavoring to form an opinion as to the value of the results thus obtained.

These diagrams, two of which we have reproduced, are 66 in number and each contains from two to four curves drawn with the distances, in feet, run by the car as abscissae and the times in seconds as ordinates. The total number of tests thus recorded on the curves as published is 220. Of these 220 stops 54 were made from an initial speed of 8 miles per hour; 51 from 12 miles; 52 from 15 miles, and 72 from an initial speed of 16 miles per hour.

A speed of 8 miles per hour is equivalent to 11.73 ft. per second. An examination of the curves for the 54 stops from 8 miles per hour shows that in every case the car traveled more than 11.73 ft. in the first second after the signal to stop was given; the maximum distance made in the first second was 23 ft. and the minimum 12 ft., corresponding to 15.7 and 8.2 miles per hour, respectively.

A speed of 12 miles per hour is 17.6 ft. per second. Curves for

velocity became as low as the initial velocity indicated for these curves.

It is not reasonable to suppose that the gentlemen making these tests could have ridden on cars going at from 30 to 50 miles per hour, and not realized that the speed was greater than 16 miles; therefore, we are forced to the conclusion that the time and velocity records shown by the curves and tables of the report are absolutely worthless. And the fact that this is true of one portion of the automatic apparatus, throws serious doubt on the other results obtained with it, and renders the table of the comparative standing of the several brakes of no value.

The Board of Railroad Commissioners is composed of men who are not versed in technical matters and must therefore rely upon the advice of their engineer, so that the responsibility for this report must be borne by Mr. Barnes; we consider it very remarkable that an engineer should have submitted such results.

Since the foregoing was written we have scanned with keen interest the editorial pages of the technical papers and find that Mr. Barnes' report must have been what Mr. Dooley would call "very imposing—to anyone who could be imposed upon." In this

DIAGRAM NO. 21—TESTS OF STREET CAR BRAKES BY N. Y. RAILROAD COMMISSION.

this speed show that in 35 out of 51 cases the car ran farther than 17.6 ft. in the first second; the maximum was 36.5 ft. and the minimum 8.0 ft., corresponding to 24.0 and 5.5 miles per hour.

A speed of 15 miles per hour is 22 ft. per second. Curves for this speed show that in 30 out of the 52 cases the car traveled more than 22 ft. per second; the maximum was 38 ft. and the minimum 12 ft. per second, corresponding to 25.0 and 8.2 miles per hour.

A speed of 16 miles per hour is 23.47 ft. per second. Curves for this speed show that in 47 out of 72 cases a greater distance than 23.47 ft. was run in the first second; the maximum was 75 ft. and the minimum 6.7 ft., corresponding to 51.2 miles and 4.6 miles per hour.

In some cases it was found that, according to the curves, the car traveled farther during each of the second, third, fourth, and even fifth seconds of the stop, than it would have gone in one second at the initial speed.

Further, in 13 of the tests, involving four different brakes, the curves show that the car ran farther after the brake was applied than it would have gone had it been allowed to proceed unchecked at the indicated initial speed. In 7 of these 13 tests the car was running up grade.

Measurements of velocity from the slope of the curves on Cross-section Sheet No. 21 show that it was only after two-thirds or three-fourths of the total distance of the "stop" had been made that the

latter class we are grieved to find some of our most esteemed contemporaries.

The Western Electrician believes that the report is a "valuable addition to technical literature, and is the first thorough investigation of street-car braking ever made the results of which are public."

The Engineering News believes the work to be "the most important and exhaustive series of test street car brakes ever undertaken," and in its issue of August 2d the principal editorial, nearly three pages, is devoted to "an attempt to summarize the main results reached by these tests and the most important lessons to be drawn from them." The conclusion is that the commission by its conduct of the tests has rendered a great public service.

The beautiful trip from Meriden, Conn., to Compounce Lake, by way of the Meriden, Southington & Compounce Tramway, is described in an interesting illustrated pamphlet issued by the company.

The first few days of the St. Louis street railway strike recalled to the minds of the older inhabitants a period in 1871, when every street railway line in the city had to suspend operation for several weeks, owing to an epidemic of influenza among the horses.

The System of the Indiana Railway Co.

The lines of the Indiana Railway Co. serve the cities of South Bend, Mishawaka, Elkhart and Goshen, lying in the valley of the St. Joseph River in northern Indiana. The aggregate population of these four places and the intermediate country is about 70,000 distributed as follows: South Bend, 36,000; Mishawaka, 6,000; Elkhart, 17,000; Goshen, 9,000; in addition there are on the route two stations of the Lake Shore & Michigan Southern R. R., Osceola with 100 and Dunlaps with 150 inhabitants. The Indiana Ry. calls its station at the latter point Dunlap.

This territory offers almost ideal conditions for an interurban electric railway; the valley of the St. Joseph River—one of the most beautiful and picturesque streams in the state—is a rich farming country, and the four towns are all manufacturing centers. South Bend is the fourth city in size in the state; among its large plants are the Studebaker wagon and carriage works and the Oliver plow works, and there are a host of smaller factories. The Singer

build to Niles, Mich., which is a town of 6,000 population, about 10 miles north of South Bend, and thence to Buchanan, a town of 4,000 population about five miles west of Niles. This extension would pass close to the Catholic schools, Notre Dame and St. Mary's, which are two miles due north from the city.

All the urban franchises of the Indiana Railway Co., save that for Elkhart, which expires in 1926, are perpetual; in the country about 18 miles are over a private right of way, and for the remainder of the distance, where the highway is used, the company has a perpetual franchise. The franchise conditions as to what the company shall do are not unreasonable; the ordinances require that cars be run at half-hour intervals during the day, and that the company pave between its rails in Elkhart, and between the rails, between the tracks and for 12 in. outside in South Bend, Mishawaka and Goshen.

HISTORY AND ORGANIZATION.

The Indiana Railway Co. was organized Mar. 15, 1899, and was the result of the consolidation of five companies known as the South Bend Street Railway Co., the General Power & Quick Transit Co., the South Bend & Elkhart Railway Co., the Indiana Electric Railway Co., of Elkhart and Goshen, and the Elkhart Goshen & Southern Railway Co.

1. The first of these was in turn the result of a consolidation. The South Bend Railway Co. was organized in 1885 and built an eight-mile horse line. Shortly after the completion of this road the South Bend & Mishawaka Street Railway Co. built two lines from South Bend to Mishawaka, one four miles long on the south side of the river, and one five miles long on the north side; this company passed through a receivership in 1888 and in 1889 was consolidated with the South Bend Ry. as the South Bend & Mishawaka Railway Co. The lines were then in part equipped for elec-

MAP OF THE LINES.

Sewing Machine Co. has recently purchased land here and will erect factories giving employment to 2,500 persons; this it is estimated will add 10,000 to the permanent population. Mishawaka is perhaps best known for the Dodge wooden pulleys made there and Elkhart for its band instruments, while at Goshen are numerous smaller factories. The population on the eastern end of the line is smaller than on the South Bend-Mishawaka division, but the traffic is greater than might be expected, because of the fact that while Elkhart has twice as many inhabitants as Goshen, the latter is the county seat, and business in court necessitates a trip to Goshen.

Between South Bend and Goshen the Indiana Ry. parallels the Lake Shore & Michigan Southern, and as one result a dummy service, formerly maintained by the latter between Elkhart and Goshen, has been discontinued, and the Lake Shore turns excursionists over to the Indiana Ry. at Elkhart. The most friendly relations exist between the two managements and the steam road was very accommodating in arranging for crossings, and in several instances exchanged lots with the electric line where doing so would enable the latter to secure a better location. This policy is quite different from that usually pursued by steam railroads in other places, but the position taken by the Lake Shore officials was that the electric interurban would increase general traffic; this in turn would result in increased freight business to the railroad company.

There appears to be but little inducement for any further extensions eastward, but the company has procured franchises to

tricity and operated till 1894, when they were sold under foreclosure proceedings and bought by the South Bend Street Railway Co.

2. In 1894 the South Bend & Mishawaka company forfeited its rights on the south side of the river by reason of inadequate and inefficient service, and the General Power & Quick Transit Co. was organized, and built an electric line between South Bend and Mishawaka, replacing that of the old company south of the river. This line was opened for traffic Jan. 1, 1896.

3. The Indiana Electric Ry. was organized May 15, 1894, and at foreclosure sale bought the property of the Elkhart Electric & Railway Co., operating a local line in Elkhart. The Indiana Electric Ry. was controlled by Mr. J. J. Burns, of Goshen. The local lines in Goshen originally built about 1893 were acquired by the Indiana Electric Railway Co.

4. The Elkhart, Goshen & Southern Railway Co. was organized in 1898 to build a line between Elkhart and Goshen, but had only proceeded as far as securing the rights of way when it was absorbed by the Indiana Electric Railway Co.

5. The South Bend & Elkhart Railway Co. was organized Mar. 8, 1898, to build an electric line to connect the South Bend-Mishawaka and the Elkhart systems.

The beginning of the present excellent system of the Indiana Railway Co. was in 1897, when the South Bend and the Quick Transit properties were bought by Messrs. Arthur Kennedy and Francis J. Torrance, of Allegheny City, Pa. The whole of the lines thus acquired were rebuilt in 1898, except the four miles built by the Quick Transit Company, in 1896. The rails taken up, and the whole equipments of the old companies were fit only for scrap.

PANORAMA OF SPRINGBROOK PARK.

Oct. 1, 1898, Messrs. Kennedy and Torrance bought the properties in Elkhart and Goshen of the Indiana Electric Co., and on October 10th of that year, began building the line from Goshen to Elkhart. Ground was broken on October 10th and on December 21st the new 11-mile road was opened for traffic. This particularly rapid work was done in the face of great difficulties; for the first month there were heavy rains, and then the ground became frozen to a depth of nearly two feet, so that it was necessary to blast on the last three miles. In the following spring the line between Elkhart and Mishawaka was put under construction and finished Aug. 1, 1899, connecting up and completing the entire system, which now has 42 miles of track. There are about 2 miles of double track, of which 1 1/4 miles are on the interurban line east of Mishawaka. The system does not present any startling features, but it is a model of substantial construction and good management. The work of rebuilding and extending the lines of the company was under the immediate supervision of Mr. William Cummins, and the excellent condition of the property stands today as a monument to his energy and skill as a constructor.

When the foregoing history of the companies formerly operating in this territory, and the financial condition of the street railways of the other towns of Indiana in the latter part of the 90's are considered, the courage displayed by the present stockholders of the Indiana Railway Co. will be appreciated. It was clearly seen that bonds of a paper street railway in Indiana would go begging among eastern investors, so the stockholders furnished the necessary funds and the bonds were not issued till the road was built and the results of operation had shown that the confidence of the promoters was fully justified.

The authorized capital stock of the Indiana Railway Co. is \$1,000,000, all of which is paid in. The authorized funded debt is \$1,000,000, and \$900,000 of 30-year 5 per cent gold bonds, due Jan. 1, 1930, have been issued, \$100,000 of the bonds being held in the treasury to pay for further permanent improvements already contemplated.

The directors of the company are: Arthur Kennedy and Walter Lyon, of Allegheny City, Pa., James McM. Smith and J. B. McCance, of South Bend, and W. L. Stonex, of Goshen. A controlling interest in the stock is held by Arthur Kennedy and Francis J. Torrance, of Allegheny City. The officers and operating staff are as follows: President, Arthur Kennedy; vice-president and general manager, James McM. Smith; secretary and treasurer, James B. McCance; superintendent, Mark Cummins; chief engineer, William Cummins; assistant superintendent, C. M. Cubbison.

OPERATION.

The map clearly shows the present system and also the proposed extension to Michigan. In the central business district of South

Bend is a double loop, a portion or the whole of which is used by all the cars operating in the city. Interurban cars run over the whole loop, leaving the company's office, which is at the northeast corner of the loop, on the even hours from 6 a. m. to 11 p. m.; the run to the center of Goshen, a little more than 26 miles, is made in an hour and a half, so that three cars give an hourly service both ways. On Sundays and other days when special conditions justify it, the number of cars on this line is doubled and a half-hourly service given. Interurban cars stop at signs which are placed at intervals of 1,500 to 2,000 ft.

The so-called local service in South Bend includes the two routes to Mishawaka, the cars on both of which run over the whole loop. On the North Side line to Mishawaka, which is a little over four miles long, two cars are run giving a 30-minute headway. On the South Side line are four cars, giving a 15-minute service; this route extends to the eastern limits of Mishawaka. In South Bend are three other lines: On the Michigan St. route, which is that through the city from north to south, are two cars, giving a 15-minute service. On the Washington St. route, which is that running due west, two cars give a 12-minute service, leaving the office on the even hours and each 12 minutes thereafter. On the Chapin St. route one car gives a 30-minute service. That portion of Wash-

MICHIGAN ST., SOUTH BEND.

ington St. used by the two lines is double tracked, and cars on both these routes run around the eastern portion of the loop. All these local lines are on the best residence streets.

In Elkhart three local cars are operated; two are on the east and the northwest branch lines, and one on that portion of the interurban line that is within the corporate limits, running over the line ahead of the interurban and following the interurban back to avoid having the interurban cars stopping for purely local traffic. In Goshen one local car is operated.

TRACK AND OVERHEAD WORK.

All of the track is either newly laid or has been entirely rebuilt since 1898, except the four miles of the South Side line built in 1896,

and a short section of the local line in Elkhart. This year two half-mile extensions to the Michigan St. line in South Bend were made, and a half-mile more will be added to the eastern local line in Elkhart. The other Elkhart track mentioned will be rebuilt as soon as sewers and other street improvements are completed. The topography is particularly favorable, the only grades worth mentioning being two of about 3 per cent, one 400 ft. and one 800 ft. long.

In the country the track is laid with 70-lb. 4 $\frac{5}{8}$ -in. T-rails, but in all streets which are paved or which are at all likely to be paved within the next five years 70-lb. 7-in. T-rails have been used. All

VIEW ON SOUTH BEND-MISHAWAKA LINE.

of the 7-in. rails and also those on the line between Elkhart and Goshen are in 60-ft. lengths and were rolled by the Lorain Steel Co. The rails between Elkhart and Mishawaka are in 30-ft. lengths.

The rails are laid on white oak ties, which are 6 x 8 in. x 7 ft. in paved streets, and 6 x 8 in. x 8 ft. elsewhere. The joints on low rails are made with 6-hole angle splice bars and bonded with No. 0000 stranded Washburn & Moen bonds placed under the splice bars. For the 7-in. rails 6-hole splice bars are used, and all joints double bonded, one No. 0000 Washburn & Moen bond under the plates and one No. 0000 outside. All joints are of the suspended type.

Details of the track construction are shown in the sketch. For the 7-in. rails in paved streets a bed of gravel 6 in. deep

TRACK CONSTRUCTION IN PAVED STREETS.

is put down, the ties are laid on this 2 ft. between centers, and the spaces between filled with concrete made of 5 parts gravel, 2 parts sand, and 1 part cement. The concrete comes flush with the tops of the ties, and above this is sand 3 in. deep as a foundation for the paving. Special bricks are used to give a flange way; they are made in whole and half bricks to permit breaking joints without using bats, and have given excellent satisfaction. On the outer side of the rail cement is placed as indicated in the sketch to provide an end bearing surface for the brick flush with the side of the rail head. Where the streets are paved with asphalt one row of special bricks is placed on the inner side of the rail to make the flange way, and on the outer side two rows of bricks are placed endwise, breaking joints, and the asphalt rolled against the bricks. Tie rods are placed 10 ft. apart wherever 7-in. rails are laid. The special work was all made by the Lorain Steel Co., and has "guaranteed" centers.

The soil between Elkhart and Mishawaka is gravel and sand,

suitable for ballast, and this portion of the line has been ballasted. The gravel is about 2 in. deep over the ties at the center and sloped off to give drainage. On the fills the shoulders are about 4 ft. beyond the ends of the ties. There was one cut 6 or 7 ft. deep for a short distance about two miles southeast of Elkhart, but aside from this the cuts and fills were all very light.

Between Goshen and Elkhart the soil is more of a loam, and on this portion of the line the soil is filled in over the ties, both between and outside the rails, high enough to cover the rail webs. This holds the track in line, but the intention is to remove the loam and ballast with gravel. The entire roadbed, excepting only the short section in Elkhart previously mentioned, which will be rebuilt when the street improvements are completed, is an ideal condition of alignment and surface.

Spring switches and frogs are used on the interurban line. Where interurban cars have to pass loose point switches, blocks are used with the object of preventing the rear truck of the interurban from taking the wrong track because of the switch point slipping.

The private right of way, which is from 30 to 50 ft. wide, is all fenced with wire; between Elkhart and Goshen steel posts are used. Steel cattle guards made by Fairbanks, Morse & Co., are in place at all highway crossings between Elkhart and Goshen and are to be installed on the other portion of the line.

The length and position of switches on the interurban line are as follows (see map): Keely, 400 ft.; Dunlap, 400 ft.; south limit of Elkhart, 300 ft.; center of Elkhart, 100 ft.; Whitaker, 200 ft.; east of Mishawaka, 1 $\frac{1}{4}$ miles of double track; western part of Mishawaka, 200 ft.; Springbrook Park, 600 ft.; near southeastern limits of South Bend, 400 ft.

The overhead line is carried on wooden poles, except in the main streets of Elkhart and Goshen, where iron poles are used. All except 2 $\frac{1}{2}$ miles between South Bend and Mishawaka is the span wire construction. On this section side brackets designed by Mr. Smith are used. This bracket is shown in one of the engravings. A casting is fastened to the pole by two bolts 18 in. apart; eyes in the top receive a piece of 1 $\frac{1}{2}$ in. wrought pipe, which is clamped by set screws; the yoke fits loosely in the end of the pipe, and by setting up on the bolt holding the guy wire the desired stress is put on the lower or span wire. Globe strain insulators are placed at each end of the span wire; both the span and guy are $\frac{3}{8}$ -in. stranded cables.

The wooden poles are 35 ft. long with 8 in. tops; the iron poles are 30 ft. long, in three sections, 5 in. at the top, and set 6 ft. deep. In South Bend, in order to reduce the number of poles in the streets, the railway company joins with the telephone and telegraph companies where both are in the same street, erecting one line of large poles used by both, and on the opposite side of the street, poles of the railway's standard size. In Mishawaka and portions of Elkhart and Goshen the railway company put up poles somewhat longer than was necessary, and permits other companies to use them for wires without compensation; the object, of course, is to keep the street from being disfigured by several rows of poles.

Michigan St. in South Bend, which is shown in one of our illustrations, is said to be the street on which an electric motor car was first operated in practical service in the United States.

The trolley wire is No. 00, all furnished by the American Steel & Wire Co., and the other line material is of the Ohio Brass Co's. make.

POWER HOUSES.

It is the intention of the company to build a water power plant on the St. Joseph River opposite Osceola, where a head of 18 ft. is available. This point is near the center of the system, and direct current could be distributed on the booster system or three-phase transmission lines and sub-stations installed. The plans for this are not settled as yet, however. The present power stations are regarded as merely temporary, though when the proposed central station is built a portion of the present steam equipment will be held as a reserve. The power stations are at Dunlap, Osceola, and South Bend.

The South Bend station is a brick building 40 x 90 ft., situated on the line of the Grand Trunk Ry. Its equipment comprises two Buckeye simple non-condensing engines, 26 $\frac{1}{2}$ x 36-in. cylinders, running at 125 r. p. m., belted to two 250-kw. Westinghouse generators; five tubular boilers, 60 in. x 18 ft.; one Warren Webster

500-h. p. feed water heater; Deane and Worthington pumps. The switchboard is of white marble with a panel for each of the two station generators and four feeder panels. The voltmeters and ammeters are Weston and the circuit breakers Westinghouse. Water is taken from the river and delivered to the tank, which is in a covered building adjacent to the power house, by a pump driven by a 15-h. p. electric motor. The pipe line is 600 ft. long and the lift 12 ft. The water contains considerable lime and magnesia and a solution of sodium tri-phosphate is introduced into the feed between the pumps and the heater. The steam pressure is 100 lbs. At this station is a lighting plant, intended for the company's

FIG. 1.

FIG. 2.

service only, consisting of a Westinghouse "Standard" engine belted to a 3,000-light Westinghouse alternator. Manhattan arc lamps will be used.

At Osceola the power station and car house are in one building, which is 40 x 300 ft. The frame is of wood and the roof and sides of corrugated steel. A sheathing of wood and tar paper is laid under the iron roof; the roof is carried on trusses, leaving a clear floor space. The equipment comprises three tubular boilers; two 22 x 33-in. simple non-condensing Buckeye engines, belted, one to a 200-kw. General Electric, and one to a 250-kw. Westinghouse generator; one Warren Webster 400-h. p. vacuum heater; Worthington feed pumps. The steam pressure is 100 lbs. On each engine is an 8-in. "Zigzag" steam separator made by J. S. Stephens. The switches and instruments are mounted on a wooden frame. Wurts tank lightning arresters are used.

The Dunlap power station is a building similar to that at Osceola, 40 ft. x 100 ft. Here are three return tubular boilers and one simple Allis-Corliss engine driving a jack-shaft, to which are belted three D-62 generators running at 900 r. p. m. The switchboard has Westinghouse instruments. The engine, generators, and switchboard were removed from the old station of the South Bend Street Railway Co. The minor equipment here includes a Wurts tank lightning arrester, Blake and Deane feed pumps, a Peneberthy injector, and an "Excelsior" feed water heater.

The South Bend station is operated from 5 a. m. to 1:15 a. m., the Osceola station from 5:45 a. m. to 12:35 a. m., and the Dunlap station from 5:30 a. m. to 1:00 a. m., and the total average daily consumption of fuel is about 17 tons of Hocking Valley coal, costing \$2.45 per ton delivered. At each station there are two shifts of three men each, engineer, fireman, and coal passer. At present the lines taking power from the South Bend and Osceola stations are connected, and those supplied from Dunlap will also be cut in.

The feeders comprise: One 300,000-c. m. line from Dunlap to

Goshen, four miles; one line from Dunlap to Elkhart, five miles, of which the first mile is 300,000-c. m. and the rest No. 0000; one line from Osceola to Elkhart, five miles, of which the first half-mile is 500,000-c. m. and the rest 300,000-c. m.; one line from Osceola to Mishawaka, five miles, of which the first mile is 500,000-c. m. and the rest 300,000-c. m.; two lines from the South Bend power station to the loop in South Bend, 3/4 mile, of which one is 500,000-c. m. and the other 300,000-c. m.; one No. 0000 feeder from

DIAGRAM OF FEEDERS.

the loop in South Bend to Springbrook, two miles. The feeders are all tapped into the trolley line at intervals of 1,000 to 1,500 ft.

CAR BARN.

The car barns are all of the wood and corrugated iron construction, similar to the power houses at Osceola and Dunlap. There are in all four car barns; one at Dunlap, 40 x 300 ft., one at Osceola, 210 x 40 ft. (part of the single building), two in South Bend, one 66 x 120 ft., and one 35 x 120 ft. In all these buildings the roof is carried on trusses, so that the floor space is left clear; in each there is a pit for the convenient inspection of motors and trucks. The trolley wires are hung below inverted flat troughs. The cost of these 40 x 300-ft. buildings was about \$1,500 each. These buildings are temporary in character and the company has recently purchased a square of ground in South Bend centrally located for the erection of a commodious and permanent car barn and shops to be built of brick and steel.

The repair shop is 66 x 50 ft., being a part of one of the power stations of one of the old companies. The front portion has four tracks, one with a pit. In the rear are the machines, which include 1 planer, 1 Barnes drill press, 1 engine lathe, and 1 emery grinder; these machines are driven by a 22-h. p. 500-volt motor. One corner of the building is partitioned off for a forge shop.

At the shop and car houses 1 machinist, 1 blacksmith, 1 carpenter, 1 painter, 3 laborers, and 4 car washers are employed. As will be apparent from the small number of machines in the shop, only light repairing is done here, wheels and axles, and motors being sent to the makers when necessary.

One man is employed as car inspector and instructor of motormen, to which he devotes all his time excepting on busy days at the park when he is occupied for an hour or so in starting cars properly. The inspector makes a careful examination of interurban

FIG. 3.

FIG. 4.

cars once each trip, and the local South Bend cars as often as their schedules bring them within reach and his time permits. Cars on the local lines at Elkhart and Goshen are inspected at Dunlap at night after they are brought into the car house. All cars are inspected for low armature bearings once each week. The inspector tries to slip a wooden gage 1-16 in. thick between the armature and lower pole pieces, and if it will not pass the bearings are renewed. All armature bearings are put in by the same gang of men, so that the personal equation is eliminated to a great extent and uniformity secured.

The superintendent, Mr. Mark Cummins, has designed a set of forms and jigs for babbiting bearings, which we illustrate and will doubtless be found interesting. All armature bearings, motor

axle bearings, and interurban journal bearings are babbitted. For armature bearings the jig in Fig. 1 is used; the two halves of the bearing are set around the mandrel and wrapped with a piece of sheet asbestos, outside of which is a sheet iron clamp, set up by thumb screws. The groove in the base serves to center the mandrel in the bearing. Motor axle bearings having an end bearing of babbitt are cast over the jig shown in Fig. 2. The flanges on the bearing shell fill the top of the groove in the base and are held at the proper distance, $\frac{7}{8}$ in., from the bottom by the set screws shown.

After casting, both styles of bearings are turned in the lathe. Mr. Cummins states his experience to be that special chucks for holding the bearings while being bored are not desirable, because of the fact that the outside of the shell will wear to an appreciable extent, and if bored in a chuck of uniform diameter the axes of the hole and of the shell are liable not to be parallel. The shells are, therefore, centered in a chuck with independent jaws for boring. The tool used is a piece of shafting with one end squared to fit the tool rest of the lathe and a transverse hole through the other end; in this hole the cutting tool proper is inserted, projecting at right angles to the body or holder, and held in place by a set screw.

While it is considered desirable to cast the bearings over mandrels of the exact size of the journal and thus save boring and utilize the greater wearing qualities of the metal, it is not practicable to do so, because the journals vary in size after wear.

The journals of the axles or interurban cars are $4 \times 8\frac{1}{4}$ in.; the contact surface of the bearing has a projected width of $2\frac{1}{4}$ in. For pouring these shells they are clamped to the form shown in Fig. 3. The form is a piece of tubing 4 in. in external diameter by 8 in. long, with two pieces riveted to opposite sides. For the single truck cars brass journal bearings are used, the axle bearings being $3\frac{3}{4} \times 8$ in. and the contact surface of the brass $1\frac{1}{2}$ in. wide. The contact faces are bored on the drill press. For holding the bearing a casting, such as shown in Fig. 4, is bolted to the table, and the brass clamped to the vertical face. The boring is done with a bar, the lower end of which is guided by the hole in the center of the

instruct the men how to handle their controllers, brakes, etc. There is more variety in the power house apparatus than elsewhere on the system, this being because, of all the equipment acquired from the old companies, only that in the power houses was in part serviceable.

The cars were all made by the St. Louis Car Co. and comprise 27 nine-bench open, 4 ten-bench open, and 21 closed motor cars

MOVABLE STAGE AT SPRINGBROOK PARK.

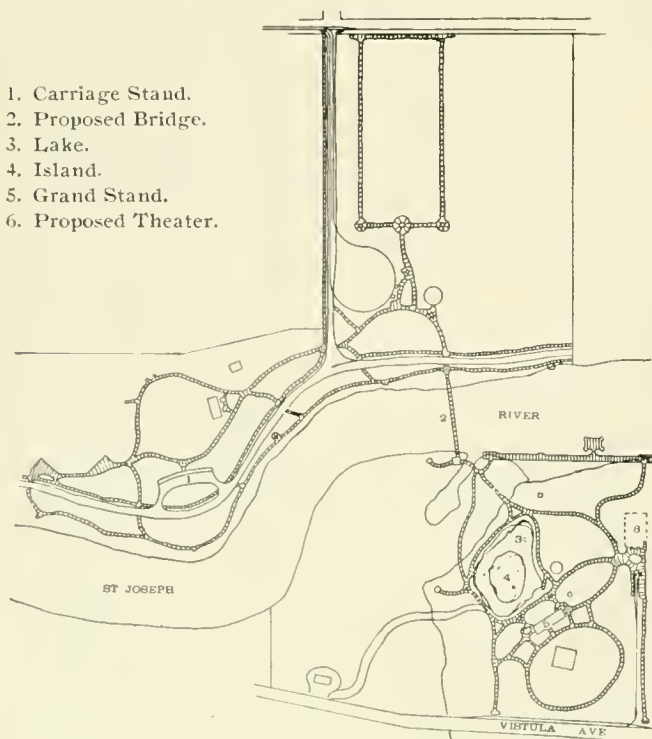

on single trucks, 10 interurban cars on double trucks, and 8 nine-bench open trailers.

The interurban cars are 42 ft. over all, mounted on McGuire No. 39 trucks, equipped with four Westinghouse 49A motors. The controllers are the Westinghouse B6. The wheels for these cars are of the double plate type and weigh 500 lb. each, made by the Griffin and Bass companies; the axles are $4\frac{1}{4}$ in. at the center, and 4 in. at the journal. Nuttall gears are used. The cars are vestibuled at both ends and plate glass is used on the interurban cars throughout; the increased cost by reason of using the plate glass was \$65 per car, but the better appearance of the car is considered to more than justify the expense. The electric heaters were furnished by the Consolidated Car Heating Co. The head-lights are the Crouse-Hinds changeable type. Each of the interurban cars has 18 full-size double seats and 4 slightly shorter seats for corners; the 18 seats have reversible backs, but the corner seats are backed against the bulkheads. The curtains on all cars are of "Pantasote." Push buttons for signalling the conductor are on the posts of all cars. For cleaning the vestibule glass in front of the motorman, a rubber window wiper is carried on each car. Interurban cars are run for only nine hours, three round trips, per day in regular service.

The smaller motor cars are mounted on McGuire single trucks, and are equipped with two Westinghouse No. 40A motors and B3 controllers. The wheels are of the spoke type, 33 in. in diameter and weigh 400 lb. The small closed cars have the same type of vestibule as the interurban and have "Consolidated" panel heaters. New Haven fare registers are used on the local cars.

The company has a full double equipment of trucks and motors. The equipment includes 2 McGuire sweepers and 1 Trenton tower wagon, and 2 Taunton snow plows have been purchased for immediate delivery.

There are 40 motormen and 40 conductors in the service. On the interurban line, the crews make three round trips per day; one crew working from 6 to 12 and from 3 to 6, and the other from 12 to 3 and from 6 to 12; these hours apply to the men running from the South Bend barn, there being a slight difference in the starting time for the other terminus. On the local lines three crews handle two cars, they are the swing crews, the early straights and the late straights. The early straights take one car from 6 a. m. to 6 p. m., with the relief at noon, and the swing men then run it till 11 p. m.; the swing men have the other car from 6 a. m. to 11 a. m. and the late straights then take it till 11 p. m. with relief at supper time. The employes other than those mentioned are 12 men and 2 foremen on track work and 1 lineman who has 1 helper.

MAP OF SPRINGBROOK PARK.

table. The drill has an automatic feed, and requires no attention until the brass is bored.

ROLLING STOCK.

The policy of the company is to have all its equipment as nearly uniform as possible, thus enabling a smaller stock of repair parts to be kept on hand, and making it much easier to thoroughly

The management is opposed to compartment cars, and for this reason prohibits smoking on all except open cars; as women and children, who constitute by far the larger number of passengers, do not like to pass through a crowd of men who are smoking, no smoking is permitted on the platforms of closed cars.

The destination signs used at present are enamelled, white letters on a blue background, slipped into brass sockets attached to the dash. At night oil signal lights are used, designating the different lines and as a precaution against rear-end collisions.

PARKS.

The Indiana Railway Co. has two parks, one at Springbrook and one at Dunlap. The General Power & Quick Transit Co. purchased about 30 acres on the south side of the St. Joseph River, midway between South Bend and Mishawaka, and opened a baseball park in 1896 which has been maintained by the succeeding company. A covered amphitheater seating 1,200 people and some "bleachers" were erected when the ball field was laid out. The Indiana Railway Co. recently purchased more land and now has 82 acres, 38 on the north side and 44 on the south side of the river, lying as shown on the map which also gives the general scheme of walks and buildings that will be followed in improving the newer portions. The original park is the southeastern portion of the property and is already a beautiful resort. The extreme southeastern corner where the ball field and amphitheater are located is level and from 25 to 30 ft. higher than the rest of the tract south of the river. North of the river also there is a rise of 30 ft. from the river bank to the north line of the property. On the lower level in the rear of the amphitheater is an artificial lake about 500 ft. long in which have been planted many varieties of water lilies. A bandstand is on an island in the lake.

The river is about 300 ft. wide at the narrowest point shown on the map of the park, and a bridge will be built at the place indicated. A spur track for waiting cars has just been completed; this extends along the east line of the south side park to the proposed site of the theater pavilion. On the north side a loop will be built as indicated, thus giving, when the bridge is built, access to the entire park from both lines of the road.

At Dunlap the park is an oak grove of some 10 acres and a cleared field adjacent laid out for a baseball diamond. A theater which will be described later was built in the grove, but no seats are provided at the ball field. This property lies about 200 yd. from the railway line and is held under lease.

This season the company wished to try the experiment of giving vaudeville performances at its parks, but hesitated to spend any considerable sum until satisfied that the venture would be financially successful. Estimates showed that a suitable theater and pavilion would cost about \$10,000, which was considered too much for a doubtful experiment. The solution adopted was extremely novel and has admirably served its purpose in demonstrating that a theater will pay.

Having the covered baseball amphitheater at Springbrook Park, with a level field in front, a covered stage was built and mounted on wheels so that it could be moved in front of the seats for the performance and drawn to one side during ball games. This movable theater is 20 x 30 ft. with an arched stage opening of 20 ft. The platform on which it is built consists of four longitudinal timbers 6 x 8 in., two placed flush with the sides and two 10 in. inside; the end sills are also 8 x 10 in. and bolted to the longitudinal sills with half-lap joints. Under each pair of longitudinal sills are three wheels 30 in. diameter and 8 in. face made of 2-in. oak planks sawed out and spiked together. The axles are 1½-in. square iron with the ends turned down for journals. The bearings are castings bolted directly to the under sides of the sills. The platform is braced diagonally by two 2 x 10 in. x 14 ft. joists between the inside sills at each end. Joists are laid on the sills and covered with matched pine flooring, except in the center of the stage where maple is used to make a better dancing floor. The walls are of lap siding on a framing of 2 x 4-in. studding, and the building is covered by a hip roof. The stage is 40 in. above the ground. There are the usual curtain and wings. At the rear are two dressing rooms, one in each corner, 4 x 8 ft. The entire cost of the building, including the scenery, was \$250. It was completed in less than a week.

The stage is moved into position by a team of horses hitched to a rope which is rove through a block attached to the building and the other end fastened to a stake; the block is on a wire cable

fastened to hook at the corner of the building. Planks are laid on the ground to form a better track for the wheels.

The Dunlap theater is similar in construction save that it is mounted on posts instead of wheels, and that larger dressing rooms are provided. The stage is 18 x 30 ft. with an opening 20 ft. wide. The dressing rooms are in a lean to at the rear 8 x 30 ft. Twenty

VIEW IN SPRINGBROOK PARK.

incandescent lamps are arranged over the arch of the stage opening, as is also the case at the Springbrook theater, and a plank with other lamps attached placed in front for footlights.

The piano, constituting the orchestra at this theater, is placed on a platform in front of the building, and when not in use is boxed in and locked; the top of the box is covered with tin to make it water-tight. The cost of the Dunlap building was about the same as that at Springbrook, \$250. Benches with seats for 700 people are placed under the trees. This park is also popular with picnic parties.

A charge of 5 cents is made for admission to Springbrook Park, (reserved seats 5 cents extra) but at Dunlap the park is free to all passengers because of a higher fare, park tickets being issued as patrons leave the cars.

Citizens of South Bend, Elkhart, and Goshen have recently organized a country club and have a tract of 110 acres, lying between the railway and the river, where a club house has been opened. Golf, tennis, and boating are popular with the members, and considerable new traffic over the railway has developed in consequence. Station No. 4 on the interurban line, which is opposite the club house, has been renamed "Somielgo," which some of the local philologists say is a Shawnee word meaning "Beautiful Links."

TICKETS AND RATES OF FARE.

The local fare in South Bend (including the two lines to Mishawaka), Elkhart, and Goshen is straight 5 cents. Books of 40 tickets good on the local lines are sold for the accommodation of patrons, but no reduction in price is made for these; they are mostly bought by merchants who have occasion to send their employes on errands.

The tickets other than those just mentioned are:

1. Conductors' Interurban Cash Fare Slip. This is the type patented by the National Ticket Co. of Cleveland. In Fig. A we

reproduce the conductor's stub side of one of these slips to show the rates of fare for single trips.

2. Conductors' Interurban Cash Fare Slip for children. The stub side of this ticket is shown in Fig. B, and gives the rate of fare for children.

INDIANA RAILWAY COMPANY
TRANSFER TICKET
Good only on Line designated, and 15 minutes after time punched. Subject to the Rules of the Company.
033201
Feb. 28, 1900

FIG. I.

of 50 for special reasons, and are of several forms, good on some one local line, on the interurban line, or on all lines like that shown in Fig. F. The name of the person to whom one of these books is issued is written, or stamped, on the back of each ticket.

Where it is desired to extend the courtesies of the road to one who will have use for a few tickets only, the same form is used, the words "Pass One" being stamped on the back. The original is 1 1/4 x 3/8 in.

6. Employes Tickets. Employes are carried on their badges when

going to or returning from work. At other times there may be issued to them a ticket such as shown in Fig. G. These tickets are good only for the date stamped on the back. Local tickets are printed in black and interurban tickets in red ink.

7. Players' Tickets. These are for the transportation of the

atrical performers and ball players between South Bend and the two parks. This ticket is shown in Fig. H.

Transfers are issued on the local lines in all three cities, but not between local and interurban cars. One of the transfer slips is reproduced in Fig. I; the original is 2 x 4 1/4 in. The slips for the five South Bend lines are each of a different color; Michigan St., red; Washington St., yellow; South Side, apple green; North Side, mandarin; Chapin St., blue.

On local lines children under six years of age are carried free when with adults.

The company lets cars to parties desiring them, and is now arranging one of the interurban cars for such special service; the principal changes consist in removing the fixed seats and substituting wicker chairs and building two ice boxes at one end, so that refreshments may be conveniently carried. The rates for special cars are given in the accompanying table.

Within a few weeks a car for light freight and express will be put in service on the interurban line. The management has not yet decided whether a flat or a graduated tariff will be charged.

ACCOUNTS AND FORMS.

The issuing of tickets to conductors and station agents is under the direction of the assistant superintendent, Mr. C. M. Cubbison, who audits the conductor's returns and from his books prepares the statements of receipts for the manager. These reports are

for the name of the article, the box number, the stock ledger folio, the name of the vender, the year, and for each of the twelve months; each item has two lines allotted to it, giving space for two years. This book shows the number and cost of each article by months.

The stock ledger has two accounts to the page with vertical columns for each month of the year. The horizontal lines are numbered 1 to 31 and the number of the articles expended is entered on the proper day and month. Below the table are footing lines for the number "On Hand," "Received," "Received by Transfer," "Total," "Delivered," "On Hand."

The articles expended are reported to the office on blanks such as shown reduced in Form 4; this form is 4½ x 8½ in. As supplies are issued by the storekeeper, he enters them on this blank and at the close of the day the foreman receipts for them by signing the blank which is then returned to the office.

Supplies are ordered on requisition blanks addressed to the superintendent and signed by the foreman. The superintendent then draws a requisition, giving names of makers and a description of the material required, with shipping directions; he keeps a memorandum on the stub of the requisition book. This requisition having been approved by the manager an order is made, a carbon copy being kept; when the order is drawn the auditor makes a pencil memorandum of what it is for that is of assistance in distributing the items.

Vouchers are made for all bills over \$5, and payments made by checks signed by the manager and the secretary. For bills under \$5 the cashier keeps a petit cash book, drawing a voucher once a month or as often as may be convenient. The pay rolls are made on blanks which are copies of the time books of the various foremen and timekeepers. The time of the trainmen is made up from their slips, turned in each day.

Supplies used during the month are passed through the books on a "Credit Voucher" for the total of the daily requisitions made on Form 4. These requisitions and a type-written summary of the several items are attached to the voucher. Each voucher has a "distribution ruling" on the back to show the portion of the total to be charged to each account. The accounts are designated by a number and letter or by two letters, thus:

- A. Cost of Road. Subdivided A to N.
- B. Equipment. Subdivided O to Y.
- C. General Expenses. Subdivided 1 to 15.
- D. Transportation. Subdivided 20 to 45.
- E. Maintenance of Track and Buildings. Subdivided 50 to 54.
- F. Maintenance of Equipment. Subdivided 60 to 68.
- G. Storeroom. Subdivided 75 to 76.

The vouchers are all entered in an "Accounts Payable Distribution Book," which is wide enough, with a short leaf interleaved, to give a vertical column for each account. Each horizontal line is for one voucher, the number, date and total being entered and the total distributed properly.

There are 50 lines to the page and about three pages of this book are filled each month.

The cash book is ruled with columns for: Sundries (including park and advertising receipts). Earnings (with separate columns for each of the local car lines, interurban cash and ticket sales, chartered cars, local ticket sales, and freight and express). Accounts Payable. Pay Roll.

Mr. Arthur Kennedy, president of the Indiana Railway Co., is one of the pioneers of the electric railway business. He was organizer and secretary of the company that built the Observatory Hill Line on the Bentley-Knight trolley and conduit system in Allegheny City in 1887-88—the first conduit road and one of the very earliest trolley roads in the country. He was president of the Cream City Railway Co., of Milwaukee, in 1890, when that property was controlled by a Pittsburg syndicate. He was also for several years a director of the Federal Street & Pleasant Valley Passenger Railway Co., of Pittsburg and Allegheny, until it was sold to the United Traction Co., and of other local roads in and about Pittsburg. In 1895 Mr. Kennedy with Mr. Francis J. Torrance of Pittsburg secured control of the Washington (Pa.) Electric Street Ry. and the road was rebuilt and put on a paying basis. Mr. Torrance is now president and Mr. Kennedy secretary of this road. In 1896 he organized the New Castle Traction Co., which took over, rebuilt and extended the property of the New Castle Electric Street Railway Co. of New Castle, Pa., and served as vice-president and director. He was also president of the electric light company of

that place. When he became interested in the Indiana Railway property he took with him to South Bend Messrs. William and Mark Cummins, who had been connected with his Pennsylvania roads. Mr. Kennedy's home is in Allegheny City, but he spends a considerable portion of his time in South Bend.

Mr. J. McM. Smith, vice-president and general manager of the Indiana Railway Co., is a railway man of long and varied experience. At the age of ten he entered the railway field as telegraph operator

ARTHUR KENNEDY.

J. McM. SMITH.

with a construction train on the south end of the Chicago & Alton Ry. His youth, together with his expert work, attracted the attention of his superiors, W. C. Van Horne, Marion Hughitt and J. C. McMullin, who advanced him rapidly through their various departments. Five years later Mr. Smith resigned his position with the Alton road to accept a responsible office with the Pullman Co. in Chicago, where he remained many years, the last twelve of which he served as private secretary to George M. Pullman. Observing the rapid advance in the application of electricity to traction Mr. Smith decided to enter that field, which he did twelve years ago by purchasing the entire capital stock of the South Bend & Mishawaka Railway Co. The history of his work with this company is the story of nearly every street railway in the country during that period—the struggle to keep alive—and it was due to his pluck and energy that the old broken-down tracks and equipment were kept running and the franchises kept intact for the foundation for the present excellent street railway system.

NEW CARS FOR PITTSBURG.

The Consolidated Traction Co., of Pittsburg, last month awarded a contract for 50 new winter cars to the American Car Co., of St. Louis. These are to be delivered by Oct. 1, 1900. In general appearance the new cars will closely resemble those now in use in Pittsburg, but a number of changes suggested by experience will be made in fittings and appointments.

They will have rattan seats which are thought to be more comfortable and cleanly than the upholstered seats at present in use. Another innovation will be a corrugated steel step designed to prevent passengers from slipping in wet or icy weather. The cars will have headlights on the dash instead of on the hood, as the latter practice has not proven satisfactory. Wagenhals headlights will be used and the cars will be fitted with Van Dorn couplers and electric heaters.

Mr. W. K. Schoepf, general manager of the Consolidated company, states that he will also make some changes in the signs designating the routes. He is convinced the present small sign on the front of each car is not comprehensive enough for strangers, and he will therefore place large signs along the sides of the roofs, naming the principal streets over which the car runs.

Compressed air blowers are to be put up at the car barns and each car will be cleaned out by compressed air every night.

To reduce the chances of collision between street cars and fire apparatus the Commissioners of the District of Columbia propose to have the street cars stop before crossing certain streets that are used for the fire runs. The matter has been taken up with the railway companies, and an agreement as to stops which will be agreeable to all parties will doubtless be reached.

Electrolysis of Underground Metal Structures.

BY DABNEY H. MAURY.

(What follows is an abstract of a paper read at the meeting of the American Water Works Association at Richmond, Va., May, 1900. Mr. Maury is a consulting engineer and engineer for the Peoria Water Works Co., Peoria, Ill. For the illustrations accompanying the paper we are indebted to the Engineering News.—Ed.)

Reports of electrolytic injury to water and gas pipes are rapidly accumulating from cities all over the United States, where the single trolley system has been in use for any considerable length of time, and the subject is one of serious moment to every corporation or municipality, owning underground metal structures of any sort.

It is the purpose of the writer, after illustrating a few of the many instances of electrolytic injury which have come under his notice, to discuss the electrical resistance of the joints of cast-iron mains, and to point out the important bearing which this joint resistance has upon all the various remedies for electrolysis heretofore suggested, and to show, from actual cases, the results

instance, on streets in which the trolleys were laid on or toward the south side of the railway tracks, 96 per cent of the recorded breaks occurred in service pipes supplying the houses on the north side of the street and in pipes passing under tracks.

In investigating the cause of the destruction of our pipes, the query early suggested itself as to whether chemical action pure and simple could have caused the injury. To make clear the claim that the damage was done by the electric current, it seemed to the writer that some evidence should be found of redeposition of the metal supposed to have been removed from the pipes by the current. Our search for this additional evidence was soon rewarded, for early in March, 1893, we observed in the excavation made to renew a broken service pipe, that the lead taken away from the pipe was deposited in the form of glistening particles, or thin metallic coatings, on soil, sand and gravel, all through the adjacent earth, but above the pipe and in the direction leading from it up to the rails—the pipe at this point being shown by voltmeter tests

FIG. 1.

FIG. 2.

which must certainly follow, if cast-iron mains are used to convey electric currents.

The writer has been, since March, 1893, engineer and superintendent for the plant now owned and operated by the Peoria Water Works Co. Early in 1893, the water company's street foreman, Mr. W. B. Norris, reported to the writer that extra strong lead service pipes laid under the street railway tracks were bursting with a frequency that was remarkable, and that the appearance of the burst pipes was unusual, and different from that of any pipes the foreman had yet seen. Electrolysis, as occurring in water and gas pipes was, at that time, almost unknown, and very little had been published, even in engineering papers, regarding it. The writer at once suspected, however, the cause of the breaks, and the foreman was instructed to give him prompt notice of every such break, so that he could personally inspect the pipe and note the circumstance attending its rupture.

To keep better track of the injury printed tags were prepared, on which the

to be electrically positive to the rails. In one excavation, where there was a well-defined wet streak along a fault in a clayey soil, the lead compound, afterwards identified by chemical analysis as sulphide, was observed along this wet streak as far as the sides of the excavation, or more than 6 ft. from the pipe, the streak leading diagonally up from the pipe to the rails. A similar redeposition of the metal was observed in the case of wrought-iron gas service pipes, and of cast-iron gas and water mains, the joints of the latter being surrounded in nearly every case by soil stained with oxide of iron, while immediately in front of the ring of lead in the joint would be found a bluish metallic discoloration showing the redeposition of the lead. The writer sent samples of the soil thus impregnated with lead and iron compounds to Messrs. Stone & Webster, electrical engineers and experts, of Boston, and to Engineering News, and to Fire and Water. The letters accompanying the samples, which were published in Engineering News, Mar. 22, 1894, and in Fire and Water of about the same date, were, it is believed, the first published

FIG. 3.

FIG. 4.

attendant circumstances were noted whenever a pipe burst; the tags were signed by the superintendent, the foreman and the men assisting in the work of repairing the pipe. A sample of the pipe was saved for reference and the tag was attached thereto. Although a number of breaks occurred before these records were begun, and in spite of the fact that some intelligent laborers in search of lead for making joints in water mains appropriated and melted down a good many of our carefully preserved samples, records are still on file of 116 electrolytic breaks.

The bursting of service pipes continued with increased frequency, nearly always occurring on those pipes which passed under the railway tracks; for

notes of such redeposition of the metals removed from underground pipes by the return street railway currents.

On Mar. 30, 1894, the water company's steel stand-pipe on the West Bluff burst, killing one person and injuring 15 others, one of whom died later from his injuries. Upon examining the wreck of the stand-pipe, the writer at once noticed a peculiar pitting of the inside of the vertical sheets, and the appearance of these pits was so different from that caused by any ordinary oxidation that he was soon almost positive that they were due to electrolytic action. A similar stand-pipe on the East Bluff was drained, and was found to be similarly pitted. The whole inner surface of the vertical shell appeared to be thickly

covered with blisters resembling in outward appearance the tubercles sometimes found inside of old cast iron mains. This blistered covering, which was almost as thin as paper, was composed entirely of oxide of iron, and on brushing it away with the finger tips, the black paint with which the stand-pipe had been originally coated would be found beneath it. The black paint was oftentimes almost unbroken, or, at least, very slightly cracked. When the paint was brushed off, the pit would be disclosed, considerably smaller in area than the surface covered by the blister. The surface of the metal in the pit was perfectly bright and clean and its fiber was clearly discernible. Many of these pits were more than 1/8 in. in depth. They were slightly more numerous in the West Bluff pipe than in the East Bluff stand-pipe, and were in both generally larger and deeper on the lower courses of the vertical shell.

Fig. 1 is from a photograph of the wrecked stand-pipe, the upturned corner of the torn sheet near the center of the picture showing the pitted appearance of the surface, the blisters having been, of course, shaken off by the fall of the metal and the metal itself having become somewhat oxidized before the photograph was taken. The two largest blotches are streaks of mud. Fig. 8 is from a photograph of a small sample of steel from the stand-pipe and shows the pitting in the sheets around the edges of the rivet heads.

It seemed advisable to secure a thorough expert examination with a view to determining the cause, nature and extent of the observed pittings on the stand-pipes, and injuries to the piping system. Messrs. Stone & Webster, of Boston, were selected to make this examination. The work, in which the writer, from time to time, assisted, covered seven weeks on the ground, and the reports submitted by Messrs. Stone & Webster fully confirmed the suspicions that the pitting was caused by electrolysis and established the fact that the entire piping system of the water company would be endangered by a continuance of the existing electrical conditions. The West Bluff stand-pipe was distant about 60 ft. from the street railway line on Bourland St. The East Bluff stand-pipe was about 700 ft. distant from the railway line on Knoxville Ave. Both stand-pipes were more than a mile from the power station, and were negative to the rails. The electrical examination relative to the stand-pipes was conducted mainly at the East Bluff stand pipe, which was still in service. A flow of a part of the current from the railway line was clearly traced through the earth to the anchor bolts which held the stand-pipe to its foundation, as shown in Fig. 5, up these bolts and into the steel of the shell, and through the shell and from its inner surface to the projecting section of the 16-in. flanged cast-iron pipe which served as both inlet and outlet, and which connected the stand-pipe to the water mains. The current was then traced along this pipe and along the mains to the power station. The deflections of the voltmeter needle were clearly traced to the railway current, being especially influenced by the one or two cars on the line beyond the stand-pipe on Knoxville Ave., and when the cars stopped running at night, the movement of the needle ceased. Where the current left the inner surface of the shell to pass through the water to the inlet pipe it made the pits already described.

Fig. 2 is from a photograph showing the interior surfaces of three sections of this inlet pipe, marked A, B and C, respectively, the positions occupied by these sections originally being shown by the letters A, B and C in Fig. 5. An examination of the photograph shows the strongly marked and numerous pits which were found inside the sections A and B, while the inner surface of the section C was found to be practically as smooth and perfect as though new. When the condition of the inside of these three sections of pipe was first noted, it seemed hard to understand why A and B should be pitted, while C was unaffected. A closer examination, however, showed that in the flanged joints between the bottom sheet of the stand-pipe and A and B, respectively, corrugated copper gaskets were used, while the pipe B was separated from the pipe C by a thick rubber gasket; and that under the nuts and heads of the bolts holding the flanges together, there were grummets or wrappings of cotton wick soaked in tallow. The result of this arrangement was, that the current which entered A, after passing through the water from the inner side of the shell of the stand-pipe, and which was trying to return along the inlet pipe and water mains to the power station, encountered, at the joint between B and C, the rubber gasket and the grummets. The effect of the gasket and grummets was to practically insulate the section C from the sections A and B, and as none of these pipes were in contact with the ground, the current was compelled to leave the pipes A and B and travel through the water or along the slimy coating of oxide on the inside of the pipes around the joint between B and C, in order to continue on its journey. As the current was not leaving C, this pipe was not injured, but the current, in leaving the inner surfaces of A and B did pit them as shown in the photograph.

These stand-pipes and the inlet pipes were negative to the rails, and are striking examples of electrolytic pitting under such conditions.

Early in 1898, Prof. D. C. Jackson, of the University of Wisconsin, and Messrs. Stone & Webster were requested to supplement the investigations already made by the latter, by another examination of the system, with a view to ascertaining whether the electrical conditions reported in 1894 still existed. The result of all these examinations and of those made, from time to time, by the writer, showed that the differences of potential between mains and rails had increased rather than diminished, while the number of breaks in the service pipes, and the number and extent of pittings in the mains, were very much greater than had before been observed.

With a view to further proving that the injury done to the cast-iron

mains and service pipes was caused by the electric current, samples of the graphitic substance dug out from the pits in the mains, and of the scale or incrustation adhering to the mains over the pits, and of the soils at various

FIG. 5.

distances from the mains, and similar samples taken from the neighborhood of the lead service pipes, were sent to the University of Illinois, where they were analyzed by Prof. Arthur D. Palmer. Samples of ordinary soils, unimpregnated by the metallic compounds from the pipes, were also analyzed. These analyses showed that there was nothing in the soil which, except for the action induced by the electric current, could injure the pipes, while all of the conditions, as found by chemical analysis of all the samples submitted to Professor Palmer, were exactly such as would be caused by the presence of the currents complained of.

In 1899, a series of tests were made by Mr. A. A. Knudson, electrical engineer, of New York, in conjunction with the writer, at the site of the fallen West Bluff stand pipe, in order to still further prove that when that stand-pipe was in service, there was an actual flow of current in the manner already shown by the previous tests at the East Bluff stand-pipe, by Messrs. Stone & Webster. The anchor bolts were still in the foundations, but the shell of the stand pipe, as well as the 16-in. inlet pipe leading thereto, had been removed. It was necessary, therefore, in order to reproduce, to some extent, the actual electrical conditions that had previously existed, to connect a wire from the ends of the anchor bolts to the 16-in. water main in front of the stand-pipe.

By connecting in a voltmeter on this wire the variations of potential between

FIG. 6.

anchor bolts and the water main were observed, and by replacing the voltmeter by an ammeter, the actual flow of current was measured. This current was clearly and positively identified as caused by the street railways, and the result of these tests fully confirmed the statement in the reports of Messrs. Stone & Webster, that the pits in the shell of the stand pipes had been caused by the street railway current.

The joints of cast-iron water mains often offer, as already stated, considerable resistance to the passage of the electric current, and the reason for this resistance is apparent, when the construction of these joints is studied. Cast-iron water pipes are coated inside and outside with a preparation of coal tar that is an insulating material. In making a lead joint, the spigot end of one pipe is inserted in the bell end of another pipe and pressed home until it touches the shoulder in the bell. The spigot pipe is centered carefully, so that the annular space designed to hold the yarn and lead may be of equal width all around. The yarn is then rammed in home against the shoulder and holds

the spigot in the center of the bell. There can thus be no actual contact between the two pipes, except where the very end of the spigot abuts against the shoulder of the bell. As both spigot end and shoulder are simply rough castings and are not turned, it follows that they are rarely in mechanical contact at more than two points, and on curves they can only touch at one point. In fact, it is frequently true that after the spigot pipe is once shoved home against the shoulder of the bell, and then released, it works away in the subsequent handling any yarning and oftentimes is not in contact with the bell at all. Even if the two pipes were in actual mechanical contact, the electrical contact would be poor, by reason of the two intervening coatings of tar or asphalt. In that portion of the joint occupied by the yarn, there is no contact between the two pipes, and they are at this point fairly well insulated by the yarn itself, as well as by the two coatings. The rest of the joint is filled with lead, which is a conductor of electricity, but in between the ring of lead and the bell outside of the lead and between the lead and the spigot on the

FIG. 7.

inside, are the two tar coatings which materially interfere with the electrical contact between the two pipes.

As it had been stated that the tar coating is completely consumed and burnt out by the heat of the molten lead when a joint is poured, the writer caused a joint to be poured and calked in the usual manner, and then had the bell sawed into three pieces, so that it could be taken off the spigot. It is needless to tell men who have had experience in laying and taking up water mains that the inner surface of the bell showed that the coating was entirely unimpaired by the heat.

Measurements were made by the writer in 1898 to determine the amount of resistance offered by the joints in cast-iron water pipes, and also to ascertain whether the pipes themselves showed any pitting as a result of this resistance.

A large number of these examinations were made during 1898 and 1899, and in every case the pipe which was of the higher potential was found pitted near the joint, while the pipe of the lower potential, or that into which the current was flowing from the other pipe, showed much less electrolytic injury.

FIG. 8.

To further test the joint resistance and to determine, if possible, the influence of different methods of calking as affecting this resistance, the writer, in conjunction with Professor Jackson, caused a line of 6 and 4-in. pipe to be laid and supported on wooden blocks, so as to insulate it from the ground, as shown in Fig. 7. There were 27 joints in all. The pipe was new and had not been previously used. The calker was instructed to drive up the lead hard in one-third of the joints and to calk these joints in every way in the best possible manner, just as though the pipe were expected to stand the heavy pressure of the Peoria Water Works Co's. system. Another third of the joints was calked not quite so hard, while the remainder were purposely only lightly driven up, the work being done as though carelessly, or by a bungler. A current of known strength was passed through the pipes, and the drop of potential around the joints was measured at points 1 ft. apart, and was compared with the drop of potential in length of 1 ft. of continuous pipe. These measurements were made at different times; first by Professor Jackson and the writer; then by the writer alone, and later by Mr. Knudson and the writer. The resistance of the joint was found, as shown by the table, to be from a few times to several thousand times that of the same length of con-

tinuous pipe, and this joint resistance was in no way affected by the manner in which the lead was driven up in the joint, some of the joints on which the best calking was done showing the highest resistance. The usual depth of lead in a joint in a cast-iron pipe is about 2 1/2 in., but assuming the length of the joint at 4 in., the joints in this line offered 89.2 per cent of the total resistance of the whole line, or on the average the resistance of a joint was 227 times the resistance of 4 in. of plain pipe. In making this calculation due allowance has been made for the fact that the points of measurement around the joint were 1 ft. and not 4 in. apart.

These observations, taken over a period of about eleven months, also showed that the resistance of the joints increased rapidly with age.

In Kansas City, Prof. Lucien L. Blake, of the University of Kansas, has recently made a number of tests of the joint resistance in cast-iron mains. He found the joint resistance in three lengths of 6-in. pipe to be about 96 per cent of the total resistance of the pipe and joints together; the joint resistance in the 58 joints of 687 ft. of 6-in. pipe which has been 13 years in service, was found to be 96.2 per cent of the entire resistance of the line; the joint resistance of 38 joints in 399 ft. of 20-in. pipe was 88.2 per cent of the total resistance of the line, and the joint resistance in 400 ft. of 30-in. pipe was found to be 96.7 per cent of the total resistance of the entire line.

Mr. Knudson found in Albany a pipe joint which showed a resistance 1,000 times greater than the resistance of an equal length of the plain pipe.

The injury caused by resistance at the joints is not so rapid at any one spot as the injury where the current leaves the pipe for the rails in the positive area, only because all of the current carried by the pipe does not flow around the joint. But one ampere of current, leaving the pipe for the powerhouse in the positive area, pits the pipe but once at that point; while one ampere of current flowing along the pipe and around joints in either the positive or negative district, pits each length of pipe near every joint, where it leaves it to flow around the joint; so that the total injury caused by this ampere is cumulative, and may be, in the aggregate hundreds of times as great as the damage caused by the same ampere of current where it permanently leaves the pipe.

The effect of the current on the rail joints of a single trolley system is similar to that on the joints in the water mains. Within the past three years the writer has examined many hundreds of rail joints, and it was always easy to tell from the appearance of the rail ends, and of the chairs, when the rails were laid on chairs, which way the current was flowing. The end of that rail which was next to the power station would show little or no injury, while the end of the other rail, or that having the higher potential, was invariably pitted. Fig. 6 is reproduced from tracing from the bottom flange or base of such a rail end (and also from two rail chairs), the solid line showing the shape when the tracing was made, while the dotted line shows the original shape of the rail when it was new and before it had been eaten away by the current. Fig. 6 also shows the bottom portions of two rail chairs. The chair B was taken from the side of the joint away from the power station. The dotted lines show its original shape. The chair C came from the other end of the same rail, on the negative side of the joint, and shows no perceptible injury.

Fig. 4 shows two rail chairs and a fragment of a third chair secured by Mr. Knudson and the writer. The chair, A, was a sample of a large number of similar chairs on the high potential side of the joint, and its thin and wasted appearance is plainly shown. The fragment, B, was broken by hand from another similar chair. The chair at C was from the same piece of roadbed, and is a fair sample of a number of chairs observed near the low potential side of the joint. This chair, as the view shows, is almost as good as new.

The soil around the outside of a water main offering an easier path for a current than the water or slime on the inside, outside pittings are more numerous and generally deeper, and they are much more easily observed. The pits on the outside may be caused either by current which leaves one length of pipe to go around a joint into the next length of pipe, or by current permanently leaving the main for some other conductor of lower potential, such as rails, or wires leading to the dynamo; but the inside pits cannot be caused by anything except resistance in the line of pipes itself at the joints,

as nothing else could make the current leave the metal of the pipe and travel through the water.

Opportunities for observing these pits have heretofore been rare, as the action is naturally slower inside the pipe than outside, and as it is necessary for some one familiar with the effect of electrolysis to be present and actually examine the pipe at the time when it is removed in order that the pits may be identified.

The pittings in the 16-in. inlet pipe to the West Bluff stand pipe, observed in March, 1894, and inside pittings found by the writer in a 30-in. cast iron main in 1896, are believed to be the earliest examples of this injury noted, but numerous instances have since been reported.

Figure 3 shows a joint of a 12-in. cast iron main on which the current was flowing from A to B. The very serious outside pittings, nearly $\frac{1}{2}$ in. in depth, are plainly shown on the pipe A, while the pipe B, on the other side of the joint, was, near the joint, almost unjured. The surface of the lead in this joint was deeply pitted in places and so much of the metal had been removed that the marks of the calking tool all around the joint were entirely obliterated. The pipe A was also pitted in a number of places on the inside, while no pits were found on the inner surface of the pipe B near this joint.

Mr. A. A. Knudson found deep outside and inside pittings in Albany, in 1890, as shown in the view, Fig. 9.

Professor Blake, from recent examinations in Kansas City, writes as follows:

"A 12 in pipe running at right angles to an electric railway, and which was negative to the rails, was found to be carrying a current of varying strength and delivering it into a 36-in. main some 750 ft. distant.

"Electrolytic pittings were found on many sections near the joints, only on the positive side, where the current was shunted around the joints. Some of the pittings were $\frac{1}{2}$ in. deep. The interior of the pipe could not be examined.

"Again, a length of 6-in. cast-iron main was taken up in another part of the city and internal electrolytic effects were apparent near the joint. A chemical analysis of the material dug from the pits gave 22.3 per cent graphite, 49.7 per cent iron.

"A second length was removed and broken into, and a fresh fracture revealed the internal electrolysis, by the discoloration of the iron where the pitting was taking place, and which was already $\frac{1}{4}$ in. deep, beginning from the inside. A number of similar cases were discovered, and are convincing proof that cast iron mains cannot convey currents without electrolytic damage, when those mains form part of the return circuits of electric railways."

Within the past few months the writer had occasion to remove from the ground a 16-in. cast iron main. This main was negative to the rails and was nearly two miles from the power station. It lay at right angles to the tracks, and the portion removed was distant, at its nearest point, about 150 ft. from the rails, and at its further end, 570 ft. from the rails, there being 420 ft. of pipe removed. Measurements with voltmeter and ammeter showed a current flowing along this pipe from the rails towards the wet soil of the river bank, in which the further end of the pipe was buried. Every length of pipe showed electrolytic injury. In one pipe the bead in the spigot end had been eaten off for two-thirds of the circumference of the pipe, and in one place the entire thickness of the pipe was eaten out for nearly an inch in depth from the end. There were both outside and inside joint pittings, always on the positive side of the joint, and no pits at all could be found anywhere else on this pipe.

In a recent paper, Professor Blake states that observations and experiments prove that the effects of electrolysis upon water pipes are not limited to the so-called "danger areas," or districts in which the pipes are electrically positive to the rails. He goes on to say:

"Resistance at the joints in cast-iron pipe is sufficient at most joints to shunt a portion of any current allowed in these mains, around the joints through the soil outside or water inside, or through both. Then on the positive side of joints, the effects of electrolysis, both external and internal, are to be apprehended."

Professor Blake then gives in detail the tests previously referred to as made by him to determine the joint resistance, and closes by giving the forcible and convincing examples already quoted of the disastrous results of allowing cast-iron mains to convey electric currents.

It must be clear to any one who has seen the evidence of injury caused by the return currents, and who has studied the effects on the water mains at the joints, or at any other point where the current, once on the pipe, must leave it, that the owners of such pipes can do nothing to prevent the injury.

Street railway companies have frequently recommended that the pipes themselves be connected by wires to the negative bus bar of the generator, or to the rails at various points, or to overhead or underground return feeder wires thus diminishing the resistance of the pipe system as a conductor, and lowering the potential of the pipes usually in what has been termed the "danger district" or the region where the pipes are shown by voltmeter to be positive to the rails. But all such methods contemplate using the pipes to convey the electric current, and they all invite more current to the pipes at some part of the system.

It would undoubtedly be a fine thing for the railway companies to have the conductivity of the pipes on which they already rely largely for the return of their current still further increased. It would mean smaller coal bills in the power station and less outlay for construction and maintenance of their own return circuit. It would, also, apparently lessen the rapidity of injury to the pipes in the "danger district," and, by stopping temporarily the number of actual breaks at the points where they have been occurring with greatest frequency, it would stave off the day of reckoning with the pipe owners. But the general pipe system would be carrying much more current, and, as the pitting goes on, at or near the joints, wherever a main is carrying current, either in the positive or negative district, it would mean that, while the injury in the "danger district" would not be so rapid, the whole system would be much more generally attacked, and that by the time a bursting pipe at length called attention to the injury at some point remote from the power station, the entire pipe system would have been seriously injured. Equally impracticable and misleading are the suggestions for maintaining the pipe system at equal potential throughout, and for "insulating sections" or "insulating joints,"

some of which have been patented. The idea of these sections or joints, as advanced by their advocates, is to break up the metallic continuity of the pipe line and reduce its conductivity, and thus prevent its serving as a path which the return current would naturally choose. The effect of thus dividing a pipe system into a small number of sections would hardly be worth considering, as the ground itself is a good conductor, and the current would leave one section only to go to another, passing through the earth around the insulating joint just as it does around the lead joint in a cast iron main. To entirely destroy the conductivity of the pipe line, it would be practically necessary to make it up entirely of insulating sections, which, as non-metallic substances are not generally recognized as good material for underground water pipes, and for other equally obvious reasons, would be absurd.

FIG. 9.

The conductivity of the tracks may be, of course, increased by the use of heavier rails, heavier bond wires and improved methods of bonding, or by the introduction of welded joints, or by making practically continuous rails; but the continuous rail itself is at best but a palliative of the electrolytic injury. The rails are not insulated from the ground, and the pipes would still carry, and be affected by a large portion of the current, as is clearly shown by numerous electrical surveys and reports of serious damage in cities where the best tracks known to modern science are in use.

In conclusion, the author recommends the double trolley system, overhead, as at Cincinnati, or conduit, as in Washington and New York, as the only perfect method of keeping currents out of the ground and preventing electrolysis.

NEW YORK FRANCHISE TAX CASE.

The New York Supreme Court has granted a writ of certiorari, returnable in October, directing the Municipal Board of Taxes and Assessments to send up the record in the case of the assessment of the Metropolitan Street Railway Co., of New York, for 1900. The company's paid-up stock in January last, was \$44,928,900. The first assessment of the company was \$4,022,800 on realty and \$45,000,000 on personality; this was on application reduced to \$4,017,800 on realty and \$10,621,789 on personality. The company claims that its indebtedness was \$38,983,234, that its stocks in other companies, amounting to \$14,542,172, were subject to taxation elsewhere, and that these items should be deducted in making the assessment.

The Railway Equipment & Finance Co., of Indianapolis, has been incorporated with \$30,000 capital, to promote, construct and finance railroads, public works and private enterprises. Directors, John C. Shoemaker, William Carter, M. E. Frazier and John E. McGettigan, of Indianapolis.

The Illinois Appellate Court holds that a city is liable for personal injuries caused by dangerous appliances used by a street railway company that has been given permission to operate an electric line in the streets. The plaintiff had sued the city of Decatur, Ill., the City Electric Railway Co. and two telephone companies for damages for injuries received by coming in contact with a broken telephone wire that fell across a trolley wire and became charged with current from the latter.

NO SIGNS ON LINE POLES.

Officials of the Union Traction Co., of Pittsburg, have serious objections to the disfigurement of the line poles by bills and other advertising matter, not only on the score of appearances but because the paper and metal signs make the poles dangerous for the linemen. A year ago the company spent \$600 in removing the matter that had been affixed to its poles. Recently the superintendent of the company saw men at work pasting bills on the poles and secured the arrest of five of them on the charge of trespass; three pleaded guilty and were fined \$1 and costs, the other two cases being dropped on a promise that the parties would not again offend.

PARK AND CASINO NEAR BUTTE, MONT.

The Butte (Mont.) Electric Railway Co. for the past few months has been developing an up-to-date pleasure resort known as Columbia Gardens, located three miles from Butte. The place was originally a beer garden owned by private parties who charged an entrance fee into the grounds, but Mr. J. R. Wharton, manager of the Butte street railway system, to whom we are indebted for the accompanying views, conceived the idea of making the place into a public park, and he immediately started to put his scheme into execution. His company purchased the property and during 1899 and the spring of 1900 expended \$48,000 in adorning the grounds, erecting new buildings, remodeling the old ones, setting

COLUMBIA GARDENS, BUTTE ELECTRIC RAILWAY CO., BUTTE, MONT.

STEAM ROADS OF THE UNITED STATES.

The report of the Interstate Commerce Commission on the statistics of Railways of the United States for the year ending June 30, 1899, states that on that date there were in the United States 189,294.66 miles of single track, 11,540.54 miles of second track, 1,047.37 miles of third track, 790.27 miles of fourth track, 49,685.64 miles of yard track and sidings, making a total of 252,364.48 miles. There were 36,703 locomotives and 1,375,916 cars of all classes. The number of employes was 928,924, an average of 495 employes per 100 miles of line. The amount of capital stock and funded debt outstanding June 30, 1899, was \$11,033,954.898 or \$60,556 per mile of line. The number of passengers carried during the year was 523,176,508.

out trees, constructing hot-houses and making flower gardens. The grounds comprise about 40 acres. Five miles of water pipe, a complete fire system, and sewers have been laid out, an electric light plant installed and numerous arc lamps placed in the park and on the buildings, the brilliant illuminations at night being one of the special features of the resort.

The main building or casino, which is shown in one of the illustrations, contains the restaurant, ice cream parlors, dance hall, which is very popular, and other attractions. In addition to the casino there is a moving picture building, a King Solomon's maze, a show building, shooting gallery, Japanese pagodas, merry-go-round and games and swings for the children.

Last year a lake was constructed at considerable expense, and as there is no body of water near Butte, this feature became at

once very popular. This year the lake has been doubled in size. A number of row boats are for hire, the proceeds from this source forming a considerable revenue.

In addition to the amusement attractions it is the intention to have at the park a fine botanical garden and zoological collection which will be free to the public. Over 80,000 plants have been taken from hot-houses and placed in various beds, and many rare trees line the paths and walks. The zoo contains a bear, lynx, porcupine, alligators, coyotes, rabbits and an aviary with doves, peacocks, eagles, swans, ducks, etc. Both these collections will be enlarged from time to time.

GENERAL VIEW OF COLUMBIA GARDENS.

Mr. J. R. Wharton, under whose management the work of beautifying Columbia Gardens has been carried on, went to Butte in 1882 from Greensboro, N. C. Until 1888 he filled the position of teller at Clark's bank, and then was made superintendent of the Silver Bow Water Co. In 1890, when the water plant was sold out, he became manager of the Butte Electric Light Co. When the two electric light companies were consolidated and sold to their present owners in October, 1891, Mr. Wharton became manager of the street railway company, in which position he is meeting with continued success.

THE DEPARTMENT OF BLANKS AND FORMS.

Secretary Brockway of the Accountants' Association, under date of July 16th, sent out the following letter relative to the association's collection of printed forms:

To the Members—The value of the department of blanks and forms can be greatly enhanced from year to year by the addition of the new forms issued by each company, and the refiling of those blanks re-issued. Therefore, it is hoped and anticipated that every member will co-operate with the secretary in the effort to make the department a continual advantage of membership in the association and keep it sensitive to the changes of their blanks and forms.

As the rubber stamp comes naturally within the meaning and intention of this collection of forms, a separate book is to be devoted to rubber stamp impressions, and there is no doubt that it will not be the least interesting of the whole. It is preferred that the impression be made upon white paper 4 x 6 in.; each impression should be on a separate slip of paper. Print on one side only.

Electric lighting in many instances is managed in the offices of street railway companies. Electric lighting blanks are, therefore, of interest to those companies, and if your company has this adjunct, please include the blanks in your package.

Experience has shown the need of the following suggestions, and they are given with the hope that they will be heeded in forwarding your package:

1. Do not fold the blanks, rolling is preferred.
2. Write in ink the name of your company upon all blanks where it does not appear.
3. The term "blanks and forms" covers everything printed in use by your company, books, circulars, rubber stamps, tickets, transfers, statements and reports.
4. Please send at least two copies of all forms, except of rubber stamp impressions.

5. Address your package to W. B. Brockway, Secretary, Post-office Box 630, New Orleans, La., and advise by letter of its forwarding.

It is appreciated that you will be put to some trouble to comply with this request, but it is believed that you will do it willingly, for you understand the importance of the collection.

The companies that complied with the request made by Circular No. 6, Nov. 15, 1898, will consider this request to apply to their issue and re-issue since that date. But the companies which have joined since then will please include their entire issue at the present time.

Yours truly,
W. B. BROCKWAY,
Secretary.

C. N. DUFFY,
President.

WHAT ELECTRIC INTERURBANS DO FOR A TOWN.

A citizen of Grand Rapids, Mich., who had been visiting in Detroit long enough to observe the working of the interurban electric lines entering that city writes as follows to one of his local papers:

"If the Grand Rapids aldermen could be here in Detroit a few days and see the crowds that the interurban car lines drop right in the center of the city, it might open their eyes a little. One line—the Ann Arbor—brings in an average of nearly 2,000 people a day, and there are seven lines.

"For three years interurban companies have been begging for franchises into Grand Rapids, and our brilliant board of aldermen, judging the world to be flat because it was flat as far as they could see, have refused them any kind of a franchise that they could take east and borrow money on. In the meantime other cities have gotten their interurban lines running and are getting the good of them, while Grand Rapids hasn't even scored yet. Worse yet, hasn't even entered for the race. Doesn't even know there is going to be a race. And that, too, for heavy stakes. We need funerals and fool-killers in Grand Rapids. Pompous 'have-beens' walk around the streets and solemnly announce that interurban lines will never pay. The belt line will never pay. A deep waterway to Lake Michigan will never pay, and such other cheerful croakings to help the town along. A frog pond on Campau Sq. would boom Grand Rapids more than this gang.

"Grand Rapids is unfortunate in depending so largely on the manufacture of furniture. Too many of our eggs are in one basket. We should make it up by everlasting push and hustle. We should have had completed and running for two years past electric lines to Holland, Grand Haven, Muskegon and Belding. Four lines besides the belt line, and every one of them should be allowed to run without right to Campau Sq. It might disturb the frog pond, but it would show in the census report of Grand Rapids for 1910. And as goes the census, so goes the real estate market, so go the bank clearings, so goes general business, so goes prosperity."

CONSOLIDATED TRACTION, PITTSBURG.

The Consolidated Traction Co., of Pittsburg, makes the following operating report:

COMPARATIVE STATEMENT.	For the Month Ended June 30th.		For the Three Months of Fiscal Year.	
	1900.	1899.	1900.	1899.
Gross Earnings from Operations	\$747,989 69	\$217,656 86	\$731,048 14	\$637,947 66
Operating Expenses	114,470 73	123,613 83	352,500 53	359,463 19
Net Earnings from Operations	\$133,518 96	\$ 94,043 03	\$378,547 61	\$278,484 47
Other Income:				
Earned Dividends on Stocks of other Companies Owned	26,834 97	16,834 95	80,504 87	80,504 85
Sales, Advertising Space, Discounts, etc.	895 72	590 71	3,763 78	1,785 09
Rentals of Buildings and Real Estate	512 45		1,093 35	472 07
Other Miscellaneous Income	328 50		738 50	
Total Net Earnings and other Income	\$162,090 60	\$121,469 69	\$485,138 11	\$379,247 48
Deductions from Income:				
Taxes	15,147 16	14,112 44	46,147 16	43,737 34
Rentals of Leased Lines	45,025 00	45,025 00	137,275 00	137,275 00
Tenement Expenses	167 55		709 73	
Total Deductions	\$ 60,339 71	\$ 60,337 44	\$184,131 89	\$181,012 34
Total Income	\$101,750 89	\$ 61,132 25	\$300,996 22	\$198,235 14
Interest on Funded Debt	26,475 53	26,580 00	79,671 07	79,740 00
Dividends on Preferred Stock	66,000 00	48,322 75	180,000 00	144,898 25
Fixed Charges	\$ 92,475 53	\$ 74,902 75	\$259,671 07	\$224,638 25
Net Income—Surplus	\$ 9,275 36	\$ 14,375 06	\$ 30,835 15	\$ 30,835 15
Deficit		\$ 13,740 50		\$ 35,383 11

Electrical Measuring Instruments.

By J. FRANKLIN STEVENS.

Mr. Stevens is president of the Keystone Electrical Instrument Co., of Philadelphia, and this paper was read at a stated meeting of the Franklin Institute.

PART I.—The author touches briefly on the history of the subject and the success with which instrument makers have met the demands for new types of instruments. Next the instruments needed in making ordinary electrical measurements are enumerated, and the requirements of a practical and satisfactory instrument for measuring voltage, current or power defined. The different types of instruments in common use are then classified and their respective advantages, disadvantages and limitations for various classes of work discussed. The six types of instruments considered are: Hot-wire, Electro-static, Tangent galvanometer, Dynamometer, D'Arsonval galvanometer, Electro-magnetic.

PART II.—After completing the discussion of the characteristics and limitations of the different types, the questions of specifications and installation are taken up. The importance of selecting a manufacturer who has learned the "trick" of making an instrument properly, is dwelt upon and suggestions are made as to the way of avoiding the troubles that arise between the maker and the purchaser and his engineer because the instruments are carelessly or ignorantly handled by the switchboard contractor. The permissible errors in instruments, the definitions of the ohm, ampere and volt, and remarks on testing and calibrating follow next, and the conclusion deals with special forms of indicating instruments.

PART II.

Further than this, the D'Arsonval instrument, which gives deflections directly proportionate to the current flow, lends itself readily to a large variety of measurements, such as determining resistances and measuring the drop of potential from which resistances and grounds may be readily computed. It is, however, a type of instrument which should be handled with great care, as rough handling or the presence of powerful external fields will permanently destroy the accuracy of its indications. Further, since it depends primarily for its continued accuracy on the maintenance of a field of uniform strength, as supplied by its permanent magnet field, instruments of this type should be frequently checked to ascertain whether the permanent magnets have maintained their initial strength.

A great deal might be said on the subject of the last type under consideration, namely, the electro-magnetic system, for there are probably more variations in practical construction contained in this type than in all the other types put together; some are good, many very bad. It is, however, unfair to adopt the policy of certain engineers, who unqualifiedly condemn every electro-magnetic instrument, solely and entirely on the grounds that they contain a moving mass of iron, which, in their opinion, must render the instrument subject to errors of lag and hysteresis. My practical experience with this type of instrument, covering a great many years, has taught me that it is perfectly possible to so construct an electro-magnetic instrument containing a mass of moving iron that errors of lag and hysteresis, if they are present, are so small as to be negligible. In order to achieve this result it is necessary, first, to proportion every part of the instrument with reference to all other parts; to carefully shield the instrument from the influence of external fields, and this by means of a shield that will not introduce errors due to its own retentivity. The iron employed should be very small and very light, and should be selected, after careful test, for purity and absence of retentivity. It should then be formed up with care, and so treated that oxidation is practically impossible. The field due to the actuating solenoid should likewise be carefully studied, and should be designed so that the moving iron will at no time be completely saturated, and yet of sufficient strength, in conjunction with the shield employed, as not to permit the indications of the instrument to be seriously influenced by external fields. In no case should two masses of iron be employed, as is common in some types of instruments, which depend on the repulsion of a moving vane by a fixed vane of similar polarity, both being energized by the actuating solenoid. It is almost impossible to free double vane instruments from errors of lag or hysteresis, and there is a further tendency for the pointer to stand off zero, due to the residual magnetism mutually induced in the two vanes.

The fact that the instruments constructed on the electro-magnetic principle contain no material subject to change or deterioration, coupled with the fact that they can be built solidly and substantially, and controlled by gravity in place of a spring or springs, renders them exceedingly reliable in practice. If their calibration is correct when first installed, there is no reason why the calibration should change with time.

In the above brief description of the most common types of indicating instruments, it may be noted that there is no one type which is universal, that is adapted for both switchboard and portable use for either direct or alternating current measurements. While we can very readily dispense with the hot-wire and electro-static instruments, the other four types are essential for some class of measurement, and for any particular line of measurement the most suitable system should be selected. It is possible that some day a uni-

versal system may be found, but, until that time, the user must select from existing types the one which in principle seems most applicable, not only to the character of electrical energy to be measured, but, also to the conditions under which measurement must be made.

There is no one line connected with the electrical industry in which so much attention must be paid to details as in the manufacture of electrical indicating instruments. A very prominent engineer remarked to me recently that he had examined the construction and operation of a great many different types of indicating instruments, and, while a number of them bore evidence of similarity in design and construction, yet, in some cases, the manufacturer seemed to have acquired the "trick" of proportioning, manufacturing and calibrating, while others utterly lacked the "trick." As a matter of fact, it is not altogether a case of acquiring the proper "trick," but is a case of studying the theory and design of instruments for a number of years, backed by a large and varied experimental experience, which marks today the difference between the successful and unsuccessful instruments in the various types commercially exploited. Account must be taken of the most petty details of construction, the most careful and skilled labor must be employed in each department, and every particle of material entering into the instrument must be carefully selected and tested with reference to its particular function.

Personally, I have seen the experiment tried of taking a finished and efficient instrument and placing it in the hands of a careful and skilled mechanic for duplication; every wire and every part would be, apparently, an absolute copy of the original, and yet the results obtained would be totally different. It follows, therefore, that it is always wise in placing orders for electrical instruments to select a house who have publicly demonstrated the fact that they have learned the necessary "trick" or "tricks" of their profession.

In no line does reputation count for more than in the manufacture of indicating instruments, nor is there any line in which I have been brought in contact where it takes so long a time to establish a reputation. Further than this, there is no line in which a greater amount of patience is required by the manufacturer. The average purchaser is totally ignorant of the laws or principles embodied in the instrument he is using, and, without regard to the fact that he may have selected the wrong type for the particular class of measurement he wishes to make, unhesitatingly blames the manufacturer for not having known what he wanted and for not having supplied him with the proper type of instrument by pure intuition.

Another obstacle which is commonly met by instrument manufacturers is the fact that for the average installation he is required to furnish instruments delivered to the switchboard contractor, who may or may not handle the instrument properly. It is true that most instruments are sealed, yet it is perfectly possible to utterly ruin the calibration of almost any type of instrument by improper handling without destroying the seal or opening the case. For instance, if a D'Arsonval instrument is laid upon the frame of an actively excited dynamo or motor, its entire calibration will be almost instantly changed, and yet no external evidence is presented to show exactly what has happened. Rough handling and an occasional fall, or improper packing for delivery to the plant, may further operate to destroy the accuracy of the calibrated instrument; yet the manufacturer is expected to provide instruments which will stand such usage and which, after they have been installed, may be subject to the influence of such strong external fields or such high external temperature as to make their correct indications impossible; and, after all of this, must have his instruments accepted or

rejected by the consulting or supervising engineer, who, on the day of the test, carefully checks them with his personal portable instruments, which are usually kept in almost ideal condition and seldom or never leave his immediate possession. Some day I trust these conditions may be modified to the extent that the engineer in charge will test and check the instruments, if he doubts the accuracy of the maker's calibration, before the instruments are shipped; or else issue instructions that the switchboard shall be drilled from template and the instruments set in place by the engineer's own assistants. In several cases I have succeeded in having the latter course adopted, with the result of mutual satisfaction on part of the owner, engineer and ourselves.

If arrangements could be made to have all instruments installed under the supervision of the engineer in charge, it would then be quite sufficient to have the specifications state the limit of error allowed in the indications of the voltmeters and ammeters; and this information, coupled with a specification covering the style of case, character of scale, range and class of measurement to be made, would enable the manufacturer to make an intelligent tender for the instruments required in any installation.

While a high degree of accuracy is desirable in all indicating instruments, it is particularly important that the voltmeter should be right within at least 1 per cent, since a variation of 1 per cent in voltage means a corresponding variation in the candle-power of every incandescent lamp which may be in circuit. It is quite well known that the candle-power of any incandescent lamp varies directly with the voltage, the variation being approximately 1 candle-power for every volt increase or decrease from the normal voltage of the system.

Further than this, a variation of 1 per cent from normal voltage on a system carrying incandescent lamps means a variation of about 16 per cent in the life factor of the lamp and about 3 per cent in the watt consumption per candle-power. Errors in the indications of ammeters do not produce such serious results, yet it is desirable that they should be accurate in order to obviate the danger of overload on circuit, translating device, or generator; and in the case of test instruments, as high a degree of accuracy should be demanded as is required in the voltmeter.

While on the subject of accuracy of indications, I would like to impress upon you the fact that, while we have three electrical units in common use, namely, the volt, ohm and ampere, the ohm and ampere are the only two fundamental units, the volt being a derived unit. The absolute ohm may be quite readily obtained, and, as you probably know, is defined by law as the resistance offered to an unvarying electric current by a column of mercury at the temperature of melting ice, 14.4521 grams in mass, of a constant cross-sectional area, and of the length of 106.3 centimeters. The ampere is likewise defined by law as the practical equivalent of the unvarying current, which, when passed through a solution of nitrate of silver in water in accordance with standard specifications, deposits silver at the rate of .00118 gram per second. The volt is defined as the electro-motive force necessary to send 1 ampere through 1 ohm. This, as you will note, gives us fundamental values for the ohm and ampere and defines the volt as a derived unit, and I am laying stress on the matter for the reason that the average electrical writer defines the volt as a fundamental unit equivalent to 1000-1434 of the potential at the terminals of a standard Clark cell, and then defines the ampere as that current which 1 volt will cause to flow through a resistance of 1 ohm. As a matter of fact, the Clark cell is a secondary standard, exceedingly useful in practice, but not designed for use as a fundamental standard, due to the fact that Clark cells will vary among themselves and will give a gradually decreasing voltage at their terminals after they have been in service any length of time. It is, further, impossible to take 1 ampere from a single Clark cell without permanently ruining it; and, as a matter of fact, the potential of a Clark cell is only correct when the cell is used on open circuit.

It has been rather difficult for me to understand why the absolute ampere has been so little used or so seldom referred to, when it is a unit more readily verified than is possible with the volt. It is true that the fundamental method of determining the ampere is rather slow and tedious, but it is extremely easy to obtain the absolute ampere in c. g. s. units, by the use of the tangent galvanometer. Defined in c. g. s. units, the ampere is such a current that, passed through a conducting wire bent into a circle of the radius of 1 centimeter, will attract a unit magnetic pole held at its center

with a force of one dyne; and this method applied to the tangent galvanometer gives the very simple formula of current equals galvanometer constant into the tangent of the angle of deflection of the polarized needle, the galvanometer constant being readily determined from its dimensions and the number of turns of wire, in connection with a determination of the value of the horizontal component of the earth's magnetism. Having once determined the absolute c. g. s. value of the ampere, we know that the practical ampere is 1-10 the value of the c. g. s. unit. Having obtained the absolute standards of current, expressed in amperes, and resistance, expressed in ohms, the standard volt is readily determined from the relations given in Ohm's law. With the primary units once determined, all others, such as the farad or coulomb, can be readily obtained.

To obtain absolutely correct standards of voltage and current for alternating current calibration, it is only necessary to calibrate a dynamometer voltmeter and a dynamometer ammeter in true volts and amperes, as determined by fundamental standards; then, as a dynamometer measures directly the square root of the mean square, it will indicate correctly the virtual voltage or current in an alternating circuit. In calculating resistance in alternating current instruments, it is necessary to modify Ohm's law to the extent of substituting impedance for resistance. Since impedance is the vector sum of the ohmic and inductive resistances, it is readily obtained by triangulation when the two resistances are known, or when one is known and the angle of lag can be ascertained.

While the design, workmanship and material entering into the construction of an instrument are of vital and fundamental importance, the actual calibration is equally important. Assuming the manufacturer has reliable standards of voltage, current and resistance, trained observers are necessary who should be instructed not only to properly mark the scale, but to check it; and should also be instructed to carefully test the instrument for errors due to reversal, to lag or hysteresis, and for errors introduced by the presence of external fields, or by the variations of internal or external temperature. Certain definite limits must be set for errors allowed, and no instrument permitted to go out until it has fully come up to the standard so set. In the company with which I am associated, we not only make all of these tests and check readings, but, likewise, provide an additional check on the calibration by plotting the calibration curve at the time the scale is made by the draughtsman, and if errors or irregularities are observed in the curve showing a departure from the standard curve applicable to the type of instrument under construction, the instrument is promptly returned to the calibrating room to have its readings checked, or to hunt for and remove the defect which caused the irregularity. It is a known fact that for every type of system there is a characteristic scale, following a more or less complex law, and any variation of the calibration from the normal indicates immediately that there is something wrong, either in the construction of the instrument or of some of the elements entering into it; or else it was inaccurately calibrated. I, personally, attribute a great deal of our commercial success to this intermediate checking in the drawing-room, and you can put it down as a settled fact that any manufacturer who produces instruments of any particular type the scales of which for corresponding ranges vary greatly from one another has not yet mastered the proper design or construction of his instrument.

It would be impossible to detail the many different kinds of measurements which can be made with the proper type of voltmeter, ammeter and wattmeter. In general, however, the possession of these three instruments enables one to measure not only voltage, current and power, but, likewise, capacity, inductance and resistance; and from these various measurements may be obtained data covering the performances of almost any type of generating or translating device.

There are many special forms of indicating instruments designed to indicate directly some of the various measurements most frequently employed, two of which, at least, are so universally used at the present time that they deserve, at least, passing mention. One is a voltmeter designed for use on constant current arc light circuits, capable of indicating directly the total electro-motive force of the dynamo, and so connected by means of self-contained switches that not only can the total voltage of the dynamo or circuit be read, but, likewise, the presence of a ground indicated and its actual value in volts directly determined. This involves an arrangement of connections so that the voltmeter can be connected

directly across the terminals of the circuit and then connected successively from the plus and minus side of line to ground. From the three readings thus obtained the number of lamps burning can be directly ascertained, the presence of the ground shown and the ground itself can be absolutely located by a very simple calculation. By employing, in addition to this, the known resistance of the instrument, the actual resistance of the ground in ohms may be obtained, thus defining its character.

An instrument of this character was brought out by my company some few years ago, and has met with almost universal favor, due largely to the growing tendency to measure resistances under full working potential. Such an instrument will show grounds which would not be shown by the ordinary galvanometer and bridge method of testing, and further enables the switchboard attendant to locate grounds while the line is in operative condition.

Another instrument which, for a time, fell into disuse, but which today is being used more extensively than ever, is the differential voltmeter, designed primarily to show the difference in potential between the bus bars and any dynamo which has to be connected to the bus bars in parallel with dynamos already operating. It is rather a curious fact that the average dynamo tender places implicit confidence in the indications of his differential voltmeter. The mere fact that he can see the pointer come back to zero when the free dynamo is being brought up to voltage, and the knowledge that when the pointer does stand at zero he can throw the free dynamo into circuit without danger of trouble, impresses him with the idea that the instrument is essentially reliable and accurate, and he is ready to condemn any or all of his regular switchboard voltmeters which fail to agree with it in indication. This tendency has led my company to devote special attention to the calibration of differential voltmeters and to furnish them with a full scale which indicates the exact voltage of the bus bars, in place of furnishing instruments which give full scale deflections for 10 per cent or 20 per cent of the normal voltage.

In closing, I would say that I know of no subject connected with electrical engineering which promises such rich rewards for investigation as the subject of electrical measuring instruments, and if my hasty and very general review of the subject will influence any one to pursue the subject thoroughly and scientifically, I shall feel more than repaid. I have confined practically my entire time and attention to this line for a number of years and find the subject grows more interesting the further I investigate it, and I hope the time is not far distant when the literature on this subject will be as complete and as comprehensive as that now available in allied branches of electrical engineering.

THE FUNNY SIDE OF THE TRAMWAY EXHIBIT.

(From Our Own Special Correspondent.)

At the recent International Tramways and Light Railways Exhibition at London some of the exhibitors enjoyed a quiet laugh at the expense of the town councilmen who visited the hall and were betrayed into mistakes because they did not fully appreciate the technical points of the appliances shown.

Mr. Harold P. Brown, of New York, gave away as a souvenir a little leather purse and enclosed therein was what looked like a \$1,000 bank bond, but on examination turned out to be an advertisement for plastic bonds. The chairman of the _____ city council visited Mr. Brown's exhibit and was much interested in the explanation of the bonding process. He had an armful of catalogs and pamphlets that he had previously collected and Mr. Brown, noticing this, remarked that he would give him a little remembrance that he would be likely to retain when the mass of printed matter had been mislaid, and thereupon presented him with a purse which was accepted with many thanks; but when it was opened and the folded bond inside came in view great was the chairman's indignation. "You have fallen very low in my estimation, sir," he exclaimed. "You can not influence my vote by giving me a purse of money, sir; such proceedings may prevail in your land, sir, but not here, sir; I will have nothing more to do with you, sir." And with that he started away. Mr. Brown, however, after considerable talk convinced him that the gift was not a bribe and that the enclosed bond was not negotiable and the chairman departed with the purse and his bond, with the laugh against him.

A very distinguished looking gentleman gazed very wisely at the Ohio Brass Co.'s exhibit of overhead material. The company's representative, Mr. Harwood, approached and inquired if he was interested in the exhibit. "Oh, yes," the gentleman replied. "You see I'm a member of the _____ city council and I'm interested in everything, don't you know?" "Can I give you any information about our goods?" Harwood asked. "Oh, no, thank you, I quite fully comprehend most of them I think, but if it would not be troubling you too much, could you kindly tell me what they are for?" was the reply.

The Doulton Co., Ltd., of London, showed a line of clay conduit material for underground wires, and in the center of the exhibit was displayed a section as it would appear under the street with the manhole built up to it. A deputation halted in front and examined this section most carefully. Finally one of them ventured to remark that he thought "if the bottom of the manhole were raised up even with the little conduit chambers that the sewage would flow easier and not collect in the bottom of the pit."

The question of how to keep a seat dry in rainy weather and still have it out in the open on the top of a tram car seems to have stirred up the inventive genius of Great Britain. Fully 50 seats were shown, and they were certainly most wonderful to behold. Each seat was accompanied by its inventor in a more or less state of enthusiastic frenzy who spent his time raining on his invention with a large-sized sprinkling can and insisting that no dampness occurred. Some of the seats were arranged to fly upside down when not in use and others had covers that closed by their own weight, giving them the appearance of small roll-top desks. Full instructions were printed on each seat telling the passenger how to sit down.

One exhibit showed a device with a seat portion very much like a row of knife blades on edge, the object being to do away with exposed surfaces, while another perspiring inventor claimed that the proper seat to use in wet weather is one made of woven wire stretched over an ordinary seat. Your representative tried this for a moment and the underneath part of his clothing was crimped most beautifully for several hours by the wire imprint. Most of the seats shown would have to be operated by an expert, and if the many conditions were not exactly fulfilled they "wouldn't go."

ELECTRIC TOWING IN OHIO.

Mr. T. N. Fordyce, of Detroit, writes us that he has closed contracts with the State Board of Public Works of Ohio, giving him permission to build an electric railway along the tow-path of the Miami & Erie Canal, on which will be operated heavy motor cars for the purpose of towing canal boats. He adds that recent experiments in which he has been interested have demonstrated that an electric locomotive running on the canal bank will tow 500 tons of freight at the same cost that 50 to 60 tons can be pulled by mule power.

OBSERVATION CAR AT DETROIT.

A special parlor car making regular trips around the city at stated intervals will hereafter form part of the regular service furnished by the Detroit Citizens' Street Railway Co., the idea being to provide a pleasant way for strangers to see the principal points of interest in the town. On each trip the car passes through the wholesale and retail districts as well as the finest residence portions of the city, affording a magnificent view of the Detroit River, Belle Isle Park and Water Works Park, the round trip taking about two hours, for which 25 cents is charged. A competent attendant is always in charge to explain the different features along the route. The car leaves the heart of the city at 9 a. m., 11 a. m., 1 p. m., 3 p. m. and 5 p. m.

Pocatello, Idaho, has an electric line. There are 2 1/4 miles of track and the equipment comprises three old horse cars that have been fitted with motors.

Dispatches state that the long legal contest waged by the city of Madison, Wis., to compel the street railway company to tear up a portion of its tracks, is to be settled by the city's lending the company \$10,000 to lay new pavement, which is an admirable method of settling disputes of this kind.

AUXILIARY WATER-DRIVEN PLANT OF THE ISLE OF MAN TRAMWAYS.

In the "Review" for February there were a number of views along the line of the Isle of Man Tramways, with an account of the method in use for carrying heavy freight. The following description and illustrations, taken from the London Electrician, of a novel water-power plant, recently completed by this company, will be of interest. The line, which derives the greater part of its traffic from summer tourists, during five months in the year is operated from several steam power stations, but to carry the load in the winter, when the road is dependent on the local passenger and freight traffic, which is comparatively light, a water power plant has been erected at a point on the Laxey River, seven miles from Douglas, and 11 miles from Ramsey, the terminal stations. From this power house, for the seven months of light load, current will be distributed over the system in both directions and the steam plants will be shut down. As all the coal used by the company has to be brought from South Wales, the financial saving will be considerable.

The water is taken after it leaves the washing floors of the Great Laxey lead mines, and the tail race discharges direct into Laxey harbor, the total fall being 41 ft., which, after deducting pipe losses, etc., allows a working fall of 38 ft. As part of the water is used for ore-washing purposes at the Snaefell and Great Laxey mines, it contains an immense quantity of sand, and special precautions had to be taken to prevent this from reaching the turbines.

The head work consists of a concrete weir 40 ft. long by 4 ft. 6 in. high, built across the river. At one end of the weir are two masonry archways, 5 ft. wide by 5 ft. high, each fitted with a sluice gate and the necessary gear for raising and lowering the gates. The two gates are separated from the river by means of an iron grating 55 ft. long by 5 ft. 6 in. high. During floods a large amount of debris is washed down the river, and the grating protects the gates from being blocked. Inside the gratings is a large settling tank for the sand, the tank being emptied by opening the gate nearest the weir, which is used as a by-pass for flushing purposes. The other gate is at the commencement of the head race, which consists of 826 ft.

a 12-in. flushing valve. At the end of the second section of race is a masonry head box 8 ft. by 11 ft. by 7 ft. 9 in. deep, from which the water is conveyed to the turbines through 820 ft. of steel pipe 3 ft. in diameter. The head box has also been built to act as a settling tank, thus preventing any sand from entering the pipes. The pipe line is made of 1/8-in. steel plates and is in 15-ft. sections with double-riveted seams; it is carried several feet above the ground on masonry piers.

The turbine house is 1,100 ft away from one of the company's steam power stations, and is a stone building 30 ft. long by 15 ft. wide by 12 ft. high. The fall from the level of the weir to the center of the turbine is 26 ft., the remaining 15-ft. fall being obtained by means of draft tubes. The turbines are of the Victor horizontal type, and consist of two independent 12-in. turbines in one casing

TURBINE, MOTOR AND BOOSTER.

with the shafts direct coupled; so that when the water is low one turbine will be used, thus enabling the plant to be worked at its best efficiency. The turbines will develop 140 h. p. at a speed of 720 r. p. m.

The electric generating plant consists of a combined bipolar dynamo and booster, the generator having an output of 160 amperes at 520 volts and the booster 160 amperes at from 100 to 200 volts. The generator and booster are coupled to the turbine by means of a friction clutch, which permits them to be used as an ordinary motor-driven booster plant when only a small amount of water is available. The mains from the generator and booster and the regulating wires are carried overhead to the steam power station near by, from which the turbine plant is entirely controlled. Two Lundell

HEAD AND TAIL RACES.

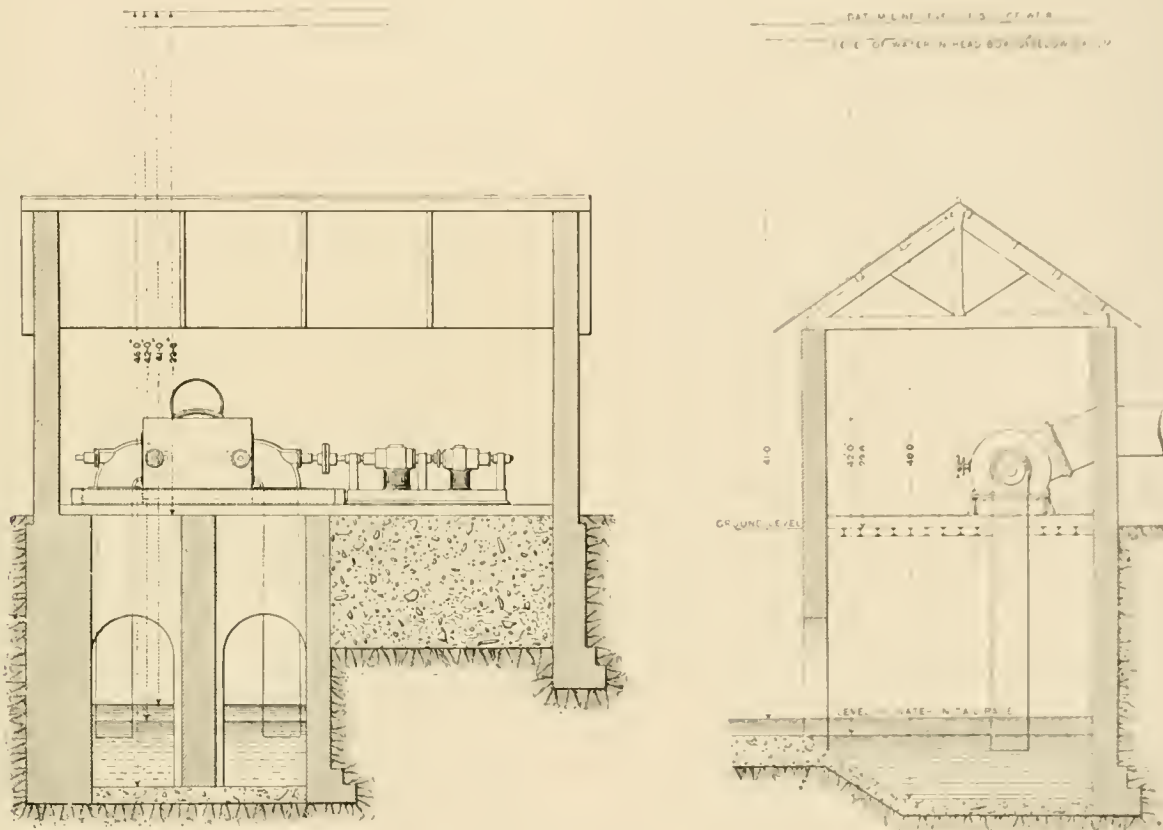

of trench 5 ft. wide, followed by 474 ft. of trench 3 ft. 6 in. wide, the depth in both sections being 4 ft. 6 in. The first portion was made larger in sectional area, to allow the water to travel slowly and permit any sand which might have passed through the first settling tank to settle to the bottom. At the end of the larger section of the race another settling tank has been formed by dropping the bottom of the trench 6 in. for a distance of 50 ft., and providing it with

1/4-h. p. motors, driven from a small storage battery, are used for opening and closing the turbine regulators. The switch panels for the generator and booster are on the main switchboard in the steam station. They comprise one generator panel, together with automatic switch, ammeter, voltmeter, positive and negative switches, shunt regulating switch, starting switch, and resistances for regulating the generator as a motor when it drives the booster during

periods of low water, and a recording wattmeter. The booster panel contains switches for controlling a motor-driven booster in the steam station, and also the switches for controlling the turbine booster—viz., positive and negative switches, voltmeter, ammeter, shunt regulating switch, recording wattmeter, and change-over switches to connect either the turbine-booster or motor-booster to any of three feeders. Adjoining the generator panel is a small panel for controlling in either direction the two 1/4-h. p. motors for regulating the turbines. A small pipe has been carried from the head race, and is attached to a gage glass fixed in a prominent position near the switchboard, so that the attendant can see the height of the water in the head race.

AMERICAN STREET RAILWAYS AS SEEN BY AN ENGLISHMAN.

A subject much discussed in both the technical and non technical press of England during the last year is that of American engineering competition, and one of the late articles appearing in the special correspondence of the London Times deals with the means of transit for passengers as a factor of America's success in manufacturing. On this side of the Atlantic the trolley car is so familiar that many patrons give it little thought, forgetting the conditions that obtained before electric traction was developed as it is today. Seen through English eyes the situation is thus de-

SECTIONS OF TURBINE HOUSE, ISLE OF MAN.

The turbine plant is worked in connection with three battery sub-stations, each containing 250 cells of the Chloride "R" type, one at Laxey, at the foot of the Snaefell mountain railway, and the other two about five miles on each side, all three stations being worked in parallel. When the cars are taking current the turbine generator is assisting the batteries, but when the cars are descending the grades or standing, the generator is charging the batteries. During the night when the cars are not running, the booster is connected in series with the generator, and the batteries are in turn charged at a heavy rate and at a high voltage through underground feeders. This enables a full load to be maintained continuously on the turbines. This is said to be the first street railway plant in the United Kingdom where storage battery sub-stations have been installed.

This auxiliary water-driven station was the idea of Alexander Bruce, the chairman of the company, but the plant was designed and built under the supervision of J. Shaw, the general manager and engineer. The turbines and pipes were supplied by F. Nell, of Queen Victoria Street, London, and the generator and booster by the Electric Construction Co., of Wolverhampton.

The Bulletin of the International Railway Congress states the best wood known for use as ties is quebracho, which is found in great quantities on the level prairies of Argentina, S. A. It weighs from 77 to 87 lb. per cu. ft., has a tensile strength of 17,000 lb. per sq. in. In transverse tests the stress in the outer fiber at breaking point was about 22,000 lb. per sq. in.

scribed: "In the more settled states wherever a town of any size is approached there are the electric railways radiating for miles out into the surrounding district. They run along the main streets of the cities and out into the country, over roads hardly formed, across fields, upon narrow ledges scarped out of precipitous hillsides (as at Pittsburg), up banks so steep as to be inaccessible to horse traction, and over slender viaducts and river bridges. Inside the cities the cars go everywhere. If a man wants to settle some business a mile or two away he finds out by telephone whether the person is at home and then steps outside. When once in the car he knows it will keep going at a good speed, and he will cover the mile out and the mile back in ten minutes or so."

The writer compares this with an extreme case of seven minutes which he required to go a quarter of a mile in a London omnibus.

Some of the interesting points of American practice noted are the following: The subway in Boston where the narrow, crowded streets present a parallel of the conditions in London. The success of the New York, New Haven & Hartford in operating an electrical suburban service and a main line steam service over the same track, as is done on some of its branches. Concerning this last it is said, not without exaggeration, perhaps: "To a cautious Englishman one of the most striking of the drawbacks is that the naked conductor is laid at the ground level and the tension of current is high. Now American railways are hardly fenced at all, and grade crossings are frequent. It is a little unsettling to see children playing on the side of the track and also using it as a

thoroughfare to and from school, after the manner of American children all over the Union. But the Americans hold the view that if a man has not sense enough to keep clear of a third rail, the United States has no use for him. Our Board of Trade principles are not popular there."

The effect of well-meant but hampering legislation in restricting the development of electric lines in England is mentioned and deplored.

AN AUTOMATIC BLOCK SIGNAL SYSTEM.

We are indebted to Mr. C. F. Bancroft, electrical engineer of the Massachusetts Electrical Cos., for data concerning the automatic block signal system invented by him and Mr. P. F. Sullivan. The system was installed on the Lowell (Mass.) & Suburban Street Ry. in February, 1898, and its successful operation led to equipping the Lowell & Nashua line about a year later.

It is designed for a single track road with turnouts, and the principle of its operation will be understood from the description. The trolley wires on the tangent portions of all the turnouts are insulated from the other portions of the overhead line and supplied with current from feeder lines; in each connection from the feeders to the insulated sections at the turnouts is an electrically operated switch the movements of which are controlled by the cars on the line. The effect of a car passing a turnout is to render dead the turnout section just passed by it, to render dead the section at the next turnout ahead that must be used by an oncoming car, and to make alive the section at the turnout next preceding the one just passed. This will appear from tracing out the connections in Fig. 3 and the details will be more fully described later.

One of the turnout contacts by means of which current to operate the switches is obtained, is shown in Fig. 1. Two span wire hangers are placed a short distance apart and connected by a copper strip or light angle bar over the top. When the trolley wheel of a car passes underneath it slightly deflects the trolley wire and makes electrical connection with the overhead bar, and thus permits a current to flow to the automatic switches controlling the insulated turnout sections.

Fig. 2 shows one of the automatic switches and its box. The switch lever is moved by one of a pair of solenoids; each of these

FIG. 1.

FIG. 2.

coils has a resistance of about 1,500 ohms, so that with the ordinary line potential of 500 volts the current flow is about 1-3 amperes. The switches are in weather-proof boxes, mounted on the line poles, and are connected with the proper contact plates by ordinary No. 8 B. & S. bare iron wire. Three wires run from turnout to turnout, and if deemed desirable a three-wire insulated cable could be used. The ground wire of the automatic switches is connected to the rail return, or a return wire may be used.

In order to avoid the inconvenience of running onto a dead section at night and cutting off the lights in the car, a cluster of five incandescent lamps is connected to each insulated section so that the motorman at night can tell whether the section is alive or dead, and if dead he holds his car on the curve of the turnout till the signal light shows the insulated section ahead of him is free.

The equipment of contact plates and switches and the wiring system are shown diagrammatically in Fig. 3. The heavy lines indicate the feeders from the power house and the track return. The medium weight lines are the trolley wires and the light lines the wires of the signal system. The sections of trolley wire between turnouts are connected to the feeders, and insulated from the two sections over the tangents of the turnouts as indicated by the openings.

At each of the three turnouts I, II and III are two automatic switches, one marked U for the out or up-bound side of the turnout and one marked D for the in or down-bound side of the turnout. Each of the U switches has two solenoids on one end, and one on the other, while the D switches have one only on each. There are five contact plates at each turnout, two, marked A and B, for the up-bound cars and three, marked 1, 2 and 3, for the down-bound cars.

FIG. 3.

Now consider a car approaching turnout II, from I. The up-bound section at I is dead and prevents a car from following, and the down-bound section at II is dead and prevents another car from entering the section from II. As the car strikes contact A₂ at II it closes the circuit through the left-hand solenoid at D₂ throwing in the switch at that point, and also, by a branch wire, closes the circuit through the left-hand solenoid at U₁, throwing in that switch, and releasing both the following car held at I and the opposing car held at II.

Now let the car pass over the insulated section, supposing it to be alive; on reaching the contact B₂ the current is closed through the switches at U₂ and D₃ opening them both.

Next take the case of a down-bound car approaching II from III. In this case the switches at U₂ and D₃ will be open. On reaching the contact 1₂ current is sent through a solenoid at U₁ opening that switch. The car then proceeds to contact 2₂ and the necessary connections are made to close the switches at D₃ and U₃. Passing the insulated section it strikes the contact at 3₂ and opens the switch at D₂, and also that at U₁ in case the latter should have been closed, as for instance by a car passing contact 2₁ after the car at 1₂ had opened it.

It will be apparent from a study of the wiring in Fig. 3 that an up-bound car does not cut out the down-bound section of the next turnout until it is leaving its own turnout, but that a down-bound car cuts out the up-bound section of its next turnout before entering the insulated section of the turnout where it then is. This takes care of the possibility of up and down-bound cars striking the corresponding contact plates at the same instant, as the up-bound car will have to halt because of the power having been cut off of the insulated section by the down-bound car at the next turnout ahead.

The cost of this system is given as \$200 per turnout, when they are about a mile apart; the automatic switches cost \$25 each.

The Chicago City Council has under consideration an ordinance requiring street cars in this city to be equipped with effective brakes, although most of them are now fitted with as good braking devices as can be obtained for cars of their size.

All the employes of the Butte (Mont.) Consolidated Railway Co. took supper at one of the best restaurants in town one evening last month at the company's expense. The men had been kept unusually busy all day owing to ball games at one of the suburbs.

THE EVOLUTION OF CITY STREETS.

BY WILLISTON FISH.

Mr. Fish is a native of Ohio and was graduated from the West Point Military Academy in 1891. He served as an officer of the 4th artillery until 1897 when he resigned to go with the Crane Elevator Co., of Chicago. In 1899 he went with the South Chicago City Railway Co., in which his father-in-law, Mr. D. F. Cameron, was interested, and remained there until September, 1899, when he became secretary to Mr. Spalding, then president of the Chicago Union Traction Co., and is still with that company.

In this paper the author first mentions the growth and development of animals and of cities, and then shows the importance of roads to communities of men. The history of roads and streets is briefly taken up and their growth traced, particular stress being laid on the specialization of city streets by assigning separate portions of them to different uses. The advantages of further differentiation with the object of securing better street car service are pointed out and some suggestions made as to the course future developments will probably take. It is then shown that elevated and underground roads are of but limited application, and that the solution of urban transportation problems is easy if the surface street railways are permitted to develop along the lines suggested.

All things change, and as long as the sun shines warm all things will tend towards perfection. It is the purpose to here consider somewhat the history of roads in general, and of city streets in particular, and to point out certain simple but important changes that seem to be at hand in the methods of using them.

Fortunately for man in his capacity of student natural phenomena are governed by a few fixed laws, and a study of one branch of science leads to knowledge of others. In considering streets, so close an analogy may be drawn between the evolution of animals and that of cities that the writer may be pardoned for dwelling upon it. Thus, as everyone knows, plants and animals are communities of cells, and the same laws which govern their growth and development are concerned in the growth and development of communities of men. People in an early time lived scattered through wide spaces, each individual depending upon himself for support, like the one-celled animals. Camps, villages and cities were formed by a process analogous to the process of formation of many-celled animals.

The first man from observing the one-celled and the many-celled animals might have foretold that some time, if the world lasted, there would be vast cities; and an examination of the system on which a large aggregation of cells is formed would have shown him many things about the organization of cities. For instance, it would have shown him that certain individuals would be selected as the governing body, like the cells of the brain; that other individuals would be detailed to bring in food, others to prepare it for use, others to distribute it. He might have foretold that cities would, if necessary, have walls and soldiers for external defense, and police for internal protection. And the cities would have streets for bringing in supplies of food and fuel and air, and for distributing them. And further he might have known that in the beginning all of these things would be imperfect—sufficient at the time, but insufficient for the future.

The first man of course did not foresee these changes which were radical, comprehensive and far in the future, but it should not now be an over-difficult thing for us to predict the changes that a few years will bring about in the use of streets. We know more about streets than the ancient man knew about zoology. He thought a clam was a clam and a deer was a deer, and that that was all there was to it. Sometimes, it is true, we appear to suppose that a boulevard is a boulevard, and an inextricable confusion a business street; and that that is all there is to it. But we know something about the history, and therefore about the composition of things; the ancient man did not. When a reasonable length of right line is given it is easy to extend it with accuracy, and say where it will run. The early man had no part of the right line given except the point at which he lived. In determining the future of city streets we have given to work from, much of the history of cities, a little of the history of roads and a great deal of the history of the evolution of animals and plants.

All the books treating of roads that the writer has seen, begin learnedly with a profusion of detailed information about the Roman roads and then abruptly pass over hundreds of years to the roads of France. One writer taking a condor flight over those dark centuries, notes the one luminous point that Cordova was not paved in 850. It probably continued not to be paved, for he speaks of it no more.

The reason of this paucity of information is that until recent times there were few roads worthy of mention. Road making and road using did not progress with the other arts. If men had studied them as long and ambitiously as they have studied war, politics, language and logic, every country would always have had in its roads, monuments to be noted in history with its pantheons, temples, schools, war-gained territories and memorials of kings. That roads have been insignificant is apparent not only from the

silence concerning them but from the crude use made of roads, and from the extravagant fuss made over the Roman roads which were, in fact, no great matter. Until modern times commerce by land was not great, and the use of roads was but trifling.

Beckman says that in the works of Greek and Roman writers he finds more proof of paved highways than of paved streets. That is the way he begins. The paved highways were those Roman roads, and he immediately turns to the roads of France. Paris, he says, was not paved in the twelfth century, but in 1184 a small amount of paving was ordered, and the name of the city was changed from Lutetia to Paris. The authorities of the city did not know much about practical matters, but, with the rich learning of the time, they knew that Lutetia was Latin for filthiness, and so they changed—the name. A little light is thrown upon the condition of the streets of Paris in those times by the following history: In Paris Oct. 3, 1131, there died a prince, the son of Louis the Fat. His death was due to an accident to his coach caused by hogs running in the streets. "An order was issued thereupon that hogs should not be allowed to run in the streets, but this order was opposed by the monks of the abbey of St. Anthony, because, as the monks represented, it was contrary to the respect due their patron to prevent his swine from going where they thought proper, and it was found necessary to grant the clergy an exclusive privilege, and to allow their swine, if they had bells, to wallow in the dirt of the streets without hindrance."

In London in 1090 the church of St. Mary le Bow was blown down, and columns 26 ft. long sunk 22 ft. in the mud. The history unnecessarily adds that the streets were of soft earth. Holborn was paved by royal command in 1417. Smithfield Market in 1614. In the seventeenth century the streets of Berlin were never swept, and swine wallowed in the dirt the whole day. Till 1641 sties were erected in the streets and even under the windows. Laing, in "Notes of a Traveler," says he found Berlin in 1841 very fine and very nasty.

Through all these times the usual roads were simply foot-paths, cattle-paths, and roads practicable for saddle and pack animals only.

Prof. Shaler, in speaking of the evolution of roads, says: "Let us note that the first step which men make above the savage state is closely related to the progress of their desires. When they cease to be content with the simple goods which they may obtain from nature about them, when they seek by trade or war to win profit from their neighbors, then the questions of transportation and of routes to be followed present themselves. If the savage in the first steps of his up-going on the way to civilization is so fortunate as to obtain possession of animals which can be used as beasts of burden the road problem at once opens before him. Beginning with pack transportation following his older trails, he soon learns in a rudimentary way the simple arts of road engineering. The pack-train state of civilization may be said, as far as transportation is concerned, to be the first stage of that development. It was a stage which was long continued even in the oldest settled lands. It is consistent with considerable advance in cultivation but not with high commercial development. More than one-half of the world is still in the pack-train stage. This is true of South America and a considerable part of our own continent. Within twenty years the writer has seen in eastern Kentucky a caravan of small mountain-bulls, each provided with a sawbuck saddle in which were packed the exportable products of the district."

Anyone may deduce the history of the development of cities, in a general way, from his knowledge of former times. The general evolution of many-celled animals has proceeded in a parallel course.

The very lowest organisms have no definite tubes at all. Their

food, fuel and air travel by diffusion or osmosis. That is the way men traveled at first—by diffusion. When they wished to reach a point they simply started towards it, and made their way as best they could—as we do now when we hear a squirrel chattering in the woods. Animals had at first no blood; men, no commerce. Size and activity in animals necessitate blood, and size and activity in nations and cities necessitate commerce. The highest form of life will have the most perfect system of tubes for the circulation of blood, and the highest state of commerce demands the best roads.

It follows from the general likeness between the organizations of animals and cities that cities must have streets ample to bring in and distribute food, fuel and air, and such other things as fit men's evolved needs. They should reach every point, and be of easy passage. In animals arteries must be amply large, or too much labor will devolve upon the system in pumping the blood.

WILLISTON FISH.

Obstructed, difficult streets represent labor thrown away. If the arteries and veins are too small or too difficult of passage, the blood must circulate more slowly, with the result that there is less activity. Animals with poor circulation are generally small and sluggish.

In the general analogy between the evolution of the metazoa and that of cities is included a particular analogy which, in connection with the present subject, deserves especial mention: The analogy between the specialization of tubes and the specialization of roads. Both tubes and roads began as indefinite ways; when definite tubes were first established they were used indiscriminately for all the purposes of tubes; and when definite roads were first established they were used indiscriminately for all the purposes of roads. Just as tubes have been produced or set aside for special uses, we find roads established or set aside for special uses under the same general law, and when in cities the process has not yet been carried as far as conditions now demand we shall expect it to be continued in conformity with the analogy between cities and the metazoa, and with the particular analogy between tubes and streets.

In general roads a striking specialization has already occurred, dividing these roads into wagon roads and steam roads. The steam road offers a special way for heavy, concentrated, permanent traffic requiring long hauls or high speed. The steam cars and the road wagons do not use each other's paths. There is a complete differentiation. Yet, of course, each started from the trail over which all traffic ran in common. It is interesting to note that the necessity for this differentiation and specialization of the steam road from the highway was not at first appreciated, and the charters of the early New England railroads provided that the general public should be permitted to use the tracks for wagon traffic.

City streets also begin with the trail, and, though the specialization of city streets began long ago, it has proceeded slowly and intermittently. It is said that the streets of Herculaneum and Pompeii had raised banks on each side for foot passengers. But sidewalks have been far from common in cities. Laing says of the streets of Berlin in 1841: "They are spacious and long, with broad margins on each side for foot passengers, and a band of plain flag stones on these margins makes them much better to walk on than the streets of most continental cities." Another

specialization in streets has been the setting apart of certain streets for pleasure-driving, and another is the building of elevated roads.

Roads therefore show the following evolution: First, roads or ways were general, and people traveled by diffusion; then there were paths or trails in which all travel proceeded in common. When cities arose, a heterogeneous traffic occupied the whole of their streets from wall to wall. After a time the width of the city street was divided to separate pedestrians from horsemen and vehicles, thus making sidewalks and a roadway. To some extent the law of the road divides this roadway into two parts in which travel moves in opposite directions. Street cars, where used, commonly run upon the middle of the street, but have in fact no separate path. The roadway in streets is practically common ground with little more mark of intelligent division than was shown on the pack trails.

In this roadway space are heavy, slow wagons, light, rapid wagons and carriages, and street cars heavier than the heavy vehicles and more rapid than the light ones, all of them moving over common ground. They get along as best they can. They work their way. They are often blocked, and carriages and cars never attain the speed of which they are capable. In other words, between curb lines travel is still proceeding by osmosis, and we leave our betterment to time as the mollusk did. Of course our cities are wonderful organisms, and their system of distribution affords sustenance to all the individuals, but so is an oyster a wonderful organism, and its system enables it to live without discomfort; but still it is only an oyster. The present system of ways in cities is not sufficient for the better cities of the future.

But suppose that a city is already built with narrow difficult streets. What is it to do? It is to do the best it can, as the animals do that have radical faults of construction. When superior animals arise they prey upon the inferior or seize their feeding-grounds, and nature abandons the inferior design. So, well-designed cities seize the commerce of ill-designed ones. Nature is even less sentimental than man, and she also lacks his pride of opinion. She loves only success. An extension of ways where necessary and a specialization of ways are the conditions for the advance of cities as they have been for the higher evolution of animal life.

The middle roadway of streets in the largest cities should be further divided. The nature of the case demands it, and the change is as sure to come as cities are to be larger, stronger and more active. The problem concerns heavy, slow traffic, light, rapid traffic and street car traffic. The two kinds of vehicle traffic should be separated. The ideal solution would be to have streets sufficiently wide to afford separate paths for each kind of traffic. Prof. Shaler says: "On the main line between Boston and Lynn it may be desirable, where possible, to have two different kinds of pavement arranged in strips parallel to each other; that of blocks for heavy-laden vehicles and macadam for lighter transportation. The success of such a method would depend, however, upon the efficiency of regulations which would serve to keep the two classes apart."

Many streets, of course, are not wide enough to afford these separate paths. One such street might be given up to one kind of traffic and a corresponding street to the other kind. In any case where the two ways are established each should be protected from invasion by traffic from the other. Boulevards are already so protected. Self-interest would be sufficient to govern traffic if self-interest were always apparent. Where it is not or where it is lost sight of in the temporary individual interest of teamsters and drivers it should be supplemented by positive regulations.

One positive regulation of traffic that seems highly desirable may be mentioned here, although it falls outside the scheme of this article. Owners or employers of horse or power vehicles sending them upon crowded city streets should be made financially responsible, as by a bond, for damages to property and injuries to persons arising from the negligent construction, maintenance or operation of the vehicles. A right of action against such an owner or employer who is possessed of property subject to execution may be enough to cause him constantly to take every care in hiring servants and maintaining his vehicles in safe condition, but the thousands of wagons upon the streets belonging to irresponsible people who sometimes add to their irresponsibility ignorance and indifference, are an uncurbed danger which a perfect city will not tolerate.

The specialization of the path of electric street cars deserves particular consideration. First, because they are the means of transit of such enormous numbers of people, and, second, because being exceedingly heavy, and capable of high speed, they can not to the general advantage run mingled with other traffic. They need a separate path for reasons similar to and now rapidly approaching in degree those requiring a separate path for steam cars. The weight and speed of street cars cannot be made less. Probably the weight will increase. The speed of the modern electric car is its most valuable quality. That this speed should be utilized instead of being confined is perhaps more apparent if we, for a moment, suppose ourselves still limited to horse cars, with our large cities expanding from a 3, 4, or 5-mile radius to a 6, 10, or 15-mile radius. Beyond the shorter distances horse-car transportation practically can not go. It has an absolute and narrow limit. A strong city striving to expand with such a cinch about it would afford the same spectacle as a vigorous tree trying to grow against an iron band. If such a limit existed now we should consider the discovery of some power capable of breaking through it as of vital importance. Some years ago the cable was seized upon as such a power, and, although enormously expensive, it was installed on many lines. It is no longer equal to the times, the people do not want it, economy of living can not endure it, and the costly machinery of the cable is worth nothing in the market today except as scrap. Fortunately, we now have electricity. It should be allowed to stretch and push out the limits of a large city's growth to the utmost. If allowed to do this freely, it will do it so well that not only will it make possible a vastly greater population, but it will allow this population ample space and air, and save it from living crowded together like the cliff-dwellers in their canons.

It might be claimed that the future specialization of street-car service has already had its beginning in the subways and elevated roads. This is not at all the case. Costly subways and elevated roads—roads whose cost per mile makes the Roman roads seem in the class of corduroy—cannot be used to transport all or any great part of a city's population. The economy of nature will no more permit it than it will permit arteries to run at maximum size from the heart to the extremities: they are not proportioned to the work to be done. Thus, the mileage in Chicago of elevated roads, single track, is about 93. The mileage of surface roads is more than ten times as great. It is to be noted, too, that as city living becomes more hygienic, and the air spaces greater, the elevated roads can not increase in mileage as the surface roads can. The elevated roads have perhaps no further problems to solve except cheap construction and connection with surface lines. The problem affecting a large city's transportation, the city's growth, and the health, vigor and activity of its people, is the problem of the surface roads.

In New York there are a little more, in Chicago a little less than a million passengers daily on the surface lines. It is an enormous army in either case, and its transportation may well occupy the attention of the best generals.

Some part of the street-car streets, say the middle sixteen feet now used, should be given up as fully as possible to street-car service. Extended boulevards from 80 to 200 ft. wide, surrounding and dividing the city, provided with the best pavement, ornamented with trees and flowers, and cared for by gardeners at public cost, are not too much for the little corps who infrequently use them for pleasure. A strip 16 ft. wide on a few streets is not too much to devote to the daily transportation of the rank and file, or rather, of the whole army. That this strip is not too great in proportion to the use is easily seen. The total miles of street-car travel in a large city is more than double the miles of travel on foot; yet the 16-foot strip, considering the limited number of streets occupied by car lines, is but a small fraction of the space given up to sidewalks.

But with a 16-foot strip on the necessary streets given up to street-car transportation, would enough space remain for wagon traffic? There can be no serious question of it. In the first place specialization of parts increases the capacity of the whole. In extreme cases other traffic might be limited to one direction only, as is now done in certain of the narrow streets of Amsterdam where vehicles must make a detour and enter from one direction only. If other wheel traffic yielded the exclusive use of this proposed space it would still enjoy in a city like Chicago, taking all the streets together, more than eleven times as much space for

itself. Suppose that all of Chicago's streets were thrown into one street, 2,600 miles long and 66 ft. wide, and suppose that the street cars were given the exclusive use of a part of this width proportioned to the total space they now occupy in the city streets. The 66 ft. width of this hypothetical street would then be divided as follows:

Sidewalks 28 ft.

Wagon roadway 35 ft.

Car tracks 3 ft.

The question whether street car traffic could be allowed the exclusive use of its present tracks, except at crossings, is thus reduced to an absurdity. The idea, which undoubtedly exists in some places, that this traffic can not be exclusive, arises from the jealous fancy that whatever might be allotted to street cars would be taken from the public. On the contrary, it would be devoted to the use of the whole public.

It seems apparent that the great streams of passenger travel should occupy this 16-ft. strip as exclusively as possible, and that the only question is how exclusive this occupancy may be. Experience will determine this, but the present use of sidewalks furnishes a guide. Wagons cross sidewalks only at cross-streets and alleys. At cross-streets vehicles would have to cross the car tracks, but at other points the necessity of crossing them would rarely occur. No need of longitudinal travel on the tracks would arise except in a few special instances. Our streets are often called "congested." In fact there is plenty of room upon the streets, and the question is how to use it. All through the 24 hours of the day the great extent of streets in the largest cities is practically empty, and yet even in the unused streets, car-passengers are now obliged to divide the way with stray wagons.

Where necessary, on long lines, cars will in the future make a further specialization by cutting out perhaps half of the present stopping points; this will be done by having alternate cars stop at alternate streets only.

When such changes as are here suggested, or better changes, are effected they will make an enormous saving in a city's energy. The daily ride to labor or business that now requires 40 minutes will be cut down to 20 or 25 minutes. On a three-mile ride the average saving will be 10 or 12 minutes. This saving will be a constant one every day in the year. Of course a car sometimes runs over its route without much delay by wagons coming upon its track, but the schedule time has to be arranged for the average delay, and cars can not be allowed to exceed their schedule, or they will become bunched, and the resulting waiting of intending passengers will offset the gain of those carried faster than the average practicable speed.

But beyond this constant saving there will be the irregular saving of time now lost because of wagons stuck or broken down on the tracks. This saving would also be constant to all those persons who must arrive at their place of labor or business at a fixed hour, and who now have to allow in starting out for possible blockades.

A car or a string of cars containing large numbers of people blocked and held by a broken-down coal wagon is now a common daily sight on the streets. The blockade often extends to several lines. It is interesting, though irritating, to estimate the lost time of each passenger at the same value as the teamster's time, and from this to compute the loss which arises from the teamster's carrying a heavier load than would be practicable if he drove on the outer pavement; and, from the average of blockades and delays to further compute the enormous daily tax imposed on street-car riders in order that a comparatively few coal dealers and teaming concerns, hidden away in their offices, may employ fewer teamsters and use fewer horses. Of course the teamsters and the train crews become angry at each other, but in fact they are little concerned in the problem, their "time is going on." But the hundreds of thousands or millions of people who are daily robbed of their time by the usurpation of their streets, are supposed to have no interest and certainly no voice in the matter.

There is no reason why the people of New York and Chicago might not have a street-car service one-half more rapid than they now enjoy. To people who have fixed times for arriving at destinations the changes suggested would work even greater advantage.

The changes suggested may not be the best ones. Even the shortest look into the future is likely to meet with illusions and mirages, but there is no doubt of the ills of our present condi-

tion. Street-car travel is slow, delayed, interiered with, blockaded, and there is no interest so small that it may not add to the obstruction of multitudes. It should be considered, too, that as cities are growing larger and the need of rapid transit is becoming sharper, the wagon traffic is growing too, and under our present protoplasmic system of diffusion, is making transit still slower and more difficult.

Another special use of city streets is worthy of mention. It has been thought that in large cities the tracks of the railways should be used for the transportation of goods. It is so argued by Mr. Dodge, president of the Ohio Highway Commission, and by many others. Where necessary to avoid the rehandling of goods, loaded wagons might be run upon suitable cars and so carried to a point near their destination. The suggestion is made that this work will provide an economic use of tracks and power plants at night when otherwise they would be idle.

Everyone knows how cities flourished and grew great in old times because of their harbors and the adjacent seas. These harbors and seas were simply good, cheap roads. Today inland cities are great because they are cheaply reached by railroads. Cities that have good roads leading to them both by land and by water are doubly served, and when they shall have secured the best internal roads they will have completed one means of material greatness. In 1817 Calhoun said: "The manner in which cheapness and facility of intercourse add to the wealth of nations has been so often and ably discussed by writers on political economy that I presume this House to be perfectly acquainted with the subject. It is sufficient to say that every branch of national industry, agriculture, commerce and manufacture, is stimulated and rendered by it more productive. The result is to diffuse universal opulence."

A WEEDING HOE.

Unless the roadbed for a railway is ballasted with stone or clean gravel, it will require a great deal of work on the part of the

trackmen to keep it clear of weeds and grass, and in a dry season it has been remarked that weeds will grow on the roadbed more rapidly than elsewhere. The reason for this is that the earth about and under the ties is damper than elsewhere. The weed trouble is one which grows worse with each succeeding year because the dust blown into the ballast will in a short time accumulate so as to sustain the weed growth.

The tool most commonly used for removing grass and weeds from the track is a shovel

to which there are several objections. The work is very severe because it must be done in a stooping posture, and the shovel blade is usually dull. On some railroads a specially designed tool is used for this purpose and the accompanying illustration, for which we are indebted to the *Railway and Engineering Review*, shows a hoe devised by Mr. E. C. Blundell, roadmaster of the Chicago, St. Paul, Minneapolis & Omaha Ry. The hoe consists of a rectangular, oil-tempered steel blade, 9 x 5 in., with rounded corners, bolted to a weighted tang which is on a handle 5 ft. long. The blade is polished on both sides and the four cutting edges are beveled from top to bottom.

It is stated that this hoe is found to be much more efficient than a shovel for weed grubbing because a man can do more work in a given time and because the dirt or ballast is not thrown aside but remains in place in the track or on the embankment.

A young woman who jumped from a moving car at New Haven, Conn., remained unconscious for two weeks.

BLUNDELL WEEDING HOE.

GUARD WIRES IN OVERHEAD CONSTRUCTION.

In the United Kingdom the tramway companies are required to make arrangements to prevent telephone and telegraph wires coming in contact with trolley wires, should the former break and fall across the line. The question is of considerable importance and is discussed by Mr. R. C. Quinn, the borough electrical and tramway engineer of Blackpool, in a paper read before the Municipal Electrical Association. He considers the best method is to place the telephone and telegraph wires underground at the crossings; this has the approval of the other electrical companies but the Post Office will not consent to it.

The next best method which is considered "all that is humanly possible to protect overhead telegraph and telephone wires," is the following:

1. The erection of two guard wires 18 in. apart at a minimum height of 2 ft. above the trolley line.
2. The length of the guard wires to be such that should the crossing telegraph or telephone wire break close up to one span insulator, and be blown horizontally in either direction it could not when falling come in contact with an unguarded portion of the line.
3. Each span of guard wires should be separate and distinct from its neighbor, but metallicly looped across.
4. No insulators whatever should be used, but guard wire standards be bolted direct to the bracket arms, or to the span wire as the case may be.
5. The terminal posts of each length of guard wire should be bonded to the tram rails.
6. The trolley line should be divided into sections, and each protected by a maximum current device. These sections should preferably not be of equal length, but proportioned for equal maximum working current.
7. The crossing span of telegraph or telephone wires should be terminated by a disconnecting insulating shackle on each side and the connection across these shackles should be by fusible metal bridge.

Another system of protection somewhat widely used is to fasten to the trolley wire brass clips which support a wooden molding of greater width than the trolley wire. These strips are regarded as more unsighted than guard wires and there has been difficulty in securely fastening them in place; also they do not afford the desired protection since if a telephone wire falls across the wooden strip the trolley wheel or pole will very probably strike it and make the very contact it is desired to avoid.

A third method recommended by the Post Office is to bunch the telegraph wires and then place an insulated cradle or hammock around them at the crossing. This is considered unsightly and inefficient also, since the meshes of the hammock are from 2 to 3 ft. square.

ALLEGED INJURY BY ELECTROLYSIS.

The city of Rockford, Ill., has a bill of \$17.25 against the Rockford Railway, Light & Power Co. for damages to water pipes alleged to have been caused by electrolysis consequent upon defective bonding; the council has directed that suit be brought if necessary to collect the claim. We judge, because of the trifling amount involved, that the matter is being pressed in order to establish a precedent.

CHICAGO GENERAL RY.

The Chicago General Railway Co. held its annual meeting July 20th. The resignation of Mr. Glenn E. Plumb as president and director was accepted and Mr. J. P. Black was chosen president and Mr. W. A. Goodman, director. The general counsel for the company was directed to begin proceedings against the Chicago City Railway Co. and secure a determination of the rights of the latter to occupy its present tracks in Wabash Ave., between 22d St. and Madison St. The General Ry. claims that the franchise for this part of the Chicago City system expired in 1894, and the General Ry. wishes to arrange with the city for an entrance to the downtown district over these tracks.

RECENT STREET RAILWAY DECISIONS.

EDITED BY J. L. ROSENBERGER, ATTORNEY AT LAW, CHICAGO.

DUTY OF CHILDREN TO OBSERVE APPROACHING CARS.

Brady v. Consolidated Traction Co. (N. J.), 45 Atl. Rep. 805. Feb. 26, 1900.

A boy 9½ years of age, playing in a public street, ran across the track of a trolley road, and was struck and injured by a passing car. He testified that he neither saw nor heard the car. There was no obstacle to his seeing the car if he had looked before going on the track. Under these circumstances, the supreme court of New Jersey holds that a verdict in his favor could not be supported.

The plaintiff, the court says, was a foot passenger crossing a street containing a car track. A duty devolved upon him before crossing to use his powers of observation to observe approaching cars, which were within a distance, if run at lawful speed, to put him in danger. Such a duty devolved upon him as an intelligent youth who was sui juris, or possessed of legal capacity to act in his own right in the matter, as he was admitted to be.

The duty of observation required from children, the court goes on to state, may differ in extent and degree from that required from an adult. Judgment which a jury might find lacking in prudence if formed by a person of mature years, might perhaps be found not to be lacking in prudence if formed by a child, but the child is not excused from some duty of observation.

ORDINANCE MAY NOT IMPAIR CONTRACT OBLIGATION IN CONSTRUCTION OF GRANT.

Mercantile Trust & Deposit Co. v. Collins Park & Belt Railroad Co. (U. S. C. C.), 99 Fed. Rep. 812. Feb. 7, 1900.

The United States circuit court, northern district of Georgia, holds that there is no escape from the conclusion that the proposition is established by United States supreme court decisions that an ordinance passed by a municipal corporation in its legislative and governmental capacity, especially with reference to the control of the streets and the granting of rights and privileges therein, is a law of the state, within the meaning of the provision of the constitution of the United States, which prohibits any state from passing a law impairing the obligation of contracts. Nor does it accept of the argument that for a municipal ordinance to be a state law, in this sense, it should be one withdrawing a right, and not one merely construing the effect of a previous grant. If a municipality grants a right in the streets or otherwise, such as that, when accepted and acted upon, a binding contract comes into existence between the grantee and the municipality, and the city, by a limited construction of the effect of the grant, deprives the grantee of a part of the rights obtained thereby, the court says that this would seem to be as much an impairment of its obligation as if the city should by express action withdraw part of the rights so granted.

LIABILITY IN LAYING HOSE ACROSS STREET FROM HYDRANT TO TANK CAR.

North Jersey Street Railway Co. v. Morhart (N. J.), 45 Atl. Rep. 812. Mar. 5, 1900.

Considering that a public street is devoted to the use of passengers on foot or in vehicles, the court of errors and appeals of New Jersey suggests that it is a question whether a street railway company may lawfully obstruct its free use by laying a hose from a hydrant at its side to a tank car on the company's track for the purpose of filling the tank with water to be used in sprinkling the company's tracks. But if a right to place such an obstruction in a public highway exists, which is here assumed, but not decided to be the case, the court holds that it must raise a duty on the company which it owes to all travelers on the highway to give such warning of the obstruction as would be reasonably required to protect the traveler from injury thereby; and whether such warning was in fact given must be a question for the jury. More-

over, evidence that a bicyclist was riding in a bent position at a considerable speed in a public highway, the court holds, in this case, where it affirms a judgment against the company, will not establish negligence contributory to his death, occurring by his being thrown from his wheel by reason of the obstruction of a hose stretched across the highway, if the attitude of the deceased was consistent with such observation as a traveler on the highway is required to make in respect to such obstacles, and the evidence may justify an inference that the obstacle might escape the required observation.

CONSOLIDATED COMPANY HOLDS PROPERTY IN OWN RIGHT.

Greene v. Woodland Avenue & West Side Street Railroad Co. (O.), 56 N. E. Rep. 642. Feb. 20, 1900.

A corporation formed by the consolidation of two or more companies, the supreme court of Ohio states, holds its property acquired by such consolidation in its own right, and not in trust for the constituent companies. The liability of the constituent companies attaches to the consolidated company by virtue of the statute, and not by virtue of the law of trusts.

Furthermore, the court holds that section 6478 of the Revised Statutes of Ohio, which provides the manner in which service of summons may be had upon railroad companies, is not applicable to street railroad companies.

PROPER PARTY TO SUE HOLDER OF ASSIGNMENT OF FRANCHISES.

Havana City Railway Co. v. Ceballos (N. Y.), 63 N. Y. Supp. 417. Mar. 9, 1900.

Where a third party is holding for the benefit of a certain-named corporation an assignment of a street railway franchise, the right of action to enforce the agreement under which he is holding same and to compel him to deliver over the assignment, the appellate division, first department, of the supreme court of New York holds, is vested in the corporation, and to enforce such agreement the stockholders are neither necessary nor proper parties, the corporation not having refused to sue. Neither does it consider a trustee for the stockholders a necessary or proper party plaintiff in such a case.

VALIDITY OF EXTENSIONS BEYOND LEASED INTERVENING TRACKS AND TEMPORARY LOCATIONS.

Daniels v. Commonwealth Avenue Street Railway Co. (Mass.), 50 N. E. Rep. 715. Mar. 3, 1900.

There intervened between the end of the old tracks of this street railway company and the beginning of the new tracks of what purported to be an extension, tracks of another company, which this company used under a contract with such other company. This contract was approved by the railroad commissioners, but had not been sanctioned by the board of aldermen. For want of that sanction, it was contended that the company was not using the intervening tracks lawfully, and that therefore the new location was not an extension, and could not be granted.

But, assuming for the purposes of decision that the authority of the aldermen was necessary to the legality of the contract, and had not been given by implication, and assuming, also, without deciding, that there must be some sort of continuity with the existing location of the company's tracks, nevertheless, the supreme judicial court of Massachusetts holds that the location did not fail on this ground. It appears to think it sufficient that the new tracks were connected with the old by a continuous line, all actually in use by the company, and that no one who had anything to say about it made any objection to the use, but rather all seemed to approve of it,—both railway companies, the board of aldermen, and the railroad commissioners. To this, the court adds that it does not conceive that the process of the statute was intended to enable

citizens having no other standing than as members of the public, although, no doubt, having a considerable practical interest, to rip up transactions satisfactory to all who have a voice in the matter, by discovering some technical flaw in the records of past proceedings.

Another objection was that the location was expressly made temporary only, to terminate upon the abolition of a certain grade crossing. The reason for this was that the location through the street in question was a detour, and that as soon as the cars could run straight on this street where the grade crossing then was without crossing the railroad there at grade, they would undoubtedly do so. But it was insisted that there was no power to grant a temporary location. The court answers that it does not see why not, if the street railway company was satisfied. Ordinarily, it may be presumed, a railway company would not accept a location in those terms. If it is willing to do so, probably some necessity exists, such as notoriously has led to such grants in the case of the Boston Subway, and elsewhere. If it is willing to do so, the court goes on to say it does not perceive any reason, the statutes being silent, for holding the grant void, or even voidable, on the protest of citizens to whom the temporary character of the grant is no injury.

EJECTION OF PASSENGER FOR PASSING SUSPICIOUS COIN.

Vassau v. Madison Electric Railway Co. (Wis.), 82 N. W. Rep. 152. Mar. 20, 1900.

A gentleman accompanied by a lady gave a conductor a half dollar, in payment of their fare, receiving back 40 cents in change. Thereafter, believing from its unusual and suspicious appearance that the coin was not genuine, the conductor so informed the passenger, and requested him to take it back, and pay him in other money. This the passenger refused to do, and the conductor took hold of him, and put him off the car. A jury gave him a verdict for \$500 damages. This the trial judge considered excessive, and required a remittitur from of \$250, which, having been made, he entered judgment for the balance. But this judgment has not been allowed to stand. The supreme court of Wisconsin has reversed it, ordering a new trial. It holds particularly, that the evidence did not justify the submission to the jury the question of punitive damages.

The circumstances under which the controversy arose, the court says, were peculiar, and called for mutual forbearance. Confessedly, the piece of money received by the conductor was unusual in its appearance. Such appearance at first excited suspicion on his part, which apparently, after more careful examination, ripened into a conviction, that the half dollar was not genuine, and so, as above stated, he informed the passenger, and asked him to take it back, and give him other money in place of it. If the result had proved the money to be counterfeit, then, the court declares, it would have been the right and duty of the conductor to put the passenger off the car, if he failed to pay his fare in good money. But the result proved that the money was genuine. That being so, the passenger, the court holds, was lawfully entitled to ride to his destination, and hence rightfully entitled to compensatory damages for being thus wrongfully ejected.

The mere fact that the conductor, in good faith, told the passenger that the money was counterfeit, the court holds, was no insult. Few are so fortunate as never to have received a counterfeit coin. It is only the passing of such coin with knowledge of the fact which makes it an offense. So, there being nothing in the evidence to warrant the jury in finding that the passenger was ejected from the car under circumstances of aggravation, insult, or cruelty, or with vindictiveness or malice, the court holds that it was error, as already intimated, to submit to the jury the question of exemplary or punitive damages. In order to recover punitive damages, it further explains, it was necessary not only to prove that the conductor's conduct was such as to subject him to such damages, but that the company either in advance authorized such conduct, or, with knowledge of such conduct, ratified the same.

The passenger testified that the next morning he went to see the superintendent, who asked him his address, and told him that the conductor was one of the oldest conductors on the line, and one of their most faithful men, and that the company would stand by what he did; that the conductor had the power to protect the company's property,—had a perfect right to put him off the car; that the superintendent told him that he would look the matter up, in order

to see whether the money was good or not. In this conversation, in respect to the passenger's having been put off the car, the court finds nothing to warrant the jury in finding that the superintendent authorized or ratified any aggravating, insulting, cruel, vindictive, or malicious conduct on the part of the conductor.

On the question of compensatory damages, the court holds that it was error to refuse to instruct the jury that, "in considering the question whether there was any injury to the feelings of the plaintiff, you have the right to consider his conduct and that of the conductor, and, among other things, whether or not the plaintiff sought to avoid trouble, or whether his conduct was such as tended to provoke and cause trouble unnecessarily."

INJURY BY LURCH OF CAR AT CURVE OF PASSENGER PREPARING TO ALIGHT.

Babcock v. Los Angeles Traction Co. (Cal.), 60 Pac. Rep. 780. Mar. 24, 1900.

There is no rule of law, the supreme court of California asserts, which requires a passenger in a street car to retain his seat or other position until the car has actually stopped. In harmony with this, it holds, in this case, that the trial court was not authorized to withdraw from the jury the determination of the issue of contributory negligence on the part of the passenger injured, because, it says, it could not declare that it was contributory negligence on his part to start to get off from the car before it had come to a full stop. And when he had shown that the company had assumed to carry him as a passenger upon one of its cars, and that while being so carried he had sustained an injury by reason of the manner in which the car was propelled along its track, a prima facie case of negligence, it holds, was established, which, in the absence of any other evidence, entitled him to recover damages.

Moreover, the supreme court holds that the company could not claim that it was negligence on the part of the passenger to stand up while riding, or to ride upon the outer part of the car, after it had assumed to carry him as a passenger, and had not furnished him with any seat upon the inside of the car. On the other hand, it says, it needs no argument to show that it would be negligence for the company to run its car against and around a curve at a speed of 15 or even 10 miles an hour, while passengers were standing upon the open part of the car, without warning or protecting them against the danger of being thrown off. And if the passenger in question had the right to expect that the car would stop on the hither side of the curve, it does not consider that he exposed himself to any unusual risk in moving across the car, before it came to the curve for the purpose of getting off there. Neither does it regard the fact that he had certain packages in his right hand, and attempted to take hold of the rail with his left hand, was necessarily a contributing cause of his injury.

CONTROLLING POWER OF PUBLIC AUTHORITIES OVER CONSTRUCTION OF JOINT BRIDGE.

Wyandotte & Detroit River Railway v. King Bridge Co. (C. C. A.), 100 Fed. Rep. 197. Feb. 12, 1900.

Two townships, lying on opposite sides of a river, and a street railway company, entered into a contract to bridge the river, the expense to be apportioned between them. Then these three parties contracted with a bridge company to construct the bridge. And now the United States circuit court of appeals, sixth circuit, holds that, as the bridge was to be a part of the public highway, notwithstanding that the bridge company agreed to build the substructure and superstructure of the bridge complete in every particular, in accordance with plans and specifications that had been prepared, and under the supervision of a consulting engineer to be jointly employed by the township and street railway company, it was still within the province and duty of the township authorities to locate this part of the highway, and equally the duty of the bridge company to adopt the location pointed out by their agent. Wherefore, it holds that the street railway company will have to pay its proportion of an expense incurred by reason of additional work required on account of such agent, who was an engineer or surveyor employed by the townships to locate the abutments, making a mistake in locating the abutments, and this, notwithstanding that his employment was without the knowledge or consent of the company. Nor does the court consider that the railway company would have any right to charge the bridge company with delay which the testi-

mony might show was caused by the direction and request of the township officers, or by their failure to furnish proper lines for the proper construction of the bridge. In this connection it states that it thinks that the bridge company might well rely upon directions given within the scope of his authority by the engineer, as well as like directions of the members of the township boards acting in good faith in the construction of the work—not to change the terms of the written contract, but as directing matters essential to the construction of the bridge, not specifically covered by the terms of the written agreement.

LIABILITY OF COMPANY FURNISHING ELECTRICITY.

Thomas' Administrator v. Maysville Gas Co. (Ky.), 56 S. W. Rep. Mar. 29, 1900.

This action was brought against the Maysville Street Railway Company and the above named gas company to recover damages for the death of a boy caused by his coming into contact with an improperly insulated, broken guy wire charged with electricity. The trial resulted in a verdict against the street railway company, from which no appeal appears to have been taken. But as to the gas company, which, besides being engaged in the business which its name suggests, supplied the street railway company with electricity to operate its car line, the judge having instructed the jury to find for it, this appeal was prosecuted, that there might be a review of such instruction. So the principal question presented was as to whether the company that furnished the electricity was responsible for the death of the boy, if it was the result of negligence in failing to keep the wires charged by it with electricity properly insulated.

The exact question submitted, the court of appeals of Kentucky says, has not, so far as it is aware, been answered by any court of last resort. That there was a duty imposed by law upon the street railway company to keep its wires properly insulated, so that those whose business or pleasure brought them into dangerous proximity to them might be protected from the deadly current which they conducted, it thinks, cannot be questioned. But did the fact that the gas company supplied the otherwise harmless wires with the force which converted them into a death-dealing agency make it responsible for the injury which resulted in the death of the boy?

The conclusion of the court of appeals is that the gas company was liable. Considering the dangerous character of the force produced by the gas company, it holds that there was a duty imposed on each to see that the wires into which it was sent were properly insulated. The danger was exactly the same whether the wires were owned by one or both of the companies. And the view taken by the court is that, when one through the instrumentality of machinery, can accumulate or produce such a deadly force as electricity, he should be compelled to know that the means of its distribution are in such condition that those whose business or pleasure may bring them into contact with it may do so with safety.

The fact, too, that electricity is unlike any other dangerous matter or force known to science, and that when so supplied it is not delivered to the street railway company and placed in its possession and control, but its control remains, as it were, with the hand controlling the generator, the court holds, distinguishes the case from one of a sale and actual delivery of possession and control of such dangerous substances as powder, dynamite, or nitro-glycerine, or even of electricity in storage batteries.

WHERE A PERSON ATTEMPTS TO DRIVE ACROSS TRACK IN FRONT OF APPROACHING CAR.

Petrie v. Third Avenue Railroad Co. (N. Y.), 63 N. Y. Supp. 315. Jan., 1900.

This was the case of a man in a light delivery wagon who judged that he could cross the track ahead of a cable car, and who made a miscalculation. This leads Mr. Justice Russell to say, at a trial term of the supreme court, in New York county, that the man had the undoubted privilege of crossing the track, if, with ordinary prudence, he could pass the intersecting point before the car reached it. He had no right to assume that the gripman would stop the car, which was conveying passengers, if that gripman also believed that he would cross ahead of the car in sufficient time. He also knew that if the car was so near that no prudent man would suppose he was going to cross ahead of it, the gripman would see no necessity

for stopping to avoid a collision with him. A person crossing a track with a vehicle must take into consideration not only the distance of an approaching car, but also what the controller of that car would have the reasonable right to expect in the way of prudent caution on the part of the driver of the vehicle. He knew that the gripman could not, in the discharge of his duty, stop before every crossing, on the mere guess that a wagon approaching would be placed in a position of danger from lack of prudent driving on the part of the person controlling that vehicle. To this, the judge adds, that he does not see why the gripman was to be judged by any higher rule than the man himself. If the gripman, seeing the situation of the two moving objects approaching the same point, could, as the man did, have judged that the latter might, with proper diligence, easily cross ahead, why was it negligence on his part to make the same mistake that the man did? If, on the other hand, the man was so near that the gripman had the fair right to believe that the horse would be stopped or turned up the avenue, what duty was imposed upon that gripman to guess at the probable action of the man, and stop his car load of passengers, to await the decision on the part of one who might be reasonably supposed not to be willing to place himself in a position of peril? That gripman did not see ahead of him any helpless object, like a child or a broken-down vehicle, upon the track. He beheld emerging from an intersecting street a horse and wagon controlled by an apparently competent person, with no intimation that such person would not exercise his superior power to choose any part of the street way for his wagon and himself which was conducive to safety. So, the court concludes, that from any point of view sustained by any reasonable evidence, there was nothing upon which the jury might rest a verdict that the gripman was negligent, or that the man was free from negligence, in consequence of which it sets aside a verdict for the man, not only as against the weight of evidence, but because there was not a fair case made for the jury to pass upon.

STRENGTH REQUIRED IN GUY WIRES.

Chattanooga Electric Railway Co. v. Mingle (Tenn.), 56 S. W. Rep. 23. Mar. 30, 1900.

A bicyclist, while riding with due care along one of the most used public streets of Chattanooga, suddenly found that he was about to run over a fallen guy wire of the above named electric railway company, and, in endeavoring to avoid it, received a serious injury, to recover damages for which he brought this action. The case discloses that an approaching car in some unexplained way slipped its trolley, which, as it rose, struck this guy wire and broke it. On breaking it fell to the ground immediately in front of the bicyclist. At the time of the accident the wire was carrying at least 500 volts of electricity,—an amount perilous to life or limb of one who came in contact with it.

This being the entire case, upon submitting it in his charge to the jury, the trial judge said that the rule of *res ipsa loquitur*—the matter speaks for itself—applied, and, if they were satisfied the injury to the bicyclist was the proximate result of the fallen wire, then there arose a presumption of negligence on the part of the company, which, unless rebutted, would entitle him to recover damages. The trial resulted in a verdict and judgment thereon for the bicyclist, which latter is affirmed by the supreme court of Tennessee, its finding, it declares, no error in the record.

The supreme court agrees with the counsel for the company that the rule is "that those who go on a highway may well be held to do so subject to their taking upon themselves the risk of injury from inevitable danger, where carelessness cannot be charged upon any one." But it does not consider that the fall of a dangerously charged guy wire is an inevitable danger, although it may be unexpected. Many accidents, it says, occur from defective mechanical contrivances, which, though not anticipated, are by no means inevitable, because they might have been avoided by the exercise of care corresponding with the danger attendant upon the contrivance.

In view of the extreme peril consequent on the displacement and fall of the wires in an electric railway system, it is essential, the court holds, that a high degree of care be exercised, not only in their construction, but in their continued maintenance in a good and safe condition. It is common experience that in propelling a car the trolley will sometimes slip from the wire along which it is passing, and if, in so doing, it comes in contact with a guy wire, it is apparent, it says, that the latter should be of sufficient strength

to withstand the violence of the stroke; and, if it fails to do so, it is not an unreasonable inference, it holds, that there has been negligence in its selection, construction, or supervision. In other words, under these circumstances, no hardship, the court thinks, is imposed upon a company which is using this dangerous agency of electricity along overhead wires, when an accident occurs from a wire which has fallen to the street, or dangerously near it, in requiring the company to repel a presumption of negligence.

MUNICIPAL ACTION NO AUTHORITY FOR CONDEMNATING PRIVATE PROPERTY.

Dewey v. Chicago & Milwaukee Electric Railway Co. (Ill.), 56 N. E. Rep. 804. Feb. 19, 1900. Rehearing denied Apr. 5, 1900.

The supreme court of Illinois says that a street railroad is built to accommodate street travel, and it has no use for private property, except so far as it may need the same for a side track, turnout, or a station, or as an incident to its main line. The necessity for its condemnation of property must be a necessity, which is incidental to the main purpose of the line along the street, accommodating street travel. Street railways are railways on or upon the streets of a city or town. They have no right to diverge from the street, and condemn private property, unless some obstruction or conformation of the surface of the ground makes such divergence necessary, in order to avoid discomfort or danger to the traveling public. A street railway may not, like a steam railway, locate its route in order to reduce time and distance for passengers traveling from town to town across the country. Such location of its route is not for the accommodation of local travel on the highways or streets, and therefore involves a perversion of the character and object of street railways.

If difficulties or obstructions are encountered which render it impracticable to construct a street railway in the street, a necessity, the court goes on to state, may arise within the meaning of the act of March 7, 1899, which will authorize the company to leave the street, and go upon private property, until the difficulty encountered is overcome, when return may be made to the highway or street. So, also, if sufficient land cannot be had in the streets for side tracks, turnouts, and stations, and the same are necessary for a successful operation of the road, the company will have the right, under the law, to resort to private property. In other words, the power conferred by section 2 of the act of March 7, 1899, which is the same as section 2 of the horse and dummy act, is not a general power of condemnation, but is limited to cases where a necessity for resort to private property is shown to exist. Such necessity must appear upon the face of the petition to condemn.

Furthermore, the court holds that the naming of a route for a street railroad under a village ordinance over private property does not create or establish a necessity to follow the line indicated by such ordinance, and that the recital of an ordinance of that character in the petition does not show that private property is necessary for the construction of a railroad, so as to give jurisdiction to the courts to condemn said private property under the horse and dummy act. The authority to condemn comes from the state, and must be derived from the statutes of the state.

Village authorities may refuse to consent to the use of their streets and alleys by a street railway corporation, but their consent or refusal to the use of their streets is the extent of their power. They control the streets, alleys, and public grounds of the village, but they do not control private property. Any attempt on their part, by consenting to a particular location of a street railroad across private property, to cause the street railroad to diverge from the streets, alleys, and public grounds under their control, is void, and confers no right and creates no necessity.

DAMAGES ALLOWED FOR EJECTION OF PASSENGER ON ERRONEOUSLY PUNCHED TRANSFER.

Eddy v. Syracuse Rapid Transit Railway Co. (N. Y.), 63 N. Y. Supp. 645. Mar. 21, 1900.

Street railroad companies, the appellate division, fourth department, of the supreme court of New York, holds should be permitted to make and enforce all reasonable rules, with respect to the use of transfers, that may be necessary to protect them against im-

position and are consistent with the rights of the public. A rule limiting the use of a transfer to the next car, it considers proper, if there be room on such car for the passenger to ride with reasonable comfort and safety. Likewise, it pronounces reasonable a rule with respect to the punching of transfers and which requires conductors to honor transfers when in doubt as to whether the time for using them has expired, but when positive that the transfer has expired, to decline it, if due precautions be taken to insure its observance and application in such a manner as to protect passengers from transfers being erroneously punched.

It being assumed that the defendant company owned or operated the line to which the conductor gave the transfer in question, which was by mistake punched at 2:30 p. m., instead of at 3:40 p. m., the court says that the passenger had a legal right, upon paying his fare, to a transfer that would entitle him to ride on the car from which he was ejected. And to hold that his only remedy, upon being ejected from the car for refusal to pay another fare, was an action for breach of the contract for transportation, it suggests might encourage the employment of negligent or incompetent conductors, to the serious annoyance and inconvenience of the traveling public, and would not afford passengers reasonable protection or security in their rights.

So, if the plaintiff entered the car believing that his transfer was valid, and was not negligent in failing to discover that it had been punched erroneously, the court holds that he was there lawfully, and was entitled to recover compensatory damages, including the indignity, the humiliation, and injury to his feelings caused by the remarks of the conductor, and his wrongful ejection from the car. And in this connection it maintains that, although he left the car by the command of the conductor, who had stopped it for that purpose, without waiting for the application of force, it, nevertheless, constituted an ejection.

But the court does not think that the passenger was entitled to exemplary damages because the conductor remarked, "I presume you picked up the transfer on the street." It would not be just, it holds, to mulct a railroad company in exemplary damages for the first act of misconduct towards passengers by one of its conductors of previously good character and conduct, and whom it had no reason to believe would be guilty of misconduct. Well-considered precedents, it states, preclude the recovery of exemplary damages in such cases, and, while public policy requires that the common carrier shall be held liable in compensatory damages for the willful or malicious wrongful acts of its conductors, no public policy demands the extension of the rule to authorize a recovery for exemplary damages when the employer has not been guilty of negligence in employing or retaining the conductor, and has not ratified his wrongful act.

DUTY OF CONTRACTORS AS TO GUARDING EXCAVATIONS AT NIGHT.

Fox v. William Wharton, Jr., & Co. (N. J.), 45 Atl. Rep. 793. Feb. 26, 1900.

When the work of construction, repair, or alteration of a street railway track in the streets of a city is authorized by law, and excavations are made in such work, which are to be kept open at night, the supreme court of New Jersey holds that the duty is incumbent upon those in performance of the work under a contract with the street railway company to exercise reasonable care to guard such excavations to protect those in the use of the streets from injury from such excavations.

In order to be reasonable, the degree of care must be a high one, because those who are in the use of the street have the right to assume, unless their attention has been attracted to the danger, that the street is free from such excavations.

Such persons as are in the use of the highway or street are bound to the exercise of only ordinary care to avoid injury from such excavations.

The question of whether the defendant, in an action for injuries received by falling or driving into such excavations, has exercised reasonable care in guarding, signaling, screening, or fencing such excavations, when the facts are in dispute, or where inferences may be reasonably drawn either in favor of or against the exercise of such care, is one for the jury, as well as the question of whether the plaintiff under such circumstances is guilty of contributory negligence.

IN THE POWER HOUSE

This department is devoted to the construction and operation of electric railway power houses. Correspondence from practical men is specially invited. Both the users and makers of power house appliances are expected to give their views and experiences on subjects within the range of the department.

WET STEAM.

(From an address delivered before the Northwestern Electrical Association by W. H. Edgar.)

Wet steam is produced by two different causes in the boiler— one is priming and the other foaming. Priming is due to the lack of delivery surface or lack of steam space and to the mechanical construction of the steam dome, and especially the connections between the different domes in water tube boilers. But wherever such a mechanical defect might exist, the water might be said to spatter the steam if the boiler water contained salts of soda.

Foaming is caused by saponification, and not, I believe, by mud or dirty water. I think it is due to the soda contained in the water, and, as a rule, wherever river water containing mud is used there is more or less soda in the form not only of a carbonate but of a sulphate. You are probably well acquainted with well waters and the tendency they have to foam after running a week or two. I believe that in 90 cases out of 100 the moisture in your steam is due to saponification or due to the presence of soda.

You might have a great excess of lime and magnesia in solution in your feed-water, but when the water is introduced into the boiler and heated the lime and magnesia are thrown out of solution into suspension, and consequently there is no action whatever in the way of foaming. It does not increase the density of the water; it is not a part of the water; it is not in solution. Soda always remains in solution. Ninety per cent of the waters throughout the country used in the boilers contain considerable lime and also some soda, and nine plants out of 10 are treated in one way or another with some salt of soda, and you get the same action in all such cases that you have with the use of artesian well water and surface well water in certain places where the soil contains sulphate of soda and generally the carbonates.

If you could get absolutely dry steam, you could use a straight mineral cylinder oil without requiring the admixture of any animal oil whatever. The animal oil is necessary only to take care of the water. The condensation washes off the mineral oil, necessitating the compounding with an animal oil to hold it, and give the clinging, adhesive, film-cutting properties of a good cylinder oil.

On one occasion the officers of a certain railroad system had considerable difficulty in getting an oil to meet their requirements. They finally got up to about 35 per cent of tallow in the compounding. They were using soda ash in the boilers, and the more soda ash they used the more moisture they had in their steam, the more they saponified the water and the more moisture was carried over; and with this moisture came soda, and the more soda that came over the more it cut the animal oil, saponifying it, forming soap, and they had considerable difficulty before they found out where the trouble really lay.

I believe that throughout the country in different plants a great many good cylinder oils have been repeatedly condemned and all due to the well water used, carrying the water a little too high in the boiler or using some preparation of soda, and, of course, the higher you carried the water, and the more you agitated the water, from a sudden opening, I suppose, of the valve in the delivery of steam, the more readily it would foam; and I believe that in all your practice in the engine room, if you would watch your water level and the nature of your water, so as to know the amount of soda it might contain, it would enable you to better take care of the oil question.

A saturated solution of caustic soda would contain 50 per cent of caustic soda; a saturated solution of soda ash would contain 40 per cent soda ash, when it would begin to cake; with salt you would have a 35½ per cent saturated solution before it would

cake. All sodium salts remain in solution until the solution is saturated, and then they cake and always cake at the hottest part of the boilers. It is quite common in Kansas and down in New Orleans and out in the Hawaiian Islands and along the seacoast where they used salty water, to buckle the tubes and bag the sheets, of boilers because of salt.

POWER HOUSE BURNED AT CHATTANOOGA.

Early on the morning of July 23d the power station and car house of the Chattanooga (Tenn.) Rapid Transit Co. were destroyed by fire, the loss being estimated at \$30,000; \$25,000 insurance was carried. The fire was discovered about 4 a. m. by a man outside the building who gave the alarm; the engineer at once started one of

VIEW OF WRECKED POWER HOUSE.

the engines and succeeded in getting current sufficient for running the cars out of the barn. Thus nearly all of the cars were saved. The boilers are reported to have been little injured. Our illustrations show two views of the wreck taken specially for the "Review" on the same day as the fire.

SHOWING CARS DESTROYED.

President Divine, of the Rapid Transit company, states that the power house will be rebuilt and put in operation as soon as the necessary new machinery can be secured. He at once made arrangements for using some of the steam dummy engines formerly run on the line and as good a service as possible will be given until the electric line is again in operation. The dummy made its first trip at 4 p. m. the day of the fire.

BARNARD FANLESS SELF COOLING WATER TOWER.

The advantages of running steam engines condensing are well known to the great majority of steam users but the general belief until recently has been that running condensing is impracticable except where plenty of circulating water is available at a low cost. This is not the case at the present time, however, and the owners of steam plants unfavorably situated as regards a supply of condensing water will be interested in the following description of the system of cooling the circulating water that has been devised and patented by the Wheeler Condenser & Engineering Co.

The Wheeler condenser is sufficiently popular to merely mention it in passing as it is to the cooling apparatus that we wish to direct attention.

For a considerable period the Wheeler company has been building and installing, with great success, the Barnard-Wheeler cooling

1,000-H. P. BARNARD FANLESS SELF-COOLING TOWER.

tower of the fan type, but despite the wide use of this admirable device, it has evolved a cooling tower bringing into play all the desirable features of the original tower, but dispensing with the use of the fans for creating a draft, and consequently eliminating a constant source of expense, the power necessary to run the fans.

The Barnard fanless self-cooling water tower is the result of years of study and experiment, the object in view having been to obtain maximum efficiency with minimum cost and space or ground area requirements. All mechanical means to circulate the air for cooling the water have been dispensed with. The water distribution system is unique in that provision has been made to operate parts of the tower where variable loads are encountered, and also what is very essential, that repairs and cleansing do not entail a shut down. A gallery and ladder provide means of inspection at all times. The entire structure is braced against strains, insuring rigidity under all conditions. The average height is about 30 ft. and the weight per square foot of foundation area is very low, thus allowing for roof installations where ground space is not available. The increased pump duty on a roof tower when used in conjunction with a Wheeler surface condenser is that due to the height of the tower only, as the uptake and down columns balance below the tower tank, so long as the tank is not more than 30 ft. above the pumps.

The accompanying illustration shows a tower for a plant of 1,000 h. p. capacity. The hot circulating water, when discharged from the condenser, is pumped up through a central standpipe, from

which it is led to a trough and distribution pipes, which ensure the constant flow of a thin film of water over the meshes of galvanized wire mats. The mats drain into a tank forming the foundation of the tower, and thence the cooled water is returned for another trip to the condenser. The mats are entirely exposed to the atmosphere and are arranged in such a manner that the circulation of air is complete and the consequent evaporation carried far enough to reduce the temperature of the water to a sufficiently low point for good condensing purposes, a common reduction being from say, 135° to between 85° and 90°.

When it is remembered that this result is accomplished by means of natural draft only the importance of this invention and the broad field open to it will be appreciated.

STANDARD DIRECT-CONNECTED UNITS.

At the Cincinnati meeting of the American Society of Mechanical Engineers a preliminary report was made by the committee on the standardizing of engines and dynamos as affecting those parts which are connected, which we abstract below.

The three points taken up first were: The size or capacities of machines which should be standardized; the speeds at which these various sizes of machines should be operated; the diameter of armature bore for each different size machine. The recommendations received from engine builders were reported as being remarkably uniform as regards these three points.

The committee was unanimously of the opinion that in order to secure practical results it should strive not for theoretical perfection but for a result which, while recommending thoroughly good practice, would at the same time coincide as far as possible with the practice of the greatest number of manufacturers. Also, that it was not desirable to have too many standard sizes, involving as such a course would the storage of a large number of patterns and carrying large amounts of stock for both engine and dynamo builders.

The sizes recommended as standard are 25, 35, 50, 75, 100, 150, 200, and 250-kw.

With respect to the matter of speeds for these standard sizes, the principle already stated, of choosing those which so far as possible conform to the practice of existing manufacturers was

STANDARDS PROPOSED FOR DIRECT-CURRENT DIRECT-CONNECTED ENGINES AND DYNAMOS.

Capacity in K.W.	Speeds in Revs. per Minute.	ARMATURE BORE IN INCHES.	
		For Center-crank Engine.	For Side-crank Engine.
25	300 to 325	4	4½
35	285 to 315	4	5½
50	270 to 300	4½	6½
75	250 to 280	5½	7½
100	250 to 275	6	8½
150	200 to 225	7	10
200	175 to 200	8	11
250	150 to 175	9	12

followed. As two of the members of the committee represent two of the largest manufacturers of electrical machinery in the country, it had the benefit of a knowledge of what would suit the builders of generators as well as the builders of engines, and the speeds recommended apply to a very large majority of the engines and generators which have thus far been turned out.

It will be observed in the table of speeds given that the committee has recommended an upper and lower limit for each size of generator and engine. The reason for this is that while the generator builders had already constructed machines for these extreme ranges, some of the engine builders tended rather to the lower and others rather to the upper limit. While in a very few cases some engine builders go slightly outside the limits, yet the limits recommended cover nearly all the data which were collected.

With respect to the subject of armature bores there are two classes of engines, designated commonly as "side crank" and "center crank." In the very small sizes it will probably be found possible to use only a single size of bore, but for the standard sizes recommended engine builders practically insist upon two separate series of dimensions of shaft.

One of the members of the committee made a special investigation of this subject and secured the opinions of a large number of

engine builders with respect to the sizes which would suit them, which enabled the committee to reach a conclusion quite readily.

The tentative recommendations of the committee are given in the table. A number of other matters on which it seems practicable to make an agreement will be taken up later.

WHY SOME MUNICIPAL ELECTRICAL PLANTS DO NOT PAY BETTER.

We take the following extracts from a paper read before the Northwestern Electrical Association at its Waupaca meeting, June 28th, by Prof. George D. Shepardson, of the University of Minnesota. The author has in mind electric-light and power stations, but the same things he finds to be true of them would also apply to municipal railways.

The subject of municipal ownership has been discussed at almost every session of this association, and the general sentiment seems to be that the principal cause of the agitation in favor of municipal ownership is the circulation of incorrect figures as to the real cost of operating existing municipal plants. It is easy to see why the reports of such cost are almost invariably too low. The towns almost never know the real cost of the lights, on account of faulty records. Each town desires to make the best showing possible, for when a low figure is quoted, the general public immediately concludes that it is enterprising, while those who know how such reports are compiled smile at their ignorance of the real cost. The other principal cause is the general belief on the part of the public that the electric companies are making enormous profits, whereas, the painful fact is that probably few of the smaller companies at least are really earning any dividends. In towns of less than 2,000 or 3,000 inhabitants, it is a very difficult matter for an electric-light station to earn respectable dividends unless it is operated in conjunction with some other business, for example, a mill, so that the labor and administrative expenses are reduced to a minimum. Similar conditions hold in many plants in larger towns. The reports of some stations show larger profits than actually exist, which, while flattering to stockholders, are yet deceptive, if not positively harmful. A uniform method of keeping accounts, such as is being urged by the National Electric Light Association, would do much to help station managers discover their own real situation. Did the municipal private plants have correct methods of keeping records, so that it was generally known how much it actually costs to operate municipal plants and how small the net earnings of private plants really are, the agitation would probably die a natural death in a few years. As a matter of fact, the managers of some of the largest central stations advocate the public supervision of their accounts that the actual facts may be in the possession of the people. The ordinary citizen reads the report that the operating expenses of a large plant are only 50 per cent of the gross income, and he believes that the remaining 50 per cent is clear profit, forgetting about the numerous charges which reduce this to 15 or 5 per cent. He also compares the cost of a kilowatt-hour produced at the station with that charged on his bill for service, and then firmly believes that the company is making from 100 to 2,000 per cent clear profit. The public generally have no objection if a reasonable dividend is earned, but there is objection to what are felt to be enormous profits.

The result of the agitation for municipal ownership of electric plants was shown in the statistics for Minnesota; in 1894 the central-station directories showed 10 municipal and 38 private electric lighting plants, while in 1900 there were 53 municipal and 63 company plants.

Of the data on costs it is said: The reports of the low rates with municipal plants are due to several causes, usually to ignorance of the real cost. Expenses that should be charged against the electric plant are often placed against the water-works or against the general fund, and are often ignored until it becomes necessary to pay some bonds. Depreciation is often not considered, and when something finally gives out, a special appropriation is made for renewals and is charged against something other than the operating expenses of the municipal lighting plant. The result is that the rates received for electric lights are often considerably below actual cost to the town, and the saving to the people who take electric lights is made up by increased taxation of the whole people. If the town sells electric light below cost, it

should in all reason furnish kerosene and candles at proportionally low figures. And why not groceries and dry goods likewise?

After a resume of the arguments for and against municipal ownership, there are given some incidents (from personal knowledge and the contributions of friends whose testimony is believed to be reliable) showing why the efficiency in municipal plants is less than called for by the theories of some political economists.

At one place they decided to secure a cheap engineer to design their plant. He specified a 20-h. p. gasoline engine to operate a 600-light dynamo, and, in addition, to drive the pumping machinery for the water-works. The council made a contract for the gasoline engine as specified, including a proviso that if a steam plant was substituted, the gas engine contractor was to receive a commission of 15 per cent of the cost of steam plant. It is reported that this was actually done and paid. Two of the larger towns of the state were contemplating municipal ownership, and each secured the services of an inexperienced young man to prepare plans and specifications for the plants, in one case because he was a friend or relative of one of the committee, in the other case probably because he was cheap. The country is full of half-baked electricians who pose as engineers and as advisers to investors.

There is frequently an attempt to reduce operating expenses too far. At one place the council discharged a good engineer and hired another because he was cheap. Within three days he got his cylinder full of water and broke the girder of the Corliss engine. It is common, even with privately-owned station to attempt economy by hiring cheap firemen, since any one can shovel coal or throw wood. But owners fail to recognize that by paying ten to twenty dollars more for securing a capable fireman they are apt to save his extra wages several times over in reduced fuel bills.

In some cases there is great loss on account of downright dishonesty of the superintendent or the council committee. A city employing an honest superintendent, with liberal pay and some backing in the council, will often prevent small and also large steals which are almost invariably found in municipal departments, such as lamp renewals (on which it is difficult to keep accurate account or check), "rake-offs" on purchases for the plant for which in the end the city pays. One supply company offered a new superintendent as high as 20 per cent on all purchases the year round, as they had always done so. This is substantiated by old bills. Lamps are checked up once a month while burning and one is often asked to go easy in counting, being offered all sorts of bribes from cigars or drinks to considerable sums in cash. I know of officials receiving special concessions in this way amounting to several hundred dollars per year. All this could have been prevented by a proper system of checking, but at best comes down to one man being honest. "Carloads of wood have been sold 'by the car' by former superintendents. An investigation by an alderman indicated that a loss of over \$1,000 per year had been received from that source alone." In another place the city recorder is said to collect the accounts and sometimes sublets the job to his friends who knock down about half and turn the balance over to the recorder, who in turn transmits to the treasurer so much of it as suits his convenience, there being no records and no other system.

The political conditions prevent best results in many plants. Where the employes are appointed by aldermanic influence it is not uncommon for an underling to retort to his superior officer when corrected for some shortcoming, "Oh, well, I have more pull than you have, and what are you going to do about it?" In one town until recently the plant was operated by two parties, an engineer, who took care of the station, and a lineman in charge of outside work. These parties were not on speaking terms, and, of course each attributed all troubles with the lights to the other man's part of the plant. This state of affairs continued for several years, during which time the arc system was in bad condition, the lineman attributing it to the dynamo and the engineer laying it to the lamps. When a change was made, there were two applicants for lineman, one a young man who would have attended to business, the other was a young son of one of the aldermen and with little experience or ability. There were also two applicants for fireman, one a good man and the other a lazy, good-for-nothing fellow who claimed to have considerable influence in the country so that he could turn considerable trade to some of the stores in which the aldermen were interested. By combining forces the poorer

man was appointed in each case. There is a continual struggle between the temperance and the saloon element in most of the towns and when a new election puts the opposition into power, the superintendent is almost sure to lose his place in favor of some friend of the new management.

COAL AND ASH CONVEYOR AT NORTHWESTERN ELEVATED PLANT.

Since the publication of our July issue we have received from the John A. Mead Manufacturing Co., of New York, a description of the coal and ash handling plant it is building for the Northwestern Elevated Railroad Co., of Chicago, giving some of the details which were not apparent from the general drawing on page 370 of the July "Review." As will be seen on reference to that view the coal storage building is 24 x 80 ft., located on the north end of the lot and connected with the boiler-room by an overhead passageway, about 40 ft. above the ground, and by a tunnel. This trestle is about 260 ft. long, and the receiving hoppers are about 50 ft. north of the power station; the ash tanks are just north of the receiving hoppers.

Coal is unloaded from the railroad cars directly into the hoppers and thence passes through the crushers, which are driven by independent electric motors, into the buckets of the horizontal conveyor which takes it through the subway to the storage house and thence up and onto the elevated trestle. The coal is dumped into the storage house or carried on south and deposited in hoppers above the boilers; the dumping is accomplished by means of a movable dump carriage which is operated by a separate chain and wheels, and can be set at any desired point on the upper line.

For loading ashes into the conveyor a special movable hopper traveling over the conveyor buckets on separate tracks in the basement of the boiler-room is stopped under one of the chutes leading down from the ash pit, and the chute opened. By this means ashes are transferred to the conveyor buckets in such manner that

they cannot reach the wearing parts of the conveyor. Once in the conveyor the ashes are carried around and up, and emptied into the ash tanks, from which they can be drawn off into railroad cars or carts. The drawing shows the ash conveyor and movable hopper.

The driving machinery for the conveyor is located on the upper line just opposite the stack; there are two drivers operated by independent electric motors of the iron-clad type, one driver being held in reserve so that in case of accident either to driver or to electric motor, the other driver can immediately be pressed into service.

This is also true of the coal crushers which are duplicates and entirely independent of each other. The length of the conveyor is approximately 1,300 ft.; the buckets and links are of malleable iron, buckets of this material being the only ones that will satisfactorily handle ashes for any length of time. The capacity of the conveyor is from 40 to 50 tons of coal per hour.

It is understood the new Lansing (Mich.), St. Johns & St. Louis Electric Railway Co., formed to build an electric line, has sold out to the Lake Shore & Michigan Southern R. R., which proposes to make the road a steam line.

IRON AND STEEL RAILS IN AMERICA.

Abstract of a paper by Robert W. Hunt, M. Am. Soc. C. E., read before the London meeting of the American Society of Civil Engineers.

The first railroads in America (1829-1833) were laid with strap-rails, $\frac{1}{2}$ in. to $\frac{5}{8}$ in. thick and $2\frac{1}{4}$ in. to $4\frac{1}{2}$ in. wide, on longitudinal stringers. On later work some strap-rails and some fish-bellied, Clarence, H, and U-rails were laid; the sectional rails were all imported until 1844 when some of the U-rails were rolled at Mount Savage, Md. The T-rail was invented by Robert L. Stevens, of Hoboken, N. J., but in Europe is generally known as the "Vignoles" rail, after Charles W. Vignoles, who introduced it there. The first T-rails rolled in America were made at Dauville, Pa., in 1845. These early rails were all short, none over 15 ft. long; the first 30-ft. rails were rolled in 1855 by the Cambria Iron Co., of Johnstown, Pa.

The rolling of iron rails was attended with many difficulties. If the pile of bars was not heated to a sufficiently high degree, the welds would not be perfect; and if heated too highly, the iron would crack in the process of rolling and yield an imperfect product. If the metal was too soft, although the rail might be free from flaws and bad welds, it would wear out rapidly under traffic. Under all circumstances it was important that the rolling process should be completed as quickly as possible, so that the reductions should be made while the iron had lost little of its heat. This, together with some local conditions, led to the invention by John Fritz, Hon. M. Am. Soc. C. E., of the three-high rail train. Three-high sets of rolls had been used for many years in making merchant bars, but it required the application of the "Fritz yielding hanging guides and driven feed rollers" to make them practical for rail rolling. This improvement was put into successful operation at the Cambria mills in 1857. It has ever since remained as the typical American rail mill. Since the introduction of steel rails there have been several two-high reversing mills on the English plan used in America; in fact, two of this kind are now running. But the three-high is the American mill, and has permitted the tremendous production which has been attained in later years.

The early mills required the work of handling the material as it passed through the rolls to be done by manual labor, through the use of tongs and hooks. Probably the rolling of iron piles, with their necessarily peculiar handling, would have indefinitely continued this, but with the use of solid steel blooms, the troubles lessened and made possible the introduction of automatic machinery. The tong and hook system necessitated the employment of 15 to 17 men, and the production of steel rails was limited to not over 250 tons per turn. Automatic machinery revolutionized this, both as to number of men employed and the possibilities of production.

It was the writer's fortune to introduce the first driven rail-mill tables, those in the works of the Albany and Rennselaer Iron & Steel Co., Troy, N. Y., in March, 1884. These were in front of the finishing rolls, and worked so well that an automatic arrangement was soon after placed in front of the roughing rolls. This latter arrangement was more particularly designed by Mr. Max M. Suppes, then the master mechanic of the works, and now the general manager of the Lorain Steel Co., Lorain, Ohio. Naturally, these devices were protected by letters patent. From this start other inventions were made, and many improvements by other American engineers have followed, until the present American rail mill, capable of turning out 50,000 tons of finished rails per month, has been developed.

It was the writer's fortune to become connected with railmaking in 1856, and among his earliest recollections is the statement that the users of rails had in service certain makes which had been and were giving good results impossible to be obtained from any of more recent manufacture. How familiar that statement must sound to many of you, and as of recent date!

Then, as now, the question demanded an answer, and many sought for the solution.

The first iron rails were made from straight pulled bars. These bars were about 1 in. thick and were placed one upon another, until a pile of sufficient weight and height was formed; the pile was then reheated and rolled into rails. And it was to the formation of that pile that inventive genius was applied.

From an investigation of the fracture of some of the rails which had given satisfaction, it was discovered that the pile of bars from

which they had been rolled had been entered into the rolls edgewise, thus bringing the line of welds between the bars in vertical instead of horizontal position. This presented a different structure to the wheel wear, and seemed to be logical. Based on that supposition many rails were so rolled, and the writer believes that the scheme was patented.

Where the rail was rolled with the layer of the pile in a horizontal position, particular attention was given to the character of the top bar, which would, of course, form the wearing surface of the rail. Cold-short or granular iron was used for it, while the remainder, or at least the flange of the rail, was of fibrous iron.

At one time a rail with a puddled-steel head—or rather with the top bar of the pile of puddled steel—found much favor, but, owing to the difficulty of obtaining uniformly good welds, the results were not satisfactory. Some of these so-called steel-headed rails had the top bar of what was known as silicon steel.

Another plan, on which much money was spent, was to hammer a puddled ball, or weld two puddled balls together, under a steam hammer, and draw them into a slab 2 in. to 2½ in. thick, which was used on the top of the rail pile. Under an order from the Pennsylvania Railroad Co., the Cambria Iron Co., in whose employ the writer was then serving, erected a special steam hammer, and made several thousand tons of such rails. Their service was somewhat disappointing, and the practice was abandoned.

At that time, as since, commercial conditions controlled. The railroads had the worn-out rails on their hands, and regardless of whether or not the practice would give satisfactory results, they adopted a system of having the old rails re-rolled into new ones. At first a certain percentage of new iron was specified, but as the necessities for immediate economies increased, that demand was eliminated from the contracts, and the new rails were composed entirely of the old ones. The best practice was to make a pile of old rails, break it down into bars, which were piled upon each other, and then rolled into rails. But presently this was found to be too expensive to successfully meet the cry for cheaper rails, and only the top and bottom of the piles were formed from re-worked iron, the center being composed of from three to six pieces of old rails.

From the many re-workings, the cheapening of the process of manufacture, and the increasing demands of traffic, the wear of the iron rails become more and more unsatisfactory, until it seemed as though, from that cause alone, the limit of railway development had been reached. Such situations frequently occur in earthly affairs; and seldom if ever has the occasion failed to be met by a solution of its difficulties. In this case came the invention of Bessemer.

It is an historical fact that the first rail ever made from Bessemer steel was placed on the Midland Railroad, of England, early in 1857, at a point where iron rails had sometimes to be renewed within three months; and it remained there until June, 1873, some sixteen years, during which time about 1,250,000 trains and any number of detached engines and tenders passed over it.

We all realize that without such an innovation as Bessemer's, the subsequent tremendous expansion in railway development would have been physically impossible.

Railroad managers were timid about using steel rails, and in America many attempts were made to produce a satisfactory rail having an iron base and web, with a steel-capped top. None was satisfactory, and the Bessemer steel rail soon conquered the situation.

The first steel rails made in America were rolled at the works of the North Chicago Rolling Mill Co., May 24, 1865; the first production of American steel rails on a commercial order was at the mill of the Cambria Iron Co., in August, 1867.

For a time after the starting of the Bessemer works of the Pennsylvania Steel Co. the ingots were cast from the top on the then accepted English plan. The late Alexander L. Holley, then in charge of those works devised a means of bottom-casting the ingots, the steel being poured into a central octagonal mold about 14 in. in diameter at the bottom and 10 in. at the top, from the bottom of which the metal flowed through connecting gates into four surrounding molds 8½ in. square. This plan was adopted after consultation with Mr. George Fritz, who had rolls turned to take the 8½-in. ingots. The central or spruce ingots were hammered into blooms. It was found that the small ingots rolled satisfactorily, while, on the contrary, the central ones cracked badly during working.

This led to much discussion and consultation among the operative officers of the Cambria Co. and Mr. Holley, the result of which was that John E. Fry, then superintendent of the Cambria Iron Co.'s iron foundry, suggested the use of a rammed-up center sprue, 4 in. in diameter, connecting through firebrick gates with surrounding ingots; the sprue and gates to be treated as scrap. This plan answered admirably.

While in charge of the experimental Bessemer Works at Wyandotte, Mich., in the interest of the Cambria Iron Co., the writer had developed a manner of bottom casting ingots. Mr. Holley, having protected his plan by a patent, Mr. Fry and the writer united in patenting theirs, and their interests and those of Holley were consolidated. For some years after this, practically all bottom-casting of ingots in America was licensed under these patents. After a time the price of rails became so much reduced that the loss incident to the scrap of the center sprue and bottom gates made in bottom-casting became a serious matter; and while it was and is impossible to cast as sound, and hence as good, ingots from the top, the better plan was abandoned.

The American blooming mill, which soon superseded the steam hammer in rail making, is due to George Fritz, who, in perfecting his plans, had the benefit of the advice of his brother John, then manager of the works at Bethlehem, Pa.

Holley started the innovation by which the production of steel ingots has been increased so greatly. Fritz gave the blooming mill, which would not only take care of all that was sent to it from the converting works, but, like *Oliver Twist*, ask for more; and the late Capt. William R. Jones, Robert Forsyth, M. Am. Soc. C. E., and several others, built rail mills which were not satisfied with the amount of steel sent to them by any blooming mill. This has all been magnificent. It has made possible undreamed of low prices for steel rails. It has helped to build railroads, but has it improved the quality of the rails produced?

Steel rails, when first manufactured, replaced iron rails, which, through their deteriorated quality and the increased duty demanded of them, were giving most unsatisfactory service. Some of the early steel rails failed, but most of them were so much better than the best of their predecessors that such failures did not excite adverse comment. They were of what would now be considered light sections, and thus in their production from the 6 in. x 6 in. or 7 in. x 7 in. blooms from which they had been rolled, had received much work, and at a comparatively low temperature. In the writer's judgment the greatest factors in the production of good rails are covered by the words "work and temperature." All steel men know that work at high heats does not change the grain of steel at all in proportion to work given at lower temperatures.

For years after the introduction of steel rails a 65-lb. per yd. section was considered a heavy one. In fact, in America it was the heaviest used, and much the largest percentage was not over 60-lb. These were rolled from 7 in. by 7 in. blooms. The ingots from which the blooms were made were generally 12 in. x 12 in. After the bloom was formed it was examined carefully after becoming cold, and all cracks and mechanical imperfections were chipped out. Then, after slow heating, with care to avoid too high a temperature, the blooms were rolled into rails by light reductions. While this was being done, if a defect showed itself, the process was stopped until it was chipped out. Now, this slow work at a moderate and steadily decreasing temperature, resulted in a fine grained metal, which, of necessity, no matter what may have been its chemical composition, would give greater resistance to the wear of traffic than could be possible from the coarser grained steel which is in the head of the heavier and more rapidly rolled sections of today.

By waiting long enough, the things of the past always become the best. That is, provided the past is not examined too closely. It must be remembered that the early rails replaced a much inferior article; in fact, created a revolution in railway maintenance of way. Hence, if a few from any cause failed, it excited little comment; they were quietly replaced by others. After a while these failures were forgotten and the whole of existing rails were instanced as an example of what rails should be. Another thing which must not be overlooked is, that the early steel rails had the ultimate stress of traffic applied by slow degrees. In other words, the traffic to which they were subjected when first put in

service was for them light duty. Heavier rolling stock, faster and more frequent trains, came gradually. The old-time rails, which are in these later days so reverently mentioned, had been subjected to a cold rolling process before being given their severest task. Today an 80-lb. is hardly cold before a 175,000-lb. locomotive, hauling 100,000 lb. capacity cars at 35 miles per hour, and limited expresses of heavy Pulmans at 60 miles per hour, are thundering over it.

The details of manufacture of steel rails changed not only in America, but also in England and other countries. This had to be, and it would today be as impossible to return to the earlier methods as to restore the service of stage coaches.

In 1876 the writer chronicled with pride the fact that the North Chicago Bessemer Works had in a single month produced 6,457 gross tons of ingots and that it led the world's record. Today these works have been abandoned, their places having been taken by the present South Chicago plant of the Illinois Steel Co., in which rail mill the largest month's production has been 58,103 gross tons.

While the faster work of modern practice has somewhat altered the character of the steel in rails, it must not be assumed that the product has been increased without any regard to other considerations. This is not true; on the contrary, the outward character or finish of the rails has been improved to a radical extent. While working fast, the improved machinery is also reliable, and the care exercised in keeping true to section, square sawing, accurate drilling and straightening of both line and surface, yield results which it would have been impossible to obtain in the earlier days. In fact, the requirements of the railroads, in consequence of increased weight and speed of traffic, etc., have made it imperative that such finished rails should be given them.

It is not desired to draw any invidious comparisons, but in the writer's judgment, American makers are today not only turning out the most rails, but at the same time the best finished one now produced. Moreover, foreign rails, imported into the United States and Canada during late years, have not worn any better than American rails.

It has been stated that examining into the past sometimes disproves assumptions. So that, while in the earlier days rail steel and rails were made with all the time and care which has been described, all the rails produced were not satisfactory. The experience of the Pennsylvania Railroad was such that its chemist, Dr. Dudley, made an investigation and reached conclusions in favor of chemically softer rails. His results were made public in 1878, but the demand thus created for softer rails did not long continue.

In 1881 the 11 Bessemer mills then making rails answered inquiries of Mr. Holley and stated that there were 188 patterns of rails considered standard, and that 119 patterns of 27 different weights per yard were regularly made. In 1891 the American Society of Civil Engineers appointed a committee to consider rail sections, which made its report in 1893. During 1899 quite 75 per cent of all rails rolled at American mills were of what are commercially known as the American Society sections.

When the Bessemer process was introduced in America imported English pig irons were used, but American irons were experimented with and gradually displaced foreign irons. Geographical and commercial conditions have led to the use of entirely distinct chemical specifications in the eastern and western districts.

The heavier equipments and higher speeds required more rigid road beds, which could only be obtained by heavier sectioned rails. These were gradually adopted. It was naturally expected that as the sections were increased so would be the resulting amount of service yielded by the rails. From the very first, the results obtained were disappointing, and the writer doubts whether we will ever succeed in getting results as satisfactory as those yielded by the lighter sections. As the area of the section is increased, so, of necessity, will the work upon the steel in forming it be decreased, and as the resulting mass is enlarged, so will the amount of heat retained in it at the time of the final reduction through the rolls be increased. In the writer's judgment it will be found that the most satisfactory results will be obtained by so modifying the rolling system that the final pass (or better, passes) shall be given after the temperature of the partially formed rail has been lowered. This is not by any means a new idea, but as yet it has not been carried out in a manner calculated to obtain the best results.

Some years ago Mr. F. A. Delano, now superintendent of motive

power of the Chicago, Burlington & Quincy R. R., in the interest of that company, had some rails rolled at the South Works of the present Illinois Steel Co., then owned by the North Chicago Rolling Mill Co., on such lines and under his personal supervision. Unfortunately, these rails were of a peculiar section, which was not continued, but the writer believes that the wear of the metal itself was encouraging.

The satisfactory wear being given by rails renewed by the "McKenna Process" at the Joliet and Kansas City Mills of the McKenna Steel Working Co., bears very strongly on this point. Mr. McKenna takes rails which have become unfit for further service in main line tracks, from having become rough in surface, through flow of metal, or other causes; or which have become curve-worn on the side of the head; and after carefully removing any fins which have been formed on the upper edges of the heads by metal flow, charges them into a long furnace, and, when heated to not more than 1,500° F., they are drawn from the furnace by a mechanical contrivance which at the same time removes any scale which may have formed on their surface, and slightly upsets or flattens the section. The rail is then passed through a set of forming rolls, from which it is carried forward to another set, in which it is given a finishing pass. The rail is then sawed hot, and cold-straightened and drilled in the usual manner. And while the section has been somewhat reduced, the original finishing sections and heights have been maintained.

Now, the steel has been given finishing work at low temperature, and examination has proven that the grain of the metal in the head of the rails has been "fined." But, more important than all, the wear of the renewed rails is promising to be much more satisfactory than that obtained from new rails of heavier sections. This treatment of rails is no longer in an experimental state, as it is over five years old, and there are nearly 100,000 tons of renewed rails in service on the Chicago, Milwaukee & St. Paul; Atchison, Topeka & Santa Fe; Wabash and other large systems. One chief engineer, on whose road there are many of these rails, says: "No rail ought to be used at all until after it has been renewed."

The writer has gone on record so often, as believing that in the absence of work at low heats, incident to the present method of making heavy-sectioned rails, it is important to increase the carbon with the section to as great an extent as the phosphorus present will permit, without incurring risk from breakage, that it seems unnecessary to repeat the arguments.

At the Atlanta meeting of the American Institute of Mining Engineers, in October, 1895, the writer presented a set of specifications for "Steel Rails of Heavy Sections Manufactured West of the Alleghanies." In accordance with these specifications thousands of tons have been made and used with satisfactory results. During the last two years the western makers have declined to limit the phosphorus to less than 0.10 per cent, but, in fact, have been making steel with a fraction less than that amount—say 0.09 to 0.096 per cent. And he regrets to say that in many cases they insist that the amount of carbon shall be less than that which he has advocated. He believes, however, that gradually, higher carbon will prevail; and certainly has not had any cause to change his mind on the subject. His experience as a steel-rail maker, and as an observer of the wear of steel rails of many sections and diverse chemical composition, leads him to advocate: First, work, after careful heating of the steel, and continued until its temperature has been much reduced. Second, that the carbon percentages shall be increased in proportion to the increase of rail section, the ultimate amount being, of necessity, limited by the contained percentage of phosphorus. In all cases he advocates the use of drop tests, on samples from each heat of steel.

At present many of the American railway engineers use the drop test, but none of them demands the static or tensile tests insisted upon by so many engineers of other countries; nor does the writer think there is any necessity for these latter. The chemical analyses and drop tests are all sufficient.

As a matter of record, the writer gives the chemical formulas contained in his specifications of 1895, in accordance with which, as stated, thousands of tons of rails have been made and have given good results. And while at present the western makers decline to limit their steel to 0.085 per cent phosphorus, the writer certainly sees no reason to decrease the carbon. In other words, so many rails have been made and proven safe with quite as much carbon as given in these specifications, and with 0.10 per cent phos-

phorus, that the writer does not think the former element should be made less, certainly not until the details of manufacture have been changed.

ROBERT W. HUNT'S SPECIFICATIONS.

Sec. 8.—The carbon in the 70-lb. section shall not be below 0.43 per cent nor over 0.51 per cent. In the 75-lb. section, not less than 0.45 per cent nor over 0.53 per cent. In the 80-lb. section, not less than 0.48 per cent nor over 0.56 per cent. In the 90-lb. section, not less than 0.55 per cent nor over 0.63 per cent. In the 100-lb. section, not less than 0.62 per cent nor over 0.70 per cent.

The phosphorus shall not exceed 0.085 per cent.

The silicon shall not be below 0.10 per cent.

The remainder of the chemical composition of the steel to be left to the maker's judgment.

CROWDED CARS IN ST. LOUIS.

The cars of the St. Louis & Suburban Railway Co. during the time that the service on the Transit lines was impaired by reason of the strike, were in a greatly "congested" state. These cars seat 40 persons, but when crowded frequently carried as many as 175 passengers. By courtesy of Mr. George D. Rosenthal, who repre-

A CROWDED CAR ON THE ST. LOUIS & SUBURBAN.

sents the General Electric Co. in St. Louis, we are enabled to publish the accompanying illustration.

At first the passengers on top secured free rides, but later the steps at the front end of the car were removed and outside passengers were required to pay fare to the conductor before climbing up. Notwithstanding the crowding very few accidents were reported.

DISCRIMINATION IN USE OF BRIDGE.

In our June issue we briefly noted that the Supreme Court of Pennsylvania had decided that the city of Pittsburg could exact tolls from a traction company for the use of a bridge owned by a separate company, notwithstanding the fact that the city owned all the stock of the bridge company and had made the bridge free for all other traffic.

The Pittsburg & Birmingham Traction Co. has applied for a writ of quo warranto to compel the Monongahela Bridge Co. to come into court and show why the contract in question should not be revoked.

Mr. J. C. Hubinger owns all the franchises for electric lights, telephones and street railways in Keokuk, Ia.

Because the words "not guilty" appeared in larger type than the remainder of the court's instructions to the jury, in a suit against the Chicago City Ry. to recover for personal injuries, the Appellate Court has ordered a retrial of the case.

BROOKLYN 10-CENT FARE CASE.

In our last issue we noted that the Supreme Court of New York had refused to enjoin the Brooklyn Rapid Transit Co. from charging a 10-cent fare on its Sea Beach line to Coney Island, but the justice said that the attorney general might sue to have the company's charter annulled. The plaintiff in the injunction suit at once acted on the suggestion, and filed a petition with the attorney general.

This suit will probably be dismissed, because of the ruling of the appellate division of the Supreme Court in another case, made July 23d. Arthur Barnett had been ejected because of his refusal to pay the 10-cent fare, and on a suit recovered \$65 damages. On appeal the court held that the provision in the railroad law limiting the maximum fare on a street railway system to 5 cents for a continuous ride did not apply in this case, because the Sea Beach line was a steam railroad, and because it was already built and thus expressly excluded from the operation of the law, which did not apply to any part of roads built and in operation prior to 1884.

STREET RAILWAY FOR KENOSHA, WIS.

The franchise for a street railway granted to Messrs. Haynes and Clausen by the city of Kenosha, Wis., has been acquired by Mr. B. J. Arnold, of Chicago, who has deposited with the city certified checks for sums aggregating \$9,000, and also bonds, one for \$10,000 and one for \$50,000 to comply with the conditions of the ordinance. The bonds were executed by Mr. Z. G. Simmons, of Kenosha, and are admitted by all parties concerned to be perfectly good, though the mayor of Kenosha is at present contending that they should be made by a surety company to conform to the wording of the ordinance. It is believed, however, that the mayor will accept the bonds offered.

If permitted to do so, Mr. Arnold will build the road this year; it will be part of the connecting line between Kenosha and Waukegan, which when completed will give a through line from Evanston to Milwaukee.

RAISE IN WAGES APPRECIATED.

On July 10th, Mr. J. M. Roach, president of the Chicago Union Traction Co., issued a letter to his employes notifying the North Side men of an increase in wages. This letter will be found in full on page 416 of the "Review" for last month.

Shortly after the notice was issued, President Roach was waited upon by a delegation of 17 of the older employes from the North Side lines, who presented him with a roll containing the names of nearly 2,000 conductors and motormen, who wished to express their thanks for the increase and their appreciation of the efforts made to better their condition. Mr. Roach assured the committee that he would never fail to look after the interests of his men, and told them the company would always share with its employes any future profits that might result from their care and faithfulness in the performance of their duties. He further assured them that if at any time they had any suggestions to offer for the betterment of the service, or complaints to make, he would be pleased to hear from them.

ELECTRIC RAILWAYS IN CANADA.

The Canadian Government has issued an interesting report on the street railways of the Dominion, from which it appears there are 632 miles of track operated by electricity. For the year ending Dec. 31, 1899, the number of miles run was 29,646,847, and number of passengers carried, 104,033,659 or 20 times the total population of the country. The paid up capital invested amounted to \$21,700,000.

For the same year the steam roads carried 87,865,468 passengers less, and ran 4,353,988 passenger car-miles less than did the electric lines.

The practice of running trail cars has been discontinued by the Union Railroad Co., of Providence. It has been decided by the management that trailers are responsible for a large proportion of accidents.

HARTFORD STREET RAILWAY BAND.

By the courtesy of Mr. T. C. Davis, who was instrumental in organizing the Hartford Street Railway Band, we are enabled to publish the accompanying engraving and also the constitution, which it is hoped will be of material assistance to others who may contemplate having a similar organization.

CONSTITUTION

The name of this band shall be Street Railway Band, Hartford, Conn. The object of this association is two fold; first, the encouragement of the study of music among its members, and second, to give public and private performances for mutual gain and profit.

I. The officers of the Street Railway Band shall consist of a president, a vice-president, a secretary and a treasurer, each of

for the same, as they deem best for the interests of the organization.

V. If the leader or musical director is a paid man, he shall not be considered an officer, but when on duty or at rehearsals he shall have full command of the band, and his orders must be obeyed to the letter. Should the leader be selected from the ranks of the band, the office must be created an elective one, and added to the list of officers, with the same power as given to the paid leader.

VI. When the band turns out for duty the president shall act as sergeant of the band and assist the leader in maintaining discipline, and in case of the latter's absence, assume the position of director.

VII. The president shall appoint a librarian to take charge of the music, etc., and also appoint such committees as shall be found necessary in the course of events.

STREET RAILWAY BAND, HARTFORD, CONN.

whom shall be elected annually, and also an advisory board of three members, all of whom shall serve for the period of one year.

II. The meetings of this association shall consist of one rehearsal each week and four quarterly meetings, which shall be devoted to the business of the organization. At the quarterly meetings the president shall preside, and in his absence, the vice-president. The weekly meeting shall be under the direction of the leader of the band.

III. The regular quarterly meetings shall be held on the last Sunday of April, July, October and January. The regular weekly rehearsals shall be held on Sunday afternoon. Should necessity arise the president may call a special meeting at any time.

IV. The president shall preside at all meetings of the band, and the vice-president shall do the same in the president's absence. The secretary shall attend to all correspondence of the association, keep a record of the meetings, etc. The treasurer shall keep a correct account of all moneys received and disbursed and shall render a quarterly account of the same; it will also be his duty to make out bills and collect the amounts for services rendered by the band. The advisory board shall formulate plans for the raising of funds by subscriptions, concerts or in any other manner that they may deem advisable, for the maintenance of the band's library, uniforms, instruments, rent of band-room, furnishings, etc. They shall also act as an auditing committee to audit the accounts of the treasurer semi-annually. The advisory board, in conjunction with the president, shall have full power to regulate the price of engagements, and to accept or reject offers

VIII. Every member must consider it his imperative duty to attend all meetings of the organization, and turn out for band engagements when properly notified of the same by the president or secretary. Should he wilfully neglect to attend after due notification, unless excused by the president or leader, he shall be subject to a fine, to be imposed by a majority vote of the organization.

IX. Applicants for membership must signify their intention in

KEY TO GROUP.

writing, and shall be voted on at the next quarterly meeting. A majority vote elects the candidate.

X. Any member may resign from the band by handing in his resignation in writing to the president. In doing so he forfeits all rights or claims upon any band property, and must return all of the same in his possession before his resignation can be accepted.

XI. Each member of this organization must endeavor to uphold its dignity and improve its musical standing, and to that end he should take more than ordinary pride in attending the rehearsals, and to his uniform equipments, instruments and other band properties, and conduct himself with propriety upon all occasions, pay proper respect to the leader and officers, and ever keep in mind that a misdemeanor while in uniform or with the band does not count against the individual, but disgraces the whole organization.

XII. The regular dues of this association shall be 25 cents per week, to be paid to the secretary at each rehearsal. Members shall be fined the sum of 25 cents for non-attendance at rehearsals.

XIII. The use of intoxicating drinks, gambling and any misdemeanor during meetings or band engagements are strictly prohibited, and for such offenses members shall be dealt with as their offense deserves.

XIV. This association being a street railway band, the band must not accept any engagements that may conflict with the work of the members, without first conferring with the proper officer of the street railway company.

XV. A member may be suspended or expelled for offenses committed against the constitution by a two thirds vote, at any quarterly meeting.

The names of the members of the band and its patrons, together with the instruments, are given in the following list: 1. Norman McD. Crawford, general manager. 2. James R. Goodrich, purchasing agent. 3. Frederick W. Miller, assistant superintendent. 4. Isaac J. Reese, foreman steam fitter. 5. Herman Van Ormer, chief engineer at power station. 6. Orrin W. Chaffee, drum major, foreman of line. 7. Thomas C. Davis, bass drum, foreman at Venon St. 8. Alfred M. Mack, clarinet. 9. Eugene W. Brown, cornet. 10. Wm. J. Shultz, alto. 11. Peter Bernhard, alto. 12. Jerome Spanier, cymbals. 13. Wm. A. Doherty, trombone. 14. Fred J. Flint, cornet. 15. Levy V. McGee, trombone. 16. John H. Mills, trombone. 17. Frederick J. Saunders, cornet. 18. John Herzog, alto. 19. Oscar Belden, cornet, and leader. 20. Hubert H. Hibbard, baritone. 21. Jos. H. Dancker, bass. 22. Wm. F. Fischer, bass. 23. Samuel P. Leadyard, cornet. 24. Wm. Hubbard, snare drum. 25. Henry F. Hosmer, first snare drum. 26. Louis A. Dreiu, clarinet. 27. Frank A. Hennessy, clarinet. 28. George F. Goodrich, clarinet. 29. Frank R. Williams, piccolo.

THE ELECTRICAL ENGINEERS ABROAD.

The functions that have been arranged for the American Institute of Electrical Engineers while in Europe have been announced by the secretary, Mr. Ralph W. Pope, as follows: In London the entertainments are by courtesy of the Institution of Electrical Engineers.

Sunday, August 12th.—Trip up the Thames by rail to a convenient point, thence by electric launches, returning by the same route after lunch.

Monday, August 13th.—Dinner in the evening.

Monday and Tuesday.—Visits will be arranged to works and other points of interest in the vicinity of London.

Wednesday, August 15th.—Special train to Paris.

Thursday, August 16th.—Joint meeting, by courtesy of Commissioner Peck, in the U. S. Pavilion.

At the Paris meeting the subject for discussion will be: "The Relative Advantages of Alternate and Continuous Currents for a General Supply of Electricity, Especially with Regard to Other Interests." The particular point which the British Committee wish discussed is: How far will interference with other undertakings, rather than ordinary commercial and industrial conditions, be the factor which will determine whether continuous or alternating current shall be used.

On July 18th, Mr. W. Roger Fronefield was appointed receiver for the Springfield (Pa.) Street Railway Co., a company existing only on paper.

A negro was arrested at Dayton, O., while in the act of throwing a switch with the purpose of wrecking a car on the Cincinnati & Miami Valley Traction Co.

IMPORTANT DECISION ON TRUCKS.

The J. G. Brill Co., of Philadelphia, Pa., announced that on July 9th Judge Shipman, of the United States Circuit Court for the Southern District of New York, rendered a decision holding that letters patent No. 578,208, granted July 5, 1892, to G. Martin Brill for certain improvements in railway trucks, broadly cover any truck having elliptic and helical springs secured to the outer end of the axle box frame for the purpose of overcoming oscillation.

The suit was brought by John A. Brill agent of the Third Avenue Railroad Co., of New York, for alleged infringement, but was defended by the Benn Car Box Co., of Springfield, Mass. The court granted an injunction and ordered an accounting for damages.

RAILWAYS ALONG AN OHIO CANAL.

The berme bank of the Miami & Erie Canal in western Ohio is in great demand as a right of way for railways, and the canal commissioners now have under consideration two applications for a lease of the bank over the whole course of the canal and other applications for portions of the route. The second applicant for the entire route is the Cincinnati, Hamilton & Dayton Traction Co., composed of officials of the C. H. & D. Ry. The other application was filed two months ago by Messrs. I. D. York, H. L. Wilhard, M. L. Sternberger, E. L. Sternberger and J. E. Lewis.

The Miami Valley Railway Co. has applied for a lease of the canal from Troy to Dayton and from Piquette to St. Mary's and for the Sidney feeder.

The Southern Ohio Traction Co., of which Mr. Will Christy is president, has filed an application for the lease of the part lying between lock No. 2, north of Middletown and Franklin.

CROSSING RAILROAD TRACKS IN GEORGIA.

Both the Atlanta Railway & Power Co. and the Atlanta Rapid Transit Co. (successor to the Collins Park & Belt Line road) have been seeking to cross the line of the Southern Ry. in Atlanta, Ga., and the steam road applied for an injunction to prevent the threatened crossings. In denying the petition for an injunction the court said that the operation of a street car line did not impose any new servitude on the street, the trend of legal authorities being that a street car should be placed in the same class with an omnibus or any other vehicle.

Permission was accordingly given the two electric lines to make the crossings desired. The Rapid Transit Co. stated that though not required to do so it would install a manually operated derauling switch which would be normally open and have to be closed by the conductor to permit cars to make the crossing.

CINCINNATI, NEWPORT & COVINGTON.

Mr. J. C. Ernst, president of the Cincinnati, Newport & Covington Railway Co., sends us the following condensed statement for June, 1900:

	June		Six Months	
	1899	1900	1899	1900
Gross receipts	\$73,446.81	\$63,141.35	\$301,381.1	\$255,501.5
Operating expenses	31,240.80	23,064.15	144,734	141,663.1
Net earnings	42,206.01	40,077.20	156,647.1	113,838.4
Tolls, damages, taxes, etc.	12,314.00	11,717.00	74,520.00	75,115.07
Net profit	30,892.01	28,360.20	82,127.1	38,723.37
Ratio of expenses to earnings				
With tolls	72.53	47.1	52.85	57.72
Without tolls	72.25	36.52	47.4	43.4

As a token of appreciation for the efficient work performed by the police at its park on July 4th, the Consolidated Traction Co., of Pittsburg, donated \$200 to the police pension fund.

A salute of 21 guns was one of the features of a celebration held at Fort George, New York City, in honor of the completion of the Third Avenue Railroad Co's. Amsterdam Ave. extension to 144th St.

MECHANICAL DEPARTMENT

COMPETITIVE TESTS OF STREET CAR BRAKES MADE BY THE NEW YORK STATE RAIL- ROAD COMMISSION.

In 1899 the Board of Railroad Commissioners of New York arranged to make some official tests of various brakes for street cars and the report of these tests has recently been issued by the Board in the form of a pamphlet of nearly 200 pages. We give below those portions of the report of Mr. Charles R. Barnes, electrical expert of Board, which describe the apparatus, methods and results; on another page will be found our comments on the results.

ABSTRACT OF REPORT.

The introduction recites the invitation to enter the competitive tests and the responses received, (this invitation was printed in our issue for May, 1899, page 336, together with some criticism of the proposed method of making comparisons between different brakes); next is a description of the apparatus and methods as follows:

The whole subject of these tests received a great deal of consideration at the hands of the Board, it being the desire that when that result was made public no claim of unfair treatment and no suspicion of favoritism could possibly be charged. To attain this end, I, as your official electrical expert, assisted by Mr. W. A. Pierson, electrical engineer of the Metropolitan Street Railway Co., designed and constructed a device that automatically recorded the result of each stop, in the form of curves, which showed the number of feet that car had run after "stop" signal had been given and the time consumed in bringing the car to a standstill. This device was built at the 146th St. car shops of the Metropolitan Street Railway Co., without expense to the public, and consisted of the following:

A pair of wooden wheels of 24 in. diameter (with leather tires to prevent skidding), 2-in. tread and standard gage, were keyed to a 1 1/2 in. axle which rotated in boxes, guided in pedestals, outside of the wheels, screwed to the body of the car; the wheels were held down on the rails by compression springs, thus insuring good traction. On the axle between the two traction wheels was held, by means of set screws, a 20-in. sprocket wheel with 70 teeth, cut for a No. 25 Ewald detachable link chain. This chain ran through the flooring of the car and was kept in tension by two idler pulleys, with tension

FIG. 2—FRONT VIEW.

springs, to a loose sprocket 6 1/4 in. in diameter, with 22 teeth, running on a 1 1/2-in. diameter countershaft of the instrument proper inside the car. The instrument was mounted on a table, the top board of which was made of three-ply ash, 2 in. thick, 6 ft. long and 18 in. wide, with another board perpendicular to it holding the paper on which the record was made. The countershaft was properly boxed near both ends, with suitable holes, grooves, etc., for lubrication. Keyed to the shaft was a friction wheel, of the cone type, which, when thrown in, engaged the hub of the small sprockets, imparting the motion of the same to the shaft. Fixed to the end of the shaft was a bevel-gear 12 in. pitch diameter, 72 teeth meshing in a smaller 3-in. pitch diameter, 18 teeth, geared at right angles to it, rotating a 1-in. steel rod, cut with a screw-thread between journal boxes near each end, the number of threads on the screw being eight to the inch and the length 4 ft. 4 1/2 in. The friction clutch was thrown in by means of a lever 13 in. long, the clutch being 3 in. from the fulcrum towards the center. At the extreme end was attached, by means of a

screw, a strong tension spring, distending when the clutch was drawn out, and held by a protected catch, the other end of which was the armature of an electro-magnet. When the circuit which included the magnet was closed, the clutch was drawn up, releasing the clutch lever, thus throwing in the clutch, and the motion of the sprocket was imparted to the screw rod through the bevel-gears. Running in guides screwed to the top of the table with a split nut, having a locking device for engaging or disengaging it from the screw, was a carriage, which, when the clutch was thrown in, travelled in the guides until the car stopped. Knowing the ratio between the travel of the carriage and the travel of the traction wheels on the track, the distance required to

FIG. 1—TOP VIEW.

stop the car was easily computed. Attached to the carriage and at right angles to the screw was a 1-in. round brass tube, slotted on each side, in which was a cylindrical 1 1/2-lb. weight of lead, with pencil attached having compression spring behind it to insure its bearing against the sheet of paper on which the record was taken. On top of the carriage was screwed a clock movement, containing a heavy main spring to secure quick action when movement was released. From the weight carrying the pencil a string was secured, running over the top of the tube on a pulley and down to a sheave held to the movement by a clutch, which could be thrown out to allow the weight to be raised, by winding the string on the sheave. The movement was released at the same time the cone clutch was thrown in, by means of a string attached to the end of the clutch lever, which pulled a lever attached to the board; this, in turn, threw out another lever which was holding the spokes of one of the wheels on the movement, thus allowing it to run, and the weight to descend into the tube at a certain rate. On the axle of the pony wheels of one of the trucks was placed a sheave which operated, within the car, a Boyer speed recorder, with a dial showing the speed of the car, in miles per hour, by means of a revolving hand. On the dial was arranged a movable contact point, which could be set at any desired speed. When the car reached the required speed the dial hand made contact with the movable point and closed the circuit in the electro-magnet, actuating the clutch and movement. When the clutch was thrown in, another circuit was automatically closed, ringing a bell on the platform of the car, and thus signalling the motorman to throw off the power and apply the brakes. To prevent the brake operator, or motorman, from taking up the slack in the brake rigging before the proper signal was given, a bell circuit was placed with the bell on the recording table. As soon as the least movement was given to the handle of the brake, the bell circuit was closed by means of various styles of contact points, and the testing operator was thus warned, by the bell on his table, that there was some premature or improper interference.

METHOD OF CALIBRATING.

The instrument was calibrated on a track about 275 ft. long, in the 146th St. car house of the railway company, great care being taken with the measurements, timing, etc. To get the track travel of the car for 1 in. travel of the testing carriage, the car was run about 200 ft., the points of departure and stopping carefully marked and the distance between them measured, as was also the travel of the carriage. About 18 readings were taken under various conditions, such as running the car slowly and at high speed; also with dry and wet rail. It was found that 1 in. travel of the carriage was equivalent to 47 1/2 in. travel of the car; and, as the maximum travel of the carriage was 51 1/2 in., the maximum length of the stop that could be recorded was 203 1/2 ft.

To get the time constant, the movement was started while the car was in motion, and the time the pencil took to drop a given distance was noted on a stop-watch, reading to fifths of seconds. If the movement ran too slow, the staff was weighted with lead; if it ran too fast, lead was taken off until the necessary speed of drop was acquired. It was thought preferable to weight the staff instead of using a fly, so that a draught of air would have no effect on the results.

The movement was finally arranged to drop the weight 9 in. in 15 seconds, or 3/5 in. in one second, and, as the maximum drop of the weight and pencil was 10 in., the maximum time range was 16 2/3 seconds. The starting of the movement was very quick, as trials were made by timing the first and last half of the drop separately, but no appreciable difference could be detected.

METHOD OF CONDUCTING TEST.

On each car 14 official speed records were taken; 3 at 8 miles per hour, 3 at 12 miles, 3 at 15 miles, 3 at 16 miles, and 2 at 16 miles, with sand.

In setting the instrument, the pencil was drawn up near the top of the paper and the clutch on the movement thrown in and the carriage brought to

the extreme end of the instrument towards the front of the car. The split nut was then locked, the lever put in place to start the movement and the contact point on the speed indicator was set opposite the figure of speed required at which the car was to be stopped. When everything was in order a signal was given to the motorman to start the car. From this time the operator had nothing to do but watch the apparatus, to see that there was no failure of the parts to work properly.

When the predetermined speed was attained, the indicator hand made a contact with the metal stop on the dial of the speed indicator, thus closing the local circuit and setting in motion the recording instrument. This was kept in motion until the car came to a stop and the curve was automatically traced by the pencil on the paper. In addition to this record, the skidding of wheels was noted, a record being made of the number of wheels skidded and the number of feet that they slipped along the rails.

As soon as the record was taken the cone clutch was thrown out, the split nut unlocked, the carriage brought back to its first position, the pencil and everything readjusted, as stated. To avoid any dissatisfaction on the part of a contestant, he was given the option of personally applying the brake or leaving it in charge of the motorman.

Figs. 1, 2, 3, show different views of the apparatus.

Arrangements were made with H. H. Vreeland, president of the Metropolitan Street Railway Co., under which each contestant was allowed to attach his brake equipments to one of the cars of that company. The tests were commenced on Aug. 31, and completed Dec. 2, 1899. During this interval a number of perhaps unavoidable delays occurred. A day for a test would be set and the Board would be present, only to find that some car had not been equipped as promised; thus that day would be lost. Again, when all was ready for the test, rain would prevent it, as tests were held only when the rail was perfectly dry. On several occasions the tests were interrupted by derangement of the braking apparatus, and a delay of two weeks was once caused by the speed indicator becoming disabled.

The tests were held on the Lenox Avenue line, between 135th and 146th Sts. Between these points the track is of 90-lb. girder rail, 2 in. head, double track underground electric construction. The distance, between the streets named, is 2,750 ft., and there is a descending grade northward from 135th St. of 8.8 ft., nearly uniform between the points.

It was the intention to make the tests at initial speeds of 20, 16, 12 and 8 miles per hour, but it was found that the higher speeds could not be attained with the motor equipment used; so the tests were made at 16, 15, 12 and 8 miles per hour. These tests were made without sand; and two additional stops, at 16 miles, were made with sand.

The regular schedule cars were operated on the line during the tests. At 116th St. is a crossover which was used in going from the south to the north bound track. After making the southbound test stops, this crossover enabled the car to return and make the test stops on the northbound track. A flagman was stationed at each intersecting street to prevent accidents. After testing a car it was run into the car barn at 147th St., and over a pit, where the testing apparatus was transferred to another car. On each of these changes four men were employed from two to four hours. Five employes of the company were on each car during the test. The largest number of brakes tested in one day was four.

Sixteen different brakes were tested which may be thus classified:

Air brakes—G. P. Magann Air Brake Co.; Christensen Engineering Co.; Standard Air Brake Co.; John E. Reyburn.

Electric brakes—General Electric Co.; Columbia Electric Light & Brake Co.; Price, Darling & Co.; Electric Selector & Signal Co.

Hand power brakes—Sterling Supply & Manufacturing Co.; M. H. Vogel; Sauvage Street Car Brake Co.

Friction brakes—Peckham Truck Co.; J. G. Brill Co.

Track and wheel brakes—Devlin Street Car Brake Co.; Philip Bach & Bernard Schlegel.

A system of brake levers submitted by the Safety Appliance Co.

The report contains a brief description of the principles of each of these, but does not give any data concerning the brake leverage or braking force available with the apparatus tested.

Then follow 66 plates of diagrams, which it is stated are reduced by measurements and photography from the original recording instrument curves. One of these is reproduced herewith and another will be found in connection with our criticisms of the report.

After the curves are 15 tables giving the results, one for each of the 15 brakes enumerated. One of these, Table 10, is reproduced herewith. Next is a general summary, Table 16, which we also reproduce. In tables 17 to 22 are data shown in Table 16, somewhat differently arranged. Table 23, reproduced herewith, was prepared to show the standing of the brakes based on the formula $ws^2 \div d$.

FIG. 3—END VIEW.

Columbia Car, Light and Brake Company	29,325	132.80	44.80	.225	44.09
Bach & Schlegel (no test)

Per cent. deducted for skidding wheels is based on the following values:

Skidding 15 feet or more.	Skidding 10 feet to 15 feet.	Skidding 5 feet to 10 feet.
One large wheel25	One large wheel... .125	One large wheel0625
One small wheel125	One small wheel... .0625	One small wheel03125
Large and small wheels45	Large and small wheels225	Large and small wheels1125
All wheels 1.00	All wheels50	All wheels25

could be furnished for this purpose except in the run from the shop to the car barn. The General Electric Co. labored under the disadvantage of having only two axles equipped with shoes, there being no shoes on the pony wheel axles. Messrs. Bach & Schlegel equipped the car with only four shoes. The construction of their shoe was such, it being a wheel and rail brake, that only the shoes on the forward wheels had any braking effect on the rail. For this reason the car could not be stopped within the limits within which the instrument would record the result. The electric controller of the Price-Darling brake lunched out after the tests at 8 miles per hour were made, so the standing given for this brake is based only upon the test made at that speed. The John F. Reyburn air brake was tested at only 8 and 12 miles per hour. This, how-

DIAGRAM NO. 43—TESTS OF STREET CAR BRAKES BY N. Y. RAILROAD COMMISSION.

ever, was owing to no defect of the brake. It was found impossible to make the faster speeds with the car equipment; so the standing of this brake is based on stops made at 8 and 12 miles per hour. The Safety Appliance Co. presented a system of levers for street car brakes which, during the test, was applied to the Sterling brake.

The standing of the respective brakes, as shown on the foregoing tables, is only the result obtained by the automatic recording instrument, and the record of skidding of wheels as noted.

To this standing must be added or deducted, as the case may be, points for the possession of, or the lack of, the following qualities: Reliability of system, ease of manipulation, simplicity of system, liability of brakes operating when they should not, safety devices in case of disablement of any part of the braking system, cost of equipment and expense of maintenance.

In addition tests were made, on the same car used for the test of the Sterling brake, with the ordinary spindle hand brake. This showed an average stop of 67.01 ft. for the spindle brake as against 63.79 ft. for the corresponding tests of the Sterling brake. An apparatus was also rigged to determine the maximum force exerted by the motorman in applying the brakes; an 18-in. hand wheel was substituted for the ordinary brake handle which is usually 12 or 14 in. long. This test showed an average stop in 58.73 ft. for the Sterling brake, the average maximum force exerted being 77.68 lb.; for the spindle brake the stop was 56.87 ft. and the average maximum force, 92.5 lb. The largest and smallest values of the maximum force exerted in any one test are given as 85 and 65 lb. for the Sterling and 105 and 85 lb. for the spindle brake.

Tests were made on a wet rail with one car the average stop on the wet rail being 71.73 ft. as against 60 ft. on a dry rail.

The conclusion of the Commissioners from these tests after adding or deducting points of merit or demerit based on the following features:

- Reliability and simplicity of system.
- Liability of brakes to act when they should not.
- Ease of operation by the ordinary motormen.
- Cost of equipment and maintenance.

was that the brakes took rank as follows:

- Electric Selector & Signal Co.
- Peckham Truck Co.
- Sterling Electric & Manufacturing Co.
- G. P. Magann Air Brake Co.
- M. H. Vogel
- Deylin Street Car Brake Co.
- J. G. Brill Co.

Its recommendation was that in all but special cases, where the liability to accident is very remote, the ordinary spindle brakes should be replaced by one of first 12 of the brakes mentioned in the preceding list or some other brake which in the judgment of the Board is equally efficient.

IMPROVED SMOOTHING PLANER.

The accompanying illustration shows a new single cylinder cabinet smoothing planer just placed on the market by J. A. Fay & Co., of 557-577 West Front St., Cincinnati. It is known as their No. 19 and embodies some late improvements, the patents bearing date of Dec. 19, 1899, Feb. 6, 1900, and May 8, 1900. The more noticeable mechanical advantages of the design are: The

IMPROVED SMOOTHING PLANER.

feed rolls are center-gearred and hung pivotly; the pressure for each roll is cushioned on a spring, giving a very fine cut, and enabling the operator to plane smooth without wave; the bed raises and lowers on long inclines; the feed is so arranged that with one lever its speed can be increased or reduced, started or stopped, instantly.

The manufacturers will be pleased to furnish any of our readers who may be interested, and will write them, prices and full particulars of this or any other machine for working or cutting wood, and will also forward their new illustrated catalog free.

CAR HOUSE LAYOUT AT LISBON, PORTUGAL.

The accompanying illustration shows in outline what is probably the largest piece of special track work ever exported, that was fitted together complete in this country. It is the special work for the entrance tracks of the car house of the Companhia Carris de Ferro de Lisboa, of Lisbon, Portugal, and was made by William Wharton, jr., & Co., of Philadelphia. It is all of 7-in. guard rail section, the style being the well known Wharton manganese steel construction. Contrary to the usual practice of fur-

proper shape, but it is necessary to do this only two or three times, as the shape soon becomes set.

Varnish brushes and brushes used in varnish stain, and all color in varnish require different handling from paint brushes. After dry cleaning them through the hand it is a good idea to pass them back and forth over a sheet of sandpaper, which will pull out all the loose bristles and smooth down the rough end.

Varnish brushes should never be placed in water. They may be washed by working them for a few moments in clean turpentine and swinging dry, and when not needed they should be kept in

CAR HOUSE TRACK LAYOUT AT LISBON, PORTUGAL.

nishing single switches, mates and frogs, and cutting and curving the rails when installed, the entire work was laid out and fitted together at the yards of the Wharton company in Philadelphia. This layout is of special interest as indicating the high opinion in which this construction is held abroad, as well as at home.

As will be seen by reference to the drawing there are 20 tracks of 90 cm. (2 ft. 11 7/16 in.) gage; the minimum radius is 40 ft.

turpentine and varnish, or, better still, in some of the varnish in which they have been used. They should not be kept in turpentine only, as this is apt to roughen the bristles.

When it is desired to change from one color to another, or from one varnish to another, all brushes should be washed in benzine or turpentine and shaken dry, not whipped.

THE CARE OF PAINT BRUSHES.

The good workman is known by his tools in car painting as in all other arts and trades, and the best car painter in the country can not turn out good work with poor brushes, so that it behooves the master painter to bestow as much thought on the selection and care of his brushes as he does on his materials. Twisted bristles and misshaped ends will make the best paint cover poorly and always deface the surface.

The first principle in brush care, says the Hub, is to keep the tool at all times when it is not in use, and especially when it is new, in a cool place, as a high temperature tends to shrink the wood of the handle, thereby causing the bristles of the brush to loosen and drop out.

New brushes require special care for the first two or three days. No new brush should be dipped in the paint and put to work without first being dry cleaned by working back and forth on the hand or a clean board. It should then be placed in water for a few minutes, not long enough to soak or swell it, but only until it is wet through, when it should be swung and shaken dry. It may then be dipped in raw oil or the paint itself and smoothed out carefully. It is better to let it remain over night before using.

Never leave a brush standing on the ends of the bristles when at rest, as this will ruin its shape and shorten its life more rapidly than will constant use. A good brush holder is easily made from a water-tight box or old paint keg, with nails driven in the inside, on which the brushes may be suspended to hang clear of the bottom but with the bristles entirely under water. Before placing in water the brushes may be wiped, but it is better not to remove all the paint.

The chisel-pointed brushes when new may be set at an incline, the handle supported just enough to allow the brush to lie along the point. This prevents the twisting of bristles and gives the

“TAYLOR-WHITE” TOOLS.

For the past two years the Bethlehem Steel Co. has been developing a method for increasing the cutting properties of a special grade of tool steel, and has achieved remarkable results. The company has had many requests for data on the operation of these tools, but until now has preferred not to make them public. July 31st representatives of the technical press were invited to South Bethlehem to see the tools at work, and all who were able to do so gladly availed themselves of the invitation.

Briefly, the Taylor-White process was the result of experiments by Mr. F. W. Taylor and Mr. Maunsel White, engineer of tests, of the Bethlehem Steel Co., and the cost to the company which has acquired the patents, has been over \$100,000. The following statement from it shows that the investment has been more than repaid, however:

“The increase in cutting speed of the various machine tools throughout the machine shop has entirely reversed the inequality of balance existing two years ago, so that the capacity of the forge has had to be largely increased to keep pace with the rapidly growing efficiency of the machine shop. The introduction of this process for the treatment of our tools has enabled us to speed up our main lines of shaft from 90 to 250 revolutions, and further changes in countershafts have been made to speed up individual machines.

“In order that the rate of progress might be observed, records from time to time were made of the average amount of metal cut per hour per tool throughout the shop. The table shows the increase in efficiency made up to January of this year.”

These tools retain a high degree of hardness when heated to a visible red, and it is possible to cut steel after the point of the tool has become red hot, leaving an unusually smooth surface on the work. The practicable cutting speed is from two to four times that for tools of any other steel of which the Bethlehem

company has knowledge. The effect of the process is said to extend to the center of even the largest tools that have been treated,

Average.	1 Oct. 25, '98.	2 May 11, '99.	3. Jan. 15, '00.	Gain in per c't. cut of 3 over 2.	Gain in per c't. cut of 3 over 2.
Cutting speed . . .	8 ft. 11 in.	21 ft. 9 in.	25 ft. 3 in.	16	183
Depth of cut25 in.	.278 in.	.30 in.	8	30
Feed07 in.	.0657 in.	.087 in.	32	24
Pounds of metal removed per hour. . .	31.18	81.52	137.3	68	340

which were 4 in. square. While all standard brands of self-hardening steel are improved by the Taylor-White process, it is preferred to use a steel of special composition. This steel forges more easily and a process has also been discovered for annealing it so that it can be easily machined to shape.

The price charged for a shop right to use the process is based on the number of machines and their size and character.

GRAPHITE FACINGS.

A recent publication of the Joseph Dixon Crucible Co. explains the theory of graphite facings for molds. Graphite is one of the forms of carbon and is combustible. When the molten metal is poured into the mold, the air in the mold and the air carried in by

CALIFORNIA CAR WITH NEW DETAILS.

The California car illustrated in the accompanying engraving was built for the street railway system of the Washington Power Co., in Spokane, by the J. G. Brill Co. and is interesting because it embraces several novel and important features. It is the California type pure and simple, mounted on maximum-traction trucks, with 8 ft. 6 in. vestibuled platforms. The first feature of novelty to strike one is the fact that the platform seats, as well as those within the body of the car, are made reversible. The aisle extends from end to end, and is 19 in. wide on the platforms and 18 in. within the body of the car. The sills are plated with iron, thus giving ample strength to carry the long car, which measures 33 ft. 8 in. outside the vestibules. Another feature is found in the panels, which are of metal, held in place by round headed brass screws. This introduction of metal for panels is significant in a car which is going into a well wooded country and into a climate where wood endures in a satisfactory manner. On the platforms the seats are fitted with round-end seat panels, and the curtains, of which there are three on each side of each platform, are arranged to come all the way to the floor, giving a complete enclosure. The dimensions are:

Length over dashers, 33 ft. 8 in.; width at the sills, 6 ft. 10 in.; width over all, 7 ft. 8½ in.; length of closed portion over the corner posts, 16 ft. 8 in.; extreme width of closed portion, 8 ft. 2

IMPROVED CALIFORNIA-TYPE CAR—J. G. BRILL CO.

the stream of melted metal furnish oxygen enough to bring about a certain amount of combustion, forming a gas between the metal and the mold. This gas effectually prevents any adhesion of the metal to the sand. A proper facing must burn to give the desired results, but it must not burn too fast as is the case with the cheaper grades of facing; also the facing must adhere to the sand and not run before the metal. To meet conditions that vary because of the different sands used and the degree of moisture, the Dixon company makes eight different kinds of graphite facings.

KW. H. PER CAR-MILE.

Mr. A. H. Binyon in a paper before the Society of Engineers (England) gives the following figures on power consumption of electric cars weighing about 12 tons for speeds of from 6 to 12 miles per hour, and with stops of 8 to 10 seconds.

Miles per hour.	No. of stops per mile.	KW. H. per car-mile.
6	6 to 14	.7 to 1.08
7	6 to 13	.65 to 1.43
8	5 to 11	.75 to 1.75
9	4 to 9	.73 to 2
10	4 to 8	.82 to 2.2
11	4 to 7	.78 to 2.04
12	3 to 6	.73 to 2.04

in.; gage, 4 ft. 8½ in.; head room inside, 8 ft. 2 in. at center; from bottom of sills to top of trolley board, 9 ft. 2 in.

The maximum-traction trucks have 30-in. and 22-in. wheels, with 2¼-in. treads and ¾-in. flanges. There are two G. E. 52 motors with nose suspension. The space between the trucks on each side of the car is closed by a life guard; the steps are of the standard pattern, folding up when necessary. Each end is fitted with Brill angle iron bumpers, a 12-in. electric headlight with a 32-c. p. lamp and a Brill radial draw bar. There are two sand boxes and two "Dedenda" gongs. The details of finish comprise quartered oak, decorated headlinings, spring cane seats within the the car body, spring roller curtains, window guards and in general a very neat and satisfactory finish. In the open part the seats are spaced 2 ft. 6 in. centers. The trim is solid bronze throughout. The California type modified as shown with the 34-in. seats, which the widths given make it possible to use, is quite satisfactory, there being always ample room for smokers, for those who wish to ride in the open air and for those who desire the protection of a closed compartment.

The Binghamton (N. Y.) Railroad Co. recently purchased the Stow driving grounds, situated in the suburbs of the city, and will turn the property into a public park. The Binghamton Railroad Co. now owns one of the finest systems of pleasure parks to be found in the country.

CHICAGO UNION TRACTION REPORT.

The first annual meeting of the stockholders of the Chicago Union Traction Co. was held on July 24th. Directors for the ensuing year, all re-elected, are: Jesse Spalding, John M. Roach, R. A. C. Smith, Walter H. Wilson, H. B. Hollins, Charles L. Hutchinson, James H. Eckles, C. K. G. Billings, P. A. B. Widener, William Dickinson, John V. Clarke.

Pres. J. M. Roach's report was as follows:

"The business done by your company during the last fiscal year, June 30, 1899, to June 30, 1900, which we have the honor to report, has been excellent, showing a satisfactory increase over business done the preceding year by the leased lines, notwithstanding the trying conditions under which the company has passed during this, the first year of its existence.

"The conditions upon which our earnings are based, since Feb. 1, 1900, have been very unfavorable. Unsatisfactory conditions have existed with the various industries which have not, up to this time, been satisfactorily settled. The weather for the months of April, May and June was anything but good for the railroad business. The Northwestern Elevated road, starting up as it did on May 31, 1900, also had its effect on the income of this company.

"Notwithstanding these unfavorable and embarrassing conditions to the management, our books show that we have earned a dividend on the preferred stock of the company and besides the roadbed and rolling stock are in better condition than ever they have been during the history of these companies.

"There were large amounts of money expended on boulevard crossings, repairing and relettering of cars, overhauling and remodeling 300 summer and winter cars, besides adding 80 new cars to our equipment, with everything incident in the shape of motors, etc. There have been no pains spared in keeping all of the electrical construction first-class and up to date.

"There have been the following amounts spent on the property of the company:

Construction:

Track construction	\$ 74,625.42
Electric-line construction	42,063.13
Real estate	158,922.01

Equipment:

New engines and machinery for power houses..	60,577.13
Additional machinery at shops.....	4,627.49
Cost of new cars.....	88,451.02
Cost of rebuilding and vestibuling old cars.....	26,218.91
Cost of new electrical equipment for cars and plows	78,073.40
Cost of building four new snow plows, wagons, horses and harnesses	10,812.79
Other property accounts	60,838.80
Reconstruction	216,026.26

A total of\$821,236.36

"With the industrial question settled and with reasonably fair weather, which we shall expect, and with the general prosperous outlook for the future, I predict that the stockholders of the Union Traction Co. who continue in the holdings of the company will find it a good, profitable and safe investment.

"It has been, and shall be in the future, our desire to obviate friction and cater to the wants of the public by broad-gage management of its affairs and courteous treatment in the handling of the public.

"I will not attempt in this address to give any financial details of the company, inasmuch as the auditor, Mr. F. E. Smith, has furnished a detailed report under our system of bookkeeping of the entire financial operations of the road. Mr. James H. Eckles, treasurer, will also furnish a short statement showing the reduction of fixed charges in the operation of the road since he became treasurer. For the splendid condition and relations that now exist you are much indebted to our former and distinguished president, Mr. Jesse Spalding, for the manner in which he has handled the property of the company and turned it over to the present officers."

Mr. Eckles reported showing that since he had been treasurer the fixed charges had been reduced \$28,080 per annum by refunding portions of the company's debt.

The income account is as follows:

Earnings.	
Passenger receipts	\$7,468,797.98
Chartered cars	2,122.50
Mail	6,477.58

Gross earnings from operation.....\$7,477,398.06

Expenses.	
Maintenance—Way and structures.....	\$ 193,666.90
Maintenance—Equipment	381,082.87
Transportation	2,619,647.41
General	567,400.18

Total operating expenses.....\$3,761,797.36

Net earnings from operation.....3,715,600.70

Compared with the similar items of the old north and west side systems for the year ending June 30, 1899, the passenger receipts for 1900 show an increase of \$423,413; operating expenses an increase of \$249,013; net earnings an increase of \$32,239.

During the year 29,691,850 car-miles were run and 208,490,562 passengers carried of whom 149,521,755 were revenue passengers, 784,660 were carried free and 58,184,147 were transfer passengers.

Data in cents per car-mile, per revenue passenger, and per total passenger are:

	C.-M.	R. P.	T. P.
Gross earnings	25.18	5.00	3.59
Expense—

Employees' deposits	61,588.00
Coupons	164,170.00
Tickets	6,827.50
Accident fund—reserve	35,989.88
Accrued liabilities not yet due:	
Interest	2,737.42
Rent for track and terminals	1,395.83
Rent for leased roads	827,841.31
Dividends	150,000.00
Taxes	50,663.29
Profit and loss—surplus	4,975.54
Total	\$47,224,833.07

A large portion of the item \$567,460 under "general expenses" was spent in the adjustment of pending claims, and the settlement of old suits of long standing and is in the nature of an extraordinary expense, so that the ensuing year may be expected to show a much larger surplus over dividends on preferred stock. The present year's report will be considered very satisfactory when all factors are taken into account.

THE ST. LOUIS SITUATION.

The cars of the St. Louis Transit Co. are operating on the regular schedules, and while for convenience people continue to speak of the strike, it is a misnomer to so call it. The second "strike and boycott" have proved failures from the start.

July 11th the strikers issued a lengthy statement of their troubles, including a denunciation of Mr. Baumhoff. On the following day Mr. Baumhoff published a letter to the public, in which he denied the charges of bad faith on the part of the company in keeping the agreement of July 2d, and gave an account of what had been done towards employing new men. We quote what Mr. Baumhoff had to say concerning the personal attack on him:

"The statement that I made to the employes of the Lindell division prior to March 10, at which time it was supposed that the strike would take place, and the resultant position which the employes of the Lindell division took, are generally conceded to have been instrumental in averting the strike at that time. I have since been informed by a number of the employes of the Lindell division that after the agreement of March 10, the lives of those who refused to join the organization were made miserable by threats that if they did not join they would be forced to leave the service of the company, and many members of the organization joined for no other purpose than the hope of being let alone in the peaceable discharge of their duties.

"The public is aware of the demands made by the organization which brought about the strike of May 8, and those who desire to refresh their memory may do so by looking up any of the daily papers published on May 8 and 9, and for several days prior. Surely, if there existed the slightest grievance or charge of un-

fairness against me, this matter would not only have been embodied in their list of grievances, but I have no doubt would have been magnified to suit the occasion.

"The list of employes on the Lindell division prior to May 8 embraced a larger number who had been in continuous service for upwards of ten, fifteen, twenty and twenty-five years, than in any other street railway system in this or any other city of the country employing a like number of men, which is certainly conclusive evidence that had I been half as bad as pictured in the statement of the strikers, these men would have sought other positions instead of remaining with the company under my supervision the number of years they did, and the men on this division were noted for their good character and deportment. The fact that the Lindell system was prepared to operate its cars for each and every day during the strike, had it been safe to do so, is the best evidence that its employes were satisfied with their treatment and conditions, and many of those who left our employ on the day of the strike have returned to work. Therefore, the imputation that the organization was effected on account of my management brands itself as a falsehood.

"Referring to their statement regarding the agreement of July 2, the last sentence reads: 'A majority of us, however, thought the directors and stockholders controlled the company.' Allow me to suggest to the strikers that had they entertained the same opinion with reference to their exorbitant and unreasonable demands made to this company, which caused the strike of May 8, there would have been no strike, for the demands made clearly indicated that they were not then of the opinion that the directors and stockholders controlled the company."

There has been comparatively little lawlessness, though on July 21st a car was injured by explosives placed on the track, and on July 27th five cars were injured in the same way.

July 17th a committee of citizens formally asked the union and the company to submit their difficulties to arbitration, but nothing has yet come of this.

The attorney general of Missouri has attacked the organization of the St. Louis Transit Co. in two suits. The first was commenced in the Circuit Court July 12th; the plaintiff asks that the compacts between the Southern Electric Railway Co., the United Railways Co. and the St. Louis Transit Co. be annulled, and the deeds of conveyance set aside, on the ground that the act of June 19, 1899, permitting a street railway company to sell or lease its property by a two-thirds vote of the stockholders, is unconstitutional.

July 17th application was made to the Supreme Court for a writ of quo warranto against the St. Louis Transit Co. The claim is made that the company was chartered to "construct, maintain and operate a street railway," whereas it has in fact "bought and leased" instead of "constructing."

CHANGES AT ALBANY, N. Y.

At the annual meeting of the United Traction Co., held last month in Albany, a new office was created, that of second vice-president and general manager, and Mr. John W. McNamara was chosen for first incumbent. Other officers were elected as follows: President, Robert C. Pruyn; first vice-president, F. N. Mann; secretary, Jas. McCredie. Mr. McNamara will continue to act as treasurer in addition to his new duties.

The directors declared a quarterly dividend of 1¼ per cent.

ELECTRIC TRAMWAYS IN VALENCIA.

U. S. Consul Horace Lee Washington, of Valencia, Spain, supplementing his recent report, a digest of which will be found on page 307 of the "Review" for last June, states that negotiations for the transfer of the tram lines in Valencia to Thompson, Houston & Co., of Paris, on a 40-year lease, have been brought to a successful issue. The lessees, in addition to paying a yearly rental, agree to substitute electricity for horse traction. Electrical machinery will probably be supplied by the General Electric Co., of Schenectady, N. Y., and the cars will be constructed in Spain.

It is announced that the Springfield (O.) Railway Co. will spend \$100,000 in rebuilding track and refitting cars.

NOTES ON THE PARIS EXPOSITION.

The Street Railway Exhibits—Transportation at the Exposition.

The main entrance to the Paris Exposition is at the Place de la Concorde—the very centre of Paris. Owing to this convenient location the question of local transportation to and from the Exposition grounds was probably not seriously considered and the ordinary means of local transportation—the cab and the omnibus—thought sufficient to take care of all who wished to ride. The result is that many who would often like to ride have to walk.

There are several tramways, some operated by electricity, others by steam or compressed air, but a stranger would need a guide

ELECTRIC RAILWAY AT PARIS EXPOSITION.

to find them. Then service is very poor and the capacity is limited, so their principal patronage is derived from the working classes. Furthermore, these lines run through the remote and poorer streets in the outlying portions of the city, generally beyond the legal cab course, or run to suburban points and not through the business districts of the city at all.

Aside from the horse cars, the principal trams are operated by steam, used in several forms, the Serpollet system, the "fireless" system and the regular locomotive. The latter is in general use and in reality this tram service is a railway train of an engine and several double-decked cars running through the streets. The "fireless" locomotives have a reservoir that is charged with water at a very high temperature and pressure and contains a sufficient store of energy to last for a run of five or six miles when the water is drawn from the engine and a new supply pumped in. This arrangement does away with smoke and fumes, but the amount of steam emitted is almost as objectionable. As before stated the cab or the bus is the principal means of transportation. At the omnibus stations you are given a ticket bearing a number which indicates the order of precedence and crowds at these stations extend into the hundreds awaiting their respective numbers to be called before they can enter a bus. The cab drivers are very insolent and will refuse to carry you if your journey is of any distance. In the evening hours when the crowds are returning home from the Exposition, it is next to impossible to obtain transportation by car, bus or cab. The cars and buses are crowded and tickets are out bearing numbers hundreds ahead of yours. The cabman will say that he is engaged, but if you offer him double rate he will forget his engagement.

The means of transport within the Exposition grounds are limited to the moving sidewalk and the electric railway. These lines run parallel but operate in opposite directions and form two belt lines one within the other.

The moving sidewalk draws a very large patronage, the fare being 50 centimes (10 cents) and permits a continuous ride as long as the passenger pleases. The sidewalk skirts the Champ de Mars, the main avenue of the fair, the Quai d'Orsay and the Esplanade des Invalides. The moving platform is supported on an endless structure covering a distance of about 10,000 ft. There are two parallel lines of platforms running $2\frac{1}{2}$ and 5 miles per hour re-

spectively, each composed of about 420 trucks. Only the alternate platforms are provided with trucks, the intermediate ones being linged to them. The trucks have wheels for carrying the weight and run on rails which are 21 ft. 4 in. above the ground. The driving, however, is done by rollers which are in contact with central longitudinal girders on the under side of the platforms. The driving rollers for both the high and low speed platforms are on one shaft, the different speeds being secured by having the rollers of different diameters. A flexible coupling is placed between the two driving rollers to allow for inequalities.

The motors are about 120 in number and of 5 h. p. each; they are carried on a spring suspension and the driving wheels are held up against the rails with a very uniform pressure so that unnecessary friction is avoided.

The Exposition tramway follows the same route as the moving sidewalk. It operates nine trains of three cars each; four Westinghouse motors of 30 h. p. each are on each car. The current is distributed by means of a third rail. This tramway is doing its work very well. The current for the operation of the tramway and the moving sidewalk is obtained from a central power station at Moulineaux, about four miles from the Exposition, where nine Westinghouse three-phase generators of 800-kw. each are installed. This current is received at the Westinghouse Pavilion in the Exposition grounds at a potential of 5,000 volts and is here lowered to 220, 350, and 550 volts for distribution to the tramway and sidewalk motors.

The street railway and electrical exhibits at the Paris Exposition are not very extensive. The general electric show is very fine, but there are few exhibitors from each country. In street railway material and rolling stock the exhibits were very few indeed and so scattered that they were next to impossible to find.

Perhaps in some lines, such as fabrics, furniture and art materials the exhibits represent the best in the world, but in the lines of mechanical engineering the lack of space prevented anything like an imposing showing. One reason for this is that not enough space was allowed in the main grounds, so an annex was designed at Vincennes some seven miles from the Exposition proper and here buildings were erected to take care of the overflow. Almost the entire American machinery exhibit is here, also the U. S. transportation exhibits, the American Bicycle Co.'s costly building and the Automobile Building. The attendance at Vincennes is almost nothing, as the distance is far and the attractions very few.

EXHIBIT OF AMERICAN STEEL & WIRE CO.

Referring to the extent of the street railway exhibits—I saw but two exhibits of rolling stock, one that of the J. G. Brill Co. at Vincennes and the other was a French tram car in the main transportation building. The following American firms had exhibits at Vincennes: International Pneumatic Railway Co., Rochester, N. Y., pneumatic tools; Gould Coupler Co., New York, couplers; New York Air Brake Co., New York, air brake apparatus; Standard Car Wheel Co., Philadelphia, car wheels; International Brake Shoe

Co., New York, brake shoes, McConway & Torley Manufacturing Co., Pittsburg, couplers; J. G. Brill Co., Philadelphia, convertible cars and trucks. (An extended description of one of the trucks exhibited by the Brill company was published in the Review for June, page 344. This truck was similar to a number furnished to one of the new Paris roads.—Ed.)

The following American concerns have exhibits in the Electrical Building:

John A. Roebings Sons Co., Trenton, N. J., shows a large exhibit of electrical conductors in all sizes and gages, and a section of conduit electric road, such as used by the Metropolitan Street Railway Co., of New York. The track is complete, showing two manholes, the interior cables, racked on the side. Above one of the manholes is placed a stock reel of cable, the outer end is carried down into the manhole, showing the method of feeding into the conduit. It also uses this track to show the Columbia rail bond. In the Mining Building the Roebling company has another exhibit of wire rope and trolley wire.

The Bullock Electric Co., Cincinnati, shows a large exhibit of motors and dynamos.

The Lorain Steel Co., Lorain, O., and Johnstown, Pa., has a

THE STANDARD PAINT COMPANY'S PAVILION AT PARIS EXPOSITION 1900
CONSTRUCTION EXTERIOR AND INTERIOR DECORATED RUBEROID

prominent exhibit of Dupont trucks, motors, controlling boxes and rails.

The General Electric Co., Schenectady, N. Y., has a very prominent space, but shows no manufactured products. It has a large model of its factory which attracts much attention.

The Western Electric Co., Chicago, has a very large and complete exhibit which shows up the company's large and varied line in the most comprehensive manner.

The American Steel & Wire Co.'s principal exhibit is in the Mining Building. It has a very large and costly display; the traction materials include trolley wire and rail bonds.

Other exhibits are: The Crane Co., Chicago, valves; Walworth Manufacturing Co., Boston, valves; Standard Pneumatic Tool Co., Chicago, tools and appliances; Gold Street Car Heating Co., New York, electric heaters, seats and appliances; Albert & J. M. Anderson Manufacturing Co., Boston, switches and overhead material; Crown Woven Wire Brush Co., Salem, Mass., sample board of brushes; Safety Insulated Wire & Cable Co., New York, sample board of cables; Van Wagoner & Williams Co., Cleveland, drop forged commutator segments; Eureka Tempered Copper Co., North East, Pa., dynamo brushes and commutator bars; Pass & Seymour, Syracuse, New York, porcelain electrical specialties; C. J. Topping Co., Philadelphia, arc lamps; Robins Conveying Belt Co., New York, ash and coal conveying apparatus; National U. S. Carbon Co., Cleveland, carbons, batteries, etc.; Weston Electrical

Instrument Co., Newark, N. J., full line of instruments; Sprague Electric Co., New York, interior conduits.

In the Colonial Section is an interesting pavilion which was occupied by the officers of the Paris customs. This was built by the Standard Paint Co., and is inscribed with the American and European trademarks and the names of the various cities where the company has head offices—New York, London, Paris, Hamburg, Berlin, Sydney—and surmounted by the well-known rooster in gold. It is constructed entirely of ruberoid; the exterior walls are decorated in imitation of gray birch with pilasters of oak; the interior walls and ceiling are painted in floral and allegorical designs and the flooring has a tastefully colored Grecian border; the roof is undecorated. The company exhibits the P. & B. electrical compounds, insulating varnish and tape in the machinery and electrical department of the American Section, and also the P. & B. insulating papers, roofing and other products in the Civil Engineering and Transportation Department. D. C. W.

SOME JULY ACCIDENTS.

July 9th there was a head-end collision between two open cars on the Duryea line of the Scranton (Pa.) Railway Co. at Old Forge, near Pittston. The cars met at the bottom of a hollow, the view of which from one side is obstructed by a curve on the line; it is reported that the signal lamps had been tampered with, probably by mischievous boys. As one of the cars came around the curve mentioned the other car was seen coming down the opposite slope, and the crew and the five passengers jumped. The motorman of the other car, which had 62 passengers on board, stuck to his post and sustained injuries from which he died a few hours later. Only ten of the passengers were hurt, most of them having jumped when the speed of the car was reduced.

July 11th two cars, one loaded with people returning from a church picnic, on the Dayton (O.), Springfield & Urbana Street R. R. collided, injuring 20 of the passengers more or less.

July 17th an open switch on the Kings County elevated road caused a loaded passenger train to run into a siding at Georgia Ave. and Eastern Parkway, Brooklyn, which was filled with empty cars. Three of the empty cars were thrown into the street. No one was hurt.

On the same day a car on the Staten Island (N. Y.) Midland R. R. was derailed while running at high speed; it crashed through a 6-ft board fence and struck soft ground, where it turned over on its side. There were 25 passengers on board, two of whom had limbs broken.

A rear end collision between an electric train and a steam train occurred on the Fifth Ave. elevated line in Brooklyn on July 19th. The electric train had left the Hudson Ave. station, but was obliged to halt by reason of a fuse blowing just after reaching the curve at Fulton St. and Flatbush Ave. The train following was an express train of five cars drawn by a steam locomotive, and as the engineer could not see the disabled train because of the curve he was unable to stop in time to prevent a collision. The motorman of the electric train had gone under the car to replace the fuse and was killed. None of the passengers was seriously injured.

July 21st a car on the Niles and Mineral Ridge division of the Mahoning Valley Rv. was derailed by the breaking of the forward axle while descending a grade about midway between Mineral Ridge and Niles, O. The car turned over on its side and 13 of the 40 persons on board were more or less injured; none was fatally hurt, however.

July 30th two cars of the Dayton (O.) & Xenia Traction Co. collided on a curve at 2 p. m. Ten of the 25 persons on board were cut and bruised, two or three seriously. The crews of both cars state that the signals indicated a clear track ahead, and the company believes that the signals had been tampered with.

Two prominent society women of Montclair, N. J., ran the first cars over a newly opened electric line at that place.

The passengers on a cable train passing through the Chicago Van Buren St. tunnel recently, had a lively time dodging bullets, which were being exchanged between a watchman and three burglars that had taken refuge in the tunnel when discovered by the police.

DETAILS OF THE TACOMA ACCIDENT.

In our July issue were shown four scenes of the accident at Tacoma, in which a car of the Tacoma Railway & Power Co., carrying about 125 passengers went over a trestle on July 4th. Forty-three persons were killed and 65 injured. It was impossible to secure details in time for publication with the illustrations, and since then our own correspondent at Portland, Ore., has visited the scene of the wreck and furnishes the following facts:

"I find that the grade on which the accident happened is in the neighborhood of 1,500 ft. in length and averages approximately 6 per cent; it contains several curves of 200 to 300 ft. radius, while at the bottom there is a 38° curve (150 ft. radius.) The elevation of the outer rail is about 4½ in. and both the outer rail and the guard rail show bright wearing surfaces on the inside, indicating that the flanges bear properly in coming around the curve. There are no marks whatever showing climbing of the wheels, nor are there any marks between the rails on the ties; the outer ends of three of the ties were broken and scratched, evidently by the axle boxes on the truck as the car turned over. Witnesses testify that the speed must have been about 40 miles per hour at the time the curve was struck. The car got away from the motorman soon after leaving the top of the grade, owing to a slight mist having made the rail slippery. The car was heavily loaded, as might be expected on the Fourth of July.

skid easily and a free use of the sand was of no avail. He also tried to reverse but the circuit breaker opened. When the car entered the curve he thought it would make it safely even at the high speed. He states the wheels did not leave the rail, but that the body simply turned over by reason of its inertia, taking the trucks with it. This statement is undoubtedly correct. One of the passengers who jumped as the car neared the bridge and had time to raise his head while lying on the ground, testified he could plainly see the inside wheels rise from the rail and that the body went over toward the outside of the curve. Had it been on the street no great harm would have resulted, but being on the trestle the car tipped over into the gulch.

"The curve is half on the ground at the edge of the gulch, and half on the trestle, which at the point where the car went over is 41 ft. high. The car struck on the roof and then slid down about 50 ft. There are several witnesses who positively state that when the car was about one-third the way around the curve it tipped on its side and slid along the trestle on its side and then slid over the edge of the planking; it then turned still further and dropped bottom upward. It is interesting to note the distance the car went after it began to tilt and the left hand wheels had lifted from the rail. It is impossible to ascertain this with any exactness, but it seems to have been between one and two car lengths.

"Mr. J. P. Clark, of Seattle, formerly superintendent of the line, after examination of the curve testified that in his judgment the

CAR NO. 115—SIMILAR TO THE ONE WRECKED JULY 4TH.

"There is abundant testimony as taken at the inquest, which lasted three days, to prove that an unusually careful inspection had been made of Car 116, as well as of all the other rolling stock. The company expected a heavy traffic on this day and had made every possible preparation to handle it satisfactorily and safely. The testimony was absolute as to the perfect condition of car, motors, brakes, sandbox, etc., when the car took its run. I also find that the motorman brought his car to a full stop at the top of the grade and made the customary inspection of the brakes before starting down. The car, which was 10 minutes late and loaded to the steps, was a substantially built car for interurban work, the body being 24 ft. long and 30 ft. over the platforms. The driving wheels were 33 in. in diameter and the small wheels 20 in., with 3-in. tread and 7½-in. flange. The motors were G. E. 53 with K 11 controllers. Ordinary hand brakes worked with a handle were used and had sufficient leverage to slide the wheels without any great exertion on the part of the motorman.

"The motorman, F. S. Boehm, while a comparatively new man with the Tacoma company, had had three years' experience in Cincinnati on a hill road. He stuck manfully to his post and went over with the car, and while badly injured is recovering at the Paddock hospital. In his testimony before the coroner's jury he stated the rail was moist and slippery and soon after starting down he felt

the speed gaining on him. The rail was so bad the wheels would curve was in perfect condition, and such a car as the No. 116 could safely pass the curve at 20 miles an hour, although there is no necessity for going that fast.

"The jury went down into the gulch and inspected the wheels. Not one of the wheels was found to be injured, nor was there any break or flaw in the flanges. The jury in its verdict placed the blame on the company. This decision, it would seem to me, was suggested by public opinion, which naturally is more excitable and intense than calm and deliberate in such times, rather than the result of the best evidence of record. Passengers and spectators formed opinions quickly and of course without any technical knowledge or practical experience to support their views; but these seemed to count as much with the jury as the testimony of street railway experts.

"One of the local papers here interviewed a large number of leading business and professional men on the verdict and there were quite as many who considered it unjust as endorsed it.

"The manager, F. L. Dame, kindly granted my request for a photograph of Car 115, (Admiral Dewey) which is a sister car to No. 110 which was wrecked. That the trucks did not leave the rail until pulled off by the car body to which they were attached by chains, is highly creditable to their design and construction."

PERSONAL.

MR. WILFRID PHILLIPS has resigned the position of manager of the Niagara Falls (Ont.) Park & River Ry.

DR. LOUIS DUNCAN has accepted the position of chief engineer for the Keystone Telephone Co., of Philadelphia.

MR. A. A. McLEOD, president of the American Railways Co., of Philadelphia, retired from that position on August 1st.

MR. ARTHUR ELLIS, of Bolton, Eng., has been appointed electric tramway engineer by the Cardiff (Wales) Tramways Committee.

MR. F. L. BEARDSLEY, formerly assistant treasurer of the Derby (Conn.) Street Railway Co., has been made superintendent of the road.

MR. B. J. ARNOLD, president of the Arnold Electric Power Station Co., sailed for Europe August 4th on the Umbria for a pleasure trip.

MR. WILLIAM DANIEL RAY was married recently to Miss Joe Lemon, at Glenville, O. The "Review" extends heartiest congratulations and best wishes.

MR. N. E. MORTON has severed his connection with the Lowell, Lawrence & Haverhill Street Ry. He held the office of superintendent of the Lawrence division.

MR. J. B. HOGARTH, until recently chief clerk and auditor of the Florence & Cripple Creek R. R., has accepted the position of auditor of the Denver City Tramway Co.

MR. ALLEN N. JOHNSON, who was appointed receiver of the Little Rock (Ark.) Traction & Electric Co., on May 5, 1900, has asked the court to accept his resignation.

MR. C. A. DORNEY, the largest stockholder in the Allentown (Pa.) & Kutztown Electric Railway Co., has sold his stock to Samuel C. Boyer, Frank R. Wagner and others.

MR. FRANK A. DRAPER, formerly connected with the Detroit, Rochester, Romeo & Lake Orion Ry., has been appointed general superintendent of the Detroit & Northwestern Ry.

MR. CHARLES O. KRUGER, who has been connected with the Union Traction system of Philadelphia since 1893, was recently elected vice-president and assistant general manager of the company.

MR. L. N. DOWNS has resigned as president of the Railways Company General, of Philadelphia, and is succeeded by Mr. Evans R. Dick, president of the Investment Company of Philadelphia, which has recently secured control of the Railways Co.

MR. J. J. COLEMAN, formerly general manager of the St. Louis Transit Co., has accepted a position with the Washington (D. C.) Traction & Electric Co., as assistant to the president. He will have general charge of the operating departments.

MR. HENRY C. PAGE, for 16 years past, superintendent of the Salem division of the Lynn & Boston R. R., was last month made superintendent of the entire system. He is succeeded by Mr. W. S. Wolcott, of Danvers, Mass.

MR. W. H. HOLMES, president of the Metropolitan Street Railway Co., of Kansas City, has been seriously ill, but is now much improved in health and is making a pleasure trip in the East before again taking up his office work.

MR. GEORGE KISSAM, of New York, the well known advertising agent, sailed for Europe on July 18th, on board the steamer Deutschland. He expects to return to the United States in September in time for the convention at Kansas City.

MR. GEORGE A. M'KINLOCK, president of the Central Electric Co., of Chicago, is an enthusiastic golfer, and has succeeded in capturing the honors at a number of contests in competition with some of the crack amateurs from the East and West.

MR. GEO. A. CRAGIN, on August 1st, was appointed assistant general sales agent of the American Steel & Wire Co., with office in Chicago. He succeeds Mr. George H. Ismon, who returns to San Francisco as Pacific Coast sales agent, in place of Mr. Frank L. Brown, resigned.

MR. FRANK ECK, having resigned as superintendent of the Brazil (Ind.) Rapid Transit Street Ry., Mr. Peter Leidinger, who has been in the employ of the company for over six years, has been appointed his successor. Mr. Eck goes to Dallas, Tex., to take charge of street railway lines in that city.

MR. C. O. BRUNNER, treasurer of the Bethlehem Iron Co. and Bethlehem Steel Co. completed on July 12th his fortieth year of service. The occasion was marked by the presentation to Mr. Brunner of a silver pitcher and salver and a handsome cane from his fellow members of the staff of the two companies.

Mr. E. G. CONNETTE, manager of the Syracuse (N. Y.) Rapid Transit Railway Co., received a very flattering offer last month to take the management of the New Orleans (La.) City R. R. He at once declined the proffered position however, as he did not wish to leave Syracuse, which city he has found very pleasant in every way.

MISS MARY ELIZABETH COOKE, daughter of Mr. W. J. Cooke, vice-president of the McGuire Manufacturing Co., was married on June 28th, to Mr. Leslie George Swortwout at the First Presbyterian Church, Oak Park, Chicago. Mr. and Mrs. Swortwout will be at home after September 1st, at the Castleton, Oak Park.

MR. F. D. ROUNDS, general superintendent of the Metropolitan Street Ry., of New York, for personal reasons has resigned his office and his resignation has been unwillingly accepted by the company. The position of general superintendent will be abolished and Mr. Oren Root, jr., will perform the duties of the office with the title of assistant general manager.

MR. FRANK L. BROWN, having resigned his position as Pacific Coast sales agent of the American Steel & Wire Co., has been appointed general sales agent of the Shelby Steel Tube Co., of which company Mr. C. T. Boynton, former general sales agent of the American Steel & Wire Co. is president. Mr. Brown is one of the best known sales agents in the trade, and has the best wishes of a host of friends in his new business. He will make his headquarters in Chicago.

MR. C. D. WYMAN, whose resignation as general manager of the New Orleans (La.) City R. R. was announced in the last issue of the "Review," was tendered an elaborated farewell banquet on July 18th, by his fellow officials and the heads of departments of the company with whom he has been associated during his stay in New Orleans. Many words were spoken testifying to the energy, fairness and executive ability displayed by Mr. Wyman, and expressing regret at his departure.

ELECTIONS.

THE ST. THOMAS (CAN.) STREET RAILWAY CO. has chosen directors as follows: J. H. Still, (president,) John Farley, C. B. Hunt, Col. Stacey and M. A. Gilbert.

THE CONSOLIDATED TRACTION CO., of Pittsburg, has elected new officers as follows: President, C. L. Magee; vice-president, Joshua Rhodes; secretary, F. H. Steele; treasurer, W. L. Elkins, jr.

THE BURLINGTON (VT.) TRACTION CO., at a meeting last month elected the following officers: President, Elias Lyman; vice-president, Joseph A. Powers, Lansingburg, N. Y.; treasurer, W. F.

Hendee; secretary and clerk, B. H. Eagan; superintendent, T. B. Jones. Directors, A. E. Richardson, W. F. Hendee, Elias Lyman, J. A. Powers, C. W. Brownell, F. C. Kennedy, A. O. Humphrey, J. J. Flynn and L. H. Turk.

AT A MEETING of the Cumberland (Md.) Electric Railway Co., all the old officers were re-elected with the exception of Mr. Lloyd Lowndes who at his own request was succeeded by Mr. Jas. A. McHenry, as vice-president.

THE NEW YORK & NASSAU COUNTY RAILWAY CO., organized some months ago to build electric lines in the Borough of Queens, New York City, has elected officers as follows: President, Jos. Bermel; vice-president, P. J. Marra; secretary, W. L. Woodill; treasurer, E. J. McKeever.

THE RAILWAYS COMPANY GENERAL, of Philadelphia, has added to its list of directors the following new names: Evans R. Dick, banker; Richard H. Rushton, vice-president of Fourth Street National Bank; J. Ogden Hoffman, representative of the Carnegie Steel Co.; Jay Cooke, 3d, of C. D. Barney & Co., bankers, and John J. Collier, secretary of the Investment Co., all of Philadelphia.

THE STOCKHOLDERS of the Albany, New York & Schoharie Electric Railroad Co. at a recent meeting voted to reduce the number of directors from 13 to 9. The following directors were elected: Henry W. Burgett, Brookline, Mass.; Charles E. Bibber, Malden, Mass.; William H. Erwin, Albany; J. Sheldon Frost, Albany; Robert J. McCauley, Albany; Benjamin M. Secor, Albany; Ezra Twitchell, Schoharie, N. Y.; Luther C. Warner, Albany, and Thomas J. Wood, of Berne, N. Y.

OBITUARY.

MR. J. R. RAND, president of the Rand Drill Co., died on July 18th. Mr. Rand had but recently taken the presidency of the Rand company, succeeding his brother, Mr. Addison C. Rand, who died on March 9th.

MRS. B. L. KILGOUR, wife of Mr. B. L. Kilgour, electrical engineer of the Cincinnati Street Ry., died suddenly last month at her home in Cincinnati. The employes of the company, on learning of the sad event, at once called a meeting and passed resolutions extending their deepest sympathy to the Kilgour family in this affliction.

NEW PUBLICATIONS.

THIRTY-FIRST ANNUAL REPORT OF THE BOARD OF RAILROAD COMMISSIONERS OF MASSACHUSETTS.—This comprises in one volume the report proper of the commissioners and the tabulated returns from the railroads and street railways of the state, published earlier in the year, and the detailed reports of the individual companies. The preliminary publication of the Board, which was abstracted in our June issue, is a book of 366 pages, and the detailed reports fill 818 pages additional, making the complete report a volume of nearly 1,200 pages. The Railroad Commissioners of Massachusetts are James F. Jackson, Fall River, chairman; George W. Bishop, Newtonville; Hersey B. Goodwin, Cambridge. Wm. A. Crafts, Boston, is clerk.

CAHALL WATER TUBE STEAM BOILERS. Fifth Edition; 120 pages. Issued by the Cahall Sales Department, Pittsburg.—Those of our readers who are familiar with the previous issues of this book will all wish to read the present edition, and others who are steam users and interested in the subject of boilers should write for a copy. The introduction is a well written essay on the evolution of steam generators from externally-fired shell types to the water-tube boilers of today; this is followed by an enumeration of the requirements of a perfect boiler and detailed descriptions of the Cahall vertical and Cahall horizontal boilers, made by the Aultman & Taylor Machinery Co., of Mansfield, O. The boilers especially designed for utilizing waste heat from heating and puddling furnaces are also described. Special attention is directed to

flowed steel headers, swinging man heads, and the Mansfield chain grate stoker. The results of various tests on efficiency and capacity are given; these show an efficiency of 77.4 per cent at 85 per cent above rated load, to 85.9 per cent at the rating. In conclusion are articles on the "Capacity of Boilers" by S. C. Munoz, and "Superheat" by R. S. Hale. The book is profusely illustrated, each alternate page having a half tone engraving.

GOOD RECORD AT GALESBURG.

The Electric Railway & Power Co. at Galesburg, Ill., is making a good record under the management of President Fred Seacord. During the past three years the bonds which are all held by the stockholders have been reduced by the retirement of \$15,000, in addition to spending \$60,000 in improvements to the property. All this has been done out of the profits of the business. When the present management took hold the bonds were quoted at 90 cents and the stock at 10 cents.

A striking combination of good management and good fortune is seen in the expense for damages which has amounted to only \$65 in the year.

NEW ROAD IN WESTERN ILLINOIS.

Mr. M. M. Stephens, of East St. Louis, Ill., who has the contract for building the Collinsville, Caseyville & East St. Louis Electric R. R., writes us that eight miles of the road have been built and it is expected to have the entire system ready for operation on or before September 1st.

The rolling stock will consist of two 42-ft. double truck cars each equipped with 37½-h. p. Lorain "Steel" motors, and three single truck cars, each equipped with two 35-h. p. Westinghouse motors. The company will also purchase a few light cars for trailers. The road will have no power station of its own, but will lease power from the St. Louis, Belleville & Suburban Ry., with which connection will be made at Edgemont or French Village.

REORGANIZATION OF ELECTRICAL HOUSE.

The Miller-Knoblock Co., of South Bend, Ind., has been reorganized under the name of the Miller-Knoblock Electric Manufacturing Co., and has taken over the plant and business of the Northwestern Electric Manufacturing Co., of Chicago, maker of insulated wire. The new company will enlarge its facilities in all departments, and will continue to make and sell commutators and armature coils. It will also produce all sizes of silk and cotton covered magnet wire, and will make a specialty of coarse sizes of single and double cotton covered wire for armature winding and field coils, the consolidation with the Northwestern company rendering the new concern independent of the wire trust.

STREET RAILWAY CLUB IN NEW ENGLAND.

A meeting was held at Young's Hotel, Boston, on July 18th, for the purpose of forming a social club among the street railway superintendents and others interested in street railways in New England. There were about 35 gentlemen present, and the "New England Street Railway Club" was duly formed. Arrangements were made for holding a grand outing in September, at which it is hoped representatives from every road in the New England states will be present.

The officers of the club for the first year are: President, H. E. Bradford, Marlborough (Mass.) Street Ry.; vice-president, L. H. McLain, Newton (Mass.) & Boston Street Ry.; secretary, R. H. Derrah, Boston; treasurer, Geo. H. Burgess, Leominster (Mass.) & Clinton Street Ry. The executive committee consists of the officers and F. G. L. Henderson, Newton, Mass.; E. E. Potter, New Bedford, Mass.; J. F. Whetles, Boston, Mass.; W. G. Meloon, Portsmouth, N. H., and D. F. Burritt, Palmer, Mass.

The rules of the Lynn & Boston Street Ry. permit smoking on the rear three seats of open cars. General Manager Foster has recently instructed his conductors, when enforcing this regulation, to count the seat on the rear platform as one of the three.

ONLY ONE ALBANY GREASE.

Those of our readers who have used this well-known lubricant will readily admit that there is but one Albany grease as far as results are concerned. There have always been many imitations of this very successful lubricating compound on the market. Of late, however, the number has increased largely, owing no doubt to the growing popularity of the real article, and many engineers have the impression that "Albany Grease" is simply a name, and may be applied to any high grade lubricant. This is not so.

The Albany Compound & Cup Co., of which Adam Cook's Sons, 313 West St., New York City, are the proprietors, has been for 30 years the sole maker of the original Albany grease, for which the claims are made that it has become the standard of excellence and the best lubricating compound ever introduced for general machinery. Referring to the matter Adam Cook's Sons said: "The country is full of bogus compounds, that are claimed to be 'similar in looks to Albany,' a 'fac simile of the Albany,' and 'the same as the Albany,' etc. We boldly declare there is no lubricating compound made the same as the Albany, that none will do the same amount of work, that there is only one Albany grease, and we are the only manufacturers of it. If there is any way by which we can make this fact more plain so the consumer and jobber will not be deceived, we would kindly ask one and all of our patrons to tell us what it is and we will give it immediate consideration."

It would seem that deception would be effectually prevented if buyers would look for the distinctive yellow label and familiar trademark here reproduced, which appears on every package containing Albany grease. There certainly is no profit in buying imitations when the genuine can be had at the present prices, but one should have a care that he is getting the real thing. Adam Cook's Sons continue to offer samples of the compound free for testing, so that every engineer may have the fullest opportunity to investigate in a practical way the claim made for it.

SPECIAL EXHIBITION NUMBER.

The issue of the Tramway & Railway World, of London, for July, 1900, is a special exhibition number in honor of the Tramways & Light Railways Exhibition recently held at London. The special features, in addition to the article on the exhibits, are a description of the new works of the English Electric Manufacturing Co., an

CONDUCTORLESS CARS IN MONTGOMERY, ALA.

The city council of Montgomery, Ala., early in July passed an ordinance prohibiting the operation of street cars without conductors, but an amendment was subsequently adopted exempting roads that did not operate six cars. The mayor vetoed the ordinance on the ground that it made an unfair discrimination. He thinks that if the safety and convenience of the public demand conductors on some cars, they are necessary on all.

DOES NOT WISH TRACKS REMOVED,

A temporary injunction restraining the Wichita (Kan.) Railroad & Light Co. from removing what is known as its Fairmount line, has been secured by a Mr. Campbell. The plaintiff alleges that the company which built the road was bound to operate it for the full term of the franchise as that was a condition on which he gave it a right of way over his property and a bonus of \$4,000 in cash. Mr. Campbell had laid out a portion of his property in town lots.

ELECTRIC RAILWAY IN KOREA.

A newspaper dispatch states that the electric railway in Korea is to be trebled in length because of a peculiar superstition. It now runs to the cemetery in which the late queen is buried, which is five miles from Seoul. The royal astrologers declare that the cemetery is not favorably located, and that the queen is not happy there, consequently the king has ordered it to be removed to a point 15 miles from the capital, and the railway is to be extended to the same place, in order that he may visit the tomb conveniently. The dispatch adds that as the road is in American hands, it is not impossible that the astrologers were inspired to utter their warning by means not unknown in the United States.

This is the road that was attacked by the natives on the opening day and almost destroyed, as a result of which disturbance several of the ringleaders lost their heads, literally. A description of the road with an account of this attack will be found in the "Review" for Aug. 15, 1899, page 534.

PROPOSED SUBWAY FOR CHICAGO.

At the request of the Chicago street railway commission, Mr. John M. Roach, president of the Chicago Union Traction Co., has submitted plans for subways in the downtown district, to be used

CROSS SECTION OF PROPOSED CHICAGO SUBWAY.

interesting and comprehensive article on "Overhead Electric Tramways for London," by J. Clifton Robinson, which is unusually valuable coming from such a high authority, and a paper on the advantage to be gained by selecting rolling stock for a given service, written by Douglas T. Heap. The number is a credit in every way to the editors and publishers.

by the street railways. In thus preparing plans, Mr. Roach is not representing his company, and the scheme does not contemplate the construction of the subway by the traction companies, nor are franchise terms considered.

The plans provide for six loops, two to be used by cars entering from each of the three divisions of the city, and so arranged that

TRANSFER STATION.

passengers desiring to transfer will in no case have to walk farther than one block, and there is a transfer station in Madison St. A new tunnel under the river at Dearborn St. is specified. Wires and gas pipes will be carried in conduits placed between the roof of the tunnel and the street surface.

The cost of the subway is estimated at \$2,000,000 per mile.

NEW ROADS NEAR HAMILTON, ONT.

Mr. John Patterson, of Hamilton, Ont., writes that construction work on the new street railway lines now building by the Hamilton Electric Light & Cataract Power Co., Ltd., is progressing rapidly and cars will be running on a portion of the route before snow flies.

bridges, one 40 ft. high, with four spans of 150 ft., and one 130 ft. high, with a single span of 600 ft.

Mr. Patterson, who is secretary of the Hamilton Electric Light & Cataract Power Co., is also actively interested in the Nickel Steel Company of Canada, the Hoepfner Refining Co., and the Cataract Power Co., of Hamilton.

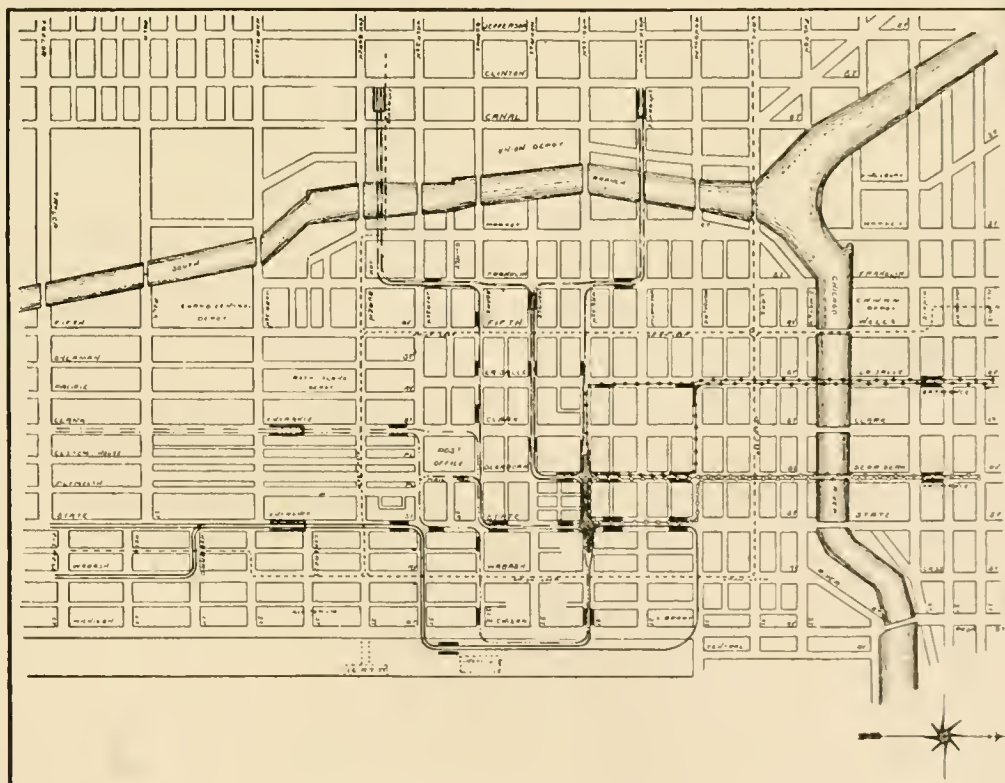

E. C. FOSTER.

Mr. E. C. Foster, who has just been appointed general manager of the individual companies controlled by the Massachusetts Electric Cos., is a self-made man in the fullest sense of the word. Starting in business life as a milk wagon driver at the age of 16, he has pushed on to higher and higher positions of responsibility and trust, without the influence or aid of those about him, except as he has won the confidence and help of his superior officers by his own worth.

E. C. FOSTER.

Mr. Foster was born in Hancock, N. H., Oct. 23, 1852. He attended the public schools of his native town until he reached the age of 15, and after a year at Appleton Academy, Ipswich, N. H., he started out in the world for himself. Arriving at Lynn, Mass., he accepted the first position that offered itself, which was running a milk route, and he stuck to this for three years. He then became a conductor on the Lynn & Boston system and has remained with this company ever since, leaving the rear platform to become starter, then superintendent of track, then general superintendent and finally general manager. His duties have now been increased by giving him direct supervision of the other street

PLAN OF PROPOSED SUBWAY, CHICAGO.

The plans of this company were published in the "Review" for Dec. 15, 1899, page 868, and include the building of an electric railway from Hamilton to Guelph, a distance of 30 miles, and from Hamilton to Waterloo, through the cities of Galt and Berlin, a distance of 44 miles. Power will be taken from De Cew falls, about 35 miles from Hamilton, making the longest transmission about 75 miles.

In addition to heavy grading it will be necessary to build several

railways of the Massachusetts Electric Cos. He will make his headquarters at Boston.

Among the events on the program for fittingly celebrating the opening of the Goffstown line of the Manchester (N. H.) Street Ry. were a band concert, a display of fireworks and a salute by an old cannon.

THE FEIST TROLLEY HEAD.

There has just been placed on the market a new trolley head, which has a number of novel features which will strongly commend it to street railway men. This device is known as the Feist patent trolley head and differs from the other self-lubricating trolley heads now on the market, in that it is absolutely self-lubricating, without oil, a fact in itself which is most thoroughly appreciated by all users of trolley wheels. The design was developed and perfected by Mr. Fred H. Fitch, then general manager of the Sioux City (Ia.) Traction Co., and the patentee, Mr. C. M. Feist, master mechanic of the same company, and the head has been given a thorough test in actual service for over a year on that line.

After its success had been thoroughly demonstrated, and knowing the demand existing for a graphite lubricated wheel of long life that would require no attention, it was decided to place this head on the market, and accordingly, an arrangement has been

FEIST TROLLEY HEAD.

made, whereby the W. R. Garton Co., of Chicago, becomes sole manufacturer and selling agent.

By reference to the accompanying illustrations, it will be seen that the device consists of a two-piece harp, made of malleable iron, and a hardened steel axle, threaded at its ends, connecting these pieces. Four holes are bored in this axle, in each of which is carried a graphite pencil of special composition, these pencils being held against the bearing of the trolley wheel by helical springs in such a manner as to secure constant and even lubrication, and assure positive contact. One set of lubricating pencils outlasts a 20,000 mile wheel.

Thin lubricating washers are placed on this axle, between the wheel and the arms of the harp, thereby insuring lubrication here, and preventing cutting such as would occur with a metal washer.

The axle for a two motor equipment is one inch in diameter, while for a four motor equipment it is made 1 7/16 in. in diameter. The size of these axles offers an increased bearing surface, thus insuring ample contact and a materially longer life to the wheel, both bearing and axle being evenly and thoroughly coated with the lubricant. An even wearing away of the bearing is thus obtained, effectually doing away with the objections to be found in some of the present graphite bushing combinations, where the wheel bearing is not sufficiently lubricated, causing it to wear away in parts, unevenly, and so rapidly becoming loose, causing destructive arcs between the wheel and its axle. This results in blistering the axle and hence there are frequent renewals and repairs, to say nothing of the short life obtained. Both standard 4 3/8-in. (2 1/2-lb.) wheels and 6-in. wheels are furnished for these harps, either 1 in. or 1 7/16 in. bore. The wheels are made after a special formula, which, it is stated, actual and severe service has proven to be superior to any other thus far used. The Sioux City Traction Co. reports a life of 14,900 miles for one of these wheels, which received no attention whatever from the time it was put in service until it was removed, and even then it was good for more mileage.

The W. R. Garton Co. reports that wherever this trolley head has been brought to the attention of managers and engineers it has met with a most hearty approval and acceptance and it already has assurances from some of the largest roads in the country, that entire equipments will be secured as soon as the wheel is ready for delivery. The company expects to be able to make deliveries within 30 days.

GLASGOW TRAMWAYS REPORT.

We have received a copy of the yearly report of the Glasgow Corporation Tramways for the fiscal year ending May 31, 1900, and reproduce herewith a tabulated summary showing the principal data for the year's operation.

Compared with the preceding year, the report shows an increase in gross receipts of 31,659, an increase in passengers of 8,853,816, an increase in car-miles run of 585,789, and an increase in the receipts per car-mile of .09d.

From the report we learn that arrangements have been made with the corporation of Paisley for the use of portions of the tramways in Paisley and that the Glasgow tramways will be extended to the Paisley boundary. Negotiations are under way with other municipal and county corporations and if these reach a satisfactory conclusion, parliamentary powers to construct other extensions will be sought. On July 12, 1899, an increase of wages of 1 shilling per week was given to the employes in the traffic department.

SUMMARY FOR YEAR ENDING MAY 31, 1900.

	HORSE TRACTION.	ELECTRIC TRACTION.	TOTAL.
Street Miles of Tramway open for traffic, ...	37 1/2	5	42 1/2
Traffic Revenue,	£411,175 1 11	53,611 13 3	464,786 15 2
Total Revenue,	£416,253 12 3	53,711 18 8	469,965 10 11
Working Expenses,	£320,468 13 0	24,252 18 3	344,721 11 3
Fixed Charges,	—	—	£78,675 7 8
Added to Reserve Fund,	—	—	£46,568 12 0
Car Miles run,	8,729,559	927,870	9,657,429
Passengers carried,	112,802,626	14,825,858	127,628,484
Average number of Cars & Omnibuses, (16 hour day),	289.14	27.82	316.96
Percentage of Working Expenses to Gross Receipts,	76.99	45.15	73.35
Average Traffic Revenue per Car Mile,	11.30d	13.67d	11.55d
Average Total do.	11.44d	13.89d	11.68d
Average Working Expenses per Car Mile,	8.81d	6.26d	8.60d
Average Fare per Passenger,875d	.868d	.874d
Average number of Passengers per Car Mile,	12.92	15.98	13.21
Number of Cars in Stock,	384	133 (47 in use.)	517
Number of Horses in Stud,	—	—	4,411
Proveeder and Litter per Horse per Week, (Less Manure Sold),	—	—	7s. 8.60d.
Total amount of Sinking Fund to 31st May 1900,	—	—	£55,592 18 4
Total amount of Depreciation written off Capital to 31st May 1900,	—	—	£124,306 1 0
Amount in Permanent Way Renewal Fund,	—	—	£69,600 0 8
Amount in General Reserve Fund,	—	—	£169,492 0 6

In conclusion the committee expresses gratification at the continued success of the undertaking and particularly at the extremely satisfactory results which have attended the introduction of electric traction. Mr. John Young, general manager of the system, was highly complimented on his excellent work.

An appendix to the report contains a lengthy statement concerning an outbreak of glanders among the tramway horses.

Another interesting statement shows that during the year there were 7,407 articles found in the cars; 3,836 of these were claimed at the tramway office and 3,571 were turned over to the police department. The articles found are thus classified: Umbrellas, 1,240; walking sticks, 95; gloves (pairs), 144; purses, 623; sums of money, 49; watches, 21; coats and waterproofs, 175; spectacles, 97; bags, 744; parcels of clothing, 839; furs, 75; workmen's tools, 95; books, 192; articles of jewelry, 71; music, 25; keys, 248; baskets, 351; boxes, 130; parcels, 727; miscellaneous, 1,466.

FOREIGN FACTS.

The Cardiff (Wales) Corporation Tramways are to be extended.

The Bury (Eng.) Town Council is thinking of building electric trams.

The electric tramway at Carlisle, Eng., has been officially opened for traffic.

The first section of the Metropolitan Underground Ry., Paris, has been completed.

The total length of electric tramways in Italy is 1,974 miles, according to the *Gazetta Ufficiale*.

Dick, Kerr & Co., of London, have the contract for building the Calcutta (India) Electric Tramways.

The municipal tramways at Mannheim, and at Ludwigshaven, Germany, are to be equipped electrically.

A bill is before the House of Commons, authorizing the Mersey Railway Co., of Liverpool, to adopt electric traction.

Mr. Gerald Barker, of London, Eng., has a project for building a light railway between Todmorden and Bacup, Eng.

About 800 employes on the street railway at Budapest have struck for an increase in wages and a reduction in hours.

La Societa Elettrica Alta Italia has contracted to convert the accumulator tramway in Turin, to the overhead trolley system.

Willesden, Eng., is planning to have electric tramways. Mr. E. T. Ruthven Murray is electrical engineer to the corporation.

A new electric line known as the Clontarf (Ireland) & Hill of Howth Tramway has been completed from Dollymount to Howth.

The Marseilles (France) suburban tramways, which are owned by the *Compagnie Generale de Tramways*, are to be largely extended.

Parliament has passed a bill providing for the electrical equipment of the South Eastern Metropolitan Ry., running from Greenwich, London, to Catford.

An electric railway has just been completed at Manaus, Amazonas, Brazil, S. A., by the Manaus Railway Co. The road is 14 miles long and was built at a cost of £120,000.

The Preston (Lancaster County, Eng.) Corporation is seeking powers to reconstruct existing horse tramways for electrical operation, and to build 11½ miles of new lines.

The Board of Trade has confirmed the following orders for light railways: Bexhill & St. Leonards Light Ry., Cheltenham & District Light Ry., and the Cheltenham & District (Extension) Light Ry.

The Chilian (S. A.) Electric Tramway & Light Co., Ltd., during its last fiscal year carried 41,743,687 passengers. The road is now being equipped electrically by the *Allgemeine Elektrizitaets Gesellschaft*, of Berlin.

Valera, Cuneo, Hermanos & Co., owners of the electricity works at San Fernando, Argentine Republic, have obtained concessions for electric tramways from Buenos Ayres to Martinez, San Isidro and San Fernando.

The Budapest Tramway Co. has a home-made snow plow consisting of an ordinary tramcar frame under which, both back and front, are placed cylindrical brushes, 3 ft. 7 in. in diameter, and rotated by means of a 20-kw. motor. There are also track brushes in front of each wheel, which clean the rails of snow and dirt. The car complete weighs 12½ tons.

Mr. W. G. Bingham, who recently secured a concession for an electric railway from the Adelaide (S. Australia) Corporation, has formed a syndicate with over a million pounds sterling capital, and the road will be built at once.

Foreign electrical papers are calling the attention of their readers to the fact that excellent opportunities exist in Porto Rico for the establishment of electric railways in the interior towns, where water power is abundant.

Preliminary plans and specifications are being prepared by the Burnley (Eng.) Town Council for reconstructing and electrically equipping the tramways within the borough. Alderman Armistead is chairman of the tramways committee.

In Sydney, N. S. W., where in some instances electric cars and steam trains operate over the same track, it has been noticed that passengers prefer to stand up in an overcrowded electric car, rather than ride in a comparatively empty steam coach.

Olympio de Assis, an engineer, whose address is Fello Horizonte, Minas, Brazil, is interested in an electric railway to be built at Cidade de Minas, Brazil, and requests that catalogs and price lists of American electric railway supply firms be sent him.

The Ballarat (Victoria, Australia) Corporation has sanctioned the proposal of the British Insulated Wire Co., of Prescott, Eng., to form a local company to acquire the tramways and convert them to electricity. The company will be called the Electric Supply Co., of Victoria.

Alexandria, Egypt, has an electric railway 18 miles long. At present the company operates 50 motor and 40 trailers, each of the motor cars having two motors of 35 h. p. It is expected 12 miles of the line now operated by steam will soon be changed to the electric system.

A syndicate in which Sir William Van Horn and James Hutchinson, of Montreal, and B. F. Pearson, of Halifax, are largely interested, has secured a number of electric railway concessions in the West Indies. It is now building a 10-mile road at Demerara and a 12-mile road in Trinidad.

A company with \$1,500,000 capital is being formed to build an electric railway connecting the Canadian towns of Port Dover and Preston, via Simcoe, Waterford, Boston, Mount Pleasant, Brantford, Paris, Ayr, Blair, Doon and Berlin. It is proposed to acquire the Brantford (Can.) Street Ry., the Galt, Preston & Hespeler Electric Ry., and the Berlin & Waterloo Electric Ry.

The employes of the Sheffield (Eng.) Corporation Tramways recently threatened to strike because, they claimed, there was no one person in authority over them and they often received conflicting orders from two or three officials. The company settled the difficulty by promoting the electrical engineer to the position of general manager. His salary was raised to £600 per annum.

The London County Council has purchased for £1,075, the entire exhibit which the British Westinghouse Co. had at the Tramways Exhibition. This comprised a tramcar fully equipped, rails and conduits for a sample section of track and the gas engine and dynamo for operating the car. The sample line will be laid down at the Camberwell depot, and will be used as an object lesson to the highways committee and the council's engineers.

In the House of Lords the following bills have been read a third time: Manchester Corporation Tramways; South Staffordshire Tramways; Mersey Ry.; Liverpool Overhead Ry.; Southport Extension & Tramways; Glasgow & District Tramways; Central London Ry.; Stockport Corporation Tramways; Great Grimsby Tramways. The following have been read the third time in the House of Commons: Blackpool, St. Anne's & Lytham Tramways; Christchurch & Bournemouth Tramways; Huddersfield Corporation Tramways; Jarrow & Hebburn Electricity Supply; Newry, Keady & Tynan Light Ry.; Metropolitan District Ry.; London United Tramways.

NEW TRAMWAY IN SPAIN.

U. S. Consul-General Lay, of Barcelona, Spain, writes the department that the Barcelona & San Andres Railway Co. is about to build an electric tramway between Barcelona and Horta, a distance of four miles. Mr. Lay states the concession is owned by the Societe Anonyme d'Entreprise Generale de Travaux, Liege, Belgium, and suggests that American dealers in electric railway apparatus and supplies correspond with this company at once. The corporation is a very large one and has built many miles of tramways in Europe, and is now constructing lines in Russia.

ABUSE OF COMMUTATION TICKETS.

When the Brooklyn Rapid Transit Co. announced an increase to 10 cents in the fare from Brooklyn Bridge to Coney Island, it was also announced that the company would sell to permanent residents in the suburban territory below 22d Ave. and Kings Highway, commutation tickets at 5 cents per ride, good only when presented by the person whose name appeared thereon. It has been decided to discontinue these, however, as it is found many non-residents have obtained the tickets, and furthermore conductors have been detected turning in five-cent tickets for 10 cent cash fares collected.

Mr. J. C. Brackenridge, in a recent interview, is quoted as saying: "We are still desirous of maintaining a five-cent fare for the residents of the localities south of Kings Highway and 22d Ave., but we have been unable to devise any system of tickets which does not permit of abuse. If the residents of those localities can suggest any practical method for overcoming this difficulty we shall be glad to adopt it."

STEEL, COPPER AND TIE QUOTATIONS.

The iron and steel markets remain practically unchanged, but there is a scarcity of orders, especially large ones, and the market prophets predict a slump in prices before the fall buying commences. Steel rail quotations are as follows: Heavy T sections, \$35 to \$37; light T sections, \$30 to \$35; girder sections, \$40 to \$44. At Chicago angles are selling at \$1.60; spikes, \$1.70; bolts, \$2.20; relaying rails,

this year has absorbed 90,277 tons of the total 134,577 tons produced for that period in the United States. Lake copper is selling at 16³/₈ to 16¹/₂ cents; casting copper at 16¹/₄ to 16³/₈ cents.

NEW THEATER AT SYRACUSE.

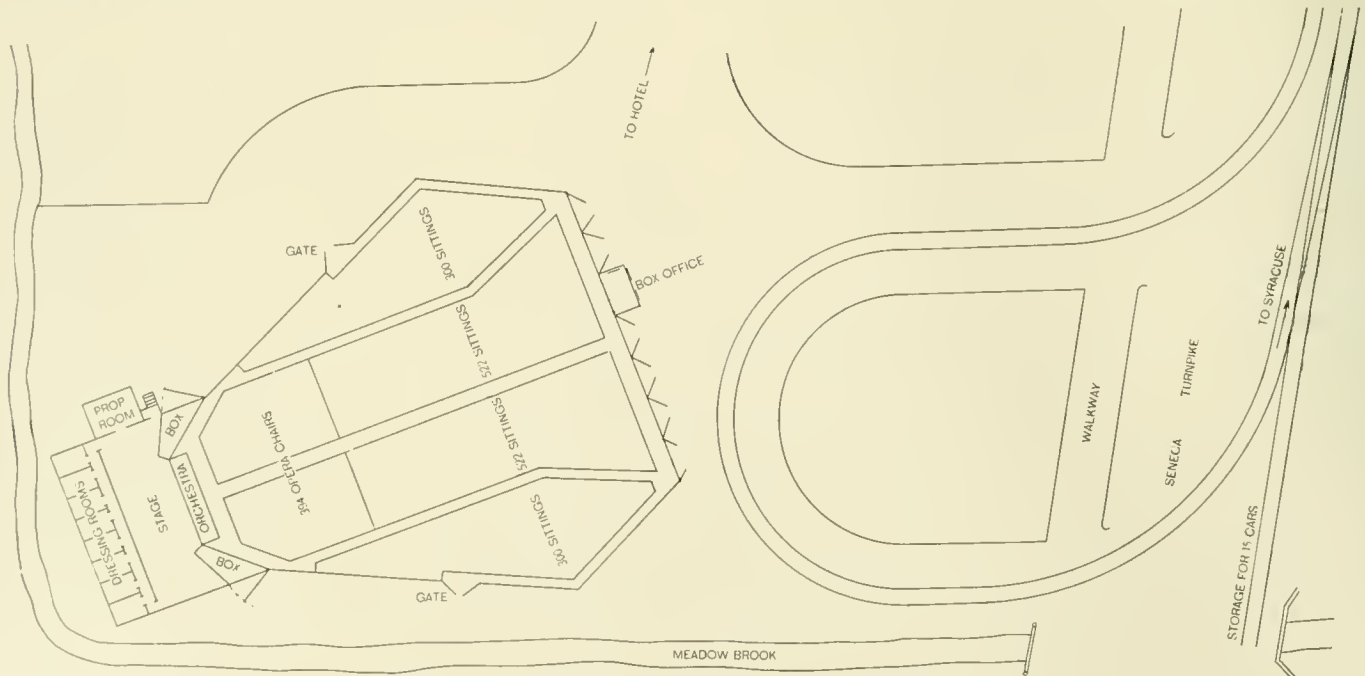

The Syracuse (N. Y.) Rapid Transit Railway Co. last month completed an outdoor theater where light summer opera will be given during the present season. The building, as shown in the

VIEW FROM STAGE.

accompanying diagram, is kite shaped, its greatest length over all being 165 ft. and its greatest width 120 ft. From the front of the stage to the rear row of seats is about 125 ft. The stage proper is 52 x 19 ft., and has a property room 11 x 15 ft. at one side, and eight dressing rooms, each 7 x 11 ft. at the rear. The total seating capacity is about 2,000.

In laying out the terminal arrangements, excellent provision has

PLAN OF VALLEY THEATER AND LOOP, SYRACUSE, N. Y.

\$20 to \$22. Good steel relaying rails, T sections in 30-ft. lengths may be purchased f. o. b. Pittsburg at \$24 to \$26; angles at \$1.50.

Cedar ties are quoted f. o. b. Menominee, Mich., 24 and 26 cents. At New York prices have advanced 1 cent over last month, yellow pine ties selling as follows: 7 x 9 in. x 8¹/₂ ft., 65 cents; 6 x 9 in. x 8 ft., 60 cents; 6 x 8 in. x 8 ft., 55 cents; 6 x 7 in. x 8 ft., 50 cents.

Copper quotations are again advancing, due, it is said, to the enormous foreign demand which during the first six months of

been made for loading and unloading passengers. A loop passing close to the front of the theater permits cars to land passengers almost at the box office, and after the performances are over, or at the approach of a sudden shower, a number of cars can be bunched on the loop to care for the homeward bound rush. A spur track having a storage capacity of 15 cars is also laid down as indicated, to facilitate the movement of extra large crowds.

Mr. E. G. Connette, vice-president and general manager, to

A PERFORMANCE OF "BOCCACCIO."

whom we are indebted for the diagram and photographs, writes, under date of July 23d, as follows: "We have now run the summer opera for three weeks, and it is growing in great favor with

EXTERIOR, SHOWING ARRANGEMENT OF EXITS.

the people of Syracuse. We are attracting large crowds of the very best people of the city. Conductors sell tickets at 25 cents for the round trip, which includes admission to the opera."

◆◆◆
WAGES INCREASED.

The Cincinnati & South Covington Street Railroad Co. will hereafter pay all its conductors and motormen 18 cents per hour. The Trenton (N. J.) Street Railway Co. has increased the pay of trainmen from \$1.60 to \$1.75 per day. The employes of the Camden (N. J.) & Suburban Railway Co. were agreeably surprised recently when the company presented each man that had been in its service five years or over with a new uniform suit; the men that had served 10 years received two suits, and those that had been employed 15 years received two suits and an overcoat.

◆◆◆
TOLEDO & ADRIAN ELECTRIC RY.

Mr. L. B. French, 314 Hammond Bldg., Detroit, advises us that the Toledo & Adrian Electric Railway Co. is now in a position to let a contract for the construction and equipment of the 28½-mile line between Adrian and Toledo. It is expected that the contractor will take a portion of the bonds. The survey has been completed and a private right of way for the entire distance secured.

It is authoritatively stated that the Baltimore & Ohio R. R. has decided to install a third rail conductor to take the place of the overhead trolley in the tunnel at Baltimore.

HALF FARES.

The Louisville (Ky.) Railway Co. has fitted up a bath room for the use of its employes.

Arrangements are about to be made for giving Kansas City, Mo., a street railway mail service.

The general offices of the Fort Wayne (Ind.) Traction Co. have been moved from Chestnut St. to the new office building on Holman St.

To overcome as much as possible the crowding of cars in San Francisco, the Market Street Railway Co. has introduced 19 ft. rolling stock.

An electric line 55 miles long to connect Pueblo, Col., and La Junta is proposed; other towns on the route are Rocky Ford, Boone, Fowler and Baxter.

The South Side Elevated R. R. of Chicago carried a daily average traffic of 60,972 passengers in July, against 52,644 in the same month in 1899, a gain of 8,328.

The Brooklyn Rapid Transit Co. has taken advantage of an old unused franchise, granted in 1893 to the Nassau Electric Railway Co., to lay tracks in Union St.

The value of the Stockton (Cal.) Electric Railroad Co.'s franchise is placed at \$25,000 by the board of equalization. The company owns 12 miles of track and 26 cars.

The Boulder Railway & Utility Co., operating a 4-mile electric road in Boulder, Col., will extend its line to a new park of 1,800 acres to be opened near Boulder.

Montgomery, Ala., and Columbus, Ga., have recently passed "Jim Crow" ordinances requiring separate street cars, or separate compartments for the white and colored races.

A new pleasure resort will be opened by the Wilmington (Del.) & New Castle Electric Railway Co. at Cofield, where there is plenty of salt water and a good white sandy beach.

Two attempts were made early in July to blow up cars owned by the Toledo (O.) Traction Co., by placing giant torpedoes on the track. It is not known what motives prompted the acts.

By a curious happening an old horse car barn, belonging to the Brooklyn Rapid Transit Co., has been rented to a company that intends to turn it into a factory for building automobiles.

Rumor has it that Mr. Charles T. Yerkes, who is now in London, is endeavoring to secure control of the Metropolitan & District railways of that city, but this Mr. Yerkes strenuously denies.

The Xenia (O.) Rapid Transit Co. has arranged to give a free band concert every Tuesday and Friday evening during the remainder of the season, at Lucas Grove, which is located on its line.

A new line to Chickamauga Park was opened last month by the Chattanooga (Tenn.) Rapid Transit Co. This will add greatly to the convenience of tourists visiting the famous battle-fields in the vicinity.

Sand, washed onto the tracks of the Twin City Rapid Transit Co., of Minneapolis, by heavy rains, recently delayed cars for from one to three hours, and in several instances caused cars to leave the rails.

An excursion guide to Detroit and its suburbs is being sent out by the Detroit & Pontiac Ry. It contains a description of many pleasure trips that can be made out of Detroit by electric railway and steamer, illustrations showing places of interest in and near the city, time cards of the electric railway and steamship lines, and other information of value to the tourist.

The Supreme Court has decided that by virtue of a contract entered into with the city in 1892, the Binghamton (N. Y.) Railroad Co. is required to pay but one-fifth of the expense of paving between the tracks.

The Milford (Mass.) & Uxbridge Street Railway Co. is securing locations and hopes to have its proposed electric railway from the end of the Milford, Holliston & Framingham line to Uxbridge in operation this year.

Cleveland has a Rapid Transit Commission, appointed to find a way by which the cars of the suburban electric lines may reach the heart of the city, at higher speeds than they can now travel in the crowded streets.

On July 31st, the Appellate Court rendered a decision confirming the legality of the transaction whereby the Alley L property of Chicago was transferred to the South Side Elevated Railroad Co., the present owner.

A coroner's jury at Muskegon, Mich., has returned a verdict that a man who fell dead on a street car, came to his death by reason of his left hand coming in contact with an unprotected lighting wire under the hood of the car.

The Amsterdam (N. Y.) Street R. R. has been sold to the Fonda, Johnstown & Gloversville Railroad Co. and it is expected that the line will be extended across the country and connect with Johnstown and Gloversville.

The receipts of the Harrisburg (Pa.) Traction Co. for the last fiscal year were \$332,583, an increase of \$19,000 over the previous year, when the large number of regiments at Camp Meade greatly increased the normal business.

The International Traction Co., of Buffalo, each summer gives every man in its employ, and his family, a day's outing at the company's expense. The men take their day in small parties at a time so as not to cripple the service.

A wire netting is being placed on the left hand side of all open cars operated by the North Jersey Street Railway Co., of Jersey City, N. J., to protect passengers from injury by putting their heads out toward the other track.

The street railway company at Galveston, Tex., has opened a new pleasure resort, where it gives a band concert every evening from 8 to 10, followed by a grand free ball from 10 to 12. No intoxicating liquors are sold on the premises.

At the regular meeting of the New England Street Railway Co., of New Haven, Conn., it was decided to pass the regular quarterly dividend of $\frac{3}{4}$ per cent and devote the surplus money on hand to retiring part of the company's debt.

July 18th a strike was ordered on the Dallas (Tex.) Consolidated Electric Street Ry., but was a failure from the start, as only 15 of the 70 men went out. It was alleged that men had been discharged because they had joined the union.

A contemporary is authority for the statement that during a severe thunderstorm at Hartford, Conn., a deaf and dumb man, who was leaning against an iron trolley pole, received a shock so severe that he yelled loudly for the first time in his life.

Suit has been filed against the Augusta (Ga.) Railway & Electric Co. to recover \$5,000 damages. The plaintiff was injured by a tie falling on him from a flat car, and he alleges the company was guilty of negligence in not having a proper car for carrying ties.

The Chicago, Harvard (Ill.) & Geneva Lake Electric Railway Co., during its first year of operation, has carried 46,486 passengers. From Sept. 15, 1899, to July 1, 1900, 603 cars of freight were hauled, the number of pounds of miscellaneous freight handled being 921,684.

If the city of Lexington, Ky., will spend \$15,000 in purchasing property for a public park, the Lexington Railway Co. offers to spend \$40,000 in improving the grounds, building a casino and laying out golf links, base ball grounds, tennis courts and croquet grounds.

The campaign has developed a new field of usefulness for the trolley car. The wife of a Brooklyn man who wishes to go to Congress, charters cars, invites her husband's political friends with their wives and while everybody is enjoying the ride and the inviting lunch, she deftly wins the votes.

The annual report of the North Jersey Street Railway Co., of Jersey City, for the year ending Apr. 30, 1900, shows gross receipts from all lines of \$2,653,990. According to the new state law the company must pay the cities in which it operates 5 per cent of this amount, or \$132,699, as a franchise tax.

The New Jersey & Philadelphia Street Railway Co. has bought the upper Delaware River Bridge in Trenton, N. J., and announces that it will be running cars between Trenton and Philadelphia by January 1st. The company intends to acquire the Philadelphia & Bristol Passenger Ry., and to incorporate under the Pennsylvania railroad law.

The report of the St. Louis & Suburban Railway Co. for the quarter ending June 30, 1900, shows that during that period, 5,179,373 passengers were carried, an increase in traffic of nearly 65 per cent over the corresponding quarter of last year. This represents an increase of nearly \$100,000 for the three months, due in a large measure to the strike on the Transit company's lines.

The Burton, Jefferson (O.) & Andover Electric Railway Co., which was incorporated a year ago, has secured a 99-year franchise in Ashtabula County, a 25-year franchise in Jefferson and Andover Counties, a 50-year franchise in Trumbull County and a 25-year franchise in Cortland. Mr. Eugene Rawdon, of Windsor, O., is president and the chief promoter of the scheme.

According to local papers the Dayton & Union R. R., a steam line now operating between Dayton and Greenville, O., has served notice on a company that is building a parallel electric road, that it will carry passengers between the two points for five cents less than the fare charged by the traction company, and if the latter makes a five-cent rate, the Dayton & Union will haul passengers for nothing and in addition give them street car tickets for any line in Dayton.

KODAKS IN YELLOWSTONE PARK.

The widespread use of small cameras, of one sort and another by travelers, has led to a great development of amateur photography. Yellowstone Park is by far the most prolific spot in this country for the gratification of this calling or amusement, particularly for those interested in prize contests. To photograph the soaring geyser; the eagles on their nests; the numberless cascades and waterfalls; the beautiful springs, or the Golden Gate and the Grand Canyon, is to obtain a noted collection of pictures.

But the park is also the only place where wild animals, as they live in nature, can now be easily caught with the camera. The elk, deer, antelope, bears, coyotes, buffalo, etc., that, while wild, have not the timidity of hunted game, make it comparatively easy to photograph them there. The bears especially are easily found.

When riding on the stage coaches, if cameras are kept in readiness, opportunities sometimes occur for snap shots at elk and deer drinking from the streams or crossing the roads. By exploring the forests and parks a little remote from the hotels, the animals can be found with little difficulty.

"Wonderland, 1900," a finely illustrated book published by the Northern Pacific Railway, has a chapter on Yellowstone Park and the animals there, and will be sent by Charles S. Fee, General Passenger Agent, St. Paul, Minn., upon receipt of six cents.

For rates, etc., address F. H. Fogarty, General Agent, 208 South Clark St., Chicago.

CHAS. J. MAYER,

Special Agents: AMERICAN ELECTRICAL WORKS, Providence, R. I.

~~~~~

We carry the largest stock in this country of Strictly Electric Railway Material.

We are now occupying our entire building, five floors and basement.

Special Attention Given to Export Business.

Send for Catalogues.

TRADE NOTES.

THE WESTINGHOUSE ELECTRIC & MANUFACTURING CO. has declared a quarterly dividend of 1½ per cent.

THE GENERAL ELECTRIC CO. will issue 47,150 shares of new common stock which will bring the total capitalization up to \$25,242,200.

THE BURT MANUFACTURING CO., of Akron, O., has made some important shipments of its Cross oil filters on foreign orders during the past month. These orders came from Denmark, Sweden, Spain, France, England and Mexico.

THE PETER SMITH HEATER CO., of Detroit, has recently closed a contract with the Mahoning Valley Railway Co., of Youngstown, O., for equipping 12 cars with its heating system. This will take the place of electric heaters now in use.

THE POTOMAC TERRA COTTA CO., of Washington, D. C., has just shipped to the Morris Electric Co., of New York, four car loads of conduits, intended for reshipment to Havana, Cuba. This is in addition to the 50 car loads shipped some time ago.

A CREDITORS' COMMITTEE, appointed to inspect the works of Laing, Wharton & Down, Ltd., 80 Coleman St., London, E. C., has recommended that the stock, plant and machinery of the firm be sold at public auction for the benefit of the creditors.

MR. H. L. PRATHER, Cleveland agent for the Morris Electric Co., of New York City, recently closed several large orders for the Morris rail bond. One contract was from the Dayton & Northern Traction Co., and was for all the bonds for 42 miles of track.

THE CHISHOLM & MOORE MANUFACTURING CO., of Cleveland, O., has just received an order for 14,500 "American Standard" rail joints to be used on the Dayton & Northern Traction

Co.'s, new road. It has also closed a contract for 11,000 joints for the Sandusky, Monroeville & Norwalk Street Ry., of Sandusky, O.

THE BETHLEHEM STEEL CO., of South Bethlehem, Pa., advises us that the Northern Pacific Railway Co. has specified Bethlehem nickel-steel for the driving-axles and crank-pins for 20 locomotives now building at the Schenectady Locomotive Works.

MR. GEORGE E. PRATT, representing the Star Brass Works, of Kalamazoo, Mich., was a "Review" caller recently. He was very enthusiastic over the increasing business of his company and states there has been a big gain in the number of roads using the Kalamazoo trolley wheels.

THE BABCOCK & WILCOX CO., of New York City, has closed an order for boilers aggregating 1,400 h. p. from the Cumberland Electric Light & Power Co., Nashville, Tenn., and one from the Richmond (Va.) Passenger Railway & Power Co., for boilers aggregating 1,200 h. p.

D. W. PHELAN, of New York, has recently sold the Union Railway Co., of New York, 75,000 ties and 1,000 octagonal poles. These are for the new extensions of the lines through the Bronx and White Plains districts. Mr. Phelan has also sold, among other orders, 2,000 poles to the Albany & Hudson Ry., of Hudson, N. Y.

THE EGAN CO., of 322 to 342 West Front St., Cincinnati, O., has just issued a large illustrated hanger showing nearly 100 different wood-working machines, many of which have been patented since January 1st. One of the hangers will be forwarded on application and should prove of value to anyone desiring information on this class of machinery.

THE JOSEPH DIXON CRUCIBLE CO., of Jersey City, N. J., is sending out a short circular entitled, "Coal at one end, power at the other—the lubricant in between." The claim is made that

the addition of 10 to 15 per cent of Dixon's pure flake graphite to any oil or grease will enable the oil or grease to do several times more work as a lubricant.

THE ELECTRIC STORAGE BATTERY CO. and the Electric Boat Co. have filed papers in suits for infringements of patents, in the United States Circuit Court, Southern District of New York, against the Gould Storage Battery Co., and in the United States Circuit Court, Northern District of Ohio, against Sipe & Sigler, makers of Willard storage batteries.

THE ELECTRIC STORAGE BATTERY CO., of Philadelphia, describes in circular No. 58, an installation of 60 "Chloride" accumulators at the Arnold Print Works, of North Adams, Mass. The battery is used sometimes as a regulator to eliminate the fluctuations of the generator load, also for peak work during certain times of the year and for all night lighting.

THE CHASE CONSTRUCTION CO., of Detroit, has just received contract for erecting the overhead work for the new Dayton & Northern Traction line, which will be about 42 miles long, running from Dayton to Greenville, O. The contract calls for nearly 570,000 lb. of copper. The above firm is also finishing up construction work on the Erie Transit Ry., at Erie, Pa.

J. HOLT GATES & CO., Monadnock Block, Chicago, have been awarded the contract for a new electric lighting plant at Urbana, Ill., which will contain one 60-kw. and one 120-kw. Warren alternator, direct connected to Ideal engines. Gates & Co. have also received orders for two 30-kw. Warren alternators and one 40 arc light machine for the new city lighting plant at West Hammond, Ill.

THE MORRIS ELECTRIC CO., 15 Cortlandt St., New York City, recently shipped the following: A quantity of small forges, picks, bars and other track construction tools, 4,000 rail bonds and a Conant rail-joint testing instrument to Lisbon, Portugal; 300 cast-iron wheels, made by McKee, Fuller & Co., to Mexico, and 50 Crouse-Hinds electric headlights and one 30-ft. Hathaway transfer table to other cities.

W. C. STERLING & SON, of Monroe, Mich., report a large business in cedar poles and ties, and are now carrying in stock, sorted ready for shipment, 75,000 poles of all sizes and lengths and over 150,000 cedar ties. They are shipping ties this month to street railways at Chicago, Buffalo, Cincinnati, Dayton and other cities. This firm reports it is holding all its old customers, as well as gaining many new ones, and it is anticipating a heavy fall trade.

THE CHIEF OFFICES of the Standard Paint Co. in Europe are at 50 Boulevard Haussmann, Paris, and 59 City Road, London, E. C., both of these offices being in charge of Robert W. Blackwell & Co., Ltd., and at 16 Friederich Strasse, Berlin, and 33 Grimm Strasse, Hamburg, the German offices being in charge of Allut Noodt & Meyer Co., Ltd. American visitors in Europe this summer will be heartily welcome at these offices, and every possible courtesy will be extended to them.

THE McGUIRE MANUFACTURING CO., of Chicago, is very busy in all departments. Among the many truck orders on hand is one just received for 100 McGuire No. 39 double trucks for the Chicago Union Traction Co. The snow plow and sweeper department is working on five sweepers for the Metropolitan Street Ry., of Kansas City, in addition to several single orders. The McGuire company has also booked numerous sales of its "New Columbia" heaters. Mr. McGuire believes the fall trade will be a record breaker.

THE CHICAGO MICA CO., whose main works are at Valparaiso, Ind., reports a gratifying increase in sales of its "Micabond" products. Mr. W. F. Hatch, the company's secretary, is at present making his headquarters at the Ottawa office, and has closed contracts for the entire output of one of the largest amber mica mines in the province of Ontario. Fully 75 per cent of the output of this mine is what is known to the trade as silver amber mica, and this will be used exclusively in making this company's well known No. 104 "Micabond."

THE SPEER CARBON CO., of St. Mary's, Pa., has brought out a new motor carbon brush which it has christened the "Long-Lived," because as the result of severe tests, it is believed the brush will last from one-half to two-thirds longer than any other design on the market. The new carbon is due to the experiments and research of Mr. J. S. Speer, the head of the company. On a recent eastern trip Mr. Speer booked orders for large numbers of the brushes. The Speer company on August 1st, doubled its working force and is now able to ship all orders promptly.

THE B. F. STURTEVANT CO., the pioneer in the introduction of fans instead of chimneys for securing draft for boilers, recently stated that the sales of its apparatus for stationary boiler plants were last year over three times those for the year before, and that they now amount to nearly 1,000 h. p. per day, about equally divided between stationary and marine plants. It is also interesting to note that in a number of the technical schools of the country experimental mechanical draft apparatus has been installed, principally for the purpose of instruction, and that numerous graduating theses are concerned with the investigation of this subject.

E. P. ROBERTS & CO. have in hand a number of important contracts. The firm is preparing plans and specifications for the Central Traction Co. of Indiana, for 65 miles of road; is supervising the completion of the Indianapolis & Greenfield Electric Ry.; has finished plans and specifications for the Dayton & Northern Ry., which will be 39½ miles long; is about to make a test on the Cleveland & Eastern Electric Ry., for which it acts as consulting engineers; is about to prepare plans and specifications for an incandescent plant for Henderson, Ky.; has under construction an electric light plant for Collinwood, O., and an electric light plant for the Deaf and Dumb Asylum at Columbus, O., besides a number of reports, special investigations, etc.

THE KEYSTONE CAR WHEEL CO., of Pittsburg, lately organized to make and sell car wheels, sends us the following information, supplementing the statement of the company's organization, published on page 340 of the "Review" for last June. Mr. Chas. V. Slocum, the organizer and general manager of the new company, was a few years ago treasurer of the New York Car Wheel Works of Buffalo and was later organizer and manager of the Pennsylvania Car Wheel Co., of Pittsburg. Mr. John Howard Yardley has been made secretary of the new corporation. He was also formerly of the Pennsylvania Car Wheel Co., and previously was vice-president of the Philadelphia Car Wheel Co. Mr. Yardley will have charge of the eastern office with headquarters at No. 807 Girard Building, Philadelphia.

THE McGUIRE MANUFACTURING CO., of Chicago, has recently issued a new catalog containing a collection of handsome halftone engravings showing the trucks, snow sweepers and other apparatus for which it is so widely known. Among the trucks illustrated are the No. 35 type used by the Brooklyn Elevated, the No. 39 double truck designed for high-speed interurban service, the No. 2 maximum traction, the solid steel "Columbian" single truck and the A 1 suspension truck. Interesting features of the catalog are a list of companies operating the McGuire combination snow plow and sweepers, of which there are over 500 in use, and a list of street railways using the "New Columbia" stoves. Other specialties illustrated are ratchet brake handles, "Elastic" brake hangers, "Royal Flush" fenders and the Roach spring guards for trail cars.

ELECTRIC RAILWAY FOR YOKOHAMA, JAPAN.

We are advised by Mr. Zensuke Tanaka, whose address is Miyazakichos, Yokohama, that he is one of the promoters of an electric railway to run from Yokohama to Kanagawa and Kawasaki, Japan. A company is not yet formed but application has been made for a charter, which Mr. Tanaka thinks will be granted in the near future.

The Metropolitan Street Railway Co., of Kansas City, has appealed to the criminal court to determine its right to drive a wrecking wagon through the streets at high speed when necessary to make emergency repairs on the line. The police court recently fined the driver of the tower wagon \$1 for fast driving.

CORRESPONDENCE.

We cordially invite correspondence on all subjects of interest to those engaged in any branch of street railway work, and will gratefully appreciate any marked copies of papers or news items our street railway friends may send us, pertaining either to companies or officers.

DOES THE MANAGER WANT ANYTHING?

If you contemplate the purchase of any supplies or material, we can save you much time and trouble. Drop a line to THE REVIEW, stating what you are in the market for, and you will promptly receive bids and estimates from all the best dealers in that line. We make no charge for publishing such notices in our Bulletin of Advance News, which is sent to all manufacturers.

This paper is a member of the Chicago Trade Press Association.

Entered at the Post Office at Chicago as Second Class Matter.

VOL. X. SEPTEMBER 15, 1900. NO. 9

On another page we give a diagram of the exhibit hall and the list of those exhibitors to whom space has already been assigned. Particular attention of exhibitors is called to the shipping instructions given in connection with the convention announcements on page 531.

The American Street Railway Association has followed the precedent set last year and assigned but five subjects on which papers will be presented at the coming convention in Kansas City, the idea being to give ample time for a full discussion of each, and in order that those attending the convention might have sufficient opportunity to prepare discussions, the executive committee announced the subjects early in March. The paper dealing with the effect of street railway consolidations upon the public is particularly timely and sure to arouse much interest; that treating of the various systems of electrical distribution is also of great importance just now. The other subjects are of interest to the operating department.

The Street Railway Accountants' Association also has an interesting program including three papers and two committee reports. One of the latter is that of the committee on a standard unit of comparison and is a direct consequence of the animated discussion that followed Mr. Mackay's paper on the car-hour as a unit, which was presented at Chicago in October, 1899; the other report is that of the standing committee on a standard system of accounts.

Where electric interurban railways have come in competition with steam roads there has often been a rate war, which usually resulted in the steam suburban service being greatly reduced or abandoned. So long as such a contest was merely one between a steam and an electric line, the manager of the latter looked upon it as the natural result of the introduction of an improved

method of transportation—it was an example of an animal of superior organization seizing the feeding grounds of an inferior animal.

Recently a steam railroad entering Detroit found that an electric competitor was seriously interfering with its business, and made a traffic agreement with another electric line and cut the through rate from Detroit to a popular summer resort. This is the first case of this kind of which we have knowledge, but there is a lesson to be drawn from it. In future the builders of electric interurban lines must seriously consider whether they are paralleling a similar road, and if wise they will carefully avoid the building of competing lines. Competing street railway lines, once so popular, are now almost a thing of the past in cities, experience having demonstrated that the necessary end of such competition is consolidation after all parties have suffered loss.

The children of Brooklyn in the crowded districts where there are no adequate playgrounds have a game of dodging the trolley cars, which gives them much needed exercise and excitement. Unfortunately an accident sometimes occurs, and then the poor motorman is blamed.

The churches and charitable organizations of Boston have a powerful ally in the Boston Elevated Railway Co., which, through these societies, this summer distributed 100,000 street railway tickets thus affording mothers and children and sick and aged persons who could not pay fare, the opportunity of a journey to the woods or seashore. In other cities individuals have distributed large numbers of street car tickets to poor children, many of whom were thus given their first chance to visit the parks.

That the boycott is a two-edged weapon, and that the imposition of fines for patronizing a boycotted institution is in the nature of a boomerang, are being realized by the trades unions of St. Louis. During the first half of August nine unions rescinded the fines ordered imposed on members who should ride on the cars of the St. Louis Transit Co.

The secretary of the Building Trades Council of America is thus quoted: "To continue the boycott and the fine is sheer nonsense now, because it imposes a greater hardship on union men than it inflicts injury on the Transit company. In short, the whip intended to punish the other fellow is stinging us as hard as, if not harder than, it is him."

The attention of our readers is called to the case of another fake accident operator, Frank Lieblang, described on page 497. The arrest of this man is due to the efforts of the Cleveland Electric Railway Co., which last year became suspicious of him because of the large number of claims for damages he was bringing against the company, and set a detective to work. The detective did not have an easy task, because the principal preferred to do the planning only and have the "accidents" happen to his partner, the detective. After an unsuccessful trip through the East, which seems to have failed because the performances were not sufficiently realistic, the pair last month landed in Detroit, where better results were achieved, and Lieblang is now in jail awaiting trial on the charge of defrauding the Detroit Citizens' Street Railway Co.

The number of interurban electric roads on which express matter is handled is constantly increasing but just at present there does not seem to be any recommended practice in methods. In many instances agreements are made with one of the old established express companies and the business is conducted just as it would be on any steam railroad, and where other arrangements have been made the reason has generally been that the steam railroads either refused to accept express from the electric lines or would not permit the express companies to make contracts with the latter.

In Cleveland a special street railway express company has for some time been conducting its business with marked success and a similar company is also operating in Connecticut; the reason for organizing separate express companies was in both cases that stated above. In other places the electric railways are themselves handling express. One of the latest additions to this class is the Southern Ohio Traction Co. which on September 1st began run-

ning express cars between Dayton and Cincinnati, superseding and extending the service rendered during the past three years by Wells, Fargo & Co. which had a contract with the electric line between Dayton and Hamilton.

The tendency now is, we believe, to operate separate cars for express matter rather than to carry it in a compartment car, for the reason that passengers do not like to have cars held while parcels are being loaded or unloaded.

In spite of all that has been written during the last three years concerning the development of electric traction in Great Britain, we doubt if there is even yet a full appreciation of the situation there. A summary of the work of the Light Railways Commission shows the aggregate length of the roads for which applications have been made to the commission in less than three and one-half years is over 3,000 miles; while light railways, by which we believe was intended what in this country are called interurbans, are not of necessity operated by electricity, that motive power is contemplated in the great majority of applications. Some 250 miles of what are street railways or tramways have been authorized under the light railways act.

The attitude taken by the steam railroads towards the light railway projects was at first one of opposition, but four years have sufficed to convince those interested that the light railway develops a new traffic, and does not necessarily "compete" with the older line.

The article by Mr. Henry L. Beach entitled "Advertising a Street Railway," which we publish in this issue, will be found very interesting by those managers who are seeking to develop the full possibilities of the pleasure riding and excursion traffic of their systems. The success of the advertising campaign conducted by the Chicago Union Traction Co. during the past summer has shown the importance of the principle enunciated by Mr. H. M. Kennedy, then general passenger agent of the Brooklyn Heights Railroad Co., in a paper read before the New York State Association two years ago. Mr. Kennedy then said: "We keep the public well informed as to where and how to go, and how to keep cool for a nickel during hot weather."

In summer months the pleasure riding business is very large and Mr. Beach states that on the Chicago Union Traction system the difference in receipts between a pleasant and a rainy Sunday often amounts to \$20,000. This business can be largely increased by "keeping the public well informed as to where and how to go," and the various methods by which this can be done are well worth considerable study. The opportunities for this work are naturally greatest in the large cities, but even in smaller places there are possibilities.

The overhead trolley system is now making advances in Great Britain. As here, the anti-trolley prejudice fades away upon actual construction and demonstration. A very important feature peculiar to England, will moreover constitute a strong obstacle to the adoption of conduit systems. Owing to the extreme mildness of the climate water and gas pipes are laid near the surface. The installation of conduits for street railway use, therefore, involves the removal of practically all water and gas mains on the streets used. The enormous expense of doing this, to say nothing of the annoyance, loss and danger attending such changes, combine to put so many difficulties in the way as to almost prohibit the attempt to build this form of electric road. And when it is completed it has only doubtful advantages over the overhead trolley from an operating standpoint, while in several respects it is positively inferior.

We desire to say a few words concerning one of our regular departments, that entitled "Recent Street Railway Decisions."

The layman probably has but little idea of the immense volume of legal decisions reported in this country. There are the Federal Supreme Court, the Circuit Courts of Appeals and the Circuit Courts, and 44 State Supreme Courts, to say nothing of the various State Appellate Courts whose decisions are regularly reported. The court reporting concerns issue these decisions as fast as they are rendered in pamphlets of from 50 to 400 pages, of which nine are published each week; these are reissued later in bound volumes for the lawyers' libraries.

In our legal department are to be found carefully prepared abstracts of all the important street railway decisions which are to be found in the great mass of the reports for the month. In preparing these abstracts the object in view is to omit no vital matters, yet make the digests brief, so that a busy man may find time to read them; to give all new points, whether of law or fact, that arose in each case, and to omit technicalities that none but a lawyer would understand. It is quite important to point out that the abstracts given are not merely a reprint of the "head notes" with which the court reporters preface the opinions; such head notes are often found to be misleading, or not to fully cover the case.

Thus there are brought together and laid before the reader a digest of late decisions which will be found equally useful to the company's attorney, who wishes to keep in touch with the course of current decisions and has not the time to hunt them up and read them; to the manager, who has to instruct his subordinates as to what they may and may not safely do, and to the claim adjusters, who should know what the decisions have been in cases that arose on states of fact similar to the ones they may at the time be trying to adjust.

"How much depends on the point of view," remarked a prominent interurban manager to a group of friends recently. "Before our line was built I frequently traveled through our territory on the steam road that we now parallel, and many are the times I have sworn at the service provided. But since our road has been opened I occasionally go over the steam line and take huge delight in noticing the dust and cinders, the inconvenience of showing tickets at the stations when one is in a hurry, the long time between trains and all the other deficiencies, because I know these but make more conspicuous our own clean cars, our quick service and the many attractions in general of traveling by trolley."

The street railway commission appointed by the city council of Chicago has prepared a list of questions which it will submit to the people with the expectation that the answers will be of assistance in formulating a policy which the commission can recommend to the council.

Perhaps the most interesting of these questions are those grouped under the heading "Co-ordination of Service." It is suggested that the city ought, as a matter of public policy, to require that surface street railway routes should be arranged with the view of delivering the long haul business to the steam and elevated lines on the ground that these latter can make faster time. Also that a special low fare on such feeders is desirable.

The work of the commission must in the end meet with popular approval or be rejected, but it would seem to us that the commission should make its own investigations after the manner of the committee appointed by the Massachusetts Legislature in 1897, and then seek to convince the public by argument that its conclusions are correct. We fear that the most voluminous answers to the commissioner's enquiries will be from those least prepared to discuss the subject understandingly.

Notwithstanding the development of the electric railway mail service has been less than was confidently predicted when it was first tried, there is no question as to its efficiency and value. The street railway service in Chicago was last year transferred from the railway division to the local post office; here one new route has been established, and on two of the four old routes independent motor cars operating over electric lines have recently been substituted for trial cars attached to cable trains. The facility with which an electric car can be transferred to other streets and dispatched around blockaded points is a very great advantage. Where there is a comprehensive system of interurban electric lines great possibilities in time saving are afforded and it is no surprise to learn that the department has made preliminary arrangements with the street railways connecting Jersey City, N. J., with the Hudson County towns to the north and south, for a pouch service; this will result in increasing the number of mails which can be delivered on the same day as posted. The letter boxes on cars that have been introduced in several cities should also be noted. In the few instances where the street railway pouch or letter box service has been abandoned the reason was the appropriations available were insufficient.

The Street Railways of Portland, Me., and Vicinity.

System of the Portland Railroad Co. Suburban Line of the Portland & Yarmouth Electric Railway Co. — Parks and Theaters— Physical Features and Equipment—Special Shop Tools and Methods.

BY C. B. FAIRCHILD.

The city of Portland is highly favored as a street railway city. On every hand one hears only praise for the facilities offered, and for the management, especially from the summer tourists and other strangers, who have occasion to patronize the cars while on their way through the city. The favor, however, is not all one sided, for the location brings the city in direct line with a very large tourist travel for it is the natural gate-way to the woods and streams of Maine, the state that is known as the "play-ground of the nation," and it is estimated that a quarter million of tourists visit Portland every summer. Besides this, the street railways are benefitted by the proximity of the numerous islands—said to be 365—within the limits of Casco Bay, on which the city is located.

The Portland Railroad Co.'s system is operated in nine divisions, some of which are located within the limits of "Greater Portland," for since the acquisition of Deering and other neighboring villages the city has taken on this pretentious name.

One of the divisions is the "Belt Line," of about 10 miles; other lines connect neighboring villages or run to one of the parks, and one is known as the Cape Elizabeth division, three miles in length, which connects the Cape with the city, and which has come under the control of the Portland Railroad Co. comparatively recently.

As both of the Portland companies make a specialty of park attractions, as a means of increasing traffic, this feature will have attention before taking up the physical description and methods of

FIG. 1—VIEWS AT RIVERTON PARK.

On all the large islands, are numerous hotels, boarding-houses and cottages, for summer residents, and all within easy reach of Portland by means of steamers; so that the street railway patronage is not limited to the resident population, said to be about 55,000, but is more than doubled by the transient summer patronage.

Two companies control the street railway lines of the city and vicinity. The Portland Railroad Co. is the principal one and has 46 miles of track and 161 cars. The system is operated under the direction of Mr. W. R. Wood, president, and Mr. E. A. Newman, general manager. The second is the Portland & Yarmouth Electric Railway Co., with 14 miles of track and 25 cars. This road is a direct line between Portland and Yarmouth, being almost wholly a suburban system, and is operated under the direction of Mr. Seth L. Larrabee, president, and Mr. S. E. Whitaker, superintendent and general manager.

operation. The principal outing tract is known as Riverton Park, (Figs. 1 and 2), which is an inland park, located on the banks of the Presumpscott River, five miles from the business center of the city. The park embraces 40 acres, consisting of a rolling plateau, which terminates in a bluff sloping abruptly to the river. For natural beauty, the park is unsurpassed by any to be found in the Eastern states, if not in the country. The grounds are artistically laid out, with areas of open lawn, and other sections, shaded by native forests, with gorges and rugged banks, and many of the rambles cross rustic bridges and by pretty rustic arbors and resting stands. On the shady borders of the lawn are numerous lawn-swings, and also a merry-go-round and other attractions for the children. One section which embraces the wildest portion, and which is surrounded by a high wire-fence, is known as the Deer, Moose and Elk park, where fine specimens of these animals roam

with all their native freedom. There are besides, cages for monkeys, raccoons, squirrels, and other small animals, and also for parrots of different varieties. The landscape features are also enhanced by clumps of shrubs and by beds of choice flowers, in artistic designs. The climate seems to be especially adapted to the growth of coleus and other bedding plants, and many of the flowering plants produce such choice colors in profusion, that even a florist hardly knows some of their familiar species, because they

FIG. 2—RUSTIC BRIDGE AT MOOSE PARK.

are so much more beautiful than those usually found in such parks.

The principal attraction of the park, however, is the large casino, and next is the open air theater. The casino is a large, handsome structure, with broad piazzas on three sides, built on the sloping bank near the river, and commanding from its upper floors a view of the entire grounds. There is a large dining-hall, and tables are also spread on the rear piazza. Here lunches or elaborate dinners are served at reasonable prices, a specialty being made of sea food. The service is exceptionally clean and dainty, and entirely free from the slovenly appearance that is usually found at such places. Women only are employed as waiters and they are always polite and attentive. On the same floor is the ladies' reception-room, which is finished in colonial design, with elegant furniture in red, and with pictures of high artistic order on the walls. There is a smoking parlor with sumptuous furnishings, a room with tables for games, and a reading-room with oriental effects. There is also a large dance hall, which is light and airy. The casino is kept open the entire year, and, during the winter season, supper, card and dance parties are entertained, and the patronage is said to be good all the year.

The rustic theater has a seating capacity for 3,000 people, and is located in a natural amphitheater sloping towards the river with a rustic stage, which stands just on the bank of the river, giving a beautiful background; the whole is well shaded by tall and graceful trees. The stage is large, and sheltered by a high rustic roof, and there are two dressing-rooms, one at each end, as shown. Stairs communicate with these at the rear. The stage is illuminated by four arc lights, and 250 incandescent colored lamps, arranged in festoons, or in artistic designs. The trees and walks are also illuminated by numerous electric lamps, properly distributed. Admission to the theater is free for all who enter the grounds by the cars and have paid the 10-cent fare from Portland. A charge of 10 cents is made, however, for all others, while reserved seats are to be had for an additional charge of 10 cents. Among the special attractions this season is Matus' Hungarian Court Orchestra, which gives concerts at the theater afternoon and evening, and during supper hour renders selections at the casino. The band is supplemented by high-class vaudeville, the troop and programme being changed every week.

The vaudeville troops are engaged for the season, from the J. W. Gorman Park Attraction Agency, of Boston, and so far have proved highly satisfactory to the railroad company and patrons, and the

latter include apparently all the best people of Portland. On every pleasant evening the seats of the theater are always filled, and the scene on a moonlight night is brilliant and attractive beyond description. Other attractions include a boat and canoe-house, where canoes owned by private parties are stored, and where flat-bottom boats are provided at a moderate charge for all who wish to take a row on the river. Just below the casino an electric launch is moored, one of the launches that was employed on the lagoon, at the Chicago Columbian Exposition in 1893, and which is still in first-class order. For a charge of 10 cents per passenger the launch makes trips of seven and a half miles in either direction up or down the river, and the ride is a most delightful one. The river, which is not over 40 ft. wide, is deep and safe, and on both sides is shaded by overhanging forest trees and vines. The batteries of the launch are charged from the street railway current, while the boat is at her moorings, suitable switches, a water rheostat and necessary instruments being provided. Just below the launch is a circular trout pond, with a number of fine specimens of the speckled beauties. This pond is fed from a nearby spring, from which the water boils up with great force, and from which, by means of a hydraulic ram, drinking water is forced to tanks in the casino and other places where water is required. The lawn swings mentioned, of which there are twenty or more, are all of the pattern known as the Fairfield lawn swing, made at Brunswick, Me., and are said by the management to be a very desirable park attraction.

The cars enter the park through an ornamental stone gate-way, with flowering plants growing on the top of the wall. The track loops, after passing the casino and encircles the mall and the section of the woods when it emerges on the street for the return trip. The scene shown in Fig. 3 is every pleasant day seen on Monument Sq. in the city about one o'clock; the open cars are banked in line ready to handle the park traffic, the cars being dispatched in rapid succession from the starting station at the head of Preble St., which is near the company's office, but not shown in the picture. The ordinary headway on this line is 15 minutes, but as a number of cars are run on one car's time, the traffic is readily handled. After the afternoon and evening entertainments, the cars, to the number of 30 or more, are banked at the park end of the line. The cars shown in rear of the monument in the picture, are park cars, ready to leave for Cape Elizabeth, being daily banked for the start on a neighboring street. The ordinary attendance at Riverton Park is from 2,800 to 3,000, while on special occa-

FIG. 3—MONUMENT SQ., PORTLAND.

sions the cars carry as many as 10,000 or 11,000 in a day. The affairs of Riverton Park are under the direct supervision of Mr. D. B. Smith, who is attentive to every detail, and very popular with all the patrons.

It is the aim of the manager to provide sufficient cars at the close of all entertainments so that all can get seats for the return trip. The people all know that there will be plenty of seats, so they are not, as a general thing, in a hurry to return, and there is

no rush or crowding. This feature is important, as it brings to the park a refined class of people who would not otherwise patronize the cars. The manager aims to please people who have money and are willing to spend it. The result is that many wealthy people who formerly drove to the park, when they did go, now take the cars and frequently take their friends out and entertain them at the casino.

The Cape Elizabeth Park (Fig. 4) is located on a bluff near the point of the Cape, on the left bank of the principal ship channel, which is the entrance to Portland Harbor. Joining the park grounds is the new Fort Williams and just beyond is the Cape Elizabeth light tower, one of the oldest light houses on the Atlantic coast. The outline of the coast is rocky, irregular and wild in the extreme, and during rough weather the surf scenes are among the finest to be found on the coast. Along the banks, on

able for the street railway companies during the present season, but they have been favored by a large influx of strangers during the month of August, to observe what has been termed "Old Home Week," which included the days between August 5th and 12th, at which time all the former residents of the state of Maine, and all home people were invited to meet in Portland. Tuesday of that week was made a special day for Portland, while Wednesday and Thursday were special days for Brunswick, Bangor, Bath and other cities. People came from all the states, and from foreign countries for that matter. Great preparations were made in advance for entertaining the visitors, while the public buildings, business blocks, and many private residences were profusely decorated. By the courtesy of the Secretary of the Navy, the North Atlantic squadron, consisting of six ships, was ordered to Portland Harbor, and on Tuesday the marines from the squadron paraded in the line with

Casino and Lawn.

Summer Theater.

FIG. 4.—VIEWS AT CAPE ELIZABETH PARK.

the water side, among the rocks below the casino, wild plants and shrubs grow in great profusion; among these are secluded walks and rustic seats, and on some of the more prominent heads, attractive pavilions are provided, where visitors can rest and get the best views of the neighboring islands and harbor. The ship channel is about three-fourths of a mile wide, and is bounded by Cushing's Island on the opposite side. A small bay, leading in behind the Cape, provides a fine sandy beach, for salt water bathing. This park, like that at Riverton, is tastefully laid out, and in front of the casino is a beautiful lawn interspersed with beds of rare flowers; so that on one side the visitor looks out upon nature in all its wild beauty, and on the other finds the beauty of the scene enhanced by art. The buildings consist of a fine large casino, with broad piazzas, a dining-room, dance-hall, reception and smoking parlors. A specialty is made here at the casino of what are termed "Shore Dinners," including soft-shell clams, fish, lobster, and such other food as the ocean supplies. A large building on the opposite side of the lawn is occupied by the theater, which is built after the prevailing style of city theaters, with stage and shifting scenery, and circular balcony and galleries. The entertainments here for the present season are conducted by a stock company, the programme being changed every week. The street railway tracks loop around the mall, past both buildings, and cars are readily loaded after the entertainments from platforms provided along the tracks. Both the parks above described enjoy very liberal patronage, and are considered paying institutions. Cape Cottage Park is also conducted under the supervision of Mr. D. B. Smith, assisted by Mr. F. S. Hatch, local superintendent, who is also popular with the patrons.

The traffic along these park lines is not limited by the pleasure riding alone, but along the entire route are farm houses and suburban homes, while in the vicinity of Cape Elizabeth are numerous hotels and summer cottages, owned by people from Boston, New York and other cities. Not only has the park traffic proved profit-

the local, military and civic societies. Notwithstanding the increase of strangers, and the great throng that attended the display of fireworks in the evening at the Eastern Promenade, the railroad companies handled the extra traffic without difficulty, and without an accident. The cars of the Portland Railroad Co. carried on Tuesday, August 6th, 94,032 revenue passengers, besides the transfers, a total of 102,919, winning the admiration of all. There was necessarily some crowding of cars, and after the evening entertainment, one conductor reported a load of 175 people, on a 12-hench open car. Besides the parks above described, as traffic promoters, there are two sections of the city, to which the street car lines cater, and which attract a good many visitors. These are known as the Eastern Promenade and Western Promenade. The former is on Munjoy Hill, the eastern terminus of the city, and from which a commanding view is had of the harbor and neighboring islands, Fig. 5. Many of the sight-seeing tourists visit this promenade in the early morning, to watch the sun rise, as it breaks over the distant line between the sky and ocean. On this promenade is located Fort Allen Park, with souvenir cannon of the War of 1812. The Western Promenade is also the termination of a high plateau, and the view is over a neighboring valley, with the Union Depot directly below, and a broad expanse of farm land lying to the west of the city. From this point, on a pleasant day, the snow-capped peaks of the White Mountains are plainly visible, although 90 miles away. Here is located the Maine General Hospital, and bordering the Promenade on the city side are numerous fine residences, this being the fashionable residence district of the city.

The cars pass near the Western Promenade, to and from the Union Depot. As the different lines of cars come to the depots a special effort is made to meet all incoming and outgoing trains, so that no hotel bus is required. One line also runs to the Grand Trunk Depot, and along the streets adjoining the wharfs of the Boston and New York steamers, as well as the local boats which ply between the neighboring islands.

PHYSICAL FEATURES.

The principal lines of the city were operated by horses up to five years ago, or until October, 1895, when all were changed to electric power. Two lines, however, one of which ran to Deering, had been electrically equipped as early as 1891, the cars being operated

FIG. 5—EASTERN PROMENADE, PORTLAND.

by W. P. motors. By delaying the equipment of the main lines the company had an opportunity to study the weak points of the original equipment, and when finally convinced that electricity was practicable, it took advantage of the low prices of materials in 1895, (copper being then only 10¼ cents per pound, and rails correspondingly cheap,) and equipped the lines as well as the state of the art then warranted. The tracks in the city were laid with 9-in., 90-lb. girder rails, with ties resting on a gravel foundation; 60-ft. rails were used. Nearly all the city lines have double tracks, so that after five years of service, the track is still in excellent condition, no joint repairs having been required. Some of the special work, however, where the switch-points were worn, has required repairs. The suburban lines are laid with 56 and 60-lb. rails. All steam railway crossings are made with single track, but over these

POWER EQUIPMENT.

At present two power houses supply the lines with current. The one from which the Cape Elizabeth road has been operated, is about to be shut down, but may be kept for the present as a reserve supply, but it is proposed to operate the entire system from the main power house. This is located on tide water on Forest Avenue. The building, Fig. 6, is of brick, on pile foundations, and is quite an imposing structure, the ground plan being 110 x 110 ft., and the walls 45 ft. high. The roof is of steel, making the building practically fireproof. A new Rice & Sargent engine made by the Providence Engineering Works, Providence, R. I., has recently been installed.

The new unit, shown in Figs. 7 and 8, is a 1,500-h. p. vertical

FIG. 6—POWER HOUSE, PORTLAND R. R.

compound engine direct connected to a 1,050-kw. General Electric generator. The engine has cylinders 26 and 50 x 42 in. and runs at 100 r. p. m. with 120 lb. steam pressure. The piston rods extend as tail rods through the heads of the cylinders; the receiver between

FIG. 7—1,500-H. P. RICE & SARGENT ENGINE.— FIG. 8.

sections two lines of trolley wires are carried, so as to avoid overhead switches. The bonding, overhead construction and feeders were all put in in a first-class manner, and are still maintained with very little repairs. Guard wires are used above the trolley wires on the principal streets in the city, this being required by the city electrician, who has not yet been convinced that these are useless.

the cylinders is cylindrical, extending across the frame, and mounted behind it, as shown in the illustrations; the exhaust pipe curves around the frame, and passes down beneath the floor to the condensers. The throttle is controlled from three positions by means of hand wheels, attached to a shaft, one at the floor and one at each platform. The valve gear is of the Rice & Sargent type, and

has silent vacuum dash pots. The main shaft is 22 in. in diameter, at the armature. The fly-wheel weighs about 85,000 lb.

The valves and valve mechanism of these machines are of special interest. All the valves have double ports, and the exhaust valves are set nearer the piston than the steam valves, so that the clearance is largely reduced. The valves are operated by direct motion from the eccentrics without the medium of wrist plates. There are two eccentrics, one for the inlet valves and one for the exhaust, on each cylinder. The range of cut-off is from zero to $\frac{3}{4}$ stroke, which gives the engine great capacity for overloads, and ensures perfect regulation under any condition of load. Proper motion for the exhaust valve is secured by means of a toggle joint on each exhaust bonnet, without the intervention of wrist plates. A further advantage of this construction is that the moving parts have small mass, and are therefore fitted to operate at comparatively high speeds with quietness. The cut-off latches operate without springs, dropping by their own weight, and are so constructed that the pressure from the eccentrics is on a line below the pivotal point, so that the latch cannot jump up. The wearing contact plates on the latches are square and are made of hardened steel so that by shifting a plate and turning it over, there are eight corners for wear. The point of cut-off is determined by a rod from the governor which actuates a yoke behind the latch, operating by means of roll-

reamed fits in their holes. The main bearing caps are adjusted by means of set screws against which the ordinary cap bolts act, this construction giving a very accurate adjustment of the main bearings. The parts are oiled by chains on the shaft, of which there are three on each bearing, leading the oil from large reservoirs in the pillow blocks. There are also four sight feed oil cups upon each bearing. On the crank side, the waste oil from the bearing is led out into the crank pin, and on the other side there are channels which convey it back to the bearings.

Drip pans are provided at each end under the crank disk from which the oil is led to the filter. The platforms about the machine are so arranged that any part can be reached and inspected without any danger to the attendant. The stairs are not spiral, but bend slightly and are not very steep, so that they are easily traversed. The engine frame is very strong and the outlines pleasing to the eye.

The original equipment of this station comprised three Allis engines, each direct connected to a General Electric generator; two of these are 400-kw. and one 200-kw.; the pressure is 550 volts. The switchboard has General Electric switches and Weston meters. The brush holders on these generators were designed by the chief engineer of the station and have a novel feature in the springs which press the brush against the commutator. This spring is made with

FIG. 9 GENERAL VIEW OF POWER STATION, PORTLAND R. R.

ers on a curved lever attached to the cut-off too. The mechanism is so balanced that it requires very little power and there is consequently little stress on the governor at the instant of cut-off. The entire design is so disposed that the utmost quietness in operation is secured, and in fact at a short distance from the engine, while in operation, it would be almost impossible to tell whether the parts were in motion or not. The intermediate rocker mechanism is supported by means of box brackets and girders bolted to the engine frames. The governor is so designed that a centrifugal effect combined with an inertia effect is obtained. The governing wheel is about 3 ft. in diameter and is located, as shown in the illustration, on the first gallery. The governor is extremely sensitive and rapid in its operation, and the regulation of the engine under varying loads is very satisfactory. In connection with the governor is a safety device, designed to shut off the steam in case the governor belt should break or fail to work properly. The connecting rod is so designed that by removing one bolt, it can be detached from the crank pin, and being swung to one side, the engine can be run by one cylinder if necessary. When it is found necessary to remove the connecting rod, it can be swung out sidewise through an opening in the frame.

The fly-wheel is built in eight sections, each section consisting of a piece of the rim and an arm. The rim joints are made by arrowhead steel keepers, and the arms are bolted to an octagonal box section hub by means of pads which are perpendicular to the axis of the arms. The bolting is done by through bolts, which are

two leaves, one longer than the other, pivoted at the stationary end. By taking hold of this leaf, and turning it to one side, the brush is readily removed, and a space is left free for polishing the commutator when necessary.

The two large Corliss engines have governors made by the Lombard Water-Wheel Governor Co., of Boston, and the chief engineer speaks in the most favorable manner of the results that have been obtained with them. The switchboard instruments show load variations of 600 h. p. to 800 h. p. per engine, yet the speed indicator shows that the variations of speed are extremely slight and slow. The Lombard governors completely rectified all the difficulties that had been experienced with the governors formerly used and give a speed regulation that is in every respect satisfactory.

The exhaust from each engine is led into a Reynolds condenser, located partly below the floor, as shown in the illustration. The engineer of the station is profuse in his praise of the original engine equipment of the station, and is looking for equally good results from the new unit, which starts off in a highly satisfactory manner, and during the middle of the day, is able to supply current for the entire system. The engine floor is spanned by a hand power traveling crane, which, together with the structural roof, was made by the Boston Bridge Co.

The oiling features employed, about the engines, are particularly interesting. Each of the horizontal engines has a Rochester lubricator, and, in addition to this, the engineer has provided, on the top of the main bearings a long, closed oil cup, or tank, which has

on its top, a small tell-tale balance lever, of brass, which indicates by its position the depth of oil in the cup. The oil from the engines is led by pipes in the usual manner to an oil filter, which is located in a fireproof room in the basement. No pumps are used and the engineer has designed a novel method of forcing the oil back to the engine floor. From the filter, pipes lead to a vertical cylindrical tank, about 12 in. in diameter and 10 ft. high, which was made by closing the ends of a section of steam pipe. The oil being let into this is forced up to the engine floor by means of water pressure let into the bottom of the tank direct from the city mains. When the oil has been forced out the water is drawn off and this operation creates a vacuum which causes a new supply of oil to flow into the tank from the filter, when the water is again turned on and the process repeated.

The oil pipe connections are cleaned by letting live steam through

FIG. 10—ARMATURE TRUCKS AND STAND.

them, which drives out all fiber and sediment that may have collected. In the same room, near the filter, are large oil supply tanks and facilities for cleaning and drying the waste that has been used on the machinery. The waste is first put into a hand press, and the oil pressed out. Then it is put into a tank of water, heated by steam pipes and a small quantity of soda ash added; the waste is turned about by hand and afterwards removed and placed in an adjoining horizontal, galvanized iron cylinder, having a partition through the middle, on which the waste is laid to dry, being heated by steam pipes in the lower half of the cylinder. Hinged doors are at the end of the drying cylinder. A batch of waste will dry during the night, and a quantity of this is then mixed with a small lot of clean waste and is again used. Only the best grade of white cotton waste is used. Before the drying process was instituted, one bale of waste lasted for the three engines about six weeks, now one bale lasts for eight months or more.

As an auxiliary to the condenser pumps a separate pump is provided, with condenser connections, by means of which, either fresh or salt water may be forced into the condensers, in case their own pump should fail for any cause. Water may also be let into the condensers by the pressure direct from the city mains. As an auxiliary to the boiler feed pumps, a large vertical cylinder, or tank, is provided, which is kept filled with salt water, under pressure from a weighted piston. In case the feed water supply, or pumps fail, this reserve can be utilized without any machinery to feed the boilers, as it is found that salt water can be used in the boilers for a limited period without injury. The steam equipment consists of Babcock & Wilcox boilers, and two Blake feed pumps. A damper regulator, of the Spencer type is employed. The furnaces are stoked by hand.

As stated, the power station is located on tide water, near a wharf, close to which the coal schooners have access. The coal is unloaded and delivered into large storage sheds. A mixture of soft Virginia coal and hard coal screenings is burned. The soft coal costs from \$2.75 to \$3.25 per ton and the screenings from \$1.25 to \$1.50; about 2,500 tons are used per year. The coal is delivered to the boiler room by iron wheelbarrows, and each load is weighed on a platform scales on its way to the boiler room. The fire room

is divided lengthwise by a low, slanting, plank partition. On the outside of this partition the two kinds of coal are dumped on the floor, and after being wet down with a hose, are thoroughly mixed by shoveling, and then the mixture is thrown over the partition in front of the furnace doors ready for firing. It is found that by wetting the fuel, and thoroughly mixing the two grades, better results are obtained than by burning either alone. The power house is a model of cleanliness, and this feature, together with the auxiliary devices above described, speak well for the skill and energy of the chief engineer, Mr. William E. Knowlton.

There are four car houses in different localities for storing cars, and from each of these the cars start for their first morning trips. The main house, with which is also the repair shop, is a large brick building, formerly one of the horse stables, and is located on Munjoy Hill, near the Eastern Promenade. Here the master mechanic, Mr. Charles P. Garland, makes his headquarters, visiting the other stations as occasion may require. The repair shop proper, with the exception of the blacksmith department, is located on the second floor of the building, and to this the car bodies are lifted on an elevator operated by electric power. For shifting the car bodies, after being removed from the trucks, a four-wheeled wagon truck is employed. The wheels of this truck have a wide tread, and are about 20 in. in diameter. The car body being shifted to its proper position in the paint room, it is jacked up, and supported by suitable blocking, when the truck is free for use under another car.

The repair shop has a fair complement of wood and iron working tools which are driven by power from a 15-h. p. motor. The equipment includes a 125-ton wheel press, made by the J. T. Schaffer Manufacturing Co., of Rochester, N. Y. Car body repairs of every description are made, some of the old cars are spliced into long cars, and, in the early history of the company, a number of new cars were built in the shops. The blacksmith shop is on the ground floor, and is provided with four forges, and the usual equipment of blacksmith tools. The paint shop is on the second floor, adjoining the wood department, but separated by a partition. The elevator is so placed that cars may be delivered either into the wood shop or paint shop.

Among the appliances used to facilitate the work about the shops are two armature trucks, shown in Fig. 10. One is in the form of a two-wheel, hand barrow, with the wheels about 8 in. in diameter; the side bars terminate in handles, and the cross bars provide for holding an armature, which is placed lengthwise, and

FIG. 11 SASH RACK.

supported in bearings which receive the ends of the shaft. By this means armatures are readily shifted about the shop, or they can be shipped, truck and all, on wagons, to any of the other houses. The other type of truck shown in the illustration is used at the different car houses; by it an armature can be readily picked up and shifted, without any hand lifting. This truck has an iron shaft, which forms a journal for the two 8-in. iron wheels, and also carries on its upper side two forked iron projections. By lifting the handles

the forks are tilted back, so they can be run under the ends of the shaft of an armature; then by bearing down on the handles the armature is lifted or loaded and can be wheeled easily along the floor, and deposited by reversing the process.

A lamp stand is also shown in Fig. 10; this is for holding an incandescent lamp, with its shade in position to reflect the light against the side of a car, and is designed for use by the painters when the day is dark, or when it is found necessary to work at night. These stands are made with a base, as shown, and have an extension, or jointed, stem so that the upper part, which carries the reflector, can be shifted up or down to throw the light to any height on the car, even to illuminate the upper letter board. By placing one of these stands on either side of his position, the painter can work to advantage when it is dark.

Fig. 11 shows a rack, which is used in the paint stockroom, for holding car windows after the sash have been newly varnished; the

FIG. 12 WHEEL STICK.

varnish is allowed to dry without moving the frames. The sash are first varnished on both sides, while they are supported on the stand that touches only the glass, then they are carefully lifted and placed upon the plugs, in the rack, beginning at the bottom. The corner posts of the rack have mortises at short intervals, and, in these adjustable plugs are placed, each plug being provided, at its outer end, on the upper side, with a knob or shoulder. By pulling the four plugs that are on the same level partly out, the sash can be placed upon them so that the weight is supported entirely by the glass, which rests upon the projecting ends of the plugs, leaving the frame free so that the varnish cannot be marred. Racks of different sizes are provided, as shown, and a large number of sash can thus be stored in a small space.

The plugs are from 8 to 12 in. long, and 1 x 1/2 in. in cross section. In another department there are expansion or adjustable rack boxes provided, in which all the sash from the same car can be stored by themselves in regular order and labeled, so that when wanted they can be returned to their particular car without any chance of being mixed up, or having misfits.

The painting of the cars is given special attention, the master painter being specially skilled in this branch of work. Great pains is taken in cleaning and repairing the cars for paint or varnish, and certain days are assigned for receiving and sending cars from the paint-shop. Paints and varnishes are purchased principally from the Sherwin-Williams Co., the Hildreth Varnish Co. and Pratt & Lambert, American agents of the Robert Ingraham Co. Good results are obtained by mixing American and English varnish.

Motor repairs are very light on this system, only one man being employed for winding fields and armatures. Of the cars that are run in the city proper, only two armatures have burned out, so as to require repairs, during the five years that the lines have been operated. On the Deering division, there have been a few burn-

outs, but not an excessive lot. Of the G. E. 1,200 motors, only one armature has ever burned out, including those used on the snow plows. Gear wheels and pinions are purchased for the most part from the General Electric Co. The trolley wheels are of the "Eureka" type, made by J. F. Newell, of Gardiner, Me.; these wheels have graphite bushings, having in one side a small hole, which communicates with a chamber, in the hub of the wheel containing powdered graphite which sifts through upon the bearings, increasing the lubricating effect. No oil is ever used on the trolley wheel bearings, and the life of the wheels is thus prolonged.

Among other useful appliances, is a wheel stick, illustrated in Fig. 12, which is used in directing a pair of car wheels in any direction, or steering them on to the wheel press. This stick is about four feet in length, and is provided with a shoulder on one side, in which is a bearing to fit the axle journal. The end of the stick, below the shoulder, is a trifle longer than the radius of the wheel, so that by placing the stick under the journal, and bringing it to an upright position, the end of the axle is easily lifted, freeing the wheel from the floor; then, by taking hold of the near wheel with the free hand, it can be turned, and the opposite wheel made to travel so as to swing the axle around at any angle. This device is not new in street railway practice, but it is claimed that it was originated at these shops, and was in use here more than 20 years ago. Owing to the numerous grades on the system, a good deal of trouble is experienced in the winter time from flat wheels. Until recently flat wheels were turned on a wheel grinder, but this is not now used.

The Deering division car house is three miles from the city, and is the largest one in the system. The walls are of brick; the ground dimensions are 372 x 78 ft. It is divided into two sections, by fireproof partition and doors. Each track in the front section is over a pit, giving ample room for inspection and repairs. The pits are connected under the floor, and some of the spaces are used for storing the car scrapers. This section is thoroughly warmed in winter by coils of steam pipes, which are located in a horizontal position beneath the floor sections between the pits. This provides for thoroughly drying the cars and motors during the winter season. Light repairs only are made at this house. Sometimes, however, the painting crew comes over from the repair shop, and does the necessary painting. Back of the pit department are storage tracks, and near the main building is an annex 200 x 42 ft., of wood, in which cars and snow plows are stored, there being 12 or 13 plows. Near by this car house is a sand bank, of considerable extent, which is owned by the company, and from which the supply of sand, for use on the rails, is obtained, and also gravel for ballast. Tracks with overhead wires lead directly into the sand pit, so that flat cars can be loaded and hauled to any position on the system. Sand for use on the cars is sifted, dried in the sun, and stored in large bins in a building near the car house.

ROLLING STOCK.

The car equipment includes 56 closed motor cars, 60 open motor cars, and 30 trail cars, of which 22 are open. The open cars are mostly 12-bench, and were made by the J. G. Brill Co.; they are mounted on Brill maximum traction trucks. The cars on the Cape Elizabeth line were made by the J. M. Jones Son's Co. Most of the single cars are mounted on Peckham trucks.

The snow plow equipment consists of 12 or 13 electric plows of the Brill and Taunton make. On some of the plows the nose wing has been reinforced on the top by a curved steel plate, extending 2 ft. above the wing. This was found necessary in order to overcome the deep drifts which frequently occur in this region. In the winter, as a general thing, only four-wheeled cars are operated. The motor equipment includes 154 G. E. 800 motors, 38 G. E. 1,000, 4 G. E. 1,200, 8 G. E. 52, 4 G. E. 62, and 10 W. P. 50's. The electric heaters used are of the Consolidated type. No power brakes are used, and none of the cars is equipped with fenders, but most of them have wheel guards.

The Brill cars are equipped with Brill sand boxes, and in addition to the sand boxes, which are on all the cars, in some cases an open box is carried attached to the front of the dash board, from which the motorman can distribute sand by hand on the rail when necessary. Sand is also carried, in some cases, in a bucket on the platform. Some of the sand boxes used were designed and made by W. A. Mitchell, of Saco, Me. Nearly all the cars are fitted with the Wilson trolley pole catchers furnished by the Frank Ridlon Co., of Boston, and the management speaks very highly of this device.

New Haven fare registers are used on the Cape Elizabeth line. On the lines where a multiplicity of fares are collected, the conductors carry bell punches, and register fares by punching slips of different colored pasteboard, which are suspended from clamps attached to the coat.

There are 270 trainmen, the pay of each being \$1.75 per day, or 20

FIG. 13—TUKEY'S BRIDGE.

cents an hour for extra men. The men are required to wear regular full uniform, and in winter they wear ulsters that are all alike. A number of conductors are college or university men, who work during their vacations; others are country boys, or men from neighboring cities in the state.

Besides the cars described, the company owns a fine parlor car, built by the Brill company, which is hired to private parties, as may be desired. Transfers are issued on all connecting lines, except that to Cape Elizabeth. In winter the company is required to cart the snow away from the tracks in the city and for this purpose country teams are used. For these, with one driver and a pair of horses, \$4 per day is paid, a standing arrangement being made with the owners of country teams, which report for service when-

FIG. 14—MILL CREEK.

ever there is a hard storm. The franchise of the company is for 50 years, from 1888, an extension of 25 years having been obtained at that time.

All the cars start from or pass Monument Sq. The company's office, adjoining a large waitingroom, is at the corner of Congress and Preble Sts., and as the cars arrive or depart the conductors

announce in a low tone the destination of the cars to those in waiting. Here is also the principal receiving station of the system. The different rooms of the offices are conveniently arranged and provided with all necessary appliances for the clerical force; there is also a handsome room set apart for the use of the directors.

The regular cars run at night till 11:30. A few cars are run at 2:00 a. m. and again at 4:00, to meet trains on the steam roads. Power for these night cars is generated by a small engine, which is started up for the purpose.

Portland & Yarmouth Electric Railway Co.

As mentioned in the introduction, this is a suburban line; it was opened two years ago to connect Portland with the village of Yarmouth, a distance of 13 miles. The line starts from Portland at Monument Sq. at the corner of Congress and Elm Sts. The cars go through Elm, Oxford and Washington Sts., across Tukey's drawbridge, Fig. 13, and along the main thoroughfare of East

FIG. 15—UNDERWOOD SPRING CASINO.

Deering. After passing the United States Marine Hospital, and over Martin Point Bridge, which spans the Presumpscott River, the cars speed along the Falmouth shore, through Falmouth Foreside and Cumberland to the Grand Trunk Depot in Yarmouth, passing Underwood Spring, the street railway park, which is midway on the line.

Yarmouth was formerly a prosperous ship building port, but of late not much has been done in this industry. A ride over this line is most enjoyable, for, after leaving Portland, the route is east along the shore line of Casco Bay, on high ground, giving delightful views of the sea which is dotted with the numerous wooded islands. As the cars cross, or wind about the numerous inlets, with which the shore line is notched, ever changing views are presented. There is cultivated and wild land, alternating with trees and shrubs of almost every variety. On the land side, along the entire route, are farm houses and small villages, and on the shore side are numerous hotels and cottages, the summer homes of a part of the great army of city people who seek this delightful region during the summer months.

Not only the residents of the shore cottages are patrons of this line, but also the people from the island hotels and homes are more or less frequent riders. The principal attraction for pleasure traffic, however, is Underwood Spring, some views of which are shown in Figs. 15 to 18. This is a new park opened last season, but is already a popular resort in summer and winter. It comprises a well-wooded tract, sloping abruptly to the shore. Of the native woods, pine prevails, but there are also large elm, oak and chestnut trees. Most of the area has been left wild, but walks and rambles, with rustic bridges, and shelters, have been provided. The park is on the head of an inlet and the shore line is protected by a curved wall, as shown in the illustration.

On the height is a large casino, open summer and winter, overlooking the water, with broad piazzas, dining-room, concert-hall, parlors and reception rooms. Here a specialty is made of shore dinners but the menu embraces almost all the items found in a

casino bill of fare. There is also an open air auditorium, with rustic seats, on the sloping hillside, and a stage, having a flaring sounding-board towards the audience. Here concerts and vaudeville plays are offered each afternoon and evening, the concerts during the present season being given by the Fadette Orchestra, of 18 women.

Adjoining the auditorium, on a circular bit of level ground at the foot of the bluff, is located a very fine electric fountain, Fig. 17, which plays with beautiful effects every evening during the intervals of the entertainment. This fountain was installed by the Chase-Shawmut Electric Co., of Boston, and is so designed and provided with adjustable nozzles and sprays that a wider range of effect is produced than is usually found in fountains of this character. The fountain reflects great credit upon the designer and makers. The water pressure is obtained by means of a rotary pump, operated by an electric motor, in a small building near the neighboring spring. The color screens are shifted, and the valves operated by attendants in a chamber beneath the fountain, a water proof covering being provided.

A boating pier and pavilion are leased to the owners of a steam yacht and pleasure boats, and for a moderate sum visitors can take a sail on the bay, or visit the neighboring islands. Among other improvements are rustic stairs, leading from the water up the bank in different directions, some to Japanese houses and various shelters, and others to the casino. The park takes its name from Underwood Spring, a boiling spring of abundant pure water, which pours out under the bluff to the right of the auditorium. This is said to be the purest spring water that has ever been found in the country, and it is bottled in great quantities and shipped to all neighboring cities. Below the auditorium, near the shore, the bottling establishment is located, and here the water is not only bottled in its pure state, but great quantities of ginger ale, soda water and root beer are also made.

All about the casino are beds of choice flowers, which add greatly to the attractive features, and scattered about under the trees are

there is a telephone, so that the movements of the cars can be safely directed. Most of the telephones were supplied by the Couch & Seely Co., of Boston. A few of the National company's telephones are also used. The line is built with 59 lb., 60 ft. T rails, with ground throw spring switches at the turnouts. The surface is undulating throughout the entire route, and there are some very

FIG. 17. ELECTRIC FOUNTAIN.

steep grades, one said to be about 14 per cent. In addition to the local traffic, the cars carry a great many Sunday school and other excursion parties, which come in from neighboring towns and villages, and for which special low rates are made to the park. So successful has the road been that the steamers from Portland, which formerly touched at two or three points along the route, have ceased to make landings, as the people prefer the cars. The through trip requires 65 minutes, while the park is reached from Portland in 35 minutes. The trolley wire is No. 6, and the feed wire is No. 0000; there are two feeders on the entire Portland end and on the Yarmouth end, two for about two miles from the power house, and one over the rest of the route.

The power house is located on the shore of the bay, not far from Underwood Spring, so that it is near the middle of the line; the building is an eighth of a mile from the track, and is a plain,

FIG. 16.—UNDERWOOD SPRING PARK FROM THE WATER.

lawn swings of the Fairfield type. Arc and incandescent lamps are profusely distributed, so that the scene in the vicinity of the auditorium at night is a brilliant one. The street railway tracks loop through the grounds and all the cars, from both directions, enter the park. The patronage during the present season has been very liberal, both from Portland, Yarmouth and the neighboring islands. In busy hours 20 cars are operated at one time, and on pleasant evenings, or when there is any special park attraction, as many as 3,000 people are transported in a single evening. The charge from either terminal to the park is 10 cents. This entitles the passenger to free admission to the auditorium and all the park attractions.

The road is a single track line, but the turnouts are 300 ft. in length, so that although the headway of the cars in summer is 15 minutes, by running a number of cars together per trip, the heavy park traffic is readily handled without delay, there being sufficient room on the turnouts for all the cars in the group. No signals are used at the turnouts, but at each one and also at the drawbridges

FIG. 18. RUSTIC BRIDGE, UNDERWOOD SPRING.

wooden structure, shut in by trees and woods. The coal is delivered by barges and unloaded on the shore. The boiler equipment of the station consists of 400-h. p., Babcock & Wilcox water tube boilers.

A 400-h. p. Westinghouse compound engine, direct connected to a 250-kw. Westinghouse generator, and two tandem compound

McIntosh & Seymour engines, of 250 and 200-h. p., respectively, each driving by belt a 150-kw. Westinghouse generator, constitute the engine and power equipment. The direct connected unit is operated alone or in parallel with one of the belt-driven units, the other belt-driven unit being kept idle for use in emergency. A 100-kw. generator, driven by belt from the direct connected unit, supplies the lights for the railway park. The feed water is obtained from a neighboring brook.

ROLLING STOCK.

The car equipment includes 4 double truck open cars, 12 single truck open cars, 6 single truck closed cars, 2 double truck closed cars, 1 express car and 3 snow plows. All but 3 of the 24 passenger cars were built by the J. G. Brill Co. The 8-wheel open cars are

FIG. 19—COUCH & SEELY TELEPHONE.

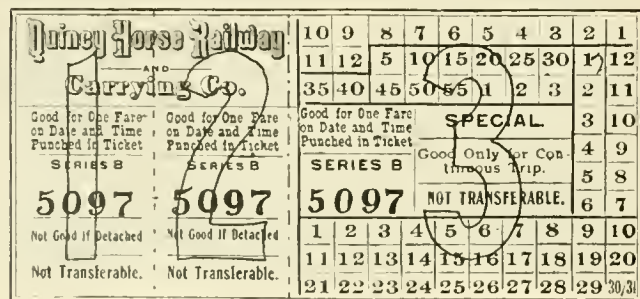

extra wide, with a seating capacity for 84 persons; each is equipped with air brakes with axle-driven compressors, and the new type of platform valves. In winter three snow plows are used, one of the rotary type, made by the Peckham Truck Co., and two of the Taunton type. The express car makes two trips daily in each direction between Portland and Yarmouth. The express business is conducted by a local express company, and the car is usually heavily loaded.

The closed cars are provided with vestibules; the 4-wheel cars seat 32 persons, and the 8-wheel cars seat 44 persons. The large open cars each have two G. E. 57 motors; all other cars have two G. E. 1,000 motors. All the cars are equipped with triple fare registers made by the New Haven Car Register Co.

The road is popular with all the regular patrons and tourists, the visitors especially being loud in their praise of the management and the politeness of the employes. From every appearance the road is a paying one, and the officers are to be congratulated.

NOVEL FORM OF TICKET.

By the courtesy of Mr. H. E. Chubbuck, manager of the Quincy Horse Railway & Carrying Co., Quincy, Ill., which, notwithstanding its name, operates an electric road, we have received samples

SPECIAL ROUND TRIP TICKET.

of a very novel and interesting form of round trip ticket with which the company is experimenting. The ticket is designed for the use of pleasure riders; it is sold for 10 cents, and permits the passenger to make a complete round trip, leaving the car at the same point he boarded it.

The original is 2 x 4 in. printed in black, with the figures 1, 2 and 3 (shown in outline in our reproduction) printed in solid red. It is divided into three parts by perforations, indicated by the dotted lines, each coupon having a serial number to correspond to the body of the ticket. The words "Date," "Month," "Hours" and "Min." are also printed in red over the proper figures, but are not shown in an engraving. The numbers 1 to 31 at the bottom of the form are for the day of the month; those from 1 to 12 at the right end for the month; those from 1 to 12 and from 5 to 55 at the top for the hour and minute.

The left hand coupon is good for transportation from the point of boarding the car to one terminus; the next coupon carries the passenger to the other terminus, and the body of the ticket is good for the return to starting point. Doubtless a passenger may continue past his proper stopping place, but even if he does the company loses nothing, because when he returns an additional fare is collected.

Mr. Chubbuck states the scheme is meeting with some considerable success.

NEW INDIANA ROAD OPENED.

On September 1st the first car was run over the new 16-mile interurban line from Terre Haute to Brazil, Ind., carrying a party of city officials and other guests. The car left Brazil at 8:30 p. m., and returned at 11:30; the first car from Terre Haute made its trip the following day. The line is to be divided into four sections, on each of which a 5-cent fare is charged; the division points between sections are different for each direction, being arranged to give patrons a satisfactory service, and at the same time provide rules easily followed by the trainmen. The sections are as follows: First from any terminus in Terre Haute to the east side of the golf links; second, from the golf links to the east side of Seeleyville; third, from Seeleyville to the east side of Williamstown, and fourth, from Williamstown to any terminal in Brazil. Westward the sections end on the west side of Williamstown, Seeleyville and the golf links. Transfers are issued from any terminal line in Terre Haute or Brazil, which are accepted on the first section of the interurban line.

EXPRESS SERVICE BETWEEN DAYTON AND CINCINNATI.

Mr. Warren Blicknell, auditor of the Southern Ohio Traction Co., advises us as follows concerning the company's plans for an express service between Cincinnati and Dayton.

For the three years preceding Sept. 1, 1900, the Wells, Fargo & Co. Express had a contract with the Cincinnati & Miami Valley Traction Co., one of the constituent companies of the Southern Ohio Traction Co., for the carrying of express matter over its line between Dayton and Hamilton. At the expiration of this contract the Southern Ohio undertook to operate its own express business over the entire line from Dayton to Cincinnati, and has been making preparations since September 1st to carry on this business. It is intended to make two round trips a day between Dayton and Cincinnati a distance of 52 miles. There will be offices in each one of the following towns through which the road runs: Dayton, West Carrolltown, Miamisburg, Franklin, Middletown, Trenton, Overpeck, Hamilton, Mt. Healthy, College Hill, Cincinnati. As soon as the business shall justify it, another car will be put on so that four round trips a day between these points can be made. The company has taken two of its regular passenger coaches, removed the seats, put in center doors and rebuilt them as much as seemed necessary for the carrying of express matter. The rates are about midway between the rates of the steam road express companies and the freight rates. The method of handling the business is identical with that of the express company.

MUST NOT GAMBLE.

The Citizens' Street Railway Co., of Detroit, does not approve of its employes playing the races, and has recently posted a bulletin reminding the boys that there is a rule to that effect. The men take the regulation in good part, and especially those who do not care to bet on horses agree that it is a good thing.

changes which have taken place and showing the veteran of today how he appeared 35 years ago. Both drawings were reproductions of pictures taken at the time. The reading matter will give an idea of the construction of previous Sunday advertisements.

The general effects of the summer's work have been good. While there is no way of estimating the returns directly due to this advertising, it is believed that the pleasure riding for the season was materially increased and that the returns were greater than the outlay. These returns are largely cumulative as the information given to one person soon finds its way to others, and is effective next year as well as this. Again, many have become familiar with places where they may find cheap land for building purposes, and thus a family is established which will be a constant source of revenue.

There has also been a marked change in the temper of the people who ride on the cars. Heretofore the street car companies, justly or unjustly, have appeared in the light of monopolists indifferent to the wishes of the public, and not caring whether they patronized the cars or not. Mr. Roach's advertising campaign has changed this for the Union Traction system so that now the public is receiving a polite invitation to use the cars of the company with the assurance of courteous treatment and the best the system affords. There has been a radical change in the general "atmosphere" surrounding the position occupied before the public by the company in the last few months and much of it may be traced directly to the spirit which invites rather than simply tolerates.

The pleasure riding business of the city runs into the thousands of dollars on Sundays during the summer months. The difference between a wet, disagreeable Sunday and one of pleasant weather and sunshine is often as high as \$20,000. That this business is worth catering to seems hardly to admit of argument and when it comes to reaching into the homes to get the people out and into the cars there seems to be no question as to the value of the daily paper. It might be said that "they come high but we must have them."

GERMAN DELIVERY OF GOODS BY STREET CARS.

The United States consul at Coburg, Germany, sends the State Department a brief account of the methods of hauling freight over the street railway lines in Gera, Frost and Spronberg. These are not large places, but industrially very active, especially in textiles. The power used on the tramways is electricity or steam; the goods are transferred at the station into smaller trucks, or the railway cars are taken over the town lines. At Frost, there are three morning and three afternoon deliveries. At Gera, perambulator cars, with flangeless wheels apart from guide wheels, have been tried with indifferent success. All these plants have been worked with a profit for several years, and though people have grumbled, the utilization of tramways for the goods traffic has points which can not be dismissed without due consideration.

DOUBLE TRUCK CARS FOR CHICAGO CITY.

The Chicago City Railway Co. has decided to put in service five double truck cars with center aisles and cross seats, seating 52 persons each. They will have window sash which drop down into the car side giving practically an open car.

It is the intention of the management to experiment with these cars and determine whether the company's patrons approve of them. Capt. McCulloch has a number of bids under consideration but the contract has not been let as yet.

SAFES INSTEAD OF RECEIVERS.

The Consolidated Traction Co., of Pittsburg, has decided to dispense with receivers at its car houses and substitute safes in which the men will make their deposits, the money being tied up in canvas bags and placed in the safe through an opening arranged somewhat as are the later type of postal letters boxes. A car will make a trip to the barns and take the receipts to the office. The advantage of the system is that but one counting and checking will be necessary and thus a smaller force can handle the work.

TORNADO AT SHEBOYGAN, WIS.

August 20th a severe storm passed over Sheboygan, Wis., doing much damage to property. The Sheboygan Light, Power & Railway Co. suffered, but not as badly as stated in the press reports. Mr. F. I. Saemann, treasurer of the company, writes us that one of the car barns was blown down and the other partly unroofed; an iron smoke stack at the power house was blown down and in fall-

POWER HOUSE AFTER THE STORM.

ing struck the pole and wires leading from the station. In addition to this only eight poles were broken and some wire torn down. A few trail cars were injured when the car barn fell. As a portion of the old material of the wrecked car barn can be used for rebuilding the total loss will probably not exceed \$1,300. Loss of revenue because of interrupted service will increase this figure to perhaps \$2,000.

The company could furnish no service whatever from Monday,

WRECKED CAR HOUSE.

the 20th, at 1 p. m. until Tuesday evening. Tuesday evening it was able to supply most of its arc and incandescent lamps and to give motor service after 6 p. m. On Wednesday the regular light and power service was restored and on Thursday the street cars were again started.

SEIZED FOR TAXES.

The Ossining Electric Railway Co., of Sing Sing, N. Y., during the last five years has shown deficits of from \$3 to \$12,000, the aggregate being \$27,745, and naturally has little money to pay taxes. Last month the tax collector for the town levied upon the company's plant and stopped the operation of the road. The cars were compelled to stop just where they happened to be and the passengers put off. The seizure took place just as the Methodist camp meeting was ready to open and was really an effort to spoil the only two weeks' good business of the year.

QUALITY OF EMPLOYES.

President Vreeland, of the Metropolitan Street Railway Co., of New York City, recently said in discussing, with a party of railroad men, the operation of his road: "A very important factor in the operation of a railroad is the quality of the men. When I came here there were only 50 men employed in running the cars who had been in the employ of the road during the preceding five years. Now there are 2,200 men who have been in the employ of the road during the past five years. Our object is to get men who will learn the business and stay with us. We don't want a man who only takes a job as motorman or conductor until he can get something else. We don't want men who simply make a convenience of us. There isn't today on this road a starter, car inspector, section foreman or superintendent who hasn't worked up from a position of motorman, driver or conductor. This has a great effect on the men. Every once in a while a young fellow comes to me who has been around trying to get a job in some store or office, and can't find anything that will pay more than \$6 a week. Well, I send him around to be examined, and if he is fit I give him a job. He has chums, perhaps, who are earning \$7 a week in offices, and they laugh at him. But he is earning \$15 a week, and can afford to be laughed at. Besides, his job is sure, and is good rain or shine. And he knows that when his turn comes, if he is efficient, he will be promoted. You should notice the number of men with stripes on their sleeves. They wear a blue stripe for every year they have been in the service up to five years. Those who have been in the employ of the road five years or more wear a gold stripe. All this shows in the operation of the road.

"The same thing is true of the construction force. We take young men into that—fellows who, because of insufficient education, have been able to earn only chance laborers' wages. In this work they get \$1.60 a day, and learn a mechanical trade in which they can find employment anywhere in the country. And they also can look for promotion."

BROOKLYN RAPID TRANSIT REPORT.

On August 18th the Brooklyn Rapid Transit Co. issued a preliminary statement of the business for the year ending June 30, 1900, showing receipts and expenses and the changes when compared with the preceding year, as follows:

	1900.	Increase.
Passengers	\$11,206,716	\$412,732
Freight, mail and express.....	61,305	24,514
Advertising	108,783	*704
Rents	167,253	26,442
Other miscellaneous incomes.....	224,493	*10,467
Totals'	\$11,768,550	\$452,517
Maintenance of way.....	\$415,729	\$ 40,782
Maintenance of equipment.....	882,183	*101,033
Operation of power plant.....	964,665	15,916
Operation of cars.....	3,551,476	*41,891
General expenses	494,530	*87,645
Damages	797,790	58,953
Taxes	736,721	100,086
Net fixed charges.....	3,398,684	*261,304
Totals	\$11,241,778	*\$276,136
Surplus	\$526,772	\$728,653
Surplus June 30, 1899.....	96,654
Total surplus, June 30, 1900.....	\$623,426

*Decrease.

The operations of the Kings County Elevated for the months of June, July and August are not here included, the company having been operated independently during that period.

The Quincy (Ill.) Horse Railway & Carrying Co., whose line is operated by electricity, is now building an extension of 2½ miles into the southern part of the city to give better access to the factory district. The track will be laid with 60-lb. T-rails in 60-ft. lengths.

ANOTHER FAKE ACCIDENT WORKER.

A man giving his name as Frank Lieblang is now under arrest at Detroit on the charge of defrauding the Detroit Citizens' Street

FRANK LIEBLANG.

Railway Co. by means of a fake accident. Lieblang is 43 years of age, a molder, and makes his home in Cleveland. The facts of the case are as follows: On August 27th J. A. Hosman fell from a car, feigned injuries, and was removed to a hospital, where the doctors made an examination and said his spine was injured. Lieblang, as Hosman's friend and representative, then effected a settlement with the company for \$200, of which he gave \$95 to Hosman. As soon as he received the money Hosman got out of bed and Lieblang was arrested, Hosman charging that the accident was a

fraud and had been planned by Lieblang.

Frank Lieblang, whose portrait we have received by courtesy of John Martin, superintendent of police, Detroit, is described as follows: Age, 43 years; height, 5 ft. 6¼ in.; weight, 170 lb.; German; stout build; hair, dark chestnut mixed with gray; mustache; eyes, slate blue; nose, prominent; marks, wreath, "Good Luck" in German above, crossed hammers, "F. L." in wreath, and clasped hands on left forearm; also, man holding flask, with "Good Luck" above, and "A Strange Molder" in German below, on right arm.

Last fall Lieblang secured a verdict for \$5,500 from the city of Cleveland for injuries alleged to have been received by falling in a manhole, and opened a summer garden. He had also effected some private settlements with the claim department of the Cleveland Electric Railway Co., and the company becoming suspicious by reason of the number of his claims detailed one of its detective force, J. A. Hosman, to investigate the matter. Hosman secured employment as a bartender in Lieblang's garden and thus describes what followed:

"I was waiting for my chance and when he had a quarrel with his wife I suggested that he start some legitimate work and travel, for he had told me of his accident business. Then he had circulars printed, making him appear as patentee and manufacturer of a portable summer screen house. We started out and went east. He had me fall from several cars and in New York I fell three times. The motormen, though, seemed to pay no attention to us and kept on going. So our scheme did not work.

"We were all through the east and at Paterson, N. J., Lieblang, who is an anarchist, donated a sum of money to the fund being raised by the anarchists there. He always spent money freely when he had it and treated me good. But we did not have a successful accident.

"He had all kinds of books in his valise, and experimented on me with belladonna. He put it in my eyes to make it appear that I was suffering from concussion of the brain. I fooled even the company's doctors with it in Cleveland, and I guess the company's doctor here (Detroit) and the hospital physicians think now that I fooled them, too. I did sprain my wrist, though, in this Detroit fall, but when they said my spine was hurt, I could hardly keep from bursting out laughing."

There is some doubt concerning Lieblang's real name. Among his papers were found naturalization papers in two names, Frank Lieblang and Charles J. Betiet, both taken out in Cleveland, the former in 1893, and the latter in 1891. He had also papers on him showing that in 1895 he was discharged under the name of John Bedit from the United States naval service. Whether these are his own papers or whether they came into his possession in some manner is unknown.

The Cleveland authorities assert that, while in the German army Lieblang shot an officer and was sent to an insane asylum, from where he escaped and came to this country.

It is also alleged that he posed as a union man during the Cleveland molders' strike and secretly made contracts with a number of firms for the importation of non-union men.

CORRESPONDENCE

HOME MADE CROSSING.

Portsmouth, O., Sept. 6, 1900.

Editor "Review": Believing that the matter may be of interest to your readers we send you a photograph of a double track crossing over four steam railroad tracks. This crossing was built complete in our own shops and without employing any additional skilled labor.

The running rails of the steam railroad, the easing rails on the outside of their regular running rails and the guard rails on the inside are all continuous from one side of the crossing to the other. The knees at the intersection of the steam railroad tracks are of especially heavy forged steel held securely by 1-in. bolts besides being reinforced with a 5-8-in. plate 4 ft. square under each rail crossing and securely riveted thereto. The street car tracks have guard rails on both sides throughout the crossing. The steam railroad tracks are each made of a different section of rail to correspond with the section in use by the road in question. The crossing is on a skew, and no two of the steam railroads have the same gage for their tracks, the gage varying from 4 ft. 8½ in. to 4 ft. 9 in.; the roads also require a different spacing of the guard rails from the running rails.

This crossing has been in use now for 60 days and is spoken of very highly by officials of all the railroads using it and especially by the patrons of the street railroad. The cars cross with sufficient momentum to carry them over the crossing in the event of any accident to trolley, power circuit or controllers. This crossing is used by over 100 steam trains every 24 hours and by the street railway with a train each way every 15 minutes. The large brick building in the background is the power station.

We feel considerable satisfaction in the fact that the crossing was made and hauled to the place and fitted so perfectly that the street railway traffic was only interrupted about nine hours, the first car crossing at 4:05 p. m., the last car having passed over the old crossing at 7 a. m.

Last fall when we laid the double track on this street we laid the high T-rail to within a uniform distance of 5 ft. of the steam railroad tracks, thinking this would be a convenient length for the arms for the new crossing, but when we came to make the survey for the crossing we discovered that the distance of our heavy rails varied from 4 ft. 11 in. to 5 ft. from the railroad

HOME-MADE CROSSING AT PORTSMOUTH, O.

rails, this being caused, we think, by the expansion and contraction of the rails during the winter; this complicated the construction of the crossing somewhat. In making the survey we had a long pole constructed in sections so as to be readily separated and laid that down on the ground marking all the gage lines of the steam railroad tracks and of the abutting rail ends of

the street car tracks. In securing the angle at which the street railroad crossed the steam railroad we stretched two fine steel wires, one parallel with the gage line of the street railroad track and the other parallel with the gage line of one of the steam railroad tracks, and made a wooden frame of seasoned white pine with arms 10 ft. long securely braced. We used this pattern in laying out all the crossings and also used the pole for all measurements so that when the crossing came on the ground there was nothing to do but put it in place and put in the bolts, excepting the cutting of the connections in the steam railroad tracks.

Yours truly, S. P. BAIRD.

Asso. Mem. Am. Soc. C. E., Supt. Portsmouth Street Railroad, Light & Power Co.

NEW YORK STREET CAR BRAKE TEST.

Editor "Review": I have read with much interest your criticism of the brake test in New York State, and think it is well-timed and to the point. I am satisfied that the commissioners desired a fair test, but, as this was the first public test of its kind, there are several details which might have been improved upon. It is a fact that none of the contestants were allowed to put their cars into service prior to the test, and we all labored under this great disadvantage. I was told that I would be allowed two days' service before the test was to take place, but, when the time came for the service test, the engineer was unable to get the permit to allow our car to go on the road, and we practically had never had an opportunity to run the car except in the limited space in the barn. This was particularly hard on our company. We did the best we could under the circumstances, knowing that we could have made a much better showing if we had been able to have used our car for a couple of days prior to the test. In our opinion, the test amounts to very little, we believing that the best way for a street car company to test the merits of a brake is to take it and use it, giving it regular daily service, and in this way only can the value of any braking device be accurately determined. Yours truly,

A CONTESTANT.

CHILDREN'S FARES.

Macon, Ga., Sept. 5, 1900.

Editor "Review": In reply to your request for confirmation of the report that this company had decided to charge fare for three-year old children in order to prevent nurse girls taking with them, when riding on the street cars, other children besides those properly in their care, I beg to say that the report is incorrect. Such a statement was printed in one of our local papers but I have no idea where the reporter got his information, as no such orders have been issued. It has always been the rule with this company, as is customary elsewhere, to charge for children over four years of age, but I never heard of a street railway company exacting fare for a three-year old child. On the contrary, I have always pursued a very liberal policy towards nurses with children and instructed my conductors not to be too exacting with them, as this class of riding is generally done at a time of day when other travel is light. And if we undertake to draw the line too closely, it is my opinion that we will lose more money by parents failing to send the children and nurses than we would gain by strictly enforcing the four-year old rule. In other words a mother may find it convenient to spend 10 cents a day to send her nurse and two or three children out for a ride, where she would not send them once a week, if the cost were 20 cents a day. Taking this view of the matter I always adopt a liberal policy towards this class of riding. Yours truly,

E. E. WINTERS.

Supt. Macon Consolidated St. R. R. Co.

BURGDORF THUN RAILWAY.

This line links together three of the main lines radiating from Berne, namely, those to Olten, to Lucerne, and to Interlaken. The

FIG. 3—EXTERIOR OF MOTOR CAR.

first of these is met at Burgdorf, the second at Konolfingen, and the third at Thun. From Burgdorf to Hasle the line runs side by side with the main line to Lucerne. At Burgdorf connection is also made with Solothurn. The distance from Burgdorf to Konolfingen is 16 miles and from Konolfingen to Thun is 9 miles, making the whole line 25 miles in length. The line is of normal gage, and carries the ordinary rolling stock of the other Swiss railways to which it is connected. It is worked entirely by electricity on the polyphase system, the power house being situated at Spiez, at a distance of five miles from Thun. A plan of the line is given in Fig. 1 and a profile in Fig. 2. From Burgdorf to Thun there are 11 trains daily, and 12 from Thun to Burgdorf. From Thun to Konolfingen there are 15 trains daily, and 14 from Konolfingen to Thun. Each train generally consists of one motor car and one trailer, together capable of seating about 100 passengers. Some of the above mentioned wires of 5 mm. in diameter to the step-down transformers situated

at intervals of two miles along the line between Thun and Burgdorf. The current is here transformed down from 16,000 volts to 750 volts, and carried from thence to the two hard copper trolley wires, 8 mm. in diameter, and to the rails forming the third wire. From the trolley wires two sliding contacts convey the current to the stator of the motors, the third connection being through the wheels of the carriages. The rotors of the motors are provided with rheostats and sliding contacts for purposes of control.

A general view of one of these cars is given in Fig. 3. Details of the construction are shown in Fig. 5. The main frame is 49 ft. long and 6 ft. 6 1/2 in. wide. The distance between the center line of the bogies is 31 ft. The wheelbase is 7 ft. 2 1/2 in. The car, when completely equipped, weighs 71,680 lb. empty, and has seating capacity for 66 passengers. Each bogie is provided with two motors, geared to the driving axle of the car. The method of suspension is shown in Fig. 7. There are 83 teeth in the spurwheel, and 28 in the

FIG. 4—LOCOMOTIVE.

pinion, giving a gear ratio of 2.96. The diameter of the driving wheel is 40 5/32 in. when new. The trailers used are of lighter construction than the motor cars, and weigh 26,880 lb. Each motor car is fitted with one of Messrs. Peyer & Favarger's tachygraphs, for recording automatically the speed of the car.

The motors are of the three-phase type, with eight poles, and designed to give 64 brake h. p. each when connected to a line having a tension of 750 volts and a frequency of 40. The speed of

FIG. 5—DETAILS OF CAR.

trains are supplementary trains, running at about 10 minutes headway.

Fig. 9 is a diagram of the electrical connections. The generators at Spiez generate current at 4,000 volts, which is transformed to 16,000 volts in the step-up transformers. The current is carried at this tension from the power house along three overhead copper

synchronism of the motor is 600 r. p. m., making the speed of the car 35.5 ft. per second, or 24.2 miles per hour, or 39 kilometers per hour. The torque curves for these motors, with different rotor resistances, are given in Fig. 17, showing the resistance per phase that has to be put in the rotor circuit to obtain any required speed. The action of the four motors is regulated by either of the two

controllers, that in the forward vestibule being the one generally used. The four stators are connected in parallel, while the four rotors are each connected to four rheostats placed under the body of the car, and electrically independent of one another. The rheostats are worked simultaneously by rods and miter gear from the controllers. The first motion of the controller connects the stators to the line and puts the full resistance in the motor circuits. The

FIG. 6—MAP OF TEST LINE.

subsequent motions gradually take out the resistances, leaving the rotors short circuited.

Automatic speed records taken with the tachygraphs mentioned are interesting. On leaving Burgdorf a sharp curve and rise of 1 in 100 reduces the acceleration, which would otherwise be uniform up to full speed, as explained above. In one case the maximum speed is 39 kilometers or 24.2 miles an hour, and is kept practically constant, the slight variations being caused by irregularities in the track, and varying curves and grades. On leaving Oberberg the record shows where the train left the level and passed on to the grade of 1 in 143, thus making the acceleration curve slightly bent

has in this case led to the adoption of such grades as largely to nullify the valuable property of polyphase motors referred to. The practical effect of the grades on the working of the line is that when the capacity of the train has to be increased beyond that afforded by one motor car and one trailer, in order to deal with a temporary increase in the traffic, a second motor car and trailer have to be added. The makers of the electrical equipment were not responsible for this.

From what has been said it might appear that the best results on a line, such as that from Burgdorf to Thun, would be obtained, if the track were absolutely level; but this is not the case, since the motors have to be able to exert an abnormal effort in order to start the train, and this effort may be utilized in mounting a grade. Thus the maximum permissible grade depends upon the effort required to start. The ability of polyphase motors to accelerate, and their economy in so doing, are thus matters of importance, and the author has therefore made a number of tests on the Burgdorf railway with a view to obtaining definite information on these points. Some of the results will be quoted here. Allowing 94 per cent as the efficiency of the gearing at full load, the actual horizontal effort of the motor cars on the Burgdorf railway, at 60 kw. input, is 3,500 lb., from which has to be deducted the axle and track resistance of the motor car itself; taking this at 15 lb. per ton of load, for both motor cars and trailers, we find that a single 32-ton motor car will get up full speed, 24.2 miles per hour, in 26 seconds. The time observed in the tests was 30 seconds. The addition of one trailer will increase the time of getting up speed to 38 seconds. Two trailers should by calculation take 51 sec-

FIG. 7—MOTOR AND SUSPENSION.

over; the same thing is shown in other places. The first part of the distance from Biglen to Gross-Hochstetten is an up grade of 1 in 40; this is followed by a short level stretch, and then by a down grade of 1 in 40. The record clearly shows the slight reduction in speed, 2 per cent, on climbing the up grade, then the return to 39 kilometers an hour on the level, and the slight increase of speed, 2 per cent, on descending the grade of 1 in 40. On leaving

onds, the test gave 57; three trailers should take 67 seconds, the test gave 71. Five trailers would take 106 seconds to get up speed. The discrepancy between calculation and test is probably due to the resistance to motion having been taken too small.

In Table 1 are given the number of trailers which can be drawn up different grades by one motor car; also the corresponding acceleration with full load on a level, and the difference of time to starting with maximum load as compared with the motor car only.

FIG. 8.

Gross-Hochstetten the acceleration curve is markedly increased when the train gets on to the grade of 1 in 40.

The grades are excessive, and have an important influence on the working of the line. The 32-ton motor cars are each equipped, as explained above, with four 64-h. p. motors. These are able, when acting together, to drive the motor car itself, and one 12-ton trailer up the maximum grade of 1 in 40. If the maximum grade on the line had not exceeded 1 per cent, four more 12-ton trailers, making five in all, might have been added when occasion required. Thus, in attempting to reduce the expense of construction by admitting steep grades, the usefulness of the electrical equipment has been seriously affected. The general impression that it makes no difference how steep the grades are on an electrically-driven line

TABLE 1.—SHOWING TIME LOST IN STARTING *Calculated*

GRADE.	Number of 12-Ton Trailers.	Total Maximum Weight.	Acceleration f.p.s. per Second	Time lost in starting. Difference between Maximum and Minimum Load.	
				One Station.	Fourteen Stations.
		tons.		seconds.	minutes.
1 in 40.....	1	44	0.92	6	1.5
1 in 62.....	3	68	0.52	20	4.5
1 in 100.....	5	92	0.33	40	6
1 in 200.....	8	128	0.17	87	20

It will be seen that as the maximum grade is reduced the maximum possible load is increased, but at the expense of a considerable increase in the time lost in starting. Thus five trailers could be hauled up a grade of 1 in 100, but 9 minutes would be lost in starting. This would probably be inadmissible, in view of the necessity of making connections with the main lines. If 5 minutes is fixed as the maximum permissible starting delay, a load variation of three trailers could be dealt with, and this would mean a maximum grade of 1 in 62. In general, the maximum permissible starting delay should be fixed first; this determines the number of trailers, and this again the maximum grade. The fewer the stops the larger will be the number of trailers, and the smaller will be the maximum grade.

In considering the application of electricity to existing railroads, the grades and station intervals are of course fixed. The average station interval in this country (England) is probably greater than that on the Burgdorf railway, which is $1\frac{3}{4}$ miles, and the grades would not be so steep. If one assumed 3 miles as the average station interval, and 1 in 100 as the maximum grade on a line 25 miles long, a motor car with an electrical equipment of 250 h. p. could haul a maximum of five trailers, or a total weight of 92 tons, with a time difference of only 5 minutes between minimum and maximum load.

On the Burgdorf railway the goods traffic is hauled by locomotives specially designed for the purpose, Fig. 4, each of

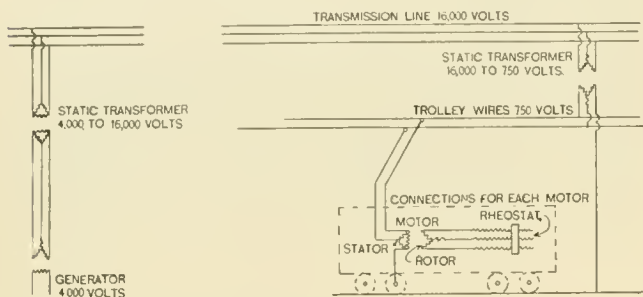

FIG. 9—DIAGRAM OF ELECTRICAL CONNECTIONS.

300 horse power; these can haul a total maximum train weight of 50 tons at full speed up the steepest grade of 1 in 40. The locomotive itself weighing nearly 30 tons, leaves only 20 tons for the weight of the train; hence it has been found necessary to reduce the speed of the locomotives by gearing, so that they can run at half speed, and draw loads of 70 tons up the steepest inclines, the total train weight then being 100 tons. A reference to Table I shows that if the steepest grade had been 1 in 100 instead of 1 in 40, as at present, the same locomotives could either carry a train of 100 tons at full speed, or a train of 200 tons at half speed. The

made during the intervals between the passing of the regular traffic, were conducted on a motor car to which trailers could be attached.

The method of conducting a test was as follows: One of the engineers of the line took charge of the controlling apparatus and acted as motorman. In the forward vestibule an assistant gave the time from a stop-watch to an observer who noted the ammeter reading at each instant. In the rear vestibule a second assistant gave the time from a stop-watch, while one observer noted the voltmeter reading, and another took the reading of a speed indicator. Two men were told off to keep a lookout and announce points passed on the track, such as grade posts, etc. The speed indicator

FIG. 10—ACCELERATION CURVES, CONTINUOUS CURRENT.

made a continuous automatic record of the speed, which was detached and numbered after each test. The motorman signalled the start, at the same moment throwing over the controller, so as to give the motors the maximum current, which was maintained constant as long as possible. The readings of all instruments were taken at five second intervals from the moment of starting, and one voltmeter reading was taken immediately before starting. Each observer recorded his own observations, and filled in those of the other observers after every test. The car was allowed to proceed for some distance after full speed had been reached, the current

FIG. 11—ACCELERATION TESTS, POLYPHASE MOTORS.

influence of the existing grades on the carrying power of the locomotives has already been found to be a serious drawback. It may, however, be questioned if it is wise to use locomotives for hauling goods on such a line, since their use means so large a percentage of dead weight. The motor cars weigh about the same as the locomotives, carry 66 passengers, and can haul 60 tons behind them up a grade of 1 in 100. Supposing the average passenger load to be one motor car and two trailers, making 56 tons, there remains 36 tons which might be made up by goods. Since there are 12 trains per day one way, the motor cars have a goods-carrying capacity of 430 tons, or six times that of the existing locomotives. It would seem, therefore, that there is much to be said in favor of combining goods and passenger traffic on such a railway.

ACCELERATION TESTS.

In September, 1899, a series of tests were carried out at Konolfingen, under the author's direction. The tests, which had to be

was then cut off, the brakes put on, and the car brought to a standstill. Three sets of experiments were made: with the motor car only, with the motor car and two trailers, with the motor car and three trailers.

The apparent power input, obtained by multiplying together the instantaneous values of the voltmeter and ammeter readings, was plotted in kilowatts as a curve, Fig. 11, on a time base, and continued up to the point at which full speed was reached, as shown by the speed indicator readings, which were plotted on the same base. The power factor for any given watt input, being independent of the rotor resistance, is the same as when the motor is running synchronously with an equal input and with short-circuited rotor, and can be found from the curve given in Fig. 16. The true watt input was thus obtained and plotted beneath the curve of apparent watt input, the area enclosed by the curve giving the energy expenditure in watt-hours up to any given time. The weight of the train being known, the number of watt-hours per ton expended in bring-

ing the train to full speed was then determined. In all the tests the experimental train started at the point shown in Fig. 6, and moved in the direction of Burgdorf, thus encountering successively a 300-meter curve, a main line crossing, and a second 250-meter curve. After starting the train ran for a distance of 1,700 ft. on a level before reaching the grade of 1 in 47.

Three sets of experiments were made with different trains, namely, one set of four tests with one motor car and three trailers, the total weight being 68 tons; one set of three tests with one motor car and two trailers, the total weight being 56 tons; one set of two tests with the motor car by itself, the total weight being 32 tons. The observations obtained in two tests out of each set have been plotted, and are given in Fig. 11. At the time the tests were being conducted the automatic regulators governing the motion of the turbines in the power-house at Spiez were being overhauled, and consequently out of action, the governing being performed by hand. The result was that the speed of the generator, and hence the frequency, varied considerably, and this was shown in a variation of the speed of the train when full speed had been reached.

The variations in the power input are due in part to irregularities in handling the controller, but the most important variation is caused by the large drop that takes place in the tension. The transformer stations are about two miles apart, and the tests were conducted on a portion of the line about midway between two stations, and therefore at a point where the drop is a maximum. The effect of the drop is shown in the diminished input and the consequent reduction of torque and acceleration at the moment of starting, resulting in an energy expenditure about 10 per cent more than would be required if the tension were kept constant. The speeds given in Fig. 11 were obtained from the indicator readings in all cases but that of Test No. 3, where they were deduced from observations made from dropping clay balls on the track at noted time intervals, and afterwards measuring up the corresponding space intervals. In Test No. 1 the motors were switched off before full speed had been reached. In Test No. 7 the trolley jumped off the overhead wire when the car struck the main crossing, causing a drop in the power input and in the acceleration.

The areas of the true power curves in Tests 3, 6, 8 and 9 have been calculated up to the point at which a speed of 23 miles per hour, or 33.6 ft. per second was reached, and the areas of the curves in Tests 8 and 9 have also been calculated up to 24 miles per hour, or 35.2 ft. per second. The results are given in Table II. The energy expended per ton of load moved increases with the number of tons per motor. The reason of this is that the energy is proportional to the time occupied, and the time increases in a greater ratio than the load. Thus if the load per motor is increased by 75 per cent, the time is increased 100 per cent, and energy per ton 14 per cent. This shows the importance of ample driving force, and the value of high initial acceleration in obtaining good efficiency. The best results were obtained in the tests with the motor car alone, and of these results the lowest energy expenditure was observed in Test No. 8, where 41.5 watt-hours per ton was the energy expended in getting up a speed of 23 miles per hour. With the motor-car and two trailers, giving a weight of 14 tons per motor, the energy expenditure rose to 52.8 watt-hours per ton. In calculating these results, the power factor has been taken rather too large, so that the actual energy expenditure is somewhat lower than the values given above.

One of the most recent continuous-current railway equipments is that installed on the South Side Elevated R. R. at Chicago. The trains on this railway are made up of motor cars operated on the Sprague multiple unit system. Each car weighs 19 tons, and is equipped with two motors making 9.5 tons per motor. The diameter of the driving wheel is 33 in.; there are 65 teeth in the spurwheel and 22 in the pinion, making the gear ratio 2.95. The tension of the line is 653 volts at the switch-board and 600 at the cars. The motors, made and installed by the General Electric Co., are rated at a maximum output of 52-h. p. at 500 volts, though in practice they are driven considerably beyond this, the maximum horizontal tractive effort actually exerted being 1,000 lb. Series-parallel control is used. To compare the weights of the cars in the two cases, we may note that each motor car on the Burgdorf Railway weighs 32 tons and carries 66 passengers, giving 1.070 lb. per passenger. Each car on the Chicago Railway weighs 18.2 tons, and has seats for 40 passengers, giving 1.020 lb. per passenger, so that there is but little difference between the two equipments in this respect.

A complete series of tests was made at Chicago on Sept. 3, 1898. The results of two of these tests, which are typical of the rest, have been inserted in Table II, while the curves are given in Fig. 10. It will be seen that the continuous-current equipment can get up a speed of 23 miles per hour with 34.7 watt hours per ton in 30 seconds, as compared with 41.5 watt-hours in 28 seconds with the three-phase equipment. Similarly, the continuous-current motors get up 24 miles per hour with 39.5 watt-hours in 37 seconds, as against 45.1 watt-hours in 30 seconds for the three-phase motors. Thus for the lower speed the continuous current motors use 84 per cent of the energy used by the three-phase motors, while for the higher speed the proportion is 87 per cent; while in the latter case the three-phase motors get up full speed in 81 per cent of the time taken by the continuous-current motors. The reduction of energy in the continuous-current motors is due to the use of the series-parallel controller, compare Fig. 13.

Comparing the maximum power input in the two cases, it will be observed that the power curves of the continuous-current equipment show a maximum of 150 kw. for two motors, or 75 kw. per motor, as against 53 kw. per motor in Test No. 8 with the three-phase equipment. In some of the tests made at Chicago the maximum input reached 90 kw. per motor, but this was because the controller was not properly handled. The large majority of the tests gave 75 kw. as the maximum power input. It thus appears that the maximum power input as obtained in actual practice with the three-phase motor is only 70 per cent of that with the continuous-current motor.

TABLE II.—ACCELERATION TESTS.

	24	24	9.5	0.96	37	75	39.5	375

The tests described above were made with the object of ascertaining the ability of polyphase motors to get up speed under ordinary conditions of railway service, and the economy obtainable in so doing when compared with that observed with the best continuous-current motors. The results of the tests go to show that polyphase motors are admirably adapted to getting up speed. A comparison of the results with those obtained with one of the best and most complete continuous-current equipments shows that there is very little difference between the two in economy of starting. The continuous-current motors have a slight advantage in the amount of energy expended, while they occupy a longer time in reaching high speeds, and require larger maximum power inputs than the polyphase motors.

THE POLYPHASE MOTOR.

The action of a polyphase motor may be likened to that of a continuous-current motor in which both the fields and the armature are capable of rotation. Supposing the fields of such a motor to be fully excited, and rotating at full speed with the armature at rest, a current of any desired magnitude may be induced in the armature by simply short-circuiting it, since the generation of a current depends simply on the relative motions of the field and the armature. The torque produced by the action of the fields on the induced current will tend to turn the armature, and if the fields be kept rotating at a uniform rate, the armature will speed up until the relative motion of the fields and the armature is sufficient to generate a current that exactly balances the load; uniform speed has then been reached. The slip, or the difference between the speed of the armature and the speed of the fields, is generally stated in per cent of the speed that would be reached if the load were nothing; that is, if the armature were rotating at the same speed as the fields. This speed is spoken of as the speed of synchronism. In a polyphase motor the rotation of the field is produced by magnetizing the fixed part, or stator, by two or more alternating currents in

such a way that the resultant magnetic field rotates at a uniform speed. In the motors used on the Burgdorf railway three alternating currents are used differing in phase by 120°. One great advantage of such a motor over the continuous-current motor is found in the absence of a commutator, for the current in the armature, or, as it is called, the rotor, can be induced by short-circuiting its coils through a simple form of slip ring, the current from the line being led directly into the stator without any moving contacts.

In a polyphase system the ratio of the current usefully employed to that generated, as measured by the power factor, depends mainly upon the width of the space between the fixed and moving parts of the motor. Hence it is of great importance to reduce the clearance to the smallest limit consistent with safety. Thus the 64-h. p. motors on the Burgdorf railway have a clearance of 1.5 millimeters on a radius, and the 150-h. p. motors have a clearance of 3 millimeters. This necessitates very careful construction, and special precautions have to be taken to prevent any chance of contact between the rotor and the stator. Some details of the 150-h. p. motors are: Speed, 600 r. p. m.; frequency, 40; number of poles, 8; tension, 750 volts; diameter of pinion, 224 mm.; diameter of gear wheel, 664 mm.; gear ratio, 1:2.96; diameter of driving wheel, 1,020 mm.; weight of motor with pinion, 1,350 kg.; weight of gear wheel, 130

off in a greater ratio, until the maximum load of 800 is reached, where the slip is about 15½ per cent. This is the breakdown load. If the load be increased beyond this the motor cannot recover itself, and is brought to a standstill. In practice, the maximum working load should not exceed 50 to 60 per cent of the breakdown load. Thus in the Burgdorf motors the maximum working load is 1.8 of the normal.

If a resistance be placed in the circuit of the rotor so as to increase the total resistance, say, to double it, the action of the motor will be represented by the curve lettered 2 in Fig. 14, in which the slip for equal torque is double what it was with the original resistance. The maximum torque is the same as before, but takes place with a slip of 31 per cent instead of 15½ per cent. Thus with any load any required speed can be obtained by merely altering the rotor resistance. The polyphase motor is therefore capable of perfect speed regulation for all loads.

The efficiency at reduced speed is, of course, less than that at full speed, on account of the heating of the rheostats. The polyphase motor herein resembles the continuous-current motor, but it is at

kg.; weight of casing, 60 kg.; weight of suspension parts, 60 kg. Some mechanical engineers consider the necessity of such a small clearance to be a fatal objection to the use of polyphase motors on railways, but experience shows that such motors can be constructed to run continuously without accident.

In a polyphase motor the speed is practically independent of the load. Thus the 64-h. p. motors on the Burgdorf railway run at full load with a slip of only 1.8 per cent. This is in marked contrast to the action of a continuous-current series-wound motor, such as is generally used on electrical railways, in which a reduction of speed of 40 per cent from no load to full load is not uncommon. Fig. 8 shows the speed variation of the Burgdorf motor compared with that of a standard continuous-current motor, firstly with constant load and varying grade; secondly, with level track and varying load. The polyphase motor maintains the speed at the expense of a corresponding amount of power, while the continuous-current motor economizes power at the expense of speed, as shown in Fig. 12.

In Fig. 14 is given the variation in speed from standstill to synchronism of a polyphase motor with different loads. Following the curve marked 1, it will be noticed that as the load increases the speed gradually decreases, until for a load of 300, for instance, the slip is 2 per cent. As the load still further increases, the speed falls

this disadvantage, in comparison, that it is not possible to couple two polyphase motors together in the way that two continuous-current motors can be coupled in the series-parallel method of control. The superiority of the continuous-current motor in this respect has, however, been somewhat overstated, seeing that it is only for speeds less than half of full speed that the motors can be put in series. This point is illustrated by Fig. 13, which gives the comparative efficiency at equal load and different speeds of a polyphase and continuous-current equipment. For heavier loads the advantage of the latter would be reduced.

The speed curve No. 1, in Fig. 14, is reproduced in Fig. 15, and continued in order to show the action of a polyphase motor when driven above synchronism, as, for instance, when a train is descending a grade. It will be seen that as the speed increases above synchronism a negative torque is applied, and the motor acts as a generator, returning current into the line, and thereby retarding the motion precisely as if mechanical brakes were being applied. The maximum torque that can be thus applied is greater than its breakdown torque as a motor, but the slip of the maximum torque is the same. This is a feature of great importance, for not only does the polyphase motor act as an efficient brake in descending a grade, but the energy of the descent is returned into the line and is available for driving other trains. Thus, on the Engelberg railway,

which is a mountain railway worked by polyphase motors, the trains descend a 25 per cent rack grade held only by the brake action of the motors, which keeps the speed at 4 per cent above synchronism; part of the current delivered into the line drives another train up a 5 per cent grade, the remainder being used up in a rheostat.

From Fig. 14 it will be seen that there is a certain rotor resistance corresponding to standstill with maximum torque, in this case 25 times as much as the resistance of the rotor itself. If the rotor resistance has this value at the moment when the motor is connected to the line it will start with its maximum torque. If the resistance is taken out of the circuit as the motor speeds up, the torque can be maintained constant and equal to the maximum starting value up to full speed for that load. In other words, the torque and therefore the acceleration can be maintained constant practically up to full speed. It follows that the speed curve of a train driven by polyphase motors shows uniform acceleration up to full speed.

DETAILS OF BURGDORF-THUN MOTORS.

The stator winding of the motors used on the Burgdorf-Thun line consists of 51 turns per phase, and is connected up in mesh. When hot, the short-circuited resistance of the winding per phase is 0.71 ohm. The rotor winding consists of eight turns per phase, and is connected up in star, the short-circuited resistance per phase being 0.0135 ohm, hot. The characteristic features of the motors are well shown by the curves given in Fig. 16. These were obtained by brake tests made with motors of the same type as those used on the Burgdorf railway, and differing from them only in the width of the clearance, which was 1.25 millimeters, as compared with 1.50 millimeters in the Burgdorf railway motors. Owing to the low internal resistance, the speed is very uniform, the slip at full load being only 1.8 per cent. For the same reason the efficiency at full load is high, namely, 92 per cent.

The large value of the apparent watts at no load indicates a large magnetizing current, amounting to 24 amperes, or 28 per cent of full load current. The good efficiency at full load, however, shows that the wattless component is a more important element in the magnetizing current than the hysteresis component; in other words, that the predominant factor in accounting for the large no-load current is the width of the clearance. This is further evidenced by the rapid rise of the efficiency curve, giving relatively good efficiencies at light loads. The large wattless component also influences the form of the power factor curve, making it rise very slowly at first, and reach its maximum at about full load. The wider clearance in the Burgdorf motors will, of course, influence the form of the power factor curve, lowering it throughout its length. Hence the values of the true watts obtained by taking the power factors given in the curve sheet will be too high. This must be borne in mind when the results of the tests are considered.

COASTING TESTS.

The data for some coasting tests are given in Table III. A single motor car was brought up to speed and allowed to coast with current cut-off before applying the brakes.

TABLE III. COASTING TESTS ON THE BURGDORF RAILWAY. ONE MOTOR CAR OF 32 TONS.

CHICAGO GENERAL RY. TO BE REORGANIZED.

The stockholders of the Chicago General Railway Co. are endeavoring to arrange for a reorganization of the company, so as to avoid a sale under the receivership. Messrs. Joseph P. Mahoney, W. A. Goodman and Charles L. Bonney constitute a stockholders' committee and Messrs. J. P. Black, L. M. Paine and N. D. Lawton, a bondholders' committee. It is hoped that an amicable settlement with all parties can be effected.

GOLDSCHMIDT WELDING PROCESS.

The process of welding invented by Dr. Hans Goldschmidt, of Essen, Germany, is now attracting much attention by reason of the success that has attended its practical application in the welding of rail joints and pipes. More properly Dr. Goldschmidt's invention consists in the production of high temperatures by the ignition of a mixture of iron oxide and powdered aluminum, and welding is only one of the many applications. The iron oxide and aluminum are placed in a crucible and some more easily ignited substance added which is lighted by means of a match. The resulting chemical action renders the mixture liquid; a liquid corundum appears at the surface and a metal residue forms in the bottom of the crucible. The surfaces to be welded are cleaned and then two pieces are placed in a suitable clamp by means of which they can be pressed together; a sheet iron mold is then placed about the joint and the contents of the crucible poured into it.

The corundum solidifies at a temperature above that necessary for welding, and both the iron and the mold are protected by a film of the corundum forming on them before the heated metal from the crucible reaches them. After the joint has cooled the welding material can be easily knocked off with a hammer.

Papers and lectures descriptive of the process have been presented before the Saxon Association of Engineers at Leipzig and before the Association of German Engineers at Kiel. Tubes and rails were welded in the presence of the audience. The street railways in Essen and in Braunschweig have used the process for welding rail joints with success and it is to be tried at Berlin, Dresden and Hanover.

PRIVATE RIGHT OF WAY FOR SOUTHERN OHIO.

The street railway men of Cleveland are firm in the belief that a private right of way is most desirable for suburban and interurban electric lines. The advantages are that franchise questions are not so serious, better speed can be made because there is less interference by the other traffic, there is greater freedom from accident for the same reason, and undesirable curves and grades can in many cases be avoided if the highways be not followed. The expense is generally a minor item since if properly approached the owners of abutting property will usually donate a right of way or lease on nominal terms.

Mr. Will Christy, of Akron, president of the Southern Ohio Traction Co., states that the company is contemplating securing a private right of way for the Dayton end of its line.

UNION STREET RAILWAY AT ST. LOUIS.

August 10th, the Labor Union Street Railway Co., of St. Louis, was incorporated. The capital stock is \$5,000 and the officers: President, Thomas B. Edwards; vice-president, Simeon O. Collins; secretary, William D. Benson; treasurer, John A. Root, all prominent in the management of the late strike on the Transit lines. It is proposed that the company pay a percentage of its earnings to the city, that percentage of the earnings during the year 1902 shall be contributed to the world's fair fund, that the franchise shall contain an arbitration clause, that the city shall have the right to purchase the road and that the company be prohibited from consolidating with any other road. The stock is to be floated among the trades unions of St. Louis, Chicago, New York and other cities.

A RATE WAR.

It is announced that the Pontiac, Oxford & Northern R. R., a steam line, has made a traffic agreement with the Detroit & Pontiac Railway Co., an electric road, whereby commutation tickets will be sold at 50 cents one way from Detroit to Oxford. This is the result of the Detroit, Rochester, Romeo & Lake Orion Ry., another electric line, cutting into the business of the steam road. The fare by this route is 57 cents.

A severe wind-storm at Bridgeton, N. J., last month tore down so many of the street railway trolley wires that traffic had to be entirely suspended until repairs could be made.

TRAMWAY CONDITIONS AND OUTLOOK IN ENGLAND.

From report of Marshall Halstead, U. S. Consul at Birmingham.

In tramway matters, when a city corporation builds tramway lines, it simply takes to itself a business in which experience everywhere has shown there is an assured profit. It debars the capitalist from a voice in the management, but, as it must borrow the money necessary, invites him to advance the money, relieving him from all financial risk; so after all it really is not municipal ownership, but municipal leadership.

The Daily Express is responsible for the statement that electric street cars (the first in London proper) will probably be "erected" under the recommendation of the tram committee at a cost of £132,000 (\$642,378) on the Victoria embankment of the Thames from Blackfriars Bridge to new Battersea Bridge via Victoria St. and Buckingham Palace Road. Possibly also the county council will demand that the machinery, rails, trolley wires, cars, etc., be all of British manufacture. Some other British cities have done so.

For the construction of other new tramways of a length of 16½ miles, in the territory on the north side of the Thames, and for 12 miles on the south side, the council will be asked to sanction the expenditure, respectively, on the north of £469,700 (\$2,285,795.05) for works and £544,306 (\$2,649,127.94) for street widenings; on the south, of £374,500 (\$1,822,504.25) for construction and £449,000 (\$2,185,058.50) for street widenings.

It should be noticed that for these two tramways, the immediate use of electric power is not contemplated and the horse power will suffice; but, as pointed out by the Express, "the estimates provide for rails of sufficient weight to permit of their being used for electric traction when that system shall have been adopted by the council's tramways."

The electric street car or tramway situation here is an extremely interesting one at present, for there is an awakening in such things. If my information be correct, there are not in the whole of this great United Kingdom more than 300 miles of electric street railway in operation, not 300 more in course of construction, and hardly this amount in addition authorized for construction by cities and private companies combined. In other words, forty millions of people, restless, given to trade, with fair enough wages, have not in reality nor in immediate prospect 800 miles of electric railroad, urban, suburban, and cross-country combined.

To illustrate the situation, I give as follows the substance of an argumentative pamphlet recently published by the British Electric Traction Co., and select sentences and paragraphs from some tramway newspaper clippings I have on hand:

In these days of keen commercial competition between the nations of the world, a nation which wishes to keep in the forefront of progress can not afford to neglect any opportunity for improving its means of communication. England owes much to its splendid network of railways; but unless this is soon supplemented by an equally up-to-date network of light railways and tramways, other nations will gain upon us and pass us. Every day our big towns grow bigger, and the suburbs of the one town stretch out farther and farther towards the suburbs of the next, until in some parts of England, such as the far-famed "Black Country," a whole district threatens to become one huge forest of factories and houses. Wherever such a state of things as this obtains, it is obvious that some cheap and handy means of rapidly conveying the workman to and from his work is absolutely essential to the welfare and continued progress of the community.

What is that "Black Country" of which people talk so much and know so little? It is simply a vast industrial center lying between Wolverhampton and Birmingham, having a total area of some 80 square miles and a population of over 1,000,000. In this area, towns of ten thousand inhabitants are "as plentiful as blackberries in September," and towns of twenty, thirty, forty, and even sixty thousand inhabitants are also to be found, not to mention Birmingham with its round 500,000 and Wolverhampton with over 80,000 inhabitants. In addition to its varied manufactures and teeming population, South Staffordshire possesses vast mineral wealth; it is, in short, a district of unsurpassed industrial importance. Here, if anywhere in this busy old country of ours, one would naturally expect to find an up-to-date, progressive organization for supplying the artisan

and mining population with a means of rapidly and cheaply and conveniently going about its daily work.

But what do we find? An altogether inadequate tramway service—we will not so misuse the English language as to call it a tramway "system"—having a total (route) mileage of only 54 miles, rejoicing in two different gages, worked by three different methods, and owned by no less than five separate companies.

It may be asked, if one uniform, up-to-date system of tramways all over the Black Country would prove such a great boon, why did not the existing concerns combine? The answer is a simple one—the law prevented them. All tramways in England and Scotland are subject to the provisions of the tramways act, 1870. Under section 43 of this act, any local authority may purchase the tramways within its area at the end of 21 years, the price being "the then value" of the undertaking. This "then value" is simply the market value of the old rails and stock, and has been called "the old-iron price."

The result of this is twofold. Since even under the act of 1870 one can not force people to invest their savings in tramways, general tramway development in England has been greatly retarded for want of capital. Then, if a tramway company does manage to get enough money to make a start with, it finds it more and more difficult, as time goes on and the day of municipal purchase approaches, to induce investors to supply the necessary cash for any improvement, such as electric traction, for instance. This is very natural; who would pay a shilling for a pipe, if he had to sell it the next moment to a policeman for twopence? Since the law obliges a tramway company to sell its undertaking at the value of old iron, the tramway company naturally arranges matters so that at the end of 21 years it shall have nothing but old iron to sell.

The British Electric Traction Co., having made arrangements with all the existing tramway companies, comes before the local authorities with the following proposition: "We are willing to combine all the tramways in the Black Country into one great system, to be worked by electricity in the most modern and improved manner, if only the local authorities will postpone for a few years their right to buy the tramways at the price of old iron." The authorities can not agree, and this causes all the delay.

When the London County Council took over some of the tram lines last year, it at once set about making inquiries for possible improvements. It soon saw that the horse tram car is today as much an anachronism as flint and steel would be. * * * The uncomfortable and crawling cars are to give way to a host of palaces on wheels, furnished in princely fashion, lit like the halls of the sun, gliding swiftly through the streets with a quick, easy motion. To travel in them will be rest and recreation.* * * The change is going to revolutionize London. Months ago the Prince of Wales, with singular prescience, declared that the one way to solve the great slum problem was to make it easy and cheap for the poor to reach the suburbs. When the workman can get from Finsbury Park to Piccadilly in 20 minutes for a penny fare, he will no longer box himself in a fetid city slum. The health of London will improve, for the country will be at almost every man's door, so easy will it be for him to get there.

Much of the success or failure of the coming change will depend on the form of electric traction the London County Council adopts. There are dozens of methods of superseding horse traffic. Gas cars, oil cars, compressed air cars may have their advocates; but they are not yet sufficiently developed to demand serious consideration. * * * The choice of the London County Council is for all practical purposes limited to one of two systems—the conduit (underground trolley) or the trolley. * * * One of the objections continually raised against the trolley system is that overhead wires and the standards necessary to support them disfigure the streets. It is admittedly a cheap system, easily constructed, simple and adaptable, and involving very little disturbance of the roadways. The conduit system does away with the overhead wires, and in actual working conduit and trolley cost about the same to maintain; but the conduit is exceedingly expensive to construct. It involves considerable disturbance of the streets, and is more or less liable to stoppage from floods in certain districts. * * * In London, especially in the older districts, great lines of pipes cross the streets in every direction. These would all have to be cleared so as to go below, the conduit involving an entire relaying of water mains and gas mains throughout the districts.

A LARGE CONVERTIBLE CAR.

The accompanying engravings show two views of a double truck, 12-bench Brill convertible car which is one of a number recently built for the New Castle Traction Co., of New Castle, Pa., by the J. G. Brill Co., and is the largest of the kind yet made. The idea of the convertible car is receiving a great deal of attention from street railway men at the present time. The patrons of the street cars are everywhere, even in our northern cities, clamoring for an open car during the warmer weather. They are equally anxious

single equipment which could at all times give the railway manager the car he most needs at any time. Furthermore it provides a car which is entirely self contained and is at all times ready to be changed from one type to the other without going to the shops or car barns and without further labor than that which can be given by the motorman and conductor in a few minutes. With an equipment of this character the storage capacity of the car barns is reduced practically one half, with a corresponding diminution in the sizes of buildings, the quantity of land required, attendance necessary and the capital invested.

FIG. 1—BRILL CONVERTIBLE CAR, OPEN.

to have these cars taken off whenever a cold wave interrupts the pleasant weather and they object very rightly to the use of them during chilly weather, late in the fall or early in the spring, yet throughout the year even in winter there are days when the use of such cars materially increase the traffic of a street railroad. The boards of health in some cities where open cars are extensively used have found it necessary to interfere and demand that a certain proportion of closed cars be run the whole year round. The railway manager at the present time is confronted with the problem of a double equipment, half of which only can be used at any one time. This, of course, means double storage capacity with all the

How perfectly the Brill car has answered the requirements can be judged from the engravings and from the accompanying description. Fig. 1 shows the car open for summer use. It is in all respects a standard cross-seat, center aisle open car. From a layman's point of view it is identical with the usual type. The expert notices perhaps the panels in the corner and certain minor details of construction, as the form of grab handles and positions of the panels. Fig. 2 shows the car closed, and the steps folded up ready for winter use. It is practically a standard box car on double trucks. It is true there is a folding step, and grab handles are at each window post, but the arrangement of the windows and panels

FIG. 2—BRILL CONVERTIBLE CAR, CLOSED.

attendant expenses, and it also means if the public is to be thoroughly accommodated the storage houses shall be arranged in such a manner as to make it possible to change from one to the other kind of car at the shortest possible notice. Actual practice only succeeds in using a double equipment and keeping the open car in service as long as possible. It is put on weeks before the proper time in the spring in order to take advantage of any stray warm days which might occur and it is kept on in the fall a month longer than is comfortable for the majority of the traveling public.

The aim in designing the Brill convertible car was to make a

is similar to that of the ordinary car. With the exception that the windows raise instead of drop, the car is as far as passengers are concerned the same in operation and arrangement as a closed car. The curtains operate in the same way; when closed they come to the window rail, when open they come all the way to the floor. These New Castle cars have 24 benches and seat 46 persons, one of the stationary seats at each end of the car accommodating one person only. The open car has the Brill round corner seat end panels which give great ease of entrance from the sides.

The cross seat car is being looked upon with more and more

favor by street railway men and several large companies are ordering them extensively. The idea is that there is a profit in carrying seated passengers and that people when seated are more comfortable if they face in the direction in which they are moving.

The following are the principal dimensions and details of these cars: Length over end panels 30 ft. 8 in.; length of platform 4 ft.; length over dasher 38 ft. 8 in.; width at the sills 6 ft. 8 $\frac{3}{4}$ in.; width over posts 7 ft. 5 $\frac{1}{2}$ in.; extreme width of the car when the steps are down, 8 ft. 8 in.; extreme width with steps raised, 7 ft. 8 in.; height of the platform steps above rail, 14 in.; riser of step, 13 in. The long step or running board is 19 in. from the track and 15 $\frac{1}{2}$ in. from the step to the floor of the car. The width of the car inside at the center is 8 ft. 2 $\frac{1}{2}$ in., and the body is 9 ft. 3 $\frac{1}{2}$ in. from the bottom of the sill over the trolley board. These cars are mounted on maximum traction trucks with driving wheels 33 in. in diameter, 2-in. tread and $\frac{5}{8}$ -in. flange. They are fitted with electric brakes, Brill angle iron buffers, Brill portable vestibule, radial draw-bars, two sand boxes and two Dedenda gongs. The General Electric Co. furnished cables, controllers and resistance. The side panels are of the new type having metal on both sides of the slats making a very warm car side, and being flexible fill the grooves completely. The interior of the car is so nearly identical with those ordinarily used that even an experienced railway man would not be likely to note anything unusual in the construction. The center of the car perhaps appears a little more lofty than usual, but the ventilators and monitor deck are the same. The construction of the roof is such as to give unusual stiffness and strength. The letter board and panels are made from a single piece which is halved upon the posts and carlines. The necessary interior furring strips also anchor each of the carlines, while the carlines being wider than usual at the foot and made up as part of the posts are much stronger than those of any ordinary car. This design has been in use long enough to have its weak points made apparent and corrected. Cars of this type have been in a number of accidents which have demonstrated their unusual strength and there is every reason to suppose that they will be as durable as the ordinary box car.

THE INIDIKIL SYSTEM.

Mr. A. Lincoln Hyde, of Cleveland, has developed a decimal system based on the inch instead of the meter, which he urges is much superior to both the metric and English systems of measurement. One inch is called an in, 10 inches an id, 100 inches an ik, and 1,000 inches an il. Similarly the squares of these for dimensions are respectively a sqin, a sqid, a sqik, and a sqil, while the cubes are to be known respectively as cubin, cubid, cubik, and cubil. The weight of one cubic inch of water is one an, 10 cubic inches one ad, 100 cubic inches one ak, 1,000 cubic inches one al. The unit of work is the in-al, which is equivalent to 36.1 inch-pounds, or the id-al, which is equivalent to 36.084 foot-pounds. As a substitute for the horse-power, 1,000 id-al per minute is suggested. A new heat unit based on the Centigrade thermometer would be equal to 1,668 id-al.

Mr. Hyde's paper which was read before the Civil Engineers Club of Cleveland, and published in "Journal of the Association of Engineering Societies" for July, is very interesting, but we doubt if the "Inidikil" system will be generally adopted. There are two objections to the metric system, first, that the units of length are not convenient, the meter being too large and the centimeter or millimeter too small, and, second, that it is a decimal system. Mr. Hyde's only objections to the metric system are that there are too many names and that the names are too cumbersome. The only argument he advances in favor of a decimal system is the following paragraph: "The advantage of a decimal system are too well known to require demonstration. A mental comparison of the monetary systems of Great Britain and the United States is sufficient to convince the average mind." This may be quite true as regards the average American mind, but the average British mind will hardly be convinced by so simple a process. One has but to look at the market reports to see that the decimal system is not used for all purposes of accounting even in the United States.

The author pokes fun at the imposing list of numbers representing the ratios of various English units to each other, which is as follows: 2, 3, 4, 5.5, 6, 7.92, 8, 9, 12, 14, 16, 16.5, 20, 22, 24, 24.75, 27, 28, 36, 40, 66, 80, 100, 112, 120, 128, 144, 160, 231, 437.5, 480,

1728, 2150.42, etc. It has been remarked by an advocate who held a brief for the other side of this question, that, if the number 10 is such a superior radix, it is very odd indeed that neither 10 nor any multiple of 10 that cannot be halved and quartered, appears in the list.

If surveyors find it more convenient to divide the foot into hundredths and thousandths, or if machinists for some purposes prefer to have the inch decimally divided, well and good, but that is no reason for forcing the decimal system on other users of weights and measures who do not find it convenient. Dr. Coleman Sellers, after long experience, is of the opinion that the decimal system is not a convenient one for shop sizes nor in the drafting room for making drawings to scale, which are two serious disadvantages.

ROCHESTER & SODUS BAY LINE OPENED.

"The Four Corners," which our readers will remember is the weekly paper published by the Rochester (N. Y.) Railway Co., in its issue of August 24th describes the formal opening on August 22d of the Rochester & Sodus Bay R. R., a 40-mile line from Rochester to Sodus Bay on Lake Ontario. This is known as the Royal Blue line.

The line was christened about 9 a. m. on the 22d when Illustrious Potentate George Loder of Damascus Temple of Mystic Shriners broke a bottle of champagne over the fender of the first one of the seven cars that carried the party over the line. The progress is described as a streak of enthusiasm; stops were made at all stations to give the people opportunity to tender their congratulations.

At Sodus Bay the excursionists had a genuine clambake in Margheretta Grove. The return trip was made in two hours and a half. On board the private car of the Rochester Ry. were Mr. T. J. Nicholl, president of the Rochester & Sodus Bay and vice-president and general manager of the Rochester Ry., and other officers of the companies and invited guests.

DULUTH-SUPERIOR TRACTION CO.

It was officially announced August 14th that the Duluth-Superior Traction Co., a Connecticut corporation, had been organized to take over the property of the Duluth (Minn.) Street Railway Co. and the West Superior (Wis.) Rapid Transit Railway Co. The new company was organized by Thomas Lowry, president of the Twin City Rapid Transit Co., of Minneapolis, and its president is C. G. Goodrich, vice-president and secretary of the Twin City. L. Mendenhall, receiver and president of the Duluth road, and S. T. Norvell, receiver and president of the West Superior company, will both have places in the directory of the new company. H. S. Warren, general manager of the old Duluth line, is general manager of the combined system. Mr. Lowry states that half a million dollars will be spent on improvements.

FAVORABLE DECISION AT SEATTLE.

On March 9th, last, the Seattle Electric Co., of Seattle, Wash., was granted franchises which would enable it to undertake extensive improvements and make a single system out of the various properties operated by it. Legal proceedings were at once begun, however, by taxpayers and the work has been stopped ever since. On August 20th the Supreme Court reversed an order for a temporary injunction granted by the lower court. It had been claimed that the council had violated the city charter in passing the ordinance. If no rehearing is asked the company hopes to begin work this fall. It will require a year to complete the new work.

The Lafayette (Ind.) street railway was turned over to a number of young women on August 9th, in the interest of St. Elizabeth's hospital.

The Chicago & Milwaukee Electric Ry. and the Chicago, Milwaukee & St. Paul have made an agreement for selling books of 10 tickets for \$1, good between Wilson Ave., the terminus of the Northwestern Elevated, and Waukegan. This gives a 15-cent fare from the city to Waukegan.

SOME DENVER CARS.

The Denver City Tramway Co. has recently built in its shops two 40-ft. flat cars for hauling supplies. It was the intention to use with these cars some McGuire maximum traction trucks forming part of the old equipment, but as these made the car higher than was

FIG. 1.

desired, the trucks were cut down and two pairs of the pony wheels used with each truck. One of these cars is shown in Fig. 1.

Fig. 2 is from a photograph of one of the combination cars which has been changed from the type formerly in use. The roof has been changed from "Bombay" to monitor deck to permit the use of a sign in the end deck light; the left hand step along the open portion

FIG. 2.

has been removed and rails permanently attached on that side (this car operates on a line with loops at the termini). At the front end are seen the canvas curtains used for closing the sides of the front platform in lieu of a complete vestibule. The curtains are provided with small glass windows. The practice of placing screens on the sides between the trucks of double truck cars has been abandoned.

DETERIORATION OF STEEL RAILS.

In May, 1896, the British Board of Trade appointed a committee "to inquire what extent of loss of strength in steel rails is produced by their prolonged use on railways under varying conditions, and what steps can be taken to prevent the risk of accidents through such loss of strength." The immediate reason of the inquiry was the collapse of two steel rails on the Great Northern Ry. at St. Neots, Dec. 24, 1895, causing an accident in which two persons were killed and many others seriously injured. One of these rails broke in 17 pieces, none longer than 22 in.

The committee, which comprised Lord Blythswood, Sir Benjamin Baker, Sir I. Lowthian Bell, Prof. Wyndham Dunstan, Prof. A. B. W. Kennedy, Major Marindin, Mr. E. P. Martin, Prof. W. C. Roberts-Austen, Dr. E. T. Thorpe, Prof. W. C. Unwin and Mr. E. Windsor Richards, has only recently completed its report. The report proper is very brief, but the members add lengthy subsidiary reports in an appendix. Professor Unwin reported on mechanical tests, Dr. Thorpe on chemical tests, Sir W. Roberts-Austen on photomicrographic examination, and Professor Dunstan on atmospheric corrosion tests.

The conclusions drawn from the chemical evidence by Sir W. Roberts-Austen and Dr. Thorpe are:

(a) The evidence before the committee indicates what the limiting proportions of carbon, sulphur, phosphorus, manganese and silicon should be. As regards the influence of phosphorus, it is pointed out that, in a broad sense, brittleness of steel does not depend on the total amount of phosphorus present, as that element may exist in steel in at least two different forms, one of which is comparatively innocuous; (b) it is very important that all who are responsible for the manufacture or use of steel rails should realize that steel is not the homogeneous mass it is often supposed to be, but possesses a complex structure. The nature of this structure will vary greatly with the mechanical and thermal treatment to which the metal has been subjected. The durability of the rail depends in no small measure on its structure, which may, if the specimens of steel have been suitably prepared, be revealed by the microscope. The peculiar structure of the St. Neots rail, for instance, can be exactly imitated.

The mechanical evidence was reported upon by Professor Unwin, Sir Benjamin Baker and Professor Kennedy. Their conclusions are as follows: (a) The preponderance of fractures near the ends of rails seems to show that the greater straining action due to discontinuity at the joint is a contributing cause of fracture; and this can be remedied by adopting rails of sufficient strength with webs of ample thickness and secure types of fastening, and by care that no looseness arises in service. (b) The fact that worn rails are improved in strength and ductility by annealing proves that part of the deterioration of rails in service is of the nature of what is sometimes termed "fatigue." (c) It appears certain that in some cases fractures of rails have been due to fissures formed during service. How far the minute transverse fissures, very often noticed in the running surface of old rails, give rise to these larger induced flaws requires further investigation. It is not likely that they usually spread into the substance of the rail, because they are common in old rails, and fractures would be more frequent than they are if that were the case. Also, the evidence as to the existence of visible flaws or defects in the fractured surface of rails is very conflicting. In some cases, undoubtedly, the combined effects of the weakening of a rail by wear and corrosion, possibly also increased straining action from defective packing of sleepers, and the presence of a flaw or fissure of not inconsiderable size have led to fracture of the rail. That such defects appear most commonly in the head of the rail is evidence to a certain extent that they are induced by the hammer hardening of the top surface. (d) It is very desirable that the mechanical tests to which rails are subjected should be, as far as possible, standardized in connection with (1) the weight; (2) the section; and (3) the chemical composition of the rail. With these conclusions the committee agree, and as regards chemical composition they do not think it desirable to insist upon too high a proportion of carbon, manganese or silicon in the steel, having regard to the ordinary contingencies of manufacture, and the greater susceptibility of high carbon steel to thermal influences.

Messrs. Richards and Martin recommend that, exclusive of iron, rails shall have the following ranges of composition in percentages:

	Minimum.	Maximum.
Carbon35	to .50
Silicon05	to .10
Sulphur04	to .08
Phosphorus00	to .08
Manganese75	to 1.00

ST. LOUIS DYNAMITERS IN CUSTODY.

Maurice Brennan and Fred Northway have been identified by employes of the St. Louis Transit Co. as men who placed explosives under the cars. They both claim to be members of the street railway union and expect assistance from that organization, though it declares the men were not in good standing in the union.

It is stated that enough is known at police headquarters to justify the statement that the dynamiting of cars of the Transit company has been done by members of a regularly organized committee, under plans formulated by councils held at fixed places by persons inimical to the company.

TELEPHONES ON INTERURBAN ROADS.

On interurban roads operating a number of cars it will at times be desirable to give orders to the crews while they are on the line, and it may be at the far end of the line. By placing a telephone system on such roads, delays to trains and other annoyances can be reduced to a minimum and the operation is rendered more secure against accidents.

Take for example a north and south road having three regular and four intermediate passing points. This would require nine instruments, exclusive of the one at the office, one at each turnout and one at each terminus. Starting at the north end, say, and number the termini and regular passing switches 1, 3, 5, 7, 9, and the intermediate switches 2, 4, 6, 8. Have a rule that crews are to report by telephone at odd-numbered stations. Now if car No. 1, leaving the north terminus on time and due to meet car No. 2 at switch 3 in 15 minutes, should arrive on time, and No. 2 fail to arrive at switch 3 or report from switch 4, the crew of No. 1 can be ordered to proceed and meet No. 2 at switch 4. In this way only one car is delayed. Of course it is necessary for the crew of No. 1 to keep a sharp look-out when proceeding from switch 3, the regular passing

THE DISPATCHER'S BOARD.

point, to switch 4 as the accident to car No. 2 may have occurred in this section.

For roads operating four or more cars, a regular train dispatcher will more than save his salary in preventing delays and the repairs necessary from "cars bumping up on one another" on account of being off time.

For enabling persons connected with the road to locate the cars at all times a dispatcher's board can be arranged in a simple manner. A convenient plan is to place the switch numbers along the left hand edge and the car numbers along the top edge; under each car number are two columns, one marked "North" and one "South" indicating the direction they are running. Holes are bored to receive suitable plugs representing the cars. When car No. 1 leaves the northern terminus it is ordered to pass car No. 2 at switch 3, (No. 2 having left switch 5 with orders to meet No. 1 at switch 3); one plug inserted at the hole marked a in the diagram and another at hole marked b serve to locate the cars at the points where they will be next heard from.

Specials and work trains can be just as easily located.

Some managers have found what they consider an objection to block signal systems in the fact that when delay occurs which throws some of the cars off time the motormen have a tendency to race for the next switch, each trying to be first and by throwing the signal at the block ahead gain the distance of the next block. It takes but little of this racing, which does not occur with telephone dispatching, to disorganize the schedules. P.

A suit to declare a forfeiture of the right of way of the Suburban Railroad Co., of Chicago, through a tract of land in the western part of the city has been decided in favor of the company. The original grant was to the Southwestern Railroad Co. in 1890, and was coupled with a condition that three stations be erected and eight trains per day operated. The court held this was a condition subsequent and confirmed the title of the Suburban company.

TRADE PAPERS VERSUS CIRCULARS.

The tendency of manufacturers to use circular letters in place of space in trade papers is the result of a wrong idea of the value of a good name, says C. V. White, in the Northwestern Shoe and Leather Journal. The right kind of a trade paper is the adviser of its readers—it helps them over the hard places in business, it gives notice of new things and makes a relentless fight on fakes and fakirs. It is, first of all the friend of its readers. This kind of a paper will not accept the advertisement of any firm which is irresponsible or fakish; this gives an implied good name to every advertiser. The business relation between persons introduced by a mutual friend are more cordial than those who meet because of the forwardness of the one who has something to sell. The trade paper will introduce any manufacturer or jobber to the class of business men he wants to reach. The introduction coming in the nature of an advertisement does not materially lessen the value of the introduction. The reader knows that the firm is responsible or it would not be allowed to advertise in this particular publication.

If each advertisement is written in the nature of a direct bid for trade, the trade paper advertisement will bring larger results than a circular every time. The average manufacturer, however, puts a standing card in the trade paper space and then supplements this advertisement with circular letters, and because returns come in he thinks the letters are alone responsible. The results come because his trade paper advertising has established his good name. A business man nowadays who gets a circular letter from a strange firm has to be mighty interested before he will give it any consideration. There's too many good and reliable firms to experiment with strangers.

It is also a fact that the irresponsible manufacturer, driven out of trade papers, has to resort to circular letters. For the legitimate manufacturer or jobber to try to compete with this class of foolishness. It is foolish for two reasons: He simply injures himself every time he notices this class; second, it costs too much in proportion to what can be taken out of it. Advertising with circular letters is one of the most expensive kinds of advertising.

CHRISTENSEN AIR BRAKES FOR BOSTON ELEVATED.

After a series of exhaustive tests on air brakes the Boston Elevated Railway Co. has awarded the contract for air brakes for its elevated system to the Christensen Engineering Co., through its Eastern manager, Mr. F. C. Randall, No. 135 Broadway, New York. The Christensen Engineering Co. will furnish its automatic air brake system complete, including its No. 2 independent motor compressors and its patent triple and engineer's valves.

Our readers doubtless remember that for the tests made in the Boston Subway in April last, the Christensen Engineering Co. furnished automatic air brakes for four cars, the Westinghouse Air Brake Co. furnished brakes for four cars, and the New York Air Brake Co. equipped four cars with its apparatus excepting compressors which were made by the General Electric Co.

In awarding the brake contract the Boston Elevated is following in the footsteps of the other elevated electric roads in this country, as the South Side, the Lake Street, the Northwestern and the Metropolitan elevated roads of Chicago, the Kansas City (Mo.) Elevated Ry. and the Brooklyn (N. Y.) Elevated R. R. are all users of the Christensen brakes. The New York, New Haven & Hartford has also adopted Christensen air brakes for its electric lines. This list includes the majority of the heavy service electric roads.

NEW MASSACHUSETTS ROAD.

On August 13th the Lawrence & Reading Street R. R. was opened between Reading, Mass., and Academy Hill, Andover. Two special cars carried a party of guests over the line and after they had made the round trip the regular service was inaugurated. The officers of the company are: President, Charles F. Woodward; treasurer, M. J. Warner; clerk, S. T. Ley.

The breaking of a wheel flange on a car of the Taunton (Mass.) & Brockton Street Ry. caused the derailment of car. Twelve of the 30 passengers were slightly injured.

RECENT STREET RAILWAY DECISIONS.

EDITED BY J. L. ROSENBERGER, ATTORNEY AT LAW, CHICAGO.

NEED NOT BE LIMITED TO SAME SPEED AS OTHER RAILROADS.

Erb v. Morasch (U. S.), 20 S. C. Rep. 819. May 14, 1900.

The difference between a street railway and a steam railroad, even where the former is operated by steam, as by the use of dummy engines, or where it is operated by electricity, the supreme court of the United States holds warrants the exception of the street railway from the provisions of such an ordinance as one making it unlawful to run a railway engine or train of cars along any track in the city at a greater speed than six miles an hour.

TRIP SHEETS NOT ADMISSIBLE IN EVIDENCE.

West Chicago Street Railroad Co. v. Kromshinsky (Ill.), 56 N. E. Rep. 1110. Apr. 17, 1900.

A refusal of the trial court to admit in evidence, in this case, a trip sheet offered by the street railroad company, the latter assigned, on appeal, as reversible error. But with it the supreme court of Illinois does not agree. In regard to the trip sheet, the supreme court says that it was a mere memorandum made by the conductor. It was no record required by law to be kept. To this, the court adds that it was not even shown to have been made in the usual course of business. And it declares that it is aware of no rule under which it was admissible in evidence. But, if it was admissible, the court goes on to say, no harm was done by its rejection, as the conductor testified on the trial to all the facts disclosed by the paper, and his evidence was not contradicted.

NOT EXEMPTED FROM SPECIAL ASSESSMENTS FOR SEWERS.

Bickerdike v. City of Chicago (Ill.), 56 N. E. Rep. 1096. Apr. 17, 1900.

Besides other objections filed in this case, and participated in by other objectors, to the confirmation of a certain special assessment for the building of a sewer, the North Chicago Electric Railway Company and the Chicago Electric Transit Company further assigned as errors that their railroad rights of way could not be assessed for the sewer because of an ordinance requiring them to grade, pave, macadamize, plank, and repair a certain width in the streets and avenues occupied by them. Now, the proportionate share of said specified improvements to be borne by the companies, the supreme court of Illinois says, was fixed by the ordinances, and their acceptance by the companies. But it was insisted that such ordinances also provided an equivalent for special assessments for sewers. Not so, however, thinks the court. It holds that the commutation did not extend to other street improvements. A sewer, it holds, was not included in the agreement, which applied only to surface improvements of the street.

FAMILIARITY WITH SPEED OF WAGONS WARRANTS OPINION ON SPEED OF CARS.

Garduhn v. Union Railway Co. of New York City (N. Y.), 64 N. Y. Supp. 210. Apr. 14, 1900.

A witness, after testifying, in substance, that he had driven horses for over 20 years, and was familiar with the speed of wagons, was permitted to give his judgment as to the speed of a certain car at about the time it collided with a wagon. He did not say, in terms, that his experience in driving had given him knowledge of the speed of cars. Nevertheless, the appellate division, second department, of the supreme court of New York holds that the admission of his testimony was within the spirit of the adjudications. It holds that there can be no disqualifying difference in the exercise of judgment as applied to the two classes of vehicles or conveyances, and that experience in the speed of the one necessarily involves some judgment as to the speed of the other. But before a witness can be allowed to testify that a car was going fast or slow, it thinks that he should at least be able to say that he had noticed the speed, so that his answer will be evidence, and not a mere guess.

NEITHER ABUTTER NOR STEAM RAILROAD ENTITLED TO INJUNCTION FOR INJURY TO PROPERTY.

General Electric Railway Co. v. Chicago & Western Indiana Railroad Co. (Ill.), 56 N. E. Rep. 963. Feb. 19, 1900. Rehearing denied Apr. 17, 1900.

The allegation of an abutting property owner that the construction and operation of a street railway in front of his property will lessen its value, or injuriously affect it, or the allegation that the construction of a street railway in the street is illegal or unauthorized, the supreme court of Illinois holds, will not give such abutting property owner a standing in a court of equity to enjoin the construction of such railway.

Nor does the court consider that a steam railroad which has tracks laid in or across a street, although laid there under legal authority, has such a right in the street that it can enjoin the construction of a street car track along said street, or from crossing its track across such street.

Operating a street railway, the court adds, is a legitimate use of the street for expeditious travel thereon, and is not an additional burden thereto.

PASSENGER ALIGHTING ON TRENCH CANNOT SUE TRACTION AND GAS COMPANIES TOGETHER.

Howard v. Union Traction Co. and Philadelphia Suburban Gas Co. (Pa.), 45 Atl. Rep. 1076. Apr. 16, 1900.

A passenger, in alighting from a street car, was thrown by a block of wood which was placed across a trench that had recently been dug and filled up by a gas company. To recover for her injuries both the traction and gas companies were sued. But the supreme court of Pennsylvania holds that the statement of claim was demurrable in that it sought to hold the two companies liable as joint wrongdoers, while it in reality showed that there was no community of fault by the two companies in the act which occasioned the injuries. The statement of claim alleged that the injury was caused by the block of wood placed and maintained by the gas company in a defective and dangerous condition over a trench dug by that company. It is too plain for argument, says the court, that this was the sole fault of the gas company, according to the allegation. For that fault that company alone would be responsible, as no authority or control over the trench by the traction company was alleged in the statement. If the traction company directed the passenger to leave the car at a dangerous place, it would be in fault, and therefore liable for a breach of its duty as a carrier in that respect. But it cannot possibly be said, the court holds, that the fault of the two companies was one identical act or omission.

QUESTION AS TO SUFFICIENCY OF BRAKE THAT CANNOT BE DEPENDED ON WITH WET TRACK.

Chicago City Railway Co. v. Mager (Ill.), 56 N. E. Rep. 1058. Apr. 17, 1900.

The testimony of the motoneer called as a witness in this case was to the effect that when he saw the party, who was here seeking to recover damages for injuries in a collision, turn his horses' heads towards the track, he applied the brake, and, seeing that the brake was not going to do, he threw the brake off and reversed the current. But, taking all of his testimony together, he apparently did not mean to be understood that the brake was out of order, or in any way defective. In fact, he said that the brake was all right, but that the rails of the track of the road were wet with water from a sprinkling cart or from rain, and were for that reason so slippery that the brake could not be depended upon to stop the train in time to avoid striking the wagon. Under these circumstances, the company complained of the trial judge giving, on his motion, instructions which authorized the jury to consider as an element of the right of recovery whether the train was properly equipped with appliances for stopping it. But the supreme court of Illinois does not think that any error was committed. It holds that it remained a fair question of fact for the jury to determine whether a car sup-

plied with a brake which, though in perfect order, could not be depended upon to check and control the motion of the train under the circumstances, should be regarded as "reasonably equipped at the time as to its stopping appliances." Judgment against the company affirmed.

LIABILITY UNDER SPECIAL CONTRACT TO KEEP HIGHWAY SAFE.

Sullivan v. Staten Island Electric Railroad Co. (N. Y.), 64 N. Y. Supp. 91. Apr. 14, 1900.

Here a contract was made with the local authorities of a township in which a street railroad was to be constructed, whereby it was agreed, "during the continuance of such work of construction on said railroad tracks, roadbed, turn-out, switches, and connections, to so conduct said work as to at all times leave said streets, roads, and highways, and the sidewalks thereof in a safe and passable condition for vehicles and foot passengers, keep all dangerous or unsafe places lighted at night from sunset to sunrise, and properly guarded both by day and night." In construing this, the appellate division, second department, of the supreme court of New York holds that it was broad enough to cover the entire duty of the township, in so far as the condition of the highway was concerned, during the contract period. Consequently, it considers it broad enough to cover liability for an injury sustained by a pedestrian stepping into a hole near the foot of a telegraph, telephone, or other pole set in the highway. And there can be no doubt, the court declares, that contractors with the state or a municipal corporation who assume, for a consideration received from the granting power, by covenant, expressed or implied, to do certain things necessary for the safety or well-being of the public, are liable, in case of neglect to perform such covenant, to a private action at the suit of the party injured by such neglect, and such contract inures to the benefit of the individual who is interested in its performance. But the contract with the township, in this instance, being to keep the highways in a safe and passable condition during the time the work of construction was being carried on, the court holds that, in order to show any liability on the part of the company to the party injured as above stated, it was necessary to establish that the work of construction was still under way at the time of the accident. And this requirement the court holds was not met where the evidence on behalf of the company showed that the work of construction had been completed about six months when the accident occurred, and where the nearest time fixed at which the injured party swore to work of construction was some two months prior to the accident.

POWER OF STATE TO DIRECT CITY TO BUILD TUNNEL AND LET IT FOR STREET RAILWAY USE.

Browne v. Turner (Mass.), 56 N. E. Rep. 969. Mar. 28, 1900.

This was a suit brought to enjoin the construction of a tunnel and the issue of bonds by the city of Boston for the payment thereof. The occasion for it was alleged to be that the Boston transit commission proposed to obey section 17 of chapter 500 of the statutes of 1897, by constructing a tunnel from a point on or near Hanover street, in Boston proper, to a point at or near Maverick Square, in East Boston, and by executing a lease of the tunnel, when completed, to the Boston Elevated Railroad Company for 25 years from the date of that act at the rental specified in the same section. Besides, it was averred, the treasurer of the city proposed to obey section 18 of the act, by selling bonds and applying the proceeds to the payment of the cost of the tunnel. The injunction was sought largely on the ground that the requirements of these sections were unconstitutional, especially as calling for an unwarranted exercise of the power of taxation, and as taking the property of the city without reasonable compensation or due process of law when the lease should be executed. But no injunction was granted.

In view of its decisions as to the subway, the supreme judicial court of Massachusetts says that it does not appear to it to need further argument to show that the contemplated tunnel, even if permanently confined to street railway travel, was a public work for a public use, for building which the legislature could require the city to pay. Nor was it impressed with the distinctions which it says were suggested between the subway and the tunnel.

Then, it was argued that, because of the direction to let the tun-

nel, and because of the difference in the rental under the statute and that which would have been received under a certain contract, the real object of the statute was to throw upon the city the burden of constructing part of its roadbed for a private corporation, and to give it a lease on easier terms. But the court says that it cannot accept the suggestion. It did not appear that the statute would have either effect. But, if it would, so long as possible, the court is bound, it says, to assume that the legislature did its duty, meant what it said, and regarded the work as a public work really needed by the public, as it might be. The purpose of the act on its face was to create a lawful public improvement.

Again, it was contended that the compensation to the city was inadequate, and that the lease would be a taking of the city's property for a private corporation without paying for it. The answer of the court is that, with regard to the former proposition, if the legislature had the same power that it had with regard to other roads, the matter of compensation was wholly within its power. With regard to the latter branch of the objection, the court says that this was not a transfer, but only a quasi, or kind of, experimental lease for a not unreasonable time. The property of the city in the tunnel, assuming it to have a property, was not of a half-private sort, but was merely the control of a public agency.

Continuing, the court says that if the tunnel was to be built it was to be used, and naturally would not be used by the city directly. If the legislature could authorize it to be let on terms to be agreed upon, it could require it to be let on terms which the legislature thought just to a corporation selected by itself, engaged in a public work like that for which the tunnel was to be used. In fact, when once the power to require the tunnel to be built is conceded, the rest follows, the court holds, in the situation now existing in Boston. Assuming that the city is not to go into the transportation business further than it has gone, it adds, the use of the tunnel by the corporation which manages the consolidated street railways of the city is the alternative, and such use is not to be expected without a lease.

LIABILITY FOR TOLLS AFTER PURCHASE BY CITY OF ENTIRE STOCK OF BRIDGE COMPANY.

Monongahela Bridge Co. v. Pittsburgh & Birmingham Traction Co. (Pa.), 46 Atl. Rep. 99. May 7, 1900.

This was an action brought by a bridge company, in its corporate capacity, to recover tolls under a contract whereby the bridge company constructed an addition to its bridge for the special use of the traction company and for which the latter agreed to pay certain fixed sums for a period of 40 years. The traction company denied its liability to pay these tolls because the city of Pittsburgh had purchased the entire stock of the bridge company at public expense for public use, for a free bridge, and no toll had since been asked for its use by ordinary foot passengers, horse, wagon, and carriage traffic. But the bridge company got judgment, and the supreme court of Pennsylvania has affirmed the judgment.

First of all, the court holds that it did not follow, as alleged, that because the city purchased the entire stock of the bridge company it became the owner of the property of the company. To the contrary, it says that the principle is well established that the shares of the capital stock of a corporation are essentially distinct and different from the corporate property, and that the owner of all the stock of a corporation does not own the corporate property, or become entitled to manage or control it.

It is clear, therefore, the court holds, that the purchase of the stock of the bridge company by the city did not dissolve the corporation, or vest in the city the title to its corporate property, or give the city, as sole stockholder, the right to manage and control the bridge or other property of the corporation. To this it adds that so far as the effect of the purchase of the stock could be inquired into in this action, the city became a stockholder in the corporation, with rights and privileges as such, and nothing more or less.

Again, the court asserts that it is settled beyond all question, in Pennsylvania, that the existence of a corporation, or its right to exercise its corporate franchises, cannot be inquired into or attacked collaterally, which would prevent the traction company from interposing as a defense the nonexistence of the plaintiff corporation—the bridge company, and thereby prevent a recovery in this action.

The answer which the court makes to the contention that the city

had no right to purchase the stock of the bridge company, with the money of the city, and continue the corporate existence of the bridge company, is that the question it raised could not be adjudicated in this action. In other words, whatever might be the merits of such a defense, the court holds that the traction company was prevented from setting it up in this action. In a proper proceeding, it says, the matters suggested here to relieve the traction company from liability on its contract could be inquired into and determined, but in this action they could not be invoked to prevent a recovery. Until judicially determined in a proper proceeding, the corporate existence of the bridge company could not be denied, so as to prevent the corporation from exercising its franchises and enforcing its contracts.

"ACCIDENT ADJUSTER" NOT PUNISHABLE FOR CONTEMPT WHERE COMPANY WINS SUIT.

Noster v. Metropolitan Street Railway Co. (N. Y.), 63 N. Y. Supp. 501. Mar. 20, 1900.

While in the commonwealth of Pennsylvania the courts have thundered forth their condemnation of accident adjusters, runners, and lawyers, who, through their agency, foment litigations, in language too vigorous to be misunderstood, Mr. Justice McAdam says, at a trial term of the supreme court, in New York county, that the methods employed by these persons have become so common in New York, particularly in negligence cases, that they are tolerated complaisantly, and scarcely made the subject of comment. Moreover, it is held in this case that should an "accident adjuster" be guilty of such misconduct, as in preparing false typewritten statements of facts for witnesses to swear to, that, if the suit of which he has been the instigator and the procurer of evidence to maintain were won, it could be said that by his misconduct the rights of the defendant were defeated, impaired, and prejudiced, and hence that he was guilty of contempt, within section 14 of the New York Code of Civil Procedure, nevertheless no such right to punish him exists under the Code provision where the defendant succeeds at the trial.

WHERE CHILDREN APPEAR IN ROAD NEAR SCHOOL HOUSE.

Oster v. Schuylkill Traction Co. (Pa.), 45 Atl. Rep. 1006. Apr. 9, 1900.

This was an action for injury to a child. The motorman testified that when he was "fifty or sixty yards away, maybe more than that," he saw children in the road on both sides of the track, and only a few feet from it. He knew the school house was there, and seeing the children in the road, the supreme court of Pennsylvania holds, was notice to him that it was recess, or, at least, that the school was not in session. These circumstances, it adds, put on him the duty of at once getting his car under special control. Whether he did all that was reasonably proper for that purpose, it holds, was necessarily a question for the jury. The cases of this kind, where it is for the court to direct the verdict, the supreme court goes on to explain, are confined to those in which the uncontested evidence leads to the conclusion that the child ran in front of the car so quickly and under such circumstances that the driver or motorman had no reasonable ground to apprehend such action, and no time after it to avoid the collision. In such cases the direction by the court is based on the entire absence of any sufficient evidence of the company's negligence. Judgment in this case, for the plaintiff, affirmed.

TAXPAYER'S RIGHT TO CONTEST DISGUISED FRANCHISE GRANT.

State v. Judge of Division A, Civil District Court (La.), 27. So. Rep. 580. Mar. 10, 1900.

If it be true, says the supreme court of Louisiana, that under the guise of an ordinance to rearrange the street railway tracks on a certain street, the better to subserve the public safety and convenience, an attempt is made to donate valuable additional franchises to one of the companies maintaining a track on part of said street, and that what is thus sought to be done is in excess of the municipal powers of the municipal council, any citizen and tax-

payer has a standing in court to contest that part of the ordinance in which is included the alleged disguised franchise grant.

Whether it has a new grant, and, if so, whether the same is valid, the court holds, are matters of *de jure* more particularly to be urged by the street railway company asserting the same, and accordingly the bringing of the suit against it alone suffices.

Furthermore, a petition, duly verified by oath, containing averment of the unauthorized grant of a public franchise, and the *ultra vires*, or unauthorized, character of the ordinance under which the franchise is claimed, and alleging interest as taxpayer, and injury to the rights and holdings of the petitioner, the court holds, presents a sufficiently good *prima facie* case to warrant a preliminary injunction restraining the street railway company, its officers and agents, in the premises until the further orders of the court.

CARE REQUIRED IN OPERATING SWEEPER TO REMOVE SNOW

Conner v. Metropolitan Street Railway Co. (N. Y.), 63 N. Y. Supp. 509. Mar. 6, 1900.

In operating a sweeper, as for example during a snow storm to clear its track of snow, a street railway company, the appellate division, second department, of the supreme court of New York says, is to be held, of course, to the rule of reasonable care, in view of the dangers to be reasonably anticipated. But a liability based upon so unusual a circumstance as that of a piece of snow or ice going in an opposite direction from that designed, and without any apparent cause connected with the machinery itself or its mode of operation, it pronounces almost tantamount to holding the company to be an insurer of the safety of others who may be using the street at the same time. Hence, in the absence of proof that the snow or ice which the plaintiff alleged hit his horse, while he was driving on the adjoining track, and which he said came from the direction of the sweeper, did in fact come from the sweeper, and in the absence of proof that this was the result of negligence, and could have been averted by care in the speed or in the operations of the sweeper in some other definite respect, the court holds that the plaintiff failed to sustain the burden of proof, and that the company's motion for the direction of a verdict in its favor should have been granted.

PRESUMPTIONS FROM COLLISION OF CARS OF DIFFERENT COMPANIES.

Loudoun v. Eighth Avenue Railroad Co. and Third Avenue Railroad Co. (N. Y.), 56 N. E. Rep. 988. Mar. 27, 1900.

This action was brought to recover damages for injuries sustained by a passenger on a horse car that was struck by a cable car, the cars being owned by different companies, and both companies being sued. That the horse car was first on the crossing, the court of appeals of New York holds, did not conclusively show that it had the right of way. But, in the absence of any evidence showing the relative position or speed of the two as they approached the intersection, it holds that it did constitute evidence from which the jury might have inferred that the horse car was entitled to precedence. The cogency of the evidence, it remarks, would also depend on the part of the horse car that was struck by the cable car. And here it appeared that the horses and a great portion of the car itself had passed the crossing before the collision occurred. Yet the court does not say that on this proof the cable car company was negligent, as matter of law, but only that it was a question of fact for the jury. In other words, the court holds that, notwithstanding the details of the collision were meager, they required submission to the jury of the issue of negligence as to each company, and that a nonsuit as to either would have been improper. At the same time, it holds that there was error in instructions which substantially took away from the jury the issue of the companies' negligence, in that they stated that the accident raised a presumption of negligence, and that there was no testimony to overcome the presumption, thus substantially stating that the party suing had successfully borne the burden of proof resting on her to establish her case.

The court says that it agrees with the cable car company that the doctrine of *res ipsa loquitur*—the matter speaks for itself—did not apply to it, and that an instruction that the occurrence of the collision raised a presumption of negligence upon its part calling for

an explanation was erroneous. The cable car company, not being the carrier of the passenger suing, it holds, was bound only to the exercise of the ordinary care in the management of its cars. If one company had been in control and management of both the cars, a presumption of negligence on its part would have properly arisen. But here, the court goes on to explain, were two actors, and the collision might have been due entirely to the fault of one party, and not at all the fault of the other.

As to the horse car company, on whose car the party suing was a passenger, the court holds that a different rule obtained. While it was not a guarantor of the safety or security of its passenger, the court holds that it was bound to exercise a very high degree of care to accomplish that result. It adds that it is easy to imagine many injuries that might occur to passengers, from which no presumption of negligence would arise. But the danger of collision with other vehicles moving on the streets is always present, and the employe managing and controlling the car must be on the alert to avoid that danger. The danger is greater at the intersection of other railroads, and care must be used proportionate to the danger. And, the court holds, the horse car company could not insist upon or assert its right of way at the crossing as against the car of the other company, if there were reasonable grounds to apprehend that thereby it would endanger the safety of its passengers. Moreover, the management and control of the transportation of the passenger are wholly confided to the employes' operating the car; and the former cannot be expected to be on the watch either as to its management or that of other vehicles, or, if a collision takes place, be able to account for its occurrence. Therefore, when such a collision occurs, the court holds, there arises a presumption of negligence on the part of the carrier, which calls upon it for explanation.

But, though the occurrence of the accident called for an explanation by the horse car company, which was the carrier of the passenger, the court thinks that the trial judge erred in charging, as a matter of law, that no explanation had been furnished, and it recalls attention to the fact that the cable car struck the rear end of the horse car. How far this circumstance tended to show that the horse car had properly and carefully proceeded over the crossing and that this collision was due not to its fault, but to that of the other company, it adds was a question of fact for the jury, not of law for the court.

Again, the court holds that the question was not whether the collision could be attributed to the companies' negligence, but whether, as matter of fact, it was attributable to their negligence.

INJURY TO CONDUCTOR CAUSED BY STONE BEING PILED ALONG TRACK.

North Chicago Street Railroad Co. v. Dudgeon (Ill.), 56 N. E. Rep. 796. Feb. 19, 1900. Rehearing denied Apr. 5, 1900.

Where a company is exercising some chartered privilege or power which could not be exercised independently of its charter, there is an exception, the supreme court of Illinois holds, to the general rule that to cases of independent contractors the doctrine does not apply, which makes the superior answerable for whatever has been done. Wherefore, it holds a street railway company liable for injuries to a conductor caused by negligence in placing piles of stones along the sides of the track in repairing its roadbed and relaying its tracks, notwithstanding that it employed independent contractors to do the work, free from all control and supervision on its part. Nor does it consider it any defense that the authority and permit given to the company extended only to the relaying of the rails, and that neither the charter under which it was operating, nor the permit, covered the paving of the street or the removal of the stones therefrom.

Besides, it should not be forgotten, the supreme court says, that the law requires that the master shall provide a reasonably safe place for the servant to work, and, failing so to do, is answerable for resulting injuries, unless the dangers are such as are reasonably incident to his employment, or of which the servant has equal knowledge with the master, or where the danger is imminent. To this, the court adds that it cannot hold the danger resulting from such piling of stones along the side of the track to be an assumed risk. It also makes a point of the fact that the duties of a conductor being principally on the car, attending to the collection of fares, his knowledge of the condition of the track, or the street adjoining the same, might easily be very much less than that of an ordinary

passenger, who would have nothing else to occupy his mind except observation as the car proceeded.

WHERE A HORSE IS LEFT ALONE AND UNHITCHED AT NIGHT NEAR TRACK.

Hoffman v. Syracuse Rapid Transit Railway Co. (N. Y.), 63 N. Y. Supp. 442. Mar. 21, 1900.

A horse was left alone, untied, on a dark, stormy night, in a narrow space between a track and the street gutter, when cars were liable to come past at any moment, and at a place in the city where a 15-miles-an-hour ordinance applied, and where the driver was bound to assume a car might come down the track, out of the dark, at a rapid speed, with its headlight staring the horse in the face, and so close to him that the side of the car would almost touch his body. Under such a condition of facts, the appellate division, fourth department, of the supreme court of New York, says that it cannot agree that it should be found, even by a jury, that the driver of the horse was free from contributory negligence; and it holds that it was error not to grant a nonsuit.

Nor could it be claimed, the court holds, that it was the duty of the motorman, if he saw the horse, when some distance away, to slow down his car, and get it under such control that he could avoid a collision by stopping the car within a few feet, if the horse chanced suddenly to go upon the track. He had a right, the court maintains, to assume, until the contrary appeared, that the horse was gentle, and not afraid of street cars, and would remain standing when the car approached and passed him; otherwise, he would not have been left alone, unhitched, so near the tracks. He was only called upon to slow down, and get his car under control so as to be stopped quickly, when he was apprised by some action of the horse that he was likely to change his position of safety, and go upon the track, a place of danger.

SOME THINGS THOSE OPERATING STREET CARS BY ELECTRICITY MUST KNOW AND DO.

Owensboro City Railroad Co. v. Hill (Ky.), 56 S. W. Rep. 21. Mar. 17, 1900.

Those in charge of street cars operated by electricity along the public streets of a city, the court of appeals of Kentucky maintains, must know that they are operating dangerous machinery; that men, women, and children have the right to cross and be upon the streets, and that they will do so; that those in charge of the cars must keep a lookout, and take reasonable measures and care to avoid injury to those that may be upon the streets. It is the duty of a street car company which propels its cars by electricity to keep them under such reasonable control as will enable them to avoid injury to those who use the street. It would be gross negligence for one in charge of an electric car on the streets of a city to fail to give warning of its approach at street crossings.

This statement the court follows by the further one that if the jury believed the testimony to be true which tended to show that the car in question was running at an unusual rate of speed, and gave no warning of its approach to the crossing, then it was bound to reach the conclusion that the company was guilty of negligence. It also thinks that the jury was properly told that, if the servant of the company discovered, or could have discovered, this other party's danger, and failed to use reasonable efforts to avoid injuring her, her negligence, if any, would not prevent a recovery of damages. Railroad companies, it adds, owe that duty to trespassers. Street car companies owe it to everybody who may be found upon their tracks in cities.

This decision, it should perhaps be noted, is "Not to be officially reported."

London is not unanimous in approving the underground roads and one man is on record that he "better prefers traveling in God's own air than in a drain pipe."

It is announced that the officials of the United Traction Co., of Albany, N. Y., and the Schenectady Railway Co., of Schenectady, have reached an agreement whereby the latter company will be permitted to enter Albany over the local system if it builds an interurban line.

LAYING PIPE IN ENGLAND.

Our English contemporaries describe an amusing dispute between the town of Dudley (Eng.) and the British Electric Traction Co. over the laying of some underground feeder cables for the Dudley & Sedgley Tramway. The company wished to use cast iron pipes but the town preferred earthenware conduits. Notwithstanding the protests of the town officials, the company laid half a mile of the pipes. The police were asked to stop the work, but the men refused to desist; then the town provided a force of laborers, who filled the trench as fast as the company's men opened it. The company then provided carts and hauled the dirt away, but the town had other carts and hauled in ashes and refuse to fill the trench. At last by surrounding the trench with carts the company's men succeeded in installing some 50 yards of the pipe by the end of the second day. The town officials announced that application would be made for an injunction, but at last accounts the company was laying its mains.

All this reads as though it might have happened on this side of the Atlantic, except that there would have been a fight and at least two injunctions before the first day was over.

CINCINNATI, NEWPORT & COVINGTON.

The condensed statement of the Cincinnati, Newport & Covington Ry. for July, 1900, sent us by the president, Mr. J. C. Ernst, shows gross earnings, \$72,704; operating expenses, \$31,135; net earnings, \$41,569; tolls, taxes and damages, \$12,479; net profit, \$29,090. This is an increase in gross earnings of \$4,000, an increase in operating expenses of \$6,931, and a decrease in net profit of \$3,347, as compared with July, 1899.

For the first seven months of the year compared with the corresponding period of 1899, the increase in net profit is \$22,449. The ratio of expense to earnings is .53 with tolls and .41 without tolls, as against .55 and .42 for the corresponding period of 1899.

TO PRESERVE WOODEN POLES.

The following method is suggested for preserving wooden trolley poles from decay due to moisture or boring insects.

First char the pole for from four to six feet on the butt end, about 1/4 in. deep from the surface. Then apply the following preparation; 1 gallon of 25 per cent crude carbolic acid, mixed with 5 gallons of coal tar, putting on one or two coats after the pole is thoroughly dried; the composition should not be applied while the pole is green. It is said this mixture will kill all eggs or worms that may be in the pole and will prevent others from being deposited.

BRIDGES CLOSED UNTIL REPAIRS ARE MADE.

The city of Tacoma, Wash., has notified the Tacoma Railway & Power Co. that five bridges over which car tracks are laid are defective, and that an "element of danger" exists in operating cars over them. The city demands that the railway company repair the bridges, and as the company has refused to do so the bridges have been closed to street car traffic. The repairs in question consist in placing new post feet, caps and stringers, and the estimated cost for the five bridges is about \$1,200. The company will take the matter into court.

TO PREVENT COUNTERFEITING TRANSFERS.

Some Philadelphia firms have had tickets printed for advertising purposes which are similar in style and color to the regular transfer slips used by the Union Traction Co., and the latter finds that many of its conductors have been imposed upon by passengers who tendered the imitation checks. To stop the fraud the company has had new transfers printed on paper with the watermark "U. T. C." so that by holding the ticket to the light the conductor can easily tell whether it is genuine.

The Warren, Brookfield & Spencer Street Railway Co., of Brookfield, Mass., has had each of its conductors appointed a special policeman.

ELMIRA & SENECA LAKE RY.

The line of the Elmira & Seneca Lake Railway Co., which was opened for operation on June 19, 1900, extends from Horseheads, N. Y., to Seneca Lake. Horseheads is the terminus of the Elmira & Horseheads Ry., over which the cars of the Elmira & Seneca Falls company will enter and leave Elmira. The route is on Main St., in Horseheads, until the Chemung Canal is reached; this canal was abandoned as a waterway some years ago, and the towpath is now owned by the railway company as its right of way. The line passes

FIG. 1 TYPE OF BRIDGE.

through a well-settled country and the villages of Pine Valley, Millport, and Croton, and leaves the private right of way on reaching the town of Montour Falls; thence it proceeds through the main streets of Montour Falls, and along the Watkins public road to Watkins, and through Watkins to the northern terminus at the lake. The road passes through two counties, Chemung and Schuyler, and directly to the entrances of the world-famous Watkins Glen at Watkins and Havana Glen at Montour. The terminus at Watkins is on the shore of Seneca Lake adjacent to the depot of the Northern Central Railroad Co., and connects with the steam-

FIG. 2 EXTERIOR OF POWER HOUSE.

boat lines of the Seneca Lake Transportation Co. Seneca Lake is a fine body of water about forty miles long, and there are a number of summer resorts and cottages along its shores reached by the steamboats.

When this route was projected it was with many doubts as to the ultimate completion of the road, but the officials of the railway company after thoroughly examining the field decided to award the contract for designing, constructing and equipping the road

to the American Engineering Co., of Philadelphia, which immediately prepared plans and specifications and commenced grading for the roadbed. The cuts were 10 ft. wide at grade line with side slopes of $1\frac{1}{2}$ to 1 and ditches for drainage at the base of the slope; the fills were made 10 ft. at the grade line after being allowed to settle along the private right of way. It was necessary to change the course of the Catharine River at four different points and wherever the river was adjacent to the fills they were protected from washing by oak piles driven 5 ft. apart parallel with the river, with willow mattresses placed between and behind the piling and backed by stone riprap work.

Wherever the line of road crossed the stream there were erected plate girder or through span steel bridges, similar to the one shown in Fig. 1, which were furnished by the Berlin Bridge Co. and the Havana Bridge Co. The bridges were set on foundations of cut stone laid in portland cement, none but dimension stones being placed in the faces of the walls. The track over all bridges has inside guard rails of the same section as the running rails, laid parallel to and 4 in. from them. The bridges have fender pieces with notches on the underside to receive the ties; the fender pieces are held in place by bolts with washers on each end. Exposed parts of ties and also the notches were treated with two coats of red lead to prevent absorption of moisture.

The rails are a 56-lb. T-section rolled by the Carnegie company. They are laid on ties 6 x 8 in. x 8 ft., of hewn oak and chestnut, spaced 18 in. on centers except at joints, where they are spaced 14 in.; the joints are suspended. The track is surfaced on a bed of 12 in. of creek gravel; stone ballast is filled in level with the tops of the ties, having the natural slope from the ends of the ties. The track is bonded with No. 0000 Morris protected stranded copper bonds, and cross bonded every 200 ft. Ground plates are buried in the stream wherever a crossing is made and connected to the

FIG. 3—MONTOUR FALLS.

track circuit by four No. 00 wires; four wires are used to guard against breakage.

The overhead construction is with side poles except through the towns and villages, where the span construction is used. Side poles are 30 ft. in length, 7 in. at the top, with seamless steel bracket arms supporting clips for suspension wire, having the overhead wire supported from an eyebolt attached to the top of the pole. All suspension and pull-off wire is stranded galvanized iron. The

trolley wire is No. 00 grooved section, hung on insulators with the General Electric Co.'s special mechanical clip for this pattern of wire.

The feeder system consists of 15 miles of No. 0000 solid copper wire, insulated in the towns and bare on the private way. It is hung on glass insulators supported by cross arms on the side poles.

FIG. 4—ENTRANCE TO WATKINS GLEN.

Lightning arresters are placed every 1,000 ft. and grounded on to track circuit.

The telephone signal system was furnished by the Novelty Electric Co., and consists of a telephone at each of the sidings and terminals. There are also instruments at the power house and office so that a car at any siding can communicate with the power house or office, and with another car through the office, or the office can reach any car on the lines by ringing bells which are placed along the line, bridged in circuit, which notify the car that is wanted. Each telephone is numbered the same as the siding at which it is located, and the system is found to work very satisfactorily.

The road is fenced for its entire length over the private right of way, nearly 12 miles, with galvanized wire. The fencing is supported on iron posts every 10 ft. and has wooden end and brace posts; the grade crossings are protected by cattle guards made of triangular oak pieces. All farm crossings are put below grade through special cattle passes.

The power house, which is shown in Fig. 2, is a brick building on a stone foundation laid in cement mortar. The roof is carried on steel trusses and covered with slate, with red tile trimmings. The floors of both engine and boiler rooms are of cement.

The engine room equipment comprises one 350-h. p. engine driving a 325-kw. generator and one 250-h. p. engine driving a 225-kw. generator; the two generators are Westinghouse. Both of these engines, Fig. 6, were made by the Harrisburg Foundry & Machine Works, of Harrisburg, Pa., and are of the type known as the Harrisburg four-valve self-oiling simple engine. This type is one of a complete series made by the company and has been specially designed to give satisfactory and efficient service under the following conditions: Steady, or if required, varying load; belted or direct connected to the generators; exhaust either free to atmosphere, or, if unavoidable, subjected to back pressure; steam pressure from

70 to 100 lb.; low-priced attendants; units of from 75 to 700 h. p.; compact floor space; quiet operation; a water rate of from 25 to 28 lb. per hour. The four valves are cylindrical in form and perfectly balanced under all conditions; the two steam valves have removable bushings which render repairs positively reliable. There are two eccentrics, one actuating the two steam valves and one the two exhaust valves, the motion being transmitted to wrist plates by independent rocker arms; this design is justified because the arrangement permits a rapid acceleration of the valve gear and secures sharp cut-off and release. The valve gear is made as simple as possible and close adjustment can be secured so that in operation there is no clattering or noisy vibration. The wrist plates and the wrist plate pin are made of a special steel, the pin being fitted with adjustable sections of phosphor bronze. Lubrication of the pins is accomplished by means of compression grease cups on the outside end of each pin thus allowing the operator to force the lubricant into use without exposing himself in the least to the mechanism.

The switchboard is of white marble equipped with Keystone and Weston instruments. A detector bell is provided which rings when a circuit breaker opens and continues sounding until the circuit is closed. All wiring from the generators to the switchboard is carried under the engine room floor.

Adjoining the switchboard is the telephone booth and near it are a tool room, a dressing room and the office for the engineers.

The steam piping, which was completed under the direction of Mr. A. C. Thompson, consists of a main header with a branch for each engine turned from it, and a Bundy automatic trap for returning hot water drippings to the boilers.

In the boiler room are two 300-h. p. boilers, an American feed-water heater and two Snow pumps. Coal storage pockets are directly in front of the boilers, and coal is deposited in the pockets through a steel-lined chute leading from a railroad siding parallel

company's property, it will be used as a resort for picnicking in summer and skating in winter.

The car barn is located parallel to the railway near the power house. It is 250 x 50 ft., and contains four tracks with a shop and employes' room in the end nearest the power house; the

FIG. 5 ENTRANCE TO HAVANA GLEN.

building and pits are heated with exhaust steam from the power house, which is piped underground from the latter. The building and special work leading from it are lighted with enclosed arc lights; the pits and rooms are lighted with incandescence lamps. The sides of the pits are of brick and are built 2 ft. outside of and

FIG. 6 HARRISBURG 4-VALVE ENGINES IN POWER HOUSE.

to the building and some 45 ft. above the pockets. Coal is thus unloaded into the storage pockets without cost for handling. The stack is 125 ft. high; it is of steel, brick lined, and fitted with lightning rods.

Water for the plant was secured by damming a branch of Catharine River and laying a pipe with natural gravity flow to a well in the boiler room. Analysis of the water showed it to be first-class for steaming purposes. The water dammed back being on the

parallel to the tracks. The tracks are carried over the pits on trestles to allow space at the sides for light and ventilation.

The car equipment consists of 12 cars; four are similar to that shown in Fig. 8. Two of these four have smoking compartments, the other two having both baggage and smoking compartments. They are equipped with four G. E. 1,000 motors, K 11 controllers, Christensen automatic air brakes, and Wagenhals arc headlights. The interior is finished in cherry and mahogany; the seats are

of the walkover pattern, covered with rattan. They are lighted with four five-light clusters of handsome design; these cars are fitted with electric push buttons. Of the other eight cars, six are open 15-bench cars and two closed 28-ft. cars; they are equipped with Westinghouse motors and G. E. K-11 controllers, and have Syra-

FIG. 7 TELEPHONE ON POLE.

cuse changeable headlights. The cars are painted Pullman green with gold striping and each has the name of one of the towns on the route as well as the number. All cars have a tool box containing pliers, wrench, and trolley wire pickup for use in case of emergency repairs, or picking up broken trolley wire.

After the inspection and opening trip those present enjoyed an elaborate banquet at the Rathbun House, Elmira, as guests of the American Engineering Co.

The people along the line of route have shown their appreciation by their generous patronage, the present equipment being taxed to its utmost capacity since the opening of the road. Figs. 3, 4 and 5 show three of the most picturesque attractions along the route, Montour Falls at the end of Main St., in the village of that name, Watkins Glen, and Havana Glen.

The officers of the Elmira & Seneca Lake Railway Co. are: President, Gen. John E. Mulford, Montour Falls, N. Y.; vice-president, John Blair MacAfee, Philadelphia; secretary and treasurer, C. L. Hathaway, Horseheads; superintendent, C. F. Baldwin, Montour Falls; assistant superintendent, C. I. Furbay, Montour Falls.

The employes of the company are uniformed in cadet gray; conductors' uniforms are trimmed with gold, the motormen's with silver and other employes' with black. All have cap badges with name of occupation and number in enamel.

The fare for the trip from Elmira to Watkins is 35 cents one way; no reduction is made for the round trip.

We are indebted to Mr. D. A. Hegarty, general superintendent of the Railways Company General, of Philadelphia, for this article and the photographs from which the illustrations were made.

FORT WORTH-DALLAS ROAD.

We are advised by Col. J. T. Voss, president and manager of the Glenwood & Polytechnic College Street Railway Co., of Fort Worth, Tex., that the results of a survey made for an interurban line to connect Fort Worth and Dallas are quite satisfactory. From the terminus of the Glenwood & Polytechnic line to the end of the Dallas line at Oak Cliff is 26 miles. The route is tolerably close to the Texas & Pacific R. R. and to the Trinity River. There are no grades of more than 3 per cent and much of the way is almost level. The estimated cost, including provision for 24 cars, is \$425,000. Orders for machinery and cars will have to be

FIG. 8—FIRST CAR OVER THE ELMIRA & SENECA LAKE RY.

There are also four side-dump dirt cars and two center-dump dirt cars for construction purposes, also a hand-pump velocipede car with collapsing ladders for emergency work, as fixing line, etc.

Fig. 8 shows the first car to reach the terminus in Watkins; it carried invited guests, including prominent citizens of the towns along the route and officials of the railway, of the Elmira street railways and of the American Engineering Co.

placed at least four months in advance, but it is hoped that rails can be obtained much sooner.

The Consolidated Traction Co., of Pittsburg, makes a report for July showing gross earnings from operation of \$254,973; operating expenses of \$122,873; surplus of \$14,588 after deducting interest and dividends on preferred stock.

CONDUIT CONSTRUCTION IN PARIS.

The French Thomson-Houston Co. which has some important street railway concessions in Paris has recently constructed the roadbed for two underground conduit lines; one is from the Porte d'Asnières to the Ecole Militaire, and the other from the Porte l'Etoile to the Montparnasse Station. A third section will be built from the Montparnasse Station to the Bastille. With the completion of this last section there will be $7\frac{1}{4}$ miles of the conduit line serving the outer boulevards and some 80 cars will be run.

An interesting feature of the construction work is shown in the accompanying illustration which is taken from *La Nature*. The skeleton of the conduit consists of cast iron rings to which the slot

CRADLE AND CAR USED IN CONDUIT CONSTRUCTION.

rails are bolted; these rings are oval in section on the interior, with the major axis of $17\frac{3}{4}$ in. vertical; the minor axis is $13\frac{3}{4}$ in. After a number of the rings are in place sheet steel shields are placed inside and cement concrete poured about them. Manholes are placed at intervals of about 14 ft. After the steel forming sheets have been removed a man is introduced to do the necessary pointing and smoothing of the interior and as the space is quite confined the ingenious device shown in the illustration is used. A steel tray is hung, by cords passing through the slot, to a two-wheeled carriage riding on the slot rails, and the workman having taken his place on the tray is pushed along as he may direct.

ABOUT CRICKETS.

A newspaper story from Mishawaka, Ind., under date of August 18th reads as follows:

"Flying crickets, a species never seen in this locality before, struck the city tonight in myriads, filling the air and making life a burden for humanity. Concerts were discontinued, summer vaudeville performances abandoned, and mercantile establishments were forced to close. Thousands settling upon trolley wires broke the electric current for street cars."

When we asked Mr. J. McM. Smith, general manager of the Indiana Railway Co. which operates the electric line in Mishawaka for confirmation on the foregoing, he replied:

"This is simply another evidence of the fertility of the St. Joseph valley. I know of people who claim to have seen trolley cars stopped by blue monkeys and pink toads and vaudeville performances have been discontinued on account of flying high balls; but the crickets are new to me. I shall place this article in the hands of the society for the prevention of cruelty to bugs and let them work on the cheerful liar."

RUNNING A TRAMWAY.

Mr. R. C. Quin, borough electrical and tramway engineer for Blackpool, Eng., thus classifies the maintenance of an electric tramway system: 1. The maintenance of generating machinery. 2. The maintenance of cables. 3. The maintenance of overhead lines and poles. 4. The maintenance of track. 5. The maintenance of cars and motors. 6. The cleansing of cars. 7. The regulation of traffic. 8. The collection of fares.

The first five of these are within the province of the engineer.

EMPLOYEES' ASSOCIATION AT AUGUSTA, GA.

The employes of the Augusta (Ga.) Railway & Electric Co. on July 21st organized the Augusta Railway Athlete & Benefit Association. At the organization meeting 23 were enrolled, which number was within two weeks increased to 64; membership is limited to the Caucasian race. The officers are: President, J. H. Adams; secretary, J. S. Campbell; treasurer, C. O. Simpson, auditor of the company. The managing board consists of the officers and J. L. Lyen and Joseph Trommerhauser.

On August 10th a meeting of the association was held at which papers were read by Mr. Bagley, a motorman, and J. S. Campbell; both discussed the conductor and his duties. Following the regular business the prize fight bulletins were read. The association has a baseball team, which played a series of games for the benefit of the association on August 20th, 22d and 24th.

EASY MONEY EXPECTED.

The Wall Street Daily News quotes the president of a large Boston bank as follows:

"I do not see anything but easy money ahead, and one of the largest banking interests in New York, for whose judgment I have the highest respect, is of the same opinion. The New York banks are bound to further increase their surplus reserve through the redemption of the continued 2 per cent bonds. The great factor, however, making for easy money is the increased bank circulation. When the Government reduced its tax on circulation, based on the new 2 per cent bonds, $\frac{1}{2}$ per cent, and allowed circulation up to par of the bonds, the conditions making for easy money were at once evident to every student of the situation."

RECOGNITION OF BRILL AT PARIS.

Naturally the attention of all makers and users of manufactured products throughout the world is now directed toward Paris, where close competition upon merit is taking place, and they will be interested in the following announcements:

The Department of Civil Engineering and Transportation of the Paris Exposition has awarded the grand prize for the convertible open and closed car to the J. G. Brill Co., of Philadelphia, also a grand prize for the complete system of electric trucks made by the same company. The J. G. Brill Co. is noted in the United States and abroad for the excellence of its work, so that the awarding of these prizes by the committee of transportation was not unexpected. Such awards, however, again attest the appreciation of the Brill products in foreign fields.

It is interesting to note in this connection that at the International Tramway & Light Railway Exhibition in London, in June last, the Brill convertible car intended for the Leeds Corporation Tramways was considered the most remarkable of the entire exhibit and said to be the most complete convertible car ever made.

PECULIAR ACCIDENT.

Charles Sanders, a motorman on the Waukesha Line of the Milwaukee Electric Railway & Light Co., suffered an odd accident as a result of wearing celluloid. He reached over his front dashboard to throw the switch on, when an electric spark from the controller flashed on his celluloid collar and set it on fire. The inflammable material of which the collar was made blazed up instantly and Sanders' hands were badly burned in his attempts to tear the collar from about his neck. On each side of his face there is a line of burned flesh three inches in width and reaching half way round his throat. The collar had almost been reduced to ashes before he succeeded in getting it from off his neck. The injuries are painful but not considered dangerous. This accident gave rise to a report that the company would forbid the men to wear celluloid collars; Mr. T. E. Mitten, general superintendent, advises that this report is incorrect, however.

The Wilmington (Del.) & New Castle Electric Ry. last month began running cars to a new resort known as Riverside Park, two miles from New Castle.

IN THE POWER HOUSE

This department is devoted to the construction and operation of electric railway power houses. Correspondence from practical men is specially invited. Both the users and makers of power house appliances are expected to give their views and experiences on subjects within the range of the department.

The commonly accepted idea is that the efficiency of a steam boiler is seriously affected by an accumulation of scale. Perhaps the most often quoted estimate is that the presence of 1-16 in. of scale causes a loss of 13 per cent of the fuel burned, $\frac{1}{4}$ in. 38 per cent and $\frac{1}{2}$ in. 60 per cent. Recently we have seen published statements tending to show that the loss of efficiency due to scale has been greatly over-estimated.

Prof. R. C. Carpenter, of Cornell University, writing in the *American Electrician*, says that so far as he is able to determine by tests a lime scale, even of great thickness, has no appreciable effect on the efficiency of a boiler. A test which he conducted when the boiler was thickly covered with lime scale showed practically as good results as when it was perfectly clean. The explanation is that the heating capacity is affected principally by the rapidity with which the heated gases will surrender heat, as the water and metal have capacities for absorbing heat more than a hundred times faster than the air will surrender heat. Any deposit which curtails slightly the capacity of absorbing heat on the water side has very little effect either on total capacity or efficiency. A thin film of grease, however, being impermeable to water, keeps the latter from the metal and generally produces disastrous results.

Mr. Walter M. McFarland, formerly an engineer officer in the United States Navy, in the course of a lecture at Sibley College, Cornell University, stated his experience had been that a considerable thickness of clean uniform scale made apparently little difference in the efficiency of the boiler. On the U. S. S. *Vandalia* there were two boilers used for distilling water, and the water evaporated per pound of coal was no more when the boilers were clean than after three months when the scale was nearly $\frac{1}{4}$ in. thick.

On the other hand, there are recent tests showing that scale does reduce the efficiency. In May and June, 1898, Prof. L. P. Breckenridge, of the University of Illinois, made tests on a locomotive boiler before and after cleaning it of scale and found that the loss due to the scale was 9.55 per cent. The average thickness of this scale was 3-64 in.; analyses of samples taken from different points in the boiler showed from 20 to 67 per cent calcium carbonate and from 4 to 40 per cent calcium sulphate.

Also, copies of reports of tests sent us by the Union Boiler Tube Cleaner Co., of Pittsburg, show that there is a marked increase in the efficiency of the boilers after the scale has been removed. In one case the gain was 16.3 per cent and in another 24.8 per cent; the thickness of the scale was not stated.

In the eighth edition of "Helios," published by the Heine Safety Boiler Co., is an illustration of a boiler sheet that has been bagged by the use of oil in the boiler. The pocket formed was 4 ft. lengthwise of the boiler, 3 ft. girtwise and 9 in. deep. The boiler was nearly new and of good mild steel, as was shown by the 5-16-in. sheet stretching into the pocket which at the apex was only $\frac{1}{8}$ in. thick without any indication of fracture.

The inspector who examined the boiler said concerning it: "I found the boiler had been cleaned from preceding Sunday, and at that time a gallon or more of black oil had been thrown into it. Monday morning the boiler was fired up and was run through the day at a pressure of 90 lb. per sq. in. As six o'clock Monday night the engine was stopped, the drafts were closed, and no more firing was done until nine o'clock. Upon going to fire up at this time, the bulge was observed. From six to nine o'clock a pressure of only 40 lb. was carried. Upon examination I found the entire boiler saturated with this oil."

The action of grease or animal oil in a boiler is to form itself into drops which are carried about with the circulating water. After boiling for some time these drops become sticky and adhere to the metal of the boiler when they come in contact with it. Only a very

thin coating of grease is necessary to keep the water away from the heating surface with the result of bagging plates and leaking seams.

A mineral oil such as petroleum does not have this effect. Petroleum is extensively used to soften scale, but it is claimed that all volatile oils will corrode the boiler, engine and piping, with which they come in contact.

RECORDING STEAM ENGINE PERFORMANCE.

In our issue for February, 1900, page 72, we published an abstract of a paper by Prof. William Ripper, head of the technical department and professor of engineering at the University College, Sheffield, Eng., describing a continuous mean pressure indicator for steam engines invented by him. This indicator consists of an arrangement of valves and gages connected so that the pressure from the steam end of the cylinder acts on one gage and the pressure from the exhaust end of the cylinder acts on the other. By two throttling cocks the range of movement of the pointers on the gages is reduced to a small amount, without affecting, however, the accuracy of the indication. Thus the difference between the readings of the two gages is the mean effective pressure on the piston measured on a time basis. The ordinary indicator gives the mean pressure on a distance basis but Professor Ripper found that a constant correction factor would in most cases bring the mean pres-

POWER BOARD OF "SAXONIA."

sure as shown on his recording gage into substantial agreement with the indicator.

Professor Ripper has further developed his method and in the current number of the *Engineering Magazine* describes the practical application of the instruments in the engine room of the steamship *Saxonia*. This ship has quadruple expansion engines and each cylinder has a pressure instrument attached. For reducing the several mean pressures to the equivalent mean pressure on the low pressure cylinder several scales are arranged on what is called a "power board" with grooves and sliding buttons, each having two pointers, so that when set with one pointer at the mean effective pressure as indicated by the instrument, the other pointer marks on a parallel scale the equivalent pressure on the low pressure piston. Thus the distribution of work among the several cylinders of the engine can be noted at a glance. On the same board

COST OF POWER FOR ELECTRIC RAILWAYS.

Output Measured by Wattmeter in Each Case.

STATION	MONTH, 1900.	Monthly Output, Kilowatt-Hours.	Cost of Electrical Output per Kilowatt-Hour—Cents.						Gals. Cylinder Oil per 10,000 k. w. h.	Gals. Lubricating Oil per 10,000 k. w. h.	Lb. Water per Lb. Coal.	Lb. Fuel per k.w.h.	Price of Fuel per Ton of 2,000 Lb.	Kind of Fuel

is also mounted a slide rule for quickly computing the indicated horse power.

Professor Ripper also states that as in all throttling engines and in the low pressure cylinders of practically all types of condensing engines the mean pressure on the driving side of the piston is found to be directly proportional to the terminal pressure in the low pressure cylinder, and as the steam used per stroke (neglecting cylinder condensation) is proportional to the terminal pressure, the reading of the mean forward pressure gage on the low pressure cylinder is a very useful approximate indication of the weight of water used per stroke.

Concerning the limitations of the method it is said that all instruments should be standardized by comparison with an ordinary steam engine indicator at light, medium and heavy loads. For mill engines no correction is necessary for the low pressure cylinder, but in the high pressure cylinder when there is a good compression the readings are 5 per cent high at .2 cut-off, varying to 2½ per cent low at .7 cut-off.

On locomotive engines and compound non-condensing engines, which types have a large compression, it is necessary to standardize the instrument for light loads.

and can be taken to pieces and overhauled. Unexpected and rapid overloads must be able to be supported by the traction plant, which is not generally the case in lighting. In a traction station it will be seen that a far greater figure is cut by the cost of generation pure and simple than in a lighting station, and that the question of interest on capital expenditure and sinking fund is relatively smaller in the former than in the latter. The following figures, which are the result of actual experience, may be of interest, and show the influence of continuous running on the cost of production:

	Cost in pence per Board of Trade unit.			
	Lighting.		Traction.	
	d.	d.	d.	d.
Fuel	0.3	to 2.2	0.09	to 0.5
Oil, waste and stores.....	0.05	to 0.38	0.005	to 0.2

Maintenance	0.054	to 0.6	0.0025	to 0.06
Total	0.684	to 4.78	0.1275	to 1.16

SOME GENERAL CONDITIONS GOVERNING POWER STATION DESIGN.

From a paper by Philip Dawson read before the Light Railway and Tramway Conference, London.

Where a lighting station is already in operation it is not desirable to combine with it a traction plant, but if a new station is to be built, and is designed by experienced traction engineers for combined traction and lighting, good results may be expected. It may be of interest to consider what are the differences between a station designed for lighting and one designed for traction and power transmission. The average number of hours per annum during which a lighting station will be running full load will probably never be equivalent to more than three months' continuous running per annum, that is to say, taking the Board of Trade units (kilowatt-hours) generated in one year and seeing how long the plant under consideration would have to run its full capacity continuously to generate this amount, this time would probably never exceed three months. Taking a representative traction station, the time of continuous running would probably be at least nine, and in some cases ten and even eleven months. A lighting plant must in three months earn enough money to pay working expenses and to pay interest and allow for depreciation and sinking fund for a whole year, whereas a traction plant has nine to eleven months in which to do the same thing. A lighting plant is on an average practically at a standstill 18 hours a day, while a traction plant is running 18 to 20 hours a day. Economical boilers, engines, and electrical generating and transmission devices are therefore far more important in a traction than a lighting plant, because it is well known that running at very light loads and keeping the fires banked and the boilers, steam pipes, engines, etc., hot, uses very nearly as much fuel as running at full load. Furthermore, whereas in a lighting plant there is ample time to overhaul the plant and execute necessary repairs, the men during the day have little or nothing to do and can easily do this work, in a traction plant there is little or no time to do this. The conditions are quite as, if not more, arduous than on a ship. There at least every few days or few weeks the whole plant is shut down for several days,

The difference which exists between a plant working practically continuously and only intermittently is at once seen in the average amount of coal consumed per unit generated. The type of engine used must, however, also be taken into consideration. Thus, taking the published results of British electric light plants, we find that the cost of coal per unit generated varies approximately between 0.3d. and 2.2d. Comparing this with traction plants, we find the cost of coal varying between 0.09d. and 0.50d. per unit generated. Again, considering the item of wages and salaries in a lighting station, we have 0.3d. to 1.6d.; in the case of traction this is 0.03d. to 0.40d. per unit. Comparing the total cost of production of one Board of Trade unit generated in a lighting station and in a traction station, interest and sinking fund excluded, in the former the unit varies from 1.00d. to 4.00d. as compared with 0.25d. to 1.00d. for traction purposes. The cost of power when generated for traction and power purposes is one-quarter of that when generated for lighting only. The amount to be added for interest and sinking fund of course depends on the length of the concession, on the terms of final purchase, and on the life of the machinery employed. The cost of producing power varies with the amount to be produced, decreasing as the amount increases. This shows the advisability of concentrating as much power as possible in one station, and reducing the number of units. In considering the various items which go to make a complete power or traction installation, including the system of feeders, distributors, track and overhead line, the cost of the power station is but a comparatively small item. The saving which can be effected by a properly designed station is very great, and a little extra capital expenditure is in many cases well justified. The total cost of running an electric tramway or railway varies between 2.50d. and 8.00d. per car-mile, according to circumstances: the electrical energy at the power station required varying from 0.49 units to 1.4 units per car-mile, according to the profile of the line and the weight and speed of the cars. The cost of power varies between 10 and 30 per cent of the total working expenses, all charges included, and if it can be reduced by 3½d. to 1d. per unit, or we may say per car-mile, as one unit at the switchboard is a fair estimate of the average power requisite at the switchboard per car mile, it is well worth doing. In the early days, before polyphase high-tension currents were known, the situation of the central station was practically imposed, very little latitude being possible owing to the maximum

distance of economical transmission being limited. Electricity works being most required in crowded centers, it was not only difficult to obtain a site at all, but the cost of the ground was very great, hence the necessity of crowding the greatest amount of power into the smallest possible space. The plants being mostly used for lighting, and only running a few hours each day, highly economical engines and boilers and labor-saving appliances were of but little advantage. At present, circumstances have altered; electricity can economically be transmitted to any distance, and is utilized—and will be more and more so every day—first for power purposes, and secondly for lighting purposes. The initial cost of a plant may be roughly divided into four parts—land and buildings, plant, including machinery in station, mains, feeders and distributors, miscellaneous, which includes such things as meters, instruments, cost of Provisional Order, and such like. According to Mr. Emile Garcke's figures in the "Manual of Electrical Undertakings," the average cost of existing British plants expressed in percentage of total capital expenditure is approximately as follows:

	Per cent.
Land and buildings.....	19 to 23
Machinery and plant.....	35 to 37
Various remaining items.....	4 to 14

As regards the first item, the above average includes several old lighting stations, and there is little doubt that if a new plant were installed the cost of land could be materially reduced. The question of system of generation, whether in several large stations generating continuous current or in one large station generating either continuous or polyphase current, is of great moment. As stated previously, in a traction station much greater capital expenditure is justified, and coal handling appliances can be installed which enable one or two men to look after the largest boiler room. Automatic lubricating systems and ash conveyors, etc., enable one or two men to be sufficient in the largest engine room. It will be evident that the item wages and salaries will be far greater in several than in one station. The waste of coal, etc., also will be far greater. From a careful study it is nearly certain that for anything above 5,000 kw. capacity, one polyphase station, operating rotary converter sub-stations is the best. Large units are also always advisable. It interests me to see that the sizes of units which I recommended several years ago are generally being adopted. For reference it may perhaps be advisable to append this table:

SIZES OF ENGINES RECOMMENDED FOR USE IN POWER STATIONS.

Maximum power required.		Number of engines.		Power of each engine.
L.H.P.				L.H.P.
200	2	200
400	3	200
600	3	300
1,000	3	500
1,500	4	500
2,000	4	750
5,000	6	1,000
10,000	6	2,000
20,000	6	4,000
40,000	9	5,000
60,000	11	6,000
90,000	10	10,000

All engine builders who have had experience in tramway work now make an entirely different kind of engine for traction from that which they supply for lighting stations. The conditions under which a tramway engine works are, if anything, more onerous than those of a rolling mill engine. A slight variation, either in number of revolutions per minute or in angular velocity per revolution, is of the greatest importance in a traction station, whereas it is of small importance in a rolling mill. A uniform speed is especially important where compound wound generators are run in parallel direct on to the line. If the momentary difference in speed between two engines exceeds very narrow limits, the voltages of the machines differ, and cause very heavy currents in the equalizing bars, and largely increased core losses, hence great waste. If the difference becomes too great, one of the generators may even be reversed. Where multiphase machines run in parallel, constant speed is of even greater importance to keep the machines in step. In cases where shunt wound generators with heavy batteries of accumulators run in parallel on the line, the question of engine regulation is not so important. A traction

station where compound wound dynamos are used should be so arranged that if the normal load be suddenly thrown on or off an engine, the speed shall not vary more than 2 per cent either way. In some cases a maximum variation of 1½ and 1¼ per cent is all that is allowed. Where polyphase currents are used, constant speed is of even greater importance, and a guarantee should be required that under no circumstances shall the angular velocity during one revolution vary more than 1 per cent, and in some cases not more than half of 1 per cent. With heavy fly-wheels and governors properly designed for tramway work, it is quite practicable to fulfill the above conditions. Or, expressed in a different way, in polyphase work the engine should not produce by variation of angular velocity a phase displacement of more than 5 degrees per half-cycle. From careful comparison of many existing systems it may be taken that the total cost of power, all fixed charges included, for one large station as compared with that for two or more smaller stations together equal in power to the larger one is from 30 to 75 per cent lower.

WAINWRIGHT EXPANSION JOINTS.

Expansion joints may be divided into two classes. One class comprises all joints which have bearing or rubbing surfaces which slide one upon the other; this class includes ordinary slip joints, all forms of ball and socket joints, finished slip joints with steam engine stuffing-box fit, and balanced joints. In the other class are the expansion joints which depend upon the bending of metal for their action, and in this class are copper bends and various forms of the Wainwright expansion joint.

The construction of the Wainwright joint is very well shown in the illustration. There are two heavy end flanges to which are fastened the flanged ends of a corrugated tube of soft copper. Inside of the corrugated tube is a straight tube of hard copper fastened to brass rings at its ends, and on this are carried the inside equalizing rings which are of cast iron. Outside the corrugated tube are other rings, made of cast iron on large joints and brass on the smaller sizes. The Wainwright joint depends for its action on the bending of the copper in the corrugations and the equalizing rings ensure

WAINWRIGHT EXPANSION JOINT.

that no one corrugation shall do more than its share of the bending, so that when once properly installed the joint will last a long time. It requires absolutely no attention when once put in position.

Each corrugation will provide for 3-16 in. motion, or ¼ in. under favorable circumstances if occasion require. The regular sizes vary from 12 to 30 in. in length and arc for pipes from 1½ to 16 in. in diameter; one joint will take care of the expansion in 100 ft. of steam pipe under ordinary variations of temperature.

Mr. Wm. R. Billings, treasurer of the Taunton Locomotive Manufacturing Co., Taunton, Mass., to whom we are indebted for the data, writes us that the business in these joints has increased very rapidly since the improvements found in the equalizing rings and slip tube were applied. The largest joints the company has ever made of this pattern are of a nominal diameter of 30 in., and were made from 32-in. seamless drawn copper tubes, for use in the power station of the Metropolitan Street Railway Co., of New York City.

SOME ENGLISH POWER RECORDS.

We have received from the British Electric Traction Co. the accompanying diagram showing the Board of Trade units, or kilowatt-hours, generated, the car miles run and the kilowatt hours per

The effect of the Saturday half-holiday in increasing traffic is very marked on the Oldham, Ashton & Hyde line; on the others the fact that the service is so fully occupied during the week is believed to make the relative increase on Saturdays small. The effect of snow in increasing the current consumption per car mile is two

POWER HOUSE DIAGRAMS FROM THREE ENGLISH RAILWAYS.

car-mile for each day from Dec. 1, 1899, to Mar. 31, 1900, on three of the electric railways operated by that company. The total units generated includes the current used about the power house and the car-mileage is the paying mileage only. Snow days are indicated by the oblique shading, foggy days by the word "Fog" and Saturdays by black dots.

fold, the resistance offered to the cars is greater and the mileage of snow plows not being counted further increases the current per paying car. Fog also increases the current consumption probably because of the cautious operation necessary. The low average for the Kidderminster line is believed to be due to it having fewer curves and easier grades than the others.

Electric Traction on Main Railways.

A Portion of the Report Made to the International Tramway Congress at Paris in 1900.

By N. H. HEFT.

Col. N. H. Heft is well known to American street railway men by virtue of the work he has done as chief of the electrical department of the New York, New Haven & Hartford, R. R., and as president of the Meriden Electric Railroad Co., of Meriden, Conn., and no one is better qualified than he to prepare a report on the subject assigned to him. His subject was "Electric Traction: A. On Main Railways. B. On Light Railways." At this time we give only the first portion of the report. Our readers will of course recognize the term light railway as synonymous with street or interurban railway.

Experiments with electric traction on main lines of steam railroads in the United States were begun in the early part of the year 1895. The managers of steam railroads were forced to take up these experiments on their systems, owing to the great inroads made in their passenger receipts, due to competition of the light electric railways, which, in some localities, amounted to 80 per cent. These light railways brought a new factor into the transportation problem, and one with which the steam railroad managers were wholly inexperienced.

With their tracks laid in the public streets of cities and extending to suburban and even interurban districts over public highways and private right of way, and, owing to their close proximity to homes and places of business, with frequent service and cheap fares, they had demonstrated that such a system of transportation was much more attractive to the traveling public than the one furnished by the steam railroads, and not only seriously affected the regular passenger business of the steam railroads, but created a pleasure traffic wholly their own. This convinced the steam railroad managers that they must turn to electric traction in order to retain their passenger traffic, and compete with the light railways. A second method of dealing with this new factor has been to purchase the control of certain light railways which were likely to form part of an extensive parallel line. This has been done by several steam railroad companies.

Charles P. Clark, president of the New York, New Haven & Hartford Railroad Co., was fully convinced, as early as 1891, as shown by his report of that year to the stockholders, that the only effective way of checking this competition was to equip the lines affected with electric traction. He advocated equipping a branch line, to demonstrate what could be done with electric traction on a standard steam railroad, with a standard steam railroad equipment, operated under standard steam railroad rules. This makes him the pioneer in electric traction as applied to steam railroads.

The New Haven system differs from every other important railroad property in this country, (a) in the immense volume of its passenger traffic, (b) in the large percentage of passenger revenue to total revenue, (c) in the large percentage of local revenue to total passenger revenue, (d) in the density of population in the territory served by its lines and (e) in the small area of that territory as compared with the mileage of the system. The company carried nearly 61,000,000 passengers in the year ending June 30, 1898, and the revenue amounted to over \$17,000,000 from its passenger department, equivalent to over 51 per cent of the revenue from all sources. The system provides regular transportation facilities for about 6,000,000 people, and the density of population in Massachusetts, Rhode Island and Connecticut, in which nearly all its mileage is located, is 260 inhabitants per square mile—greater than that of any other state or section in this country. In spite of the fact that it controls nearly 3,000 miles of track, the system, from New York to Boston, can be travelled in five hours.

Within its territory are found the two great cities of New York and Boston, with rich suburban residential areas tributary to their business centers, five other important cities with suburbs, and no less than 65 independent cities and towns of greater or less importance for manufacturing or residential reasons.

Owing to the close proximity of the cities and towns in its territory, the New Haven system had been seriously affected by this competition. The gravity of the situation was such that, in November, 1894, the management of the New Haven road authorized the introduction of electric traction on the Nantasket Beach branch, the first installation of electric traction on a standard steam railroad. This was completed May 20, 1895.

At this time the Pennsylvania Railroad Co. felt the effects of similar competition, and, in 1895, authorized Pres. George B. Rob-

erts to introduce electric traction on the Bordentown and Mt. Holly Branch of its Amboy Division. This installation was completed in July of the same year.

In the same year the Baltimore & Ohio Railroad Co. had completed its tunnel under the city of Baltimore, and, in order to avoid the objectionable smoke and gases inseparable from service with steam locomotives, it decided to introduce electric traction on its belt and tunnel lines in the city of Baltimore.

In considering the application of electric traction to main lines, railway managers are confronted with the following questions, to which your reporter appends answers, based on the experience of various roads on which electric traction has been introduced:

1. Can electricity be substituted for steam as a motive power on main lines of steam railroads?

Yes. But the value of electric traction on main line steam railroads is wholly dependent on the style of equipment, manner operated, location of power station, method of power distribution and train service, and distribution of population in territory covered.

2. Can a main line so equipped be operated under the same rules as govern on standard steam roads?

Yes. The New York, New Haven & Hartford is operating by electric traction 6.95 miles of double track, overhead trolley, from Nantasket Junction to Pemberton, 11.51 miles of double track third rail from Braintree to Cohasset, 3 miles of double track third rail from Berlin to New Britain, 18.6 miles of single track third rail from Hartford to Bristol and 8 miles of single track, overhead trolley, from Stamford to New Canaan.

The Pennsylvania Railroad Co. is operating 8 miles of double track, overhead trolley, from Bordentown to Mt. Holly.

The Baltimore & Ohio Railroad Co. is operating 4 miles of double track, overhead trolley, in the city of Baltimore.

All the lines named above are operated under the same rules as govern the operation of steam trains on the other portions of the systems.

a. Schedule speed has been maintained during times of heavy travel and frequent service.

b. Train service has been reliable, and to a certain extent trains have been able to make up time.

3. Can same weight of train be operated?

Yes. Trains of the same weight have been operated by the three following methods:

a. By using specially designed locomotives, as is done by the Baltimore & Ohio. This method has the disadvantages of great concentration of weight on roadway, and low efficiency when operating light trains. Where the service is infrequent or largely of freight, or where it covers a section of main trunk line through service, such as that on the Baltimore & Ohio R. R., then this equipment is the most desirable.

b. By equipping standard passenger coaches with motors on one or both trucks and using these cars as locomotives to haul passenger trains. This style of equipment is used on the Highland, Hartford and Plymouth Divisions, and New Canaan branch of the New York, New Haven & Hartford; also on the Bordentown and Mount Holly branch, Amboy Division of the Pennsylvania. Where the service is frequent and light, schedule speed moderate, and station intervals sufficient to allow trains to reach full acceleration, it has been demonstrated that this service can be operated satisfactorily. The simplicity and low first cost makes this equipment desirable for this service.

c. By equipping all or part of the coaches with motors mounted on motor trucks, and operating them in trains controlled from the first, or any of the motor cars, as is done on the South Side Elevated R. R., of Chicago. Where the conditions of operation require the maintenance of high schedule speed with frequent stops,

the problem resolves itself into one of acceleration and braking. These conditions are found mostly on the elevated railways of our large cities.

4. Can existing train schedules be maintained?

Yes. The service operated by electric motors on the Nantasket Beach Branch of the New York, New Haven & Hartford during the summer of 1897, was the fastest ever operated over this branch, and one that could not have been operated with steam locomotives, as was frequently demonstrated during that year. This service is shown by the following official schedule.

	Distance.	Sta- tions.	Schedule time.	Average speed.
Steam, 1894 . .	6.95 miles.	10	25 to 35 minutes.	16.7 to 11 m.p.h.
Electric, 1897. .	6.95 —	16	21 —	19.8 m. p. h.

5. Can stations be added without loss of schedule speed? Yes.
6. Can a train of a given weight be accelerated more rapidly?

Yes. Owing to the steady torque of electric motors, at least 15 per cent of the weight on drivers is available for starting effort.

The tests of the Baltimore & Ohio electric locomotives, which weigh 96 tons each, have shown a draw bar pull of 60,000 lb. on a dry rail, corresponding to a traction coefficient of over 30 per cent. Tests on a steam freight locomotive with 146,000 lb. on drivers show a maximum draw bar pull of 30,000 lb., corresponding to a traction coefficient of 20 per cent or two thirds of that developed by the electric locomotives.

A standard combination coach on the Plymouth Division of the New York, New Haven & Hartford, equipped with four motors of 175 h. p. each, aggregating 700 h. p. and weighing complete 50 tons, developed 12,000 lb. with an over load on the motors of only 25 per cent. Allowing a starting effort of 300 lb. per ton weight of train, such a car could accelerate to a speed of 30 miles per hour in 10 seconds, or allowing 90 lb. per ton weight of train, could accelerate a train of 130 tons to a speed of 30 miles per hour in 30 seconds.

A train of individual coaches each completely equipped with motors on all axles, operated from one control, would give the maximum acceleration possible, i. e., that of a single unit with all its weight on the drivers.

7. Can an effective system of brakes be applied?

Yes. The Pennsylvania Railroad Co. uses the full Westinghouse air brake equipment; the Baltimore & Ohio Railroad Co. uses the Westinghouse; the New York, New Haven & Hartford Railroad Co. uses the Westinghouse and the Christensen brake with satisfactory results.

8. How will the electric air compressor compare in reliability and economy with the steam air compressor?

The Westinghouse, General Electric Company and Christensen air compressor have all proved reliable and fully as economical. The compressor, when using motors under car bodies, is placed on the platform of the open, in the baggage compartment of the combination and suspended under the closed coach, thereby allowing the motor car to be operated either as a single car or as a locomotive for drawing trains.

9. Can trains be provided with equally satisfactory train signals?

Yes. Whistles of the same power are blown from the air-braking reservoirs, and have proved satisfactory. Locomotive bells or heavy gongs are placed on cars and run either by foot or hand-power.

10. Can motor cars be equipped with pilots and headlights, complying with the statutory rules and regulations governing railroads?

Yes. The pilots can be attached to truck or coach body. Both electric and oil headlights are used, and are satisfactory. The New York, New Haven & Hartford uses oil in place of electric lights, owing to the loss of current when passing over grade crossings, where the third rail conductor is cut out.

11. Can trains be operated over third rail during snow and ice storms?

Yes. The operation of the third rail section of the Highland Division of the New York, New Haven & Hartford during the last two winters has proved that passenger coaches equipped as electric locomotives, with nose plows and brushes, can handle snow as efficiently as steam locomotives with plows. The third rail is kept clear of snow by steel brushes mounted on the trucks ahead of the contact shoes. Ice, which gathers on the third rail during sleet storms, has proved more difficult to handle. Experience on this same division has shown that the use of a zero oil sprinkled on the

third rail from the trams, prevents the ice from freezing to the rail, so that it can be removed by the stiff steel brushes.

12. How will cost of operation be affected by more frequent service of lighter trams?

The service on the Highland Division of the New York, New Haven & Hartford is frequent, with light trams, while the service on the Berlin Branch is not so frequent and with heavier trams. A fair answer to this question will be a comparison of the train miles run on each Branch and the cost per train mile.

Daily train miles, Berlin Branch = 66.

Daily train miles, Highland Division = 737

Cost per train mile, Berlin Branch = 30.0 cent.

Cost per train mile, Highland Division = 12.5 cents.

13. How will cost of operation be affected by the form of power transmission? a. By overhead or underground trolley? b. By simple or sectional third rail? c. By direct or alternating current? d. By static or rotary transformers? e. By direct or alternating current motors?

The local conditions govern the form of power transmission.

a. The overhead trolley form has proved to cost more to install and maintain than the simple third rail, and to be less economical to operate. The first cost of the underground trolley and the difficulties encountered in drawing make its use prohibitive on main railways.

b. As the simple third rail, charged throughout its length, has been the only form in use on main lines, no data as to the economy of the sectional or safety third rail can be obtained.

c. On main railways, where the distribution of power does not exceed a distance of ten to fifteen miles, the direct current has proved economical. In lines where power must be transmitted over a greater distance than 10 to 15 miles, the alternating current should be used.

d. When alternating current motors can be designed to give a satisfactory starting torque, then alternating currents may be transmitted from the central stations through static transformers direct to the motors. At present transmission with alternating currents requires the use of rotary converters for conversion to direct current when delivered to the working conductors.

e. When the development of the alternating current motor shall enable it to compete with the direct current, then there will certainly be a large saving for transmission over long distances, and the equipping of main trunk lines will follow.

14. How will cost of motive power per train mile with motor cars compare with steam locomotives?

A comparison of the figures obtained from the operation of the several power stations, and from the performance sheets of steam locomotives of the New York, New Haven & Hartford shows the cost of motive power per train mile to be as follows: Steam locomotives equals \$0.10 to \$0.24. Highland Division equals \$0.064. Nantasket Beach Branch equals \$0.1441. New Canaan Branch equals \$0.0783. Berlin Branch equals \$0.1406.

The cost of electric motive power, shown above, includes the operation and maintenance of power stations, the maintenance of motors and other equipment on the cars, oil, grease and waste used on the cars, and the wages of the motormen who operate the cars. The cost of steam motive power includes fuel, oil and waste, maintenance of locomotives and the wages paid the men who operate the locomotives.

15. How will cost of operation per train mile with motor cars compare with steam locomotives?

The total cost of operation per train mile with electric motor cars (excluding interest and depreciation), on the New York, New Haven & Hartford is as follows. Berlin Branch equals \$0.3032. Highland Division equals \$0.1255. Nantasket Beach Branch equals \$0.2925. New Canaan Branch equals \$0.1754. Figures for operation with steam cannot be obtained.

16. How will cost of tram labor compare?

Cost of tram labor per train mile as shown from operation with electric traction on lines of the New York, New Haven & Hartford is as follows: Berlin Branch equals .18. Highland Division equals .027. Nantasket Beach Branch equals .0829. New Canaan Branch equals .063. With steam, per train mile, about .12

17. Can trains be shifted at stations and yards as quickly?

Yes. When operated by third rail, motor cars can be run around train without turntable or other delay. When operated by overhead

trolley a slight delay is caused by the necessary shifting of the trolley.

18. Can trams be run over frogs and through yards at same speed?

Yes, when operated with third rail system. With overhead trolley system, provided the trolley is looked after and kept on the wire when passing through overhead frogs.

18. Can coaches be economically heated, and how would cost compare?

No. Experience has shown in the New England States, during the average winter weather, that a coach 60 ft. in length will require from 6 to 12 kilowatts, and figured at the rate of one cent per kilowatt-hour, costs from 6 to 12 cents per hour. With the temperature at zero, the cost would be 18 cents per hour. From the best data received, the cost of heating the same coach with steam from locomotive in ordinary weather would be 2 cents per hour; zero weather, 3 cents per hour.

19. Can coaches be satisfactorily lighted, and how would cost compare with oil or gas?

Yes. The New York, New Haven & Hartford places 30 lamps of 16 candle power in a 60-ft. coach. These lamps would consume 1,500 watt-hours. At one cent per kilowatt hour the cost would be 1½ cent per hour, and, taking into consideration the cost of necessary attention, with oil or gas, would be fully as economical and more desirable.

20. Will the use of electric traction increase or decrease wear on tracks per train-mile run.

With electric locomotives or motor cars of equal weight, the wear on service rails would be less, due partly to the rotary application of the power, and partly to the fact that with the electric motors no dead weight need be carried outside of weight on driving wheels necessary for traction.

21. How will passenger receipts be affected by more frequent service of lighter trains?

The receipts will be increased, as shown by a comparison of the number of passengers carried by the New York, New Haven & Hartford on the Nantasket Beach, Highland, Berlin and New Canaan Branches, with steam trains, and electric trains with more frequent service.

	Steam.	Electric.
Nantasket Beach	304,292	702,419
Highland Division	387,695	1,060,617
Berlin Branch	267,936	241,207
New Canaan Branch	98,302	184,728

22. What kind of coach will be most satisfactory to the traveling public?

The local conditions govern as to the most desirable coach.

For summer travel the open car is most desirable, provided speed does not exceed 20 miles per hour.

For spring, fall and winter travel the closed coach with cross seats, center aisle, toilet room and water coolers.

On lines traversing the sea shore the open coach is most desirable. The ideal coach is one that can be changed at will from an open to a closed coach. To meet the views of President Clark, who has long been a believer in the use of coaches of less weight for suburban and branch lines, and of such a design as would make the same available for both summer and winter service, the New York, New Haven & Hartford has designed such a coach for service on its Providence, Warren & Bristol Branch, now being equipped for electric traction.

23. Maximum speed at which to run open cars?

Not to exceed a train schedule of 14 to 15 miles, including stops, with a maximum speed of 20 miles per hour between stations.

24. Will electric traction on main lines between towns and cities, with frequent service, higher speed, and equal fare, be more attractive than the light railways which parallel the steam lines, cover the same terminals, take up and leave passengers at their own doors, but consume more time?

Yes. Experience on two main steam railroads shows that after the substitution of electric traction, they have not only regained the lost travel, but have made monthly gains during the last two years; showing that the passenger will travel by the shortest route, even when other conditions are not equal.

25. What is the maximum distance that power can be transmitted economically by direct current?

Ten to 15 miles under ordinary conditions on main lines.

26. What is the maximum voltage allowable in the working conductor when using direct current?

Experience with third rail systems has demonstrated that 700 volts can be maintained on the working conductor without giving trouble. With voltage exceeding 700, arcs and short circuits are hard to prevent. Owing to difficulties of motor insulation and commutation with voltages much higher than 700, the same limit may be taken for all forms of working conductors.

27. Can freight trains be operated?

Yes. The Baltimore & Ohio Railroad operates all passenger and freight trains passing east and west through the city of Baltimore over the main trunk line, and your reporter is advised that the service operated is satisfactory from every standpoint.

The Erie Railroad Co. leased its branch line between Buffalo and Lockport to the Buffalo & Niagara Falls Electric Railway Co., which has been operating a freight service with special electric locomotives. The management reports that this service is operated, in connection with passenger, mail and express, most satisfactorily.

There are several other railways operating a freight service with equal success.

Trains of 15 to 20 cars, each loaded with 30,000 pounds of freight, are operated on the Buffalo & Lockport line.

28. What should be the location and equipment of motor car house?

The motor car houses should be located at the most central point, preferably close to the power station; this will allow the use of either steam or electricity for power required in the maintenance of motors and cars. The design should provide for the repair shop being placed under house tracks, provided with power hoists, so arranged that motor cars can be run over them. Power jacks should be provided to lift coach body from trucks, to permit cable and brakes to be quickly disconnected and allow the dropping of the trucks into the repair room below. The motors and trucks being interchangeable, this arrangement allows the replacing of motors or trucks with a minimum loss of time. The repair shop should be provided with tools for making repairs only, it having been found to be in the line of economy to purchase repair parts from the manufacturers.

29. Are motors satisfactory?

Experience in the use of heavy railway motors is limited to the past five years, and there are but few distinct types. The first motors followed the light railway practice by the adoption of four poles instead of two. These motors were so wound as to produce two salient and two consequent poles. The motor frame completely enclosed the armature, and no provision was made for ventilation. The bearings were insufficient in size, the journal brasses or linings were badly designed, and the methods of lubrication were crude. The air gap, or distance between the armature and the pole faces, was so small that a slight wear on the armature-bearing brasses was sufficient to allow the former to drop down and come in contact with the lower pole face, which immediately disabled the motor by burning out the armature. The experience of the railway managements, operating these motors, quickly developed the above defects, and their demands upon the manufacturers resulted in the design of a motor with increased power, with four salient poles, a much larger air gap, greatly improved journal boxes, and a method of lubrication which is satisfactory. In the method of ventilation, and the general design of the gear cases, there is room for radical improvement. These motors are geared to the axles by a single pair of gears, but in the heaviest type of electric locomotives the armatures are mounted directly upon the axle.

The experience gained in the operation of heavy electric railway motors shows that the work that they are called upon to perform is even more severe than that required of steam locomotives. They are required to attain an equal if not greater schedule speed. The number of miles run per day is from 200 to 400, which is much more than is required of any steam locomotive in regular service. With such conditions existing, it is evident that the strictest care must be exercised in the design of the mechanical details of motors and in their maintenance.

30. Are motor trucks satisfactory?

In the design of a motor truck, special attention should be paid to strength of frame, size and composition of wheels, dimensions of axles, springs, brakes and the motor suspension. A motor truck carrying two heavy motors in some cases weighs 25,000 lb.

The wheels should be standard, with steel tires. It should not be

forgotten that, as these trucks are to do the work of steam locomotive, the axles should be of proportional strength. Experience on the New York, New Haven & Hartford with light axles, considered to be of ample dimensions for the required service, demonstrated to the management that the motor axles must be increased in size. The standard axle adopted by this company for motor trucks is 8 in. in diameter at gear wheel hub, and $6\frac{1}{2}$ in. at motor bearing and wheel fit with journals $5\frac{1}{2}$ x 9 in. These axles are oil tempered and have a $\frac{1}{2}$ -in. hole through the center.

The brakes should be arranged without a brake beam, for convenience in inspecting motors.

The form of motor suspension is of great importance. The ordinary method used on heavy roads is to hang the rear end of the motors in journals on the axles, while the front end is supported by springs attached to the bolster of the truck. This method has serious disadvantages. The truck springs, having to support half the weight of the motors, as well as the coach body, are necessarily made larger and heavier than usual. The uneven strain on these springs, in addition to their being unnecessarily heavy for the coach body, produces a rigidity, causing the coach to ride with discomfort when partly loaded. The motor suspension now used by the New York, New Haven & Hartford differs from the above in that the motors are supported entirely by the axles, no part of their weight being carried by the truck frame or the springs supporting the coach body. This is accomplished by the use of two equalizing suspension bars which extend from one axle to the other beneath, and on each side of, the motors. These bars are supported at their ends by links, which are held by lugs cast on the motor frames, directly under the motor axle bearings.

With the present railway motors, it has been demonstrated that either heavy or light trains can be operated over the same tracks, and can perform any service required of the steam locomotive. These motors can be mounted on trucks, with either one or two motors on each truck. The coach then becomes the locomotive. Its whole weight is available for traction, and, in addition, it has a seating capacity equal to any coach operated with the steam locomotive. A coach such as is used on the Highland Division of the New York, New Haven & Hartford, having a seating capacity of 70 passengers, equipped with two motors on one truck placed under one end, and using a standard passenger truck on the other end, can be used as a single car during the hours when travel is light, with trail coaches added as required during the hours of heavy travel. Two coaches in addition to motor car are used on this line, making a train weighing 161,000 lb. and operating a train schedule of 30 miles per hour, including stops. The seating capacity of such a train is 174 passengers. With two motors on each truck placed under such a coach, we have a locomotive with 100,000 pounds on drivers, and a total weight, including passengers, of 110,500 pounds available for traction, when carrying 70 passengers.

A comparison with a standard steam locomotive designed for suburban service is of interest. It shows the total weight to be 166,000 lb., with 72,000 lb. on drivers, leaving 94,000 lb. as dead weight, and not providing any passenger seating capacity.

The results obtained with electric traction on main line railroads demonstrate that the present application of this power is no longer experimental; that it will rapidly supersede steam on lines where travel is heavy and congested, and where, for economy in operation and increased passenger receipts, a frequent service is necessary.

This mysterious and silent power will undoubtedly continue to grow in popularity, taking an advanced position among the known motive powers of the world.

NEW TRAMWAYS FOR LONDON.

The London County Council proposes to promote a bill at the next session of Parliament to authorize the building of $28\frac{1}{2}$ miles of electric tramways. All of the proposed lines which will be connected with the present system of the Council are to be operated electrically; on the other lines which connect with the road leased to North Metropolitan Tramways Co. horses will be used.

The rail breaking machine designed by Mr. George W. Baumhoff, general manager of the St. Louis Transit Co., is now being used in tearing up the Broadway cable line. This machine was illustrated in the "Review" for January last, page 39.

NEW TYPE OF LIGHTNING ARRESTER.

The accompanying illustration shows the several parts of a new type of lightning arrester which is known as the Wood's arrester and is made by the Central Union Brass Co., of St. Louis, for which the Central Electric Co., Chicago, is general selling agent. The arrangement of the parts when assembled will be readily understood from the description. The shell is of seamless drawn brass tubing and at the bottom of this shell is placed the porcelain piece shown in the center of the cut. The socket with two set screws, on the right of the cut, is then placed through the porcelain plate and on top of this the composition rod. On top of the rod is placed a porcelain cup with corrugated edge, next is the small porcelain button seen in the upper corner of the illustration. The cap with a

WOOD'S LIGHTNING ARRESTER.

corrugated cup inside is screwed down on the shell holding all the parts firmly in position.

There are no coils, hence the arrester is non-inductive. There are no moving parts and it is claimed for the arrester that it requires no attention after being installed. It can be made for protecting telephone lines by merely changing the resistance of the composition rod.

In order to compare the action of the Wood's arrester with other types, a portion of the casing was cut away and a section of mica put in its place. The Wood's arrester was then put on the line with several others of different types, the experiment being conducted in a high altitude where static discharges are more frequent than in other places. The result was that the Wood's arrester was found to be taking care of heavy discharges while the others indicated no action, thus showing its lower resistance.

SALE OF WEST END, PITTSBURG.

Mr. M. K. McMullin, one of the directors of the Consolidated Traction Co., of Pittsburg, and intimately associated with Messrs. Given, Jones, Widener, Elkins and Magee in the organization of the Union Traction Co., of Pittsburg, on August 17th acquired the franchises and property of the West End Traction Co. It is understood that par was paid for the \$2,500,000 of preferred stock and 80 per cent of the face value for the \$2,500,000 common stock. The West End Traction Co. was chartered in 1897 as a consolidation of the Pittsburg & West End Passenger Ry., the Pittsburg, Crafton & Mansfield Street Ry., the Pittsburg, Neville Island & Coraopolis Ry., the West End, Mt. Washington & Banksville Ry., and the Carnegie, Heidelberg & Bridgeville Street Ry. It has $45\frac{1}{2}$ miles of track. This property will be turned over to the Southern Traction Co., a new corporation now being formed in which Senators C. L. Magee and William Flinn, T. H. Given, J. D. Calley, ex-Judge James H. Reed and Joshua Rhodes are interested. It is stated that the Southern Traction will ultimately merge all the lines south of the Monongahela River.

President Divine, of the Chattanooga (Tenn.) Rapid Transit Co. has made the necessary arrangements for building a power house to replace the one destroyed by fire, and hopes to have the electric system in operation in time for the reunion at Chickamauga Park, in October.

SOME INTERESTING EUROPEAN VIEWS.

The accompanying illustrations are reproduced from the 1900 edition of "Electric Tramways," which is issued by the Allgemeine Elektrizitäts Gesellschaft (General Electric Co.), of Berlin.

Figs. 1 and 2, respectively, are views of the Burgthor (castle gate) in Luebeck and the Weisser Thurm (white tower) in Nuernburg.

FIG. 1 BURGTHOR, LUEBECK.

FIG. 2 WEISSER THURM; NUERNBURG.

and the effect of the old and the new when thus contrasted is very striking. Figs. 3 and 4 are two views of a draw-bridge at Duisburg occupied by the electric railway, and show the method of supporting the trolley wires. As will be noted in Fig. 4, when the arch to which the wires are fastened is lifted, the wires are

allowed to depend from the two supports in a broad sag; this method has great simplicity to recommend it, and while it looks dangerous, the wire does not hang low enough to strike a pedestrian or a horse.

Fig. 5 shows the two entrances to the Sant Ugo tunnel in Genoa, which is one of the most remarkable pieces of strictly street railway construction ever built. The topography about Genoa is very unfavorable to railway construction; until 1890 there was but one line in the city, but with the development of electric traction it became practicable to build other lines. Three companies have concessions, the Societa di Ferrovie Elettriche e Funicolari has the lines in the center of the city, the Societa dei Tramways Orientali the eastern lines, and the Unione Italiana Tramways Elettrici the western lines. All the roads were built by the Allgemeine Elek-

FIG. 3 DUISBURG BRIDGE CLOSED.

FIG. 4 - DUISBURG BRIDGE OPEN.

tricitacts Gesellschaft, and they are now operated under a uniform fixed system. The total length of track is 60 miles and several of the routes are long, one being 18 miles; in many places there are steep grades and sharp curves. A cable auxiliary is used on some lines.

In certain cases it was necessary to build special tunnels running under heavy buildings, and to reconstruct streets and squares. The tunnel illustrated in Fig. 5 was built to surmount a rise of nearly 40 ft. In plan this tunnel is a loop with reverse curves at the entrances; the radius varies from 65 to 85 ft.

"Electric Tramways" is the most elaborate publication of its kind that we have ever seen. The book contains 400 pages, 10 x 13 in., and is most profusely illustrated with half-tone engravings, maps, profiles and plans. The text is printed in three languages, German, French and English, arranged in parallel columns.

After a few pages devoted to illustrations of the company's works, there are fifty pages discussing electric tramways in general; next

FIG. 5 ENTRANCE TO TUNNEL, GENOA.

follow brief descriptions of all the lines using the company's system. From the concluding table we learn that the number of completed lines is 38, with an aggregate of 485 miles of track, and that the number in course of construction is 27 with an aggregate length of track of 300 miles. At the beginning of the year there were over 30 other projected lines under consideration.

NEW TEXAS INTERURBAN LINE.

The Denison & Sherman Railway Co. which is to build a 10-mile electric line between these two towns has let the contract for construction to the Electrical Installation Co., of Chicago. Mr. Fred. H. Fitch will have charge of the construction work.

A 30-minute service is contemplated, the fare one way being 15 cents. The power house, car barn, etc. will be located midway on the line. It is the intention of the company to establish a park to contain about 75 acres at some point between the two towns. This park will be improved on an elaborate scale, making it a resort for the people of Denison and Sherman, and also one that can be used for large gatherings from all over North Texas. A fine pavilion will be erected which can be used for a dance hall, public speaking or large gatherings of any kind. An artificial lake of good dimensions will also be constructed so that boating can be enjoyed.

PREMIUMS FOR NOT HAVING ACCIDENTS.

On May 1, 1900, the Washington Water Power Co., which operates the electric light, power and street railway plants of Spokane, Wash., put in effect a system of reward for freedom from accidents and obedience to rules. The plan is described as follows, the premiums for May 1 to Dec. 31, 1900, being payable on the first pay day of January, 1901.

"An account of the hours worked by each motorman and conductor will be kept monthly by the superintendent. A premium of one-half cent per hour, over and above the regular pay of his grade, will be allowed each motorman and conductor for freedom from accidents and obedience to the company's rules. An account will also be kept of all accidents and infractions of rules, and fines will be imposed by the superintendent, against the premiums hereinbefore mentioned, for such accidents and infraction of rules. At the end of the year, such premiums as carmen have earned, less such fines as have been imposed, as before mentioned, will be paid in cash to the carmen earning such premiums.

"In addition to this, all fines that have been imposed during the period, will be distributed among those receiving premiums, pro rata, in the proportion that the premiums earned bear to the total amount of fines.

"It should be distinctly understood, among the carmen, that the fines imposed do not return to the company's treasury but are distributed among the premium earners, pro rata to the amount of premiums. The fines mentioned herein are not taxed against the regular pay of the grade but against the premium of $\frac{1}{2}$ cent per hour. Any man discharged or leaving the company's employ, will lose all interest in the premiums and all pro rata interest in the fines, and the amount thus released will be added to the amount to be distributed among the men.

"The following examples will tend to explain the practical working of the plan: Supposing that during the year, a total of 250,000 hours are worked by carmen, then a sum equal to $\frac{1}{2}$ cent per hour or \$1,250 would be set aside and become divisible among the carmen. Supposing that, in the same period, a man worked 3,500 hours and had had no accidents and broken no rules, he would then have a premium of \$17.50 due him, in addition to his proportion of the fines that had been imposed during the same period. Assuming that the total fines, for the same period, amounted to \$250, then his premium would be increased in the proportion that \$250 (total fines) bears to \$1,000 (unfined premiums) or $\frac{1}{4}$; therefore, his total premium and share of fines would be \$17.50 plus \$4.37 or \$21.87.

"Supposing that, during the year, a man had been fined \$10, his premiums then, proceeding as above, would be \$17.50 minus \$10 or \$7.50, and his share in the fines would be $\frac{1}{4}$ of \$7.50 or \$1.80, making a total of \$9.37.

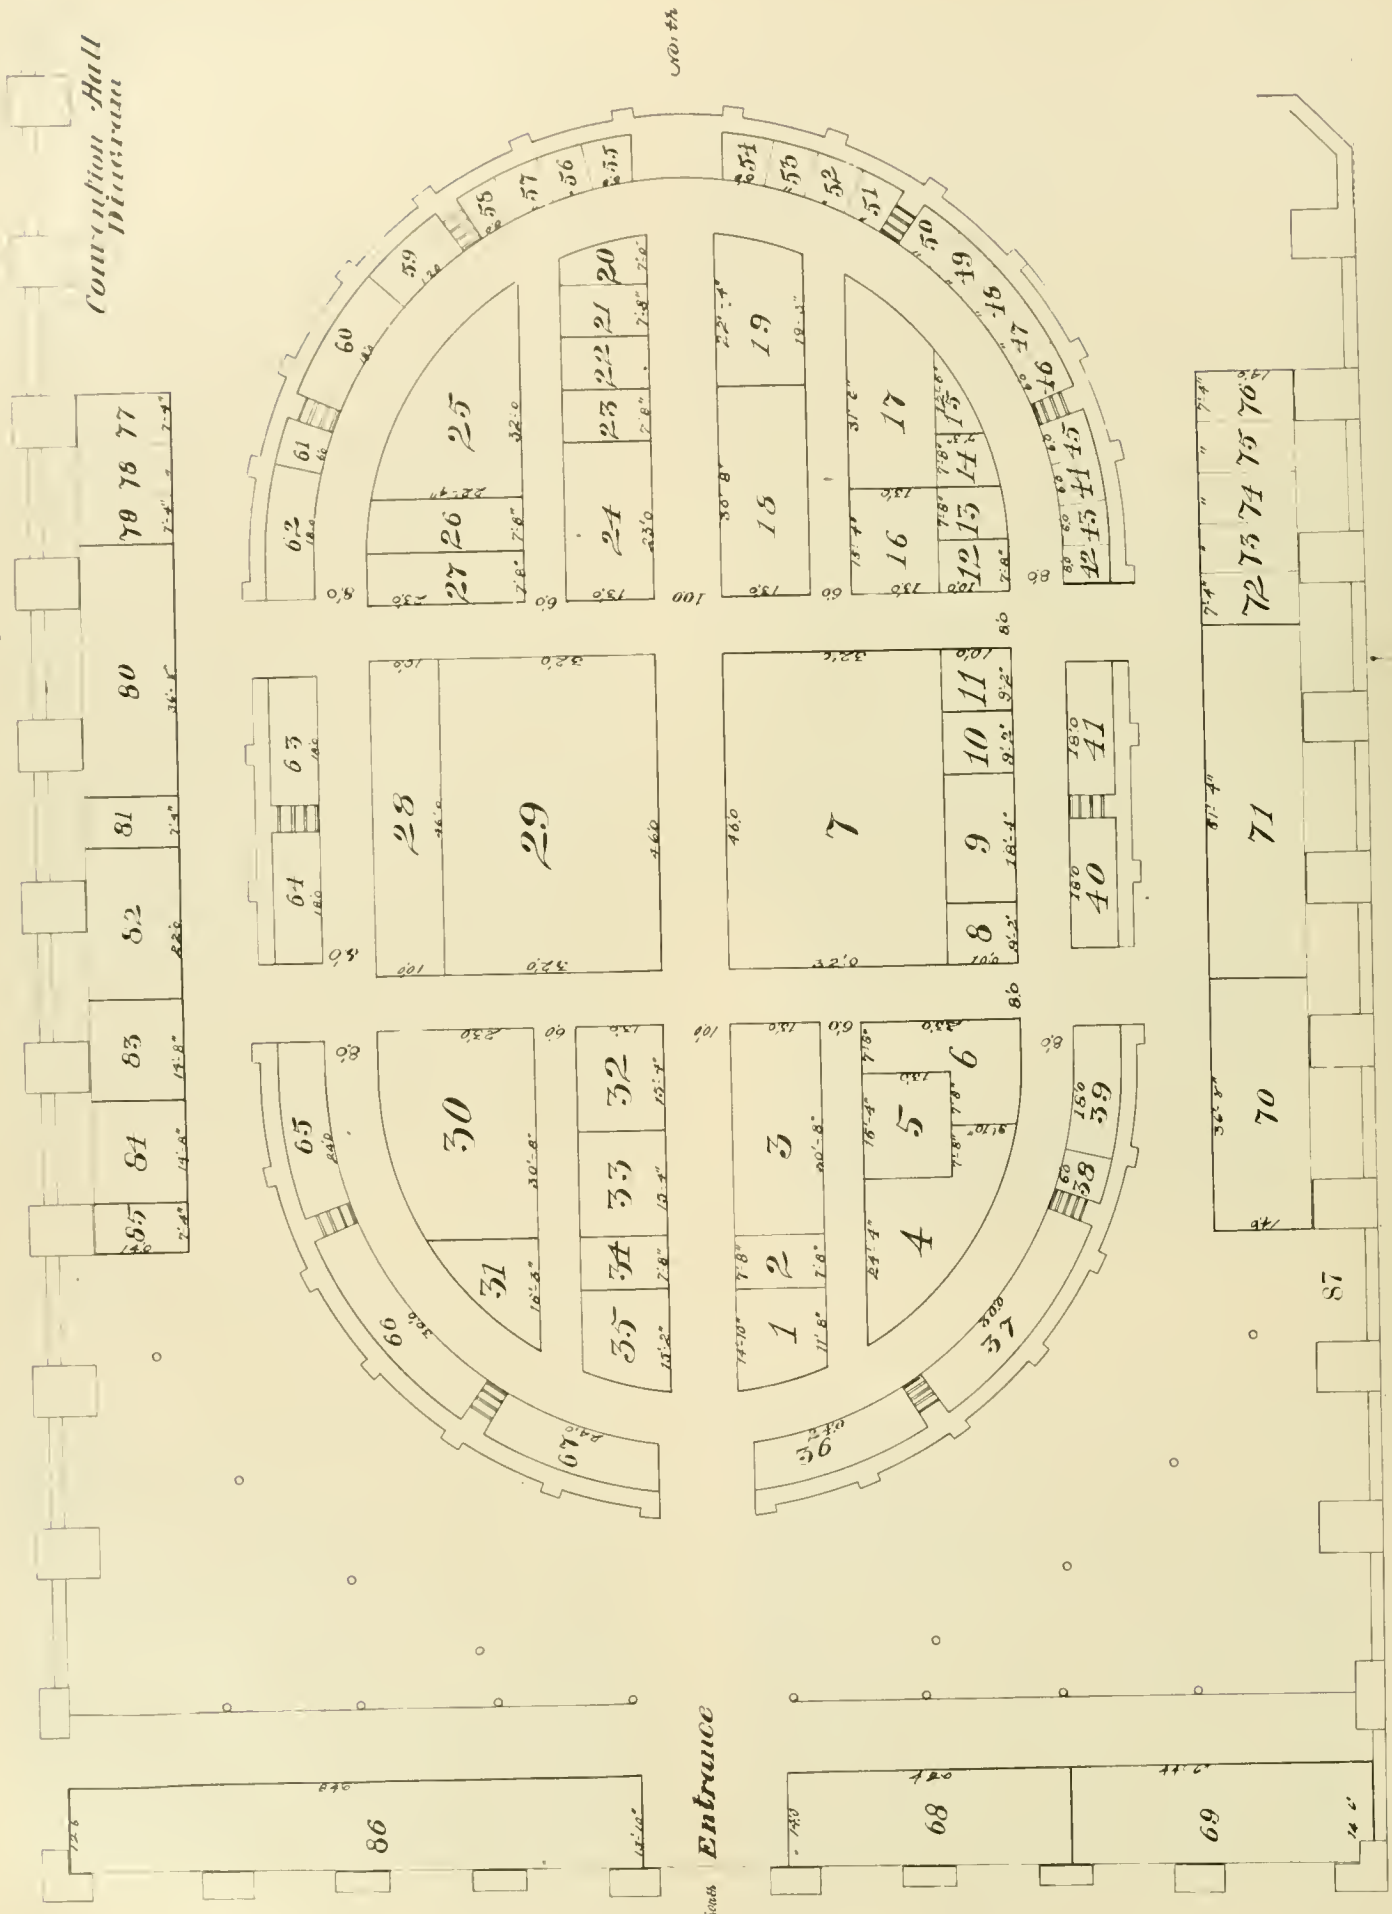

"The foregoing plan is the result of much consideration, it being the desire of the company to so arrange that each carman may have an opportunity to earn a premium above his regular pay, for especially meritorious services. During the present year the plan will, necessarily be more or less of an experiment and will be subject to such changes, after Jan. 1, 1901, as the experience of 1900 may suggest."

Mr. D. L. Huntington, general manager of the Washington Power Co., who furnished us with the foregoing facts, states that while the period the system has been in operation is too short to justify any final conclusions as to its success he believes that the effect has been to lessen the number of accidents.

FINED FOR NOT MAKING REPAIRS.

The Rangoon (India) Tramway Co. was recently prosecuted by the city for failing to keep its line in good condition and repair, and the magistrate found that the company had neglected the most ordinary precautions and had failed to store a sufficient stock of rails for maintenance and repair. He imposed a fine of 100 rupees. The company has paid no dividends for 10 years and as the franchises have only 3 $\frac{1}{2}$ years to run it is scarcely probable that it can afford to put its lines in the good condition demanded by the city.

The state tax commission of Wisconsin arranged for a hearing September 4th to discuss the methods of taxing street railways.

PLAN OF EXHIBIT HALL, AMERICAN STREET RAILWAY CONVENTION.

THE ANNUAL CONVENTIONS.

Secretary Penington announces the subjects on which papers will be read at the coming convention of the American Street Railway Association in Kansas City, October 16th-19th, as follows:

"Double Truck Cars; How to Equip Them to Obtain Maximum Efficiency Under Varying Conditions." By N. H. Heft, president Meriden Electric Railroad Co., Meriden, Conn.

"Comparisons of the Various Systems of Electrical Distribution for Street Railways." By C. F. Bancroft, electrical engineer Massachusetts Electric Companies, Boston, Mass.

"Consolidations of Street Railways and Their Effect Upon the Public." By Daniel B. Holmes, counsel Metropolitan Street Railway Co., Kansas City, Mo.

"The Storeroom and Storeroom Accounts." By N. S. Hill, jr., general manager Charleston Consolidated Railway, Gas & Electric Co., Charleston, S. C.

"Painting, Repainting and Maintenance of Car Bodies." By F. T. C. Brydges, superintendent of car shops, Chicago Union Traction Co., Chicago, Ill.

Friday, October 19th, has been set apart as a day for examination of the exhibits. No session of the Association will be held, so that all may have plenty of time to view the exhibits. It is earnestly requested that managers have their heads of departments present on that day.

The annual banquet will be held at the Coates House, Friday evening, when the officers elect will be installed.

The headquarters of the Association will be at the Midland Hotel.

The following hotels are first class and not far from convention hall, the Coates and Baltimore being the nearer. October being always a busy month with Kansas City hotels, reservations for rooms should be made at once:

Midland—American, \$3.00 to \$6.00 per day; European, \$1.00 to \$5.00 per day.

New Coates—American, \$3.00 per day and up; European, \$1.00 per day and up.

Savoy—American, \$2.50 to \$6.00 per day; European, \$1.50 to \$3.50 per day.

Baltimore—American, \$3.00 to \$5.00 per day; European, \$1.50 to \$3.00 per day.

The passenger associations have made the usual reduced rate of a fare and one-third for the round trip.

ACCOUNTANT'S ASSOCIATION.

The program of the Street Railway Accountants' Association aside from the routine business of the meeting includes the following papers and reports:

"What Does the General Manager Want to Know from the Accounting Department?" By C. D. Wyman, Boston, Mass., lately general manager of the New Orleans City Railroad Co.

Report of the Standing Committee on a Standard System of Street Railway Accounting. By the chairman, C. N. Duffy, auditor Chicago City Railway Co., Chicago, Ill.

"The Routine of a Street Railway, Electric and Gas Lighting Company." By C. O. Simpson, auditor Augusta Railway & Electric Co., Augusta, Ga.

Report of Committee: "Is a Standard Unit of Comparison Practicable?" By the chairman, H. C. Mackay, comptroller Milwaukee Electric Railway & Light Co., Milwaukee, Wis.

"Department Accounts." By H. L. Wilson, auditor Boston Elevated Railway Co., Boston Mass.

"Material and Supply Accounts." By W. M. Barnaby, accountant Brooklyn Rapid Transit Co., Brooklyn, N. Y.

The plan of the convention provides for three half-day sessions allowing the whole of the fourth day for the examination of exhibits, and in the case of this association this includes the exhibition of blanks and forms. Secretary Brockway announces that there have been important additions made to the collection of blanks which will undoubtedly continue the interest aroused at the convention in Chicago. This exhibit gives one an understanding of the part taken by blanks and forms in the construction and operation of railway properties, a knowledge of which is so important to the successful financial, operating or accounting officer.

Formal notice is given that a change is proposed in Article VII of the By-Laws. This article provides that the annual meeting of the association shall be held at the same time and place as that of the American Street Railway Association, and the proposed

change will undoubtedly be made the subject of earnest discussion.

The headquarters of the Accountants Association will be at the Midland Hotel.

EXHIBITS.

The display of exhibits will be fine, the hall being admirably adapted for that purpose. The diagram of the convention hall is shown on page 530 and the following list gives the assignments of space that have already been made.

Applications for space should be made to the chairman of the committee on exhibits, W. A. Satterlee, general superintendent Metropolitan Street Railway Co., Kansas City, Mo.

Convention Hall is at the corner of 13th and Central Sts., reached by either the Broadway or Wyandotte electric lines. It is well lighted and ventilated and there will be no trouble to secure current for power purposes, but all electrical connections for power and extra lights must be made at the expense of the exhibitor. The floor is hard cement which will necessitate the laying of wooden floors or at least wooden foundations where the exhibits are of such a nature as to require fastening down, as permission can not be obtained for making holes in the cement. If it is desired to show an exhibit on tracks, the rails will have to be laid on stringers. The local committee has made arrangements with W. A. Kelly, carpenter and builder, 947 New York Life Building, Kansas City, Mo., for doing all carpenter work required at reasonable prices. He will also supply all lumber and remove it after the convention. His representative will be in constant attendance at the hall after Sunday morning, October 14th.

All articles intended for the exhibition must be delivered at the building by the agent or owner and at his expense. An agreement has been made with the Kansas City Transfer Co. to haul and deliver all shipments to and from the building at 6 cents per 100 lb. for pieces weighing less than 2,000 lb., and 10 cents per 100 lb. for pieces weighing more than 2,000 lb. Goods should be marked with the owner's name, Convention Hall, Kansas City, Mo., in care of Kansas City Transfer Co., and if the exhibit space number is also added, the articles will be delivered on the proper space. Send the transfer company the bill of lading or a letter of advice at the same time the shipment is made.

There are several wide doors at the front and side of the convention building so that trucks, cars and other large exhibits can be taken inside the hall without difficulty.

The meetings of both the American Street Railway Association and the Accountants' Association will be held in the upper gallery, reached by a stairway at the rear of the hall and all delegates and others in attendance will pass through the hall on their way to the meetings.

CANADIAN ELECTRICAL ASSOCIATION.

The 10th annual convention of the Canadian Electrical Association was held at Kingston, Ont., August 29th to 31st. Headquarters of the association were at the Hotel Frontenac; exhibit space was provided at the City Hall, where the business sessions were held.

The papers presented were:

"Use of Dynamo and Storage Battery in Telegraph Offices," W. J. Camp, Canadian Pacific Railroad Telegraph Co., Montreal.

"Utilizing the Available Central Station Capacity," Prof. R. B. Owens, McGill University, Montreal.

"Power Factor as Affecting Operations and Investment with Special Reference to Induction Motors and Enclosed Arc Lamps," F. H. Leonard, jr., Montreal.

"Conditions Affecting the Wave Form of Alternators," Prof. L. A. Herdt, McGill University, Montreal.

"Rotary Converters," A. Gordon Grier and J. C. Hyde, Montreal.

"Railway Subject, Giving Several Curves Showing Up the Average Power During a Day, and Maximum and Minimum Requirements for Power Called For on the Quebec System," D. E. Blair, Quebec Railway & Lighting Co., Quebec.

The social features included a search-light excursion among the Thousand Islands tendered by the mayor and citizens of Kingston, the annual banquet, various excursions to plants of interest to the members, and a spectacular concert by the 14th Regiment Band, with electrical effects and fireworks. The street railway company extended the courtesies of the road to the association.

NEW POWER HOUSE AT NEW ORLEANS.

The New Orleans City Railroad Co., of New Orleans, has retained Sargent & Lundy, consulting engineers, of Chicago, to design a new power house to be located near the company's old one. While the plans for the building are not yet completed a contract has been closed with the E. P. Allis Co., of Milwaukee, for a vertical cross-compound condensing engine with cylinders 32 and 68 x 60 in.; it is to run at 75 r. p. m. with 120 lb. steam pressure and will be direct connected to a 1,500-kw. generator.

A NEW FARE REGISTER.

We illustrate herewith a new fare register, recently placed on the market, which it is claimed has all the advantages of other registers and also some of its own. The greatest care has been exercised in designing the mechanism to secure certainty of action, and the ease to prevent tampering. There are some ingenious interlocking devices, and a flag and catch to prevent the alarm from ringing except when both the trip register and the totalizer register. This

MONARCH FARE REGISTER.

register is known as the "Monarch" and is made both single and double, the one we show being of the double type. The cases of both types are the same size. No seal is used on the case as the mechanical features are believed to be a sufficient guard. The "Monarch" registers are made by Neilson & Bentson, of New York, the senior member of which, Mr. A. E. Neilson, has had a long experience in this business. The Morris Electric Co., of 15 Cortlandt St., New York, controls the registers and is sole selling agent.

METHOD OF TAXING STREET RAILWAYS.

On September 4th the tax commissioners of Wisconsin heard arguments as to the best plan for taxing street railways. Henry C. Payne, vice-president of the Milwaukee Electric Railway & Light Co., was the principal speaker, though I. P. Lord, of the Waupaca & Chain o' Lakes Electric Ry.; E. L. Debell, secretary of the Sheboygan Light, Power & Railway Co.; B. E. Edwards, president of the Lacrosse City Railway Co., and F. W. Oakley, president of the Madison Electric Railway Co., were also present and took part in the discussion.

The speakers all agreed that the present system of a percentage tax on receipts was preferable to a tax on property and franchise, and claimed that their companies could not get justice from local assessors. Mr. Payne pointed out that the tax rate should be lower for street railways than for steam railroads because the latter have perpetual franchises; he also believed that the rate should be lower for smaller companies than for the larger ones.

ADDITIONS TO PROVIDENCE POWER STATION.

The Union Railroad Co., of Providence, R. I., is enlarging its power house capacity by adding two new Filer & Stowell engines of 1,600 h. p. each, these being duplicates of one already installed and which was described in the "Review" for May, 1900, page 278. The engines are direct coupled to two 1500-kw. alternating current dynamos, generating at 10,000 volts. New transformer stations will also be built.

It is proposed by Mr. Jacob G. Kasjens, an alderman of Peoria, Ill., to equip a flat car with fire apparatus; this car would be serviceable wherever steam or electric railway tracks are laid.

AN ATTRACTIVE ADVERTISEMENT.

The New Jersey & Hudson River Railway & Ferry Co. has recently issued a very artistic card advertising "the most picturesque trolley ride in America," which we reproduce. The original was printed on a card 14 x 18 in.

On the Hudson River line the regular schedule provides for cars at 30-minute intervals except on Sundays, holidays and Saturday afternoons, when they are run every 15 minutes. The running time from Hackensack to 130th St., New York, is 45 minutes. On small pocket cards issued by the company are given, in addition to its own time table, the time tables of the 9th Ave. and 3d Ave. Elevated express trains and the following summary of good points of the "Hudson River Line": Stone ballasted roadbed. Steel trestles and bridges. No railroad grade crossings. Commodious open

SUIT AGAINST SCHUYLKILL VALLEY CO.

Two stockholders of the Schuylkill Valley Traction Co., J. W. and D. B. Shepp, on September 6th began a suit against the company and the United Power & Transportation Co., of New Jersey, which owns a controlling interest in the Traction company stock. Messrs. Shepp seek to enjoin the Transportation company from continuing to control the Traction company and ask for a receiver; the action is based on a section of the constitution of Pennsylvania which forbids a transportation company to engage in business other than that of a common carrier, the United Power & Transportation Co. also controlling various lighting plants. The defense is that the Schuylkill Valley Traction Co. is managed by its own directors, and that the United Power & Transportation Co. merely owns stock of the Traction company.

summer cars. Electrically heated winter cars. Special accommodations for smokers. Powerful, speedy motors. Duplicate power and hand brakes. Arc searchlight headlights. All cars carry bicycles and tandems.

Mr. Frank R. Ford is second vice-president and general manager of the company, which has its office at No. 149 Broadway, New York.

The Hartford (Conn.), Manchester & Rockville Tramway Co. on August 7th announced that hereafter all employes who have been in the service more than five years are to wear a stripe on the coat sleeve. This decoration carries with it additional pay of 25 cents per day.

THE EFFECTS OF STREET CAR RIDING.

A Toledo professor announces that riding on electric cars destroys the nerves, but to offset this a prominent Louisville physician holds that trolley car riding is a most expeditious cure for insomnia, due to nervousness. We are inclined to favor the prominent physician's view, as the announcement of the Toledo professor is accompanied by the statement that he has a machine for counteracting this nerve-wrecking tendency, which he will sell for a consideration.

The Cleveland board of equalization has raised the assessment of the Cleveland City Railway Co. from \$336,000 to \$660,000.

PERSONAL.

MR. P. A. B. WIDENER of Philadelphia was in London last month.

MR. H. S. COOPER has resigned as general manager of the Ithaca (N. Y.) Street Ry.

MR. D. F. BURRITT has resigned as general manager of the Palmer (Mass.) & Monson Street Railway Co.

MR. S. G. DE COURCEY has succeeded Mr. A. A. McLeod as president of the American Railways Co., of Philadelphia.

MR. F. L. HART has tendered his resignation as general superintendent of the Washington (D. C.) Traction & Electric Co.

MR. A. H. WOODWARD, president of the International Register Co., is receiving congratulations on the arrival of a son.

MR. J. A. DAWSON, Montreal, who is establishing a Canadian agency for all kinds of street railway supplies, spent several days in Chicago last week.

MR. D. R. M'LAIN has resigned as assistant manager of the Huntsville (Ala.) Railway, Light & Power Co. to go with the Westinghouse company.

MR. THOMAS NEELY, formerly of Vicksburg, Miss., has accepted a position with the Meridian (Miss.) Street Railway & Power Co., as general superintendent.

MR. WILLIAM D. WEAVER, editor of the Electrical World and Engineer, of New York, was married in July, at Bremen, Germany, to Miss Mildred E. Niebuhr.

MR. GILES ALLISON, of New York, eastern representative of the St. Louis Register Co., stopped over in Chicago and visited his friends on his way East from St. Louis.

MR. A. B. DALBY, president of the Hipwood-Barrett Fender Co., New York, has returned from Europe where he has been introducing his fenders on several prominent tramways.

MR. J. E. WOODBRIDGE, formerly editor of the American Electrician, has left the field of journalism to enter the railway engineering department of the General Electric Co., at Schenectady.

MR. HENRY S. NEWTON has resigned as general manager of the Syracuse (N. Y.), Lakeside & Baldwinsville Railway Co. to become manager of the Beaver Valley Traction Co., Beaver Falls, Pa.

MR. HAROLD P. BROWN, 120 Liberty St., New York, has returned from a trip of two months' duration abroad, on which he conducted demonstrations of his plastic bonding system in London and Paris.

MR. H. W. WOLCOTT, general manager of the Kansas City-Leavenworth Ry., has returned from Cleveland and announces that all orders for material have been placed and that work on the extensions will be pushed as rapidly as possible.

MR. H. H. VREELAND, president of the Metropolitan Street Railway Co., of New York, on August 12th entertained a number of officials and employees of the company at a clambake at the Torietta Club, and later at his house at Brewsters.

MR. T. J. NICHOLL, vice-president and general manager of the Rochester (N. Y.) Railway Co. was one of the speakers at the second annual encampment of the Empire Organization of Veterans and Sons of Veterans held at Margheretta Grove, Sodus Bay, in August.

MR. A. M. CRANE, formerly general sales agent of the Illinois Steel Co., and more recently assistant chairman in the American

Steel & Wire Co., has formed a partnership with Mr. W. A. Green under the name of A. M. Crane & Co., dealers in pig iron, steel and railway supplies. An office has been opened in room 573 of the Rookery, Chicago. Prior to his association with Mr. Crane in their present business, Mr. Green was treasurer of the American Steel & Wire Co.

MR. J. C. BRACKENRIDGE, general manager of the Brooklyn Rapid Transit Co., was the guest of honor at a dinner given at Ulmer Park, Brooklyn, on August 31st, by about 50 of his friends representing the commercial, railroad, political and newspaper life of the boroughs of Brooklyn and Manhattan.

MESSRS. T. B. GOODYER, general traffic superintendent; H. M. Sayers, chief engineer, and J. A. Lycett, district superintendent of the British Electric Traction Co., of London, have been making a tour of the principal cities of the United States, inspecting the street railway systems and making notes on constructing and operating methods.

MR. J. D. HAWKS, president of the Detroit, Ypsilanti & Ann Arbor Ry., in company with several of his business associates, last month made a trip in carriages from Grand Rapids to Muskegon, Mich., to inspect the route of the proposed Grand Rapids, Grand Haven & Muskegon Rapid Ry., an electric railway enterprise in which they are interested.

MR. L. G. READE, general manager of the Abendroth & Root Manufacturing Co., New York, reports an improvement in the company's foreign trade, naming a number of recent shipments, including a large consignment of boilers for the Spanish market. The Abendroth & Root company has recently opened a branch office at No. 2 Jewry St., London.

MR. A. L. PARKER, who has been associated with Mr. John Winter, in a number of new electric railway projects near Detroit and in New York State, has been chosen second vice-president of the Detroit (Mich.), Rochester, Romeo & Lake Orien Ry., and will hereafter take an active part in the management of that road. His headquarters will be at Detroit.

MR. L. B. STILWELL has severed his connection with the Niagara Falls Power Co., to remove to New York City, where he will take an important position in connection with the electrical equipment of the Manhattan Elevated Ry. Mr. Stilwell aided in the installation of electrical machinery at the 50,000-h. p. station in Niagara Falls and has assisted in its management since 1897.

MR. CHARLES STEWART SMITH, a member of the New York Rapid Transit Commission, has been visiting London and Paris for the purpose of studying the ways in which rapid transit problems have been worked out in those cities. He states that what is called fast traveling in Europe would not satisfy the average American, and while the London and Paris underground roads are wonderful examples of engineering skill, they are not "rapid transit" lines, as the term is understood in this country.

MR. C. K. DURBIN resigned as general superintendent of the Denver City Tramway Co. on September 1st. We chronicle with a regret that will be shared by many, this announcement of his retirement from street railway work. The death of his brother last spring left an important business in Denver, which Mr. Durbin has had in charge since, and which not only demands his entire time, but more than warrants his leaving the company. He tendered his resignation several months ago, but was induced to remain until now he can no longer afford to do so. Under his management the physical condition of the road has been brought up to a highly creditable standard. The board of directors presented him with the finest watch procurable in Denver, and a set of very complimentary resolutions.

MR. RUSSELL WILEY, electrician of the Kankakee (Ill.) Electric Railway Co., died August 13th, after a long illness with typhoid fever. He was 36 years of age.

MECHANICAL DEPARTMENT

MORE MAIL CARS FOR CHICAGO.

The Chicago Union Traction Co. has recently put in service on its North Clark St. and Milwaukee Ave. lines five mail cars one of which is shown in the accompanying engravings. In addition to these one extra mail car is to be built. The cars were originally used on the Cicero & Proviso line and have been changed to meet

NEW MAIL CAR, CHICAGO UNION TRACTION CO.

the requirements of the postal service, by Mr. F. T. C. Brydges, superintendent of the shops. Doors were cut in the sides of the body and the platforms completely enclosed by providing doors for the left side of each. A sub-sill, 4 x 5 in., was placed under each side of the body. The body is 20 ft. long inside and the car 28 ft. 6 in. over all.

The cars are mounted on Peckham single trucks with two G. E. 52 motors and K 10 controllers. Folding fenders are carried on

INTERIOR OF CAR.

each end and headlights are mounted on top of the hood. In common with most all the cars used by the Chicago Union Traction Co., these cars have a wooden frame surrounding the wheels to serve as a guard and the illustration shows a simple addition to

the ordinary frame which has in several instances prevented persons falling under the car and being injured. This is a piece of 2½-in. rubber hose placed vertically just over the rail; it can be carried low and while stiff enough to brush an arm or leg from the track it is sufficiently flexible to do no harm if it comes in contact with the rail. We understand that the use of rubber hose in this manner was an idea of Mr. Yerkes.

The interior fittings include the regulation equipment of sack racks, pigeon holes and sorting and stamping board. The car is heated by Consolidated Car Heating Co's. electric heaters, and well lighted with 15 incandescence lamps; the lamps are placed 1 in each vestibule, a cluster of 3 at each end inside, 2 in the middle of the car, and 5 single lamps with downward reflecting shades over the pigeon holes and sorting board.

On September 1st these cars were put in service replacing the postal cars previously attached to cable trains on the two streets mentioned, North Clark and Milwaukee Ave. The cars of the "North Clark St. line" will run over Market and Sedgwick Sts., Lincoln Ave. and Halsted St. to the intersection of Halsted with North Clark St., beyond which point the latter street is equipped with the overhead trolley wires.

The down-town terminus of the mail routes will be changed to the corner of Washington and Clark Sts. for the Clark St. line and to a point on Lake St. for the Milwaukee Ave. line. This will obviate the delays now caused by the transfer of mails on the cable loop. While the new routes will make longer wagon hauls to some of the sub-stations, other hauls will be shortened, so that the average is about the same. Fourteen round trips per day are scheduled, three being made to Evanston.

The postoffice department hopes to eventually operate all the postal cars in the city over electric lines. The advantage lies in the fact that in case of a fire or other obstruction to the street an electric car can be switched on some parallel line and continue without loss of time. This was demonstrated one day last month, when the Wentworth Ave. car encountered a large frame house encamped on the track. The house was being moved across the street; some of the apparatus had broken and there was every prospect that the house would remain to block the thoroughfare for the rest of the day. The postoffice car was promptly backed to the switch and continued its trip downtown by a different route, arriving in time to make connections, according to schedule. A cable car in the same predicament must have waited till the house on the tracks had taken all day to "move on."

Next spring another railway postal route into the southwestern part of the city will be opened, making six in all. The business transacted over the street railway mail routes is reckoned principally by the sale of stamps at the various stations. From the two stations on North Clark St. the sale of stamps has averaged \$12,637 per month, and from the two stations on Milwaukee Ave., \$10,133. Since the North Clark St. route has been extended to include Edgewater, Rogers Park and Evanston the sales from the stations on the route will be increased to aggregate about \$15,190 per month, Edgewater, Rogers Park and Evanston selling a total of \$2,553.

EAVE TROUGHS FOR STREET CARS.

A number of open cars owned by the Hartford (Conn.) Street Railway Co. have been fitted with eave troughs to prevent rain water from the roof, from dripping on the passengers or on the ends of the seats. The troughs are of wood and run the length of the car on each side, just beneath the edge of the roof. The accumulated water finds its way to the street through 1-in. pipes at the corner posts.

SPLICED CARS AT ROCHESTER, N. Y.

The Rochester (N. Y.) Railway Co. has recently enlarged some of its vestibuled cars and mounted them on double instead of single trucks. The cars were cut in two and three new side posts inserted, thus increasing the length of the body over the corner posts from 18 ft. 8 $\frac{5}{8}$ in. to 27 ft. 9 $\frac{1}{8}$ in. Body bolsters were placed 13 ft. 7 $\frac{5}{8}$ in. between centers and two truss rods added on each side. One of these extends under the side sills between the bolsters

FIG. 1 INTERIOR OF CAR.

with a single strut in the center; the other is a $\frac{1}{2}$ x 2-in. bar extending to the ends of the body. Cross tie-rods, $\frac{5}{8}$ in. in diameter, are placed at each cross sill and three longitudinal tie rods run from the bolsters to the next outside cross sills.

The greatest difficulty in altering the car was to so locate the side sills that there would be space between to allow for the swing of the double trucks in taking curves, and thus avoid raising the car body so high as to require two steps.

The arrangement adopted was to bolt a block, marked "A" in Fig. 5 to the foot of each post and then mortise the block into the side sill; the blocks were properly grooved to fit the outside surfaces of the posts. The details of the block and the spacing of

the posts and sills in both the old and rebuilt cars are clearly shown in Fig. 5. It will be observed that the side sills of the rebuilt car are 5 $\frac{3}{4}$ x 7 $\frac{3}{4}$ in. instead of 3 $\frac{3}{4}$ x 4 $\frac{3}{4}$, as in the old one,

FIG. 2 SPLICED CAR, ROCHESTER, N. Y.

and the distance between them is 5 ft. 11 in., instead of 5 ft. 5 $\frac{1}{2}$ in. Peckham maximum traction trucks with 33-in. driving wheels are used; the motors are Westinghouse 49. In the plan view in Fig. 3

FIG. 3—TRUCK SHOWING CLEARANCE.

the truck wheels and axles are shown and the gage lines for a 30-ft. curve have been drawn in dotted lines and the point reached by the front edge of the driving wheel indicated.

FIG. 4—HALF PLAN AND ELEVATION.

The half tone engravings, Figs. 1 and 2 show exterior and interior views of the altered car. We are indebted to Mr. T. J. Nicholl, vice-president and general

there is little doubt but the lines referred to will serve as important connections in the through electric road from Chicago to Green Bay, to which reference has been frequently made. The company

FIG. 5—SECTIONS OF NEW AND OLD CARS.

manager of the Rochester Railway Co., and to Mr. Alfred Green, master mechanic, for the data and illustrations.

is at present in every way distinct from the Milwaukee Electric Railway & Light Co., but the ultimate purpose is to bring the properties all under one head."

McGUIRE FACTORY IN ENGLAND.

Mr. W. A. McGuire, president of the McGuire Manufacturing Co., of Chicago, returned from Europe last week, and reports electric railway matters as exceedingly lively, both in England and on the continent. While the McGuire company has made no effort to do European business because of its geographical location, the number of inquiries for its work has induced it to institute a branch factory in England. Its present plans are to have the works running within six months, and it is the intention to make all such street railway equipment that is manufactured by the Chicago concern. In the meantime it has established an office at 5 Warwick Court, High Holborn, London, W. C., and is actively in the field for everything that is going. Until the factory is completed all orders will be filled from America. The McGuire company at the present time is exceedingly busy, especially in the truck and snow sweeper departments. The company sold 62 sweepers last fall and from present indications will exceed that number the coming season. We wish the company a prosperous career in Europe. If it repeat its American record, it will add a most creditable concern to the institutions of England.

LARGE ORDER FOR SPECIAL WORK.

The Falk Co., of Milwaukee, through its second vice-president, Mr. C. C. Smith, has closed a contract with the Metropolitan Street Railway Co., of Kansas City, Mo., for supplying and laying a number of pieces of special work in that city as follows:
 One branch off from Union Depot line into the post office with two special cross-overs.
 A three-part Y to connect with crossing now in place at 5th and Main Sts.
 Special layout at 5th and Delaware Sts., including connecting curves and switches at both ends.
 Double track three part Y at Summit St. and Southwest Boulevard, and a similar one at 25th St. and Southwest Boulevard.
 Six standard cross-overs.

AMERICAN ELECTRICAL WORKS' CLAM BAKE.

One of the pleasantest events of the year, and one that is eagerly looked forward to by several hundred members of the electrical fraternity, is the annual clam dinner given by Mr. Eugene F. Phillips, general manager of the American Electrical Works, of Providence, R. I. The bake was held this year on September 13th, at the Pomham Club as usual, and as usual the day was spent in renewing old acquaintances, in story telling and in doing justice to the bountiful refreshments provided, both solid and otherwise. Mr. Phillips was again voted the prince of entertainers.

IMPROVED CARBON BRUSH.

The desirable qualities in a carbon brush are that it shall be self-lubricating, of low resistance, and not blacken or gum the commutator. For the brush to be self-lubricating it is necessary that a fine grade of carbon be used, and it must be so treated as to close the pores and enable the brush to take a high polish. Further, the special treatment given it should not increase the electrical resistance of the brush.
 The Speer Carbon Co., of St. Marys, Pa., has recently put on the market a brush which it claims is superior to anything of the kind heretofore produced. The maker guarantees that these brushes will last many times longer than any other brush made; that they will take a high polish and constantly lubricate the commutator without gumming; that the electrical resistance is very low; that they will not crumble and chip, and that they will not cut the commutator. Samples will be supplied on request.

CHICAGO-MILWAUKEE ELECTRIC LINE.

On August 24th the Wisconsin Traction, Light, Heat & Power Co. was incorporated by H. C. Payne, John I. Beggs, Chas. F. Pfister and F. G. Bigelow, all officers of the Milwaukee Electric Railway & Light Co.
 "The object of the new corporation," explains Mr. Beggs, "is primarily the uniting and fostering of certain small properties in the Fox River valley, and that object for the present at least will be the sole one. The articles, however, provide for extensions, and

CONDUCTORLESS CARS FOR BOISE CITY.

The Boise City (Idaho) Rapid Transit Co. has decided it can give a better service if it does away with conductors and returns to the fare box system. The rear platforms of its cars will be entirely shut in by gates and passengers will be required to enter and leave by the front doors. They will deposit their fares in boxes within sight of the motorman, who will give change if necessary.
 The company promises to apply the saving thus effected toward running additional cars, giving a more frequent service.

FOREIGN FACTS.

The Chester (Eng.) tramway system is to be extended.

The Farnworth (Eng.) tramway has been changed from horse to electric traction.

The Newcastle (Eng.) Tramways Committee proposes to extend its electric lines into Benwell.

The city authorities of Munich are planning to build 30 new electric lines in and about the city.

Berne, Switzerland, is to spend nearly \$10,000 in improving the municipal street railway system.

The Oldham (Eng.) Corporation has applied for sanction to borrow £280,000 for electric tramways.

The Calcutta (India) Tramways Co. during its last fiscal years earned £68,719 gross and £8,030 net.

A municipal tramway scheme for Bath, Eng., is said to have the approval of every local authority interested.

The tramway committee of the Glasgow Corporation is advertising for bids for building several extensions.

In the District of Birkenhead, Eng., the work of constructing electric tramway is being carried on vigorously.

A tramways provisional order has been granted the Urban Electric Supply Co., of Glosop, Eng., by the town council.

Plans and estimates have been prepared for equipping the lines of the Morecambe (Eng.) Tramways Co. with electricity.

The Derby (Eng.) City Council is seeking powers to construct a system of electric tramways at an estimated cost of £200,000.

It is expected that the Compton tramway route at Plymouth, Eng., will be electrically equipped and ready for opening by March, 1901.

The lighting and traffic committee of the Newport (Eng.) Corporation has resolved to build a new power station for the tramways.

A scheme for electric tramways in Bowness, Eng., has been submitted by the British Electric Traction Co. and approved by the council.

It has been resolved by the Maidstone (Eng.) Corporation to apply for a provisional order for constructing and working electric tramways.

Electric traction is about to be applied to the lines of the Compagnie de l'Est Parisien, from Noisy, Fontenay, Raincy, Bondy and Pantin to Paris.

Concessions for five new electric lines in the Northwest section of Paris have been granted to the Compagnie des Tramways Mecaniques des Environs de Paris.

A committee has been appointed by the Bombay (India) municipality to report on the advisability of the city's purchasing the tramway lines of Bombay and equipping them with electricity.

An electric tramway at Lyndhurst in the New Forest, Eng., has been proposed. Mr. E. Kite of Lyndhurst, and Mr. C. J. Wharton, Palace Chambers, Westminster, London, are the promoters.

During the month of July, 1900, the value of electrical goods and apparatus imported into the United Kingdom was £129,022. The total for the seven months ending July 31, 1900, was £549,275.

La Capital Tramways Co., of Buenos Ayres, Argentine, has acquired the property of the New and the Grand National Tramways companies and both systems will be converted to electric traction.

Electric traction on the overhead system is fast superseding the old horse traction lines in Munich. A uniform charge of 10 pfennige is made for a journey of any length where no change of cars is involved.

The official opening of the Sunderland (Eng.) Corporation Electric Tramways took place last month. Luncheon was served at the town hall and several cars laden with visitors made the round trip over the line.

There are many indications that India within the next few years will become an important market for electrical tramway apparatus. The latest scheme proposed is an electric railway from Hyderabad to Secunderabad.

The tramway lines in Moscow, Russia, are about to be extended and will reach a total of 84 miles. At the same time the present horse lines will be equipped electrically, part with the overhead system, part with the surface-contact system and part with accumulators.

An agreement has been reached between the city of Birmingham, Eng., and the Birmingham City Tramways Co., relating to the erection of the overhead system in Bristol Road. The Tramway company will procure the necessary materials and proceed at once to convert the line.

English steam roads are beginning to feel the effects of electric tramway competition. The chairman of the Great Northern Ry., in his annual report stated there was a decrease last year in the Yorkshire district of more than 200,000 passengers carried due to the opening of parallel electric lines.

So satisfactory have been the results with electric traction as applied to the underground roads of London, that a committee consisting of three members has been appointed by both the Metropolitan and District companies to report upon the question of applying electricity to what is known as London's "Inner Circle" railways.

In the House of Commons the following bills have passed third reading: Wirral Ry., Croydon Tramways, Plymouth, Devonport & Stonehouse Tramways, Cork Electric Tramways, South Staffordshire Tramways, Aston Manor Tramways, Great Grimsby Street Tramways, Mersey Ry., Rawmarsh Urban District Council Tramways and Hastings Tramways.

Indian Engineering, published at Calcutta, says the superstition about the kidnapping of children to bury under the foundations of railway bridges, which has more than once caused trouble in India, is now widespread in China and seldom is a new bridge commenced without the disappearance of several children from the neighborhood.

The Board of Trade has confirmed the following light railway orders: Bexhill & St. Leonards Light Ry., to run from Bexhill to St. Leonards, in the county of Sussex, Eng.; Cheltenham & District Light Ry., from Cheltenham to Cleeve Hill, in the County of Gloucester, Eng.; Robertsbridge & Pevensey Light Ry., from Robertsbridge to Pevensey, in the county of East Sussex, Eng.

In the House of Lords the following bills have passed third reading: Bexhill & Rotherfield Ry., Vale of Rheidol Light Ry., Airdire & Coatbridge Tramways, Brighton Corporation Tramways, Reading Corporation Tramways, Wellingborough & District Tramroads, Nottingham Corporation Tramways, Bournemouth Corporation Tramways, Southeastern Metropolitan Tramways, Aberdeen Corporation Tramways, Blackpool, St. Anne's & Lytham Tramways, Bradford Corporation Tramways, Baker St., & Waterloo Ry. and Croydon Tramways.

HALF FARES.

The Los Angeles (Cal.) Railway Co. is fitting its cars with air brakes.

An eastern syndicate is seeking a franchise for a street railway in Corsicana, Texas.

The Chicago Union Traction last month earned \$10,700 more than in August, 1899.

A new interurban line between Kalamazoo and Battle Creek was opened last month.

The Toledo (O.), Fremont & Norwalk Electric Ry. began regular operation September 12th.

The Charlotte (N. C.) Electric Railway, Light & Power Co. is equipping its cars with air brakes.

Over 600 men are now at work building the Columbus (O.), London & Springfield Traction Co.

The Altoona & Logan Valley Electric Railway Co. has increased the wages of its trainmen 7 per cent.

It is announced that the proposed Jamesville (Wis.), Beloit & Rockford Electric Ry. will not be built.

Semi-annual dividend No. 1, of 2 $\frac{1}{4}$ per cent, was paid by the Boston Elevated Railway Co. August 15th.

Three New Yorkers recently made the trip to Boston by trolley and pronounced it a most agreeable excursion.

The Union Traction Co., of Anderson, Ind., has ordered a private car for the use of General Manager Henry.

The Penobscot Central Ry., of Bangor, Me., has completed the building for its new power station at Kenduskeag.

The employes of the Toronto (Ont.) Railway Co. have asked an increase in wages from 16-23 to 20 cents per hour.

The Union Traction Co., of Philadelphia, has effected large reductions in its fixed charges by refunding its bonds.

The South Jersey Electric Light & Traction Co. is reported to be anxious to build a 3-cent line in Camden, N. J.

The employes of the United Traction Co., of Pittsburg, held their annual picnic at Calhoun Park on September 4th.

Thirty-five persons were injured in a collision between a horse car and an electric car at Paris, France, on August 16th.

At Montgomery, Ala., the negroes express their disapproval of the separate seat ordinance by boycotting the street cars.

The Cincinnati Street Railway Co. has named its four new special outing cars, Manila, Santiago, Porto Rico and Honolulu.

The Citizens Railway Co., of Fort Scott, Kan., ceased operation of the road on August 31st, poor business being given as the cause.

The assessment of the Indianapolis (Ind.) Street Railway Co. has been increased from \$1,000,000 by the state tax commission to \$3,500,000.

The Consolidated Traction Co., of Pittsburg, has issued an order that trainmen must not indulge in the use of chewing tobacco when on duty.

The public of Santiago de Chile is greatly delighted with the new electric railway opened September 2d, in the presence of President Errazuriz.

Representatives of a number of street railway companies in Ontario met in Toledo a short time ago and formed an amusement circuit.

There is a report that the Lynn & Boston Street R. R. will have some of its cars lettered in Hebrew, but we have no confirmation as yet.

The employes of the Toledo (O.) Traction Co. in addition to their band have a baseball team that judging from the record thus far is a good one.

A new issue of 4 per cent bonds of the Hartford (Conn.) Street Railway Co. was allotted last month. They were all taken by the stockholders at 103.

The recent report of a street car hold-up at Racine, Wis., had its origin in the fact that two tramps boarded a car and solicited the passengers for money.

It is announced that the change from storage batteries to the overhead trolley system will be made by the Chicago Electric Traction on September 15th.

The Chicago street railways are engaged in fitting their winter cars with vestibules. The date when the vestibuled cars are required is November 1st.

Charles T. Davis, one of the men convicted of conspiracy to depreciate Brooklyn Rapid Transit stock, has been admitted to bail pending an appeal.

Two wire thieves, men 50 and 52 years of age respectively, were recently caught taking bond wires from the tracks of the Reading (Pa.) & Womelsdorf Ry.

The North Jersey Street Railway Co., of Jersey City, N. J., has announced that it will build a line over the Bergen Turnpike from Hoboken to Hackensack.

A car of the Omaha & Council Bluffs Railway & Bridge Co. was held up about midnight, August 14th, and his watch and money taken from the conductor.

The Richmond (Va.) Passenger Railway & Power Co. and the Richmond Traction Co. are endeavoring to arrange an agreement for the interchange of transfers.

It is stated that an agent of the shah of Persia is in this country examining trolley systems preparatory to building an electric railway from Teheran to the Caspian Sea.

Over 1,500 ft. of copper wire was taken from the poles of the Newtown (Pa.) Electric Ry. one morning last month by five men who were acting in the guise of inspectors.

August 14th the 16 year old daughter of a conductor of the St. Louis Transit Co. had her shirt waist torn off by a crowd of boys because she had been riding on her father's car.

The postmaster at Chattanooga will establish a sub-station, to be conducted in connection with the Chattanooga Electric Ry. The street cars will be equipped with mail boxes.

The Aurora & Geneva Street Railway Co. is negotiating with the Chicago & Northwestern Ry. for the building of a tunnel under the eight tracks of the latter company at Geneva.

The 36-miles electric line of the Quebec (Can.) Railway, Light & Power Co. to the Roman Catholic shrine of St. Anne de Beaupre was opened August 19th. About 60 cars are run daily.

The two injunctions issued August 19th, restraining the Columbus (O.), London & Springfield Traction Co. from building its terminal loop in Columbus were dissolved August 28th.

The joint committees on judiciary and railroads, of the Milwaukee council, have reported adversely on a proposed ordinance requiring the street railway company to use girder rails.

Wire thieves recently carried off 500 lb. of copper from the New York & North Shore road in Flushing, L. I., causing a delay of two hours in the traffic between Jamaica and Far Rockaway.

A car of the United Traction Co., of Pittsburg, was destroyed by fire while enroute to the barns, after having completed its last run. The cause is believed to have been defective wiring.

One Darlington Davis, of Evansburg, Pa., is now in jail at Norristown, Pa., in default of \$100 bail. He is charged with tampering with the brakes on a car of the Schuylkill Valley Traction Co.

Broken wires caused the underframing on two electric cars of the New York, New Haven & Hartford to take fire one day last month. Two or three passengers were injured by jumping from the car.

Last month work on the Seattle & Tacoma Electric Ry. was resumed, the company laying 1,500 ft. of track to enable materials to be transported for building the trestle work over the tide flats.

The Boston Elevated Ry. early in September put on a new line of cars and arranged the route so that the fare to Brighton, Medford, Charlestown, Malden and Somerville is now 5 cents instead of 8 cents.

A citizen of Racine, Wis., has petitioned the attorney-general to institute quo warranto proceedings to annul the street railway franchise granted by the Kenosha common council to P. F. Haynes and G. L. Clause.

The Metropolitan West Side Elevated Railway Co., of Chicago, declared its second dividend, of 2 per cent, payable August 31st. The first dividend was 2½ per cent paid Feb. 28, 1900, for the fiscal year ending that day.

Patrons of the Central London Ry., the recently completed underground line, find that a ride in the "tuppenny tube" is very agreeable on a hot day, the temperature being about 30 degrees below that of the street.

Olcott Beach Park, a new pleasure resort of the International Traction Co., of Buffalo, was opened on August 29th, the new 12-mile line between Lockport and Lake Ontario being formally dedicated at the same time.

The Atlanta (Ga.) Rapid Transit Co. has leased three miles of track from the Seaboard Air Line and is building the necessary tracks in Atlanta so as to make connection and give an interurban line from Atlanta to Decatur.

An inclined elevator has been built as an experiment at the Third Ave. and 50th St. station of the Manhattan Elevated Ry., New York City. It is operated by electricity and has a capacity of 3,000 passengers per hour.

The Metropolitan Band, composed of employes of the Metropolitan Elevated road, Chicago, gave its second annual excursion and dance on September 2d; two special trains carried the party to one of the summer gardens.

The Brooklyn Rapid Transit Co. is seeking to redeem the property of the old Brighton Beach R. R., which was sold for taxes in 1895. The property is now part of the Brooklyn Union Elevated road controlled by the Transit company.

The San Francisco (Cal.) & San Mateo Electric Ry. with 28.3 miles of track reports gross earnings for the last fiscal year of \$224,425 as against \$204,440 for the preceding year. The figures for expenses of operation are \$189,715 and \$187,448.

A petition has been filed asking to have a receiver appointed for the Columbia (Pa.), Ironville & Mt. Joy Street Railway Co., a

corporation chartered five years ago to build a road through the cities indicated in title. This line was never built.

Preliminary arrangements have been concluded with the North Jersey Street Ry. and the Jersey City, Hoboken & Paterson Street Ry. for a pouch mail service between Jersey City and the Hudson County towns reached by the lines of these companies.

The court has dissolved the injunction which has heretofore prevented the Harrisburg (Pa.) & Mechanicsburg Electric Railway Co. from building a trolley line down the Cumberland Valley. It is announced the extension will be completed at once.

The city of Grand Rapids, Mich., has sued the Grand Rapids Railway Co. to recover some \$3,000, alleged to be due for maintaining patrolmen at certain street crossings. The time covered by these amounts is from Sept. 25, 1899, to Aug. 1, 1900.

Miscreants at Richmond, Ind., on September 2d smeared soap on the street railway tracks of the Earlham division and as a result there were two collisions, the men being unable to stop their cars. One motorman and two passengers were slightly injured.

The boycott of the Montgomery, Ala., street cars by the negroes has proved to be a very good thing for the company. The greater use of the cars by the white people has increased the receipts of the belt line 20 per cent over the highest earnings heretofore.

A 7-year-old Chicago boy tried the old experiment of tying a cord around his waist and dropping the other end in the cable slot to get quick action. The end caught, but fortunately the cord was cut through by rubbing on the slot rails after the boy had been dragged 50 ft. He was bruised and cut, but not fatally injured.

Reports as to the traffic on the Central London Ry., the underground electric line from Shepherd's Bush to the Bank, recently opened, are very gratifying to the management. On the opening day 83,000 passengers were carried; the number rose to 91,600 on the second day, to 93,000 on the fourth, and has been steadily increasing.

The strike and boycott against the East St. Louis (Ill.) Electric Street R. R. have been formally raised, all the striking employes having secured employment elsewhere. None of the old men is seeking employment of the railway company, but it was believed that the matter being ended practically it would be well to end it theoretically.

Engineers are at work preparing plans for a 12-mile extension for the Detroit, Plymouth and Northville electric line, reaching from Wayne to the city limits of Detroit. Secretary Russel reports that the financial arrangements from the extension have all been completed and that some work will be done yet this fall, although no effort will be made to place the extension in operation until early spring. Ashwell & Co., Detroit, will have charge of the engineering.

The Inland Traction Co., of Souderton, Pa., is meeting with serious opposition to its proposed extension from Lonsdale to Chestnut Hill. The points of objection are that the turnpike which it will occupy is too narrow; that it will endanger the lives of children going to Sunday school and annoy church congregations; that it will depreciate the value of farm lands; that compensation is not offered for land taken, and that cheap fares will bring tramps and thieves to the neighborhood.

The Detroit city council has passed an ordinance requiring all street cars operated within the city to be equipped with air or electric brakes. The companies have until next spring to comply with the ordinance. General Manager du Pont will give the matter his personal attention as soon as the busy summer season is over. His plan is to equip cars of the same type with the various new and old brakes and give all a trial under the same circumstances and conditions. There will be about 700 cars to be equipped.

RAIL AND TIE QUOTATIONS.

The expected slump in the iron and steel markets has not yet occurred, prices remaining as they have been for the past two or three months. It is still confidently predicted, however, by those who claim to know, that present quotations cannot hold and there will be a big drop as soon as the scramble for orders begins. Heavy T rails are \$35 to \$37; girder sections, \$40 to \$44.

Cedar and yellow pine ties can be purchased at same prices as given on page 478 of our last issue.

MR. YERKES IN LONDON.

Dispatches from London under date of September 11th say that Mr. Charles T. Yerkes has organized a syndicate which is about to acquire control of the Metropolitan District Ry., and has purchased the franchise of the Charing Cross, Eaton & Hampstead company which is to build a tunnel road $4\frac{1}{2}$ miles long. The business associates of Mr. Yerkes in Chicago state that they have no knowledge of his reported plans.

NATIONAL ELECTRIC HEATERS.

The accompanying illustration shows the type of plate for electric car heaters which is made by the National Electrical Manufacturing Co. The plate is of sheet iron, corrugated and then heavily coated with white enamel which insures perfect insulation and at the same time prevents deterioration. The heating resistance is also imbedded in enamel and thus protected against cor-

rosion, or against a break that would ground the heater. The wires are so placed as to be free from mechanical strains and as the heater cools slowly when current is shut off, the wires are subjected to an annealing process each time. The form of heater plate is such as to give a large radiating surface for a small space. The company also makes a regulating switch which carries 25 amperes at 650 volts and can be arranged for three degrees of heat; a lock prevents the degree being changed until the main switch is opened. Both these devices are placed on the market by the Morris Electric Company of New York.

KODAKS IN YELLOWSTONE PARK.

The widespread use of small cameras, of one sort and another by travelers, has led to a great development of amateur photography. Yellowstone Park is by far the most prolific spot in this country for the gratification of this calling or amusement, particularly for those interested in prize contests. To photograph the soaring geyser; the eagles on their nests; the numberless cascades and waterfalls; the beautiful springs, or the Golden Gate and the Grand Canyon, is to obtain a noted collection of pictures.

But the park is also the only place where wild animals, as they live in nature, can now be easily caught with the camera. The elk, deer, antelope, bears, coyotes, buffalo, etc., that, while wild, have not the timidity of hunted game, make it comparatively easy to photograph them there. The bears especially are easily found.

When riding on the stage coaches, if cameras are kept in readiness, opportunities sometimes occur for snap shots at elk and deer drinking from the streams or crossing the roads. By exploring the forests and parks a little remote from the hotels, the animals can be found with little difficulty.

"Wonderland, 1900," a finely illustrated book published by the Northern Pacific Railway, has a chapter on Yellowstone Park and the animals there, and will be sent by Charles S. Fee, General Passenger Agent, St. Paul, Minn., upon receipt of six cents.

For rates, etc., address F. H. Fogarty, General Agent, 208 South Clark St., Chicago.

NOTICE CONCERNING TRUCK PATENTS.

The Peckham Truck Co. advises us that the recent decision on street railway truck patents rendered by Judge Shipman in a suit for infringement brought against the Third Avenue Railroad Co., of New York City, does not at all affect the validity of the patents granted to Mr. Peckham for certain combinations of elliptical and helical springs used in the Peckham truck. Elsewhere in this issue is a notice to the trade prepared by the Peckham company, and to which it particularly directs the attention of all who are interested in this subject.

NEW YORK MEETING.

The 18th annual meeting of the Street Railway Association of the State of New York will be held at the Iroquois Hotel, Buffalo, on Tuesday and Wednesday, September 18th and 19th. The papers include the following: "Rotary Transformers," "Power Distribution in Buffalo," "Use of Storage Batteries on Small Roads," "Electrically Welded Joints in Actual Operation," "Practical Experience in the Operation of Combined Public Franchises by One Company, and the Advantages to the Public and the Corporation."

The entertainments include excursions over several divisions of the International Traction Co's. system and over the Great Gorge Route, visits to the parks, the annual dinner at the Iroquois Hotel and a luncheon at the Dufferin Cafe.

The present officers of the association are: President, G. Tracy Rogers; vice-presidents, Charles Clemmshaw and John Boyle; secretary and treasurer, Henry A. Robinson.

WINS SUIT ON TROLLEY HARPS.

The Star Brass Works, Kalamazoo, Mich., announces the decision of the United States Circuit Court which has modified a former order and now permits the Star company to sell trolley harps. The suit was brought by the General Electric Co., and the court order in favor of the Star company was issued August 16th.

THE DALLAS STRIKE.

The press reports from Dallas, Tex., might lead one to think that there really was a street railway strike at that place. The facts as reported by our correspondent in Dallas are: "Only a small number of men went out on a strike, and their places were filled at once. The cars were not delayed at all, and have since been operated as usual without any appreciable difference in traffic."

NOISELESS CAR WHEELS.

The Chicago City Railway Co. and the Chicago & Milwaukee Electric Railway Co. are each making a trial of noiseless car wheels which are the invention of Mr. I. Hogeland, 1113 Monadnock Block, Chicago. The wheels now in service on the Chicago & Milwaukee line are 33 in. in diameter while those under the Chicago City car are 30 in. in diameter, otherwise they are similar. The centers are of cast iron of the spoke type; the tires are of chilled cast iron and between the two sections is placed a layer of paper, the paper in a wheel weighing about 2 $\frac{1}{2}$ lb. The edge of the center and the inside surface of the tire are stepped and beveled so that the two pieces can be drawn tightly together. The fastenings consist of 12 $\frac{7}{8}$ -in. machine bolts placed parallel to the axis which are set up with a 30-in. wrench and the ends riveted over.

Besides the claim for noiseless running it is also stated that the Hogeland wheel is much cheaper in the long run, the cost of renewing (a new tire and the paper) being from \$1.50 to \$2.00 less than the cost of a new cast iron wheel of the ordinary type.

A safety water column of simple design is made by the Pittsburg Gage & Supply Co., Pittsburg. The device consists of a seamless copper float placed in the water column to which the gage glass is attached, and rises and falls as the water level varies. Should this level become either too low or too high for safety the float opens a valve which admits steam to a small whistle mounted on top of the column, thus sounding the alarm.

NEW PUBLICATIONS.

LEWIS INSTITUTE School of Engineering.—This is an illustrated pamphlet of 50 pages, describing the equipment of the Lewis Institute, Chicago, with particular reference to the school of engineering.

L'ALBUM DES ELECTRICIENS. Price 5 francs; foreign subscriptions, 5.50 francs.—The editors of L'Electricita announce they have issued a very handsome album containing 200 phototype portraits of men to whom the science and art of electricity owe their present development. The book is printed on fine art paper, quarto in size, but aside from its artistic merits should be valuable for reference. L'Electricita is a weekly paper of 19 years' standing published at Milan, Italy, via Cusani et.

ARTHUR KOPPEL'S ALBUM FOR 1900.—This interesting publication is a book of 50 pages giving descriptions and illustrations of a few of the field railways and light railways installed by Arthur Koppel, of Berlin. Among the countries represented by illustrations are Norway, Sweden, Denmark, Great Britain, Belgium, Holland, France, Germany, Russia, Austria, Italy, Egypt,

manual of the methods, utility, and cost of public improvements for the municipal officer, and the preface further explains that it is particularly intended as an aid to those members of town and city councils whose education and training have not made them familiar with the details of the municipal improvements to be undertaken during their terms of office. The first edition was published in 1892, and the present edition has been considerably enlarged, seven chapters having been added in the last revision. It does, in fact, constitute a valuable handbook for one seeking practical information concerning the building of sewers, streets, water-works, cemeteries, public halls and other improvements which a municipality is called upon to make or superintend. The author has added three chapters of what he calls "notes by the way," in which are given his ideas on elevated traffic versus subways, on civil service appointments, and on municipal ownership. He believes that the two-story street is more advantageous than a subway and far less costly; that civil service examinations in many instances are absurdly impractical, and that municipal ownership is a failure because it removes all real incentive to progress and effort. Commenting on the dearth of business ability in municipal management, he says: "What can we promise in the way of an able management of a gas plant or a street railway when our cities and towns are mulcted annually of large sums of money because of defective sidewalks, badly kept street surfaces, and weak bridges?"

KOPPEL TRAMWAY IN PESCARA.

Togo, Transvaal States, Persia, India, China, Japan, Australia, and nearly all the states of Central and South America. The album has all announcements and descriptions printed in six languages, and to this thorough method of advertising the firm doubtless owes a great part of the large foreign trade that it enjoys. The accompanying illustration shows a Koppel railway in Pescara, Italy.

DUNCAN'S MANUAL of Tramways, Omnibuses & Electric Railways, 23d annual edition. Published by T. J. Whiting & Sons, Limited, 7A South Pl., London, E. C. Price, 3s. 6d.—The 1900 edition of Duncan's Manual contains over 450 pages, being considerably larger than any previous issue. As heretofore the publication includes the tramway and omnibus companies of the United Kingdom, and the foreign and colonial companies that are registered in England; wherever it has been possible to do so an analysis of the revenue accounts is given. Some 15 new companies have been added and 5 foreign roads are this year omitted by reason of their being no longer controlled by English companies. Following the statements of accounts are extracts from the Tramways Act and samples of the by-laws adopted by English companies. The last 86 pages contain a directory, alphabetically arranged, of the directors, officials, engineers and auditors of the enterprises mentioned, and also of firms and individuals closely connected with the tramway industry. The publishers have won an enviable reputation for accuracy by their previous editions of the manual, and the same high standard is preserved in the present book.

MUNICIPAL IMPROVEMENTS. By W. F. Goodhue, Civil Engineer. Third Edition; 207 pages. Published by John Wiley & Sons, New York. The sub-title of this book shows that it is a

THE CAR-HOUR UNIT.

At the Chicago convention of the Street Railway Accountants' Association, Mr. H. C. Mackay, comptroller of the Milwaukee Electric Railway & Light Co., presented a paper in which he argued in favor of the car-hour instead of the car-mile as a unit for comparing the results of street railway operation. The discussion was very animated and indicated that there was considerable opposition to the proposed plan. Since then, the car-hour as a basis for comparing different lines has been adopted by the Milwaukee company and also by the Twin City Rapid Transit Co., of Minneapolis.

The Milwaukee Electric Railway and Light Company.

		Day.	Month to Date.	Year to Date.	Car Hour	Month to Date.	Year to Date.
1900							
1899							
Increase or Decrease.							

The accompanying reproduction shows a portion of the daily earnings sheet of the Milwaukee company, some of the names of divisions being omitted; the original is 8½ x 14 in., and has a similar ruling for the Milwaukee Light, Heat & Traction Co., which operates the interurban lines of the Milwaukee system. Some figures of actual operation are as follows:

Line.	Speed M.P.H.	Earnings per Car-Mile.	Earnings per Car-Hour.
1	8.3	\$.33 1-3	\$2.76
2	16.2	.2857	4.63
3	10.7	.2679	2.86

On the Twin City road it was found that lines showing the greatest earnings on a car-mile basis were inferior to others on the car-hour basis, the speed making the difference.

TRADE NOTES.

THE JACKSON & SHARP CO., of Wilmington, Del., has recently completed an order for 100 trolley cars for Paris, France.

THE HUNTER ILLUMINATED SIGN CO. has just closed a contract with the Washington (D. C.) Traction & Electric Co. for the equipment of all its cars with signs.

THE TRIUMPH ELECTRIC CO., of Cincinnati, reports a large business, and says that the trade for the past year is over 50 per cent more than for the previous year.

THE BETHLEHEM STEEL CO. advises us that its office at St. Louis has been discontinued, and that the business in that territory will henceforth be handled by the Chicago office.

J. G. WHITE & CO., LTD., have been incorporated in London with capital of £100,000, to build railroads, tramways and telegraphs and to represent the firm of J. G. White & Co., of New York.

THE IMPERIAL ELECTRIC LIGHT, HEAT & POWER CO., of St. Louis, after a thorough trial of a year, has placed duplicate order for the Siegrist automatic oiling system for some new units it is now installing.

THE MORRIS ELECTRIC CO., 15 Cortlandt St., New York, has recently secured a large order for 8,000 iron poles to be used by the General Electric Co. in India. Mr. Morris also reports the shipment of five cars to Mexico.

THE MICA INSULATOR CO., Schenectady, N. Y., was awarded a gold medal for its unique exhibit of mica and micanite at the Paris Exposition. The award was made not only on the merits of the exhibit, but in consideration of the Mica Insulator Co. being the original inventor and patentee of "Micanite."

THE ROCKFORD RAILWAY CO., Rockford, Ill., has commenced installing the Weber joint on its lines, and will probably use this joint on its entire system. The sale was made by Mr. F. A. Poor, of the Chicago office.

THE STEWART HARTSHORN CO., of East Newark, N. J., has been awarded a medal of merit for its exhibit of self-acting curtain and shade rollers in the United States Department of Varied Industries at the Paris Exposition.

THE EDWARD P. ALLIS CO., Milwaukee, Wis., has established a branch office at 110 Mill St., Spokane, Wash., discontinuing the office at Butte, Mont. Mr. H. V. Croll has been placed in charge of the office at Spokane.

THE ELECTRIC STORAGE BATTERY CO., of Philadelphia, has issued Circular No. 59, of its regular series. The pamphlet describes and illustrates the installation of "Chloride Accumulators" in the mills of the R. & H. Simon Co., silk manufacturer, Union Hill, N. J.

THE MICHIGAN MANUFACTURING CO., Ypsilanti, Mich., reports an exceptionally lively trade, both at home and abroad, in track drills. Four of these drills were recently shipped to the City of Mexico, this being the second order received from the same parties this year.

THE CRANE CO., of Chicago, has sent us a very handsome metal sign printed in colors, showing the company's 18-in. No. 11-E iron gate valve with outside screw and yoke and by-pass. This type of valve is used extensively in the equipment of power plants, which has become such an important part of the Crane Co's. business.

A. L. IDE & SONS, of Springfield, Ill., have recently issued "Supplement No. 42," which is an 8-page pamphlet illustrating and describing their four-ported engines, which show a steam distri-

THE P & B

DENOTES THE WORLD'S STANDARD

THE STANDARD PAINT COMPANY

NEW YORK 81-83 JOHN ST.	CHICAGO 189 FIFTH AVE.	HAMBURG GRIMM 33	PARIS 50 BOUL HAUSSMANN	LONDON 39 VICTORIA S.W.
-----------------------------------	----------------------------------	----------------------------	-----------------------------------	-----------------------------------

bution and economy closely approaching the Corliss type, and also embody the simplicity of the well-known "Ideal" engines which this firm has developed.

THE DICKE TOOL CO., of Downers Grove, Ill., has been awarded a bronze medal on tools at the Paris Exposition. This is the highest prize awarded on tools. Mr. Dicke was in personal attendance at the Paris Exposition and the exhibit created considerable interest among foreign manufacturers. Thomas G. Grier is the Chicago representative of the company.

THE DETROIT STEEL & SPRING CO., of Detroit, Mich., advises us that the fire at its works on the evening of August 19th was confined entirely to the foundry department, where steel castings for railway and other work are made. The rolling mills, spring shops, and other departments were in no wise affected. The loss was fully covered by insurance, and the foundry was again in operation in less than two weeks.

AS AN INSTANCE of direct returns from advertising, the Burt Manufacturing Co., of Akron, O., reports that it is crowded with orders as the result of an illustrated notice of its "Burt" exhaust head, which it has only recently commenced to advertise. "Any article of merit," claims Mr. Warden, manager of the company, "can be pushed successfully through judicious advertising in the trade journals, as we have demonstrated to our own satisfaction, at least."

THE GARTON-DANIELS CO., of Keokuk, Ia., has lately received a number of large and gratifying orders for lightning arresters, among others being one for 200 poles arresters from the Union Traction Co., of Philadelphia. The Garton-Daniels Co. expects to exhibit at the coming street railway convention in Kansas City, a perfected form of the "Automotoneer," a device for automatically regulating the speed at which the controller can be turned when starting a car.

STONE & WEBSTER, the well known electrical engineers, were completely burned out in the early morning of August 24th. Their offices occupied three floors at No. 4 Post Office Sq., Boston, and only the contents of the fire proof vaults escaped destruction. At 10 o'clock of the same morning the auditing and engineering departments were doing business in new offices at 95 Federal St., and it is more than possible that considerable activity was indulged in that morning.

THE CHICAGO MICA CO., whose main office is at its factory, Valparaiso, Ind., attributes the increase in sales of its products in the Central and Western States, to the fact that consumers of insulating materials appreciate being able to deal direct with the makers. The thorough equipment and organization of the Chicago Mica Co's. factory and its excellent location, 40 miles from Chicago on three trunk lines, enable shipments and deliveries to be made promptly and cheaply.

FISHER & SAXTON, 123 G St., N. E., Washington, D. C., have published their first catalog descriptive of the "Dromedary" mixer which has been introduced with great success for mixing concrete and mortar without the use of mixing platforms, wheel barrows, planks or other common accessories to the process. The catalog contains some 30 pages liberally illustrated with half-tone reproductions of the "dromedary" and a number of diagrams. It is printed on the finest paper and in the clearest type.

FOWLER & ROBERT, of No. 149 Broadway, New York, on August 16th incorporated their firm as the Fowler & Robert Manufacturing Co., to manufacture and deal in general railway supplies. The officers of the new company are J. W. Fowler, president; L. E. Robert, vice-president; G. W. Linch, treasurer, and F. Vieweg, secretary. Mr. Linch and Mr. Vieweg are both experienced street railway men. The former has been prominently connected with the Christopher & Tenth St. Ry. and the

THE CONVENTION CITY

Where Will Be Held October 16th—19th, the 19th Annual Meeting of the American Street Railway Association and the 4th Convention of the Street Railway Accountants' Association of America—
History of Missouri—Story of the Phenomenal Rise of Kansas City.

The coming of Christianity to the Mississippi Valley marked the beginning of its history. DeSoto, with his coterie of adventurers and priests, discovered the river in 1542. He found the country an unbroken wilderness, a barbarous solitude, and claimed it in the name of the king of Spain. That was the end of legend and the beginning of eventful modern times in the Western forests.

"When the Mississippi was first seen by white man," writes Mark Twain, "less than a quarter of a century had elapsed since Francis I's defeat at Pavia; the death of Raphael; the death of Bayard, sans peur et sans reproche; the placarding of the Ninety-five Propositions which began the Reformation. When DeSoto took his glimpse of the river Ignatius Loyola was an obscure name; the order of the Jesuits was not yet a year old; Michael Angelo's

guished office. They propitiated him with gifts of beads and furs. His march from Tampa Bay to the Mississippi under the verdant arches of the forest was that of a conqueror. But he found no gold. Everywhere through the trackless wilderness, over the barren sites of present cities, the lonely company of white men searched for caves of treasure, miraculous mines that should pour forth gold at the Spaniards' approach. Their quest was as erratic, as hopeless as that former one of Ponce de Leon searching for the waters of immortal youth in the Eden of Florida. A year or two of famine and disheartening failure, and DeSoto perished on the eastern border of what is now Missouri. The few followers that survived him kept his death secret from the Indians, fearing massacre should the savages learn that the protection of the Sun's Son was removed from them. DeSoto was buried at midnight in the

INCLINE—UNION DEPOT AND MANUFACTURING DISTRICT.

paint was not yet dry on the Last Judgment in the Sistine Chapel; Mary Queen of Scots was not yet born; Calvin, Benvenuto Cellini and the Emperor Charles V were at the top of their fame; the Spanish Inquisition was roasting and racking and burning. When DeSoto stood on the banks of the Mississippi it was still two years before Luther's death; 11 years before the burning of Servetus; 30 years before the St. Bartholomew slaughter; Rabelais was not yet published; Don Quixote was not yet written; Shakespeare was not yet born; a hundred years should elapse before Englishmen should hear the name of Oliver Cromwell. Unquestionably the discovery of the Mississippi is a datable fact which considerably mellows and modifies the shiny newness of our country and gives her a most respectable outside aspect of rustiness and antiquity."

The story of DeSoto's expedition is an unparalleled romance, and of all the expeditions to the new world it was the most disastrous. With nine ships, 700 men, 350 horses and the crudest of mechanical means DeSoto came to unearth a fabulous treasure in some unknown quarter of the continent, to wrest from the granite mountains, the river valleys and the primeval forests a quantity of gold and silver for the decoration of the Spanish court. DeSoto came with considerable pomp. He was believed by Indians to be the Son of the Sun, which they worshiped, and his shining rapier and resplendent dress were accepted as the livery of his distin-

Mississippi, an event remarkable as the first Christian ceremony solemnized in the western forests, and prolific of numberless dismal illustrations in the history readers of American school boys.

The early history of Missouri is inseparable from that of the entire Mississippi Valley. DeSoto had turned the eyes of the world upon this region. Within 130 years Marquette, Joliet and LaSalle completed DeSoto's work. Marquette, a French priest, named the Mississippi the Conception, in honor of the Virgin. The Missouri River, of which he was the discoverer, he called "Pekitanoui," meaning Muddy Water. The pious French soon established Catholic altars far to the northward, and pierced the wilderness of Missouri "to explain hell to the savages." Next came LaSalle, whose explorations gave Europeans their first accurate geographical knowledge of the Mississippi and its vast basin. LaSalle's first expedition was a victory. At the delta of the river he buried a silver plate, engraved with the arms of France, claiming the entire river valley for the French king, and naming it Louisiana in his honor. Through LaSalle, Louis XIV found a means of extending his domain, and sent out expeditions to colonize the wilderness. In a few years a miniature France mined, planted, fought and worshiped in the American forests. The Catholic missions became parishes. Forts guarded the frontier. Frenchmen became addicted to tobacco, and the Missouri and Illinois learned the use of firearms.

WORKHOUSE.

Crozat, who held the first Louisiana charter under the French king, ruled the colony by the same laws that governed Paris, and these were the first laws of civilized society that ever existed between the Gulf of Mexico and the Falls of St. Anthony. Later, the Mississippi Company was appointed to succeed Crozat, and under the new regime liberal inducements to French miners and mechanics were advertised. The tide of immigration swelled. Famous Fort Chartres 65 miles below the mouth of the Missouri was built in 1720, and was for a long time the strongest fortress on the continent. The Mississippi Company started the cultivation of wheat in Illinois, and that of tobacco, indigo, rice and silk throughout "Louisiana." The lead mines of Missouri were opened in the hope of finding silver, an experiment which nearly wrecked the company financially, and put the king in a bad temper. It cost him 50,000,000 livres yearly to support his colonial subjects while they wasted time in what amounted to an unavailing rainbow chase. But the French had a gambler's passion for risking all they had gained in the New World on the chance that the next venture would prove a lucky one. They believed that silver must abound in the unexplored West. Mining settlements sprang up and perished along the Missouri River, leaving no record. Ste. Genevieve, the oldest permanent settlement in Missouri, was founded. In 1719 Phillip Francis Renault, a director in the Mississippi Company, and a famous mining expert left France with 200 artificers and miners to solve the silver problem in Louisiana. In his passage he put in at the island of St. Domingo, where he purchased from the slave market 500 negro slaves for working his projected mines. Arrived in Louisiana he established his headquarters at St. Phillips, near Fort Chartres, and from here he sent out mining and exploring parties into various parts of Louisiana. The extensive lead mines on the St. Francis River, and those north of Potosi were discovered and the energies of the Mississippi Company were directed toward their development. The mines failed to yield silver. They were valuable, however, for the lead and copper they contained, and Renault continued their operation until 1731. He shipped great quantities of

these minerals from Ste. Genevieve, via New Orleans to France, and established a permanent industry west of the Mississippi. To him were made the first grants of lands in what later became the state of Missouri, and to him is attributable the introduction of negro slavery in Missouri. Thus, in the search for silver were sown the seeds of a national disgrace, which, more than a century later, ripened into the War of the Rebellion.

The colonial treasury was chronically empty. Next to mining, the fur trade was principally depended upon, and a grant of the exclusive privileges of trade in the north and northwestern part of the territory was made the firm of Maxent, Laclède & Co. Pierre Laclède Ligueste, or Laclède as he was generally known, though but a junior partner in the firm, was placed in command of an expedition which left New Orleans Aug. 3, 1762. The company spent the winter at Fort Chartres, and in February or March resumed their journey. On reaching the west bank of the Mississippi Laclède founded St. Louis by establishing his principal trading post on the site of the present city. He gave it the name St. Louis in honor of the French king, unaware that since his departure from New Orleans the entire valley had been ceded by France to Spain. The white flag of France was floated, a clearing made and a number of log cabins erected for the storage of merchandise. Other posts were established far to the West, near where Kansas City now stands. Guns and clothing were usually the articles exchanged for furs. The Indians showed a great preference for leather shoes, which they attached to strings of beads and wore as ornaments. The fur trade became the most important of colonial resources, and after 40 years amounted to \$200,000 per annum.

Disastrous mining ventures had exhausted the colonial treasury. A famine had brought death and devastation in the South. The disheartened colonists demanded the revocation of the Mississippi Company's charter, a demand with which the king willingly complied. In 1762 France could no longer support her prodigal colonies. The king had lost his power in Canada; his English enemies possessed Havana, and their ships in the harbor prohibited egress from the colonies by the sea. An incursion of the English into Louisiana was threatened, which would dispossess France of this territory forever. Hoping to save something from the wreck of his investment the French king ceded all Louisiana to Spain, which was then an ally of France. By this ruse the English incursion was forestalled, and forty years later France bargained for her colonies, which were retroceded by the treaty of 1800.

The colonies prospered during the 40 years that Spain ruled Louisiana. A happy commonwealth existed. Every head of a family was entitled to a house lot in his village, and to all the land he cared to cultivate, and in return it was required of him to keep a part of the highway in repair. An old historian writes disparagingly of these people, but admits that they were probably the happiest folk in the world. They had no politics to corrupt them, but were simply and loyally French. There was social intercourse but no society. Dancing and card games diverted everyone. The friendliest relations with the Indians were maintained, and from them the pioneers borrowed many customs, and learned their skill in the ways of hunters and woodsmen. No house was finer than its fellows, no man received more deference than he paid his neighbors. Slaves and cattle comprised wealth. There were no tailors, no shoemakers, no bakers, and no shops. Hogs, oxen and horses wan-

DELAWARE ST. NORTH FROM 7TH.

THE JUNCTION.

MAIN AND 9TH ST.

THE CONCOURSE.

dered at liberty through the village streets. Hospitality and honesty were the cardinal virtues of citizenship. "His magnanimous Majesty" attempted to establish schools, but not a single pupil was presented for the Latin class. The colonists cared not a fig for education. There were classes of manners, however, where the children were taught "politeness and self-denial." All were Catholics. The festivals of the church were observed devotedly, and anyone who joined in these celebrations with a gloomy countenance was suspected for a fraud and a hypocrite.

Money was as yet too scarce to be useful as a medium of exchange, though Spanish milled dollars circulated in the payment of certain debts. Peltry at a fixed rate was legal tender. The salaries which the priests, soldiers and officers received from the government were paid in foreign goods. The colonial "chef lieu" was removed from New Orleans to St. Louis, and Missouri's place as the commercial center of the colonies was established. Spain exacted little of her colonies in Louisiana. A duty of six per cent on all exports and imports was levied, aggregating \$120,000 annually. This, and a tax on salaries, legacies and liquor licenses, amounting to less than \$10,000, comprised Spain's only revenue from Louisiana.

While the pioneers of the Mississippi Valley were peaceably engaged in agriculture and the sowing of masses, the "Sons of Liberty" in the eastern colonies were bitterly resisting British oppression. England had prohibited manufactures in America. American farmers were compelled to send their products to England, and to purchase their goods in English markets. The odious Stamp Act of 1765 required that stamps bought of the English government should be put on all legal documents, newspapers and publications in English colonies in America. Exorbitant taxes were levied in order to defray the expenses of England's war with France, and the colonists were denied representation in the affairs of government. The Americans revolted. Every English colony in America was ripe for revolution, and in Philadelphia, Sept. 5, 1774, the First Continental Congress assembled to declare that the acts of the British parliament should no longer be obeyed. Paul Revere's lanterns in the church tower burned as beacons to National liberty. Lexington and Bunker Hill were fought, and Washington assumed command. The Declaration of Independence was adopted July 4, 1776. There followed the terrific struggle of the Revolution, the sorrowful winter at Valley Forge, and finally a splendid victory. Through Franklin, France was induced to acknowledge the independence of the United States, and to lend assistance. Thus a great Republic sprang into life in America. The pioneers of the Mississippi Valley, while they had no share in the revolution, rejoiced in the triumph of the United States. It promised them protection from the British, whose determination to expel Spain's colonists from the Mississippi Valley was well known. In 1780 the British governor at Michilimackinac sent a considerable force down the river to attack St. Louis. It was planned in London that when St. Louis should be in the possession of the English, troops should proceed down the river, and with the assistance of the English forces already stationed in southern Louisiana, capture New Orleans. The attack on St. Louis was defeated by General George Rogers Clark in command of the Virginians, who stationed a force at Kaskaskia sufficient to repulse the invaders. In lower Louisiana, Governor Galvez anticipating the British attack, successfully forestalled it by raising a

great force and capturing Natchez and Baton Rouge, which were England's only important strongholds on the Mississippi. Thus a common cause, their hostility to England, linked the Americans and the French in the Mississippi Valley. Spain offered most liberal inducements to emigrants from the United States who should settle within the borders of Louisiana. Lands were freely granted to all comers. A farm of 800 acres could be obtained for \$41. Often the tracts granted included valuable lead mines, and taxation was, practically, unheard of. No discrimination was made against Protestants. Emigrants poured into Louisiana from the United States, entirely changing the character and condition of the colonists. In 1803 three-fifths of the population of Louisiana were English-Americans, and the majority of these were the owners of negro slaves.

With the beginning of the 19th century Spanish rule in the Mississippi Valley was practically at an end. Napoleon, to whom Louisiana was retroceded in 1800, purposed to establish his power in America; the province of Louisiana was to be extended, the people of the Ohio Valley brought into subjection, and moreover, from this territory troops and supplies for the Haytian campaign should be procured. Two years were spent in the preparation of the expedition to Hayti, and in wrangling with Spain over disputed boundaries of the province retroceded, a contest in which the United States was involved for the protection of its harbor rights. In 1803 France was exhausted from her protracted wars; the plans for the occupation of Hayti were exploded, the presence of the English fleet prevented the approach of French vessels to the American coast. Napoleon was checkmated. An opportunity to part with his untenable province at a profit was welcomed, and Louisiana was sold, through negotiations concluded April 30, 1803, to the United States, for 80,000,000 francs, with the stipulation "that the inhabitants shall be incorporated in the Union of the United States, and admitted as soon as possible."

Napoleon appears as a prophet in this transaction. When he

BAND STAND IN FAIRMOUNT PARK.

THE COUNTRY CLUB.

signed the documents of the Louisiana Purchase he remarked to the American envoy: "This accession of territory strengthens forever the power of the United States. I have given England her greatest rival."

On March 9, 1804, the French flag in the public square at St. Louis was hauled down, and that of the United States unfurled in its place, while the assembled citizens of Missouri greeted it with patriotic cheers. The day was one of public rejoicing. American troops crossed the river, and the ceremony of Spain's evacuation was formally enacted. Captain Amos Stoddard of the United States Army received Louisiana from Don Carlos Delassus on behalf of France and transferred it, as he had been commissioned by Napoleon to do, to the government of the United States.

Louisiana was now erected into a territory, and accorded the privileges of self-government under the administration of a governor general. Trial by jury was introduced. French and English schools were established, and the French pioneers, who had cared not a fig for education, led the settlers from the States in petitioning for seminaries where Latin, Greek, mathematics, mechanics, philosophy and the principles of the Constitution of the United States should be taught. Wandering tutors divided their time between teaching and molding candles out of deer's tallow. Hebrew was "taught" in 12 lessons. Latin in 10. More pains were spent in the acquirement of skill in waltzing, fencing and piano playing. Turveydrop, if he had lived in Louisiana, might have been a happy man.

An act was passed "confirming all claims made by virtue of incomplete French or Spanish grants prior to the United States' accession of Louisiana." There was need of such legislation, for when Kentucky and Tennessee came pouring over the borders to seek homesteads in Missouri the condition of the country became like that of a pack of cards shuffled unskillfully. Each man hazarded an ambitious guess as to the largest possible limits to his acres; no one cared to live within hearing of the barking of his neighbor's dog. Claims encroached on claims that had the right of precedence, and little heed was paid the tenth commandment. The new settlers not only coveted; they usurped. Conflicting claims resulted in duels, and duels ended in feuds enduring for several generations. Every man went armed with dirk and gun. There was the droll paradox of judges "full of wise saws and modern instances," dispensing justice from the bench and tightly grasping cocked pistols in their hands for the preservation of their lives. Duels were considered sport among gentlemen. Murders were frequent among the lower classes. A story is told of two army officers, brave and adventurous men, both, who had lived for years such friends as Damon and Pythias, and one day disagreed about a mining claim. There was no quarrel. They were at dinner among friends when the dispute occurred, and one of them said:

"I have the highest opinion of your honor, sir, but you mistake. The property you claim is mine. Let us settle this little matter in an amicable way." Whereupon both rose in their places on opposite sides of the table; seconds were quickly chosen from among the interested guests; pistols were leveled, aimed, and at the signal fired. Damon fell dead, his blood mingling with the wine spilt in his fall upon the table cloth. Pythias, when the corpse had been removed, sorrowfully related anecdotes of his friend's good qualities during the remainder of the meal.

Towns were no longer formed merely to afford protection in numbers against the dangers of frontier life; they became the result of localized industry. A miner, perhaps, would be the first to settle on the site of a future city. In good time the miller followed, and

after him the blacksmith. Next would come the publican. When these four were engaged in a merry game of trade the storekeeper was attracted. There would soon be a school, then a church, and at last a post office. When numbers were thus attained and the community was self-supporting, a suitable extent of the surrounding territory would be laid out and erected into a county. The town was no longer attached to the judicial circuit; it was launched proudly into a separate political life, with judges and other county representatives of its own. The territory of Missouri comprised five counties in 1812, and 15 in 1820, in which latter year the population numbered 66,000. Ten thousand of these were negro slaves.

St. Louis, as the early capital, made rapid progress. This was a village of 180 houses when Louisiana was purchased by the United States. Four years later, in July, 1808, the first newspaper ever published in Missouri was established, and accomplished more than any other institution in advancing the political and commercial interests of the people. St. Louis was incorporated into a town in 1809, and in ten years, so rapidly did it progress, the streets were "lined with brick houses that would not have disgraced Philadelphia." In the homes of the rich there were valuable private libraries, notably those of Colonel Chouteau and Frederick Bates. Bishop Dubourg established a private gallery in which there were original paintings by Raphael, Rubens, Guido and Paul Veronese, strangers indeed in the wild country of the pioneers.

Rough roads were built connecting the counties and principal towns of Missouri, but these were comparatively little used. Until the coming of the "iron horse" many years later, the Mississippi River continued to be the chief artery of commerce. The dry goods with which Missouri was supplied were purchased in Philadelphia and wagoned across the Alleghany mountains to the Ohio River, and were then loaded on barges and brought down the Ohio and up the Mississippi to St. Louis. Groceries were purchased in New Orleans and brought to St. Louis on barges or rafts. A history published in Missouri in 1819 makes the following statement:

"Steamboats have lately engrossed the business of transportation and should they continue to multiply at the rate now indicated they will in a few years throw keel boats and barges out of the question."

Cutlery, castings, paper, and the implements used by farmers, carpenters, blacksmiths and miners were brought from Pittsburg.

Peltry was no longer legal tender. Money was scarce, however, and the Spanish dollars still in circulation were cut up into halves, quarters and eights. These latter were called "bits," and this is the origin of the term as applied to small change in the west at present.

The Bank of St. Louis went into operation in 1816. Others were soon established. They opened the flood-gates of trade, and land, live stock, slaves, personal property and everything salable found ready purchasers. Everyone spent his money as quickly as possible, "for a penny saved burnt a hole in the pocket." Credit was never denied. Debts accumulated against a day of wrath, and the day came in 1819. The tide of immigration was checked, owing to the stringency of the eastern money market. Local institutions, when the downpour of capital abated, could not meet the demands of the United States Bank for specie; many were forced into bankruptcy. Bank notes became worthless. Missourians were "property poor," and in the midst of broad acres the owners of abundant crops and comfortable homesteads "had not a penny to buy a blessing." These were hard times, indeed. The government rescued Missouri from the panic by instituting "a system of relief, which, by extending the time of payment and authorizing purchasers to secure a portion of their lands by relinquishing the remainder to the government, in the course of eight years extinguished a large

FAIRMOUNT PARK.

portion of these debts and eventually absorbed the whole without injury to the citizen and with little loss to the government."

The slavery system still existed in Missouri unchallenged. In 1818 Missouri applied for admission to the Union, and the slavery issue was opened by the House of Representatives amending the enabling act so as to prohibit the further introduction of slavery into the new state; the Senate rejected this amendment and as neither house would yield the territory was not admitted. In the following year Maine applied for admission and after a warm controversy in Congress the Missouri Compromise was effected by which both Maine and Missouri were to be admitted as states without restriction (i. e., Maine free and Missouri slave), but slavery to be forever prohibited in the other territories north of latitude 36° 30", the southern boundary of Missouri. Maine was duly admitted in 1820, but Missouri in framing her constitution inserted a provision declaring it to be the duty of the legislature to pass laws preventing free negroes or mulattoes coming to or settling in the state, and by reason of this clause she was again refused admission to the Union. Finally, in 1821 Missouri was admitted as a state on accepting the fundamental condition imposed by Congress that the obnoxious provision of constitution should never be enforced.

During the following 40 years, in which the clouds of secession and civil war were gathering, Missouri remained essentially faithful to the Union, though her interests and sympathies were identified with those of rebellious "Cotton States." Her slaves were valued at \$35,000,000. Abolition meant the loss of this great property, and a far greater loss resulting to the industries, agriculture and commerce of the state. There were many "rabid" abolitionists in Missouri, and most of them were unwise in the course they pursued to advance their cause. One, a rich man in St. Louis, invited a number of his neighbor's slaves to dine with him. A sumptuous banquet was served, and the ladies of his family received the negroes as honored guests. This radical action was considered an insult to St. Louis society, and the press throughout Missouri figuratively "mobbed" this hospitable abolitionist. Some papers published lengthy editorials denouncing the outrage; others caricatured the host and his family, and the scandal spread like wildfire over the whole of America. That dinner was perhaps the most expensive entertainment ever given in Missouri.

Such incidents became of daily occurrence. Reasonable arguments were unheard, and it was safer for a man to smoke his pipe in a gunpowder mill than to speak against slavery in Missouri. Preachers who preached against it were tarred and feathered. A system of running slaves over the borders into free territory re-

TROOST PARK.

West, and occupied by Federal troops under General Lyon. The possession of Missouri was bitterly contested. An army of secessionists believing they were fighting for the cause of justice joined the Confederate forces at Memphis.

The official report of John B. Gray, adjutant general of the Missouri State Militia, to Hamilton R. Gamble, governor, rendered at St. Louis, Dec. 31, 1863, contains the following:

"The shock of the contest which was precipitated upon our state, and which was so nobly met by the loyalists of Missouri, has passed away, and the triumphant arms of the defenders of the Republic have forced the enemies of liberty from our borders, and they are now seeking battlefields far remote from that state which the traitors desired should experience all of its horrors and devastations.

"The accomplishment of this glorious result is due probably more to the efforts put forth by the loyal people of Missouri than to any other cause; for, without their bravery and patriotism, and without their willingness to submit to any and all sacrifices rather than prove false to the trust which was imposed upon them by the founders of our republic and the state, the war in Missouri might now be at its height, instead of so near its conclusion."

The defense of Missouri is a history in itself. The battles of Springfield and Bloody Hill were fought, Missourians against Missourians, but the battles in Missouri, terrible as they were, did not de-

LAKE-VIEWS IN THE PASEO-PERGOLA.

sulted in constant hostilities, and murders and lynchings frequently occurred.

When war was declared, Missouri decided for the Union. In his message to the General Assembly Governor Stewart announced:

"Missouri will hold to the Union so long as it is worth an effort to preserve it. If South Carolina and other cotton states persist in secession Missouri will desire to see them go in peace with the hope that a short experience at separate government and an honorable adjustment of the federal compact will induce them to return to their former position. I would here record my unalterable devotion to the Union so long as it shall be made the protector of equal rights."

St. Louis was made the headquarters of the Department of the

cide the fortunes of the Rebellion. In Missouri war was rather a long story of half rations, long marches, bad quarters and endless maneuvers for the advantageous position.

At the end of the war Missouri was poorer in slaves and richer in heroes. The subsequent history of the state is the story of prosperity and progress. Since the coming of the railways the swift advance in all commercial and educational institutions is evidenced in a score of cities. The empire state of the West is unexcelled in its natural resources; nowhere is business better, nowhere are people more hospitable. The prophesy of Napoleon, that the accession of the territory of Louisiana should strengthen forever the power of the United States, to make them England's greatest rival, has been fulfilled, and the credit belongs to Missouri.

KANSAS CITY.

Nothing succeeds like success. Kansas City illustrates the principle, and proves the energies of success in this direction. Located just where the West rushes into the East, just where the mountains rise from the prairies to mark the spot, and just where the rivers come pouring into each other as if unanimous in their choice for the site, Kansas City is the elect of Nature as the first city of the Plains.

Half a century ago the site of Kansas City was marked by a flatboat landing and the Santa Fe trail. While the French colonists under Spanish rule still occupied the Mississippi Valley, Laclède and his scouts penetrated to the western borders of Missouri and it is probable established their trading posts in the then desolate

HOLMES SQ.

wilderness where Kansas City is now roaring and ringing in the performance of her business. Perhaps they stalked great game

where rows upon rows of homes were later built; they may have sat round camp fires with red aborigines and traded guns and whiskey for priceless furs in the very place where men trade better things for gold in Kansas City marts today. The fur trade throughout this region in the early days amounted to \$200,000 annually; from it the territorial government derived its most important revenue. Lewis and Clarke, engaged in the profitable business of fur-trading, visited this place on one of their expeditions into Kansas, and the following old record, dated June 26, 1804, relates their experience.

"We encamped at the upper point of the mouth of the River Kansas. On the banks of the Kansas reside the Indians of the same name, their encampment consisting of two villages, one at about 20 the other 40 leagues from its mouth, and amounting to about 300 men."

Another entry is made in September, 1806, "About a mile below the Kansas River we landed to view the situation of a high hill which has many advantages for a trading house or fort, and while on shore we gathered great quantities of Papawa, and shot an elk. The low grounds are delightful, and the whole country exhibits a rich appearance." A writer in the Magazine of Western History, April, 1889, states that the hill which Lewis and Clarke admired as an advantageous site for a trading house or fort, is the high bluff north of Fifth and Bluff Sts., in Kansas City. Elk are not shot there now.

A branch of the great American Fur Co. established a post at St. Louis in 1819, and two years later a depot for supplies and storage was erected opposite Randolph Bluffs, three miles from Kansas City. The trappers built log cabins at the mouth of the Kansas River, and thus the first permanent settlement of Kansas City was made. Locally the Kansas River is also known as the Kaw.

In 1830 a few rail fences marked the site of the coming Kansas City. Squatters, Indians and half-breeds lived in rough shacks which they managed to stick on the side of precipitous bluffs, and did nothing for a living. There were two or three cabins in the wooden ravines, occupied by old French trappers who spent their time hunting deer, trading whiskey with the Indians for pelts, and raising families of half-breed children.

John C. McCoy laid out the town in 1833, and called it Westport. Westport was four miles south of the Missouri River. Steamboats

landed at the place where the city now stands, and this place was called Westport Landing. The owner of the landing died, five years later, and a company was organized, which purchased Westport Landing for \$4,220, and there laid out the town of Kansas. The land was platted, in 1846, and 150 lots were sold, bringing on an average \$55 each. Less than a year later, 600 people lived in the town of Kansas.

The story of the growth of Kansas City is a story of adventure. Forty years ago the town was the advance-guard of a westward-roving people, that was all. There was but one thing about it significant of the wonderful development that was to come. That one thing was its location at the junction of two great rivers. Up and down these rivers fussy little steamboats of ungainly shape and noisy importance came and went, bringing a great deal of freight to the town of Kansas. The town of Kansas then became the great receiving and distributing point of southwestern commerce. All the goods which the East poured into the Southwest were handled in Kansas City. Rapidly as the resources of the whole country are developed, just so rapid is the increase of a great American trade which follows the course of the sun to the West, and when Kansas City became at last the nucleus of all these streams of commerce her future was determined.

The way in which the gentle Indian has been made to do his part in building up the white man's cities, to his own deprivation and despair is not without a moral. Kansas City allowed the Indians to do much toward her advancement. Across the western border of Missouri lay the Indian Territory,—for as yet the Territory of Kansas did not exist,—and the people of Kansas City had for near neighbors the tribes of the Shawnees, the Delawares, the Wyandottes and Pottowatomies. These guileless Indians received from the United States government several hundreds of thousands of dollars in gold and silver, annually, in payment for lands farther East from which they had removed at the demand of the white strangers. An Indian with gold and silver is defenseless. He knows that money is the magic by which the white man conjures into this world all the joys of the happy hunting grounds, and he envies him. But when possessed of money himself, the Indian fails to conjure anything except trouble; he doesn't know the combination. So when the Shawnees, the Delawares, the Wyandottes and Pottowatomies received their gold from the United States they were at a dead loss what to do with it. The white men came to their assistance and showed them how to exchange their money in the growing town of Kansas for firewater and Eastern blankets, and the Indians expressed themselves as much obliged. In this way a lively local trade was inaugurated.

Crops were good around Kansas City. Farmers had plenty for themselves, and became rich supplying the Santa Fe trade with cattle, hogs and grain. Their prosperity had its direct effect on the merchants, and Kansas City lost some of its wild west aspect and took on an air of pride.

In the earlier years of its history the Santa Fe trade, which began about 1838, amounted to from \$50,000 to \$100,000 in merchandise conveyed each year across the plains to Mexico. Outward bound caravan trains consisting of two or three wagons each were loaded with whiskey, provisions (including fancy groceries), cotton, domestics, prints, notions and Indian goods. Returning, they loaded with gold dust and sometimes with silver ore, with buffalo robes,

C. M. & ST. P. RY. BRIDGE.

GRAND OPERA HOUSE.

AUDITORIUM.

dried buffalo meat, rough wool and Mexican dollars sewed up in rawhide sacks. In 1843 hostilities with Mexico checked trade for a year. The northern ports of entry into Mexico were closed, and though this temporarily threatened disastrous consequences to Kansas City, the embargo was removed a year later, and trade resumed. Business increased, and in 1850, six hundred wagons left Kansas City, loaded with merchandise for Mexico. In 1855 the business transacted amounted to \$5,000,000, and in 1860 there were shipped from Kansas City 16,439,134 lb. of freight, in 3,033 wagons, giving employment to 7,084 men, over 6,000 mules, and nearly 28,000 yoke of oxen. Kansas City now became a bustling market place. Six steamboats thumping and bumping against her wharf at once yielded up their motley freight to a throng of busy stevedores; nearby a great area was filled with horses and caravans, making ready for their expedition. Burly drivers of all complexions swore fiercely in a half dozen different languages with weird effect. The mules, the horses and the oxen would not be reconciled. Dogs napped or fought everywhere regardless of the peril of stampeding hoofs and the sudden movement of heavy wheels. Ox whips cracked and the sound was like curses. The scene was exciting. It was chaos before the formation of the present orderly and expeditious shipping system in Kansas City.

Two events which gave the town a friendly lift in her struggle to attain great numbers and importance were the discovery of gold in California in 1849, and the opening of the Kansas and Nebraska territories in 1854. Kansas City was directly on the overland route to the gold fields and afforded hospitality to endless trains of emigrants, dusty and weary from travel, sometimes also half starved and sick. These stopped long enough there to make good their courage for the rest of the way, and when they left the town was richer by their good will and a little of their money. Other gold seekers bound for California came up the Missouri River in boats, and these purchased in Kansas City the entire outfit of horses, wagons and provisions necessary for crossing the desert.

The opening of Kansas and Nebraska attracted a different class of emigrants, who passed through Kansas City on their way to new homes on the western prairies. The growing town had not only the Santa Fe trade and the Indian trade to supply, but also the little communities which soon became thickly scattered through Kansas and Nebraska. These dependents poured riches into Kansas City. Two banks had been in operation since 1849, and money was abundant until 1854 when Kansas City suffered in company with St. Louis and all the rest of Missouri the miseries of the great financial panic which preceded the more terrible troubles of the Civil War.

Kansas City was on the soil of a slave state. Her progress was held in check and her destiny uncertain during the bitter conflict which threatened the severance of the state from the Union, and resulted in civil war. But even in these turbulent times Kansas

City was doing her best to forge successfully ahead. In 1857 four miles of road were graded and macadamized; in 1858 the telegraph strung Kansas City on its humming wire, and the lightning brought her the news of violent times in the East. The Western Journal of Commerce, Kansas City's first daily newspaper, was established in 1858, and in 1860 the Chamber of Commerce was organized. In 1860 bonds were voted for a steam railway to connect with the Hannibal & St. Joseph R. R. at Cameron. This road, which was called the Kansas City, Galveston & Lake Superior R. R., was partially constructed in 1861; but the war interrupted and the road was not completed until 1867. Following this pioneer railway with the long name came the Pacific of Missouri, later known as the Missouri Pacific; the Kansas City, St. Joseph & Council Bluffs R. R. and the lines now known as the Hannibal & St. Joseph and the Wabash. In 1869 James F. Joy completed the "Hannibal" bridge of great fame and importance, and Kansas City leaped ahead of her competitor, Leavenworth.

Kansas City owes a lion's share of her progress to the activity and enterprise of her newspapers. The "Journal," established in

AQUADUCT BRIDGE OVER THE KANSAS RIVER.

1858, proved under the management of Col. R. T. Van Horn, a powerful ally of the city's interests. In 1869 Dr. Morrison Munford started the publication of the "Index," a journal devoted to real estate. Two years later he purchased an interest in the "Kansas City Times," a daily which had recently been launched with great success, and at once assumed active management both in the

editorial and business departments. The "Times" began a career of hustle marked with unqualified success. It was a Democratic paper. It was a paper which soon made Kansas City famous. Dr. Munford was a keen and vigorous writer. He believed in Kansas City devotedly, and banked his fortune and his future on her success. The "Journal," a Republican newspaper, was a worthy competitor for the "Times," and both papers were united in a bold and energetic policy for the advancement of Kansas City which

BOARD OF TRADE.

availed to float the town through all seasons of discouragement and financial depression.

"The rapid increase of Kansas City in population, business and wealth is one of the marvels of the great West, but it is as natural as the rank growth of wheat and corn in the deep rich soil of the surrounding prairies," writes Z. L. White, in an article on Western Journalism. "And in a city that accomplishes in a decade what older Eastern cities have only done in half a century, newspapers well edited and managed necessarily attain in a very short time circulation, pecuniary prosperity and influence which the journals of the Eastern cities are many years in securing. Kansas City, beside being the metropolis of western Missouri and eastern Kansas, is the newspaper center of a broad region of country beyond. Dr. Morrison Munford and Colonel Van Horn and their newspapers are almost as much essential parts of Kansas City as her streets and public buildings."

Certainly the influence of the press of Kansas City, voicing the ambition of a busy and determined people, has been felt not only through the contiguous country, but in the far Eastern States and across the Atlantic as well, for capital from Boston and from distant Scotland was attracted during the earlier years of the boom, and has remained satisfactorily and lucratively invested in Kansas City ever since.

Kansas City has now four great dailies; the "Journal," Republican, and the "Times," Democratic, both morning papers; the "Star" and the "World," independent, evening papers.

On the map Kansas City is nicely balanced on the line separating Kansas and Missouri. This leaves the inquiring mind in doubt whether Missouri stole the best part of the town, or whether the town's founders elected the location with a just idea of impartiality. There are in Kansas City, Mo., 200,000 people, and in Kansas City, Kan., 50,000. This is because the army of early immigrants marched from East to West, and coming to the western borders of Missouri, settled Kansas City within the confines of that state and were satisfied to go no further. Until a few years ago there was no Kansas City, Kan. The nearest town on the eastern border of Kansas was Wyandotte, and not till Kansas City, Mo., had attained importance and prestige did Wyandotte collect her outlying suburbs and incorporate them with herself as Kansas City No. 2.

The Civil War left strange wreckage in Kansas and Missouri. As undesirable debris drifts to the shore from a wreck at sea, so a population of queer people was tossed up in Kansas City in the years immediately following the Rebellion. These were never Kansas Cityans, they were strays, and had no share in the enterprise

from which the Kansas City of today resulted. Some came with a purpose of perpetrating all kinds of villainy, and a rapidly growing city on the borders offered them opportunity. They had their measure of success. A motley crowd of vagabonds made merry mischief in Kansas City for several years. Saloons and "dives" of a murky character where all kinds of bloodthirsty deeds were incubated outnumbered the dwellings of people who had right and business there. Then the boom came, and Kansas City shuffled off these incumbrances, and cleared the deck for a race which has placed her in the lead of all the cities of the West.

Property values increased commensurately with the increasing current of immigration. Money was abundant. The poorest found no lack of business opportunities, and each new comer was accepted at the highest possible estimation, and given a chance to prove his abilities. No city in America has offered stronger inducements, or rewarded the pluck and energy of her citizens more abundantly. With the railroads in operation the boom spirit struck Kansas City like a Dakota cyclone, and no cyclone ever altered the aspect of a town so suddenly, certainly never with such beneficent effect. There was nothing undecided about the boom. It came with its mind made up, and when the gale abated a wonder was discovered. From the soil of the tough frontier town a great city had sprung up miraculously, as Cadmus' army was harvested in a night from a such unpromising seed as dragon's teeth. Regiments of dwellings lined up the streets. Battalions of stores and office buildings stood at attention throughout the down town district. Steep bluffs had been tumbled over to fill up unsightly gorges, and ranks of level streets were made to cross these spaces. Enough substantial homes to shelter a populous city had been built; enough more were projected to house half of London. Acres upon acres of city lots were platted out; and these were bought and sold repeatedly at prices which challenged the courage of the most reckless speculator.

The boom, of course, could not last forever. Had it continued at an equal pace till now, Kansas City's city limits would be encroaching on Chicago; San Francisco would be a suburb. After a season of extravagant profits the tide turned; and when the prosperous wave ebbed away Kansas City was stranded, indeed. Banks broke, and business temporarily collapsed. Great fortunes faded out of sight as pools left by receding breakers sink in the sand. Kansas City was a sadder and a wiser town, but she had gained distinction as a great American trade center, and the energy of her promoters sufficed to build her fortune for a second time. The value of land settled down to compare about equally with that in Minneapolis, which was uniformly less than in Cleveland or Chicago. The era of speculation was over, and that of sound development begun. Kansas City has been visited by several booms, since; safe booms, and less fantastic. The cable railways accomplished very much to relieve the strained conditions in Kansas City after

RESIDENCE OF D. L. LUMBAR.

the collapse. They were first suggested by the promoters of real property, and were copied after the system in use in San Francisco. This happened in 1886. In a year 40 miles of cable railways had replaced the horse car lines. The most remote suburbs became easily accessible, and the effect was to make Kansas City possible as a city of homes as well as pre-eminently a city of hustle. Outlying property was again readily disposed of; more houses were built, land bought and sold, and the tax rolls swelled. In 1888 the

CITY HALL.

POST OFFICE.

COURT HOUSE.

transfers of city property recorded amounted to very nearly \$40,000,000. In the same year, according to Bradstreet, business capital of the city, exclusive of street railways, amounted to \$107,616,500 wholesale capital; \$65,267,400 retail capital, while bank clearings reached the high water mark of \$421,771,953. A large share of this good fortune was attributable to the street railways.

When the boom was at its height several great steam railroad projects were evolved, and by their successful consummation Kansas City became next to Chicago the greatest railroad center in the United States. Fifteen companies are now operating through trains on 37 different routes out of Kansas City. The names of the companies are: the Wabash; the Missouri Pacific; the Atchison, Topeka & Santa Fe; the Kansas City Southern; the Chicago, Milwaukee & St. Paul; the Chicago Great Western; the Kansas City, Fort Scott & Memphis; the Chicago, Burlington & Quincy; the Missouri, Kansas & Texas; the Chicago, Rock Island & Pacific; the Kansas City & Northern Connecting; the St. Louis & San Francisco; the St. Joseph & Grand Island, the Alton and the Union Pacific. The finest trains in the world—in reality, hotels on wheels,—are ceaselessly rumbling in and out of the Union Station, bound for or returning from every city between Boston and San Francisco, Duluth and New Orleans. The sight of the parading trains, the multitudes of passengers and mountains of freight in the Kansas City station is unparalleled except in Denver and Chicago. There are no "prairie schooners" hitched to rebellious mules, discouraged oxen or misanthropical horses, loading at the wharves in Kansas City nowadays.

The Indian,—his numbers are no longer great nor his blankets fancy, though he enjoys his firewater with undiminished appetite,—has witnessed all these changes with profound surprise. Surely the white man has conjured into this life strange things from the happy hunting grounds; but the Indian does not know the combination.

When he occasionally appears in Kansas City he is regarded curiously as a relic; and is in danger of being stolen by some tourist for a souvenir.

It is said that all the inhabitants of the earth could be fed from the land within a circle of a thousand mile radius around Kansas City; could not only be fed, but could draw their supplies of iron for their manufactures, lumber for their building, gold and silver to jingle in their pockets, and oil to light them to bed from this magic circle for indefinite time. Last year Kansas City's stockyards handled over 6,000,000 head of live stock, valued at \$121,706,632. Over 2,600,000 swine surrendered their lives to satisfy the hungry, and the mills of Kansas City turned out over 350,000 barrels of flour. Anyone who sees the freight piled on endless trains pulling out of Kansas City's depots might easily believe that all the earth's inhabitants are being fed out of that bountiful circle.

There is a tradition that mud was once abundant in Kansas City. The oldest inhabitant is said to remember the time when there was mud; much mud, and yellow. But that was only a necessary incident in the town's progress.

When still very young, Kansas City set about leveling the high bluffs which interfered with the landscape and made street railways an impossibility. And in the leveling process a great deal of soft, sticky earth was spilled over the town. The result in wet weather led to mistakes. A traveler who happened upon the town just after a rain storm reported he had found a new Vesuvius that spit forth mud, and under it a modern Pompeii. But these slanders have lost their point, for Kansas City is free from mud. As early as 1885 forty miles of brick, asphalt and cedar block pavements were laid. In later years vast sums of money have been expended on the best of pavements, the amount so spent in 1899 being \$787,000.

The city now covers an area of nearly 27 square miles and has 178 miles of paved streets. In these are stretched 160 miles of street railways carrying 50,000,000 passengers annually. All roads in Kansas City lead to one or another of half a dozen extensive parks which are equipped for sports of all sorts and every kind of public entertainment, combining with natural scenic beauties the attractions which modern architecture and an abundance of money afford. The business buildings of Kansas City are capacious and substantial. A new Federal building has been erected at a cost of \$3,000,000 and will soon be ready for occupancy. City hall, court house, schools, libraries, art galleries, museums, alms-houses, theaters and prisons have been built according to the principle that what is worth building at all is worth building well. The municipal improvements authorized by the city government in 1899 cost \$1,370,345. The total of taxes paid annually to the city and county on \$71,000,000 assessed valuation of property is less than 27 mills on the dollar, clearly giving Kansas City the advantage in the matter of taxation over many cities in the United States.

Kansas City would be distinguished as a city of rapid growth and wonderful prosperity, if in no other way, by her modern and beautiful homes which typify the success of her industries. Kansas

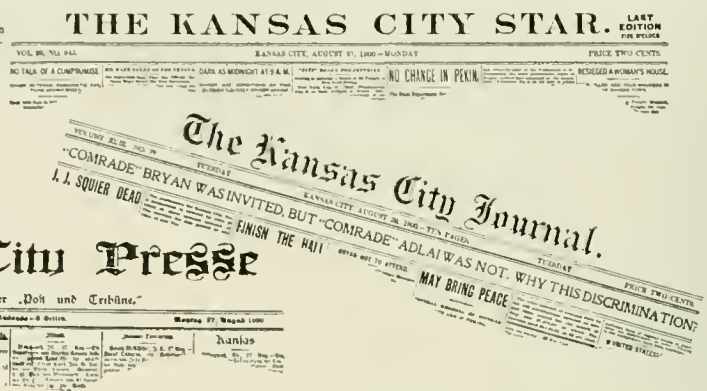

City has become a city of fashion as the result of having been particularly a city of enterprise.

Here is located the second live stock market in the world, her packing industries giving employment to 50,000 people and representing an investment of \$30,000,000. There are also 28 elevators and warehouses with a total storage capacity of 6,765,000 bushels. No city west of St. Louis surpasses Kansas City as a lumber market. There are 23 lumber yards and nearly 100 firms engaged in the

usually the parades and balls given by the Priests of Pallas and Karnival Krewe. Horse shows and sporting events of far-reaching interest are also billed each year, and bring the devotees of sport from East and West.

Kansas City has 4,800 telephones in operation, and has a fire department unexcelled if not unequalled in the world. Her fire crew defeated all competitors in the Omaha Exposition in 1898. At an earlier exhibition in London the crew won great honors, and

wholesale and retail lumber business. From 3,600 to 4,000 cars of soft wood and 1,000 cars of hard wood are handled annually.

Kansas City has a world-wide reputation for hospitality, and combines with its reputation the most practical facilities in the way of numerous hotels of the first class. Besides the never-ceasing stream of visitors bent on business or diversion there is each year a multitude attracted by the political or other conventions, the musical festivals, street fairs and festivities in which the chief features are

her men and apparatus were awarded first prize at the Paris Exposition this year. The department employs 175 men and 77 horses and the finest engines and other equipment for fighting fire.

Kansas City has best of all an accommodating climate which liberally allows 255 sunny days on an average each year. The rainfall is just sufficient to do the duty of a rain-fall, and the wind may be depended upon to blow from the Southeast eight months out of twelve.

CONVENTION HALL.

The spacious and costly auditorium in which the meetings of the Accountants' and the American Street Railway Associations will be held and where the exhibition of apparatus and supplies will be given is at the corner of 13th and Central Sts., a location convenient to the depots and principal hotels, and reached by either the Broadway or Wyandotte electric lines.

The building is about 300 ft. long by 200 ft. wide, with walls of stone and brick, and roof supported entirely from the side walls on steel girders leaving the interior unobstructed by posts or

Accountants' Association will be held in the upper gallery, reached by a stairway and inclines from the rear of the hall, so that all delegates and others in attendance will pass through the hall on their way to the meetings. The lighting, heating and ventilating arrangements are of the best.

Convention Hall is in itself a building of which any city may well be proud, but loyal Kansas Cityans tell with especial pride of how it was built. There had previously stood on this site a mammoth convention building that had cost over \$100,000, but on

CONVENTION HALL AS REBUILT.

RUINS OF CONVENTION HALL, APRIL, 1900.

columns. Tiers of galleries rise one above another until the top-most gallery, known as the roof garden, is reached, the ascent being made by means of inclines instead of stairways. The floor is of cement and around the sides under the first balcony are rows of small stalls or boxes well fitted for exhibition purposes. At the south end of the building are dressing and toilet rooms, telephone booths, registration rooms, etc. There are several wide doors at the front and sides so that trucks, cars and other large exhibits can be taken inside the hall without difficulty. The meetings of both the American Street Railway Association and the

the afternoon of April 4th last, just as preparations were being commenced to get the place ready for the Democratic National Convention which was to meet on July 4th following, the structure burned to the ground. With characteristic spirit and pride a committee of prominent citizens was appointed before the fire was out and enough money subscribed to insure the erection of a new and better building. Teams and men were at work preparing the new foundations before the ruins had ceased smoking, and the building was in excellent shape in ample time for the convention that nominated Mr. Bryan.

The same spirit of progressiveness and enterprise that has placed Kansas City as a commercial and financial center far ahead of other cities of equal population, has been manifested in the growth and development of her transportation system. Working at a disadvantage as regards the layout of the city's streets, her street railway promoters have been quick to adopt improved apparatus and methods brought out in other cities, and not content with this, have freely given their financial encouragement to those who were seeking by experiment and research to demonstrate new principles in the science of street railroading.

The first horse railway in Kansas City was built in 1870 while the town was little more than a way-station. The first cable road was commenced in 1882 just as that system of traction was coming into vogue in San Francisco and Chicago; and it was on the old horse line from 16th St. to Westport, that Mr. J. C.

scheme and in securing a franchise. But the road was finally built and it took but a few months to demonstrate the advantages of cable traction for Kansas City's steep grades. Before the year 1890 over 75 miles of cable lines had been laid down. Mr. Gillham was ably assisted in his labors by Mr. Clift Wise, now a prominent engineer of Chicago.

While the work of changing the old animal power lines to cable was going on, Mr. J. C. Henry on the Westport line was carrying out his experiments with electricity, which was ultimately to become as formidable a rival to the cable as the cable had been to animal traction. Mr. Henry had taken out a number of patents covering his motor and overhead trolley, and in 1884 he was successful in interesting Mr. W. H. Holmes, then president of the Westport & Kansas City Street Railway Co., in his ideas. Mr. Holmes donated an old mule car and half a mile of track for

WALTON H. HOLMES,
President.

CONWAY F. HOLMES,
General Manager.

Henry as early as 1884 carried on his experiments with the overhead trolley system while the possibilities of electricity in its application to street railways were still but phantoms in the minds of a few enthusiastic "cranks," so called.

The first horse road extended from the corner of Fourth and Main Sts., by way of Fourth, Walnut, 12th and Grand Ave., to 16th St. It was built by the Kansas City & Westport Horse Railway Co., of which the leading spirit was Mr. Nehemiah Holmes, father of Messrs. W. H. and C. F. Holmes, now president and general manager, respectively, of the Metropolitan company. The first cable line was commenced in the fall of 1882, and in June, 1885, was opened for travel from the Union Depot, over the viaduct, to Eighth St. and Woodland Ave. This enterprise was one of the boldest engineering feats of recent times and its successful completion was due to the inventive skill and personal efforts of Mr. Robert Gillham, who early in 1878 conceived the scheme of a cable railway to connect the Union Depot in the West Bottoms with the city proper on the cliffs above. The only means of making the trip at that time was by rickety bob-tail cars nominally operated by mule power, which was usually reinforced, however, by the combined efforts of the passengers on the up trips. The line was barely earning enough to feed the mules. Mr. Gillham spent four years in attempting to interest capital in his

experimental purposes. The power house was a frame dwelling near 39th St. and Broadway, and the generator was driven by an old portable threshing machine engine that had been purchased from a junk dealer. The 2,000-lb. motor was placed on the front platform without counterweight on the other end, and must have made the little 16-ft. car look as though it was trying to plough a hole in the ground. Possibly the idea was suggested to the early stockholders who were furnishing the capital that it was trying to dig its own grave. The motor armature revolved constantly and the car was started and stopped by throwing the armature shaft into or out of gear with the axles. There were about 30 gear wheels.

These experiments did little more than prove that cars could be run by electricity from an overhead trolley, but this was a tremendous step. Mr. Henry continued in his work and was soon able to demonstrate his ability to construct an electric line that would prove a success commercially, and in 1887 the Kansas City Electric Railway Co. was organized, and built a double track line on Fifth St., which for a time at least paid satisfactory interest on the investment.

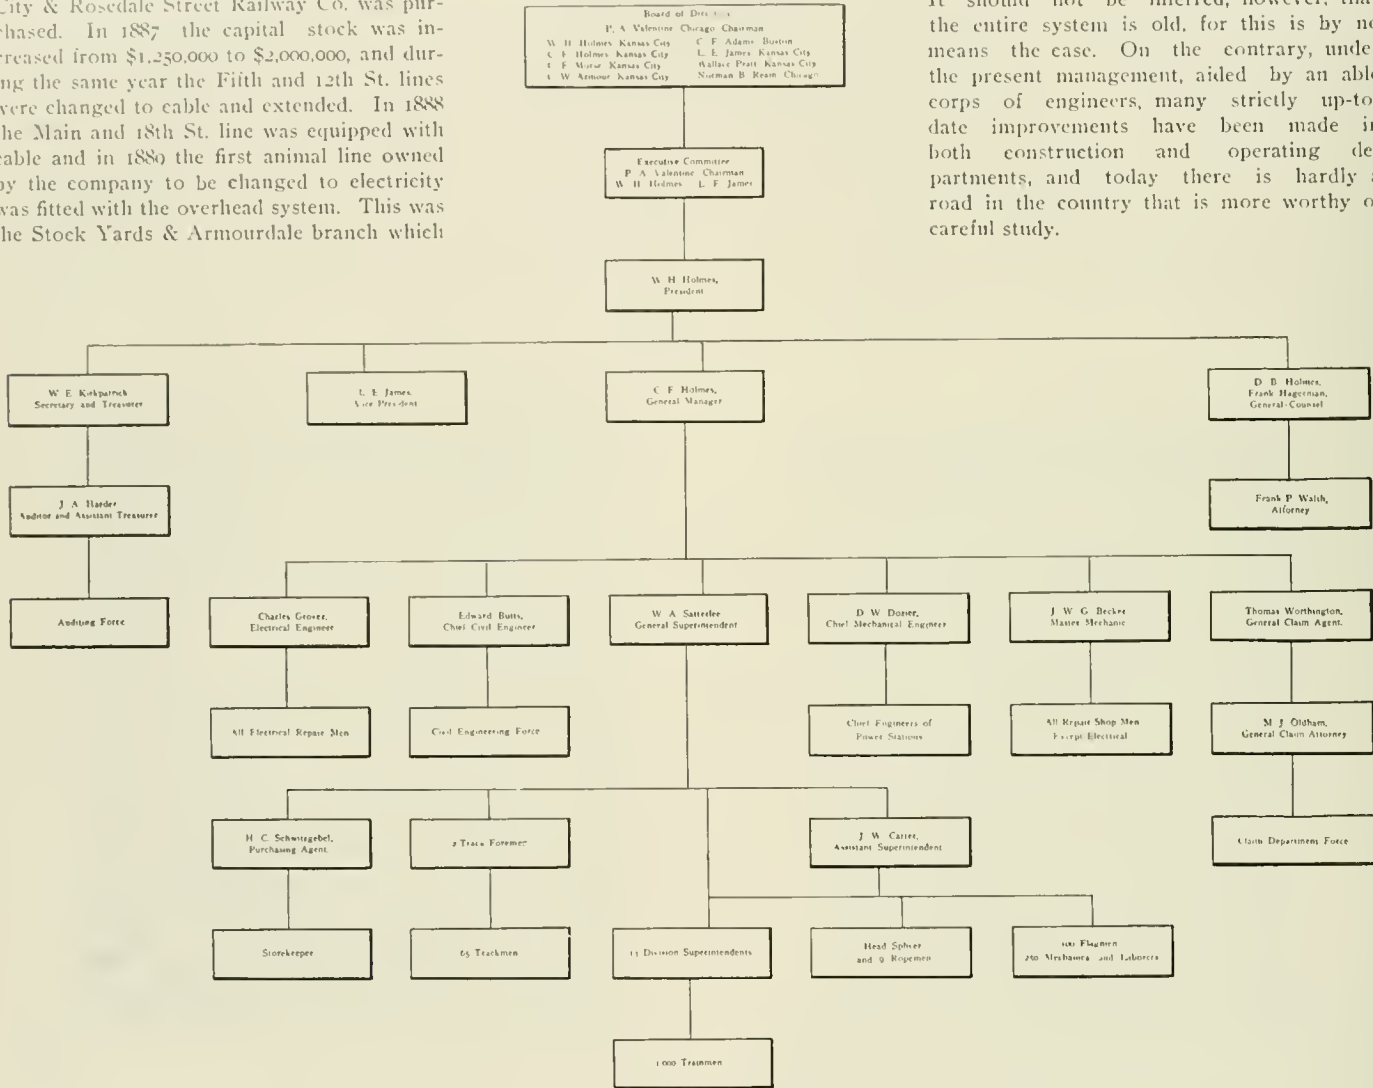

The present Metropolitan Street Railway Co. was chartered in August, 1886, with \$1,250,000 capital stock and in that year purchased all the property of the Corrigan Consolidated Street Rail-

way Co., consisting of the Union Depot Horse Ry., the Kansas City Horse Ry., the Jackson County Horse Ry. and the Corrigan Horse Ry., comprising 20.7 miles of horse and mule lines, several of which had been in operation since the early 70's. The Metropolitan company also assumed a \$1,000,000 mortgage that had been issued on the Corrigan property to secure funds for changing to mechanical power, and at once took up the work of equipping the lines for cable traction and rapidly carried it to completion.

In October, 1886, the property of the Kansas City & Rosedale Street Railway Co. was purchased. In 1887 the capital stock was increased from \$1,250,000 to \$2,000,000, and during the same year the Fifth and 12th St. lines were changed to cable and extended. In 1888 the Main and 18th St. line was equipped with cable and in 1889 the first animal line owned by the company to be changed to electricity was fitted with the overhead system. This was the Stock Yards & Armourdale branch which

PRESENT CONDITION.

In a city with the topography of Kansas City and on a system formed as the Metropolitan Street Ry. has been, by successive consolidations of horse, cable and electric lines, many of which were pioneer roads, it is not surprising to find a somewhat varied collection of apparatus and engineering work, a portion of which would now be considered almost obsolete. But to the credit of the early workers it may be said that much of their handiwork is still doing good service and earning dividends. It should not be inferred, however, that the entire system is old, for this is by no means the case. On the contrary, under the present management, aided by an able corps of engineers, many strictly up-to-date improvements have been made in both construction and operating departments, and today there is hardly a road in the country that is more worthy of careful study.

DEPARTMENT ORGANIZATION OF THE METROPOLITAN STREET RAILWAY CO.

is still running. The officers of the company in 1888 were: President, C. F. Morse; treasurer, A. W. Armour; secretary and general manager, R. J. McCarty; superintendent, E. J. Lawless.

The next important event occurred in May, 1894, when the Metropolitan company acquired a controlling interest in the stock of the Kansas City Elevated Railway Co., operating an elevated electric line, and guaranteed the interest of a mortgage for \$2,600,000 covering the property. In the same year other smaller independent lines were absorbed.

The longest step in the formation of the present system was taken in May, 1895, when an agreement was reached whereby the Metropolitan company came into possession of the Kansas City Cable Ry., the Grand Avenue Cable Ry., the Kansas City & Independence Rapid Transit Ry., and the Westside Ry., of Kansas City, Kan., consisting of 67.5 miles, measured as single track and operated by cable, electricity, steam dummy and animal power. The final consolidation took place in 1899, by the acquisition of the Central Electric Railway Co., which was the successor to the Brooklyn Avenue Railway Co., and the North East Electric Railway Co. By this act the Metropolitan company secured control of the last line in independent operation in Kansas City, Mo., Kansas City, Kan., and the adjacent suburbs.

TRACK CONSTRUCTION.

The Metropolitan system comprises 164 miles of railway measured as single track, most of which is laid as double track. Of this 47.6 miles are operated by cable and 116.4 miles by electricity; two miles of double electric track are built on an elevated structure; one-half mile of cable on inclined trestles with an average grade of 15 per cent, and one-fourth mile of electric road through a tunnel. There are numerous grades of from 5 to 10 per cent, the steepest on the cable lines being 18½ per cent, and on the electric lines 8 per cent.

The Metropolitan standard rail sections for electric track are 6 in. and 9 in. center bearing girder rails, weighing respectively 83 and 103 lb. to the yd., and rolled by the Lorain Steel Co., of Lorain, O. There is some mileage laid with lighter sections and some with T rails, but in all future work it is the intention to use center-bearing sections of the weights mentioned. The standard cable rail is a 4¾-in., 60-lb. center-bearing girder.

According to later-day practice a center-bearing rail for electric roads is obsolete, but the Metropolitan company's experience with this shape has been so satisfactory that it has determined not to change to the more modern sections. Mr. E. Butts, the company's engineer, has made a study extending over several years, of rail

shapes and their effects on street traffic and on the cars, and is convinced the center-bearing girder combines all the advantages of a T rail for city streets and is preferable from both the company's and the city's standpoints. He contends the extra groove on the outside of the rail between the rail and the paving stone catches most of the dirt that would otherwise lodge on the head of the rail, thus giving better electrical contact and making a much easier riding bearing surface for the car wheels. Furthermore, in his opinion, the granite blocks at the side give a better

WORK OF ELECTRIC INSTALLATION CO. ON 14TH ST.

purchase to wagon wheels when turning out of the track than does the outer flange of the usual girder rail.

About 12 miles of electric lines in Kansas City measured as single track are built without the use of ties, the rails being embedded in solid beams of concrete, prepared as explained later in this article. In this work a trench is dug for each rail 20 in. wide at the top, 16 in. wide at the bottom and to a depth of 15 in. below the top surface of the rail. The rails are placed in the trenches in the position they are to occupy permanently, and wherever there is a possibility of any yielding or variation of alignment, 1-in. tie rods are inserted at intervals of 6 ft. and fastened with heavy hexagonal nuts on both sides of each rail. When working in paved streets it is not usually necessary to employ tie rods. When the roadbed has been thus prepared the concrete, mixed to the consistency of a paste, is poured into the trenches and tamped around

With natural cement at 80 cents a barrel and the portland at \$3.50 the saving is evident, and in Kansas City at least the results are in every degree as satisfactory as when the higher-priced material is used exclusively.

The concrete mixture for trench work is compounded as follows, all proportions being accurately determined by measure; one part cement (mixed as above), two parts clean sand, five parts fine broken stone, pieces from 1/4 in. to 1 in. in greatest diameter. Measurements are made by barrel and it is stipulated in all specifications that a barrel is to mean 3 1/2 cu. ft.

The Metropolitan company is so well pleased with the results of this tieless concrete construction that it has decided to follow this practice wherever possible in new work, and in rebuilding. The cost is but \$3.50 per ft. exclusive of the cost of the rail, which is practically the figure the company has paid for roadbed laid with wooden ties in the usual way. It is also important to note that there are in Kansas City miles of tieless track, on some of the heaviest lines, that have been down five years and on which not one cent has been paid for repairs, and thorough inspection fails to reveal signs of wear. This means not only a saving in maintenance charges but also in all the losses attendant upon opening streets in business portions of the city to repair tracks.

Another advantage is due perhaps largely to local conditions. Owing to the many hills, the Metropolitan company is compelled to use salt in large quantities to keep rails free from ice, and in a number of instances has had to replace rails laid with the regular tie construction, where the base of the rail had been almost eaten away by the action of the salt, while the head was still in good condition. With the base embedded in concrete there is of course no corroding action possible from this source.

But probably the strongest claim that can be brought forward for this concrete construction is the saving in the return circuit and the absolute prevention of stray currents. Concrete is one of the best insulating materials known, and the time may come when this practice of embedding rails in concrete without ties may be the most economical way of removing the slight arguments upon which water companies and cities now base their claims for damages from electrolysis.

Where ordinary tie construction has been put in, split hewn white oak railroad ties, 6 x 8 in. x 8 ft. are standard. These are spaced 2 ft. c. to c. with 6-in. rail, and 30 in. c. to c. with 9-in. rail.

The cable roads were built at different times by different companies and the cross sections vary widely as to shape of yokes, pulley supports and rails. One of the sections in the business portion of the city is given among the engravings accompanying this article.

Most of the Metropolitan tracks, both electric and cable, are cast welded at the joints by either the American or Falk methods.

LATER CABLE CONSTRUCTION.

and under the rails with care, to insure perfect alignment and surface. Four days are allowed for the concrete to properly set before the track is used.

In preparing concrete the company departs from the notion usually accepted by civil engineers that portland and natural cements can not be mixed with good results, and all the concrete used in the tieless construction is made from a half-and-half mixture of the two grades.

The Falk company as contractor also built a number of the electric lines complete, and has laid down nearly all of the recent special work required, the most intricate layout of this nature being the section of track from Third to 13th Sts., on Grand Ave. The cable tracks on this thoroughfare between Eighth and Ninth Sts. were originally laid on a diagonal line, the ends being about 15 ft. off center to obtain room for making the curves into the cross streets. It was thought desirable to change this arrangement

and the Falk company took the contract to move the conduit, rails, pullies and cables bodily into the center of the street. In order to do this it was necessary to cut out 12 or 15 ft. of rail from each track to bring them into the new position, after which the curves had to be readjusted and relined. When this task had been completed special work was put in place, consisting of a double track branch off curve at Ninth St., and a double track

About 10 miles of track and 40 miles of overhead work were constructed by the Electrical Installation Co., of Chicago, which has been doing work for the Metropolitan company since 1896. The North American Railway Construction Co., Chicago, of which Mr. A. S. Littlefield is president has also received several contracts for track and overhead work in Kansas City, and this company laid the first track built on concrete beams instead of ties.

CROSS SECTION WITH ASPHALT PAVING.

CROSS SECTION WITH BRICK PAVING.

PLAN AND SECTIONS WITH MACADAM PAVING.

TRENCH CONSTRUCTION.

layout at Eighth St., the latter including a double track crossing a double track with double track curves connecting three of the corners. The rails and slot rails on cross streets were also changed and laid on concrete. All this work was completed in 60 days with cable and electric cars passing over the tracks at intervals of two minutes, without a single accident or delay to traffic.

A large portion of the special work put in by the Metropolitan company in the last five years has been of the Lorain "Guarantee" construction and most of the cable crossings are of the Lorain cast steel design. Two very complicated pieces of special work furnished by the Lorain Steel Co. are located at Grand Ave. and Eighth and Ninth Sts.

The elevated structure previously mentioned was built in 1888. It is of the truss type, the cross members being iron I beams 40 in. deep x 20 ft. 6 in. long, resting on iron posts. Where the smaller supporting girders intersect, the members are held together by pin connections. The iron columns rest on concrete foundations 4 ft. square.

jasperite. In several places all three pavings are found between the curbs of the same street. For instance on Grand Ave. near the company's general offices, the space between the two tracks is paved with brick, between the rails of each track with jasperite and the remainder of the street with asphalt. This condition is due to the fact that nearly all of the cable lines were originally paved

RECONSTRUCTION WORK DONE BY FALK CO. ON GRAND AVE., KANSAS CITY.

The tunnel through which cars pass just before reaching the elevated structure is 15.1 ft. high at the center line and 21.30 ft. wide at the widest part. The brick arch lining is 2 ft. 2 in. thick.

PAVING.

As in the other departments, considerable diversity of practice is found in the methods of paving, due to the many different managements under which the work has been done, and to the various changes in motive powers. Three materials predominate, asphalt, brick and Sioux Falls imitation granite, otherwise known as

between the track rails and slot with jasperite and the space between the up and down tracks with cedar blocks. As these blocks were unsatisfactory they were replaced temporarily with brick, which, however, have never been disturbed, and when the city wanted to pave the remainder of the street, it decided upon asphalt. Asphalt is the favorite material with the company and has been used almost exclusively for the past three years in reconstruction work and on new extensions. The price paid per sq. yd. laid is \$2.12, with a 10-year guarantee that there will be no expense for maintenance, which, considering the durability of other materials and the greater satisfaction given by asphalt from the standpoint of the general vehicle traffic, makes this the most desirable paving the company has discovered.

Trinidad Lake asphalt is used. In preparing the street a bed

STANDARD RAIL SECTIONS—LORAIN STEEL CO.

TRACK ON BROADWAY, ELECTRIC INSTALLATION CO.

of concrete is first laid to a depth of 4 in., or more if the conditions require. On this is placed the asphalt in two strata, the lower or binder course, 1/2 in. in depth, consisting of asphaltic cement mixed with fine clean gravel. After the binder course has been thoroughly tamped, the asphalt is spread on in a layer 1 1/2 in. thick, and rolled, dusted and finished with hot irons. Whenever asphaltic pavement is put down, "toothing stones" of jasperite are invariably placed along either side of each rail in alternate headers

and stretchers, that is a stone laid lengthwise and the next endwise. This effectually prevents the formation of wagon wheel ruts at the sides of the rails.

Brick paving is being laid in some quantities in localities where there are apt to be changes, as repairs or abandonment of line and on some of the cable lines that are to be changed to electric traction in the not distant future. Wherever brick are used they are placed on a 4-in. foundation of concrete and 1 in. of sand, tamped to a smooth surface and grouted with portland cement grout, consisting of one part cement to two parts sand, accurately measured. The grouting mixture is poured over the concrete-sand foundation and tamped and pressed into all openings and crevices. The cost of brick paving of this character averages \$1.25 per sq. yd. The durability of brick for street surfaces in Kansas City has been limited, the life varying according to street traffic density from three to six years.

On some of the early cable lines, cedar blocks were tried for paving between the slot and the rails, but these had to be removed almost immediately, as moisture caused the blocks to expand and close the slot openings.

A few of the outlying lines are paved with macadam.

POWER STATIONS.

The Metropolitan system is operated from eight power stations, of which two are electric, two cable, three combined electric and cable, and one a cable plant driven by motors taking current through feeders from the largest electric station.

KAW RIVER OR CENTRAL AVE. STATION. This is located just

load rating 50 per cent for three hours. Runs at 80 r. p. m. Was erected and started in September, 1898. This is direct connected to a 1,500-h. p. cross compound condensing Allis engine, with cylinders 22 and 56 in. x 60 in.

One 550-kw. 550-volt direct current General Electric generator, overload rating 50 per cent for three hours. Runs at 90 r. p. m. Was erected and started in February, 1900. This is direct connected to a 1,000-h. p. tandem compound condensing Allis engine, with cylinders 28 and 44 in. x 48 in.

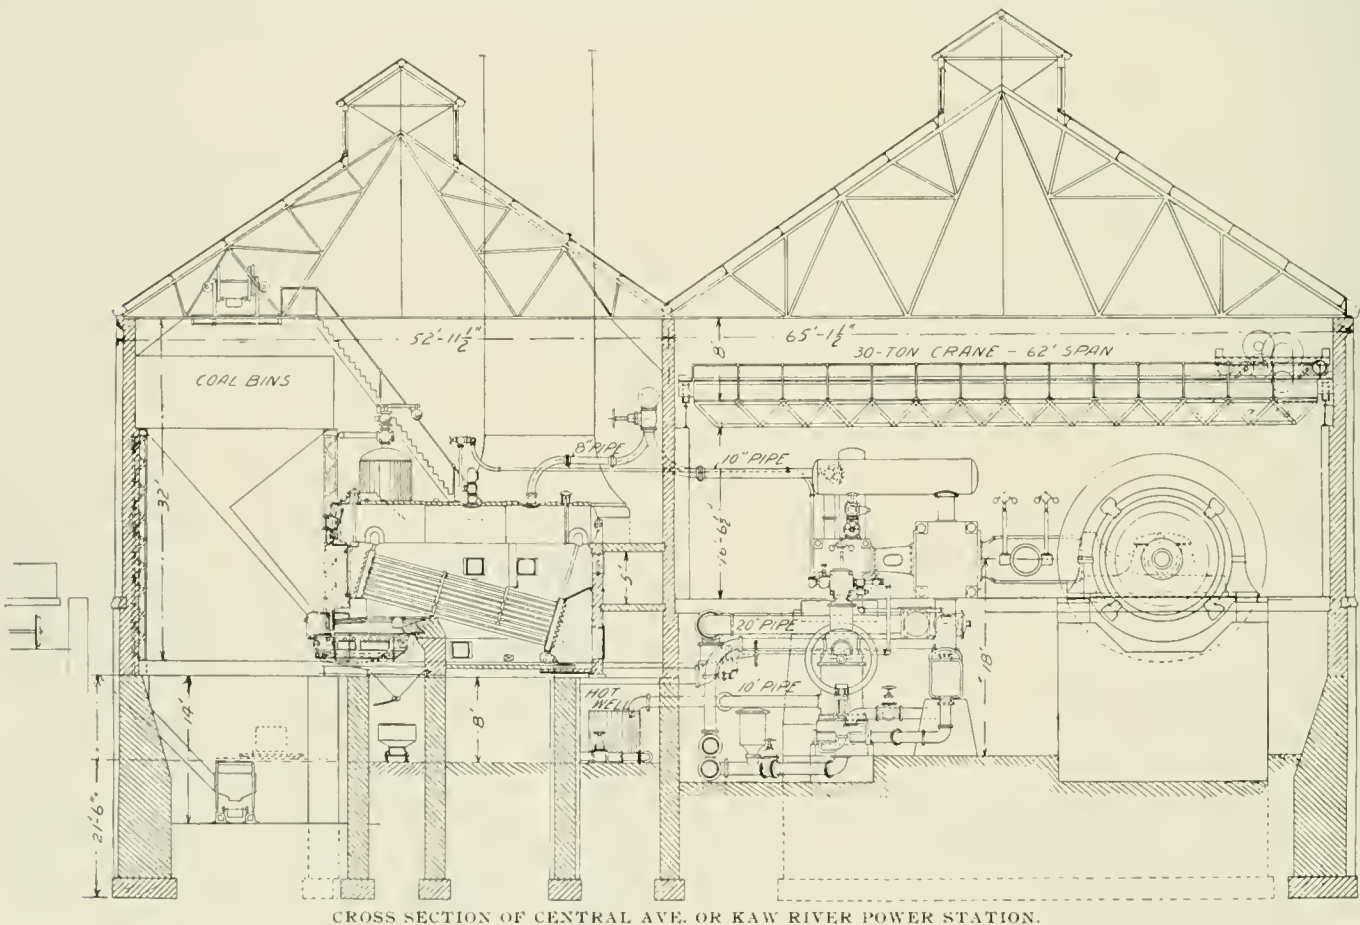

One 1,500-kw. 550-volt direct current General Electric generator, over-load rating 50 per cent for three hours. Runs at 75 r. p. m. Was erected and started in August, 1900. This is direct connected to a 3,000-h. p. cross compound condensing Allis engine, with cylinders 36 and 72 in. x 60 in.

The first unit is equipped with Reynolds-Corliss combined air and circulating pump, air cylinder being 36 in. x 16 in. stroke and steam cylinder 14 in. x 18 in. stroke; also a Wheeler condenser having 3,000 sq. ft. of cooling surface.

The second unit has Blake combined air and circulating pump with cylinders as follows: Steam, 16 in. x 24 in. stroke; air, 20 in. x 24 in.; water, 22 in. x 24 in.; also Wheeler condenser having 3,000 sq. ft. cooling surface.

The third unit has Blake combined air and circulating pump with cylinders as follows: Steam, 14 in. x 16 in. stroke; air, 16 in. x 16 in.; water, 16 in. x 16 in.; also Wheeler condenser having 1,800 sq. ft. surface.

The fourth unit has one vertical Allis independent triple plunger circulating pump rated at 5,000,000 gal. in 24 hours, and an Allis

across the Kaw River in Kansas City, Kan., and is the main electric generating power house of the system.

It contains four units as follows:

One 1,200-kw. 550-volt direct current Walker generator, overload rating 50 per cent for six hours and giving in service 1,500 kw. continuously at 80 r. p. m. This was erected and started in June, 1897, being one of the first machines built by the Walker company of a larger size than 800 kw. It is direct connected to a 1,500-h. p. tandem compound condensing engine built by the E. P. Allis Co. Cylinders are 30 and 60 in. x 48 in.

One 1,200-kw. 550-volt direct current Walker generator, over-

air pump, 42 x 16 in. with Reynolds valves and gear; also Wheeler condenser with 5,000 sq. ft. of surface.

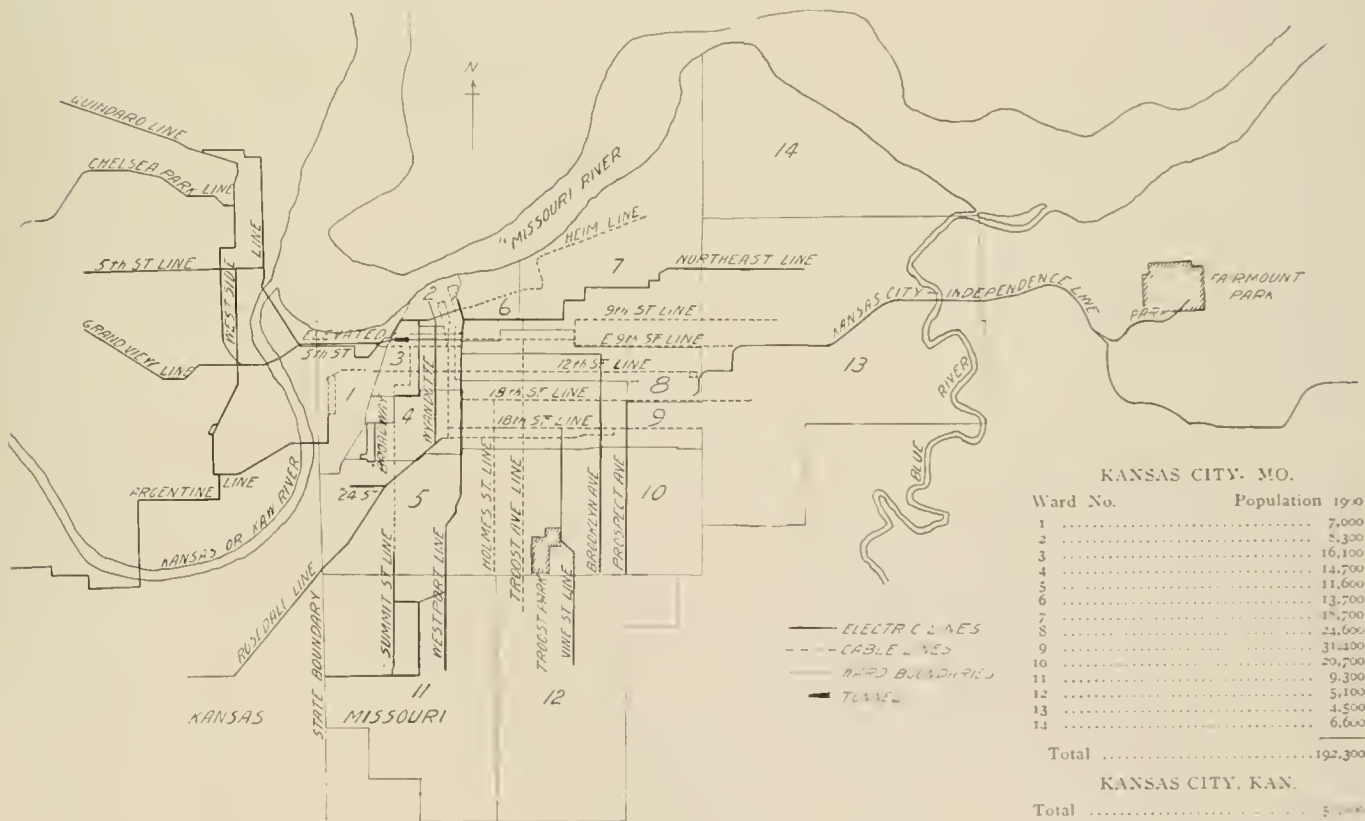

The engines are fitted with an automatic gravity oiling system.

At all four engines the steam is lead from the main steam pipe into a Reynolds separator. Each engine also has between its high and low pressure cylinder a reheater which is jacketed with steam led from the high pressure cylinder through a small by-pass.

All water from condensation is returned to a hot well in the basement, from which it is taken by the feed pumps and passed through a 3,000-h. p. feed water heater, heated by the exhaust steam from the auxiliary units, which raises the temperature from

The quantities of coal and oil are estimated from the total quantity purchased.
The fuel used is Cherokee slack, which on occasions of extra heavy load is mixed with nut coal, half and half. The cost per ton is from \$1.20 to \$1.40.

110° to 180 or 190° before the water reaches the boilers. Losses in the circulating system are made up by water automatically trapped in from the city mains. The water for condensing purposes is taken from the Kaw River through two 24-in. mains and returns by gravity.

The switchboard comprises 35 panels as follows:

One wattmeter panel with one 5,000-ampere Thompson recording instrument.

Three 3,000-ampere generator panels, each containing one Form K, G. E. circuit breaker, one Weston illuminated dial ammeter, two quick break switches, rheostat and switch for field coils of generator and one lightning arrester.

One 5,000-ampere generator panel, same as other generator panels except instruments are for 5,000 amperes.

Thirty feeder panels, capacity from 500 to 800 amperes, each

ning the length of each side wall and supported by the columns of the building.

At present steam is generated in six 250-h. p. Babcock & Wilcox boilers and two 500-h. p. Aultman & Taylor "Cahall" horizontal water tube boilers. Four additional boilers of the same size and make as the two latter are nearly ready for use. Steam is carried at 160 lb.

One of the most interesting features at this station is the piping system; though the main header is over 200 ft. long it has no expansion joints. The boilers are arranged in batteries of two and from each battery a pipe bent to form a reverse curve leads to the main header which is carried along the side wall as shown in one of the engravings. The header is anchored near its middle point and supported on cradles with rollers. The main engines only are supplied from this header, an auxiliary header being provided to take steam to the pumps and other auxiliary machinery. The piping was made for a pressure of 250 lb. per sq. in. All flanges are of flomed steel, extra heavy, and the valves of the Crane extra heavy gate pattern.

Six of the boilers are fitted with B. & W. automatic chain-grate stokers and the others with Green chain-grate stokers, fed by means of an elaborate system of coal-handling machinery and storage bins. The bins are 14 in number, carried near the roof of the boiler room, partly by the side walls and partly by independent girder columns. Two girder beams each 7 ft. deep span the boiler room, and form the upper part of the bin sides, the canting or converging bottoms being made of 3/4-in. steel plates riveted together. A conveyor carries the coal from the basement to the bins above, which have capacity for 800 tons. The two bins in the center are kept for storing ashes which are lifted by the same conveyor at times when it is not working on coal. When ash bins are full the ashes are dumped into wagons or cars for removal.

The company uses principally Cherokee slack costing \$1.20 to \$1.40 per ton and which contains nearly 10,000 heat units per lb. When slack can not be easily obtained and on special occasions when it is necessary to force the boilers owing to extra heavy loads, a mixture of half and half slack and nut is used.

The stack is 183 ft. high from the boiler room floor and 18 ft. across at the base. The flue is 100 in. in diameter the full length. The stack is of steel plate, self-supporting construction, and is lined with brick through to the top. A second stack similar in all respects to the first is in course of erection for use when the additional boilers are ready.

The building itself is 148 ft. 11 in. x 118 ft. 6 in., and 61 ft. high, divided by a brick wall into two bays, one the engine room, 63 ft. x 148 ft. 11 in., the other the boiler room, 52 ft. 6 in. x 148 ft. 11 in. The walls are 18 in. thick at the base, and are of brick with stone trimmings. Each bay has a steel truss monitor roof covered with slate, with gutter and spouts of copper.

In excavating for the foundation it was necessary to go down 22 ft. to reach a firm footing in the shape of a stratum of coarse sand. On this was spread an 18-in. layer of concrete, and all wall, boiler and engine foundations go clear down to this concrete bed. Fifteen feet of the engine foundations are of heavy rubble masonry, built with portland cement and the rest of hydraulic pressed brick in portland cement. All foundations are spread to give ample foot-

EXTERIOR OF KAW RIVER STATION

panel containing one Form K, G. E. circuit breaker, lamp bracket with shade, one Weston round pattern ammeter, one quick-break switch and one lightning arrester.

For all the generator panels mentioned two 750-volt Weston illuminated dial voltmeters are used. The switchboard is also fitted with one 750-volt recording voltmeter and one 3,000-ampere recording ammeter of Bristol make. Readings from these instruments showing the output of the station will be found in a table given later in this article.

Spanning the engine room is a 63-ft. 32-ton hand-power crane, built by the Brown Hoisting & Engineering Co., of Cleveland. The crane travels on 56-lb. T rails, bolted to 24-in. I beams run-

ing surface and are designed to support 2 tons to the sq. ft. of base area.

The boiler room floor is supported on 15-in. I beams running from wall to wall, upon which is laid a granitoid floor composed of portland cement, sharp sand and granite screenings.

BLUE RIVER OR SHEFFIELD ELECTRIC STATION. This is 16-

direct connected to a 500-h. p. simple condensing W. Wright engine.

One 250-kw. 550 volt direct current General Electric generator, likewise compounded for 10 per cent rise in voltage at full load. This is direct connected to a 300-h. p. simple non-condensing Allis Reynolds-Corliss engine, with cylinders 24 x 48 in.

VIEWS IN SOME OF THE METROPOLITAN POWER STATIONS.

cated on the Blue River about six miles east of Main St. in Kansas City, Mo., and operates the interurban line to Independence.

It contains two units:

One 450-kw. 550-volt direct current General Electric generator, compounded for 10 per cent rise in voltage at full load. This is

There are three duplex feed water pumps, one Allis jet condenser and one feed water heater.

The switchboard is in the shape of the arc of an ellipse and comprises 10 panels as follows: One wattmeter panel with Thompson and Bristol recording instruments; one 1,000-ampere generator panel; one 800-ampere generator panel; three 300-ampere feeder panels;

four 800-ampere feeder panels. These have a full complement of instruments, switches, circuit breakers, etc.

Steam is taken at 100 lb. from five 125-h. p. fire tube boilers.

The station on a recent test developed a total output of 739 electrical h. p. for a single hour.

EIGHTH AND WOODLAND AVE. COMBINED CABLE AND ELECTRIC STATION. This station is about half way between the Kaw River and Blue River power houses and its electric generating unit is used to help out either one or the other of those stations as the load requires. This it does through a system of

STEAM PIPING, KAW RIVER STATION.

feeders, which will be described later. Its cable plant drives the Ninth St. cable, the Independence Ave. cable, the Troost Ave. cable and the East Ninth St. cable.

The station contains the following:

One 300-kw. 550-volt direct current General Electric generator belted to a 500-h. p. simple non-condensing Wright engine, with cylinders 28 x 48 in. As the boilers carry steam at 160 lb. for the cable engines, and this Wright engine was built for 120-lb. pressure, steam is taken through a Davis reducing valve. The switch-board comprises one 3,000-ampere generator panel and four 300-ampere feeder panels.

The cables are driven by a 1,500-h. p. tandem compound non-condensing Allis Reynolds-Corliss engine, with cylinders 26 and 40 in. x 72 in. It runs at 42 r. p. m. This engine is half of a double tandem which ran in Machinery Hall in Chicago during the World's Fair. It is coupled direct to the line shaft which extends across the building. On the shaft are the four cable pinions which are connected to it by friction clutches. The pinions drive the gears at a reduction in speed of 134.

The boiler room contains two 400-h. p. and two 300-h. p. Babcock & Wilcox boilers, with B. & W. automatic stokers; two feed water pumps, and one feed water heater. As this plant has been troubled with excessive boiler scale the engineer is using a compound furnished by the Dearborn Drug & Chemical Works, Chicago, which is fed into the hot well drop by drop from a barrel at the top.

In the boiler room there is also a water storage tank, 24 ft. in diameter and 18 ft. deep, in which the feed water is stored. Steam coils around the inside of the tank raise the temperature of the water to a considerable degree before it passes to the heater itself. The coils take steam from the exhaust main.

EIGHTEENTH AND OLIVE STS. AND 31ST AND HOLMES STS. COMBINED CABLE AND ELECTRIC STATIONS. The electrical units at these two stations feed into the same feeders and the two stations together operate the Vine St. electric line and the Prospect Ave. electric line, and when necessary they can help out on some of the other near-by branches.

The cable machinery at the 18th and Olive Sts. house drives the 18th St. cable, the Main St. cable and the 19th St. cable. The 31st and Holmes Sts. house drives the Holmes St. cable.

The station at 18th St. contains the following: One 125-kw. 550-volt Westinghouse generator belted to the balance wheel of a

Hamilton-Corliss twin engine which also drives the cable machinery. The engine was built by Hooven, Owens & Rentschler, of Hamilton, O., has cylinders 30 x 72 in. and each side is rated at 750-h. p. There are also two reserve units consisting of two D-62 500-volt Thompson & Houston generators belted to two high-speed Armington & Sims engines. The steam plant includes three 200-h. p. Babcock & Wilcox boilers.

The 31st St. station contains one 125-kw. 550-volt Westinghouse generator belted to a 300-h. p. simple non-condensing Reynolds-Corliss engine, with cylinders 24 x 48 in., taking steam from two 175-h. p. Babcock & Wilcox boilers. The same engine drives the cable machinery.

FIFTEENTH AND GRAND AVE. CABLE STATION. This house operates the Walnut St., the 15th St., and part of the Holmes St. cable lines, the machinery being driven by one 750-h. p. simple non-condensing Allis engine, with cylinders 36 x 48 in., and one 500-h. p. simple non-condensing Allis engine, with cylinders 32 x 48 in. Steam is taken at 100 lb. through a separator from four 250-h. p. Babcock & Wilcox boilers. Two Worthington duplex pumps supply the boilers with feed water which passes through a Berryman heater.

TWELFTH AND CHARLOTTE STS. CABLE STATION. This house runs the 12th St. cable line by two ropes driven by two 600-h. p. simple non-condensing Hooven, Owens & Rentschler engines, with cylinders 28 x 60 in., taking steam at 110 lb. from three 200-h. p. Babcock & Wilcox boilers. All the cable drums are in the basement beneath the main engine room, the pinions passing up through the floor to mesh with the gears. The station also contains a Worthington pump for supplying water to an automatic fire sprinkling system protecting the repair shops and car barn which are in the same building.

NINTH AND WASHINGTON STS. MOTOR-DRIVEN CABLE STATION. This installation which operates the Summit St. line is interesting as showing the application of electricity to driving a cable where severe grades forbid the use of the overhead trolley system.

The cable machinery at this house was originally driven by a pair of 24 x 48 in. Wright engines, but is now operated by two 300-kw. 550-volt General Electric generators, arranged to run as motors and taking current through feeders from the Kaw River station.

To protect these motors against the excessive variations in the load incident to this service a small electro magnet is mounted at

BOILER ROOM, KAW RIVER STATION.

one side of the main circuit breaker for each machine, its coils being connected as a shunt to the motor circuit, and provided with mechanism for automatically opening the breaker whenever the line potential falls below 400 volts or rises to a dangerous point.

The starting rheostat consists of 12 separate boxes made of white pine, each box containing 680 ft. of No. 9 galvanized iron wire, wound in helices 2 in. in diameter, and placed in a zig-zag shape with glass partitions between to prevent electrolytic action. Water

is passed in a continuous stream through the boxes to keep the wire cool during the time the rheostat is used in operating the motors at very low speeds. Each box has four points of resistance in series which are connected to quick-break switches on the switchboard, and the 12 boxes are connected in parallel. The arrangement of the resistance coils gives from 50 to 1,080 amp. at 500 volts for any desired length of time. The rheostat is connected in on the negative side of the motors to prevent a leakage of current through water connections.

It is estimated a saving of 70 per cent is secured by driving this cable in this way instead of by steam engine direct.

FEEDER SYSTEM.

As can be readily imagined the general layout of the Metropolitan's electric lines has made the problem of economical distribution of power an extremely difficult one, and to the company's electrical engineer, Mr. Charles Grover, belongs the credit of having worked out a system, which, while it requires a considerable investment in copper, is undoubtedly the best that could be devised under the conditions and one that is giving highly satisfactory results.

The feeder system comprises 889,106 ft. of cables, as follows:

	Positive Cables, Ft.	Negative Cables, Ft.
No. 0	6,114	4,650
No. 0 0	33,946	7,652

Total length	763,929	125,177

BUILDING THE VINE ST. LINE IN 1887.

As has been stated, electric power is taken from five different plants, and it is carried to all parts of the system by an arrangement of feeders shown in the accompanying diagram. The Holmes and Olive Sts. houses work together through feeders as a single unit.

Ordinarily the Kaw River or Central Ave. power house carries all the lines in Kansas City, Kan., and those in the western portion of Kansas City, Mo., but when necessary it calls on the Woodland Ave. station for help, at which times the latter house carries the lines in its immediate vicinity. When the load on the Independence line approaches the total capacity of the Blue River station it likewise seeks help from the Woodland house, the times of heavy load on the two river stations seldom occurring at the same period of the day. When the Woodland generator is assisting either station in this way it cuts direct into the feeder system of the station it is helping and no equalizing wire is used. This arrangement has been found in practice to work perfectly. Of course when the point of

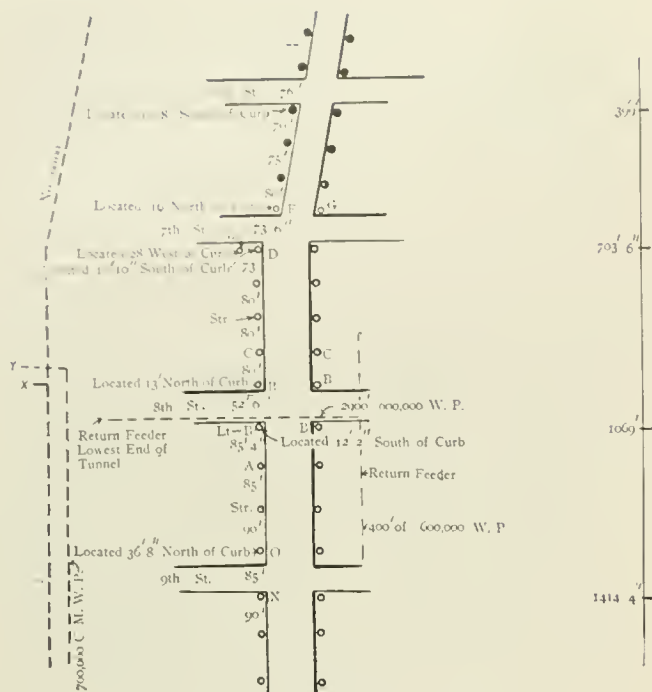

DIAGRAM OF FEEDER SYSTEM.

maximum load approaches one or the other of the two stations when they are working together, the house nearest that point will carry the bulk of the load and if the load approaches too closely, the main circuit breaker will go out. But this seldom occurs, the system being self balancing to a remarkable degree.

To assist in the work of caring for this extensive feeder arrangement Mr. Grover has devised a method whereby he can tell almost at a moment's notice the dimension of any feeder at any point on any line, the size and kind of any pole at any point and the location of every lightning arrester and section insulator. He

SECTION OF FEEDER RECORD DIAGRAM.

All poles unless marked differently must be set 10 in. back from curb line and 12 in. against span.

Cross arms for feeders will be placed on west side of street.

- SL—Section insulator.

keeps these records by means of sheets of tracing paper, on which the different lines are plotted in detail as shown on the portion of a sheet reproduced herewith. If repairs are to be made or a new line built across an old one, a blue-print copy of the line involved is given the assistant engineer in charge of the construction gang enabling him to clearly understand the situation and follow his instructions more intelligently.

OVERHEAD WORK AND MATERIALS.

Practically all of the 116 miles of overhead construction is No. 0 hard drawn copper wire supported on span wires from iron tubular poles 30 to 40 ft. high set 10 in. back from the curb line. Most of the work has been erected or rebuilt and thoroughly standardized in every part under the supervision of Mr. Grover, who designed all the standards and also all the overhead materials used which are made by the Ohio Brass Co., according to the Metropolitan specifications and purchased through the B-R. Electric Co.,

local agent. The various conditions found on the system have been studied with care and a solution adopted for each problem, and whenever a similar condition was encountered the same solution was invariably applied, this practice resulting in a small number of standards that will make all repairs and the designing of new work a simple matter of reference to what has been done before. Another prominent feature of this road is the attention that has evidently been given to the inter-relation of the trolley wheel and stand, the trolley and span wires and the cars, cross-overs and

TYPICAL KANSAS CITY MOTOR CARS.

other overhead appliances, each part having been specially designed to work in the fullest harmony with all the others, and so well has this been done that the company owns but one tower wagon and that does not average one call a month for emergency repairs. In fact the company does not keep regular horses for the wagon but rents a team from private stables when there is any work to be done.

On page 568 is a special truss pole used where excessive strains are to be met or where there is not room for a regular turn-buckle brace. The truss rod is held firmly against the pole near the top by an iron ring that is slipped on while hot and allowed to shrink, and the rod itself is heated for some distance before it is coupled up with pin coupling as shown, so that when it cools the pole is strongly braced in the desired direction.

In nearly all cases feeders are carried overhead, but in a few instances as at boulevards it is necessary to run them underground for a short distance. Where these underground cables come up to join the aerial lines a novel junction box is used which is shown herewith. Its chief feature is its compactness, as it will hold eight cables in a space 18 x 25 in. and 9 in. deep. The feeders are brought up in two sets, one set behind the other, the cables at the

back leading out near the top of the box and those in front near the bottom. Each cable is supported from the roof of the box by a Brooklyn insulator, to which is fastened a small casting carrying two V-shaped bolts through which the feeder passes. The portion of the cable near the points of support has the lead covering cut away and is wrapped with insulating tape.

An accompanying drawing illustrates the method of carrying the underground feeders across the Eighth St. viaduct. They are strung between the rails in asphalt paper ducts laid in portland cement and covered with asphalt.

All trolley wheels are made at a local brass foundry after patterns prepared by Mr. Grover, and are machine finished in the

SECTION OF FEEDER CONDUITS.

company's shops. The harp, as will be seen from the cut on this page, has absolutely no projections to catch in the overhead work. On the under side the two halves of the harp come together and are held by a screw so that there is no chance of the trolley wire becoming caught in the harp when the conductor is pulling the pole down to replace the wheel on the wire. The spindle is made of Shelby seamless steel tubing with two opposite holes at its center, through which project a small copper plug and a steel plug for contact points, the plugs being continually pressed outwardly by means of a hair-pin spring. The spindle is oiled through a screw-hole, the screw when in place also acting as a stop to keep the spindle in its proper position.

The trolley stand was designed by Mr. J. W. G. Becker, the company's master mechanic. It is of the compression helical spring

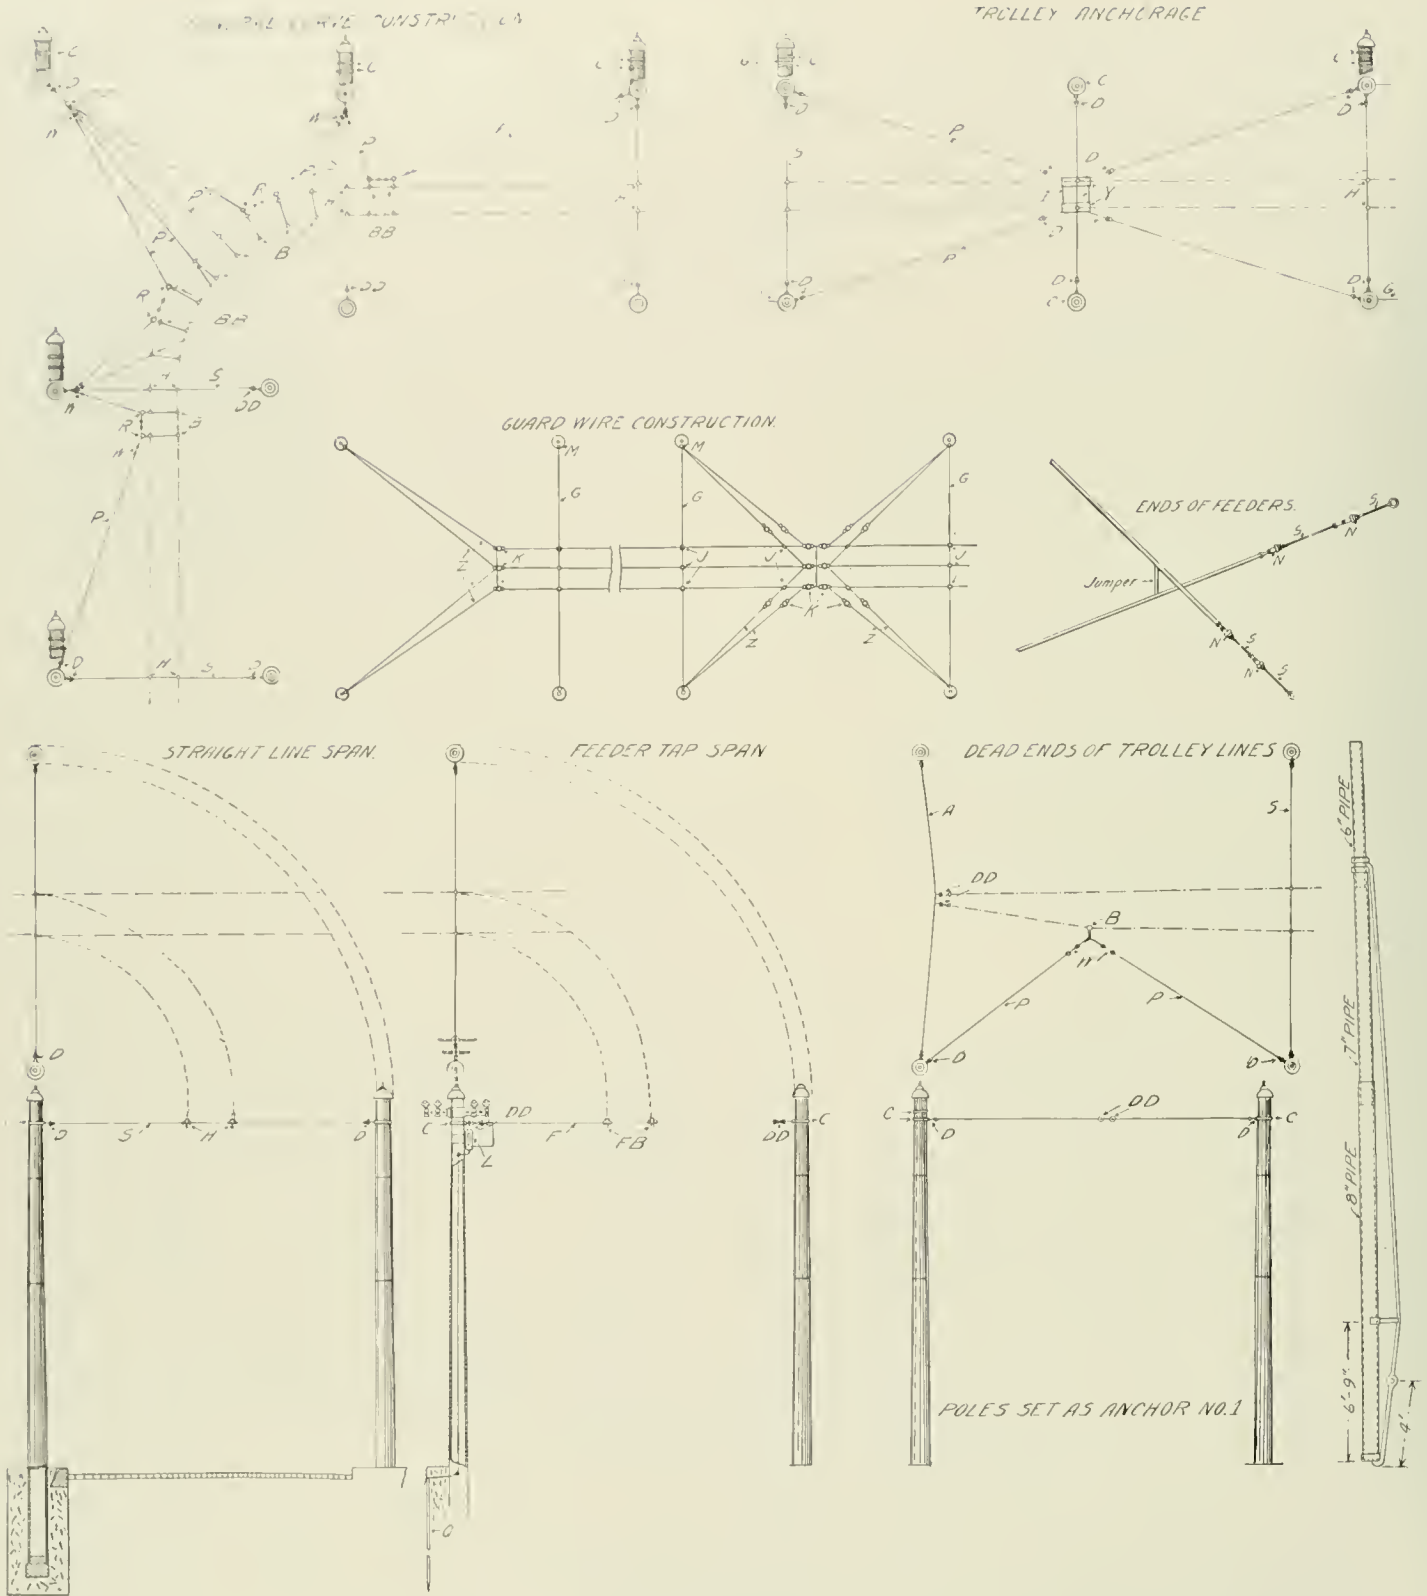

type and consists of a cast iron case containing a connecting rod, joining the spring pin to the steel casting that holds the trolley pole, the spring and the connecting rod being joined by a pin link, the pin having its ends elongated to travel in horizontal guideways on the inside of the case, causing the end of the connecting rod nearest the springs to always travel in a horizontal plane. The piece that holds the trolley pole is pivoted in C-shaped babbitted bearings and is held in its bearings by the tension of the springs alone, being free to move for a limited distance in the opposite direction from the springs, this freedom to "kick" greatly easing the blow caused when the trolley wheel jumps the wire and the pole flies upward suddenly. This blow is further cushioned by a piece of rubber 1 x 1 1/2 x 4 in., which is inserted at the top of the casing where the pole-base casting would otherwise strike. The backward kick is limited by two projections on the under side of the base casting which strike a stop bar and prevent a dislocation of the base piece from its bearings. This arrangement makes a differential joint keeping the upward pull exerted at the outer end of the pole nearly constant whatever the position of the pole, for as the end is pushed or pulled down the tension of the springs increases in practically the same proportion as the leverage decreases.

JUNCTION BOX.

OVERHEAD MATERIAL AND TROLLEY BASE—METROPOLITAN STREET RAILWAY CO.

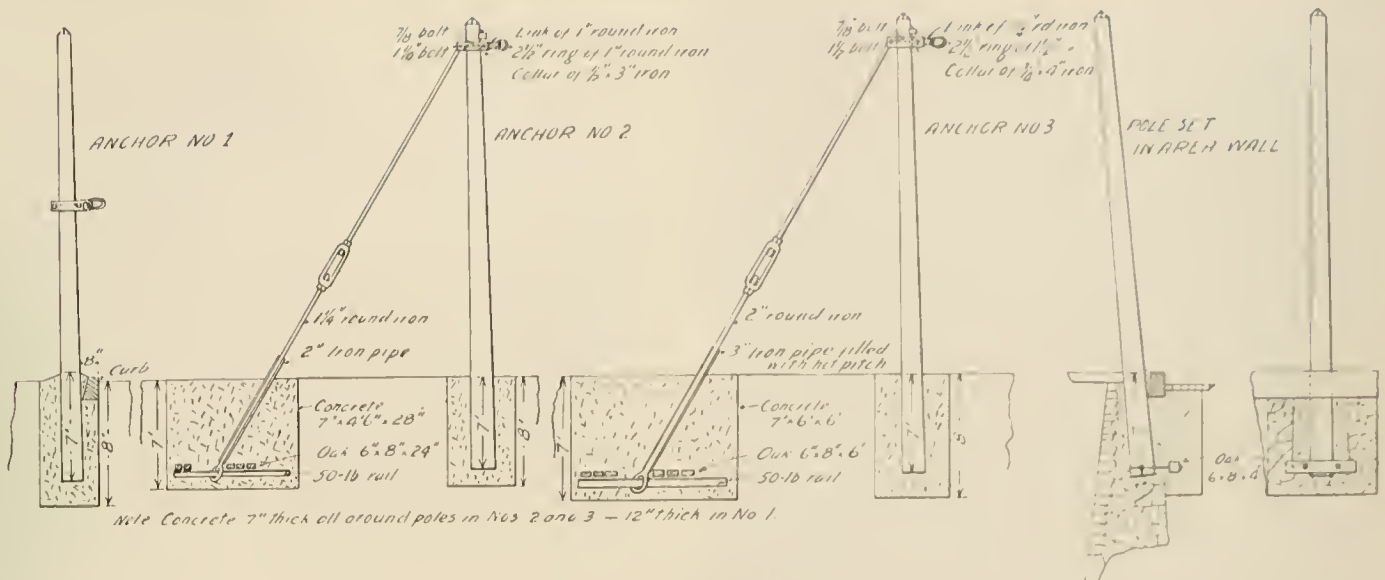

OVERHEAD LINE WORK.

The various standards for pole and span erection are shown in the accompanying plates. The reference letters have the following significance:

- A. 9/16-in. seven strands galvanized steel cable.
- B. Single pull off; body 3/8-in. malleable iron japanned with 5/8-in. insulated stud bolt and brass ear with Detroit lip tinned.
- BB. Double pull off; body of malleable iron japanned, with 5/8-in. insulated stud bolt and brass ear having Detroit tinned lip.
- FB. Feeder tap; body made of brass with 5/8-in. cap screw and lock washer.

- C. Pole collar; made from 1/4-in. x 1/4-in. iron clamped around the pole with 3/8-in. machine bolt and 1/2-in. x 1 1/4-in. machine bolt for fastening the insulator.
- D. "D" Insulator.
- DD. Double "D" insulator.
- F. No. 0 seven strands weather proof copper cable.
- G. 1/4-in. seven strands galvanized steel cable.
- H. Straight line hanger body with brass ear with Detroit lip and 5/8-in. insulated stud bolts.
- HH. Same as H except with stronger ear.
- I. No. 1 B. S. weather proof copper cable.
- J. General Electric straight line guard wire holder.

ANCHOR POLES.

- K 1 1/2-in. spherical strain insulator. (On curves pull-offs are spaced the same as on trolley curves.)
- L Lightning arrester type M. S. with No. 4 B. & S., W. P. wire soldered to feeder tap span and connected to the fuse box of lightning arrester. The ground connection is made with No. 0 bare copper wire, run down inside of the pole and wrapped around pipe Q six turns and soldered. The top of pipe must be 3 in. below the sidewalk level and covered in with a portland cement finish.
- M 5/8-in. plain eye bolt.
- N Brooklyn strain insulator; 5/8-in. for 300,000-c. m. or less and 3/4-in. for larger feeders.
- P Pull off wires out of 1/4-in. seven strands galvanized cable.
- Q 1-in. iron pipe 8 ft. long, driven down in ground outside of the concrete the full length.
- R Wrought iron ring 1 in. inside diameter made of 3/8-in. round iron.
- RR Wrought iron ring 1 1/2 in. inside diameter made of 1 1/2-in. round iron.
- S 5-16-in. seven strands galvanized steel cable. On feeder anchors and strain guys 9-16-in. cable is used for feeders larger than 300,000-c. m.
- U Stirrup made out of 3/8-in. round iron to fit pole and clamped on two (1 1/4-in. x 3-in. x 8-in.) finished oak strips. Nuts must be countersunk in strips. The iron and strips to be painted before erection of the arrester.
- W Wood strain insulators.
- Y Brass strain ear with Detroit lip and malleable iron guard plate supported to span by straight line body and 5/8-in. insulated stud bolt.
- Z No. 6 B. & S. silicon bronze wire.

All galvanized cable is of the best quality covered with heavy double galvanizing. The hangers, ears, insulators, etc., are the company's special pattern shown on page 567, which also illustrates the Metropolitan feeder anchor, standard pole cross arm, switches, and trolley wheel and stand. The straight line ears are slightly arch shaped, thus giving the wire a tendency to support the ends, preventing them from working loose; ears are clamped to the wire and then soldered; all cross-overs have unusually long flaring approaches and rounded guidways at the sides; strain ears have upwardly flaring edges; and likewise in all other overhead material the one idea is carried out to offer the least possible obstruction to the passage of the trolley wheel and reduce to the minimum the danger of pulling down the span work or injuring the trolley pole when the wheel leaves the wire. As before stated results have proven the efficiency of the designs.

Anchor No. 1.—The pole is set with 18 in. rake at the top in direction opposite to pull of feeders and, if carrying the span wire also, with a rake of 14 in. opposite to the pull of the span wire. This anchor is used for dead ends of feeders when the total area is 350,000 c. m. or less; also for end span of trolley lines and dead ends of trolley wire.

Anchor No. 2.—The pole is set straight unless it carries span wire,

then it is given to in. rake in direction opposite to pull of span. This anchor is used for dead ends of feeders where the total area is 400,000 to 950,000 c. m.

Anchor No. 3.—The pole is set straight unless it carries span wire, then it is given to in. rake in direction opposite to pull of span. This anchor is used for dead ends of feeders having a total area of 1,000,000 to 4,000,000 c. m.

In addition to the three types of anchors the drawing shows a pole as set in an area wall. The anchor thus provided has been found to prevent the butt of the pole being pulled over and breaking out the wall.

REPAIR SHOPS AND REPAIR SHOP PRACTICE.

The principal repair shops for the Metropolitan system are at 12th and Charlotte Sts., and a few repairs on cable cars are made at the Ninth and Washington Sts. barns and minor repairs and

CAR GATE AND OPERATING MECHANISM.

inspections at all the terminal barns. Plans are under way for building a new central repair shop with larger capacity and better accommodations.

The 12th St. shops are equipped as follows: Machine shop: eight lathes of various sizes; two planers, 24 x 72 in.; four drill presses; one 50-in. Niles boring mill for boring ear wheels; two shapers; one Watson-Stillman hydraulic jack axle straightener; two belt cutters; one hack saw; one rail saw; one slotting machine; one grindstone; one twist drill grinder and one circular saw grinder. All tools are belted to ceiling shafting driven by a small New York Safety engine.

Wood-working department: One band saw; one circular rip saw; one Egan shaper; one Egan joiner; one 6-ft. lathe for pattern work; one router; one Fay tenoning machine; one Fay 6-in. planer; one Fay mortising machine and one saw grinder.

Blacksmith shop: Three open forges blown by small electric motor; one heavy drill press; one heavy combined shears and punch; one small furnace for retempering springs; one steam hammer for heavy forgings and one hydraulic wheel press for pressing wheels on and off axles. The smith shop is connected with the ear barn by a single rail ceiling track, on which runs a trolley carrying

TRENCH CONSTRUCTION NORTH AMERICAN RAILWAY CONSTRUCTION CO.

chain block and tackle. This facilitates the handling of heavy parts from the cars to the shops.

The company casts its own babbitt bearings, which are used exclusively. A jig is kept for every size of bearing and a lathe chuck for boring each different diameter. Formerly it was the practice to have a standard diameter for armature shafts for each make of motor; the standard being the smallest shaft on the road for that particular make. This often necessitated turning down a comparatively little worn shaft to meet the standard, resulting in considerable waste. Now each armature and its shaft is given a serial number and the shaft keeps its own diameter, being turned down when worn, just sufficient to true it up. The number is stenciled into the shaft with steel stencils and steel wire gages are

EDGERTON CAR BARN.

made giving accurately the diameter of each end of the shaft. To these gages are attached a brass tag bearing the make of motor and the corresponding shaft number. These tags and gages are filed at the repair shop. When the motor-inspector decides a motor will need new bearings in a short time he sends the shaft number to the shop and bearings are cast and bored in accordance with the corresponding gages. It is therefore not necessary to keep an armature out of service until new bearings can be made.

Armatures after being rewound are baked for 48 hours at 200°

F., in a small oven 6 ft. square and 6 ft. high. The oven is made of sheet iron lined with asbestos, and is heated by a steam coil in the bottom. Four armatures may be baked at one time and are supported in the oven on an armature truck, shown herewith.

All tracings and blue prints used in connection with repair work of any kind are kept in the master mechanic's office in enclosed cardboard mailing tubes with a removable cap at one end. The

ARMATURE RACK.

tubes are numbered and drawings are indexed in a small blank book.

Mr. Becker has originated the following model set of rules to be observed by all shop employes:

SHOP RULES.

1. The time for commencing and stopping work will be indicated by steam whistle. All employees must have their shop clothes on, prepared for work at that time, and not then begin to get ready. Repeated tardiness will not be overlooked. Shop engine will be started five minutes before whistle blows. Smith helpers must light their fires at the same time and have them ready for a heat promptly when whistle blows. All oiling of machinery must be done before whistle time.
2. No employe shall leave his respective department during working hours, except by permission of his foreman. An employe intending to be absent must notify his foreman of such intention, so that foreman can arrange work accordingly.
3. Smoking during working hours is positively forbidden.
4. It is our intention to employ only strictly sober, steady, reliable men; those in the habit of losing time unnecessarily, and without previously notifying his foreman will not be retained.
5. Loud and unnecessary conversation with other workmen is forbidden.
6. All devices, patterns and tools made by mechanics to facilitate their work, shall be the property of the company, and must not be destroyed or taken from the premises.
7. No employe shall use any material for his personal use or do any kind of work for himself on the company's premises.
8. Each workman will be responsible for all tools or machines, including counter-shafts and loose pulleys, used by them, and for the window at their benches. Any breakage of tools, machinery, waste of material, breakage of glass, or damage to building, must be reported at once to their foreman, who will fix the responsibility.
9. No employe will be allowed to leave his work during working hours to procure beer or other stimulants; neither will the drinking of the same be allowed on the premises at any time, under any circumstances.
10. Employes are expected to pay strict attention to their work during working hours, to the exclusion of all other subjects, and at all times endeavor to advance the interests of the company in every way. Inasmuch as they each expect their full wages, without deduction for time wasted, material destroyed or imperfect work, it is but just they should be willing to give an equivalent for what they receive.
11. Each workman will record his daily work on a time card provided for same. You will receive instructions as to what division and account your work is to be charged to when assigned to it by your foreman.
12. Each workman is expected to keep his respective tools clean and well oiled; also their places clean and free from offal. Employes must not occupy car or other vehicles while eating meals or when not at work; neither shall they leave any refuse from their meal exposed when through eating.
13. Violation of, or indifference to the foregoing rules will be sufficient cause for discharge.
14. The foreman of each department is expected to be present

AGNES AVE. TRESTLE 1888.

there at least ten minutes before and after working hours. He will be responsible for the conduct and work of the men in his charge; will see that the rooms and machinery in his department are kept clean and in good order, and that all "waste" and waste material and litter are removed at the close of each day. It shall be his special duty to see that these rules are duly enforced.

PAINT SHOP METHODS.

The routine of repainting a car is as follows:

After burning off, two coats of lead are applied and the crevices and nail holes puttied. The surface is then given what is known in these shops as a "glazing" coat, consisting of a mixture of putty, white lead and varnish, a few drops of color corresponding to the final color being added. The glaze dries two days, when it is sandpapered and three coats of paint put on, allowing a day between each coat. The car is then ready for varnishing, during which process all the windows in the shop are closed and the floor around the car sprinkled with water to ensure freedom from dust. Over the last layer of paint is applied a layer of color varnish, mixed in the proportion of one-sixth of color to five-sixths of varnish. This is not rubbed at all, the glaze coat giving all the effects secured by the rubbing process. Two coats of finishing varnish, on which no rubbing is done, complete the car body.

PAINT PRESS.

The dash is treated in a little different way. After burning it is washed in a strong solution of lye to remove any scraps of the old paint. The lye is washed off and as a precaution against rust the surface of the dash is gone over with a piece of block pumice stone and afterward treated with a washing of coal oil, which has been found to absolutely kill all traces of rust. The coal oil is washed off with gasoline. After these preparations the dash is painted and varnished according to the same process as is followed on the body.

The interior decorations are seldom touched, but when it is necessary are re-stained.

Paint brushes when not in use are kept in water and varnish brushes in varnish to which a little oil has been added to prevent skin forming on the surface. Brushes are suspended around the inside of small tubs by means of screws, screwed a short distance into each handle and catching on the edge of the tub.

Paints are purchased in small cans and instead of dipping them out with a stick or brush, which always results in more or less loss, a small screw press is used having a disk at the lower end of the screw just large enough to fit into the inside of the can. By turning the screw the desired quantity of paint may be forced out through a small trap door in the bottom of the can which is

fastened to the wall by brackets. The disk always rest on the top of the paint, preventing evaporation or the formation of scum.

ROLLING STOCK.

The company owns 814 cars, of which 482 are grips and cable trailers and 332 are electric motors. They are of various sizes and shapes, but the company has selected the following lengths for future standards: For single truck cars, 24 ft. bodies, 30 ft. over all; for double truck cars, 30 ft. bodies, 42 ft. over all. The cars have been supplied by the Brownell Car Co., the Laclode Car Co., the American Car Co., the St. Louis Car Co., and the Stephenson

PARLOR CAR—METROPOLITAN RAILWAY BUILT BY BROWNELL CAR CO., ST. LOUIS.

Co. Part are mounted on Du Pont single trucks, part on McGuire maximum traction trucks, a number on Brill and Peckham double trucks and the remainder on Bemis box trucks. The Du Pont "C" single truck, made by the Lorain Steel Co., is the standard for single truck cars.

The motor equipments in service are as follows: 22 G. E. 57; 24 G. E. 1,200; 30 G. E. 800; 74 G. E. 1,000; 172 G. E. 52; 490 G. E. 67; 20 Westinghouse No. 12; 16 Westinghouse No. 3. Eighty-five of the double truck cars have four motor equipments to the car. Some of the cable trains are fitted with friction brakes, some with track brakes and 86 of the newer electric cars have Christensen air brakes of a recent type.

The company also owns 15 McGuire electric sweepers, eight cable sweepers, one Trenton trolley wagon, and is now rebuilding three passenger cars, which will be used for carrying mail bags from the post office and sub-stations along the route to the depots, a

INTERIOR OF PARLOR CAR.

contract recently having been made with the Government for this service.

Most of the wheels in use have been furnished by the Kansas City Car & Foundry Works, now owned by the Griffin Wheel Co., Chicago. Cable car wheels are 30 in. in diameter and electric wheels 33 in. Each wheel at the time it goes into service is given a serial number, cut into the hub with steel dies, and when it is removed a report of its life is made out on a form reproduced herewith.

All motor cars are built with vestibules completely enclosing the platforms except on the side nearest the curbs, this opening being protected by folding gates which are operated by the motorman. The arrangement of levers by which the gates are opened and closed from the front platform will be apparent from one of the accompanying sketches. A motorman that opens his gates before he has brought the car to full stop is immediately discharged.

have instructions that whenever an accident occurs involving personal injuries, to notify the office at once by telephone and the surgeon immediately goes to the scene. He renders all assistance possible and has the person removed to the hospital or home, as seems best. If the patient so desires he takes full charge of the case, making as many visits as necessary and providing medicine and bandages without charge.

CAR HOUSES.

There are on the Metropolitan system 14 car barns, most of them at the terminals of important lines. They are used mainly for storage purposes, for inspection of cars at night and for making such light repairs as the foremen can attend to.

CLAIM DEPARTMENT.

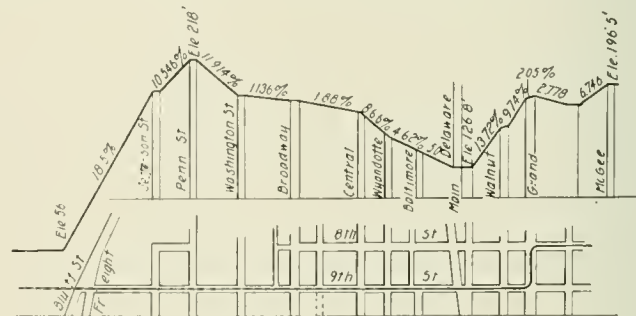

The great number of hills, and the many intersecting points of cable and electric lines in the business district tend to make the item of "claims and damages" on the Metropolitan system excessive, although the amount is not nearly as large as one would be apt to predict after riding over the system for the first time. The trainmen seem to be above the average in the display of ability and good judgment, and the knowledge of the hazardous conditions undoubtedly causes a higher degree of care on the part of both public and employes. Special signalmen at the more dangerous points, careful inspection of braking mechanism and the use of safety platform gates on electric cars, also have the effect of keeping down the number of accidents. The following records give

A full report of every mishap is required from both conductor and gripman or motorman. These reports are made in copying ink on blanks printed in copying ink. The blanks show date, direction car was going, time, number of car, names of train crew, rate of speed, exact place of accident, name, occupation and address of person injured and part of body hurt, or name, occupation and address of owner of property damaged, kind of property and extent of damage. In addition the names of all witnesses that can be secured must be given and a statement by conductor and motorman or gripman. On the reverse side of the form is printed a diagram, on which the trainmen must indicate relative positions of car and persons or wagons struck, and the location of any object that would have any bearing on the case.

The day the report is received at the office, blanks are sent to all the witnesses named, asking the following questions: Did you see the accident? When and at what time did it occur? Where did it occur? Where were you when the accident took place? Was the car in motion? Were the bells ringing? Do you know anyone else who saw the accident? If so, give names and address. Who in your opinion, is to blame for accident? Please give full account of accident as witnessed by you, showing no favor to either party.

HEAVIEST ELECTRIC GRADES.

HEAVIEST CABLE GRADES.

the total number of all occurrences during June and July that could possibly result in actions for damages being brought against the company, including ejections of passengers. The months are average ones.

ACCIDENT STATEMENT.

Total accidents for July, 1900.....	445
Fatal accidents for July, 1900.....	2
Total accidents for June, 1900.....	409
Average per day, July, 1900.....	14.35
Average per day, June, 1900.....	13.63

Considering the conditions these numbers are not excessive. Of the 445 accidents for July, 1900, 116 were collisions of cars with vehicles; 55 were the result of persons leaving moving car; 32 of persons boarding moving car; 22 were accidents to employes; 21 were collisions of cars with persons, and 15 were ejections of passengers.

At the company's office there are in constant attendance from the moment the first car is scheduled to start in the morning until the last car is turned into the barn at night, at least one expert surgeon and one or two assistant claim agents. The car crews

In the case of personal injury accidents the attending surgeon also makes a report, using a blank on which the following questions are asked: Name of injured party. Age and nationality. Present residence. Occupation. Married or single. Place of accident. Time of accident. Statement of injured party. Is this accident slight, serious or probably fatal? Will any permanent injury or deformity result? If so, what? How soon will injured party be able to resume his usual occupation? Previous disability? Where was injured person treated? What disposal was made of injured person?

As soon as the train crew's report is turned in it is given a serial number, and all replies received from witnesses, the surgeon's report and any other papers connected with the case are given the same number and pinned together. These are filed in numerical order. The train crew's report is also copied into an ordinary letter copying book, so that there shall always be a duplicate in case the original is sent to some other department for reference or should be lost.

The files of reports are double indexed in a small book under the motorman or gripman's name and under the name of the person injured or the owner of the property damaged.

The secretary of the claim department makes up a statement at the end of each month showing the number of each kind of accident for each line. To facilitate this work all the various kinds of accidents are given numbers, as shown by the following schedule, and in making the report the accidents are referred to by these numbers.

CLASSIFICATION OF ACCIDENTS.

1. Boarding moving cars.
2. Leaving moving cars.
3. Cars striking obstruction in slot or track.
4. Fell in cars.
5. Cars starting while alighting.
6. Cars starting while boarding.
7. Cable slot injury.
8. Collision of cars.
9. Collision of cars with persons.
10. Collision of cars with vehicles.
11. Collision of cars with animals.
12. Cars off track.
13. Fell off cars on curves.
14. Fell off cars on straight track.
15. Struck by column while boarding.
16. Struck by column while alighting.
17. Struck by column while passenger.
18. Center pole injury.
19. Bicycle accidents.
20. Disturbance on cars.
21. Ejectment through trouble about fare.
22. Ejectment through trouble about transfer.
23. Ejectment through trouble about change.
24. Employes injured while on duty.
25. Electric shock to persons.
26. Electric shock to animals.
27. Frightened horses.
28. Injury to company's property.
29. Miscellaneous.
30. Injury to packages, clothes, etc., belonging to passenger.
31. Fell leaving standing train.
32. Fell boarding standing train.
33. Struck while on one car by car passing on opposite track.
34. Falling in excavations in or at side of track.
35. Fell after leaving car.
36. Hit by brake handle or grip lever.
37. Injured by car door.
38. Fell before getting on.
39. Manhole covers to slot breaking.

When the person involved in the accident is a woman the fact is indicated by drawing a circle around the number. A number underscored once indicates "also personal injury," as when a car smashes a wagon and also injures the driver. A double underscore indicates "fatal."

The company has had trouble with "accident" lawyers locally known as "snitches" who make a specialty of inducing persons injured by cars or owners of property damaged to bring suit against the company, whereby the client usually receives one-third of the money recovered and the lawyer the remaining two-thirds. In one instance the company discovered that one of these practitioners was in the habit of keeping close watch at the company's office and whenever the surgeon left, apparently for the scene of an accident, the lawyer would mount his wheel and endeavor to make a contract at once with the injured party to bring suit.

Suits for damages in the state of Missouri must be brought within five years of date of accident or they become outlawed.

The personnel of the claim department is as follows: General claim agent, Thomas Worthington; general claim attorney, M. J. Oldham; secretary claim department, Omar R. Nagle.

METHOD OF PURCHASING AND KEEPING SUPPLIES.

The purchasing agent, Mr. H. C. Schwitzgebel, buys all materials with the exception of rails, ties, cables, wheels, oil and one or two other items that are purchased on contract and charged to special accounts. Materials bought through the purchasing agent go into a general storeroom and are given out only on requisitions signed by the division superintendents or heads of departments and O. K.'d by the general manager or superintendent.

ELEVATED ROAD, SURFACE LINES AND TUNNEL.

The storekeeper enters on the requisition the value of the goods corresponding as near as possible to the price originally paid for them and charges them to the division on which they are to be used under one of the following heads:

Car repairs (which includes everything that is not movable connected with a car).

Car expenses (which includes all movable parts of a car).

Track repairs.

Motor repairs.

Overhead line and trolley repairs.

Bridge repairs.

Building repairs.

Engine and machinery repairs.

Electric light repairs.

Miscellaneous.

Construction (which includes materials for new work not ordered by contract).

The company carries from \$30,000 to \$35,000 in stores.

PARKS AND PLEASURE RESORTS.

The Metropolitan lines serve several parks, two of which have been fitted up quite elaborately with the usual attractions found at places of this kind. Fairmount Park, located seven miles from the center of Kansas City on a spur from the Independence electric

PAVILION AT TROOST PARK.

line, is the most extensive and contains a dancing pavilion, a lake covering five or six acres, athletic grounds, hotel, cafe, small theater and a large uncovered amphitheater having a stage and sounding board where free entertainments of a high order are given nightly and afternoons. During the past season the Banda Rosa rendered concerts for three weeks. The fare from the heart of Kansas City to Fairmount and return is 25 cents.

This resort and Troost Park, two miles from the business district, are owned by a park company, of which Mr. C. W. Waddell is president.

EMPLOYEES.

Applicants for the positions of gripmen, motormen or conductors are required to answer certain questions as given below, and to their applications are attached a report made by the company's physician. The blank used is as follows:

METROPOLITAN STREET RAILWAY CO.

EMPLOYEE'S EXAMINATION.

Name of Applicant _____
 Residence _____
 Nationality _____ Married _____ Single _____ Age _____
 Former Occupation _____
 Application for position of _____
 Have you now any diseases or disorders?
 For what have you had medical advice during the past two years? _____
 What physician did you consult? _____
 What personal injury or accident have you had? _____
 Have you ever had any of the following?
 Dropsy _____
 Diseases in Urinating _____
 Disease of Heart or Brain _____
 Loss of Consciousness _____
 Habitual or Chronic Cough _____
 Defect of Sight _____
 Headache, (frequent) _____
 Do you use alcoholic liquors or narcotics? _____
 Have you been in any sanitarium or taken treatment for alcohol or narcotics? _____
 Signed this _____ day of _____ 190____
 (Applicant sign here) _____

EXAMINER'S REPORT.

Did he sign the above in your presence? _____
 Has he had stricture or venereal disease? _____
 Has he a rupture? _____
 Has he the appearance of a temperate man? _____
 What is his figure? _____ Height _____ Weight _____
 Chest circumference in repose _____ Forced inspiration _____
 Forced expiration _____ Circumference of Abdomen _____
 Condition of heart _____ Pulse rate _____ Temperature _____
 Urine, specific gravity _____ Albumen sugar _____
 What is the condition of eye sight? _____ Hearing _____
 Would you class him as fully up to average of requirements? _____
 Remarks: _____
 Dated _____ day of _____ 190____
 By _____ M D

If the examination is satisfactory the applicant deposits \$25 and signs an agreement with the company covering rate of wages, liability of company toward the employe in case of accident, and other matters. He then works seven days without pay as a student, in charge of a regular employe, and if he proves himself capable at the end of this period he is assigned to some division and placed at the bottom of the extra list. It usually takes from five to eight months to secure a regular run.

Trainmen are paid according to the following schedules: On cable lines, 17 cents an hour the first year, 18 cents the second, 19 cents from the third to the fifth, and 20 cents thereafter; on the important electric lines, 16 cents the first year, 17 cents the second, 18 cents from the third to the fifth, and 19 cents thereafter; on the lesser electric lines, 15 cents the first year, 16 cents the second, 17 cents from the third to the fifth, and 18 cents thereafter. The runs average from 9 to 12 hours a day.

Each division superintendent keeps a record of every man on his division, entering in an indexed book every time the employe violates a rule.

The following are two sample records:

John Smith. Employed July 19, 1895. Gripman. Broken in by Chas. Peters. Feb. 12, 1896, failed to release cable at Brooklyn Ave., west bound. Broke wheel and delayed trains about 30 minutes. Said he made throw all right and in good time, but found that rope was not going to leave grip and then tried to stop but found he could not stop in time to save wheel. Discharged for want of evidence to bear out his statement. Mar. 26, 1897, reinstated in company's employ. July 2, 1898, missed run. July 6, 1898, missed run. Sept. 10, 1898, resigned to go to work on a farm. This man was never contented with what he had. Was only a medium gripman.

Peter Jones. Employed Apr. 22, 1898. Conductor. Formerly dry goods salesman. Feb. 16, 1899, suspended three days for starting his train before passengers were safely on and off. May 22, 1899, suspended one day for not making his meal relief at supper. Aug. 15, 1899, discharged for missing fares.

TICKETS AND TRANSFERS.

There are 63 transfer points on this system, and although transfer tickets are given at practically all intersections the arrangements are so made that a passenger can not ride in a loop and must make a continuous journey. The transfer system makes possible several trips approximating 12 miles in length for a single five-cent fare. Transfers for each division are numbered consecutively and a record is kept of the total number issued to each conductor. The month and day are punched out by the division superintendents in the morning and the conductors punch the time and division to which the ticket is issued. Tickets must be presented within 15 minutes of the time punched. A different color is used for each day, ten colors in all being employed, as follows: Light green, mandarin, straw, lilac, old gold, salmon, blue granite, rose, oiive and gold, these having been found the most satisfactory. The company issues about 75,000 transfers a day.

On the line to Independence regular stations are established and single, round trip and commutation tickets sold to each station at proportionate rates.

FINANCIAL.

The total capital liabilities of the Metropolitan company aggregate \$14,086,800, of which \$5,586,800 is capital stock issued, the total authorized stock being \$8,500,000, and \$8,500,000 is mortgage bonds, part being the obligations of the underlying companies, to retire which at maturity a sufficient amount of Metropolitan bonds are held in escrow. The company also guarantees the interest on \$2,600,000 Kansas City Elevated Co's. bonds.

The accompanying table shows the growth of the Metropolitan Street Railway Co. since 1886. These statistics do not include the figures for the purchased companies prior to their becoming a part of the Metropolitan system.

Personal and Biographical.

Kansas City has been the schooling place for a number of prominent street railway engineers and managers. A few of these have passed from this life, but several others are still actively engaged in railway work, and are profiting by the experience gained while trying to find ways and means of keeping cars running over the city's hills. This description of Kansas City's street railways would not be complete without some further mention of these pioneer workers to whom the industry at large is indebted for many of the ideas and principles that are now common property.

Mr. Nehemiah Holmes, well styled "the father of Kansas City's street railways," was recognized as one of the most progressive and public-spirited citizens in the state. A man of large

W. E. KIRKPATRICK,
Secretary and Treasurer.

J. A. HARDER,
Auditor.

means, he was always foremost in making improvements and starting new enterprises, some of which have, since his death, been carried forward by his sons, Walton H. and Conway F., to an importance exceeding his own flattering anticipations.

He was born in New York in January, 1826. He left school at an early age and went to Aberdeen, Miss., where he engaged in the mercantile business with highly successful results. Disposing of his establishment in 1856, he was attracted to the hustling town of Kansas and ultimately became closely identified with its growth and prosperity. In 1868 he projected the Kansas City and Westport horse railway and completed it to Westport. He also built the Jackson County horse railway to the state line, and at the time of his death, in 1873, was the chief street railway capitalist west of the Mississippi River. Mr. Holmes was an old line Whig, and a grand worthy master of the Independent Order of Odd Fellows.

Mr. Robert Gillham, the founder of Kansas City's cable railway system, was born in New York, Sept. 25, 1854. He continued the study of engineering until 1874, when, at the age of 20, he began the practice of his chosen profession at Hackensack, N. J., and by faithful work and the display of unusual ability soon attracted a wide clientage. In 1878 he went to Kansas City, where he determined to make his home. He had been in the city but a short time when he was taken with the idea of substituting the cable system on the unsatisfactory horse lines then constituting the only means of transit, and at once bent his energies toward carrying out his projects. After years of discouragements and delays he saw his cherished plans completed and lived to enjoy the full fruits of his labors. Mr. Gillham subsequently acted as consulting engineer for cable railway companies in St. Joseph, Mo., Nashville, Cleveland, Ft. Worth, Providence, Brooklyn, Chicago, Omaha and Denver. At the time of his death in 1898 he was general manager of the Kansas City, Pittsburg & Gulf R. R.

Mr. Clift Wise, who assisted Mr. Gillham in the construction of the early cable line, went to Kansas City in January, 1884, having been appointed division engineer of the Kansas City Cable Ry. The following year he was made chief engineer, succeeding Mr. Gillham, who had been badly injured while working in a cable conduit. Mr. Wise built the Independence Ave. line, the East Ninth St. line, and the Troost Ave. line, and was chief engineer of

construction work on the Eighth and Woodland Ave. power station. He left Kansas City in 1889 to take a position with the St. Paul Street Ry., St. Paul, Minn., from which city he went to Chicago to engage in general railway construction work. Mr. Wise tells with pleasure that he gave Mr. M. K. Bowen his first street railway position and in 1889 obtained for him the office of superintendent of the Kansas City Cable Ry.

The late M. K. Bowen began his street railway career as transit man on the Kansas City Cable Ry., but by the display of those rare qualities that foretold something of his coming successes, he soon advanced to the positions of chief engineer and superintendent of the system. Upon the completion of this road Mr. Bowen went to New York City as representative of the Short Electric Railway Co. He remained there a year and then went to Chicago as assistant superintendent of the Chicago City Ry., from which office he rapidly advanced until finally he became president and general manager, which positions he held until his death on Apr. 9, 1899.

Mr. J. C. Henry was born in Woodstock, Ont., in 1848. He left school at the age of 16 and immediately took up the study of telegraphy. During the next to years of his life he was employed as superintendent of telegraph lines and train dispatcher for the Philadelphia & Erie Ry., the Union Pacific and other roads, but spent his evenings and holidays in studying electrical science with particular reference to the application of electric power to street railways. In these years he made a number of valuable inventions, including the Henry velocimeter, now sold in slightly modified form under the name of the Boyer speed recorder.

In 1883 he resigned his railway position so that he might devote all his time to experimental and inventive work. The following year he moved to Kansas City and installed two electric railways on the overhead system as described elsewhere in this issue. After completing his Kansas City work Mr. Henry went to San Diego, Cal., where he built a number of electric roads, on one of which

W. A. SATTERLEE,
General Superintendent.

CHARLES GROVER,
Electrical Engineer.

a 9-per cent grade was successfully surmounted by cars equipped with his apparatus. In 1889 he went East and became connected with the Thomson-Houston and General Electric companies as an expert in patent matters. He now lives in Denver, Col., where he devotes his time to making further developments in electric railway apparatus.

Mr. E. J. Lawless commenced his street railway career in 1877, taking charge of a crew on the construction of a branch line of the Sutter Street Ry. in San Francisco, Cal. When the work was completed he was made assistant secretary and afterwards assistant superintendent. In 1885 he was called to Kansas City and superintended the operation of the Kansas City cable road until 1886, when he was engaged by the Metropolitan road to superintend that system, which position he held until 1888. He then retired from the railroad field, but came back to the fold in 1891, when he was engaged as manager for the Paterson Railway Co. In 1894 he became general agent for the American Car Co., of St. Louis, which company he still represents.

EDWARD BUTTS,
Chief Civil Engineer.

D. W. DOZIER,
Chief Mechanical Engineer.

J. W. G. BECKER,
Master Mechanic.

THOMAS WORTHINGTON,
General Claim Agent.

The general direction and management of the Metropolitan system are now in the hands of two gentlemen who were born and reared in Kansas City and have been in the street railway business all their lives, Walter H. and Conway F. Holmes, sons of Nehemiah Holmes. At the age of 12, Mr. W. H. Holmes went into the office of his father's company, the Kansas City & Westport Horse Ry., and his brother Conway at the same time was a mule car driver. Within a few years the brothers organized the Grand Avenue Cable Co., of which Walton was president and Conway general manager. In the spring of 1894 this company absorbed the Kansas City Cable Co., and the following year was itself merged into the Metropolitan Street Railway Co., Walton being made vice-president and general manager, and Conway general superintendent of the consolidated system. These positions they held until 1899, when Walton became president and his brother general manager, which offices they now occupy. Walton H. has just passed his thirty-eighth year and Conway F. is three years his junior.

The Holmes boys, as they are familiarly called in their native city, have a business record seldom equalled and still more rarely surpassed. Trained by their father during their early years to appreciate that success is but another name for hard work, they have learned and practiced his lessons well. Always business-like and to the point in their dealings, yet courteous and with the highest ideas of integrity, they are admired and respected by their business associates and their fellow citizens; and strict yet always just and considerate in the exercise of their offices as managers, they enjoy the loyalty and good-will of every man in their employ.

Mr. W. E. Kirkpatrick, secretary and treasurer, was born in 1858, at Niagara Falls, Ont., but calls himself a Western man, as he went to Chicago in his early youth and most of his life has been spent in that city. In 1874 he accepted a responsible position in the dry goods house of Field, Leiter & Co., now Marshall Field & Co., and at the same time was an officer of the Chicago Title & Trust Co. These relations remained unbroken until a trifle over a year ago, when Mr. Kirkpatrick left for Kansas City to take his present offices with the Metropolitan Street Railway Co. He is also secretary and vice-president of the Kansas City Electric Light Co.

In Mr. W. A. Satterlee, the general superintendent, the president and general manager have an able assistant, who has every detail of the system, literally at his finger's ends, for he can answer after a moment's reference to one of half a dozen note books tucked away in the pigeon holes of his desk, and indexed according to a system of his own, about every question that could be asked concerning the company and its property, from the date each line was built to the age and weight of the last conductor added to the extra list.

Mr. Satterlee was born in February, 1856, at Birmingham, Mich. He graduated from the University of Michigan at Ann Arbor in 1877, and for the next two years taught school in his native state. He went to Kansas City in 1880, and started a successful carriage business which he continued until 1882, during which year he associated himself with the Smith & Keating Implement Co. When this company sold its business in 1887 he was retained to

close up its affairs. In 1890 Mr. Satterlee commenced his street railway life as purchasing agent for the Kansas City Cable Ry., and the following year was made auditor, purchasing agent and cashier. In 1895 when the property of the Kansas City Cable Co. was sold to the Metropolitan Street Railway Co., he was retained as purchasing agent for the system until April, 1899, when he was appointed general superintendent.

Mr. Edward Butts, chief civil engineer, has had nearly 40 years' practical experience in engineering work, 12 of which has been devoted exclusively to street railway construction. He is the son of Mr. Anson Butts, who was also a civil engineer and surveyor of wide experience. Mr. Edward Butts commenced work as transitman on the Albany & Steventown R. R. in 1869, and from that time until 1892, was connected with several railroad enterprises. In the latter year he was appointed city engineer of Kansas City, Mo., but resigned two years later to become chief engineer of the Metropolitan Street Ry. He is the author of the "Civil Engineer's Field Book."

Mr. Charles Grover, electrical engineer, is a native of Liberty, Mo., born in February, 1863. At an early age he went to Kansas City, Mo., where he soon took up the study of applied electricity, showing unusual aptitude for matters of this kind. In 1886 he opened a branch office in Kansas City for the Heisler Electric Co., of St. Louis, maker of electric lighting machinery, but resigned this agency in 1887 to go with the Hawkeye Electric Co., of Oscaloosa, Ia. He severed this connection the following year and became superintendent of the Consolidated Electric Light Co., of Kansas City, Kan., and in this capacity built and operated a new plant, supplying current for city and commercial lighting. In February, 1889, the Hawkeye Electric Co., having reorganized and removed its factory to Davenport, Ia., Mr. Grover again became associated with this house, remaining until June, 1891, when he was made superintendent of the Kansas City Vine St. electric line, then operated by the South Suburban Railway Co. Upon the purchase of this property in June, 1894, by the Metropolitan Street Railway Co., he was made division superintendent, and later chief engineer of the entire system. Mr. Grover was married in 1889 to Miss Mary J. Link, of Linkville, Mo., and has three children.

Mr. D. W. Dozier, chief mechanical engineer, before he had become of age left his home in Richmond, Ky., where he was born Oct. 30, 1853, and started his business career as a steamboat hand on the Mississippi River. While still a youth his ability to understand and operate machinery won for him a position as chief engineer on one of the largest boats running from St. Louis. In 1873 he left boating and spent the next few years in the employ of the Jerome Wheelock Engine Co., of Worcester, Mass., the Barney & Kilby Engine Co., of Sandusky, O., and the William Wright Engine Co., of Newburgh, N. Y. During this time he assisted in the installation of engines and boilers in mills, power stations and isolated plants all over the United States. He left the Wright company to become erecting engineer for the E. P. Allis Co., retaining this position for seven years, when going to Kansas City in 1887 to erect a pair of Allis engines, he was invited by the

H. C. SCHWITZGEBEL,
Purchasing Agent.

E. C. HUGHES,
Chief Draftsman.

J. J. O'KEEFE,
Chief Inspector.

C. W. WADDELL,
Manager of Parks.

Holmes brothers to remain and take charge of their power stations, which he did. Both the Kaw River and the Blue River electric stations were erected and equipped under his supervision. In 1892 Mr. Dozier went to Washington, D. C., for a few months to superintend the construction of the Washington & Georgetown Electric Ry's. present power station.

Mr. J. W. G. Becker, master mechanic, was born in Springfield, Ill., Sept. 8, 1866, and received his preliminary education in St. Louis. Developing a liking for mechanics, he took lessons in the art of machine and pattern making, and studied drawing and civil engineering. He has been engaged on work at St. Louis, Denver and Kansas City, and for the past 12 years has been with the Metropolitan Street Railway Co., as machine shop foreman, car barn foreman, assistant in civil engineer's office, and finally as master mechanic.

Mr. Thomas Worthington, general claim agent, was born in Mason County, Ky., in 1852. He has been connected with the street railways of Kansas City since 1892, having been assistant claim agent of the old Metropolitan system which was then under the management of Mr. R. J. McCarty. Mr. Worthington was appointed general claim agent of the consolidated companies in March, 1900.

Mr. H. C. Schwitzgebel, purchasing agent, has lived all his life in Kansas City. He was born Jan. 4, 1857, and at an early age went into the banking business, following this line of work continuously for 27 years. In March, 1899, he accepted the office he now holds, in which capacity he purchases all supplies for the Metropolitan system and takes general charge of their distribution to the several departments.

Mr. John J. O'Keefe, chief inspector, received his first experience in street railroading as a conductor on the old Kansas City Cable Ry., under the late M. K. Bowen. In 1889 Mr. O'Keefe was appointed chief inspector of the system and in 1890 was made claim agent, retaining both positions until 1892, when he went to Chicago to take the position of chief of special agents for the

Chicago City Ry. He was later appointed chief supervisor of that road, which position he held until 1900, when he again returned to Kansas City as chief inspector. Mr. O'Keefe was born in 1862 in New York City.

Mr. J. A. Harder, auditor and assistant treasurer, began work with the Metropolitan company in 1887, his first position being chief clerk in the auditor's office. In June, 1888, he was appointed auditor and cashier. Before going to Kansas City, Mr. Harder spent several years on the Pacific Coast in the employ of the Oregon Improvement Co. and the Columbia & Puget Sound Railway Co., at Seattle. He was born in 1855 at Logansport, Ind.

Mr. T. C. Hughes, chief draftsman in the civil engineering department, is a native of Plattsburg, Mo. He was born in 1859 and received a technical education at Liberty, Mo., and at the State University in Columbia, Mo. Mr. Hughes was associated with a number of experimental lines when electric traction was in its infancy, having been chief engineer of the Riverside & Suburban Ry., of Wichita, Kan., in 1887, and chief engineer of the West Side line in Kansas City, Kan., in 1889. Upon the completion of this latter road he became chief engineer for the Chicago & St. Louis Electric Railway Co., a corporation formed for the purpose of building a double track electric railway between Chicago and St. Louis, over which cars were to be operated at 100 miles an hour. When this project was abandoned he took up steam railroad work for a while, but a position in the engineering department of the Metropolitan Street Ry. offering itself he returned to Kansas City. In 1888, while engineer for the West Side Railway Co., Mr. Hughes visited and inspected all the then existing experimental electric lines in America.

Mr. C. W. Waddell, who has charge of the park properties and amusement features, was born in Gallipolis, O., in March, 1856, and spent the early part of his life in his native state. He went to Kansas City in 1878, where he spent eight years in the dry goods business and was afterwards connected with various corporate interests in the city. He has been engaged in park work for the past six years.

INTERIOR OF TUNNEL.

The East Side Electric Railway Co.

The only line in Kansas City not under the control of the Metropolitan Street Railway Co. is the East Side Electric Ry., locally known as the "Heim Line," running from the corner of Main and Fifth Sts. through the East Bottoms for a distance of three miles. On a portion of this route an experimental electric line was operated on the Henry system from 1884 to 1887, but was not entirely successful. From 1887 to 1892 steam dummies were run over the line, but these were also abandoned and the rails removed owing to lack of patronage.

In 1897, Messrs. Joseph J. Heim, M. G. Heim and Ferdinand Heim, owners of a large brewery and other property in the East Bottoms, recognizing the influence better transportation facilities would have on land values, determined to build a first-class electric line from Market Sq. into the district, and if necessary operate it at a loss until the region became more thickly populated. Accordingly a franchise was secured and construction work was commenced in June, 1899. The road was opened early in the present

stones of jasperite are laid on each side of each rail as on the other lines in Kansas City, to prevent the formation of wagon wheel ruts. There is one grade of 5.4 per cent for a distance of 300 ft., and one of 4.3 per cent for 1,800 ft.

The overhead work is span construction, with No. 0 trolley wire supported from 30-ft. wooden poles 8 in. in diameter at the top. The poles are set against the curb with oak plank, 4 x 6 in. x 3 ft., buried at the base under the curb line to keep the poles from displacing the curb stones. Trolley wire was furnished by the Roebblings company and overhead material by the Ohio Brass Co., through its local agent, the B. R. Electric Co.

The power station is at the northern terminal of the line and contains the following: One 350-h. p. simple non-condensing engine with double eccentric and cylinder 18 x 36 in. It was built by the St. Louis Machine Works. The engine is direct connected to a 10-pole 200-kw. Siemens & Halske generator which is guaranteed for 50 per cent overload for three hours. There is

ELECTRIC PARK ON THE HEIM LINE.

year, and, somewhat to the surprise of the owners, has paid not only operating and incidental expenses, but a considerable percentage on the money invested as well.

All of the construction work was carried on by the company itself under the supervision of Mr. W. O. Hands, the present general manager.

There are six miles of track, all laid with 6-in., 82-lb., Johnson center bearing girder rails, on best white oak ties, 6 x 8 in. x 8 ft., placed 26 in. c. to c. Joints were cast-welded by the Falk process and rails were cross bonded every 600 ft. with two No. 0 wires.

In preparing the roadbed, a track 16 ft. wide was excavated to a depth of 13 in. The bottom of this trench was rolled and a 3-in. bed of broken stone laid and rolled. The ties were then placed in position and ballasted with stone up to within 4 in. of top of ties, after which the rails were laid and the track surfaced and lined. The concrete was extended about 12 in. outside of each outside rail and up to 4 in. of the top of the rail. Most of the streets through which the line runs are paved with hard vitrified brick, grouted with imported portland cement grout. Tothing

also a reserve unit used for helping out on what is known as the park load. This unit consists of a 200-h. p. Armington & Sims engine with cylinder 14½ x 15 in., running at 260 r. p. m. and is belted to two T. & H. D-62 machines. For lighting the park owned by the company and operating an electric fountain, there is also one 200-h. p. Armington & Sims high speed engine belted to one 2,000-incandescent light, 110-volt, Siemens & Halske dynamo, and one 400-light, 110-volt, Edison machine.

Steam is taken at 120 lb. from one 350-h. p. and one 200-h. p. Heine boilers. Coal is Cherokee mill and on the average eight tons are consumed per day. The station is equipped with Crane valves.

One 450,000-c. m. feeder extends about one-half the length of the line. It then changes to a No. 0000 cable and continues to within one-half mile of the city terminal. Feeder taps into the overhead wire are made every 500 ft.

The company owns eight single truck open motor cars, and six double truck closed motor cars, the latter having been furnished under an order "to build the finest street railway cars that could

be made, regardless of cost." The short cars are mounted on McGuire No. 6 trucks with Westinghouse No. 3 motors, and the long ones on maximum traction trucks, with Westinghouse No. 49 motors. The rolling stock is equipped with Falk gears and pinions, the Grover trolley wheel, Meaker and Sterling registers, Consolidated electric heaters, sand boxes and Griffin 33-in. 350-lb. wheels.

All sand used on the system is dried in a steam dryer designed by Mr. Hands and for which application for patents has been made. The dryer consists of a box that may be built as large as desired, near the bottom of which is placed a coil of steam pipe heated by either exhaust or live steam. The sand is shoveled in at the top and gradually sifts down between the coils to the bottom, and is then removed by shovel or hoe through a small opening near the ground. This was the form first devised by Mr. Hands, but in service it was found that the steam from the moist sand condensed and dripped down on the dried sand below, defeating the purpose for which the contrivance was intended. When on the point of abandoning the scheme the inventor conceived the idea of placing a number of pipes in the interior to lead the steam arising from the sand adjacent to the coils at the bottom, up through the box and out at the top. This was tried and the dryer is now giving excellent results in every way.

Mr. Hands has also designed a rather novel bulletin board on which announcements are made to the employes. Referring to the accompanying sketch of the board, Webb is a regular motorman who has violated Sec. F, Rule 6, of the company's "Rules and Regulations" and has been laid off from the 6th to the 9th inst. Rodgers as the first extra man on the list is marked up to take his place. Oliver is sick and is replaced for the day by Rockhold. Biggs and Stewart are other extra motormen, and Duffy and Sinclair are extra conductors, who are marked up to take out extra cars to carry the evening traffic, Biggs and Duffy to take car 6, leaving at 5:30, and Stewart and Sinclair car 11, leaving at 5:40. Butchert and Harelson may be either over or short in their accounts, but do not know which until they call for their slips. Hedge is ordered to call at the office to answer for some misconduct.

The company employs 18 motormen and 18 conductors. The men are paid 17 cents per hour and average 11 hours per day.

The rules for employes on this road are very complete and quite voluminous. The following extracts will be of interest:

INTRODUCTION.

The trainman is a representative of the company to the public. The success and reputation of the road to a large extent, depend

Times of unusual danger require an unusual degree of care. Be cool and keep your head at all times.

CONDUCT OF TRAINMEN.

You must be temperate in the use of intoxicating liquors while in the service of the company. Be cleanly in your personal appearance and polite to passengers. Make use of no profane or improper language. Abstain from smoking, ungentlemanly conduct and unnecessary conversation with each other or with passengers when on duty. Employes of the company when off duty and using the cars must sit down on the inside of the car, when there are vacant seats, but they must not occupy seats to the ex-

Remarks - Attention of trainmen is again called to Rule 12. We will give our patrons much better service if this rule is strictly followed. W.C. Hands, Gen. Man.

BULLETIN BOARD.

clusion of passengers. Do not expectorate out of the windows or through the gates.

TOOLS AND NECESSARIES.

Motormen are required to have the following tools in a neatly painted box: A pair of cutting pliers; a medium-sized screw driver; an 8-in. monkey wrench; a 1/2-pint oil-can always filled with oil; a 10-in. file; a screw wire connector; some tape; four fuse wires; a 20-ft. piece of 1/2-in. new rope and two carbon motor brushes.

Conductors must supply themselves with the following: A good broom; a feather duster; some good soft clean rags or chamouis; some polishing compound; a punch and not less than \$2.00 in change.

The company will furnish the screw wire connectors, the tape, motor brushes, the broom, the duster, the polishing compound and the punch.

SIGNALS.

Conductor to motorman. One bell, stop at next stopping place. Two bells, go ahead. Three bells, stop immediately. Four bells, back up.

Motorman to conductor. One bell, come forward. Two bells,

POWER STATION AND CAR HOUSE.

INTERIOR OF POWER STATION.

upon his civility, his honesty, his good judgment, his tact and his ability to get along with all sorts of people.

While the road is intended and expected to be a source of profit to the company, it was built for the convenience of the public, and each employe should endeavor to make the service so excellent that the public will find the road worthy of patronage. In this way the interests of the company, as well as his own, will be best served.

going to back, watch trolley. Three bells, set the rear brake. Four bells, sand track from rear end.

Superintendent or assistant to motorman or conductor. Swinging arm or light slowly across the track, prepare to stop. Swinging arm or light rapidly across the track, stop immediately. Swinging arm or light slowly from head toward feet, move cautiously. Swinging arm or light rapidly from head toward feet, all right, go ahead. Swinging arm or light over head, back up.

STRAIGHTENING OUT BLOCKADES.

When a car has been delayed at any point for 15 minutes or more the cars will become bunched. After the cause of the delay has been removed the first car should proceed immediately. The second car should remain until two-thirds of the schedule interval has elapsed. That is, on a 12-minute schedule the second car should wait eight minutes before starting, and the remaining cars should do the same.

When a blockade occurs, passengers on the rear cars should be transferred to the forward cars.

FOG OR SMOKE.

During a fog or when there is heavy smoke in the streets, motormen will run slowly enough to be able to stop their cars within the

J. J. HEIM,
President.

M. G. HEIM,
Vice-President.

W. O. HANDS,
General Manager.

W. W. MORGAN,
Chief Engineer.

distance they can see ahead. It is much better to be behind time than to run the risk of an accident. During a fog the bell should be kept ringing almost continuously, and if a car should be delayed for any reason, the conductor must go back at least three poles and flag the following car.

INSPECTION OF EQUIPMENT.

Before starting out in the morning, it is the duty of the motorman to thoroughly inspect the trolley wheel, the motors and bearings, brakes, brake shoes and sand boxes.

SANDING HILLS.

Sometimes when the car is going up a hill the wheels will slip. If the conductor will then open the rear sand box and the motor-

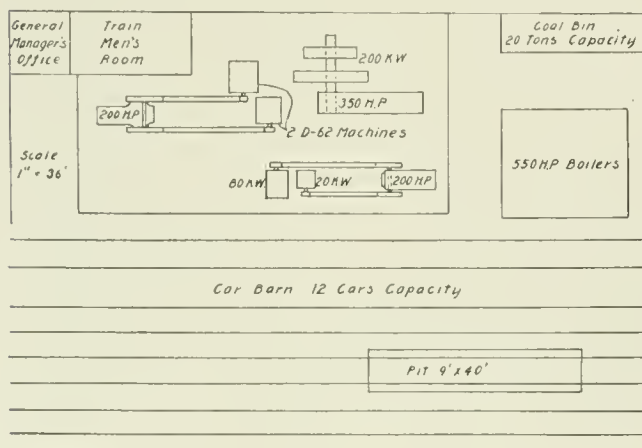

DIAGRAM OF POWER STATION AND CAR HOUSE.

man will permit the car to drop back on to the sand the car will often gather sufficient headway to climb the hill.

DAMAGE TO CARS.

Conductors will endeavor to obtain payment for glass broken or damages to cars caused by passengers or careless teamsters. If the guilty party refuses to pay take his name and address or his em-

ployer's name, and report the occurrence at the office. Side windows cost \$2.75 each, and end windows \$1.85 each.

To accommodate the patrons along the route the company does an incipient express business on the front platform. A trunk or large box is carried for 25 cents. A crate of berries or other small box for 5 cents. Lap dogs ride free and other dogs are carried on the platform for 5 cents each. Disabled bicycles when accompanied by the rider are taken on the front platform at a charge of 10 cents in addition to the rider's fare.

Transfers are interchanged with the Metropolitan Street Railway Co. at several points.

One of the principal features of the East Side Ry. is "Electric Park," which is located near the power house. This resort covers about 12 acres and is modeled somewhat after Sans Souci Park in

Chicago, which has been fully described in the "Review." The principal attractions are a well-built theater where vaudeville performances are given afternoons and evenings, an electric fountain, a cinematograph, bowling alleys, shooting gallery, pool tables, a ladies' orchestra and a beer garden which occupies one end of the grounds and is separated by a partition from the rest of the park. Great care is taken to preserve perfect decorum in the garden and the place is patronized by the best element in Kansas City.

Particular attention has been given to the lighting features. The fronts of the theater and other buildings are decorated with colored incandescent lights in artistic designs, tinted lights are scattered in the branches of the trees and in addition are lamps are placed at frequent intervals along the walks so that at night the place resembles the proverbial fairy land.

Admission to the park is 10 cents, and reserved seats in the theater are from 10 to 30 cents extra, depending upon the performance.

The resort has been a great success from the start, as is shown by the following statistics: From June 3 to Sept. 9, 1900, there were 273,700 people who paid admission into the park, and this number does not include 10,000 who entered on passes. During the last week an open air

SAND DRYER.

band concert and moving pictures were given and proved the best attractions of the season, 31,800 admission tickets being sold for the period. On the last Sunday, September 9th, there were 6,650 paid admissions. The electric road carried all of these people three miles with 14 cars without an injury to a passenger. It must be remembered when reading these figures that the entire population of Kansas City is but 200,000.

The officers of the company are: President, Joseph J. Heim; vice-president, M. G. Heim; secretary and treasurer, Ferd. Heim;

general manager, W. O. Hands; chief engineer, W. W. Morgan; electrical engineer, Harry Turner.

The Heim brothers, who own the East Side Electric Ry., "Electric Park," the Heim brewery and considerable property in the East Bottoms, are progressive business men in the fullest meaning of that term. They are sons of Mr. Ferd. Heim, who came from Germany in 1861, and after spending some years in St. Louis went to Kansas City in 1885, and recognizing the future possibilities of the city, determined to make it his home. He established the present brewery which has in later years been extended by the sons until it has become one of the largest institutions of its kind in the country. Mr. Joseph J. Heim was born in Germany in June, 1860. Mr. Ferd. Heim, Jr., was born Oct. 11, 1863, and Mr. M. G. Heim three years later.

Mr. W. O. Hands, general manager, has been identified with electrical and street railway enterprises for many years. From 1887 to 1890 he worked in the various departments of the Brush Electrical shops at Cleveland and was then employed by the Short Electric Co. For the next few years he supervised or assisted in the installation of street railways in Muskegon, Mich.; Rochester, N. Y.; Baltimore, Washington, D. C., and Beaver Falls, Pa. In 1894 Mr. Hands went to Kansas City and was made superintendent and purchasing agent of the Northeast Electric Ry., which is now owned by the Metropolitan Street Railway Co. In 1897 he became associated with the East Side Electric Ry., first as constructing engineer, then superintendent and finally general manager.

EARLY ELECTRIC RAILWAY EXPERIMENTS IN KANSAS CITY.

BY J. C. HENRY.

In 1884 and 1885 the writer constructed in the suburbs of Kansas City, an overhead wire electric railway which so far as he knows was the first trolley road built in the United States. Previous to that time a number of Kansas City capitalists had become interested in electricity as a means of propelling street cars and enough money was subscribed to build a short road on the Henry system.

J. C. HENRY.

Mr. W. H. Holmes then president of the Kansas City & Westport Horse Railway Co. offered the use of an old horse car and a section of track between the Kansas City Fair Grounds and the town of Westport, and also contributed financially towards the experiment. The road was equipped during the winter of 1884-85. We suspended a pair of hard drawn copper wires of No. 1 gage over the track at an elevation of about 14 ft. from the ground. This wire was supported from the brackets and span wires by thin metal straps, which left the underside of the trolley wire smooth providing an unobstructed runway for the trolley, which was a small carriage having grooved horizontal contact wheels which ran along and gripped the underside of the wire. The trolley was connected to the car by flexible wires leading from a pole or mast on the car roof, the object being to provide a flexible connection at all times with the wire which in several places was a dozen feet to one side of the track.

Our car was an open summer one with seats down the center facing outward. This construction permitted the motor to project up through the floor onto the front platform. The motor was of a machine similar to the generators which Mr. C. J. Van Depoele had used for arc lighting. It was supported in an iron frame with speed changing gearing somewhat similar to that used in lathes. The frame at one end had a bearing on the car axle, and was spring supported at the other. The motor was regulated with a rheostat.

The generator was a 10-light Van Depoele machine. The track rails which had been down a dozen years weighed but 12 lb. per

yd., so that our attempts at fast speed were usually followed by the car landing on the inside of a neighboring hedge or at the roadside. As we had connection with both wires and could change the gearing so as to get a tremendous leverage we were usually able to get back onto the track again.

In 1886 I converted the East 5th St. horse line in Kansas City (now the Heim line) to electric traction. The road did not have sufficient business to justify cable construction and its grades were too steep for animal power. The street was narrow and given over to heavy trucking and teaming. After the first day's operation I was badly discouraged and afraid we would have to give up. Many of the horses on the street went wild and during the afternoon it was necessary to carry police officers on the cars to go to the assistance of the drivers. The following day there was considerably less teaming on that thoroughfare and although the horses soon became accustomed to the cars, we were still bothered with teamsters who took great pleasure in blocking our way. I instructed the motormen to scare such fellows but to be careful not

EARLY OVERHEAD TROLLEY CAR IN KANSAS CITY, 1884.

to hurt them. As I remember them the results were often amusing. We soon had a free way and made good time.

This road had span wire, feeder and curve construction similar in many respects to the general types of today. The motors were operated from constant potential compound wound generators, arranged for 500 volts potential. When planning the station I hesitated whether to use high speed engines or to purchase a large second-hand slow speed throttling engine, and to control the latter with an electric governor which seemed easy to do. Our president, Mr. W. W. Kindall, favored the former and they were purchased. I have often wondered since that time that electric governors have not been used.

On the East 5th St. line we had four motor cars. The motors which we made ourselves in Kansas City were slow speed machines, and had 18-in. armatures with projecting teeth. Fields were wound with a lot of small wires in parallel. The resistance of the field was varied by coupling the wires together on a switch. The motors were connected to the car axle through a differential gear very similar to those now commonly used on automobiles. The armature ran continuously and was thrown into gear by a clutch.

As I look back to these early experiences I wonder how we ever pulled through. Keeping up our own courage and that of the men interested with us in the face of the most disheartening conditions, running cars in the day time and at night tearing them to pieces to get at some small defect, this was the program for years. But we lived through it and demonstrated the truth of our theories.

The report to the stockholders of the Consolidated Traction Co., of Pittsburg, for the month of August, 1900, shows gross receipts from operation, \$240,935; operating expenses, \$109,132; net earnings from operation, \$131,803; total net earnings and other income, \$159,788; surplus after deducting interest and dividends on preferred stock, \$8,906. For the five months of the current fiscal year the surplus is \$44,330, as against a deficit of \$4,107 for the first five months of the preceding year; this notwithstanding an increase in the dividends on preferred stock of nearly \$12,000 per month.

PERSONAL REMINISCENCES OF EARLY CABLE STREET RAILWAY WORK IN KANSAS CITY, MO.

BY E. J. LAWLESS.

The work of construction on the Kansas City Cable Ry. was completed in the spring of 1885, at which time the writer was engaged to come from San Francisco and take charge of its operation. This was the fourth city in the United States to operate street railways by cable propulsion and one of the first cities to depart from the regular practice in vogue in San Francisco, the cradle bed of cable roads, the result being novel, startling, but hardly surprising to an experienced man, with the final culmination of being obliged to change to San Francisco methods which should not have been departed from in the first instance.

The grades in Kansas City are numerous and as a whole very steep, one in particular running from the "Bluffs" to the "Bottoms" called the "Incline" (mostly trestle work) having a rise of 18½ ft. per 100 ft.

The cars were closed, single truck, vestibuled ends, having the grip hung between the axles, and operated by a wheel attached to a staff with hardly sufficient power to pull a baby carriage, to say nothing of hauling a car load of passengers. To overcome this obstacle a worm gear was attached to the grip staff which helped to further demonstrate the inefficiency of the grip. I shall never forget the first trip made over the road. The schedule time for the journey was 45 minutes, but we made it that day in about four hours. How the car ever managed to climb the Incline is still a mystery, but the writer can yet hear the echo of the sigh of relief from the occupants, when the top of the hill was reached.

E. J. LAWLESS.

A peculiar incident occurred in laying the track on this road, and who was responsible for the error could never be found out, but the rails were laid about an inch too far apart, with the result that the car wheels had a bad habit of dropping off the track on one side, which usually resulted in an argument between persons on either side of the car, one insisting that the wheels were off the rail, while the person on the opposite side thought the other either blind or a fool. It came about this way: The maker of the gage allowed for the play of the wheels. The contractor did the same. The track layer followed suit and the truck maker adopting the regular practice at the time of allowing this play, the results were as stated. Of course the rails had to be relaid to gage.

The double cable system was adopted, but with a city like Kansas City, having heavy grades and numerous curves, the cables were always interfering, so much so that when the reserve cable was wanted it was found to be in sections and absolutely useless. Another serious obstacle was the difficulty of getting trained gripmen. We got a few from Chicago, but as they were not experienced in operating cars on grades, they were not much better than green men.

Having fully demonstrated the utter impracticability of the original grip adopted; through the kindness of Mr. C. B. Holmes, then superintendent of the Chicago City Railway Co., a grip similar to that in use in San Francisco was borrowed. This grip demonstrated its superiority over the other by pulling the platform off the first trailer when hauling six cars up a heavy grade.

After three months of the hardest kind of work to perfect the system, a grand opening was given the public, with the privilege of riding free the first day. A grip car with two trailers containing the officials of the road and many prominent citizens led the van. Everything went well until we came to the head of the Incline. Here a stop was made preparatory to starting over the bluff. To many on the cars, that grade looked like a plunge down a cliff. When starting from the level down the steep grade the cars naturally give a heavy lurch. That was enough that day. In less

time than it takes to tell, only two were left on the train, one the gripman, the other the brakeman. It was on that occasion that a prominent citizen made his famous leap, the record for which has never been equalled in that district.

It would take too much time and space to relate the troubles and tribulations of the first few months of operation. As the men got experienced the system ran smoother, with the ultimate result that the financial success of the enterprise was so pronounced (net earnings 30 per cent for the first year), a regular epidemic of cable roads started throughout the city. I wish to state here that too much credit cannot be given to Mr. W. J. Smith, then president of the Kansas City Cable Railway Co., for his pluck in putting his hand down in his pocket and furnishing the money (about \$100,000) to make the changes necessary to success, in the face of adverse conditions and when financial aid was refused elsewhere.

The next cable move in Kansas City was the purchase of the Corrigan horse car system by a Boston syndicate, and a conversion of those lines to cable. No doubt many have still vivid recollections of their early experiences with the Corrigan horse cars, 10-ft. bobtails, with mules inured to all kinds of service. The tracks (what there were of them) were single with turnouts. These turnouts were, however, superfluous, as when the cars met, one simply turned towards the gutter and traveled along until it struck the track again. This, however, did not trouble the public any, as it was difficult to tell if the cars were on the tracks or not. The first step the Boston syndicate took was to have these cars washed, and it is said the price of soap in Kansas City advanced for the time being in consequence. During the conversion of the Corrigan system the Grand Ave. and Westport lines were also changed to cable, and this was followed by the construction of the 10th St. cable road, which paralleled the lines of the Kansas City Cable Railway Co., and proved immediately on its completion and operation that cable roads in Kansas City had been overdone. In a period covering little more than two years, about eight millions of dollars had been invested in the various systems throughout the city.

The cable craze ended in a grand flourish with the construction of a cable road in the northeast part of the city, under the Terry patents. This was to prove a revelation in economy of construction, and it did so, with a vengeance, as few working on its construction or furnishing material got any money; about \$50,000 actual cash paid represented an expenditure of \$250,000. The grip was constructed to occupy little space in the conduit and the cable was grasped by a series of perpendicular steel rollers placed loosely in the jaws which were tapered at each end.

After numerous delays and tribulations a start was effected, and only one trip made over the road. Such an experience has rarely if ever been equalled. The rollers in the grip jaws made a noise like a threshing machine, and when they did succeed in gripping the cable, the car shot forward with a jerk sufficient to throw you off your feet. In fact the entire trip was a series of jerks and jumps, the rollers slipping from one end of the jaws to the other. On the completion of that trial trip every creditor made a rush for his money. Liens were filed and suits instituted to such an extent that for years that road stood as a monument to the folly of the enterprise.

Too much tribute cannot be paid to the citizens of Kansas City for the hearty co-operation accorded the success of the roads. They quickly recognized what an important factor the cable system was in the development of their city, and did everything in their power to foster and encourage it. There is no portion of his life on which the writer looks back with greater pleasure than on his street railway experience in Kansas City.

“ALONG THE WAY.”

Under the foregoing title the Rapid Ry., of Detroit, has issued a handsomely printed and illustrated brochure telling of the charms and beauty and the opportunities for healthful enjoyment which are found along its line. The cover of the pamphlet is a startling poster effect in yellow and green. This company has also published a time table which is gotten up in the shape of a folder similar in every way to the form usually adopted by steam roads, with a lithographed map of the system, a description of the cars and route, and connections made at each station with other electric lines, steam roads and steamship lines.

CONVENTION PROGRAMS.

The papers before the American Association are:

"Double Truck Cars; How to Equip Them to Obtain Maximum Efficiency Under Varying Conditions." By N. H. Heft, president Meriden Electric Railroad Co., Meriden, Conn.

"Comparisons of the Various Systems of Electrical Distribution for Street Railways." By C. F. Bancroft, electrical engineer Massachusetts Electric Companies, Boston, Mass.

"Consolidations of Street Railways and Their Effect Upon the Public." By Daniel B. Holmes, counsel Metropolitan Street Railway Co., Kansas City, Mo.

"The Storeroom and Storeroom Accounts." By N. S. Hill, jr., general manager Charleston Consolidated Railway, Gas & Electric Co., Charleston, S. C.

"Painting, Repainting and Maintenance of Car Bodies." By F. T. C. Brydges, superintendent of car shops, Chicago Union Traction Co., Chicago, Ill.

Friday, October 10th, has been set apart as a day for examination of the exhibits. No session of the Association will be held, so that all may have plenty of time to view the exhibits. It is earnestly requested that managers have their heads of departments present on that day.

INTERIOR OF CONVENTION HALL.

A complete list of the cities where the conventions have been held and the presiding officer is as follows:

- S. H. Velie, Treas., John Deere Plow Co.
- Jas. A. Reed, Mayor.
- Lathrop Karnes, K. C. Electric Light Co.
- Harry Friedberg, Div. Supt. K. C. Electric Light Co.
- Hugh McGowan, Pres. K. C. Gas Co.
- W. H. Lucas.
- Mrs. C. F. Holmes.
- Mrs. G. T. Stockham.
- Mrs. W. H. Holmes.
- Mrs. W. A. Satterlee.
- Mrs. W. E. Kirkpatrick.
- Mrs. A. M. Crow.
- Mrs. J. H. Durkee.

The entertainment committee announces the following program:
 Tuesday night, reception at Midland Hotel.
 Wednesday afternoon, trip to Armour Packing Houses.
 Wednesday night, theater party.
 Thursday afternoon, trip to Ft. Leavenworth.
 Friday, examination of exhibits.
 Friday night, banquet at Coates House.

OFFICERS ACCOUNTANTS' ASSOCIATION.

President, C. N. Duffy, auditor Chicago City Railway Co., Chicago, Ill.
 First Vice-President, William F. Ham, comptroller Washington Traction & Electric Co., Washington, D. C.
 Second Vice-President, W. G. Ross, comptroller Montreal Street Railway Co., Montreal, Can.
 Third Vice-President, Edwin M. White, cashier Hartford Street Railway Co., Hartford, Conn.
 Secretary and Treasurer, W. B. Brockway, assistant secretary and auditor New Orleans & Carrollton Railroad Co., New Orleans, La.
 Executive Committee, the officers and—
 John F. Calderwood, auditor Twin City Rapid Transit Co., Minneapolis, Minn.
 C. K. Durbin, ex-superintendent Denver City Tramway Co., Denver, Col.
 C. L. Wight, auditor Toledo Traction Co., Toledo, O.
 C. O. Simpson, auditor Augusta Railway & Electric Co., Augusta, Ga.

A list of the cities where the Street Railway Accountants' Association has held meetings and the presiding officers is as follows:
 Cleveland*Morris W. Hall, Chairman..1897
 Niagara FallsC. N. Duffy, Vice-President..1897
 BostonH. L. Wilson1898

 *Deceased.

MORTUARY LIST SINCE LAST CONVENTION.

The list of prominent street railway men who have died since the convention in Chicago a year ago comprises:

Philip T. Begley, superintendent of the Lowell (Mass.) & Suburban Street Ry. December.
 Capt. Thomas H. Browne, secretary and treasurer of the Havana Street Railway Co., and previously connected with the street railways in Boston and with the Metropolitan Street Railway Co., New York. December.
 Charles R. Brown, manager of the railway department of the Michigan Malleable Iron Co., and previously connected with the Illinois Steel Co. Detroit, March 11th.
 Joseph H. Brown, formerly a director of the Lowell (Mass.), Lawrence & Haverhill Street Ry. Lowell, March 26th.
 John R. Bullard, for years a director of the Norfolk Suburban, West Roxberry, Roslindale and Norfolk Central companies. Boston, March 16th.
 William Bacon Crittenden, vice-president of the Duplex Car Co., of New York. Brooklyn, June 6th.
 Isaac Engle, chief engineer of the City Railway, Dayton, O. June 14th.
 Dr. E. J. Finney, a well-known inventor of electrical devices. Fox Lake, Wis., December 19th.
 Allen Follick, master mechanic of the Oakwood Street Railway Co., Dayton, O. March 14th.
 Robert F. Fox, general manager of the Wilmington (Del.) & Chester Traction Co., Meadville, Pa. November.
 James H. Frothingham, for many years treasurer of the Kings County Elevated Railway Co., and later receiver of that line. Brooklyn, April.
 Lieut. S. Dana Greene, general sales manager of the General Electric Co., drowned in Mowhawk River at Schenectady, N. Y., January 8th.
 Capt. C. E. Hall, for many years connected with the Chicago City Ry. Chicago, October 26th.

Hon. Garrett A. Hobart, vice-president of the United States and president of the Paterson (N. J.) Railway Co. November 21st.

John Quincy Adams Hoyt, one of the promoters of the elevated railway system in New York. January 12th.

George C. Herschell, treasurer of the Armitage-Herschell Co., North Tonawanda, N. Y. January 11th.

A. S. Hallidie, the inventor of the cable street railway system. San Francisco, April 25th.

G. E. Herrick, a promoter of the first street railways built in Cleveland. New York, May 28th.

John Love, the patentee of the Love underground conduit system. March.

W. K. McAllister, superintendent of the Atlantic City (N. J.) Ry. January.

John McLeod, receiver of the New Albany (Ind.) Street Ry. Louisville, Ky., January 22d.

Gen. John McNulta, receiver of the Calumet Electric Street Railway Co., of Chicago. Washington, D. C., February 22d.

Frank O. Mason, superintendent of the New Castle Traction Co. and the New Castle Electric Co., of New Castle, Pa. March 22d.

Dr. Truman W. Miller, surgeon in chief for the Chicago Union Traction Co. May 21st.

F. J. O'Donoghue, superintendent of the Nashua (N. H.) Street Ry. November 10th.

John D. Oxner, connected with the street railways in New York City. Rome, N. Y. December 21st.

Cornelius Pierpont, who built some of the horse car lines now forming part of the Fairhaven & Westville Electric system. New Haven, Conn., March 20th.

Salvator Potis, chief engineer of the West and North Chicago Street Railroads. Chicago, April 17th.

William R. Prall, paymaster of the Staten Island (N. Y.) Rapid Transit Co. March 19th.

Addison C. Rand, president of the Rand Drill Co. New York, March 9th.

J. R. Rand, July 18, who shortly before his death succeeded his brother, Addison C. Rand, as president of the Rand Drill Co.

Herbert A. Reeves, of the Manville Covering Co. of Chicago. California, January.

Bernard M. Shanley, president of the Consolidated Traction Co., of Jersey City, N. J. Newark, March 19th.

George E. Newlin, formerly treasurer of the West Chicago Street Railway Co. and later associated with the Chicago Union Traction Co. April 2d.

George T. Smith, secretary and cashier of the San Mateo & San Francisco Electric Ry. June.

Winfield Smith, connected with the early street railways of Milwaukee. London, England, November 8th.

H. J. Termohlen, chief electrician of the Rockford (Ill.) Railway, Light & Power Co. Freeport, Ill., May 15th.

Frank Tryon, jr., superintendent of the Huntington (N. Y.) Street Railway Co. January.

V. C. Turner, formerly president of the North Chicago City Ry. Chicago, December 2d.

J. H. Vanderveer, superintendent of the shops of the Brooklyn Heights Railroad Co. Bay Ridge, N. Y., December 3d.

Russell Wiley, electrician of the Kankakee (Ill.) Electric Railway Co. August 13th.

F. W. Wood, manager of the Los Angeles Railway Co. California, May 19th.

I. A. Kelsey, a director in several New England street railway companies. September 24th.

STREET RAILWAY MEN IN POLITICS.

Among the street railway men in politics whose names we now recall are:

M. A. Hanna, president of the Cleveland City Railway Co., who served as chairman of the Republican National Committee in 1896 and this year was again chosen by Mr. McKinley to manage his campaign. Mr. Hanna's career in politics is quite remarkable; prior to 1896 he was known only as a successful business man and his first public office was that of United States Senator from Ohio to which he was chosen in 1897 when Senator John Sherman resigned to enter the cabinet.

OFFICERS OF THE STREET RAILWAY ACCOUNTANTS' ASSOCIATION OF AMERICA.

W. F. HAM,
First Vice-President.

C. N. DUFFY,
President.

W. G. ROSS,
Second Vice President

E. M. WHITE,
Third Vice-President.

W. B. BROCKWAY,
Secretary and Treasurer.

J. F. CALDERWOOD.

C. K. DURBIN.

C. L. WIGHT.

C. O. SIMPSON.

Henry C. Payne, vice-president, of the Milwaukee Electric Railway & Light Co., has long been active in state and national politics and this year is vice-chairman of the Republican National Committee.

M. S. Quay, lately United States Senator from Pennsylvania, is a director of the New Castle Traction Co., of which his son, R. R. Quay, is vice-president.

C. L. Magee, president of the Consolidated Traction Co., of Pittsburg, has for years been a member of the state senate and is a political power in Allegheny County.

Thomas Lowry, president of the Twin City Rapid Transit Co., of Minneapolis, is active in state and national politics though he has not aspired to office.

E. F. C. Young, president of the North Jersey Street Railway Co., has served as presidential elector and as state railroad director.

David Young, vice-president of the North Jersey Street Railway Co., was president of the Jersey City Council for four years and served also in the New Jersey Legislature.

John D. Crimmins, who is a director of the North Jersey Street Railway Co., of Jersey City, and was for several years president

of the Metropolitan Street Railway Co., of New York, is prominent in Tammany Hall. Mr. Crimmins has for many years been a contractor, much of his work being street railway construction: he built the Broadway cable line in New York.

E. P. Shaw, for several years treasurer and receiver general of Massachusetts, has been interested in many of the interurban lines of New England, and is a partner in the firm of James F. Shaw & Co., which has built many of these roads.

Arthur Kennedy, president of the Indiana Railway Co., South Bend, Ind., has served in the Pennsylvania Senate but is now out of politics.

John F. Hill, governor-elect of Maine, is secretary of the Norway & Paris Street Railway Co., Norway, Me.

Edward Louderbach, who was largely interested in the Third Avenue Railroad Co., of New York City, is a prominent Republican politician.

Hugh J. Grant, ex-mayor of New York, was early in the year receiver of the Third Avenue road and the allied companies.

L. E. Magann, ex-congressman, and now Commissioner of Public Works of Chicago, was the successful promoter of the Chicago General Railway Co.

the criticism mentioned, but in each of these cases the causes are found to be very unusual. Seldom do such fires as burned the ocean liners at their docks, occur; seldom also do conditions arise as have prevailed in China the past three months.

The steady tendency has been and will continue to be in favor of more and more safeguards in the operation of our cars. Our tracks, and cars and apparatus are better than ever before, and in the hands of more skilled operators than five years ago. In the interurban service, where the two most serious accidents of the year occurred, the operation has been with a remarkable freedom in the aggregate from accidents and fatalities. Telephone and automatic signal systems, air brakes, are headlights, good roadbed, all these insure the largest degree of safety to the passenger. Even when an occasional car has left the track through some unpreventable cause, the present construction of the car body is such that unless it suffers a long drop, the occupants receive little more than a jolting.

The almost universal use of side bars, or their equivalent, on open cars running on double tracks, has made a notable difference in the number of injuries formerly incident to the use of summer cars. The growing tendency also toward long open cars on double tracks in place of the short cars, reduces the work of the conductor and by seating passengers who would otherwise ride on the foot-board lessens the number of injuries arising from personal carelessness of the victim.

What the daily press is pleased to term high speed, is by no means dangerous if conducted under our present improved methods; on the contrary fewer passengers are hurt in getting off the car as they are content to wait until it stops when moving at high speed, instead of taking the apparently slight risk of jumping from a car going say six miles an hour.

The railway managers of the country are most certainly alive to their responsibilities and will neglect no opportunity to avail of every possible means which can make for the safety and comfort of their passengers. Of these things, however, their practical experience makes them far better judges than editors of daily press or the average legislator.

In a certain western city the old settlers were planning a grand celebration and reunion. It was intended to make the event one which would attract people for miles around, and possibly some from distant portions of the state. Celebrations, as our readers are not unaware, cost money, and this money must be raised by "voluntary contributions." The street railway in the place was requested to chip in, and did so by planking down \$500 in cold cash. Thereupon the local press, which stands to make a great deal more out of the event in paying contracts for extra advertising, attacks the company for what it calls a "niggardly," "beggarly" contribution. One paper even intimates if the company paid all the bills, that it would be nothing to mention.

But why, in all reason and fairness, should the street railway be held up for \$5,000 which is the minimum amount which the editor has decided the company should pay? Steam railroads, hotels, restaurants, and business of every kind will expect to derive a good profit from the scheme and the influx of visitors. They should all pay their share, and simply because the street railway is easy to reach and in the public eye is no reason why it should be held up. The probability strongly is that if the others named paid in the same proportion of their anticipated receipts the company's proportion would not be one-half the amount it has given.

A street railway management is justified in chancing a certain sum on the expectation of increased revenue growing out of a special occasion, but the earnings created by the special event are by no means all profit. Indeed the experience of not a few managers has made them feel like paying something not to have the celebration. The extra cost for labor, the time and money lost by blockades from marching bodies, the damage to cars from overloading; and by no means least, the frequent damage claims from people who are injured by reason of not knowing how to use a car, or getting hurt while intoxicated: all these combine to constitute conditions which the subscription committees fail to take into account. The receipts from 100,000 extra passengers,—and this number constitutes the entire population of a large city—is only \$5,000, and a bad accident to one passenger is liable to cost this amount plus the court expenses.

Street railway companies with possibly a very few exceptions, indeed we do not call any such to mind,—are liberal contributors to

all public movements, and we are convinced that were the truth known it would be found the street railway does far more than its share at such times. It is proper, however, to explain these conditions to subscription committees who perhaps in the absence of such information may feel disappointed where they should be satisfied with the contribution.

"How shall I administer a reprimand?" is a question that frequently confronts the manager and it is one that oftentimes requires a deal of careful thought, for a reprimand unjustly or too harshly given, nine cases out of ten, makes a dissatisfied employe who down in his heart will never forget what he looks upon as an insult, and he will grasp the first opportunity of getting square. A little group of such employes means before long unions, grievance committees and a generally unsatisfactory relation between company and men, and it sometimes means a strike. On the other hand, if the boys get the idea that the "Old Man" is easy and that a "walk on the carpet" signifies nothing more than a pleasant chat and some good advice, the general discipline on the road drops to a low standard and accidents, and complaints from the public will surely follow.

We have heard the point made that it does not pay to warn employes; that the company should have but few rules and when those rules are violated in any degree, suspensions or discharge should follow. This practice would perhaps be a good one if the road is to be run on the theory that the men are machines, and in exchange for their wages must do their work as accurately and well as a machine or give way to others. But we believe the country's largest employers of labor now go on the principle that it is far better, for business reasons alone and aside from humanitarian ideas, to deal with their men, as such, giving them full opportunity to clear themselves of any charge, showing them leniency when there are extenuating circumstances and letting them feel that the management has the welfare and prosperity of its employes in mind.

How then is the best way to deal with a man who has been guilty of some slight infraction of the rules, as missing a fare, running by people who wish to ride or some other small offense that in the first or second instance does not require severe punishment. We believe there is a way of so speaking to an employe in a case of this nature that the man will recognize his fault and the possible consequences without getting "sore" against the company. It is better to keep the good will of every man on the road if it can be done without sacrificing discipline and the rights of the stockholders or the public, and it is even permissible to wink at trivial offenses at times, rather than make an enemy in your employes' ranks.

The best reprimand we ever heard was given recently in the office of one of the largest street railway systems in existence. A motorman had been told to report to the manager, an inspector having stated that the man was in the habit of not stopping for passengers whenever he was a trifle late. The manager turned as the motorman entered and remarked, "Good-morning, James, you ran by three passengers yesterday on your afternoon run. What have you to say in regard to the matter?" The man replied, "Well, sir, I was behind my schedule and I didn't really see the people until it was too late to stop." "All right, James," the manager replied, "but you know we are in the business of carrying passengers, James, that is all, good-morning." The man was heard to remark as he passed from the building, "The super is all right." The motorman had recognized his fault, and its effect on the company, and he felt he had been treated fairly and squarely, and the chances are that he will never again be guilty of the same offense, for he also understood from the manager's tone of voice and actions that on the next occasion he would not get off with simply a warning. It should be added that this general manager always addresses his men by the first name on occasions of this kind, and if he can not keep the name in mind, he obtains it from the payroll just before the man is ushered in.

The subject may be summed up as follows: It is better not to lay a man off when a reprimand or warning will secure the desired result. Show the employe in as few words as possible how his offense injures the company's business and appeal to his judgment and manhood. If he has no manhood to appeal to, discharge him at once. Let the man understand by manner and voice, that the management is in earnest and will brook no trifling, and always live up to your promises of rewards or punishments.

Conditions of Operation of Street Cars in the City of Quebec.

Read before the Canadian Electrical Association by D. E. Blair, Electrician Quebec Railway, Light and Power Co.

Of all financial undertakings, none perhaps depends more upon the nature of local conditions than does the successful development of a city street railway system, and for this reason it may be of interest to give a more or less general description of the difficulties encountered and overcome by those responsible for the development of the Quebec street railway.

PHYSICAL FEATURES.

Quebec, as a city, has many distinctive features that are not to be found in any other city in America, and the stranger within its fortified walls is very soon struck with the unique fashions, methods and temperament of the quiet people who make up what may be called the native population, numbering about 75,000, and of whom about 65,000 are French-speaking. When the construction of the road was first contemplated by those responsible for the promotion and fulfillment of the scheme, there existed certain unpromising conditions which tended to arouse the doubts of many as to the feasibility and possible financial success of the enterprise. Of these I might mention a few at random. Business in general is carried on in a very quiet and matter-of-fact way, and an observant critic does not notice the hustle and bustle so common in most modern cities of this continent. The salary of the clerk and the wages of the laborer are moderate, and the average individual very seldom appears inclined to do any more than he is paid for. The natural result of this was that the electric street car could not be looked upon as a valuable and indispensable time-saver, as well as a welcome convenience, but rather as a luxury to be enjoyed by those who could afford it.

The manufacturing interests of the city are limited and further development along this line is hindered by the conservatism of capital. Further, the average laborer or even expert workman is the proud possessor of a large family, several of whom are perhaps engaged in the same work as himself, and he finds it convenient and economical to live near his work, as rents in the manufacturing districts are very reasonable. The city is very compact and densely populated; furthermore, it is divided into certain sections which are practically self-contained municipalities. Public entertainments and social functions were very little appreciated or patronized, and the principal streets seemed almost deserted after 9 p. m. Although these conditions may have no direct bearing on the practical expenses of construction and operation, they were certainly not in favor of the credit side of the prospective railway company's cash book.

The more formidable objections, however, were of a practical nature. Five years ago, and even less, it was considered impossible that anything that looked like a street car could ever climb the steep, narrow and winding thoroughfares that lead from the water's edge to the highest points of the mass of solid rock upon which the city is built. Besides this the heavy snowfalls and the narrowness of the streets were likely to be a great hindrance to the service, but in spite of everything the road was completed, and it has now been proved that the limiting conditions of street railway operation were not overstepped in the bold undertaking which has given the people of Quebec a reliable and efficient means of transportation. The city has improved wonderfully since the opening of the road, and promises to become, before long, as wide-awake and progressive a center as any in the country. Even theatrical entertainments have become more or less popular, and everything seems to be moving at a faster pace than heretofore.

On Nov. 1, 1896, was commenced the laying of the rails through the main streets of the city, and on July 1, 1897, the road was opened to traffic.

The track is of standard gage; the rails are of steel, 72-lb., 6-in. T-section, in 30-ft. lengths, and were made by Cammell & Sons, England. The ties are 7 ft. long and spaced 2 ft. c. to c. Each joint is bonded by two No. 00 solid copper wires in "Eclipse" copper bonding caps made by the Ohio Brass Co.; these are tinned and ends of wires riveted on outside of rail. Double cross bonds were placed at every fifth joint, 150 ft. apart. There are 7.28 miles of single track and 5.14 miles of double track, a total of 17.56 miles.

Tubular poles 28 ft. long, weighing 700 lb., and spaced 90 ft. apart, are used throughout for the overhead construction. The insulation is of the "Dirigo" type, and the trolley wire is No. 00 hard-drawn copper. The span wires are of stranded galvanized steel three-eighths of an inch in diameter. Lightning arresters of the Wurts non-arcing type are used. All construction is pleasing in appearance and of a substantial nature. Altogether there are 10 miles of span wire construction and 2½ miles of bracket.

There are two car sheds—one in Upper Town, 210 x 120 ft., having 14 tracks and 7 doors, where all cars in service are housed at night, and the other in Lower Town, the latter being used for storage purposes only. The capacity of the working car shed is 52 cars, and here all repairs are made. There are seven floored pits communicating with the machine and blacksmith shops underneath.

When the road was built all streets without exception were covered with a generous layer of macadam. Within the last two years, however, a great improvement has been made in this respect on nearly all the streets through which the lines run. All macadam was removed to a depth of about 12 in., leaving the ties completely exposed, and these were then filled in with concrete to within about 4 in. of the top of the rail. The facing of the new pavement through the city now consists of scoria blocks between and 8 in. beyond the rails, while the remaining strip of roadway is filled either with asphalt, asphalt brick or scoria blocks, according to the grade of the street.

In Upper Town, the residential district of the better class of people, the streets were nearly all wide enough to permit of a double track, but even here it was found necessary to run through certain sections on single track. Lower Town, the business section of the city, is a semi-circular strip of ground of varying width and practically level, which is surrounded on the outer edge by water, and lies beneath the cliffs which mark the boundary of Upper Town. Here the lines are all single track with the exception of one section where two parallel streets converge into one wide street one-quarter mile in length. The main street which runs through the entire length of this section is about 2½ miles long and is so extremely narrow in places that there is hardly room for an ordinary vehicle to squeeze past on either side of a car on the single track in the center of the street. The return line is through a maze of narrow and unsymmetrical side streets which seem to run in almost any direction until they form a junction, at an oblique angle, with one of the larger arteries, thereby losing their identity.

On one section of the line, one mile in length, there are no less than eleven curves of from 35 to 40 ft. radius at intersections of about 90 degrees, and one that requires a reverse curve of 40 ft. radius. On all these streets the inner rail is placed within two feet of one sidewalk in order to leave room for single vehicles to pass a car on the other side.

The Upper and Lower Town lines are connected by two cross-town lines which ascend obliquely along the face of the cliff. One of these, the Green Line, runs through the public thoroughfare, which, though very steep, is yet practicable. The actual length of this line is 3,440 ft. and the difference of level between junctions is 172 ft., which is equivalent to an average grade of 5 per cent. The total length is made up of sections of 200 ft. 12½ per cent, 100 ft. of 10 per cent and 600 ft. of 9.5 per cent grades, the rest of the line being nearly level. All these grades have sharp curves in their length, but the most difficult to operate is the first, which begins to rise at a gradient of 11½ per cent and terminates at 14.15 per cent. There is a 40-ft. radius curve at the top, of which one-half is on the heaviest part of the grade.

The second cross-town line runs for a distance down Palace Hill on an average grade of 11 per cent and then turns off the public street at an angle of 90 degrees onto a steel trestle which runs parallel with the face of the cliff on a gradient of 7.5 per cent for 800 ft. The total length of this line is 1,300 ft. with average gradient of 6.85 per cent and a maximum of 12 per cent, the difference of level being 89 ft. One disadvantage in the operation of

this line is that when a car leaves the trestle to take the 11.5 per cent grade it is running at half speed and must be accelerated on the grade. This means a very heavy load on the motors for the first fifty feet of the climb.

CAR SERVICE.

The Upper Town system consists of a double belt line, 3½ miles in circumference, with from 4 to 7 cars running in each direction on a headway of four minutes in summer and five minutes during the winter. Schedule speed on all lines is approximately eight miles per hour. Except for a few short stretches of level the total length of this belt is on streets having gradients of from 4 to 8 per cent.

In Lower Town there is but a single belt line, both branches of which are intersected by the cross-town lines. Cars running west are for most of their run within one block of those running east. Here also cars are run at intervals of four minutes, and the service requires from eight to twelve cars. Free transfers are issued from one belt to the other over the cross-town lines. These are run separately in winter, but form two sides of a double rectangular belt line in summer. Both tracks are single, and the cars pass at turn-outs.

Strict regulations govern the operation of cars on grades and sharp curves. On some of the grades stop-boards are placed at the top and bottom, and the motorman may not proceed until signalled by the conductor. The speed down grades must not exceed four miles per hour. As a result of these precautions runaway cars are very rare and have never yet been attended by any serious consequences. The average number of cars in regular service during the summer months is about 35, and in winter about 30. In a city of heavy grades, such as Quebec, the system of braking should be of special interest. Hand brakes are used throughout, the effective leverage being 100 to 1. The brake shoes in use are of very soft cast iron, and it has been found that the retarding force due to the application of this shoe is much more evenly applied, and that the coefficient of friction is higher under all conditions than when hard cast iron is used. This is especially the case in frosty or snowy weather. New shoes weigh 19½ lb. and wear down to 4½ lb.; the average life is 6,150 miles, or 410 miles per pound of wear.

All wheels used are of ordinary chilled cast iron, 33 in. in diameter, weighing 425 lb. each, and are mounted on a 4-in. steel axle. Of the wheels removed from cars during the first three years of operation there is not a great proportion of "flats," as will be noticed from the following table:

	Pairs.	Per Cent.
Total wheels removed.....	125
Worn out	94	75.2
Flats	23	18.4
Broken flanges	8	6.4
Average life, 24,800 car-miles.		
Maximum life, 49,000 car-miles (reached by to pairs).		

The rolling stock comprises: Thirty-five 28-ft. double vestibule closed cars, which weigh 14,500 lb. when fully equipped and seat 30 passengers; 24 double-end open cars weighing 16,500 lb. and seating 50 passengers; 6 double-ended snow sweepers; 2 double-ended wing plows; 1 street sprinkler; 1 converted horse car. All cars are equipped with single trucks having a 7-ft. wheel base.

The electrical equipment is standard on all rolling stock and is of the Westinghouse make. It consists of 124 No. 12 A 30-h.p. motors, 124 No. 28 A controllers and 62 sets of controlling resistance. All closed cars are fully equipped and in service during twelve months of the year, and the extra equipment required for sweepers and snow plows during the winter are borrowed from the open cars.

The sweeper and plow equipments are necessarily very much overloaded at times, and it will be of interest to know how they have stood the hard usage. An overload of 100 per cent for several minutes at a time has often been carried by these motors during heavy snowstorms, and a sweeper will sometimes burn five or six No. 13 B. & S. copper wire fuses, or in other words, draw from 200 to 250 amperes at 520 volts, before it can get past a difficult spot. This extremely hard usage does not seem to have any very bad effects beyond a temporary softening of the armature insulation and sometimes the loss of a certain amount of

solder from the commutator connections, and the management is proud to say that there has not been a single armature burned out since the road has been in operation; in fact the only trouble ever had with armatures was in two cases the insulation was scraped off the wires by rubbing against the pole pieces in consequence of a defective bearing. This is not a bad record considering that there were 124 of them in use. There has never yet been a commutator lost, nor has it been necessary to even repair one—apart from resoldering a few melted connections—and the heaviest wear on any diameter up to date is ¼ in. The average wear taken from the first 28 closed cars in operation is .22 in. on the diameter after having made an average run of 71,800 miles. There has not been a commutator "flashed" or "bucked" in the past eighteen months, and this perhaps is largely due to the excellent quality of brushes used, as well as to the constant care that they receive.

It has always been the practice to send an armature to the lathe at the first sign of a "buck," and it has been found that this is absolutely the only way to prevent a recurrence of the trouble. A sharp eye is kept on the brushes to see that they do not wear down too far or become gripped in their holders, and the commutators are cleaned and sandpapered about once a week with No. 0 sandpaper, although it is quite common for a commutator to keep a nice chocolate glaze for over a month without being touched.

The commutator is the most delicate and troublesome part of any electric equipment, and there are two or three more points which ought to be strongly recommended in its care:

1. To send it to the lathe before it has worn down too far. Just as soon as a slight shoulder is formed at each side of the wearing surface the brush is lifted by the end play of the armature and unnecessary and expensive sparking is the result. Further, the copper segments are rarely of a uniform hardness throughout, and the least inequality of wear soon develops into a low spot on the commutator.

2. It is very important that the brush springs be set at the proper tension, and it is easy to make a rough comparative test of this statement with no other tools than a pair of calipers or steel tape line and a spring balance. It will be found that too light is just as serious a defect as too heavy a tension, if not more so. In one case excessive wear is due to sparking and probable "flashing," and in the other to actual friction.

3. See that the brush-holders are accurately aligned so as to divide the current equally between the two circuits of the armature. If the brushes are but the thickness of one segment out of place, one is liable to be notified of the fact at the first heavy overload on the motor.

Of course a great deal depends upon the quality of brush used and cost price of this article should not be considered. The brushes used here have an average life of 12,600 car-miles and cost 15 cents each, which is more costly than most brushes of this size on the market. But let any one make a simple calculation to see how many times the difference in the price of the brush goes into the saving effected by prolonging the life of a commutator several years. The cost of renewing one commutator would keep a 50-car equipment in brushes for two years.

Some trouble has been experienced during the snowstorms of winter by the grounding of field coils, but means have been found to effectually prevent this in future. It might here be mentioned that during twelve hours of a cold dry snowstorm, when light particles of snow are flying about, two or three gallons of water are sometimes collected in the bottom of the motor casings. Water and slush in the spring have given no trouble.

A word about controllers. Aside from the burning out of a couple of magnetic blow-out coils there have never been any repairs made on any of the 124 controllers in service beyond the renewing of the sparking tips of the drum, which is done about once in two years at cost of about 50 cents for each controller.

Here again are the results attained by rigorous inspection and careful cleaning each night. Apart from the nightly inspection it is the practice of the road to thoroughly overhaul every car once in every six weeks. This work is done during the day. Bearings and armatures are examined, brush springs set, brake rigging adjusted, and journal boxes examined and renewed if necessary.

As a result of this routine work, which costs but little, it is seldom that the service has to suffer the annoyance and blockade of traffic caused by a disabled car on the road. It can be safely said that there are not more than two or three cars ever taken out

of service for any reason whatever from early spring until late in the fall. In winter the number is somewhat greater.

CURRENT REQUIRED ON GRADES.

The current required to get a loaded car up the steepest grades on a good summer rail is practically constant and well within the overload capacity of the car motors. The maximum amount usually drawn from the line at 520 to 540 volts, under such conditions, is rarely above 125 amperes, and that for a short time only. The average current is from 60 to 80 amperes per car.

Just as soon as the appearance of snow or ice on the rail has to be considered, the ascent becomes a more serious question. Wheels begin to skid and the car loses momentum, then sand is applied and the sudden overload on the motors as the wheels take a grip, is often beyond the capacity of the heaviest fuse wire it is safe to use on the car equipments, No. 14 B. & S. This wire will carry 180 amperes for several minutes in winter time and 200 amperes for about 10 seconds and this will give a rough idea of the power required. The rated capacity of the motors is 50 amperes, so that when running on the parallel connection the rated load per car would be 100 amperes. In other words every equipment on the road has frequently to stand each day an overload of from 50 to 120 per cent. The figures, however, are yet too low for the current consumed at times by the driving motors on the sweepers. On these there has been frequently measured an overload, lasting an appreciable time, of 180 to 200 per cent. Apart from these sudden maxima, the average load distributed between the two motors is sometimes as much as 150 amperes for hours at a time, including several short periods of comparative rest. Some I know will say that it is extremely bad practice to strain an equipment to such an extent, but, without denying the charge, it may be said that these sweepers have cleaned over 6,000 miles of track every year for the last three years, and the only mishap which occurred to any one of them was the grounding, during the third year of their operation, of one field coil, this, too, in spite of the fact that they were on one occasion running for 106 hours continuously, each one wearing out three or four sets of brooms during that time. On several occasions they have run continuously for two or three days except for an occasional stop of an hour to renew the brooms.

Fig. 2 shows the average energy required by each car in service during each month of the year. These curves are calculated from the readings of an integrating wattmeter in the central station. These results agree closely with the tests of individual cars that have been made.

The total cost of maintenance of electrical equipment per car-mile per year is 0.17 cent. This account includes all renewals.

The car service calls for a working staff of 70 conductors and as many motormen. All motormen, before being accepted on the road, must go through a period of training averaging from three weeks to a month. Part of this time is spent on the road in the company of a good regular motorman and at least a week is spent in the car sheds where the novice acts as helper at nominal wages. He is then examined as to his knowledge of the road, car equipment and regulations. Very little technical knowledge is required of him beyond a thorough understanding of the different parts of the equipment. As a result of this discrimination against the blockhead and the fool, it is a marked fact that on every car in service, "the man behind the gun" knows his business and uses his brains to the advantage of the company.

The greatest difficulty encountered by the company in its efforts to provide a regular and efficient car service during the winter months is the clearing away of the snow from the tracks. It is not so much that the snowfall is somewhat heavier than in the Montreal and Ottawa districts, as that the extremely narrow strips of roadway, either on one side of the track or the other, soon become piled up with snow to such an extent that all snow removed by a passing sweeper immediately slides back on to the rails and blocks the passage of the following car.

Another serious disadvantage is that all cars in the city have to run over some sections of single track. This fact requires, of course, that cars shall meet regularly at certain points, and if one car should be late for—or worse still, not reach—its meeting point, several of the following pairs of cars which pass at the same point will be stalled there until the tangle is straightened out.

A delay of this sort is disastrous in many ways because the leading car, when it gets away, has sometimes to plow its way through

a heavy accumulation of snow until it is possibly extricated from its sorry plight by a passing sweeper which has to be signalled and shunted past the waiting cars before it can be of any service. Matters are soon straightened out, but then that sweeper should have been somewhere else and there is more trouble ahead. Just as long as all cars make their proper meeting points, no matter if they be a few minutes behind scheduled time, everything works smoothly, and, after that, complications seem to increase in geometrical progression.

It is the practice to send out the wing plows as soon as a certain amount of snow has fallen and these follow the sweepers around the whole length of track, at regular intervals, pushing the snow piles back as far as six feet from the rail, where it is possible, although there are miles of track to be kept open where there is less than that distance between the rail and the buildings, to say nothing of the sundry poles and sidewalks that necessarily intervene.

As the day wears on, and the snow still continues to fall, the swing of the plows is limited to two feet and possibly to one foot, after which it is a hard struggle to keep everything moving through the rectangular channel four or five feet deep which has

FIG. 1.

been formed by the wing plows in their endeavors to clear the right of way.

There are several bad spots at which it is absolutely necessary to keep gangs of snow shovellers at work, as soon as the storm reaches any more than even moderate proportions. It has further been necessary on two or three occasions to take all cars out of service in order to give the sweepers a chance to keep the road open, but only once in 1898, and once in 1899, has the service been entirely blocked, and that for one day only.

Nearly all cars in service now carry side brooms or flangers about three feet in length which are set obliquely across the rails about one foot ahead of the front wheels. These consist of cast iron frames into which are fastened a number of cuttings from the sweeper brooms about 10 in. in length. They cost very little and have proved invaluable in keeping the rails clear of snow during the half-hourly or hourly intervals between passing sweepers; in fact the car service very often depends entirely upon these to get through a light snowstorm, a couple of sweepers being sent out, after it is all over, in order to clean up. These long brooms have another great advantage over a narrow steel wire brush in that they keep the snow and ice at each side of the rails at an easy slope toward the bottom instead of cutting a deep rectangular trough which remains filled with snow after the sweeper brooms have gone over the track.

Since adopting these brooms on the road, a marked decrease in the power consumed by the rolling stock during storms is noticed and a great saving has been effected in the quantity of rattan used by the sweepers for each mile of sweeping. This results from the fact that when the transverse section of the winter roadbed is properly graded the sweeper brooms need not be let down so far in order to clear all snow from the rail, thus saving a great deal of breakage.

The total snowfall in Quebec for the last three winters has been as follows:

1897-98	104.6 in.
1898-99	120.6 in.
1899-1900	100.3 in.

Fig. 1 shows the proportion of last year's total fall during each month, also the number of miles covered by the sweepers during each month of the same year. The total cost of removing snow last winter was \$16,335.08 which is \$2.60 per sweeper-mile; 1.473 cents per car-mile; \$1,089 per mile of track. These include all costs of sweeping, shovelling and carting away of snow, as well as the interest, depreciation and maintenance of the necessary equipment.

With reference to the removal of snow, the city by-laws provide that "proprietors or occupants shall remove the snow and ice from their roofs and from the streets, from the street line to the center of the street and keep the same within two inches of the pavement."

The by-law granting a franchise to the Quebec Railway, Light & Power Co., provides that "the company shall remove the snow from their tracks and two feet on either side thereof." As the company could not see its way to carry out this regulation, without having trouble with the proprietors or tenants, it every year makes an arrangement with the tenants on that side of the street on which the company throws its snow, to remove the same, paying them at the rate of 10 cents per lineal foot of their frontage, except in places where the snow is known to accumulate, where they pay at the rate of 15 cents per lineal foot. Consequently, all the company has to do is to throw the snow off the tracks, leaving the proprietors to remove it along with their own. With this arrangement the proprietors seem very well satisfied. One can better appreciate the relative magnitude of the snow expenses when told that \$1.54 has to be deducted from the daily gross earnings of every car in service during the year in order to make up the amount.

All closed cars in service are heated electrically during six months of the year, the heaters being divided into four sections, two on each side of car, each pair being separately controlled. The current consumed by each pair is 4.9 amperes and it therefore requires 9.8 amperes at 520 volts, equal to 5.1 kw., to heat a car during four months of the year, when both sides are in use, but during the months of November and April, one side is quite sufficient to maintain a comfortable temperature within the car body.

Taking the average time of service of car at 18 hours per day and the actual cost of the extra current required at 0.65 cent per kilowatt-hour, the cost of heating one car is 3.32 cents per hour, 60 cents per day or \$90 per year. This is equivalent to 0.204 cents per car-mile. The interest on first cost, depreciation and maintenance of the heating equipment would not add more than 2 or 3 per cent to these figures.

POWER STATION.

The electric railway, as well as nearly all lights and motors in Quebec, are operated, through a sub-station within the city, from a power house situated at the Falls of Montmorency. The power house is 150 ft. long and 50 ft. wide, and contains the following equipment: Three 600-kw. and one 750-kw. two-phase, 5,500-volt S. K. C. alternators; one 600-kw. double current 273,500-volt Westinghouse generator; two 30-kw. bipolar exciters.

All the larger machines are direct connected to 52-in. water wheels of 1,000-h. p. capacity each and operating at a speed of 286 r. p. m. They were built by the Stillwell Bierce & Smith-Vaile Co., Dayton, Ohio.

The current is transmitted to the city over 16 wires, carried on two separate pole lines. Each machine is fed into a separate circuit at Montmorency, but may be connected in parallel at the sub-station in the city.

The sub-station consists of a substantial stone building containing the following machines: Two 600-kw. two-phase S. K. C. synchronous motors, taking current at 5,000 volts, direct connected to two 500-kw. 550-volt G. E. railway generators. Two 200-kw. two-phase, 5,000-volt synchronous motors, direct connected to four 125-light multicircuit Brush arc machines.

Besides these are the direct connected starting motors required for the motor-generators, two exciters driven by induction motors,

and all necessary transformers and switchboards for distributing the current to its various uses.

The railway switchboard contains, besides switches, circuit-breakers, voltmeters, ammeters and field resistance, one Thomson integrating wattmeter, two Bristol recording ammeters and one Bristol recording voltmeter.

From the daily readings of the wattmeter has been prepared the curve shown in Fig. 2 which gives the current consumed by the railway cars during each month of the year. It will be noticed how much more power is required during the winter than in summer, in spite of the fact that fewer cars are in service, and the car miles run by each are fewer than in summer. It will also be seen that, during the month of February, each car requires an average of 24 h. p. during a whole day's run.

FIG. 2.

Month	Total Car-Miles	Cars in Service	Av. H. P. per Car.
1899-1900			
July	98,070	32.6	11.6
August	107,862	32.9	12.8
September	119,850	35.8	12.9
October	105,360	30.2	13.6
November	97,920	29.9	17.6
December	84,710	26.4	18.3
January	82,914	26.2	23.0
February	74,186	25.9	24.0
March	69,060	22.7	23.2
April	76,260	24.2	13.7
May	93,851	29.1	13.6
June	99,228	33.3	13.0

The maximum overload capacity which the station is ever called upon to furnish the railway, is about 900 kw. and a yearly average is about 350 kw. The peak of the summer load very rarely reaches 550 kw. and is easily handled by one generator, although a 20 per cent increase upon this load would be very liable to pull the synchronous driving motor out of step, if of long duration.

Before closing it will be in order to mention the conversion of the old Quebec, Montmorency & Charlevoix Ry. to an electric suburban line. This excellent roadbed now serves to carry a fast service of electric cars—interspersed with steam trains, which handle the heavy traffic—between Quebec and the shrine of Ste. Anne de Beaupre.

A figure 8 trolley wire is suspended at a height of 22 ft. above the rail by stranded steel span wires hung from wooden poles and the rails have been connected with single bonds of No. 00 wire for a distance of 26 miles. A copper cable of 300,000 c. m. area runs parallel with trolley wire for most of its length and is connected to the trolley every quarter mile.

This cable is fed at a pressure of 560 volts at three points, at Quebec, at Montmorency, seven miles away, and at St. Anne's, 21 miles away from the city, all current of course being generated at Montmorency and transmitted to far ends of line at a high alternating tension.

The cars used are 50 ft. over all, weighing 49,000 lb., each equipped with four Westinghouse 38-B motors geared to a speed of 45 miles an hour. A recent test showed that a loaded car took 1.6 kw. h. per car-mile when fully loaded with passengers. The cars make 160 miles per day. On account of the many stops to be

made in the length of the line, 18, a schedule time of 21 miles in 60 minutes has been adopted. This is quite satisfactory and fast enough, because the line is a very busy one, in two ways. The number of passengers carried is beyond the highest hopes of the management and it would be impossible to run any more trains over a single track and on train orders, than are operated at present. There is every prospect of a second track being laid in the near future. The plan of running steam and electric cars is a novel one, in this country, but it is highly successful in every respect.

ATLAS RAIL JOINTS.

In developing both the steam and the street railways the problem of securing an efficient and continuous track has been an important one and the joint, the weakest point of a railway track, has received much attention. As a solution of the joint question the "Atlas" rail joint has been designed to withstand the greatest stresses and insure a smooth, silent, economical, simple and permanent track. It is the proud boast of the maker that the "Atlas" joints have given perfect satisfaction wherever tried and that no complaint has ever been received concerning the hundreds of thousands of them in use.

The first indication of weakness in a rail joint is the vertical play between the splice bar and the rail; this is due to elongation of the bolts and loosening of the nuts, to the fact that the bolts are smaller

POSITION OF RAILS WITH SPLICE BAR JOINT.

than their holes, and to the absence of adequate support for the rail base. This vertical play grows greater as time goes on and the result is pounding at the rail ends which prematurely wears out both joints and rolling stock till finally the splice bars crack or break. The points where the wear takes place indicate the needs to be a greater bearing surface to resist pounding and greater vertical strength immediately at the joint. These needs are met in the "Atlas" joints by providing a plate for the rail base to bear upon, and a double truss immediately beneath the joint. The bearing plates are continuations of the angle bars and give a bearing surface on each tie that is over twice as great as that afforded by the rail base alone; being one piece with splice bars no opportunity is given for relative motion between the several bearing surfaces

ATLAS RAIL JOINT.

that receive the rail. The two truss-pieces are clamped together by two transverse bolts and hold the rail ends firmly while permitting the rail movements due to changes of temperature. The angle bars and the lower rail flanges being wedge shaped any wear of the rail due to sealing is readily taken up by tightening the transverse bolts.
