In this type of joint the lateral force tending to displace the rail ends is resisted by the continuous strip of metal extending around and beneath the lower flanges, by eight braces extending from the top of the splice bar to the edge of the bearing plates, and in suspended joints by a truss. Creeping of the rails is resisted by bearing the joint has on the sides of the ties.

The Indianapolis Street Railway Co. installed "Atlas" joints on a section of track laid with 70-lb. girder tram rails, and Mr. Miller Elliott, superintendent of the road, states that the condition of the track is becoming better with use; before the joints were applied the rails were so badly battered at the ends that it had about been decided to scrap them.

The claims of the maker are that the "Atlas" joint is the strong-

est and simplest and best; fulfills all the requirements of a joint; it combines the angle bar, tie and bed plate and brace, and gives five times as much bearing surface as the same length of angle bar; it makes in effect a continuous track; it adds very greatly to the life of the rail; it does not break or get down in service. The joints are made of malleable iron either of the supported or suspended type, in eight different styles, adapted for all kinds of rails.

AIR STORAGE SYSTEM OF BRAKING.

The rapid development of electric interurban railways with the constantly increasing speeds and the heavier cars that are now becoming accepted as standard on such roads as well as city lines have made it extremely important that great precautions be taken to insure the safety of passengers, and one of the improvements is the introduction of power brakes. The requirements of a good brake may be enumerated as follows: It should be efficient in action; reliable; simple; easy of operation and not liable to act when it should not. In addition it is desirable, from railway's standpoint that the cost of the apparatus be not excessive in the first instance and that the maintenance account should be a minimum. To meet these requirements many experiments have been made in power brakes both electric and air, and it has been the desire of the street railways to obtain a powerful, simple and practical brake that would meet the requirements of high speed and heavy tonnage.

In looking over the various power brakes now in use upon electric railways, we have with much interest watched the developments of the storage system of air brakes and have noted with pleasure the satisfactory workings of the G. P. Magann air brake, which is a storage system.

A main air compressor and a large storage tank are provided at some convenient central point; separate storage tanks carried on the cars are charged in a few seconds from the main tank at the compressing station. The initial pressure in the main reservoir on the car is usually 300 lb. per sq. in.; by a reducing valve this is lowered to 50 lb. or less, according to the speed and weight of the cars, at which pressure the air enters the auxiliary reservoirs on the cars. From the auxiliary reservoir to the brake cylinder the air is controlled by the engineer's valve. The brake cylinder is finely machined and provided with two pistons movable therein and adapted to be pressed towards each other through the agency of a spring, or other similar means; means are provided by the motorman's valve for connecting the air supply or reservoir to the space between the pistons whereby the pistons may be separated against the tension of the spring to apply the brake when it is desired.

To release the brake a controlling valve is operated to cut off the space between the pistons from the air supply reservoir, and to connect it with the air space of the cylinder behind the pistons whereby the pressure on the opposite side of the piston is equalized and the springs permitted to return to their normal positions.

By this arrangement of exhaust, fresh pure air is always supplied behind the pistons thereby overcoming the danger of accumulating dust in the cylinder, and by connecting the compressed air between the pistons with the cylinder behind the pistons when releasing the brakes, the pressure on both sides of the piston is rapidly equalized and the springs at once force the pistons together.

The advantages claimed for this system are: the absence of a noisy air pump on the car to annoy passengers; the saving of all labor and expense incident to keeping in continual operation a pump on the car, whether electric or axle driven; greatly reduced possibility of breakdowns while in use and avoidance of maintenance and repair account by removing costly and complicated apparatus from the car.

The G. P. Magann storage system is adapted to any condition of service, as the storage capacity on the car has been proved from experience to be sufficient for from 300 to 500 stops. Cars are now running from New York over the Brooklyn Bridge, through Brooklyn and out to Brighton Beach, and making five round trips without the necessity of recharging.

The new division of the Seaview Electric Ry. between Wickford, R. I., and East Greenwich was opened last month. This branch completes a through electric line from Narragansett Pier to Providence.

RECENT STREET RAILWAY DECISIONS.

EDITED BY J. L. ROSENBERGER, ATTORNEY AT LAW, CHICAGO.

NO PRESUMPTION OF FREEDOM FROM CONTRIBUTORY NEGLIGENCE.

Citizens' Street Railroad Co. v. Wagner (Ind.), 57 N. E. Rep. 49. Apr. 26, 1900.

There is no presumption, the appellate court of Indiana holds, that one claiming damages for an injury caused by the negligence of another was himself free from fault, as, for example, that one was without contributory negligence in attempting to board a slowly moving car, or in taking hold of same, where he charged that he was injured by the negligent, sudden starting ahead of the car.

MAY CORROBORATE EVIDENCE OF HIGH SPEED BY QUESTION ON DISTANCE FOR STOPPING.

McDonald v. Brooklyn Heights Railroad Co. (N. Y.), 64 N. Y. Supp. 480. May 8, 1900.

The question was asked in this case as to the distance in which a car, with its brake and appliances in order, going 8 miles an hour, as required by a city ordinance, could be stopped. The answer was, "12 feet." The appellate division, second department, of the supreme court of New York holds that there was no error in admitting this evidence, there having been evidence that the car was going at a much greater speed. It considers that it was material to corroborate the evidence of high speed, as witnesses had testified that 80 ft. had been in fact needed in which to stop the car in question.

BICYCLIST'S DUTY TO LOOK BOTH WAYS NOT CHANGED BY APPARENT SOUNDS.

Bennett v. Detroit Citizens' Street Railway Co. (Mich.), 82 N. W. Rep. 518. Apr. 24, 1900.

In this case, a man was riding north on his bicycle at a speed of from four to six miles an hour in a street that crossed at right angles one in which there was a double-track electric railway, and while attempting to cross the tracks he was struck by a car coming from the west. He sought to excuse his failure to look to the west by saying that he heard a noise seemingly coming from the right, and that he thought the noise indicated that a street car was coming from the east. The trial court held that he was guilty of contributory negligence, and the supreme court of Michigan affirms its judgment in favor of the company. It says that it is a matter of common knowledge that waves of sound are diverted when striking buildings, and holds that there was no sufficient reasons shown why he did not look both ways, as it was his duty to look both ways.

OMISSION OF WORDS "IN VALUE" DID NOT CHANGE CONSENT REQUIRED.

In re Rochester & Lake Ontario Railway Co. (N. Y.), 64 N. Y. Supp. 429. Apr. 10, 1900.

Section 100 of the New York railroad law provides, among other things, as to consents, that a change may be made in the motive power on a street railroad when "consented to by the owners of one-half the property bounded on that portion of the railroad." In preparing this section, the revisers omitted the words "in value," which occurred in the old law after the word "property." Nevertheless, the appellate division, fourth department, of the supreme court of New York, thinks that the intention of the legislature was to conform the practice in obtaining the consent of the property owner's to a change of motive power to that prescribed for obtaining their consent to the original construction and operation of the road; and it does not think that a change of this intent was manifested by the omission of these words, under the circumstances. Wherefore, it holds that the consent required by this section is that of the owners of one-half in value of the property

bounded on that portion of the railroad where it is desired to change the motive power.

CHARGE OF NEGLIGENCE CANNOT BE PREDICATED UPON UNEXPLAINED ACCIDENT.

Smith v. Kansas City Elevated Railway Co. and others (Kan.), 60 Pac. Rep. 1059. May 5, 1900.

A charge of negligence, the supreme court of Kansas says, cannot be predicated upon an unexplained accident. In this case a little boy, about 6 years old, was run upon and killed by an electric street car. Two witnesses saw the accident at the moment of its occurrence. But they did not see enough to enable them to tell how it occurred. How the child happened to be upon the street car track was not told. What he was doing the moment before, from whence he came, in what direction he was going, or what he was doing, was unknown. The accident occurred in daylight upon one of the principal streets of Kansas City. The track, however, was level, and the street clear of vehicles and pedestrians. No bell or other alarm was sounded by the approaching car. The usual rate of speed of cars was 10 miles an hour, and, running at that speed, they could be stopped in 57½ ft. These statements are made by the supreme court to explain the case. It adds that from the fact that the accident occurred in daylight, upon a straight, level track, without obstructions to the view of the motorman, and that no alarm was sounded, it was contended that a presumption of negligence arose, and that the case should have been submitted to the jury. But the supreme court declares that it cannot concur in that view, and affirms a judgment sustaining a demurrer to the plaintiff's evidence.

OLD COMPANY MUST BE PARTY TO SUIT OF MORTGAGEE TO ENJOIN CONDEMNATION OF TRACK.

Old Colony Trust Co. v. Atlanta Railway Co. (U. S. C. C.), 100 Fed. Rep. 798.

This suit was brought by the Old Colony Trust Company against the Atlanta Railway Company and the Consolidated Street Railway Company to enjoin the former company from enforcing a right which it said it had obtained by an ordinance of the city to condemn a certain portion of the track of the Consolidated Street Railway Company, which the city had authorized it under a certain reservation to do; that is, to allow the new company to use a certain part of the track of the old company under certain circumstances. The bill sought to prevent the new company from proceeding to condemn the track of the old company, to obtain the right to use it. Now, in such a suit, the United States circuit court holds, the old company is an indispensable party, it being absolutely necessary to have it before the court in order to determine and fully dispose of the issues presented. But it further holds that it should be put on the side with the complainant, rather than on the side of the new company, as a defendant, a change which, in this case, ousted the federal court of jurisdiction, the two railway companies being citizens of the same state, and the court declaring that it would have no jurisdiction on the ground of diversity of citizenship, under the statute, if all of the parties on one side were not citizens of different states from all the parties on the other side.

WHEN BROKER ENTITLED TO COMMISSION FOR SALE OF STREET RAILWAY PROPERTY.

Henry v. Stewart (Ill.), 57 N. E. Rep. 190. Apr. 17, 1900.

In an action brought to recover commissions claimed on the sale of the capital stock and property of a street railway company, the supreme court of Illinois holds that the law was correctly stated by an instruction to the effect that, if the jury believed from the evidence that the party sued employed the party suing as his agent to negotiate the sale of his street railway property, that the party suing undertook said employment, and was instrumental in bringing together the buyer and the party sued, then

and in that case the party suing was entitled, as a matter of law, to recover from the party sued compensation for his services, regardless of the fact that the party sued himself concluded the sale, and upon a price less and upon terms different from those at which the party suing was authorized to sell. To this, the supreme court adds, that if the party suing, as agent for the party sued, offered the property to a certain third party, and thereby brought about a sale, it was wholly immaterial whether such third party acted for himself, or for himself in connection with others, or for a syndicate. In other words, whether he, the third party, was himself the purchaser, or an agent of the real purchaser, the court holds, was, in this action for commissions, a matter of no concern to the party sued therefor. It was sufficient that the party suing found a buyer whom the party sued was willing to accept and did accept, whether such buyer was acting for himself or others.

LIABILITY FOR NEGLIGENTLY KILLING DOGS.

Smith v. St. Paul City Railway Co. (Minn.), 82 N. W. Rep. 577. Apr. 19, 1900.

In Minnesota dogs are made personal property by statute, they are taxed as such, and, the supreme court of that state holds, an action will lie in favor of the owner of a dog, having a substantial money value, for its destruction through the negligence of a third party.

Here was an action brought to recover for the killing of a valuable, highly bred, large dog by a street car negligently run. It appeared that on the day of the accident, in the absence of the owner from home, his wife had a number of dogs (among them the one killed), for exhibition to third parties, in the yard of the family residence, which adjoined the street upon which this car was run. The dogs escaped from the yard and control of the woman, and went to the opposite side of the street, followed by a child. At this, she became very much excited, and did her utmost to recall the dogs and child to the yard, for fear that they would be injured by the street car, which was approaching something more than a block distant. The dogs and child started to return to the yard, and on their way back all got safely across the street car tracks, except the animal in question, which was struck and killed by the approaching car.

This car, the court goes on to say, was one of the usual passenger cars on that line, operated by a motoneer, who could and did, upon his own admission, discover the danger of a collision in sufficient time to stop the car, notwithstanding which, as the plaintiff's evidence tended to show, he ran the same at a dangerous rate of speed, estimated by the plaintiff's witnesses to be over 20 miles an hour, and 10 miles faster than was authorized by the city ordinance, until he struck and killed the dog. Nor did he then stop, but continued on his way, without giving the accident any further notice.

That such conduct on the part of the company's servant operating its car was negligence, the court declares, does not seem to admit of doubt; and it says it was a question for the jury whether, under all the circumstances of the case, the dog would have escaped if the car had been run at a legal and proper rate of speed, or, in other words, whether the negligence of the defendant company was the proximate cause of the loss of the dog, for which damages were awarded. The jury returned a verdict in favor of the owner of the dog, and, after considering the facts in the case, the court holds that the evidence supported the verdict of the jury, and their finding that the collision between the street car and the dog was actionable negligence, for which the owner might recover its value from the street railway company.

The supreme court says that it does not hold that a street car company must stop its cars, when running at a legal or reasonable rate of speed, to avoid collisions with dogs. Ordinarily, it thinks, dogs may be presumed to take care of themselves, and the motoneer may act on such presumption. To this, it adds that it places this decision upon the ground that it was for the jury to say whether the dog could have escaped if the car had been running at a proper rate of speed. But upon the improper speed of the car from which the collision resulted, as found by the jury, the verdict, determining that there was actionable negligence, it holds, should be sustained.

A municipal ordinance authorizing a police officer to destroy a dog which is unlicensed, or not wearing a collar or muzzle as

required thereby, the court further holds, does not authorize a third party to kill such animal, or relieve him from damages for negligently destroying the same, and was no defense in this case.

NOT LIABLE TO PERSON INJURED ON FENDER EXTENDING FROM REAR OF CAR.

Gargen v. West End Street Railway Co. (Mass.), 57 N. E. Rep. 217. May 17, 1900.

This was the case of a woman who was injured by coming into contact with a fender extending from the rear end of a street car. Fenders were attached to both ends of the cars, but were usually so adjusted that they projected only from the front end. This fender, however, had in some way become so disarranged that it projected from the rear end of the car without the knowledge of the company's employes who were in control of the car. The woman had just left the car, which had stopped about opposite her dwelling, by the gate on the opposite side from the house, because the other gate was closed. It was quite dark, and she turned at once, upon reaching the ground, and began to walk towards the other side of the street, on the crosswalk, which was about seven feet wide, but a portion of which was occupied by the rear end of the car, from which at the time the fender mentioned projected about two feet. She did not notice the fender, but struck it, and fell.

It was admitted that when the woman left the car she ceased to be a passenger of the company's. The supreme judicial court of Massachusetts says that when she began to walk towards her house, she was merely a traveler upon the highway. The respective rights and duties pertaining to her and the company were not those of a passenger and a common carrier, but those of a pedestrian crossing a public street in which was a street railway track then occupied by a street car, and of a street railway corporation lawfully using the same street in its traffic.

It could not be contended, says the court, that the presence of the car in the street, or its stoppage to allow passengers to leave, was unlawful. Nor was it claimed that the stoppage was too long, or that the woman expected that the car would move on to allow her to cross the street. What was contended, was that the presence of the fender projecting from the rear end of the car was such a negligent occupation of the highway by the street railway company as to make it liable for the personal injury sustained by the woman.

Now, any vehicle stationary upon a highway over which travelers are passing and repassing, the court continues, may be an occasion of injury to them if they come in contact with it in consequence of their own motions. In such cases the test of the liability of the owner of the stationary vehicle to compensate for his injury the traveler who walks against it is not the probability that the traveler will be hurt if he walks against the vehicle, but is whether its owner was within his right in having such a vehicle or load stationary upon the street.

Again, the court points out that the fenders at each end of the car were not like a cutting instrument, or an apparatus so dangerous that it ought not to be transported upon a public way without unusual care for the safety of travelers, but were appurtenances of the car, with which the law required it to be equipped. That fenders do not usually so project, it holds, bears on the question of the company's care or negligence, but does not make it unlawful to propel in the street a car with a fender so projecting.

Nor does the court think that it makes any difference in a case of this character that it was in the night time that the traveler walked against the obstruction, not seeing it on account of the darkness, if the owner of the vehicle had complied with such requirements as to lights as were in force at the time when the collision occurred. It adds that it knows of no requirement anywhere that a street car or other vehicle used at night upon a highway shall be so lighted that every part of it shall be plainly visible to those who come upon it in the rear as well as in front.

Wherefore, the court holds that, irrespective of the question whether the plaintiff in this case could be found to have been in the exercise of due care in walking against the fender, a verdict should have been ordered for the defendant company, because, upon the undisputed evidence, the obstacle against which the plaintiff walked was part of a vehicle lawfully using the street within the defendant company's right.

KANSAS CITY PLANT OF THE GRIFFIN WHEEL CO.

In line with its general policy of extending the scope of its business and enlarging its facilities for furnishing the best car wheels that can be produced in the shortest time possible and at reasonable prices, the Griffin Wheel Co., of Chicago, in December, 1899, purchased and assumed control of the extensive foundry and shops owned by the Kansas City Car & Foundry Co., and located at 12th St. and the Kansas City Belt R. R., Kansas City, Kan. The plant has been changed and improved, new buildings and machinery added, and the total capacity increased 50 per cent.

The buildings and grounds cover an area of 13 acres, giving ample room for storage purposes, and spur tracks and switches direct to the foundry and shops from both of the belt railroads, furnish the best of facilities for handling the pig and coke, and shipping the finished products to any desired point. The works can turn out 5,500 wheels a month, requiring the services of about 150 men.

At the foundry, which is an iron sheathed building, the pouring is done on 11 straight floors, having 22 wheel molds to the floor. The hot metal is carried from the cupola by pneumatic hoists running on overhead tracks above each floor and but 10 seconds are required to complete a cast from the time the metal flows into the ladle. The wheels are left in the mold for 18 seconds, they are then covered with sand, after which they are immediately removed to the annealing pits, where they remain for five days.

The machine shop is 50 x 80 ft. and is equipped with three wheel horers, three axle lathes, two wheel presses made by the Niles Tool Works, one planer and two machine lathes, all tools being operated from shafting driven by an electric motor. Here wheels are bored and pressed onto axles when customers so desire.

The company has its own power plant for generating electricity for lighting the grounds and buildings, and driving tools and machinery in the foundry and shops, and for supplying compressed air with which to operate hoists, elevators, etc. The power station is a brick structure 30 x 140 ft. and contains a double battery of Stirling water tube boilers rated at 250-h. p. each, one 150-h. p. Bates tandem corliss engine belted to a 100-kw. Triumph generator and also driving the air compressor, and a 150-h. p. Atlas engine belted to a 100-kw. Triumph generator. The total output of this station is not ordinarily required, but all machinery has been installed in duplicate to provide against a break-down and insure a liberal supply of power under all conditions.

Seven fire hydrants, each equipped with 250 ft. of hose, are placed at convenient points, and fire drills given at frequent inter-

vals, so that the possibilities of a fire getting sufficient headway to do much damage are extremely slight.

The Griffin Wheel Co. owns six car-wheel plants, the largest at Chicago, and others at Detroit, Denver, St. Paul and Tacoma, in addition to the Kansas City works. At none of these plants are wheels made by guess work, but on the contrary the managers in each city know absolutely from the time the ore is purchased till

KANSAS CITY PLANT GRIFFIN WHEEL CO.

the finished products have been placed on the cars, just what materials have gone into every wheel sold, what processes it has passed through and what workmen have taken any part in its making. At the local plants tests for composition, chill and strength are made on samples from each pouring, and in addition fragments and samples are sent for chemical testing at frequent intervals to Chicago, where the Griffin company has a fully-equipped laboratory in which tests and experiments are constantly under way to determine improved compositions and methods. Each

wheel made is given a serial number, stamped into the metal and a record is kept of the date it was cast, the name of the foundryman that did the work, the formula by which it was made and when and where it was shipped.

The selling of all products made by the Griffin Wheel Co. is under the general supervision of Mr. F. L. Whitcomb, of Chicago, general sales agent, assisted by Mr. C. K. Knickerbocker. The Kansas City works are under the management of Mr. Hy. H. Meday, whose territory covers parts of Nebraska, Kansas, Oklahoma, Texas, Arkansas, Missouri and Iowa.

CHICAGO ELEVATED ROADS.

The reports of the four elevated railways of Chicago for the year ending June 30, 1900, have been made to the Illinois Railroad and Warehouse Commissions, and show the following statements of gross earnings:

	1900.	1899.	Gain.	Per ct.
Metropolitan	\$1,603,461	\$1,336,799	\$266,662	19.9
South Side	1,258,379	1,061,656	196,723	18.5
Lake Street	727,587	653,299	74,288	11.4
Northwestern.....	65,487	(May 31 to June 30, 1900.)		

The Metropolitan carried 31,008,186 passengers; the daily average is 84,954, which is 14,176 more than for the preceding year. The operating expenses, including rentals and taxes, were 55.6 per cent of the total income; the surplus for stock was \$302,856.

The South Side carried 24,349,868 passengers; the daily average is 66,712, which is 10,477 more than for the preceding year. Operating expenses, including rentals and taxes were 56.6 per cent of gross receipts; the surplus for stock was \$510,572.

The Lake Street carried 14,269,506 passengers; the daily average was 39,094, an increase of 4,062. The operating expenses, including rent and taxes were 66.1 per cent of gross earnings. This road has increased its mileage, as compared with 1898-99, which so increased the operating expenses and rentals that notwithstanding the larger traffic there was this year a deficit of \$16,628, as against a surplus of \$5,591 for 1898-99.

The Northwestern gives its report for 30½ days; total passengers, 1,300,748; daily average, 42,942. Operating expenses, including interest and taxes, were 52.7 per cent of gross receipts; the surplus for stock was \$10,055.

The Union Traction Co., of Philadelphia, laid in 125,000 tons of coal in anticipation of a famine caused by the strike.

KANSAS CITY PLANT—GRIFFIN WHEEL CO.

IN THE POWER HOUSE

This department is devoted to the construction and operation of electric railway power houses. Correspondence from practical men is specially invited. Both the users and makers of power house appliances are expected to give their views and experiences on subjects within the range of the department.

Mr. A. E. Le Rossignol, corporation tramways engineer for Newcastle-upon-Tyne, England, in commenting on American street railway practice, writes of the modern power station as follows:

"As economy in current generation is greatly influenced by the expenditure on labor in the station, central station practice in America rightly tends to the introduction of very large steam power units, but these are all of the open slow-moving type, and so require a larger amount of attendance than would the same size units, if enclosed and provided with automatic lubrication, such as have been largely adopted in this country. A system of mechanical oil supply to these large open engines has been adopted; but if the enclosed type were made as strong in proportion and as reliable in operation as the large open type, there is no doubt that increased economy in labor would be obtained, and doubtless English manufacturers will awaken to this fact in a short time. Due to the heavy strains encountered in direct-current traction work, American steam units have gradually grown to huge proportions of the strain bearing part, the shaft, and even though the strains probable in alternate current work will be very much less, the same proportioned engines are being installed in the three-phase plants. Owing to the adoption of large steam units the question of provision of adequate boiler power in a reasonable amount of floor space to correspond with the engine floor space has been met by the adoption of two or more boiler floors one above the other, surmounted by huge coal bunkers at the top, and exemplify the trust placed by American engineers in steel-framed buildings.

"The question of control of the large amount of electric power generated by the large units is now being taken into adequate consideration; up to the present switchboards have always been strongly suggestive of the instrument making days, but in the new power station of the Metropolitan Traction Co. the switches are built on engineering lines of generous proportions, and are worked by pneumatic power and controlled electrically. Three large galleries at one end of the engine house are given up entirely to the switches, each in a brick cell of its own, while the actual controlling boards take up very little space."

A GRAVITY LUBRICATING SYSTEM.

The cost of properly lubricating the machinery in a large electric station is small indeed when compared with the damage that will result from an insufficient supply of the lubricant. If the lubricant be supplied with regularity a very little will suffice, but to guard against the injury consequent upon a stoppage of the oil it is necessary to supply much more than is really needed; when this is done economy dictates that the excess be filtered or cleaned and used again. By this method the cost of lubrication is actually lower than when less oil is used, but not filtered for reuse. Further there is a greatly decreased liability of the bearings heating, as the excess oil will carry away considerable heat.

Where a large amount of the lubricant is fed to each bearing a filter that will clean the oil quickly is necessary; otherwise too large an amount must be carried in the storage tanks.

The purpose of this article is to describe and illustrate a system that has been used in a large power station in New England, and has given the best of satisfaction.

A journal oil is used costing 14 cents per gallon. All the oil cups about the engines, excepting on the valve gearings, are connected by piping to an elevated tank, so that the oil flows by gravity to each cup. A general view of the engines thus piped is shown in Fig. 1.

Three streams of oil are led into each main shaft bearing, a stream to each eccentric, and a stream to each crank and crosshead

pin; two cups furnish fast-fed drops to the crosshead slides. Furnishing so large an amount of oil serves the purpose of reducing the total friction load of the engine and also the tendency of the parts to heat and wear. After passing through the bearings, the oil is carried through pipes placed just under the engine room floor, to a filter in the basement. The general arrangement of the filters is shown in Fig. 2.

Duplicate filters are shown, one being in use at all times, taking care of about 100 gallons of oil per hour. In operation, the

FIG. 1—OIL PIPING OF ENGINE.

oil comes from the engines through the pipe A and enters compartment B of the filter tank, where it passes through wool waste by gravity, down through pipe C and outward over the flange D, and up through wool waste in compartment F. The filter tank is partly filled with water, so that the wool waste in compartment F is partly submerged, the object being to separate any dirt or entrained water in this compartment. The oil then passes through the pipe G to the storage tank, where it runs through the compartment H filled with wool waste and is then pumped to the elevated tanks in the engine room. The wool waste is taken out after about two weeks' use, washed and then used over again. The

FIG. 2—ARRANGEMENT OF FILTERS.

arrangement of valves permits a quick change from one set of filters to the other and also for washing out the tanks when necessary. The advantage of using wool waste, instead of cotton waste or sponges is, that wool waste does not pack down or plug with dirt until practically filled with it.

A special oily waste press is used to extract the oil from all the waste used to wipe the engines and the mops used on the floor or cellar. The waste comes from the press dry enough to use for wiping, but the oil is dirty, as it contains all the drip from the stuffing boxes and moppings from the floor and cellar. Fig. 3 is a shop drawing showing all the parts. The bed plate is a cast iron

the engraving. Fig. 5 shows a plate (excepting the supporting lugs) and a distance piece with dimensions. The filter plates are covered with one thickness each of two kinds of filter cloth (mat and chain) on which the dirt and impurities are gathered. To clean the press the plates are removed, and the earth and dirt scraped off the cloth; the plates are again assembled and the press is then ready for operation.

The object of adding fuller's earth to the oil is that it acts as a filtering medium, separating the particles of dirt and absorbing any water. As the oil emerges from the press it is free from all dirt and is but little discolored.

During the process of filtering, some cylinder oil finds its way into the engine oil, which discolors it, from an amber to a deep wine color. This cylinder oil increases the specific gravity of the oil but after it has passed through the filter press, the gravity test is the same as for new engine oil, the press having removed some of the residuum, tar, wax, etc.

IMPROVED AIR PUMP AND CONDENSER.

The accompanying illustration shows the latest design of the jet condensing apparatus for street railway power plants, that has been developed by the Dean Bros. Steam Pump Works, of Indianapolis, Ind. The power required for the operation of this pump is given as one-half of one per cent of that developed in the engine, while the steam consumption of the latter is reduced 30 per cent. This air pump can be speeded to deliver just the amount

471

DEAN AIR PUMP AND CONDENSER.

of water required for condensation. It is started before the engine and the vacuum obtained is used to assist in the first revolutions. This feature is important with compound engines, as the full power of the low pressure cylinder is secured at once.

It was formerly supposed that a vertical air pump must be single-acting, but the manufacturers have designed a double-acting, vertical air pump that is believed to be entirely successful. The vertical type of air pump is said to be much more durable than the horizontal type, because there is no side wear in the cylinder and

stuffing boxes. In horizontal pumps, especially large sizes, there is a constant downward wear of piston and rods, due to their weight. Any sediment in the water will settle on the lower side of the cylinder, where this pressure is greatest, causing the piston and cylinder to wear rapidly. The vertical air pump occupies but little floor space, and it is much more convenient to set down into a pit, should it be necessary to lower the air pump, so as to reduce the vertical lift of injection water.

The piston rods are separable at the cross heads, tapering keys being used to hold them in place. The cylinder head can be easily removed and taken entirely out of the way, for inspecting the interior of the cylinder or for repacking the piston. The piston rod stuffing box is provided with a water seal to prevent air from entering. The cylinder is lined with bronze and the piston rod and all valve seats are of bronze.

AUTOMATIC SHUT-OFF VALVE.

The Locke Regulator Co., of Salem, Mass., as the name indicates, makes a specialty of regulating devices for steam plants though it is also an extensive manufacturer of steam appliances

other than regulators and governors. The illustration shows the Locke emergency or automatic shut-off valve which has been extensively used in New England power plants and in a number of instances has averted serious accidents by promptly closing down the steam supply. The valve proper is actuated by a piston in the cylinder mounted on top of the valve casing, the lower end of this cylinder being connected with the boiler and upper end with the steam main near the engine. So long as the pressures

are normal the valve remains open but a reduction of the pressure on the upper side of the piston such as would follow a break in the piping, permits the piston to rise, closing the valve. A screw and wheel are provided for operation by hand after the manner of ordinary valves. When desired electric attachments are furnished making the valve a perfect engine stop that can be operated from any point in the station. Among the other Locke specialties are hydraulic damper regulators, water pressure regulators, reducing valves, pump governors, open and closed float traps, relief valves, etc.

SUNDAY CARS IN ST. JOHN, N. B.

An attempt by the Sabbath Observance Association of St. John, N. B., to prevent the running of street cars on Sunday, has failed, because of an adverse ruling by the police court. Complaint had been made against several motormen who were operating cars carrying passengers, and the street railway company moved for their dismissal on the ground that the street railway was exempt under the Sabbath Observance Act. Section 1 of this act provides that it shall not apply to persons carrying travelers, and the case turned on whether street railway passengers could be considered travelers within the meaning of the act. The principal difficulty was to determine the length of a Sabbath day's journey. The local authorities in matters ecclesiastical could give no assistance, but finally a case was found in the law books where a Sabbath day's journey was defined as 2,000 paces, or about three-quarters of a mile. Under this ruling the judge dismissed the complaints, holding the company's point as to passengers being travelers to be well taken.

ELECTRIC STREET RAILWAY TRACK DRILL.

A tool of this kind taking its power from the trolley wire and doing the work in a fraction of the time required by hand, should certainly appeal to every one interested in street railway construction.

From the fact that this device is used on a grounded circuit and usually handled by unskilled workmen, the motor requirements are very exacting. It must be practically dust and water proof and unbreakable, simple in construction but of high efficiency, in fact

FIG. 1.—PLANT IN OPERATION.

constructed specially for this kind of service. The Stow Manufacturing Co., of Binghamton, N. Y., has been working along this line for years, some of its earlier designs having been previously illustrated in these columns. Several of the more primitive type have been in active service for the past four years and are still in good working order, but practical use has from time to time developed faults in construction which, as fast as discovered, have been corrected. The invention of the Stow multi-speed motor has aided greatly in perfecting this plant, and while no doubt further improve-

FIG. 2.—SECTION OF MOTOR.

ments will suggest themselves, the Stow Manufacturing Co. has no hesitation in stating that in its present form, the combination of Stow flexible shaft and ironclad electric motor is as near fool proof as any electrical device on the market, and that no appliance used in street railway construction will pay a larger dividend than this.

Fig. 2 shows the extreme simplicity of motor construction and also method of speed regulation. By simply raising and lowering the soft iron plunger in the hollow field by means of the hand-wheel on top of motor, the speed can be varied even to the fraction of a revolution. The motor is self contained, no outside speed

FIG. 3.—TRACK DRILL PRESS.

regulator or starting box being required,—a most desirable quality in a portable motor.

The automatic track drill press, Fig. 3, is a most valuable tool to use in connection with this plant for rebonding. If the road is in operation, this drill can be adjusted and detached in a moment. Catalogs, discounts and other information desired will be furnished on application.

GRAPHITE PAINT.

Within the last few years a great deal of experimenting has been done in endeavors to find a satisfactory paint for use on metal surfaces exposed to the weather, or to the action of corrosive gases such as locomotive fumes, and one result has been a greatly increased use of graphite paints. It is believed an ill-judged demand has arisen for paints containing no other pigment than graphite, due to too much stress being put on chemical specifications and mechanical specifications ignored. The Detroit Graphite Manufacturing Co., of Detroit, Mich., states that its experience shows that graphite alone is not a good and reliable pigment, as it does not mix well with oil and lacks body and binding qualities to give it permanence and effectiveness. Its own product, known to the trade as "Superior" graphite paint, is made from amorphous graphite, in which there are other ingredients that give the paint body, weight and hardness. The greatest care is taken in the manufacture and the result is a product that can be relied upon as of uniform quality. The claims made for "Superior" graphite paint are that it is suitable for wood and all metals; that it will last five times longer than other paints, and will cover two to four times more surface; that it is easier to apply than other paints and can be used on either new or old work; that it has twice the bulk of mineral and four times the bulk of lead paints; that it is practically fire, water, acid and weather proof. It is particularly recommended for bridges and viaducts, especially where exposed to the fumes from locomotives; a viaduct over steam railroad tracks in Detroit given one coat of this paint in 1894 is reported to not yet need attention.

MELBOURNE TRAMWAYS REPORT.

The statement of the Melbourne Tramway & Omnibus Co., Ltd., of Melbourne, Australia, for June 30, 1900, shows a total income of £426,234, of which traffic receipts were £415,024. The expenses were £360,069. The balance carried forward from the preceding year was £30,420 and the profits amounted to £57,165; it is proposed to pay dividends at 8 per cent on the capital stock of £480,000 and set aside £20,000 for depreciation and sinking fund, leaving a net balance of £29,185. Mr. F. B. Clapp is chairman, and Mr. W. G. Sprigg is secretary of the company.

WAGES INCREASED AT TORONTO.

The Toronto (Ont.) Railway Co. on Sept. 17th announced the following rates of wages for trainmen: First year, 15 cents an hour; second year, 16 2-3 cents; after the second year, 17 cents; after the fifth year, 18 cents. The rate heretofore in effect was 15 cents. Men who have been more than five years in the service will receive 18 cents per hour.

NEW ELEVATED CARS IN CHICAGO.

The accompanying engraving shows one of the new cars built for the South Side Elevated Ry., of Chicago, by the Jewett Car Co., of Newark, O. An order for 30 of these cars was placed in February, 1900, through Hanna & Gray, of Chicago, who represent the Jewett company.

The cars are 46 ft. 5 $\frac{1}{4}$ in. over the platforms and 39 ft. 4 in. over the sills, and weigh approximately 50,000 lb.; the truck centers are 32 ft. 10 in. apart. The seats are arranged as in the other cars of the company, cross seats at the center and side seats at the ends. The interior finish is in mahogany except the headlinings which are of three-ply oak; the doors, sash, seat frames, etc., are mahogany.

These cars are the handsomest ever seen in Chicago and embody several new features. The windows have double drop sash, so

JEWETT CAR FOR SOUTH SIDE ELEVATED, CHICAGO.

that in summer the cars may be made practically open ones, a design which will be greatly appreciated by the traveling public. The gates extend from the platform to within 6 in. of the hood and are covered with wire netting of $\frac{1}{2}$ -in. mesh; this arrangement will effectually prevent attempts of passengers to climb over the gates, which is sometimes done with the lower gates. The motor-man's cab is entirely within the car instead of on the platform, and is a model of compactness and convenience.

The equipment includes Van Dorn automatic couplers, Christensen air compressor, Westinghouse brake cylinder and valve, Peckham 14-A-X-L special trucks and electric heaters.

LUMEN BRONZE.

"Lumen" is the name given to a special bronze which was patented by Prof. R. C. Carpenter, of Cornell University, and is made by the Bierbaum & Merrick Metal Co., of Buffalo, N. Y. This metal was carefully tested and found to give satisfaction in practical use, before being put on the market. A particularly low coefficient of friction is claimed for it.

The physical properties of lumen are: Specific gravity, 6.9; tensile strength, 30,000 lb. per sq. in.; compressive strength, 75,000 lb. per sq. in.; torsional strength, 35,000 lb. per sq. in.; coefficient of linear expansion, .0015 per 100° F.; electrical conductivity about the same as brass. The metal is said not to deteriorate in remelting, and the tensile and compressive strength are reported to increase with the temperature to 350° F.

Lumen has been used in the construction of the "Ideal" trolley wheels recently put on the market by the Bierbaum & Merrick company. The flanges are of soft cold-rolled steel which it is stated does not scale and is not blistered by an electric arc, nor does it wear the trolley wire more than a soft bronze. The wearing tread is of pure lake copper slightly hardened. The flanges are held together by a hub of lumen bronze cast in place. A graphite bushing is used with these wheels. A number of large railways are using the "Ideal" wheel exclusively.

F. N. Rowley, of Kalamazoo, Mich., is seeking a street railway franchise at Jackson, Mich.

NEW YORK STATE MEETING.

The 18th annual meeting of the Street Railway Association of the State of New York was held at Buffalo on September 18th and 19th, the sessions being at the Iroquois Hotel. At the opening meeting Tuesday morning there were over 100 delegates present. After a brief response to the address of Mayor Diehl, who welcomed the association to the city, President Rogers delivered his annual address.

Mr. Rogers believes that before any improvement in the condition of the railways of the smaller cities and towns of the state can be expected, the present paving law must be amended; he suggests that paving requirements should in each case be made the subject of special agreement between the municipality and the railway. Reviewing the last report of the Railroad Commissioners, he said that of the 94 electric roads in the state, 41 show a deficit for the

year and only 14 declared dividends; of the latter 4 were in smaller cities, being operated partly as interurban roads. The gain in receipts for the surface roads of the state was 7.1 per cent over the preceding year; the roads of Greater New York carried 55 per cent of all the passengers in the state, their increase being 74 per cent of the total increase for the state. The good will of the people being necessary for the success of a street railway, Mr. Rogers believes that the management should take the municipal authorities into its confidence and appeal to their sense of justice. The excessive taxes imposed on American street railways were mentioned and also the injustice of the present law taxing street railways 1 per cent of their gross receipts and other corporations only $\frac{1}{2}$ per cent. The municipal ownership agitator, Mr. Rogers thinks, is wending his way westward.

Speaking of transfers, he states that there is no obligation, except on the newer roads, to give transfers and recommends that the points of issuance of transfers should be limited and designated by the Railroad Commissioners. In conclusion Mr. Rogers noted the extensive improvements in the street railways of the state during the past year.

The papers read at the two sessions of Tuesday were:

"Accidents on Street Railways; Methods Employed in Handling Them and Preparing for Trial," by D. W. Patterson, of the legal department of the Metropolitan Street Ry., New York City.

"How Can We Increase the Efficiency of Our Employees," by E. G. Connette, vice-president and general manager Syracuse Rapid Transit Ry.

"Railway Power Transmission," by J. H. Armstrong of the General Electric Co.

"The Use of Storage Batteries on Small Roads," by B. B. Nostrand, jr., president Peekskill Electric Light & Power Co.

"Storage Batteries," by Thomas Henning, superintendent of power house, Buffalo Ry.

"Rochester & Sodus Bay Ry.," by T. J. Nicholl, vice-president Rochester Railway Co.

"Test of the Buffalo Railway Power House," by Prof. H. H. Norris, Cornell University.

After the business session the delegates visited the Cold Spring power house of the Buffalo Ry. and the Pan-American Exposition grounds. The annual banquet was held at the Ellicott Club on

Tuesday evening, President Rogers presiding and Mr. Ely acting as toastmaster.

On Wednesday the following papers were read:

"Precision in Steam Power Making," by A. S. Mann, assistant engineer, Metropolitan Street Railway Co., New York City.

"Compressed Air Motors," by H. D. Cooke, president Compressed Air Co., New York City.

"Snow Plows," by R. E. Danforth, superintendent Buffalo Railway Co.

"Rotary Transformer Stations," by R. E. Danforth, superintendent Buffalo Railway Co.

General discussion followed on "Repair Shop Methods," "Efficiency of Employees," "Pavements" and "Snow Plows."

The officers and executive committee chosen were: President, G. Tracy Rogers, president Binghamton Railroad Co.; first vice-president, John W. Boyle, president Utica Belt Line Street Railway Co.; second vice-president, E. G. Connette, general manager Syracuse Rapid Transit Railway Co.; secretary and treasurer, H. A. Robinson, solicitor Metropolitan Street Ry., New York City; executive committee, the president, H. H. Vreeland, C. L. Rossiter, T. J. Nicholl, W. Caryl Ely. The next meeting will be held at Rochester.

THE EXHIBITS.

About 25 exhibitors made a display of appliances, among which were the following:

Harold P. Brown, New York, specimens of the Edison-Brown plastic bond with demonstration of same.

The Mayer & Englund Co., Philadelphia, a line of its "protected" rail bonds.

The G. P. Magann Air Brake Co., Detroit, had car No. 607 equipped with its brake, which passed the hotel at frequent intervals from 8:15 a. m. to midnight.

Speer Carbon Co., St. Marys, Pa., displayed a fine line of carbon brushes.

The Keystone Electric Instrument Co., Philadelphia, had a handsome line of meters.

J. W. Gorman, Boston, used a fine collection of photographs to illustrate the extent of his business in supplying attractions for pleasure resorts.

The Edison-Johnson Co., New York, exhibited its new form of trolley harp which allows the trolley wheel a wide play preventing its leaving the wire.

The Morris Electric Co., New York, had an extensive display of many of the numerous specialties handled by this concern.

The Consolidated Car Heating Co., Albany, presented an attractive and timely collection of electric car heaters.

The Bliss Manufacturing Co., Pawtucket, R. I., showed its car gate to advantage.

The Weber Rail Joint Co., New York, had a full line of joints for use on various sections and types of rail.

Hale & Kilburn, Philadelphia, showed several samples of cross seats.

The Atlas Railway Supply Co., Chicago, exhibited its combined rail brace and tie plate, and samples of joints for different rail sections.

The H. W. Johns Co., New York, many of the numerous specialties made by it for line and overhead work.

The Chisholm & Moore Manufacturing Co., Cleveland, had track specialties, and pictures of its appliances for handling heavy machinery in the power house.

The Bierbaum & Merrick Metal Co., Buffalo, showed its "Ideal" trolley wheels, and samples of "Lumen" bronze.

Other exhibitors were: Couch & Seely Co., Boston; Gold Street Car Heating Co., New York; Cutter Co., Philadelphia; P. H. Alexander, New York; G. S. Allison, New York.

CONVERTING TRAM RAILS INTO GROOVED RAILS.

The accompanying illustration shows the method of attaching a block of cast iron to the flange of a tram rail by means of which it is converted into virtually a grooved rail; this is designed for use

where city authorities or the courts have condemned tram rail and require a change. This device has been used very successfully on the lines of the Springfield Street Railway Co., Springfield, Mass., and has now been in service for more than two years on about two miles of track in the city streets and during that time not one of the blocks has ever been broken from the traffic and none have got out of alignment. The blocks are cast in lengths of one foot,

each, with a groove, which fits over the flange of the tram and is held in place by the paving blocks and grouting. It is readily attached and serves equally well with granite, brick or asphalt paving and in the case of Springfield has given entire satisfaction to the street railway management and city authorities. All the tram head rail in the city has been thus fitted.

The blocks weigh, for 5-in. tram rails, about 7 1/2 lb. each, making 15 lb. per foot of track, one for each rail; for girder rails that measure only 4 1/2 in. across the top the blocks weigh only 5 lb. per foot of length. The cost is estimated from \$1,200 to \$1,700 per mile, where it is necessary to take up and replace the paving.

The device is the invention of Seth J. Buckland, a former councilman in Springfield, and is being made by the American Street Railway Paving & Improvement Co., of Springfield, Mass.

PROTECTING ALUMINUM CONDUCTORS.

Lord Kelvin, in a recent paper on "Distant Electric Power Transmission," says of aluminum conductors:

The weight of aluminum required is almost exactly one-half of the copper which would produce the same effect. The diameter of cable is 28 per cent in excess of one made of copper, and the cost of insulation for an underground cable is increased in about the same proportion when we pass from copper to aluminum.

Aluminum is not a pleasant metal to deal with, but its high conductivity will make it invaluable for overhead transmission. It is true also that the weight to be supported on posts is half of copper, but the surface exposed to the wind is greater, and its strength is not great. The chief drawback to its use, especially overhead, is its liability to become rotten. This defect does not exist if the metal be pure, and especially if free from sodium. But exposure to the atmosphere, especially near the sea, induces deterioration. The fact that aluminum is easily oxidized ought not to condemn it. The same is true of iron and steel, and yet we do not hesitate to place structures of these metals in exposed positions. Only we paint them; so I propose that we paint or varnish our aluminum conductors wherever necessary. We have had little experience in this direction. I laid out a few hundred yards of 1/4-in. aluminum wire on a Scotch estate a year ago, and am watching the effects of weather.

HALF FARE IN MASSACHUSETTS.

The Massachusetts Legislature at its last session passed a law requiring street railways to transport school children at half rates, and pending a judicial decision as to the validity of the law the Consolidated Street Ry., of Worcester, has decided to put on sale books of school tickets. The tickets are issued in books of 10 for 25 cents and 40 for \$1, good for the transportation of pupils in the grammar and high schools. The company formerly sold high school pupils tickets at the rate of 33 for \$1.

The Springfield (Mass.) Street Railway Co. intends to increase its capital stock from \$1,550,000 to \$2,300,000, the proceeds to be used in making extensions, purchasing additional real estate and adding to the equipment of the road.

Residents of St. Joseph, Mich., have asked the street railway company to inaugurate an ambulance service over its lines. It is probable an old single truck car will be fitted up to carry injured persons and a spur track will be built into the hospital yard.

ELECTRIC INTERLOCKING ON THE TOLEDO, FREMONT & NORWALK ELECTRIC RY.

The accompanying illustrations show the signal and interlocking apparatus recently installed by the Taylor Signal Co., of Buffalo and Chicago, at Fremont and Genoa, O., where the Toledo, Fremont & Norwalk Electric Ry. crosses the main line of the Lake Shore & Michigan Southern R. R. The two installations are similar. Figs. 1 and 2 are diagrams of the crossing and Figs. 3 and 4 show two views of the motor and mechanism for operating the derails. Fig. 1 shows the normal positions of the signals and derails and Fig. 2 their positions when an electric car is crossing the track.

On the Lake Shore track are two home signals, D and D', 600 ft. from the crossing, which stand normally at clear, and two distant signals, E and E', each 1,200 ft. from the home signal, and these are also normally at clear. On the electric line are two dwarf signals, F and F', which are normally at "stop", and four derailing switches, two of which, C and C', are normally closed, and two, B and B', are open. A is the tower; this tower is no necessary part of the installation, but the employment of a watchman was insisted upon by the Lake Shore as a condition of its consent to make the crossing.

A rail circuit extends to a point 500 ft. outside the Lake Shore distant signal, 2,300 ft. from the crossing, and the presence of a train on the rails within this distance locks the signals F and F' on the electric line. When this lock is released, that is, when no steam train is within 2,300 ft. of the crossing, and an electric car reaches the point indicated in Fig. 1, the towerman at A sets signals D, D', E and E' against approaching Lake Shore trains and this in turn closes the derails B and B' and opens the derails C and C' on the electric line. The electric car can then cross the track and continue until it is stopped by the open derail C'.

FIG. 1.

FIG. 2.

This being closed by the towerman at the same time opens the derails B and B' and sets the Lake Shore signals at clear. The object of having the outlying derails C and C' is to prevent the Lake Shore signals being set against the trains when there is no necessity for it; the steam road signals must be restored to normal position before the electric car can proceed. This overcomes one of the most annoying objections that has been found to some other interlocking systems, that the trainmen on the electric cars would proceed and leave the signals for the steam road at "stop." It is a notable improvement over the clumsy device of locking the operator in the cabin until he has properly set the signals.

When the towerman goes off duty he connects the controlling circuits to hand key boxes located on the electric line and the signals are then operated by the conductors of the electric cars. It is quite evident that if it is safe to leave the operation of the signals to the electric railway employes part of the time it is equally safe at all times and a towerman is unnecessary. Thus this system is entirely automatic and affords complete protection without the continuing expense of a man to operate the signals, which

is a point of great superiority over mechanically operated interlocking signal systems.

The interlocking board and the mechanism for moving the sig-

FIG. 3—DERAIL OPEN.

nals and derails have been very carefully designed. Current for operating is supplied at 60 volts from a storage battery. At crossings with electric lines current to charge the battery is taken from

FIG. 4—DERAIL CLOSED.

the trolley line; at steam crossings a small gasoline engine drives a dynamo which charges the battery.

The president and general manager of the Taylor Signal Co. is Mr. A. W. Hall, 1318 Monadnock Bldg., Chicago.

SAVING MONEY ON TIES.

Perrizo & Sons, who are among the largest producers of railway ties in the country, operating yards at Daggett, Mich., Marinette, Wis., Nathan, Mich., and Pembina, Mich., in an interview with a "Review" representative made the following suggestion:

"Interurban and city electric lines will do well to investigate the merits of the white cedar timber that cedar dealers in northern Wisconsin and Michigan have commenced to make during the past five years. In our judgment these ties fully answer the purpose of more expensive woods and in many cases last even longer. These ties are made from commercially standard white cedar timber, and furnished either hewn or sawed on two sides, as desired. They are made in 5 x 6 in. x 7 ft., and 6 x 6 in. x 7 ft. and longer. As these 7-ft. ties are smaller and shorter than the regular standard 8-ft. tie they are sold cheaper and cars can be delivered to long distances at a minimum price, and there is no reason why electric roads should not use more of this class of ties than they do. It is conceded that the white cedar tie is as good if not better in durability than the white oak, and where roads are built on solid ground,—as is usually the case with electric roads—in clay or gravel this size of tie will not only last but will sustain any ordinary traffic as well as if they were 7 x 7 in. x 8 ft.

"The cost would be about half of what the larger size ties are worth, and except in a swampy or spongy soil, where they have been used they have been found to answer the purpose just as well; and the economy in construction cuts a very large figure. As we previously remarked, it will pay any manager to carefully investigate this tie question, and our experience has been that where they do so it is almost certain to result in the adoption of the white cedar 7-ft. tie."

September 11th was "Trolley Day" at Wichita, Kan., and the Wichita Railroad & Light Co. devoted the entire receipts of the day to charity. Of the \$200,000 taken in, \$108.87 was presented to the King's Daughters, \$108.97 to the Children's Home, and \$72.66 to the Wichita Hospital.

MECHANICAL DEPARTMENT

SPLICED CARS AT TOLEDO.

By courtesy of Mr. Thomas H. McLean, vice-president and general manager of the Toledo Traction Co., we have received a drawing showing the plan adopted by the company for making long

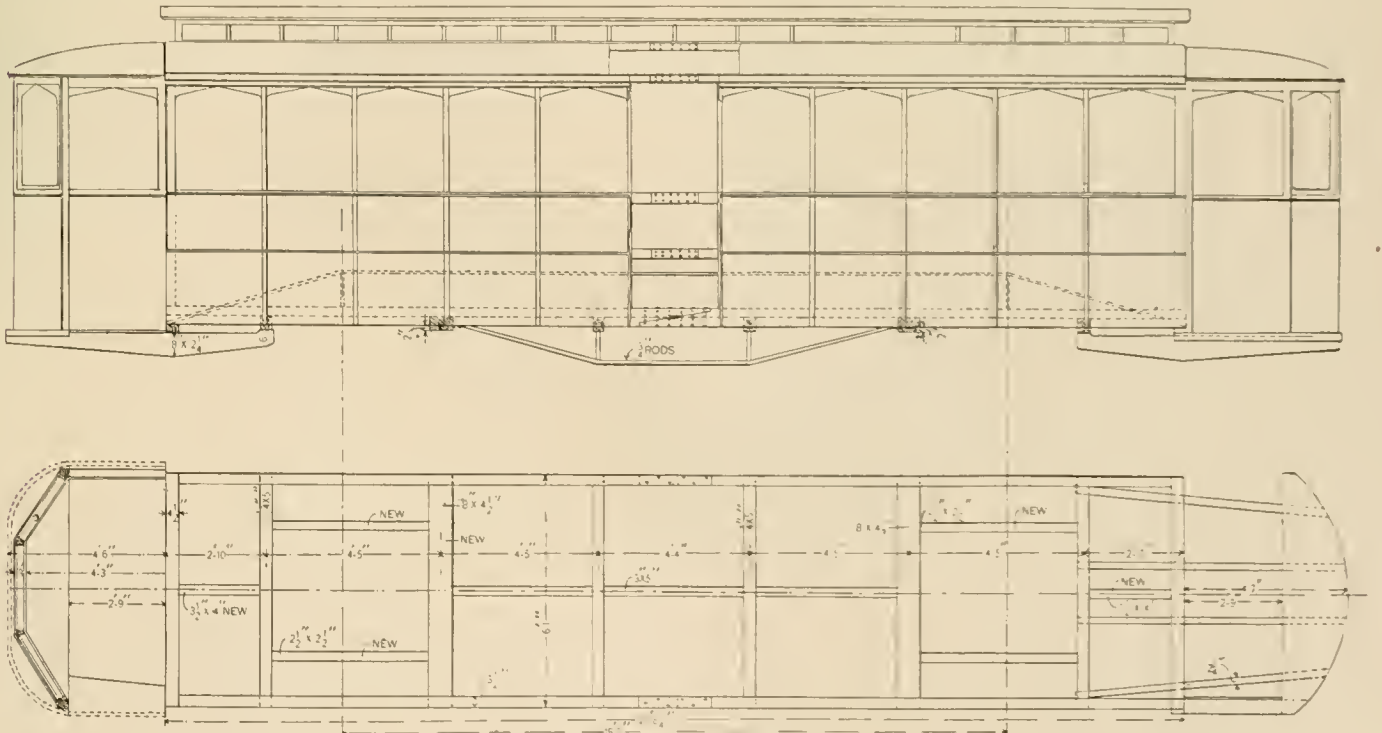

cluding the 4 1/2 x 8 in. cross piece, and the 3 1/2 x 4-in. longitudinal from the trap framing to the end sill are new. New vestibules were put on the spliced cars and these are somewhat wider than those on the smaller cars. When finished they present a very attractive appearance, as shown by the half-tone engraving

SPLICED CAR, TOLEDO TRACTION CO.

cars by splicing two shorter cars. The old cars were 16 ft. long in the body and when spliced made a body 28 ft. 8 1/4 in. long. Very little new framing was used; the framing around the trap doors in-

The company last year made 12 long cars out of 24 short ones and this year has made 7 additional long cars by splicing; the later ones are 1 ft. longer than those first spliced.

SIDE ELEVATION AND FLOOR PLAN.

BAYLEY HEATING AND VENTILATING APPARATUS.

There are many places about a street railway system where blowing apparatus may be used with advantage, but it is important that the blowers installed be properly designed for the work they have to do and particular account must be taken of the surrounding conditions. Mechanical draft in the power house, heating and ventilating systems for the car shops and barns, and exhausters for those shops where there is much dust or shavings to be removed, are some of the applications most extensively used.

In a boiler plant with chimney draft, blowers properly installed will enable a given boiler equipment to carry a temporary overload, or the number of boilers may be increased without enlarging the existing stack or stacks. In building new plants the advantages of a forced draft system are carefully weighed; these include reduced first cost, the ability to regulate the draft to suit all conditions, reduced temperature of the escaping gases, and the facility with which additions may be made to the original installation.

For car barns it is quite important to have some method of heating the pits so that ice and snow can be readily removed from the cars and trucks in winter. The peculiar advantages which a hot air system of heating offers for such a purpose have already been recognized by railway men and some of the largest car barns recently built have been so equipped.

The paint shops must be thoroughly ventilated at all times and in winter heated also. If wood working machinery is used to any extent an exhausting system for removing shavings and dust is almost a necessity.

The William Bayley & Sons Co., of Milwaukee, has perfected a system of hot blast apparatus including fans, ventilating wheels and planing mill exhausters; in all the different types the design has been carefully worked out to suit the various conditions. The planing mill exhausters are made in sizes ranging from 30 to 80-in. with capacities at 1 ounce pressure of from 1,250 to 11,000 cu. ft. of air per minute; at a pressure of 6 ounces the corresponding capac-

BAYLEY STEAM FAN WITH HEATER.

ities are 3,200 and 26,000 cu. ft. per minute. These are all made with outlets and pulleys arranged so that the proper direction of discharge can be secured without the necessity of using crossed belts.

For use with boilers, forges, heating furnaces, etc., a special type

known as the volume blower is recommended; these are so called because designed to move large volumes of gases against comparatively small pressures.

Our illustration shows a Bayley steel plate steam fan with sectional heater; the discharge is known as "right hand up," right hand meaning that when standing so as to face the discharge pipe the driving mechanism is on the right hand. The heater comprises 2,200 ft. of 1-in. steam pipe over which the fan draws the air discharging it through ducts which are built into the walls or carried through the rooms. The steam pipes are arranged in sections one or more of which receive the exhaust steam from the fan engine, the others being supplied with the exhaust from other steam apparatus or with live steam. The temperature of the air moved may be regulated by cutting sections in or out, and the volume by throttling the air pipes or by reducing the engine speed. The heaters may also be motor driven.

This type is extensively used for factory and public buildings and is admirably adapted for railway shops and car barns.

EFFECT OF TEMPERATURE ON THE FRICTION OF BRAKE SHOES.

In the "Review" for July, 1899, page 477, we published a comprehensive digest of the experiments heretofore made on brake shoes for cars, but this did not include data as to the effect of heat on the coefficient of friction. At the September meeting of the Western Railway Club, Prof. R. A. Smart, of Purdue University, presented a paper giving the results of various tests of brake shoes that have been made at Purdue since the Master Car Builders' brake shoe testing machine was installed there. Prof. Smart discussed three points: The variation of the coefficient of friction with speed, braking pressure being constant. The variation of the coefficient of friction with braking pressure, speed being constant. The variation of the coefficient of friction with the temperature of the shoe.

The experiments on the first two of these points confirmed the results of the M. C. B. tests made in 1896, and we do not give them here; that portion of the paper dealing with the effect of temperature is as follows:

The investigations on the effect of temperature were undertaken for the purpose of finding a partial explanation for the very considerable variations which frequently occur in the results of brake shoe tests under identical conditions and which it has seemed impossible to avoid even when exercising the utmost care. Such differences often amount to 2 or 3 per cent, with a value of the coefficient of friction of, say, 25 per cent, and as has been stated, they have been attributed to two causes, namely, variations in the temperature of the rubbing surfaces and variations in the comparative roughness or smoothness of those surfaces.

So far as the writer is aware, no reliable information has been obtained heretofore on the effects of temperature, a fact which is easily explained by the difficulties attending such investigations. In fact, it is well nigh impossible to carry out the experiments with a great degree of refinement or to arrive at other than general conclusions. This, however, has been done in the investigation under consideration, and the general conclusion reached is put forth with confidence as one which is accurate for all practical purposes.

The tests upon which the conclusion is based involve ranges of temperature of the shoe up to 1,500° F., speeds of from 40 to 60 miles per hour, and normal pressures of from 2,800 lb. to 6,840 lb. They also involve continuous runs of about five miles in length and from five to ten minutes in duration. It is believed that the range of temperature mentioned is sufficiently high to embrace all but the most extreme conditions of service. The term "temperature of the shoe," as here used, is more accurately defined as the temperature of two points on the center line of the face of the shoe and near either end. It is obviously impossible to measure the average temperature of the whole shoe while running. Two points of measurement, as just noted, were chosen to represent the average temperature of the shoe.

(The paper included four diagrams showing the temperature of

shoe and the coefficient measured at short intervals during four continuous runs at 40 miles per hour and 2,868 lb. braking pressure; two were for soft cast iron shoes and two for hard cast iron shoes, a chilled wheel being used in all four runs. The temperature of the shoe rose from about 100° or 150° F. at starting to about 1,000° F., and in one case 1,400°, at the end of the test. The coefficient of friction rose and fell irregularly, the maximum variation being about 5 per cent and the average value of the coefficient about 20 per cent.)

Both shoe and wheel were cold at the start. Successive readings were taken, during the run, of the temperature of the trailing end of the shoe, and these are plotted with the coefficient of friction for the same instant. It was found that the curve of temperature of the shoe rises during the run to several times its original value, while the coefficient of friction changes but little. The curves show that the coefficient of friction is practically a constant, while the temperature of the shoe varies through a wide range.

The curve representing the coefficient of friction does not, in these diagrams, start at the axis of ordinates. The readings obtained at the beginning of an application are always more or less irregular, and were, therefore, omitted when plotting the curves. The lines showing the coefficient of friction are not straight, but the variations are not greater than the variations found in ordinary stop tests under identical conditions. Their character and direction warrant the general conclusion which has been drawn.

It should be said that at no time did the shoe heat up uniformly over its entire rubbing surface. The point of maximum temperature during the first part of the tests, particularly, shifted from the center to either end and back again for no apparent reason and with no observable regularity. Readings taken from both ends in quick succession would sometimes show the leading end hotter and sometimes the reverse, although at any time the difference between them was not great. The general form of the temperature curve may be explained as follows: Immediately after the shoe is applied to the wheel, its temperature rises to about 500° F. In this time the wheel, being of greater mass, has remained practically cold. At this point the shoe begins to impart heat rapidly to the cold wheel, thereby keeping its own temperature down, until the wheel has been heated up and the tread has acquired a comparatively high temperature, after which the temperature of the shoe again increases.

In the continuous tests just described, the initial temperature conditions of the shoe and wheel were the same. Both were cold. To show that variation in the initial temperature does not lead to different results 15 stop tests were made in which the wheel was brought to rest from a 35-mile speed under a continuous brake shoe pressure of 6,840 pounds. The initial temperature of the shoe varied from about 200° to 600° F. The temperature of the wheel varied also, following approximately the temperature of the shoe. The tests were run in several series, each series consisting of three or four tests run after the other, the final temperature conditions of one being the initial conditions for the next, and so on.

The conclusion drawn from these results confirms the one already stated, i. e., that within the limits of the tests the temperature of the rubbing surfaces does not affect the coefficient of friction.

A number of series of stop tests were made in addition to those the results of which have just been presented. The results from these tests were irregular and unsatisfactory and no conclusion could be drawn from them.

DECISION ON POLYPHASE MOTOR PATENTS.

The Westinghouse Electric & Manufacturing Co., in August last brought suit against the New England Granite Co., for infringement of the Tesla patents covering the polyphase system of transmission. The case was heard by Judge Townsend, sitting in the United States Circuit Court for the District of Connecticut, and the entire field of power transmission was thoroughly covered by the experts employed on the case, and much interesting matter relating to the early days of alternating current work was brought to light. The Westinghouse company sends us the following data concerning the most important citations bearing upon the case, which were those which related to the Deprez, Bradley, Siemens, Gramme and Bailey apparatus, all of which were taken up in detail.

Deprez' invention related to the use of an annular electro-magnet wound with two coils at right angles to each other. Cur-

rents of different strengths being sent through the two cells, the resultant polarity of the magnetic field would of course depend upon the ratio between the two current strengths. It is important to note that Deprez designed his shifting magnetic field for use in combination with a magnetic needle suspended in the center of the annual magnetic field. The direction of the magnetic needle was to be controlled from a distance by simply varying one or both of the currents in the two different field windings, direct currents of course being used.

The next point brought up by the defending company bore upon the invention of C. V. Bradley, who in 1887 applied for a patent on a dynamo electric machine, in which two currents were generated in separate windings. The complainants showed, however, that Bradley had no conception of the use of these two currents for the purpose of driving a motor, the sole object of the invention having been "to obviate difficulties in prior constructions."

The defendants then took up the case of Bailey, who had, as suggested by Arago, effected the rotation of a disk by means of rotating electro-magnets. It was, however, shown, as indeed the defendants admitted, that Bailey's apparatus was merely for a laboratory experiment, and that the inventor had not used alternating currents.

The Siemens and Gramme multiple circuit machines were next considered, and the defense set up the point that these machines might have been used as motors, since they contained the necessary elements for such use. Judge Townsend ruled, however, that such use was at no time developed, and that its development would have called for distinct invention.

The evidence all showed that, while many earlier inventors had at one time or another touched upon the general field of magnetic rotation, no one had ever evolved a machine embodying the principle of magnetic rotation by means of alternating sine currents differing in phase, and that Tesla's conception of the rotating field, as applied to the induction motor, had produced a sweeping change in the electrical industries. The court declared that Tesla was therefore entitled to the protection of a patent, quite as much as were the inventors of electric telegraphy and telephony. Judge Townsend spoke eloquently of Tesla's achievements, and his decision in favor of the Westinghouse company concluded thus: "It was he (Tesla) who first showed how to transform the toy of Arago into an engine of power; the 'laboratory experiments' of Bailey into a practically successful motor; the indicator into a driver; he first conceived the idea that the very impediments of reversal in direction, the contradictions of alternations, might be transformed into power producing rotations, a whirling field of force. A decree may be entered for an injunction, and accounting as to all the claims in suit."

PHONO-ELECTRIC WIRE.

"Phono-electric" wire is a product of the Bridgeport Bras Co., and is described by the maker as follows: "This wire is the result of a demand for a material that would stand up under all sorts of trying conditions, endure extraordinary stress without yielding, and prove absolutely trustworthy in all extremes of wear and weather. It is a special copper alloy designed to give the best possible combination of strength, toughness and conductivity. Phono-electric wire is nearly twice as strong as annealed copper, and nearly 50 per cent stronger than hard-drawn copper, and its good properties are permanent; it is as tough as mild steel, vastly more durable, and four times as good a conductor. It is a homogeneous metal, while hard-drawn copper is only hard on the surface."

We have made inquiries of Mr. J. R. Chapman, electrical engineer of the Chicago Union Traction Co., as to the service he had been getting from this wire, and he states that the Traction company has been using it for about two years and is putting up more of it nearly every month. Phono-electric wire has been adopted as the standard trolley wire to be used at all points where the service is particularly severe.

The Jackson (Mich.) Street Ry. was sold at auction on Sept. 13th. After spirited bidding by W. A. Boland, representing the Michigan Traction Co., J. D. Hawks, of Detroit, president of the Detroit & Ann Arbor Electric Railway Co., C. D. Beebe, of Syracuse, N. Y., and others, the road was struck off to Mr. Boland at \$153,500.

RAIL BOND TESTS.

Made by Experts of the French Government in July, 1900, at the Ecole d'Electricite, Paris.

To determine which was the best method of rail bonding, very careful and thorough tests of the leading types of rail bonds were made in July by experts of the French Government at the Ecole d'Electricite in Paris, and the formal report has just been issued. To insure fairness each bond was applied by one of its representatives, who was present at the test. In each case the current and potential difference were measured from which the resistance was calculated. In each test the same pair of grooved girder rails were used, weighing about 80 lb. to the yard, and joint plates were not used.

1. Edison-Brown plastic copper rail bond; size, No. 0000; length 76 mm.; height 38 mm.; thickness 3.2 mm. This bond was merely laid by its own weight so that one-half touched the amalgamated spot upon one rail and the other half a similar spot upon the other rail. A current of 1.915 amperes was passed from rail to rail through this bond with a difference potential of 0.0234 volt; calculated resistance 0.0000122 ohm. After five minutes the current was 1.806 amperes; difference of potential, 0.0233 volt, and calculated resistance, 0.0000129 ohm. After the passage of the current for five minutes through this bond the finger could be held upon it without discomfort.

2. Conditions the same as in the first, except that two No. 0000 Edison-Brown plastic copper rail bonds were used. In this case the current was 1.915 amperes; difference of potential, 0.0127 volt, and calculated resistance, 0.0000666 ohm. No apparent heating above temperature of room.

3. Conditions the same as before, except that one Edison-Brown plastic copper rail bond, No. 000000 size, was used. Length, 89 mm.; height, 44.5 mm.; thickness, 4.7 mm. The current was 1.910 amperes; the difference of potential 0.0114 volt, and the calculated resistance 0.0000598 ohm. No appreciable heating above temperature of room after five minutes' passage of current through the bond.

4. Conditions the same as in No. 3, except that two Edison-Brown plastic copper bonds, No. 000000, were used. The current was 1.880 amperes; difference of potential, 0.00678 volt; calculated resistance, 0.0000036 ohm.

5. Copper bond of No. 00 size set in rails by driving steel pin in the longitudinal hole in the terminals. Diameter of conductor,

peres; difference of potential, 0.1213 volt, and calculated resistance, 0.0000659 ohm. Bond became very hot.

8. One end of a permanent copper bus-bar on switchboard in the laboratory of Ecole d'Electricite was connected to adjoining bar by the experts of the school, in the best French manner. The other end of the same bus-bar with contact of the same area and with the same number and size of bolts, was made up with the Edison-Brown contact alloys. With a current of 1,760 amperes the loss at the first joint was 0.048 volt; the loss at the plastic alloy joint in series with the first was 0.0008 volt, or only 1-60 as much.

9. A current of 202 amperes was passed through a copper rod 11 mm. in diameter. Difference of potential measured between two points about 10 cm. apart on the rod was 0.0038 volt; calculated resistance, 0.0000188 ohm. The rod was then sawed in two, the ends of the rails were amalgamated and a small amount of plastic alloy was placed between the ends in contact with each other. With a current of 206 amperes the difference of potential was .0045 volt, and the calculated resistance, 0.0000218 ohm. The length of a bar of unbroken copper to give the same resistance measured 11.5 cm. Resistance of the rail per metre, 0.0000564 ohm.

ROUND TOP HANGERS.

The comparative simplicity in design of the round top form of trolley wire hanger, has led many street railway companies to prefer this type of hanger to the other standard forms now on the market. To meet the demand for hangers of this form, the Ohio Brass Co. has recently brought out, as an addition to its Type R hanger, a variety of round top hangers, which it designates respectively as the Types J, N and N-W straight line hangers. The various styles are shown in the accompanying cuts, which illustrate not only the general form of each hanger, but also their internal construction. They are made in either bronze or malleable iron, galvanized or Japanned, and are regularly fitted (with the exception of the Type N-W) with a $\frac{5}{8}$ in. stud bolt to fit the standard forms of ears and clamps. Where special sizes of stud bolts are desired, these are furnished to order. The Type N-W hanger is almost a duplicate of the Type N, and is designed especially for use with the D-W trolley clamp, made by the same company, and, in place of the regular $\frac{5}{8}$ in. stud, is provided with a conical stud bolt, internally threaded to fit the stud bolt in the clamp.

For insulation the Ohio Brass Co's. well known "Dirigo" is used

TYPE J.

TYPE N.

TYPE N-W.

ROUND TOP HANGERS—OHIO BRASS CO.

9.3 mm.; diameter of terminals, 16 mm. In this case the current was 1,610 amperes; difference of potential, 0.75 volt, and calculated resistance 0.00046 ohm when the circuit was closed. After five minutes the current was 1,530 amperes; difference of potential, 0.83 volt, and calculated resistance, 0.00054 ohm. After the current had passed for two minutes it heated the bond to redness.

6. Two copper bonds aggregating the same section as in test No. 1; these bonds were set by driving steel pin in the longitudinal hole in the terminals. The diameter of each bond was 9.3 mm.; diameter of bond terminals, 16 mm. In this case the current was 1.805 amperes; difference of potential, 0.278 volt, and calculated resistance, 0.000154 ohm at the start. After 5 1-3 minutes the current was 1,620 amperes; difference of potential, 0.37 volt, and calculated resistance, 0.000219 ohm. Bond became very hot.

7. In this test the leading type of flexible copper bond with solid terminals was used, which had exactly the same section as the bond in test No. 1, viz.: No. 0000; diameter of terminals 22 mm. The current was 1,830 amperes; the difference of potential, 0.119 volt, and the calculated resistance 0.000065 ohm when the circuit was closed. After five minutes the current was 1,750 am-

peres, and is molded directly in the body casting of the hanger. The interior ribs and corrugations on the body casting, which project inwardly into the insulation, serve to hold it securely in place. As will be noted the stud bolt is furnished with a flanged head, which in like manner secures a firm anchorage in the insulation. This form of construction prevents all possibility of the insulation becoming loose in the shell, or the stud bolt pulling out. The Types J and N hangers are fitted with a circular washer, which is set flush with the lower face of the insulation, and furnishes a bearing surface for the boss of the trolley ear or clamp used in connection with it. The body casting entirely envelops the insulation and serves to protect it, not only from rain and moisture, but also from accidental blows of the trolley wheel.

On Oct. 1st a new scale of wages went into effect on the lines of the Pueblo (Col.) Traction & Electric Co. Trainmen that have been with the company for one year will hereafter receive 19 cents per hour instead of 18; two-year men will receive 20 cents instead of 19; and three-year men will receive 22 cents.

CORRESPONDENCE

TRAMWAYS IN HONOLULU.

Honolulu, H. I., Sept. 13, 1900.

Editor "Review": It may interest your readers to know that we are about to commence active construction work on the first electric railway built in the Hawaiian Islands. Contracts for the material to be used on this road were let some time ago but various unfavorable conditions have prevented work from progressing more rapidly.

You are probably aware that building a railway in Honolulu is a somewhat different matter from building one in Chicago, as there you are close to and in constant touch with the various points of manufacture, while we are a very long distance away and we have no cable. In the manufacture of our material, for instructions as to any particular point, it is necessary to communicate by mail with Honolulu, and by the time the reply has been received, practically a month has gone by, and then the reply may not be satisfactory and further delays are caused.

The matter of transportation is a very serious one, as the steamship companies between the coast and the Islands have a habit of exercising their own judgment as to what they will load, regardless of what the fellow at this end may particularly require. In the United States an engine, for instance, loaded at the machine shop, would be shipped to any part of the country and delivered complete, whereas with us we are apt to get the beds in one shipment, probably all the wheels in another, mixed up with various smaller parts, and the rest following in the third shipment, the first being useless until we have received the whole outfit.

However, we are glad to be able to say that while our stuff has not arrived in its entirety, still we have on hand materials for a complete railway system of 20 miles, including power plant, road-bed and overhead material. If all goes well, we shall have part of the system in operation during the earlier part of next year.

Yours truly,

C. G. BALLENTYNE,

Manager Honolulu Rapid Transit & Land Co.

NEW YORK STREET CAR BRAKE TESTS.

Editor "Review:" The comments made in your August, 1900, issue, page 422, upon the New York street car brake tests seem to us eminently just and proper, although we do not think your strictures are nearly as severe as the incompetency displayed and inconclusiveness of the tests deserve.

These tests were made primarily for the purpose of showing the relative efficiency of the different styles of brakes. Extreme accuracy is presupposed from the fact that the figures given are carried in all cases to several places of decimals. Times of stops are indicated in hundredths of a second, while the figures in other cases are carried out to 4 or 5 places. Upon an inquiry into the facts connected with the tests the absurdity of the figures becomes astonishing.

Then the question of skidding wheels is one where the most accurate figures are given, the allowance here being carried out to five places of decimals. It was a standing joke among engineers some years ago that in one of the old handbooks data were given with figures extending to six decimals and foot notes were added saying the figures were probably within 25 per cent of truth. In this table of skidding we have five places of decimals which are correct within 50 per cent, for according to headings of the table skidding to which these long decimals belong varies by one-half.

As you intimate, the utter worthlessness of these figures is best shown by the fact that the cars frequently ran further in the given time than they would have gone in the same time at the given speed. From this we may derive several conclusions; we may believe that some of these brakes when applied to the wheels greatly increased the speed of the car, or that the recording apparatus of the New York State Railroad Commission produces a great acceleration, or we may reach the less charitable but more practical conclusion that the Commissioners paid so little attention to the matter that the car was accelerating with great rapidity

when the required speed was reached, and this acceleration accounts for the seemingly impossible figures. Such reports are a waste of good printing paper.

Railroad men are deeply interested in the question of brakes and their relative merits, but they have no practical interest in comparing brakes with the incident of skidding wheels nor of the personal equation of the operator in manipulating the brakes. They have no interest whatever in the operation of brakes before they are properly adjusted to the car and before they have run long enough to obtain contact of the shoes with the wheels.

We do not think there is a brake man in the country who can look over these figures and feel that he has learned anything. Some of the best brakes are put at the foot of the list. Some of the brakes which made the most absurd stops have received a high position, while others making good stops seem to have been ranked very low. The advantages which a power brake has over even an expert motorman were not shown. Mr. Thomas Millen's operator with the Sterling brake, if we understand the figures, made better stops than any of the power brakes, and in fact should have been placed at the head of the list. At the highest speed his stops were practically equal to the best.

But one conclusion can be reached from looking over the table and reading your remarks, and that is that tests of this kind are in the highest degree desirable and they should have been put in the hands of an expert mechanical engineer, and an electrician might have been with advantage associated with him as consulting engineer, but an electrical engineer is out of place when taking charge of a matter purely mechanical like these tests. Yours truly,

J. G. BRILL CO.

THE LAST HORSE CAR IN SYRACUSE.

With the turning on of the current on the Lodi St. line of the Syracuse (N. Y.) Rapid Transit Ry. early in this month, one more of the few remaining horse car lines in the United States passed out of existence. Another horse car is for sale cheap and the two

LAST HORSE CAR IN SYRACUSE.

faithful servants that drew it have ended their labors in that field. Through the kindness of Mr. E. G. Connette, general manager, we are able to reproduce herewith a photograph taken of the last car as it stood at the corner of James and Lodi Sts. ready to make its last run. The fog at the end of the white horse is due to the fact that the photograph was taken in fly time.

The latest thing in trolley wheels is one having the harps extended into outwardly flaring wings which make it more difficult for the wheel to leave the wire and greatly facilitate replacing the wheel when it does jump.

As a result of the coal miners strike in Pennsylvania several street railway companies, including the Scranton Ry., were forced to shut down part of their power stations and run on longer schedules for a number of days.

Washington, D. C., has a novel advertising scheme. In several places along the street railway lines the ordinary bill posters' signs have above them a reflector, containing incandescent lamps. An overhead line taps the trolley feeder and supplies current to the lamps, which at night light up the signs for the benefit of the trolley passengers.

The Great Storm at Galveston, Texas, September 8, 1900.

Loss of Life Estimated at Between 7,000 and 8,000—No Person Escaped Property Loss—Total Property Loss from \$25,000,000 to \$30,000,000.

BY CHARLES B. WOOLVERTON, GALVESTON.

The story of Galveston's storm tragedy can never be completely written. Since the terrific gale of Saturday night September 8th, an army of faithful men have been struggling to restore the afflicted city to something of its previous condition, while others have worked as faithfully trying to convey to humanity some of the particulars of the tragedy. They have told much, but they could not tell all, and even at this late date it is impossible

The strongest wind blew late in the evening when it shifted from northeast to southeast and attained a velocity of about 110 miles per hour. The exact velocity was not recorded owing to the destruction of the wind gage of the United States Weather Bureau after it had registered 100 miles per hour for two minutes at 5:10 p. m.

The poles of the East Broadway street railway line are standing

CORNER 22d ST. AND AVE. H.

WRECK OF POWER HOUSE.

to give a full description; only those who lived through the awful experience can imagine how terrible the whole thing was.

Over four miles of the beach were swept clean of buildings. Some idea of the destructive path of the hurricane can be had from a view of the beach from Tremont St. east. Standing on a pile of debris 20 ft. high that marks the line of devastation extending from the extreme east end to Tremont St., an unobstructed view of the awful wreckage is presented. A line from Tremont St. and Ave. P straight to Broadway and 13th, where stands the demolished Sa-

but the lines are all down as a matter of course as far east as 14th St.; beyond that there is not a pole left standing and the tracks are all filled with wreckage. The line of wreckage crossed Broadway between 13th and 14th Sts. and in it at this point were a number of bodies which could not be got out for several days owing to the great piles of lumber. The great bulk of this lumber is unbroken and represents sides or roofs of houses still intact.

The entire plant of the Galveston City Railroad Co. was demolished but fortunately none of the employees of the company were in

WRECK OF A VESTIBULED CAR.

BRIDGE AT 43d ST. AND AVE. R.

cred Heart (Jesuit) Church, is now as accurately marked by the ridge of wreckage that once stood as homes, as if staked out by experienced engineers. All the houses to the south and east of this line were razed to the ground. This territory embraces 70 blocks and was thickly populated. Not a house withstood the storm and those that might have held together if dependent only upon their foundations, were buried beneath the stream of buildings and wreckage that swept like a wild sea, from the east to the west.

the building at the time. Their escape may be accredited to the fact that the cars could not run after three o'clock in the evening and by five, the water was high enough in the boiler rooms to extinguish the fires. This building was constructed nine years ago. The machinery in the power house was all of the most modern type and it is an entire loss. Major Baer, receiver of the road, said today that the plant was a total wreck, the loss amounting to over \$200,000. All records of the property and bonds of the company

and all books were ruined in the flood. In the offices of the company not a desk remained. Bookcases were demolished and their contents strewn about the rooms. The offices of the company are located on one of the highest streets in the city and it is of interest

made the horrors could not then be realized. Three or four barge loads of the dead were carried out to sea and there buried, while thousands upon thousands of others were either buried or burned where found and among these were fathers and mothers, who in a

TRACK MOVED 200 YDS.

CORNER OF 22d AND WINNIE ST.

to know that the water rose to a depth of 4 ft. 1 in. in these offices, which are 2 ft. above the street level.

It is the desire of Major Baer to give the patrons of the company electric service in the lesser damaged districts by the end of the week and men are now at work repairing breaks in the trolley wires and car tracks of the Market St., Center St. and West Broadway lines, arrangements having been made with the Brush Electric Co. for power. One of the engines owned by the Galveston City Railroad Co. is being repaired and will probably be used to furnish part of the power. The work of repairing the broken trolley wires is really a minor task. The chief consideration is the question of power and it is hoped that the temporary arrangements will suffice until the repairs to the power plant can be completed.

A few of the piles that once supported the street railway trestle, extending from Center St. to Tremont, on the beach is all that remains to mark the curved line of the right of way at that point. At Denver Resurvey, the extreme western portion of the city, the wires and poles are down and the tracks badly disarranged.

twinkling had been taken from their all, leaving them in a wide world to battle with the coming storms of life, homeless, penniless and barely with friends.

Sept. 26, 1900.

WOVEN WIRE FENCING.

With the development of electric traction, the problem of fencing rights of way through rural districts has become as prominent as it has been for years with steam railroads; but fortunately for the traction companies, they are able to profit by the experience of the railroad companies, and are in position to avoid the expensive experiments which have caused the railroad companies so much annoyance and unprofitable outlay.

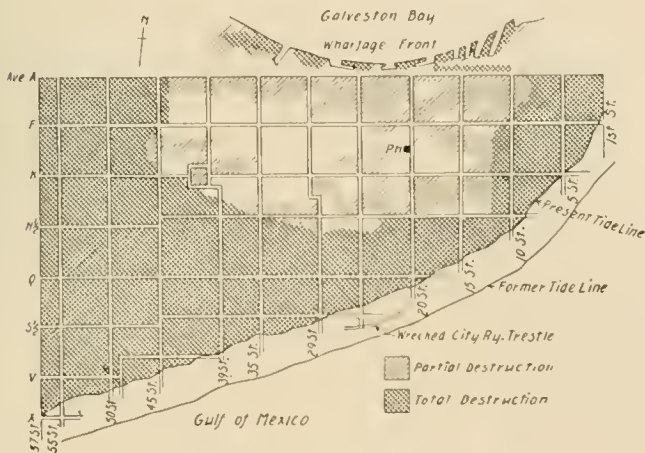

The traction companies are able to apply at once to their rights of way the most improved and most economical of fences, which are now taking the place of all the more primitive forms hitherto used by railroads. During the past year, thousands of miles of railroad property have been fenced with the American steel woven wire fences, and a number of traction companies have also availed themselves of the advantages afforded by this form of fencing and have placed it along their rights of way. It goes without saying that the expense of construction and the still greater expense of maintenance of wooden fences of any character, whether made of finished lumber, pickets, or split rails, cannot be considered for a moment as the proper solution of this problem.

A fence that is proof against wind, fire, snow drifts, against heat and cold with their expansion and contraction, is what the traction companies must have. These requisites are found in the woven wire fence, of which the American style, manufactured by the American Steel & Wire Co., is recommended as at once the cheapest and strongest.

The immense production of wire by the American Steel & Wire Co., and its facilities by reason of producing from the ore every grade of steel by the bessemer, open hearth and crucible processes, enable it to make for this fence just that grade of steel wire best calculated to meet the peculiar requirements of fencing. And, further than this, the galvanizing being done with zinc or spelter of its own production, assures a finished wire strong and durable.

Another feature in which the American Steel & Wire Co. is unique is in its contracts for furnishing the fence erected. It has a corps of trained fence builders, and will take contracts to build any amount of fencing, including furnishing the posts, all necessary appurtenances and all labor. Fence erected by these expert workmen is sure to be properly put up.

The American Steel & Wire Co. solicits correspondence from all interested in fencing, will promptly furnish estimates for any quantity of American fence of any height, either delivered in rolls of 40 rods, or fully erected and in place.

PORTION OF THE CITY DESTROYED.

The Galveston City Railroad Co. was chartered in 1867, and is a consolidation of two smaller companies; a receiver was appointed in 1897 and on Feb. 6, 1900, the property of the company was purchased by the Guaranty Trust Co., of New York. The system had 40 miles of track and 76 cars were operated.

There is a well organized citizens' committee at work in a business-like manner, but the work before them is a vast undertaking, and it will be some time before thousands will know the real nature of the disaster which has overtaken them and the world will never know it all.

The accompanying illustrations will show a small part only of what has been, and even could a picture the size of the town be

COMPRESSED AIR TRACTION IN NEW YORK.

About three years ago the street railway companies of New York, wishing to secure a practical and economical motor that could be used on their cross-town lines, where the installation of electrical conduits was not justified, because of the light traffic, undertook extensive experiments with compressed air for traction. The Third Avenue R. R. had motor cars built by the General Compressed Air Co., on the Hardie system, which comprised long stroke single expansion engines driving one of the car axles, the two axles being connected by side rods, as in the common type of steam locomotives. The Metropolitan Street Ry. had Hoadley motors, built by the Compressed Air Power Co.; these motors were compound, of short stroke and ran in oil, driving a shaft geared to the car axle.

The success of the Hardie motors on the Third Ave. lines convinced the managers of the Metropolitan Street Railway Co. that the patents of the General Compressed Air Co. were necessary for the best results, and the Metropolitan syndicate formed the American Air Power Co., which was a consolidation of the two air companies mentioned. Some modifications of the motors used on the Metropolitan lines were made, but the general characteristics remained the same.

About this time Mr. Robert Hardie became engineer for the Compressed Air Motor Co., which was the licensee of the General Compressed Air Co. for Wisconsin and Illinois, and introduced the Hardie motors for the night service of the North Clark St. cable line of the Chicago Union Traction; the cars used in Chicago were described and illustrated in our issue for October, 1899, page 729.

The excellent results achieved with the Hardie motors in Chicago led the Metropolitan syndicate to open negotiations for a further consolidation, and as a result the Compressed Air Co. was formed, thus merging all interests. Hardie motors have been substituted for those formerly used by the Metropolitan company, and the future of compressed air traction is now brighter than ever before.

The cars as now used in New York carry 14 reservoirs on the truck, and one under each seat, having an aggregate capacity of 55 cu. ft. and weighing 4,340 lb. The air passes from the reservoirs into a common header, and from the header into a pipe running to each end of the car. A stop valve under the control of the motorman regulates the flow of air. The air passes through a reducing valve and comes out at a working pressure of 150 lb. It then passes into the reheating tank, which is placed in the middle of the truck, and contains 500 lb. of hot water, varying in temperature from 320 to 170 degrees. The air passes into the bottom of this heater and escapes into the water through a perforated pipe. The air is heated to the temperature of the water, and is then drawn off at the top whence it passes from the exit pipe to the throttle valve of the motor, and thence to the valve chest of the engine, in the same way as steam in a steam engine. The cars are fitted with air brakes.

The compressing station at W. 24th St. and the Hudson River, which was built for use with the old cars, will be used for the new. It has a capacity of 56,735 cu. ft. of free air per revolution, and compresses to 2,500 lb. per sq. in.

FOR A BIG INTERURBAN IN CANADA.

An act is being prepared to incorporate the Toronto & Central Ontario Electric Railway Co., with \$5,000,000 capital, to construct and operate a system of railways in conjunction with different municipalities. Assurance has been received that such a system could be financed in New York, as interurban systems in the states have been wholly successful, and this stock is very popular with investors. It is intended that there shall be main routes with branch lines; and the standard railway gage will be adopted. This system is to be equipped with vestibuled palace cars at least 75 ft. long, having separate compartments for mail and packages. There is also to be a smoking compartment. It is the intention to furnish the cars in the most luxurious manner in order that passengers may be carried long distances without fatigue. There will also, it is intended, be small and suitable freight cars provided for shippers of farm produce. It is hoped that at least 500 miles will be constructed within five years.

VAN DORN COUPLERS.

The business of the W. T. Van Dorn Co. for 1900 to date is almost double that of any previous years, and Mr. Van Dorn states that now all the elevated roads of this country have adopted the Van Dorn couplers as standard, the Manhattan and the Boston elevateds being the last ones to do so. Large shipments have lately been made to Yokohama and to Glasgow, and orders have recently been received from Europe and from many interurban roads in the United States.

The company has now 13 distinct patterns in 13 sizes, which it has been necessary to build to meet the requirements of customers. The No. 3 and No. 4 draw bar heads with draft rigging, shown

NO. 3 AND NO. 4 VAN DORN DRAW BAR HEADS.

in the illustration, have been built for the Manhattan Elevated, of New York. They have been made on strong lines to withstand the heavy service; the rail is comparatively straight and the spring power in the heads has been materially increased, each head having five lifts of springs, 2 x 3-16 in. each. The draw bars for the

NO. 5 VAN DORN DRAW BAR.

Boston Elevated are similar to these, except that the drop is less and the stop casting slightly different.

The No. 5 draw bar is shown here connected to a ball joint. This is the company's standard for street cars. The No. 7 and No. 11 are similar to the No. 5, but are heavier, being for interurban cars.

BAD WIRE THIEVES IN CHICAGO.

The police of Chicago have spent considerable time of late trying to catch a gang of wire thieves that have been despoiling the electric lighting, trolley and telephone systems. The gang seems to be composed of expert electricians and in one or two instances they have gone so far as to drive up to the wires in a wagon resembling a street railway repair outfit and remove several hundred feet of feeders without attracting suspicion.

This was bad enough, but to cap the climax the thieves one day recently, after securing 500 ft. of cable, went and stole the telephone instruments and batteries from two of the patrol boxes used by the policemen for reporting to headquarters. The policeman on the beat had to walk to the station to turn in notice of the theft and the boys in the police department are feeling sore.

The Toledo Traction Co. has decided to permit firemen and policemen in uniform to ride free at any hour of the day or night.

The report of the Auburn (N. Y.) City Railway Co. for the year ending June 30, 1900, shows net earnings of \$76,237; operating expenses, \$50,002; other income, \$342; fixed charges, \$22,416; net income, \$4,160; deficit from previous year, \$26,080; total deficit, \$21,920.

VERTICAL WHEEL GEARED BRAKE.

The accompanying illustration shows a ratchet geared brake handle, designed for use on vestibuled cars, where there is not sufficient room for the ordinary horizontal wheel or ratchet handle. This vertical wheel brake handle is known as the Beverly, and is made by the Beverly Engine & Machine Co., of Beverly, Mass.

The wheel is any desired size from 12 to 15 in. The bevel gears are in the ratio of 2 to 1, and are made of brass with the teeth milled to secure a good fit and noiseless operation; the gear case is of

BEVERLY RATCHET CLUTCH.

malleable iron and is attached to the dashboard of the car. The ratchet clutch is in the spindle in the lower part of the case and the device is so arranged that it can be welded to the ordinary brake spindle. The wheel takes little room on the platform and the gear and the ratchet clutch gives a great leverage, as the motorman can work the wheel back and forth from any position the same as he can the ordinary ratchet handle. The device has been in use for the past two or three seasons on a large number of vestibuled cars in New England and in some of the Middle States, and is rapidly gaining favor with street railway managers.

MULTIPLEX ELECTRIC HEADLIGHTS.

It is a well-known fact that the use of electric headlights is much more convenient and economical for street railway purposes than is the use of the now out-of-date oil headlight, and it is equally a recognized fact that the light from an electric headlight consisting of a 16-c. p. lamp and a parabolic reflector is not much more than the light obtained from the lamp itself. The reason for this is, that a true parabolic reflector requires the source of the light to be practically a point, such as an arc light produces, or as is produced in less degree by a brilliant oil light.

Therefore, a regular locomotive headlight with an oil lamp will always be more efficient than the same headlight would be, fitted with an incandescent electric lamp of equal candle power, because the reflected image of the latter is very much distorted and out of focus. The light of the oil lamp is more condensed and consequently most of it is in proper focus with the parabola, while but a very small portion of the light of the incandescent lamp is in focus.

It is for these apparent reasons that the inventor of the "Multiplex" reflector conceived the idea of making a reflector which is adapted to the requirements of the incandescent lamps. The general form of the "Multiplex" reflector is on the lines of a true parabola and the "Multiplex" improvement consists of so altering the form of the parabolic reflector as to form a number of annular and concentric separate reflectors which illuminate the distortion of the reflected image of the incandescent lamp, with the result of a reflector which is several times as efficient as an ordinary parabolic reflector.

"Multiplex" reflectors have now been on the market little more than one year and have attracted the attention of street railway

managers everywhere, their introduction and adoption having been extremely rapid. The cost of headlights fitted with these improved reflectors being on a par with that of ordinary headlights, they are very naturally preferred and adopted in competition with the latter.

For railway headlights they are constructed in accordance with scientific principles. They are spun out of brass of heavy gage, and consist of a series of convex or concave corrugations of shape, size and radius varying with the style and kind of light to be used in combination therewith. They are polished, heavily silver plated, and then burnished, or nickel buffed, and are finished in such a manner as to maintain a lasting brilliancy. Each one of the concave corrugations performs the functions of a separate and distinct reflector, reproducing the light in a greatly magnified and intensified beam, the beams from each corrugation merging into those of the other corrugations, and this multiplication of separate beams of light is the secret of the intense light produced by the "Multiplex" reflector headlights. Two kinds of rays are projected from this reflector. One set forms a bright beam of great intensity, projected in a comparatively small field and penetrating to a great distance, while the other set has a much larger field of less intensity. This feature makes the headlights especially desirable for street railway purposes.

The Multiplex Reflector Co. makes a specialty of furnishing reflector shells to parties who may desire to substitute "Multiplex" reflectors in the cases which they now have. The factory of the company is at Cleveland, O., a convenient and centrally located shipping point for all parts of the United States. The selling agents for these headlights and reflectors are the W. R. Garton Co., Chicago; Western Electrical Supply Co., St. Louis; Morris Electric Co., New York; and Percy Hodges, Boston.

MR. YERKES WILL BUILD LONDON ROAD.

Mr. Charles T. Yerkes has purchased the charter for an underground road in London, and will proceed at once to build the line. The price paid for the charter was about \$500,000. The road is from Charing Cross to Hamstead, and will cost about \$12,000,000. It will be built of American material, by American men with American capital, everything, in fact, about the road will be American except the employes and passengers. It will be of a type representing the highest development of the electric railway art and cannot fail to be a revelation to the British riding public. The third-rail system will be used and special attention will be devoted to ventilation and lighting. The equipment will be something fine, and fast time will be made.

Mr. Yerkes sailed on October 6th for this country, where orders for necessary material will be placed, and everything connected with the construction of the road will be pushed with the utmost possible speed.

ROCK ISLAND ROUTE TO CONVENTION.

A large number of delegates will take the Chicago, Rock Island & Pacific from Chicago and intermediate points to the Kansas City convention. The usual concession is made in rates, which are one and one-third fares (\$16.70) for the round trip. The well known excellence of the Rock Island and its great popularity need no recommendation to travelers who want everything the very best. The train leaving Chicago at 5:45 p. m. carries buffet, library, smoker and dining cars. Reservations and further information can be had of any of the following agencies: Chicago, 91 Adams St.; New York, 305 Broadway; Boston, 200 Washington St.; Philadelphia, 111 South Ninth St.; Pittsburg, 415 Park Building; Detroit, 11 Fort St., West.

RELIEF ASSOCIATION AT WASHINGTON.

The officers and employes of the Washington (D. C.) Traction & Electric Co. are planning to form a relief association for the benefit of the 950 men employed on the system. President Stevens has promised to give \$1,000 as a nucleus for the insurance fund.

The Rockford (Ill.), Beloit & Janesville Electric Railway Co. has filed a bond to insure the construction of the road.

NEW CARS FOR ALBANY & HUDSON RAILWAY & POWER CO.

The accompanying illustrations show two styles of cars recently built by the Wason Manufacturing Co., of Springfield, Mass., for the Albany & Hudson Railway & Power Co., which has a 40-mile third-rail line connecting Albany and Hudson, N. Y. The cars have overhead trolleys, as well as shoes for taking current from the third rail, as they operate over the local street railway

the ceiling at intervals of about 4 ft. The buffers are curved angle bars, and are braced by the wooden floor beams and by two steel channels extending in a flaring direction and bolted to the platform timbers.

The summer cars are 53 ft. 6 in. long over the buffers and 52 ft. over the vestibules; the body proper is 43 ft. long, 8 ft. 6 in. wide, and 9 ft. 2 in. from the bottom of the sill to the top of the roof. The weight of the car body is 27,763 lb.; trucks, 15,900 lb.; electrical equipment, 12,600 lb.; air brake equipment, 1,465 lb.;

FIG. 1—SUMMER CAR FOR ALBANY & HUDSON—WASON MANUFACTURING CO.

tracks in Albany and Hudson. There are 10 summer cars, Fig. 1, and 8 winter cars, Fig. 2; of the winter cars 5 are full passenger and 3 combined passenger and baggage cars. The trucks are the Brill No. 27 extra heavy, the type developed by the J. G. Brill Co. for operation over T rails at high speed, while also suitable for the grooved rails in cities. The summer cars each have four G. E. 57 motors, 50 h. p. each, and K-14 controllers; the winter cars have four G. E. 51 motors, 75 h. p. each, and L-4 controllers. All cars have Christensen air brakes, with motor compressors, the compressors being housed in under the floor near the middle of the

total, 57,728 lb. This is heavier than the standard passenger coach of the Boston & Albany R. R., which weighs 52,000 lb. The window sashes are in two parts, and drop into the walls of the car flush with the coping. The vestibules have low side doors and curtains; the windows are shaded with ordinary duck curtains, which roll up. The interior finish is in white ash, white grained, while the ceilings are of light colored bird's eye maple simply decorated. Double sliding doors are provided at each end, giving a clear opening of 36 in. The cross seats are of the Wheeler patent type, made by the Haywood Brothers & Wakefield Co., of Wake-

FIG. 2—WINTER CAR FOR ALBANY & HUDSON—WASON MANUFACTURING CO.

car; also, ordinary ratchet hand brakes. They also have Providence fenders, and track sanding devices made by the American Locomotive Sanding Co., of Philadelphia, using compressed air. For lights there are 15 single keyless electric lamps on each side along the ventilator stringers, and two candle lamps at each end for use in case of failure of the lighting current. The registers are the Meaker duplex type; the two register cords and the bell cord are carried above the center of the aisle, being strung through rings at the lower ends of thin flat bronze strips, which depend from

field, Mass. The seats and backs of the summer cars are of wooden slats, and have corner grab handles.

The winter cars are divided by glass partitions into two compartments, one for smokers, and are to be run one way all the time, smoker end forward. They have 15 windows on each side, and the lower sash is designed to drop into the wall of the car. The interior finish is in mahogany, with paneled ceilings to the windows, finished in special marquetry design at the posts; the upper sashes are provided with embossed plate glass windows.

The ceiling is painted and decorated with tasteful designs. The cross seats are of the same type provided for the summer cars, and are upholstered in carpet, and provide seating capacity for 60 passengers. The ventilator shifting device is a rod and lever arrangement recently designed by the car builder, by which the ventilators can be operated from the rear end of the car. These cars have Perry ventilators, designed by E. S. Perry, of New Bedford, Mass. There are call buttons on the posts, and corrugated rubber floor mats. The additional equipment includes Consolidated electric heaters and Dorner & Dutton track scrapers. The total weight of the car is 59,700 lb.

The sills are reinforced by steel trussing; there are no steel plates used with the sills. The steps are of the double Stanwood type. Besides the ordinary grab handle at the ends an outriggered wooden vertical handle is provided against the end of the car. The gates are of the Wood type, made by the R. Bliss Manufacturing Co., of Pawtucket, R. I.

The three combined baggage and passenger cars are similar to the other five winter cars, except that a baggage compartment 14 ft. 6 in. long has been partitioned off. This compartment has seats that can be used if needed.

There are also two 43-ft. cars for express or freight; these are really electric locomotives, and have M. C. B. couplers. The express cars have side doors near the center 5 ft. in width.

DAMAGES FOR JOINT USE OF TRACK.

There has been much litigation at Atlanta, Ga., concerning the exclusive right of the Atlanta Railway & Power Co. to operate street railways. As we understand the situation the predecessors of the Atlanta Railway & Power Co. had the exclusive right to operate street railways over streets already so occupied by it, for a term of 30 years from Jan. 1, 1806; and that in consideration of an ordinance granting permission to change the motive power the companies agreed to submit to the condemnation of their tracks under certain conditions.

The Atlanta Rapid Transit Co. sought to condemn portions of the tracks of the Atlanta Railway & Power Co. for joint use, and three separate suits were begun. The matter was referred to three assessors. The portion of the assessors' report considering the elements of damage is as follows:

1. That the Atlanta Rapid Transit Co. shall pay the cost of the special work and the readjustment of tracks to suit the present situation.
2. That it shall be the duty and obligation of both companies to bear in equal proportion—that is to say, one-half each—of the cost of maintenance during joint occupancy, and what we mean by maintenance includes renewals necessary to keep the track and appurtenances connected therewith in good condition.
3. That upon abandonment of the joint use of these tracks by the Rapid Transit company the street railway structure shall belong to the Power company.
4. That the Atlanta Rapid Transit Co. shall pay to the Atlanta Railway & Power Co. for a one-half interest in the use of the property condemned, the sum of \$1,078.85, and for interference and damage to its property, and interference with its exclusive right, the sum of \$3,500.

In the other two suits the awards were \$1,221.48 and \$740.40 for the use and \$1,000 and \$3,000 respectively for damages. One of the assessors dissented as to the award, but concurred in the reasoning of the report, while another dissented as to the reasoning but concurred in the amounts. Appeals were taken in all three cases by the Rapid Transit company.

C., B. & Q.'S FINE SERVICE TO KANSAS CITY.

Three fast trains daily leave Chicago for Kansas City on the Chicago, Burlington & Quincy R. R., one at 6:10 p. m., arriving in Kansas City at 8:40 a. m. This train, which offers unsurpassed accommodations, comprises buffet, library and observation cars, high grade sleepers, and dining cars in which meals are served a la carte. Special arrangements will be made to accommodate all delegates to the street railway convention at Kansas City, October 16th to 19th, and their guests. Application for accommodations or for special cars should be made to F. E. Bell, city passenger agent of the Burlington Route, 211 Clark St., Chicago.

ADVERTISING IN STREET CARS.

BY GEORGE KISSAM.

(Mr. Kissam is the senior partner of George Kissam & Co., a firm which does a more extensive business in street car advertising than any other in the world.—Ed.)

Nowadays when street railways are projected the possible income from advertising in the cars is always considered, and in many cases it is put too high. Fifteen years ago there was very little advertising seen in the cars, and it was of a character vastly different from the present display; the cars and advertising have both advanced materially in that period.

The late Mr. Wm. F. Carleton, of Boston, was really the pioneer of legitimate street car advertising, and his methods were of a character to induce a rapid increase of this business by reason of the fact that they were agreeable and profitable to both the street railway companies and the public. In the early years of his career Mr. Carleton made money rapidly as he had exceptional ability to secure advertising contracts, but he was compelled to expend thousands of dollars in the purchase of advertising racks to equip the various cars controlled by him, all of which capital and much more invested by Carleton & Kissam was practically sunk forever.

In the early days of street car advertising contracts were plentiful at good rates, but as the cars increased rapidly the demand for space did not keep pace with it, there was no particular trick in selling space in a thousand cars, but ten or twenty thousand car contracts are like century plants and bloom about as often.

Few railroad officials are aware of the amount of time, work and expenditure involved in securing advertising for street cars; it takes years sometimes to close a deal, many costly designs by the best lithographic artists, reading matter evolved by writers of national fame, who must condense their copy and keep it absolutely free from even a word that might be offensive to the passengers, solicitors who must be paid liberal commissions and who are depended upon to induce the prospective advertiser to use street car space. The competition of other advertising mediums is very keen, and inducements are offered and prices made that, in many cases, place the buyer of space in a position to dictate the price of street car advertising and pay considerably less for it than the railway companies actually receive from the lessees. This state of affairs has been largely brought about by the competition for privileges of the various street car advertising concerns and by the erroneous idea of what the advertising should bring on the part of railway officials.

It is a fact that since 1803 hardly any of the advertising companies have made any money, several have "gone up" leaving unpaid rentals and some have been on the "ragged edge." The concerns with large capital have hung on hoping for better rates and reasonable terms from the railway companies. Eighteen hundred and ninety-nine was a good year for all, but it would take several good years to make up the losses sustained previously. The large lessees of advertising privileges—and they could be named on the fingers of one hand—must have plenty of capital to carry on the business, the outlays for labor, office expenses, commissions and rentals are all cash down and in advance, while the receipts are necessarily of a credit nature with the accompanying losses.

Open cars are the bane of street car advertising concerns; during the months of their operation there is a certain loss to be faced, the transverse seats make it difficult to see the advertising cards, and many regular buyers of space eliminate the summer months in consequence; the cars are usually longer than box cars and cardboard to keep the spaces full is quite an item of expense.

Many roads are building long box cars with transverse seats and center aisles; these are open to the same objection, though in a milder form; but they are not desirable because railway officials imagine that because they are longer more should be paid for them. If the railway men knew how hard it was to sell 20 spaces in a car they would faint at the prospect of selling 30 or 32. As a matter of strict fact these long cars (unless every car is long) are a two-edged sword in respect to selling space; the spaces must be kept full of something unproductive, and the companies' idea of their value is based on their length.

Small plants of from 10 to 30 cars are almost invariably unprofit-

able to the lessee, the experience of all is singularly similar in this respect. The first year is a good one, then the local merchants drop out like a drove of sheep and the large general advertiser, the backbone of street car advertising, does not want the small towns, yet the railway companies controlling these plants expect to receive the same price per car yearly as is paid in large cities.

The lessees of large plants are compelled for self-protection to carry many of these small places at a loss or with the prospect of their being consolidated in the future with plants of a larger number of cars; when this does not occur the small town shows an invariable loss, and is not only an expensive luxury, but an annoyance, as well, for the lessees of reputation must keep these cars looking well. To do this properly requires frequent visits by men of experience, an experience that takes years to acquire, even though it "looks easy enough to put the cards in" to an outsider.

Some companies have experimented with running the advertising themselves, and some have been quite successful (apparently) the first year, but experience has shown that there is a vast difference between running an advertising business and a street railway, and the invariable sequel has been to make a lease with some one who understands street car advertising and how to run it properly. In this connection it is proper to say that far seeing and experienced street railway officials prefer to contract with concerns who understand the requirements of street railways and adapt the advertising to existing conditions, than they do with amateurs or people who imagine the business an easy one and offer more for the privileges than those who know its real worth can afford to.

To run street car advertising properly requires years of experience. The appearance of the cars, reading matter and illustration of the advertising must be of a character pleasing to the public; the railway companies must not be hampered or annoyed, and the work is necessarily done at hours and places not to interfere in the slightest degree with the road's management. This means running the business agreeably to all, those who do it usually find the street railway officials in harmonious mood.

There is one grand underlying principle which the railway officials should consider, that it is for their interest the lessee should make something on his contract, otherwise the old proverb of "killing the goose that laid the golden egg" is bound to be exemplified; the men who devote their time, capital and energies to procure advertising in the street cars should enjoy a fair profit on their investment and efforts, otherwise it is only a matter of time when they either fail or retire from the field.

In a sense the street railway companies are special partners of the lessee; any special partner in other business would be glad to realize 20 or 25 per cent on his capital and assume all business risks. The street railways, when dealing with responsible parties, assume no risks and receive from 50 to 90, and sometimes over 100 per cent. They are put to no trouble except to receipt bills and draw sight drafts for rentals; the advertising space used in the cars is of no practical utility so far as running the roads is concerned, so the revenue thus derived is, in a certain sense, "velvet."

A phase of the business that street railway presidents should carefully consider and analyze is "malicious bidding" for the advertising privileges by so-called advertising companies and piratical individuals, who have no idea of taking the cars, and only bid to compel the lessee to pay a higher price than it is legitimately worth, so they can gratify their malicious spirits or get revenge for fancied injuries. The respectable and responsible concerns engaged in street car advertising have been considerably annoyed by these pirates, and in many cases put to great trouble and financial loss by reason of their illegitimate bidding. Let railway officials carefully study the apparently attractive letters they receive in reference to their advertising privileges, analyze them thus: Do they come from a distant city, do they treat somewhat bombastically of the writer's great responsibility, and practically contradict it by offering to put up surety bonds? Let the manager hesitate and ask himself why they should want cars out of their territory; why offer bonds if they're good. Maliciousness and want of good faith are apparent in the one case, bluff in the other; they may succeed in compelling the old reliable tenant to pay more and lose money, but when a new lease is made, is it logical to suppose the said old lessee will continue unless he gets a fair deal? If these "malicious bidders" should succeed in driving out the old lessee they will find

a way to squirm out of closing a losing lease, or if they should take the cars they immediately proceed to sell to the advertising public a number far in excess of what are run; this swindle goes on until detected, often involving the railway company in considerable trouble. Is it worth while for the sake of a few more dollars (offered) to take the chances here alluded to or possibly worse? Any concern capable of malicious bidding and over selling cars will be capable of any other crooked action. Is it not better to "let well enough alone" and stick to the "old reliables," whose contract means sure money and no annoyance?

"EXCELSIOR" TROLLEY HARP.

The "Excelsior" self-oiling trolley harp has come to be well-known in the trade, and is now being used by over 25 of the large electric railway systems of the country. An excellent testimonial as to the merits of this harp is the fact that the largest users of it are roads operating heavy cars at high speed; among these are the Cleveland City Ry. and four of the Cleveland interurban roads, the Detroit Citizens and three of the Detroit interurbans, the interurbans at Toledo, the Mill Creek Valley Street Ry., the Cincinnati Street Ry.

The harps are made in three sizes, for 4, 5 and 6-in. wheels. The 4-in. size is made of brass, but the larger sizes, where the

"EXCELSIOR" TROLLEY HARP.

weight is too great in brass are made of aluminum; the 4-in. harps will be made of aluminum if desired. The self-oiling feature is readily understood by examining the illustration. The main reservoir C is filled through oil filler holes D. The auxiliary reservoir A is filled every time the trolley pole is lowered, and the partition B holds this supply around the end of the axle through which the oil is fed to the wheel by way of passage E centrally bored through the axle. In a slot on the axle is placed a piece of "piano" felt to distribute the oil and prevent too free a flow.

These harps are made by the International Specialty Co., of Detroit, which makes the following claims for the harps: They effect a saving in oil and at the same time efficiently lubricate the wheel. They are noiseless and cleanly. Having no bushing to wear, the wheel runs true. The oil is fed by gravity and reaches the bearing where it is needed.

LACKAWANNA LIMITED TO CONVENTION.

The Lackawanna Railroad announces its facilities and calls attention to the mountain scenery afforded by its route from eastern points. The limited leaves New York daily at 10 a. m., crossing the Delaware and the Blue Ridge Mountains at noon. Binghamton is reached at 3:20 p. m. and Buffalo at 8 p. m.; from Buffalo the run is made over the Wabash lines, reaching Detroit at 2:40 a. m., and St. Louis at 2 o'clock in the afternoon. At 9:30 p. m. the train arrives at Kansas City having made a run of over 1,400 miles in less than 36 hours. Sleepers, dining cars and all equipment are strictly first class. Tickets are sold on the certificate plan, one and one-third fare for the round trip.

Reservations can be made of H. J. Ball, 429 Broadway or Guy Adams, 26 Exchange Place, New York City; M. L. Smith, Scranton, Pa.; W. C. Brayton, Syracuse, or F. P. Fox, Buffalo.

NEW INTERURBAN LINES IN CHICAGO TERRITORY.

Electric interurban interests are quite active at the present time promoting new lines in the vicinity of Chicago, there being one such line approaching completion, one well under way and three others which seem certain to be built.

The Joliet Railroad Co., of Joliet, Ill., has for two years been operating a line to the town of Lockport, about five miles distant, where the controlling works of the Chicago drainage canal are located, and about a year ago a further extension to the town of Lemont was planned. The idea originally was not to extend the system beyond Lemont, but the numerous excursions from Chicago to the drainage canal, and the lack of proper facilities for easily reaching the various points of interest led the American Railways Co., which controls the Joliet company, to decide upon a line to Chicago. The first car was run over the Lemont extension on September 17th, and the hope is that the track can be laid to connect with the Chicago lines before winter stops the work. The line, when completed, will be 30 miles long, and open up what is believed will prove a desirable suburban residence district in the Desplaines Valley. The route keeps close to the drainage channel, and this fact insures a heavy excursion business in summer. In Chicago the line will connect with the Chicago City Ry. at Archer Road and 59th St. From this point a branch will extend north and connect with the Suburban R. R. in Lyons, thus making the Joliet road accessible from the west, as well as from the south side of the city.

Grading for the Aurora, Wheaton & Chicago Electric Ry. was begun on September 18th, and the work is to be pushed as rapidly as possible. The route of this road is from Aurora to Wheaton, the county seat of Du Page County, via Eola and Warrenville, and thence to Chicago, where it will connect with the Metropolitan Elevated at W. 48th St. From Aurora to Wheaton is about 14 miles, and from Wheaton to the connection with the Metropolitan is about 18 miles. There are a number of cuts and fills on the line, some being 25 ft. deep; though there are 11 railroads on the route, only two or three of the crossings will be at grade. Messrs. L. P. Wolf and U. P. Hord are the principal local promoters of this line, and they expect to have it in operation before the winter of 1901. This is the road in which Mr. Henry A. Everett and his Cleveland associates are largely interested.

The Illinois & Rock River Railway Co. has been organized with a capital of \$1,000,000 to build a 64-mile line along the Rock River from Sterling north to Rockford. Most of the necessary franchises have been secured and grading will be commenced after the election, so that a portion of the road is expected to be in partial operation by spring. Mr. Glenn E. Plumb, formerly president of the Chicago General Railway Co., is the principal promoter.

The two other interurbans projected in the territory directly contributory to Chicago are the Waukegan, Fox Lake & Western Electric R. R., of which R. D. Wynor is president, and the Rockford (Ill.), Beloit & Janesville (Wis.) Electric Ry. It is expected that the former road will be graded so that track laying can commence by May 1, 1901, and a forfeiture bond has been filed to insure the construction of the Rockford-Janesville line.

NEW HAVEN REGISTERS.

One of the interesting exhibits at the street railway convention in Kansas City will undoubtedly be that of a register which in actual use on quick running wood working machinery has registered nearly eleven million times. This machine will be exhibited by the New Haven Car Register Co. at its space, No. 65. The company advises us that this number of registrations is many more than would be made on any street railway in over 100 years, and that the test is a much more severe one than the same number of registrations made in actual service on any street railway. The machine is still unimpaired for regular service, which speaks volumes for the great wearing qualities of the New Haven fare registers. The company will make a full exhibit of its widely-known single, double and triple registers, both round and square, such as are in daily operation on the leading railways in all sections of this and foreign countries.

REPORT OF UNION TRACTION, PHILADELPHIA.

The Union Traction Co., of Philadelphia, makes the following report for the year ending June 30, 1900, which shows an increase in receipts and expenditures over the previous year:

	1900.	Increase.
Receipts from operation.....	\$12,971,291	\$1,202,133
Operating expenses.....	5,624,898	831,532
Net receipts.....	7,371,392	370,991
Other receipts.....	253,528	11,111
Net income.....	7,624,921	382,029
Fixed charges.....	6,680,990	61,073
Surplus.....	938,021	320,947

At the annual meeting on September 19th, Charles O. Kruger was elected a director to fill the vacancy caused by the death of James McManes, and the following directors were elected: Thomas Dolan, William L. Elkins, Alex. M. Fox, John B. Parsons, William H. Shelmerdine, Alfred Smith, J. J. Sullivan, P. A. B. Widener, George D. Widener, George W. Elkins and Alex. Balfour. Resolutions were adopted commending President Parsons and other officers for the way they have managed the affairs of the company during the past year.

CROWN RAIL BONDS.

The simplicity of the "Crown" bonds furnished by the Washburn & Moen department of the American Steel & Wire Co. is doubtless the key to their widespread adoption in the construction of electric railways and tramways. Taking it for granted that the copper of which these bonds are made is of standard conductivity, and that the company is able to furnish every style of bond, solid or flexible, for bonding over or under the fish plates, under the rails, or for cross-bonding, the simplicity of application is a reason for the popularity these bonds have attained.

When it is noted that the work of applying "Crown" bonds is all done on one side of the rail, and that only one man is required

CROWN RAIL BOND.

to handle and properly attach the bond, the economy effected on the score of labor alone is a very considerable item in every mile of bonding and accounts for the claims made by this company that unquestionably more "Crown" bonds are in use on electric railroads than bonds of all other patterns combined. Perhaps one of the greatest labor saving points in connection with this type is in re-bonding work. The ability of one man to handle the re-bonding without assistants is a point in economy which cannot be overlooked by street railway superintendents and contractors.

A catalog or little booklet on "Crown" bonds will be sent free to anyone writing for it to the American Steel & Wire Co., at either the Worcester, New York or Chicago offices, and the company will be glad to extend the services of its expert electrical engineers to facilitate by suggestions the settlement of all questions regarding bonding, line wires, feeders, whether aerial, underground or submarine, and other electrical work for lighting or power plants.

The Cleveland, Berea, Elyria & Oberlin Railway Co. is now using at its outing resort, Puritas Springs, a starting bell that 25 years ago served to announce the leaving of the single horse car that comprised the rolling stock of the street railway of Berea in those days.

KNELL AIR BRAKE FOR STREET CARS.

The accompanying illustrations show the air compressor and the general arrangements of an air brake system for street cars recently patented by Mr. W. F. Knell, of Battle Creek, Mich.

From the two views of the compressor, one with the upper part of the gear case removed, the general arrangement of the parts

AIR COMPRESSOR.

COMPRESSOR WITH TOP OF CASE REMOVED.

is readily apparent. The gear case is dust proof and partially filled with oil, which the motion of the crank carries to every part of the interior, lubricating the crank pin, crosshead pin, cylinder and gears. All these parts are carefully made and fitted; being amply strong and with bearing surfaces large and well lubricated, the wear will be found slight and the repair bills small.

At the front end of the pump is an automatic pressure regulating valve. The mechanism of this valve is such that a uniform pressure is maintained in the reservoir. When the pressure in the reservoir reaches the desired point, usually from 60 to 80 lb., depending a great deal on the speed and weight of car and the conditions under which a service stop has to be made, the automatic valve goes into operation and maintains the pressure in the reservoir

The Michigan Traction Co., of Kalamazoo, Mich., has been making a trial of the Knell air brakes and advises us that they have been most satisfactory in service.

SANTA FE ROUTE TO CONVENTION.

Two fast trains daily over the Santa Fe route will afford excellent accommodations for delegates or visitors to the convention at Kansas City October 16th to 19th. Trains leave Chicago at 6 p. m. and 10 p. m. over this route, arriving in Kansas City at 8:30 and 10:30 a. m. respectively. Both trains carry palace sleepers and dining car. Three special sleepers have been engaged, one being for Mr. A. S. Littlefield and party, to leave at 10 p. m. October 15th.

DIAGRAM OF KNELL AIR BRAKE EQUIPMENT.

at that point until air is taken from the reservoir for use in the brake cylinder.

During the time that the air from the reservoir is maintained at the desired pressure by the action of the valve, the pump is released from all duty, simply working back and forth, but exerting no pressure against the air contained in the reservoir, and simply "pumping the atmosphere" through an open port in the automatic valve, the air being forced through the same port to the atmosphere again.

As soon as the pressure in the reservoir has been reduced by an application of air, the automatic valve is instantly released and the pump goes into operation, and in a few revolutions raises the pressure to the maximum point, when the valve again operates and the pressure is maintained in the reservoir until it is reduced by another application of the brakes.

The line drawing shows diagrammatically the arrangement of the apparatus. Pipes lead from the reservoir to each platform, and thence back to the air brake cylinder; in the bends are inserted the motorman's valves.

The advantages claimed for the system are: Simplicity. The wearing parts run in oil, securely protected from dust and dirt, thus ensuring durability. Low weight, from 350 to 400 lb. for a complete equipment. Constant supply of air at full pressure, being always ready for any number of emergency applications in quick succession. Positive and instantaneous release of brakes under

Representatives of the General Electric Co. have chartered a special car, and another has been engaged for a party of prominent officials of different street railway supply companies. Mr. J. M. Roach, president, and Mr. T. C. Pennington, secretary and treasurer, of the American Street Railway Association, have arranged for accommodations over the Santa Fe route, as have Mr. J. G. McMichael, president and treasurer of the Atlas Supply Co., for himself and party, Mr. C. K. Knickerbocker of the Griffin Wheel Co., Mr. Brazier of the Laughlin Brake Shoe Co., Mr. Finney of the Curtain Supply Co., and many others. Application for accommodations should be made to J. M. Connell, general agent passenger department, Santa Fe Route, 109 Adams St., Chicago.

The Indianapolis Street Railway Co. intends to keep its park open all winter, and the merry-go-round and some of the other features will be operated regardless of the temperature.

In exchange for a renewal of its franchises for 25 years the Columbus (O.) Street Railway Co. offers to pay \$40,000 cash and a percentage of the gross receipts beginning at 2 per cent and gradually increasing to 5 per cent. It will also sell 28 tickets for \$1, good at all times, and will give universal transfers. The company further agrees to make the experiment of selling workingmen's tickets good morning and evening at 32 for \$1, but if the receipts show a falling off it will not continue this rate.

TWO INTERESTING CARS.

The illustrations herewith show two interesting cars recently turned out by the J. G. Brill Co., of Philadelphia. The closed car, which is one of the standard American types, is one of a number built for the Brooklyn City & Newtown Railroad Co., of Brooklyn, and is for the run between New York and Coney Island. Being intended to some extent for special service, there

Government Tramways, it is the modified California type, similar to that adopted by the Metropolitan, of New York. The cars are intended to be operated in trains of two each, the closed sections being next to each other; no means of passing from one car to the other are provided, and a train crew consists of a motorman and two conductors. Brakes, controllers, etc., are operated from the open end of the forward car. The general dimensions are: Length over dashers, 36 ft. 4 in.; width at sills, 6 ft. 5 $\frac{1}{4}$ in.; width

A STANDARD AMERICAN CAR J. G. BRILL CO.

are some features in which the design differs from the usual type; perhaps the most noticeable is the absence of vestibules. The car body is 25 ft. long, with 4-ft. platforms, giving a length over the dashers of 33 ft.; the width is 6 ft. 10 in. at the sills and 7 ft. 6 in. over the posts. The seats are longitudinal, of cherry slats covered with Wilton carpet. To permit the car to be used in winter a stove is provided. The body is strengthened with truss rods pass-

over posts, 7 ft.; length of closed compartment, 11 ft. 2 $\frac{1}{2}$ in.; platform at closed end, 3 ft. 11 in.; platform at open end, 3 ft. 8 in. The trucks are the "Eureka" maximum traction, which are arranged to pass a 46-ft. radius curve; a G. E. 1,000 motor is mounted on each truck. The cars have duplex standard air brakes. The arrangement of seats, steps and drainage pipes through the grab handles is quite similar to that of the Metropolitan Street Ry. cars.

CALIFORNIA TYPE CAR FOR AUSTRALIA.

ing over saddles and bearing on needle beams against the bottom of the car. Many of the cars of this general type when for winter use only, have the glass stationary. The trucks are Brill maximum traction, with 33 and 20-in. wheels; each has a No. 49 Westinghouse motor. The details include spring roller curtains at the windows; Brill folding gates, which are hinged to the dasher, instead of to the car body; electric headlights at each end; Brill angle iron bumpers, with 6-in. face; two Brill sand boxes and two gongs. The weight of the car body is 10,500 lb., and of the trucks about 3,250 lb.

The other car is one of a lot built for the New South Wales

In building these cars the Brill company has employed a modification of its ordinary system for the shipment in the white. Electric headlights, angle iron bumpers and Brill folding gates are used.

The hackmen of Detroit, Mich., have asked the city council to pass an ordinance preventing the Detroit Citizens' Street Railway Co. from running its private car Yolande around the city and carrying passengers at 25 cents each for the round trip. They contend the company's franchise does not authorize it to charge more than the regular fare on any of its cars.

PERSONAL.

MR. A. C. MOTT was on September 28th appointed receiver for the Erie (Pa.) Rapid Transit Railway Co.

MR. W. A. HOUSE, manager of the United Railways & Electric Co., of Baltimore, has been making a pleasure trip through the Eastern states.

MR. FRANK E. LOWE, president of the Greenfield (Mass.) & Turner's Falls Street Ry. was married to Mrs. C. F. Towle on September 27th.

MR. CHARLES H. BIGELOW, inspecting engineer of the bureau of surface lines of the Boston Elevated Railway Co., was a "Review" caller last month.

MR. J. G. MILLER has taken the Northwestern agency for the Ajax Metal Co., of Philadelphia, and will make his headquarters in the Marquette Building, Chicago.

MR. E. ADAMS, of Toledo, O., has been appointed general manager of the Sandusky, Bellevue, Monroeville & Norwalk Electric Ry., succeeding Mr. J. D. Parker, resigned.

MR. MAX LOWENTHAL, a well known electrical engineer of New York and a frequent contributor to the electrical press, was married last month to Miss Elizabeth Trier.

MR. GEORGE M. BRILL, of Chicago, has recently returned from Peoria, Ill., and Indianapolis, Ind., where electrical plants for which he is the consulting engineer are being installed.

MR. W. R. MORRISON, in charge of track work on the Wichita (Kan.) Electric Railway & Light Co., called at the "Review" office recently on his way to Joliet, Ill. He is taking a month's vacation.

MR. F. J. J. SLOAT, general manager of the Southern Ohio Traction Co., and his wife will spend three months in California. During Mr. Sloat's absence Mr. Bicknell, auditor of the company, will act in his stead.

MR. C. S. KNIGHT, JR., for the past four years sales agent at Pittsburg for the American Steel & Wire Co., has removed to Chicago and will have charge of the electrical and wire rope department of the same company.

MR. J. W. HARKINS, who enjoys a large acquaintance among power station engineers through his long and successful connection with Wm. Baragwanath & Son, has accepted a position with the Dearborn Drug & Chemical Works, of Chicago.

MR. E. W. GOSS, for several years superintendent of the Middletown (Conn.) Street Ry., has resigned that position and will devote all his time to the Milford (Mass.), Hollister & Framingham Street Ry., of which he has been superintendent since last spring.

MR. T. H. M'LEAN, general manager of the Toledo (O.) Traction Co., was recently the recipient of a silver loving cup presented by the Ohio Electrical Light Association, as a token of the members' appreciation of his interest and hospitality displayed during the recent convention of their association in Toledo.

MR. EDWARD P. SHARP, of Buffalo, has lately become connected with the Bierbaum & Merrick Metal Co., maker of "Lumen" bronze bearings and trolley wheels, as manager of the street railway department. Mr. Sharp has been in the railway supply business for years and is one of the best known supply men in the East.

MR. H. S. COOPER, until last month general manager of the Ithaca (N. Y.) Street Ry., and formerly manager of the Schenectady (N. Y.) Street Ry., has been retained by a prominent syndicate of capitalists as a street railway expert, and will devote his time to examining and reporting upon bankrupt street railway

companies with the view of reorganizing them and placing them on a paying basis.

MR. A. C. VOSBURG, secretary of the New Process Rawhide Co., Syracuse, made a western trip the latter part of September, and reports a fine trade in gears and pinions. Managers are always glad to see him and only wish his visits were more frequent. The noiseless feature of the New Process gears have made them as popular with the manufacturers of automobiles as they long have been with street railway operators.

THE WASHINGTON (D. C.), FREDERICK & GETTYSBURG ELECTRIC RAILWAY CO. has decided to build a new road and has elected officers as follows: President, L. Victor Baughman; first vice-president, D. C. Winebrener; secretary, Chas. C. Waters; treasurer, F. B. Smith; attorney, Wm. H. Hinks. Directors: L. Victor Baughman, John C. Motter, John Baumgardner, Wm. H. Hinks, T. E. R. Miller, C. R. Nutt, F. B. Smith, L. T. Brien, Charles Wertheimer, Isaac S. Annan, D. C. Walker, C. C. Waters, C. E. Cassell, John R. Stoner, D. C. Winebrener, E. R. Zimmerman and Alexander Ramsburg.

OBITUARY.

MR. W. L. HODGE, vice-president of the Butte (Mont.) Electric Railway Co., died at his home in Brooklyn on September 4th.

MR. I. A. KELSEY, a stockholder and officer in a number of New England street railway companies, died at his home in West Haven, Conn., September 24th, at the age of 41 years. Mr. Kelsey was president of the Middletown (Conn.) Street Railway Co., president of the Milford (Mass.), Holliston & Framingham Street Ry., a director of the Winchester Avenue Railroad Co., of New Haven and a stockholder in several other roads.

NEW PUBLICATIONS.

A SYSTEM OF ENGINES. 111 pages. Issued by the Harrisburg Foundry & Machine Works, Harrisburg, Pa.—This concern claims to be the first engineering firm to design and place in successful operation, a complete scientific system of engines, involving a different style of machine for each changed sphere of conditions and service. Its new catalog illustrates and describes in detail each type of the system.

LIGHT ON THE JOINT QUESTION. Issued by The American Improved Rail-Joint Co., Monadnock Block, Chicago.—This pamphlet gives in full the recent decision of the United States Circuit Court of Appeals holding that the general process of cast-welding joints is public property and denying the validity of patents securing to any one person or collection of persons the control of such general process.

YEAR BOOK FOR 1900-1901, of the Armour Institute of Technology, Chicago. Armour Institute was founded in 1892 by Mr. Philip D. Armour, of Chicago, for the avowed purpose of giving to young men and women an opportunity to secure a liberal education. The year book just published gives full information concerning the departments and courses.

BULLETIN OF THE UNIVERSITY OF WISCONSIN. No. 39, "The Chemical Engineer," by Magnus Swenson, special lecturer at the University. No. 40, "Recently Improved Methods of Sewage Disposal," by J. B. Johnson, dean of the College of Mechanics and Engineering. Price 25 cents each.—Mr. Swenson defines the chemical engineer as one who has a very broad and thorough knowledge of the chemistry in his chosen field, a thorough theoretical knowledge of general chemistry, and also such a knowledge of mechanics and engineering as will enable him to be a leader in that particular branch of mechanics where his work lies. The work of the chemical engineer in developing the portland cement and the beet sugar industries are dwelt upon at length and the opportunity which a technical school has for educating men for this comparatively new profession is pointed out.—Prof. Johnson's paper was read before the Science Club of the University and deals with

sewage disposal by chemical precipitation and by bacterial reduction, and gives an account of a number of experiments and practical installations that have been made.

SHOULD WORK BOTH WAYS.

The daily passenger on the street car is usually alive to detect any shortcoming, accidental or otherwise, on the part of the car crew, and frequently makes himself very ridiculous by the loud and pompous manner in which he threatens to report some one. But it is very seldom the thought ever occurs to him of dropping the general manager a line commending some of the many really worthy acts the boys go out of their way to do in helping some stranger or unfortunate person.

On a certain well managed road there was recently posted in all the cars the following sign:

IN CASE OF ANY DISCOURTESY ON THE
PART OF EMPLOYEES PLEASE REPORT
THE SAME TO THE GENERAL MANAGER.

The signs had been up only a few days when a large number of them were found to read thus:

IN CASE OF ANY COURTESY ON THE
PART OF EMPLOYEES PLEASE REPORT
THE SAME TO THE GENERAL MANAGER.

The change occasioned by effacing the first syllable of one word makes a radical change in the character of the request of course, but is suggestive none the less of what the patron can do if he will.

CANADIAN NOTES.

The Halifax Electric Tramway Co., of Halifax, N. S., has declared a quarterly dividend at the rate of 5 per cent per annum on the capital stock. This is the 15th dividend declared by this company.

Another interesting decision regarding Sunday work has been made by the police magistrate of London, Ont. Three employes of the railway company were charged with profaning the Lord's day by sharpening and steeling switch points. The company maintained that, owing to the frequent running of cars, this work could not be done on a week day, nor could it be properly done by night time. The magistrate upheld the contention of the company and released the men.

On September 23d the Niagara, St. Catherines & Toronto Electric Ry. inaugurated a through service between Niagara Falls, N. Y., and St. Catherines, Ont., under most auspicious circumstances. The time schedule calls for 10 round trips per day between the hours of 7 a. m. and 11 p. m. The cars in service on the new system are 50 ft. in length and have smoking and baggage compartments; the coaches are well heated and lighted, and are equipped with high speed motors and automatic air brakes. The work of clearing the land where the new terminal station is to be located, has been started, and will be pushed to completion. This company expects to have a through line between the Falls and Toronto at an early date.

The Chambly Manufacturing Co., of Montreal, Canada, which has recently agreed to supply the Montreal Street Railway Co. with electric power, is now preparing to install the necessary apparatus to enable it to fulfill the contract. The company has secured the services of Mr. Ralph D. Mershon, who for some years past has been the expert for the Westinghouse company in connection with long distance transmission of electricity. Mr. Mershon is now making his headquarters at the company's office at Montreal, but is not in a position to give details of the proposed work until he has given the question some careful consideration. The Chambly company has an extensive water power about 20 miles distant from the city, and will transmit current to the central distributing station in Montreal at 25,000 volts.

At the suggestion of General Manager McLean, of the Toledo Traction Co., a benefit was given at the Casino for one of the veteran conductors who had been ill for several weeks.

TRACK MATERIAL QUOTATIONS.

At a meeting of the steel rail maker in New York on September 20th a substantial reduction in the price of steel rails was made, but the cut was not as great as many of the larger buyers had hoped for or expected. New quotations are as follows: Standard sections over 50 lb. per yard, \$26 at mill, a cut of \$9 per ton, light rails, \$25 delivered; girder rails, \$38 at mill; relaying rails, f. o. b. New York, \$20; track supplies f. o. b. Chicago, splice bars, \$1 35 to \$1.40, spikes, \$1 70 to \$1.80, bolts with hexagon nuts, \$2.10 to \$2.20, with square nuts \$2.00 to \$2.10.

The following quotations on ties have been sent us, all prices being f. o. b. at shipping point. Landsley Brothers & Co., Menominee, Mich., cedar ties, 20 to 23 cents; hemlock, 18 to 20 cents; G. S. Baxter & Co., 18 Wall St., New York City, yellow pine ties, 7 x 9 in. x 8 1/2 ft., 64 cents; 6 x 9 in. x 8 ft., 59 cents; 6 x 8 in. x 8 ft., 53 cents; Perrizo & Sons, Daggett, Mich., white cedar ties, 5 x 6 in. x 7 ft., 23 cents; 6 x 6 in. x 7 ft., 26 cents; 5 x 6 in. x 8 ft., 27 cents.

CHICAGO ELECTRICAL ASSOCIATION.

The fall and winter program of the Chicago Electrical Association includes special papers as follows: "Electric Elevators for Safe and Economical Operation," by Hayward Cochrane; "The Alternating Arc," by C. Wiler; "Roentgen Rays," by W. B. Hale; "Electrical Features of the Paris Exposition," by J. M. Hollister; "Electricity in the Equipment and Construction of a Ship," by C. C. Mattison; "Standardization of Arc Lamps," by H. Almert. The first fall meeting of the association was held on October 5th.

FROM THE EAST TO KANSAS CITY.

For several years past large numbers of delegates from the East in traveling to conventions have used the same route. Special cars and if sufficient numbers warrant, a special train will leave New York at 1 p. m. Sunday, October 14th, on the New York Central. At Albany it will attach the special cars which leave Boston at 10:45 a. m. the same day on the Boston & Albany. Stops will be made at the principal cities on both roads to take on the street railway men from those points. The party will leave Albany at 4:40 p. m., arriving at Cleveland at 3:30 a. m. Monday. From Cleveland to St. Louis the run is over the Big Four, and from St. Louis to Kansas City over the Wabash, arriving at destination at 7:00 a. m. Tuesday, which is the opening day of the convention.

Delegates who desire to visit Chicago can take the Lake Shore from Buffalo, arriving in Chicago about noon and leave at 6 p. m. for Kansas City, arriving there at 8 a. m.

Milton C. Roach, general eastern passenger agent of the New York Central, 1216 Broadway, New York, will make reservations and furnish detailed information. Passengers from Massachusetts should address A. S. Hanson, general passenger agent Boston & Albany Ry.; or local agents of the Boston & Albany.

NEW KIND OF CREATED TRAVEL.

Managers will do well to consider the possibilities of a new source of created business from now until election. It was tried in Chicago last week and pronounced a great success by all concerned.

A political meeting was to be held in a park in one of the suburbs and the local workers conceived the idea of increasing the attendance and interest by inviting numerous political clubs of like faith to join in the good time.

The ward is a large one comprising in all 32 square miles, and to assemble the clans special trolley cars were chartered for the occasion. Forty-five gaily decorated and illuminated cars were required to move the 3,000 guests and the sight was an inspiring one as the long procession of moving colored lights glided along to the music of a dozen bands. At the point where the various sections converged the procession extended over several blocks.

In many places it will only be necessary for the manager to present the plan to the local campaign managers as a decided novelty which is sure to be popular, and afford good revenue to the company.

THE PECKHAM MANUFACTURING CO.

The Peckham Manufacturing Co. has been organized to build new works and take over the business of the Peckham Motor Truck & Wheel Co., which has now grown to such an extent that it is impossible to handle it in the present works. The new works, which will be ready for occupancy about November 1st, are located

of sufficient capacity to care for these as well as other appliances used by electric railways.

The dimensions of the different buildings are: Main truck building, including stock rooms on each side, 314 x 152 ft.; blacksmith shop, 120 x 70 ft.; power house, 40 x 65 ft.; brake department, 150 x 75 ft.; snow plow department, 200 x 75 ft.; foundry, 140 x 75 ft.; office (two stories), 48 x 48 ft.

WORKS OF THE PECKHAM MANUFACTURING CO.

at Kingston, New York, on the main line of the West Shore R. R., and also have a connection with the Ulster & Delaware R. R. to the river, so that the company can have the benefit of water transportation when desired. These works have been designed with a view of handling the material for the construction of trucks in the most economical manner possible, and are so arranged that the material is so distributed when received, that every move necessary

Peckham's "Kansas City Special" truck is constructed on the same general lines as the Peckham regular 14-B-3 short wheel base truck, the difference being in cast steel side frames which are modified to suit the requirements of the master mechanic of the Metropolitan Street Railway Co., of Kansas City. The changes made are mainly in the construction of the end extensions for supporting the motors, which in this truck are made lower and

PECKHAM'S "KANSAS CITY SPECIAL" TRUCK.

in its manufacture is one leading to the truck erecting department, where by means of a five ton crane, the trucks are loaded on the cars for shipment. The power used is electricity. The capacity of the new works will be 5,000 trucks per year.

In addition to the making of electric trucks, the Peckham company controls the manufacture of the Price friction brake and electric rotary snow plows, and the new works are being constructed

provided with pockets for the motor suspension springs which are located nearer the axle than in the regular 14-B-3 construction, so that the weight of the motors is carried nearer the axles. The end cross bars connecting the two side frames are made flat in this truck, while in the 14-B-3 design they are of angle bar construction.

The bolster of this truck, as in the 14-B-3, is a center bearing

swing bolster carried upon two half elliptic springs, which in turn are carried by coil equalizer springs. Large coil springs are also placed over the journal boxes, thus making three separate sets of springs between the car body and rail, insuring a very easy and steady riding car under all conditions of load. The motors are placed outside of the axles, and the brakes are inside hung, as in the 14-B-3.

HALF FARES.

The Cincinnati Street Railway Co. has declared its regular quarterly dividend of $1\frac{1}{4}$ per cent.

The Lansing (Mich.) City Electric Ry. has decided to install a storage battery in its power station.

"An electric wire on the loose" in Spain means the swinging end of a broken trolley or light wire.

The railroad commissioner of Michigan refuses to permit electric railways to cross steam roads at grade.

The Manhattan Elevated Railway Co., of New York, paid its regular quarterly dividend of 1 per cent on October 1st.

The Peter Cooper Club, of Omaha, Neb., is protesting against a proposition to bond the county to assist an electric railway company.

The Northern Ohio Traction Co., of Akron, O., has reduced the fare between Cuyahoga Falls and Akron from 10 cents to 5 cents.

It is rumored that Brooklyn Rapid Transit Co. will soon pass under the control of the Metropolitan Street Railway Co., of New York.

The Detroit street railways have issued pass badges to their employes in lieu of books of tickets formerly used; the design is copyrighted.

Two attempts were made last month to wreck cars on the Toledo (O.), Fremont & Norwalk Electric Ry. by piling fence rails, ties and large stones on the track.

Mr. C. L. Henry, president of the Union Traction Co., of Anderson, Ind., states that by November 1st cars will be operating between Muncie and Indianapolis.

The Chambly Power Co., of Quebec, Can., has entered into a contract to supply the Montreal Street Railway Co. with 5,000 h. p. continuous current, day and night, every day in the week, for 23 years at \$25 per h. p. per annum.

The Winchester Avenue Railway Co., of New Haven, Conn., has issued an order prohibiting passengers from riding either on the running board or standing between the seats of open cars. This will limit the number of passengers carried to the seating capacity.

Action was brought recently against the Burlington (Ia.) Railway & Light Co. to restrain it from placing cinders between its tracks for the purpose of protecting the paving. It was claimed the cinders washed into the catch basins and formed obstructions in the sewers.

The city council of Tacoma, Wash., undertakes to regulate the speed of cars. A recent ordinance passed by that body provides for a speed not exceeding 6 miles an hour on down grades, 9 miles on Pacific Ave., 12 and 15 miles on residence streets and 20 miles an hour on interurban lines.

The minority stockholders of the Haddonfield Turnpike Co. are seeking an injunction to prevent the Camden (N. J.) & Sub-

urban Railway Co. and the West Jersey Traction Co. from operating cars over the Haddonfield turnpike. It is claimed that the company's rights are infringed by the trolley franchise.

A long interurban car on one of the western electric roads last month ran into a cow that was wandering down the track in search of greener pastures. The car was not badly damaged but, to quote one of George Stephenson's sayings, "it was awkward for the cow."

One of the objections urged against an ordinance at New Orleans providing for separate street cars for white and colored passengers, is the difficulty of deciding where some of the wealthiest white people in the city who are known to have negro blood in their veins would ride.

An attempt by minority stockholders of the Reading (Pa.) Passenger Railway Co. to have the lease of that property to the Reading Traction Co. set aside because of inadequate consideration, has failed. The consideration was \$1, but the court failed to find any evidence of conspiracy or wrong doing.

The Syracuse (N. Y.) Rapid Transit Railway Co. has prepared plans for building a second story over a portion of one of its car barns, and will move its offices. This arrangement will enable the company to concentrate the supervision of the road, and also to save the rental now paid for offices.

The franchises of the Seattle-Tacoma Railway Co., organized to build an interurban road between Seattle and Tacoma, have been sold to a syndicate headed by Jacob Furth, of Seattle, Wash., George B. Blanchard, of Tacoma, Wash., and W. C. Forbes, of Boston. It is said the project will be carried out at once.

The United States Circuit Court has been asked to issue an injunction restraining the Newton (Mass.) & Boston Street Railway Co. from complying with the provisions of an act requiring street railroads to carry public-school children at half fare. The petitioner alleges that the act is class legislation as it affects public-school children and not others.

One of the exhibits at the trial of a suit brought against a street railway company in Tennessee to recover for personal injuries was a photograph taken several months after the accident. For this occasion two cars were placed as near as possible in the same position they occupied at the time of the mishap and a man was placed between them on the spot on which the injured person stood. The photograph was used in explaining the case to the jury.

The Supreme Court of Kentucky has held that a company selling electricity to a street railway is responsible for the maintenance of the wires of the latter in a proper and safe condition. The view taken by the court is that electricity is unlike any other dangerous matter or force and that its control remains with the hand controlling the dynamo; therefore the producer must see to it that the wires to which current is supplied are in a safe condition.

CHANGE IN LEAVING TIME FROM THE EAST.

As the last form of this issue is going to press we are advised that arrangements for the accommodation of Eastern delegates to the Kansas City convention, as given on page 621, have been changed. The New York Central & Hudson River R. R. will run a special train leaving New York at 10:00 a. m. Sunday, October 14th, arriving in Kansas City at 9:30 p. m. Monday, October 15th, making but one night on the road. Other leaving times are as follows: Albany, 1:30 p. m. Sunday; Buffalo, 7:40 p. m. (Central time) Sunday; Cleveland, 12:10 a. m. Monday; St. Louis, 2:15 p. m. Monday. Regular train leaving Boston at 10:45 a. m. does not connect with New York Central special.

The city fathers of Johannesburg, South Africa, refuse to grant concessions for an electric railway to take the place of the present horse lines for the reason that the farmers would lose a good customer of oats and straw.

ECHOES FROM THE TRADE

GARSON MYERS has been appointed Western sales agent for the Crucible Steel Co. of America.

BABCOCK & WILCOX boilers have been awarded a Grand Prix at the Paris International Exposition.

THE UNITED STATES FENDER CO., Camden, N. J., has been incorporated by W. J. Browning, W. F. Weiss and J. W. Morgan, all of Camden.

THE BETHLEHEM STEEL CO., of South Bethlehem, Pa., furnished the shaft for the 1,500-h. p. unit at the Kaw River station of the Metropolitan Street Railway Co., of Kansas City, Mo.

THE J. G. BRILL CO., of Philadelphia, is building 75 convertible cars for the Union Traction Co., of Philadelphia. These are 38 ft. over all with cross seats and center aisle and are mounted on Brill double trucks.

THE WESTERN ELECTRIC CO., of Chicago, has purchased 225,000 sq. ft. of dock property on the Chicago River, and will build a new \$1,000,000 factory for heavy foundry work and the construction of cables.

THE CROUSE-HINDS ELECTRIC CO., of Syracuse, N. Y., supplied many of the panels for the large switchboards in the United States Pavilion and the United States section of the Palace of Diversified Industries at the Paris Exposition.

THE SHAW-WALKER CO., of Muskegon, Mich., is one of the largest exclusive makers of card indexing systems in the world, and its cards and cases are well adapted to keeping storeroom accounts, records of employes, tools, patterns and drawings, histories of accidents and to other conditions arising in street railway operation.

THE SIMPLEX ELECTRICAL CO., of Cambridgeport, Mass., has issued a very interesting pamphlet on electric heating which also includes electric cooking utensils, irons, etc., as well as a complete assortment of heaters. The catalog is extremely interesting and will surprise one who has not kept in touch with the development of this art.

THE DEAN BROTHERS' STEAM PUMP WORKS, of Indianapolis, Ind., is sending out its catalog No. 42, devoted to single style steam pumps for handling any kind of liquid, hot, cold, clear, gritty, fresh, salt, acidulous, or alkaline. All parts of Dean pumps are interchangeable and all machinery is given a severe running test before it leaves the factory.

THE CRANE CO., of Chicago, furnished all the valves, fittings and piping for the new plant of Armour & Co., Chicago. The installation gives a very practical example of the accurate and durable construction of Crane valves, as some of them have been under 150 lb. steam pressure for five months with one end connected and the other open to the atmosphere.

THE EVENING SCHOOL OF ELECTRICITY, under the direction of the Harlem Branch of the Young Men's Christian Association at No. 5 West 125th St., New York City, opened for its third season on October 2d. The school is in charge of Mr. S. A. Small assistant instructor in electricity at Columbia College, who has seen active service in all branches of electrical work.

THE GENERAL ELECTRIC CO. is distributing a 92-page pamphlet on the subject of "Aging of Transformer Iron." The book contains five important articles that have been issued regarding this subject, as follows: "The Aging of Transformer Iron," by Prof. W. Elwell Goldsborough; "On Slow Changes in the Mag-

netic Permeability of Iron," by Mr. W. Hordey; "Effects of Prolonged Heating on the Magnetic Properties of Iron," by Mr. S. R. Roget; "Hysteresis in Sheet Iron and Steel," by Mr. Arthur Hill-eyer Ford; and "The Aging of Transformer Iron and Steel," by Mr. J. A. Capp. This pamphlet is one that should be in the hands of every central station manager, and will be furnished free of charge upon application to the General Electric Co., Schenectady, N. Y.

THE B. F. STURTEVANT CO., of Boston, Mass., has issued an illustrated catalog of its steel plate planing mill exhausters for removing chips, shavings, dust and all kinds of light refuse from mills, factories and other establishments. The catalog contains the following tables: One giving the weight per running foot of round galvanized iron pipe, the weight of elbows and the proper gages for diameters of pipes ranging from 3 to 72 in.; a factor table for reducing the weight of galvanized iron pipe of one gage to that of another gage; velocity, volume and horse power required when air under given pressure in ounces per sq. in. is allowed to escape into the atmosphere; pressure and horse power lost by friction of air in pipes 100 ft. long and of varying diameters; areas of circles of given diameters and lengths of the sides of squares of the same areas.

THE WESTERN ELECTRICAL SUPPLY CO., of St. Louis, will be represented at the convention by Mr. Charles Scudder, jr., manager of its electric railway department, who will make his headquarters at the exhibit of the Ohio Brass Co. in Convention Hall. He will also have a display and be glad to see electric railway men at the Baltimore Hotel. This company has gradually enlarged its electric railway department so that today it carries one of the largest stocks of electric railway supplies in the West. It is prepared to equip electric railways complete with anything pertaining to construction, maintenance or operation. It has recently printed a catalog devoted exclusively to electric railway supplies, which is about the only catalog covering everything pertaining to electric railways from a bonding cap to a complete electric railroad; this will be mailed on application.

THE ELECTRIC STORAGE BATTERY CO., of Philadelphia, sends us the following list of railway companies that have recently contracted with it for "Chloride" accumulators: Pawtuxet Valley Electric Street Ry., Providence; Brooklyn Rapid Transit Co.; Boston & Maine R. R., Boston; Potomac Electric Power Co., Washington; Metropolitan Street Ry., New York (increase); Brightwood R. R., Washington (increase); Rhode Island Suburban Ry., Providence; Bellows Falls (Vt.) & Saxton River Street Ry.; Detroit Citizens Street Ry.; Union Traction Co., Philadelphia (sixth plant); Sea View R. R., Wickford, R. I.; Stillwater & Mechanicville (N. Y.) R. R.; Glens Falls (N. Y.), Sandy Hill & Fort Edward Street Ry.; Biddeford (Me.) & Saco Ry.; Portsmouth (N. H.), Kittery & York Street Ry.; Newton & Boston Street Ry., Newtonville, Mass.; Waterville & Fairfield (Mass.) Railway & Light Co.; Keene (N. H.) Electric Ry.; Buffalo Ry. (four orders); American Railways Co., plants for Joliet, Lemont, and Spring Forest, Ill.; Boston Elevated Ry.; Dayton (O.) & Northern Traction Co.; Indianapolis (Ind.) Street Ry.; Union Railroad Co., Providence (increase).

The North Jersey Street Railway Co. will hereafter carry U. S. mails between Jersey City, Hoboken, Union Hill, Bayonne and the other towns and cities on its route, making in some cases a saving of from 12 to 18 hours in the delivery of mail.

It is said that owing to the ordinance passed two months ago by the Montgomery (Ala.) city council requiring the local street railway company to provide separate seats for white and negro passengers, the company's receipts have fallen off 25 per cent. The negroes have declared a boycott and refuse to ride on the cars.

DAILY STREET RAILWAY REVIEW

PUBLISHED BY

WINDSOR & KENFIELD PUBLISHING CO.

VOL. X. WEDNESDAY, OCTOBER 17, 1900. No. 1.

PROGRAM.**American Street Railway Association.**

WEDNESDAY, OCTOBER 17TH.

"Comparisons of the Various Systems of Electrical Distribution for Street Railways." By C. F. Bancroft, electrical engineer Massachusetts Electric Companies, Boston, Mass.

"Painting, Repainting and Maintenance of Car Bodies." By F. T. C. Brydges, superintendent of car shops, Chicago Union Traction Co., Chicago, Ill.

Appointment of Committee on Nomination of Officers and selection of next place of meeting.

Wednesday afternoon, trip to Armour Packing Houses.

Wednesday night, theater party.

THURSDAY, OCTOBER 18TH.

"Double Truck Cars; How to Equip Them to Obtain Maximum Efficiency Under Varying Conditions." By N. H. Helt, president Meriden Electric Railroad Co., Meriden, Conn.

Election of Officers for ensuing year.

Thursday afternoon, trip to Ft. Leavenworth.

FRIDAY, OCTOBER 19TH.

The entire day has been set apart for the examination of exhibits. Friday night, banquet at Coates House.

Accountants' Association.

WEDNESDAY, OCTOBER 17TH.

Convene at 10 a. m.

"The Routine of a Street Railway, Electric and Gas Lighting Company." By C. O. Simpson, auditor Augusta Railway & Electric Co., Augusta, Ga.

Report of Committee: "Is a Standard Unit of Comparison Practicable?" By the chairman, H. C. Mackay, comptroller Milwaukee Electric Railway & Light Co., Milwaukee, Wis.

"Department Accounts." By H. L. Wilson, auditor Boston Elevated Railway Co., Boston, Mass.

THURSDAY, OCTOBER 18TH.

"Material and Supply Accounts." By W. M. Barnaby, accountant Brooklyn Rapid Transit Co., Brooklyn, N. Y.

Informal Discussion upon any subject in street railway accounting. (This is to be in every sense informal.)

Report of Convention Committees.

Election and installation of officers.

LOCAL COMMITTEES.**ENTERTAINMENT AND BANQUET.**

W. H. Holmes, Chairman, Pres. Metropolitan Street Ry.

L. E. James, V. P. Metropolitan Street Ry.

 Inside 31st and Prospect and beyond 23d and Woodland.
 Passenger 1 00
 Each additional passenger 50
 Inside 42d and Cleveland and beyond 31st and Prospect.
 First piece baggage 50 cents, each additional 25
 Each Passenger 1 00
 First piece baggage 75 cents; each additional 25
 Day or night, \$2.00 first hour, \$1.00 each additional hour or part thereof.
 The opera rates are: To and from any point within the following boundaries:
 23d and Woodland, two persons.....\$3 00
 23d and Woodland, four persons..... 4 00
 31st and Prospect, two or four persons 4 00
 42d and Cleveland, two or four persons..... 5 00

TELEPHONE SERVICE.

Kansas City is well provided with public and private telephones and has connection with all suburban and long distance points. The toll rate for five minutes' conversation within city limits is five cents. Public telephones are operated by nickel-in-the-slot machines.

To call central give hell crank one sharp turn. Place receiver to ear and give number wanted to central, who will repeat it back. Hold receiver until party responds. A numeral after the telephone number as given in telephone directory signifies a party line and designates the number of rings. It should be repeated to central thus when calling: Main 891-2, say "Main eight ninety-one, two rings."

DISTANCES FROM KANSAS CITY.

When you are in Kansas City, you are 1,267 miles from Albany; 1,459 from Boston; 981 from Buffalo; 458 from Chicago; 614 from Cincinnati; 997 from Cleveland; 633 from Denver; 708 from Detroit; 962 from Galveston; 166 from Independence, Kan.; 26 from Leavenworth, Kan.; 1,805 from Los Angeles; 942 from New Orleans; 1,303 from New York; 894 from Pittsburg; 1,213 from Philadelphia; 2,093 from San Francisco; 273 from St. Louis; 63 from St. Joseph, Mo.; 1,267 from Washington, D. C.

THE LIGHT THAT FAILED.

When President-elect Roach led the grand march into the banquet room of the Auditorium at Chicago last year his face wore its usual pleasant smile, and his demeanor did not give the slightest clue to anything calculated to ruffle one's spirits or impair digestion. And he was as cool and collected as anyone present, though few would have been after his experience. This episode is now made public for the first time, and its publication will be as much a surprise to its subject as it will prove interesting to our readers.

In accordance with the usual custom Mr. Roach as the new president was to extend the welcome and introduce the toast-master at the annual banquet with which each convention closes. Mr. Roach is noted for never failing to keep an appointment, and exactly on the minute; and it was no fault of his that attendance on committees and looking after the comfort of guests kept him at the headquarters hotel until nearly six o'clock. In Chicago during October it is quite dark at five o'clock.

He jumped into his own carriage and directed the driver to make all speed to his residence on the north side, where he meant to exchange his business suit for one appropriate to the occasion. Now, it appears that only the day previous the police department, seized with a sudden zeal, had issued the strictest kind of orders as to vehicles without lamps after sundown. The conveyance in question had lamps, but little oil in them, and the carriage had not proceeded more than two blocks when out they went. At the next corner a stalwart policeman held up the vehicle and promised to run them in. An apology followed the explanation and discovery of who the occupant was, but the cop at the next crossing was a new man who didn't know anybody, and entreaties would not go. Neither did the carriage.

The driver was sent on the double quick to secure another conveyance. The first one he encountered was an electric automobile. This was chartered and Mr. Roach changed cars and congratulated himself on having lost only fifteen minutes in going four blocks.

Autos were comparatively new in Chicago a year ago, and were untamed creatures more uncertain than the weather, but the two sixteen candle incandescents beamed brightly and the machine labored along at nearly eight miles an hour. Everything went pretty well until the Chicago river was reached, and here two tugs were trying to pull a belated and overloaded ore barge through the narrow channel. After waiting five minutes, which seemed as many hours, the electrician who perched up aloft was ordered to go through the tunnel. This involved retracing the course and going out of the route several blocks, but seemed the only solution. When the tunnel was reached the auto traveled pretty well down the incline, in fact, nearly ran away, but evened matters when it reached the up grade. Here it bucked and spit fire and finally stuck, refusing to go forward, and to turn and retrace the course in that narrow passage was simply impossible. All the north side cable trains must go through this tunnel, which in two minutes was choked with a long blockade. The driver was told to ask the gripman to "give a push," but that official was not to be ensnared into any responsibility for damages to a broken-down auto. Finally Mr. Roach succeeded in getting the rear window open, and immediately there was all the pushing anyone could ask for. The auto never made such speed up a steep place before or since. Meanwhile time had been going on if autos had not.

Out of the tunnel fortune favored the trip, which was directed through Lincoln Park to avoid travel and get up speed. When fairly in the park the auto rolled along quite respectably until suddenly—hump! bang! it ran over a stray stone and the lights went out. The driver stopped. Mr. Roach held a short but very unmistakable conversation, which included threats, entreaties, and promises of reward and of going bail, after which the trip was resumed. It was noticeable, however, that the auto went lame,

seemed to interfere or something, but when a park policeman shouted to stop and get arrested for running without lights the chief engineer put her up to the last notch and prospects were even on getting out of the avenging hand of the law. But this was not to be. What happened might have been either the policeman's revolver, an explosion of dynamite, an earthquake, or all three combined. The noise was something fearful and accompanied by a hissing sound, as if all the serpents in the park collection were let loose. The auto reared and bucked and shook, and then came to a dead stop. The trouble was inconsequential; "Only a tire busted," explained the disciple of Edison.

The policeman, fortunately, knew Mr. Roach, and the promised patrol wagon was not called out; so, leaving the wreck, our friend betook himself to pedestrianism, which, supplemented by a two block's lift on his cable car and further sprinting, got him home.

* * *

At the moment when a large man with both arms full dashed out of a house and into a closed carriage there lacked exactly twenty-four minutes of the time when several hundred hungry people were scheduled to enter the banquet hall. No kodaks would have been obtainable of the exertions of the lightning change artist within the carriage, as it rushed at break-neck speed over the three and one-half miles which lay between the residence and the hotel. People on the sidewalks stopped to look, but saw only a flash of wheels, a carriage with the curtains tightly drawn, and a streak of black fading away down the street.

* * *

With two minutes to spare a vehicle drew up in front of the Auditorium, and from it emerged in faultless attire President J. M. Roach, who leisurely strolled into the reception room, remarking in a careless, indifferent manner, "I hope the steward will be prompt. We are all ready for dinner, and delays are annoying." Just then the orchestra started up and the procession started with Mr. R. at the head.

* * *

Down stairs, outside, a pair of foaming horses were panting for breath, and in the box the driver, his face beaming with excitement, was telling another driver how he had just earned twenty dollars.

STORY OF A STRANDED CABLE.

In the balmy days of cable traction the greatest bugbear was a stranded cable, which sometimes unwound and balled up in hopeless confusion, and sometimes parted entirely. When this occurred far from the power house the work of repair was frequently done at the pit at the end of the line. At this point the cable is carried around a big horizontal wheel called a sheave. The work was always done under high pressure in order to get the cars moving again as quickly as possible.

Mr. F. A. Tucker, now general superintendent of the Omaha Street Railway Co., relates an amusing incident which occurred here on one of the Kansas City lines in the early days. He had been connected with the San Francisco road, and when Kansas City started a new road it sent for him. He relates an experience as follows:

"I had been here some time, and began to congratulate myself in having gotten both our men and system into pretty good shape, when our cable rope stranded most unexpectedly and inopportunistly. The city was crowded with people for a special holiday, and our traffic was exceedingly heavy. I had our rope crew at the trouble pretty quickly, and then being called away on an important matter, I kept posted as to progress of the work by a special messenger. About time for the work to be completed I went down and found a beautiful job of splicing, with a loop around one of the spokes in the tail sheave. Of course the rope had to be cut and the splicing done all over again. Each minute seemed an hour, and each of the three hours as many days. I had always theretofore found words to relieve my mind, but on this occasion I was fairly speechless, and to this day I always think of that occurrence and the attendant circumstances as the most serious affair I ever experienced."

THEATERS.

COATES.—Wednesday night and matinee, "The Runaway Girl." Thursday, Friday and Saturday nights and Saturday matinee, "At the White House Tavern."

AUDITORIUM.—Every night, Wednesday and Saturday matinees, "The Great Ruby."

ORPHEUM.—Every night, Thursday and Saturday matinees, Vaudeville.

GRAND.—Every night, Thursday and Saturday matinees, "In Old Kentucky."

GILLIS.—Every night, Wednesday and Saturday matinees, "The Night Before Christmas."

STANDARD.—Every night, Saturday matinee, "The Broadway Burlesquers."

The American has made a new ruling on badges. Now the delegate who is a railway official but whose road has not joined the association receives the same badge as the supply member. It was desirable to have some means of distinguishing actual members when voting. There are a lot of companies who send delegates each year and receive all the benefits without contributing a dollar to the organization.

In addition to the American and Accountants' conventions, there are also here this week a big gathering of fancy stock-men, the Knights of Pythias and a religious conference, and they claim it isn't a very good week for conventions either.

Which would you rather own, the street railway or the hotels of Kansas City? Judging from what we can see either are good enough for the average man.

The trip to the stock yards this afternoon will be a killing affair.

Convention Hall only seats 22,000 and yet there were a number of vacant seats yesterday.

Nothing the matter with Kansas City, and Kansas City weather.

The mayor in his welcome omitted several blocks of statistics we have been accustomed to. Thanks, even if we don't know the exact number of fire plugs and lamp posts.

C. Densmore Wyman will not be present, much to the regret of his many friends. He is in the far South on an inspection trip which cannot be postponed.

Nicolas S. Hill, Jr., general manager of the lines at Charleston, S. C., and a member of the executive committee, cannot be present. He has been in poor health for some time and his physicians have decided on an operation which will be performed this week. We extend sympathy and an earnest wish for his speedy recovery.

Convention Hall will be occupied with a big horse show two days after the railway convention closes. This explains the "ground floor" on which the exhibits got in.

There is going to be a hot time at the theater party to-night. Don't miss it.

Among the prominent and regular attendants at conventions who has rarely missed a meeting, is Mr. John A. Brill. He is at present at the Homestead Hotel, Hot Springs, Va., where he is being much benefited in health.

EVIDENTLY A GOOD ROAD.

A man from St. Louis recently rode in an electric car in Cape Town with eight other Americans from different parts of the United States. The car was made in Philadelphia, the rails in Pittsburg, the motor in Lynn; the motorman was from San Francisco, and the conductor from Boston.

AMERICAN STREET RAILWAY ASSOCIATION.

Opening Session.—Welcome by Mayor Reed.—Annual Address by President Roach.—Reports of Executive Committee and Secretary.—Paper by Mr. D. B. Holmes.

The 19th annual convention of the American Street Railway Association was called to order at half past eleven by President J. M. Roach. Notwithstanding the late arrival of a large number of the delegates, the large room in the roof garden of Convention Hall was well filled, and the attendance steadily increased until adjournment. The meeting room is on the west side of the building, and while the association as a body was never before so near the sky, the ascent was reached by a series of easy inclines not at all tiresome.

JOHN M. ROACH,
President.

The speaker's platform was tastefully ornamented with potted plants and cut flowers, and the delegates almost reluctantly gave up the social greetings of old friends to take up business at the sound of the gavel. The representation this year is excellent and comes from almost every state. If anyone has doubted the wisdom of selecting so distant a point as Kansas City that doubt was wholly dissipated yesterday morning. There was the same earnest interest in the meeting which has been the history of former years, and the somewhat chilly temperature of the room was not reflected in the attention paid the speakers, some of whom were interrupted frequently by the "hum of industry" from the exhibit section.

After calling the meeting to order the president introduced Mayor Reed, of Kansas City.

ADDRESS OF MAYOR REED.

Mr. President and Gentlemen: I do not know whether I can make you hear me this morning or not. My voice, which usually is as soft and as musical as the notes of a nute wafted over moon-lit waters, has been laid out on the altar of my country to such an extent in the last few days that I imagine it bears a distinct resemblance to the malignant blending of the sounds of a cracked fiddle and the roar of a buzz-saw. If I could make you hear, and say something to make you feel at home in this city, I shall be delighted.

I esteem it, Mr. President and gentlemen, a great honor to address this body of distinguished gentlemen, and I trust that your meeting here in this roof garden is not being held under that part of the scriptures which states that "The wicked dwell in high places." (Laughter.)

Of course, I do not know much about street car men, except our friends, Con and Waiton Holmes; but I have heard it rumored on the street that that is not Mr. Con Holmes' proper name at all—that his first name has been acquired by virtue of his various and intricate business transactions in this city, and his ability to talk franchises out of the council, and when he gets them to immediately put them into execution. (Laughter.)

In the little I have to say to you, I shall not bore you with a speech, because I do not know what purpose a speech serves on an occasion of this kind. When the old Egyptians had a feast and everybody was feeling hilarious and good-natured, there was a pleasant custom of passing around a skull and saying to each of the guests, "Remember you are mortal; remember you are mortal." I apprehend I was brought here to represent the skull and cross-bones on this occasion. You are here to transact important business, having important objects in view, and it is not a time for speech-making. It is a time when you desire to deliberate and get to business.

I wish to say on behalf of this city that Kansas City, as much as any other city in the world, welcomes to her midst the representative business men of all other cities. We in the West believe that it requires capital and brains and courage to build cities. We in the West know that if capital comes to us it must come because it expects a fair remuneration; and I wish to call your attention, gentlemen, to the fact that you are in Missouri; and, notwithstanding the fact that all of the states that surround us, in times past, in those troublous times when there were hard financial conditions existing, nearly all of the Western states placed upon their statute books laws aimed at the destruction of the wealth of financial institutions, there never has been a syllable, line, or sentence of what we commonly denominate crank legislation placed upon the statute books of Missouri. (Applause.)

We in this state believe that capital should receive its fair remuneration; but we believe, at the same time, of course, that these great institutions which you represent owe some duties to the citizens of the cities, and that it is their business and duty to serve the citizens and serve them well. We at the same time realize that great financial institutions must be secure in their profits, and that all the people have the right to ask of them is a policy of "Live and let live," a policy of serving the people and in turn of being benefitted by the people. That is Missouri doctrine, and it is Kansas City doctrine. We in Kansas City know what Eastern capital has done for us. We know that fifteen or sixteen years ago we scarcely had in Kansas City a mile of paved streets. We know that it took a great deal of money to pave our streets; of course that was paid for by our citizens, but it took money to create the great plants for the purpose of paving our streets. While we insist, and shall insist, that these institutions should treat our people fairly, at the same time the people of Kansas City are willing that they shall receive a fair remuneration upon their capital invested. Our people have done this and the result has

been that for the size of the city, we have paved more streets than any other city in the world. (Applause.)

We believe in luring the capital of the East here for the purpose of investing in great public buildings. I do not think a single man lives who came to Kansas City and used ordinarily good business judgment in the matter of his investment in great public buildings, but to-day is receiving splendid dividends upon that investment. Of course, there were men who came here during the "boom" days when the whole town and the whole country had gone mad, who bought property without regard to business judgment, and paid fabulous prices and lost money; but the men who came with business judgment and with business care, and invested their money as men ought to invest it, have all received fair dividends.

We had a few years ago in this town two streaks of rust and five teams of mules, drawing horse cars, that meandered slowly and laboriously up and down the almost inaccessible cliffs of this town. This was called a railroad system, and it was said that the cars were run for many years for the purpose of holding the franchise. I do not know what the object or purpose of the railroad was, but I do know that everybody who was in a hurry was obliged to walk. (Laughter.)

About the period referred to, fifteen or sixteen years ago, there was begun the building of the present street car system of Kansas City—built first with a cable equipment, and Mr. Holmes will tell you here in your secret meetings, if you can have any with your walls of canvas, of the struggles, I presume, that his road underwent in overcoming the natural difficulties of this town; but to-day, in riding over this street car system, you, better than I, will judge whether any progress has been made in that respect. And as far as dividends are concerned, I apprehend that Mr. Holmes can tell you all about that, if he only will.

The point I wish to impress upon you, gentlemen, and I do it with a selfish purpose of convincing, as far as I can each man in this audience, that Kansas City is a good a place to invest money; that every legitimate enterprise where the men have come and used good business judgment, has been a success in this city. We have no warfare to make upon capital. Of course, as I said before, we do insist that capital shall treat us fairly, and as a general proposition, capital has treated us fairly. I would call your attention to the fact that Kansas City lies in the very center of the richest agricultural country that God ever spread out beneath the canopy of the skies. In whatever direction you go, for hundreds of miles, you pass through the finest arable land there is in the United States of America. I want to call your attention to the fact that there is scarcely a town or village for hundreds of miles in either direction from Kansas City but is, by force of our railroad system, compelled to pay its tribute to the center.

From this city down to the Southern coast and down to the Gulf we have various railroad lines. This city is the outlet for all of the grain, all of the cattle, and all of the farm products of every description of the entire West and Northwest and as soon as the Nicaragua Canal is built, if it is ever built, and I hope when it is built it will be built by the American Government (applause), and that crowning over all, at each end, and wherever is necessary between those ends, will be American forts and American cannons (applause)—and that great waterway is added to the lines of vessels that already ply from these Southern ports, this city must receive the greatest benefit that any city in the United States receives from the building of that canal. The reason for this is that the railroads are already built here, and they will not be torn up, and having already been built here, all of the grain and all of the farm products of the great West and Northwest, and much of the Southwest, will flow through the gateway of Kansas City to these direct lines leading down to the Gulf.

Another reason why we are going to succeed here is because of the qualities of our people. Each of you lives in a city and each one thinks his city is "it." Each of you gentlemen thinks your city is the best city, and I have nothing to say against your city; but I hold, with all due modesty, that it can be said that this is the most typically American city on the continent. Here in our state and city is the parent stock of the very best blood of the South, and grafted on to that we have the genius of the Yankee, the men from the Middle States and the men from the Eastern States, and from all parts of this country; and whenever you come to Kansas City, you will touch elbows as you pass upon the street,

with men from every state in this nation. I might say we have a few Greeks and Turks whom we keep for exhibition purposes. What does this mean in the upbuilding of a city? We have always heard it said that the "horizon of civilization was covered with the white caps of progress;" that it is the boy who has brains and genius and courage, who leaves his home in the East and comes to the West and develops into the great man representing the type which has made this country what it is. In the progress of the nation, every time that the milk of humanity has been skimmed, the West has been favored with the creamy side of the dish. The result is that there is such energy, such determination to succeed, such an indomitable will back of everything that our people undertake, that Kansas City has made a splendid success in the few years she has been a city. Let me give you one illustration, and with that I close. At a tremendous expense for a town of this size, with not very many extremely wealthy men in it, we built this Convention Hall. We built it as a public enterprise, and into it went the money of the capitalist, and the money of all our citizens, even down to the men who carry the dinner-pail, not always so full, either; into this Convention Hall went the dollars of the laboring men. (Applause.) It was destroyed by fire, we had invited the National Democratic Convention to meet here on the 4th of July. This hall was burned, if I recollect aright, exactly 90 days before that convention met. Before the building had been on fire an hour, thousands and thousands of dollars had been subscribed to rebuild it, and in the 90 days which intervened between the burning of the building and the 4th day of July the new hall was erected. We had to make our contracts as rush orders, and you street railway men will understand what a "rush" order means, and how much it costs, but when the 4th of July rolled around, this building had risen from the ashes of the former building and was completed as you see it here at this minute. (Applause.) A lot of "lobsters," gentlemen, do not do that kind of work, if you will pardon the use of a slang phrase. It is because we have that kind of people that we are succeeding here; we are glad to have you come here, and ask you to look this city over, and see whether it is not about the best place in the United States in which to make money. If you come here, you will be treated fairly by our citizens.

I need not extend to you the liberty of this city. That old phrase died years ago, and then I never saw a lot of street car magnates in my life that needed the liberties of a city—they generally know how to get them (laughter); but you are welcome among us, and I know you will be made to feel at home because I know the Messrs. Holmes and their associates in business will make you feel at home. You may have read something in the papers here of the police outrages, but if, perchance you lose your way, for that is all would ever happen to so distinguished a body of gentlemen as you are—if perchance you do lose your way, I guarantee you that some good police officer, like a good Samaritan, will conduct you to your hotel in peace and with due dignity and if necessary will take you up the back way.

President Roach: Mr. Mayor, on behalf of the association, I desire to thank you for your eloquent words of welcome spoken to us, and also to give you my personal thanks.

The first business at this meeting is the calling of the roll. If it is the pleasure of the meeting, instead of taking time to call the roll, the official registration of the secretary will be deemed the calling of the roll. That has been the custom in the past, and will be considered as applying at this time, if there is no objection. We now extend an invitation to those companies represented at this meeting which do not belong to our association, if there be any here of that class, to join us; or if the representatives of such companies have not time to do this at present, they can do so later by applying to Secretary Penington.

President Roach then delivered his annual address:

PRESIDENT'S ADDRESS.

Gentlemen: It gives me great pleasure to meet with you in this magnificent western city. I have every assurance that nothing will be left undone to make our visit most pleasant and profitable. There is a breadth of character and freedom of personality in this young metropolis of the plains, which is peculiarly appealing to the business man who has large interests entrusted to his care, and I believe the members of this association will show their appreciation of the many pleasant things provided

for their entertainment while in this community. When this 17th annual convention of the American Street Railway Association shall have finished its labors, I am sure I may safely say to Mayor Reed that none of you will have regretted the acceptance of the hospitality of the people of Kansas City, so graciously extended by him.

I see before me representative men from all the leading cities of this country. To your hands are entrusted street railway investments aggregating hundreds of millions of dollars and the welfare of over a million persons. From the single-track one-horse car of forty years ago the business in which you are engaged has grown to a magnitude where nearly all fields of human endeavor are called upon to perfect its equipment or aid in its management. It has outgrown ridicule and financial instability and in the rapid whirl of events has built cities, enriched its promoters and made possible a freer, healthier and happier life for its patrons. Each day the street car is entering more and more into the business life and pleasures of the community, and each day its benefits are becoming more apparent to the general public.

The street railways of America now represent the enormous investment in bonds and stocks of \$1,800,000,000, upon which investors are receiving annually over \$70,000,000 in interest and dividends. Salaries and wages amounting to \$250,000,000 a year are distributed among the 300,000 employes necessary to equip, operate and manage this great industry, repair its 20,000 miles of track, handle its 60,000 cars and meet the ever-pressing demands for improvement. Directly and indirectly over 1,200,000 persons depend upon the traction interests of America for their livelihood.

An industry of such proportions penetrates and more or less affects all other enterprises in the country which sustains it. Nine-tenths of the business men and women of the United States look to the management of street railway companies to furnish them with swift, comfortable and safe transportation to and from business. Still a greater per cent of pleasure-seekers demand and receive from the same management service to and from the theater, casino, park and suburb and the transportation is of such elegance of equipment and so efficient as to satisfy the most exacting. It has required heroism and patience on the part of the street railway men to meet, with so little friction, the demands of a critical patronage in so excellent a manner as is being accomplished by them at the present time.

On all sides we hear the cry of improvement and in every direction we hear the sound of the busy car shop as it responds to the demand for more modern equipment. The public is becoming more exacting and there is need for the most perfect knowledge and the widest experience to successfully cope with the ever-changing situations which confront the street railway manager. Street railway companies have frequently, at great cost, increased their miles of tracks and added to an expensive equipment, primarily for the sole purpose of accommodating the public, by extensions into outlying districts, unwarranted by additional business to be acquired in such territory. This policy has proved wise in nearly every instance. It requires considerable pluck on the part of a company to back a temporary loss in order to please its patrons. Those companies which have pursued such a course have generally been rewarded by more liberality on the part of municipalities, more good nature and praise from patrons and an early increase in the new districts acquired, which soon brought those lines to a paying basis.

In thus catering to the wishes of the public the street railway industry of the United States has been brought to a high standard of excellence and has kept safely in advance of traffic. The aggregate of miles of track has grown from a few hundred miles of single track, confined mainly to business centers, to many thousands of miles of thoroughly equipped double tracks, which have brought the country districts within quick and active touch with the larger cities. Such energy and management must and will be appreciated and fairly treated by the communities benefitted.

It may be declared that corporations are without soul, but it cannot truthfully be said that managers of street railway corporations are lacking in good sense or business principles. False economic doctrines yield to and flee before rapid development and prosperity. A well equipped street railway with modern service, which seeks to oblige the people, operated in any community, will develop the best resources thereof and bring pros-

perity to its people with such rapidity as to utterly confuse and put to flight all false economic doctrines.

Newspapers, reviews, magazines, periodicals and journals of this country, indeed of many parts of the world, are entitled to the thanks of this association for the fair and generous treatment accorded in their columns to the street railway men and their interests during the year. It is the province of these publications to exploit the great industries of the land. If upon one day we are able to congratulate ourselves upon their unstinted praise, we should patiently hear the publicity given to our faults, if any there be, in the next issue.

The last year has been a period of notable activity and healthy progress, with but few disturbances of a serious nature. The managers of large street railway properties should shape their policy toward their employes and the public so that disturbances between employer and employe will be entirely eliminated from their history. The management of the great corporations of the country can best retain the adherence and loyalty of employes by adopting toward them a policy at all times just, and at the same time courteous, kind and conciliatory. The good will of your employes and of your patrons will be found an asset of great value in the days of trouble and most desirable at all times.

A business so widespread in its usefulness, holding and judiciously employing as it does so great a portion of the capital of the country and so essential to the best interests and prosperity of the trade centers, should, and I believe in good time will, possess the very necessary good will and hearty support of the municipalities it so faithfully serves. Our interests and those of the public are inseparably interwoven and naturally harmonious. If the relations become strained and in conflict, such conditions are unnatural and illogical, therefore it should become one of the leading features of our association to suggest a uniform policy for street railway companies, and of so broad a gauge that the mutuality of the best interests of the public and of the company shall be as apparent to the people as to the street railway managers themselves.

I take pride in announcing that the condition of your association, both as to membership and finances, is improving each year. I wish to urge you to make this gathering of use to our association and of importance to the street railway industry. This may be accomplished by a full attendance upon and participation in the business meetings. The executive committee has selected members who have prepared papers on important subjects, and I urge upon you the advisability of entering into full discussion and analysis of these subjects, so that a clear understanding of all questions presented may be carried home with you. I also urge the association to show appreciation for our friends, the supply men, who have produced for this annual meeting their splendid exhibit. Allow me to request your hearty support in the work of the Accountants' Association, which meets in annual convention here at this time. Its work is of great importance and is worthy of your most serious consideration.

To the secretary and members of the executive committee our thanks are due for the satisfactory manner in which they have assisted in conducting the affairs of this association. Personally their efforts have been highly appreciated.

The honor of having acted as your president for the last year has been most gratifying to me and shall ever remain one of the pleasant recollections of my life as a street railway man. For my successor I bespeak the same courtesy and cordial coöperation which it has been my good fortune to enjoy.

The secretary then read the report of the Executive Committee. The committee recommended the following rules of procedure:

1. No member will be recognized by the president unless he shall announce distinctly his name and address.
2. Speeches will be limited to 10 minutes, unless the time shall be extended by the convention.
3. Members who desire to offer resolutions or other matters to be considered by the convention, are requested to submit them in writing over their signatures, to the secretary.

Regarding banquet tickets the committee endorsed the action of former years, to-wit: "There shall be two tickets issued to each member company of the association when there are two or more official representatives; when there is only one representative, only one ticket, and when a company is not officially represented, no ticket shall be issued on account of said company."

It was recommended that, because of the satisfactory condition of the finances of the association, the admission fee be waived in the case of any company joining the association at this meeting.

The president had appointed Messrs. John A. Rigg and C. W. Wason as a committee on Memorials of Deceased Members.

Mr. C. K. Durbin, having left the street railway business, resigned from the executive committee of the association, and was succeeded by Mr. W. H. Holmea.

On motion of Mr. Dyer, of Augusta, the report of the executive committee was adopted.

Mr. Penington then made the following report:

REPORT OF THE SECRETARY AND TREASURER.

The report of the secretary and treasurer, T. C. Penington, showed a balance Oct. 10, 1899, of \$5,658.87, receipts of \$6,564.55, expenses of \$5,222.67, and a balance Oct. 10, 1900, of \$7,000.75.

Oct. 11, 1899, the number of member companies was 165; since then 32 new companies have joined the association, 2 have been suspended and 31 have withdrawn.

The new members are:

Atchison, Kan.—Atchison Railway, Light & Power Co.
Aurora, Ill.—Aurora Street Railway Co.
Asbury Park, N. Y.—Atlantic Coast Railroad Co.
Bridgeton, N. J.—Bridgeton & Millville Traction Co.
Chicago, Ill.—Chicago Electric Traction Co.
Columbia, Pa.—Conestoga Traction Co.
Detroit, Mich.—Detroit & Pontiac Railway Co.
Dayton, O.—Dayton & Western Traction Co.
Elgin, Ill.—Elgin City, Carpenterville & Aurora Railway Co.
Fond du Lac, Wis.—Fond du Lac Street Railway & Light Co.
Ft. Wayne, Ind.—Ft. Wayne Traction Co.
Galesburg, Ill.—Galesburg Electric Motor & Power Co.
Hamilton, O.—Cincinnati & Hamilton Electric Street Railway Co.
Highwood, Ill.—Chicago & Milwaukee Electric Railway Co.
Joliet, Ill.—Joliet Railway Co.
Kansas City, Mo.—East Side Electric Railway Co.
Knoxville, Tenn.—Knoxville Traction Co.
Montreal, Canada.—Montreal Street Railway Co.
Oakland, Cal.—Oakland Transit Company.
Pasadena, Cal.—Los Angeles & Pasadena Electric Railway Co.
Pittsburg, Pa.—Consolidated Traction Co.
Peoria, Ill.—Peoria & Pekin Terminal Railway Co.
Pueblo, Col.—Pueblo Traction & Electric Co.
Schenectady, N. Y.—Schenectady Railway Co.
Sioux City, Ia.—Sioux City Traction Co.
St. Louis, Mo.—St. Louis Transit Co.
Seattle, Wash.—Seattle Electric Co.
South Bend, Ind.—Indiana Railway Co.
Vicksburg, Miss.—Vicksburg Railroad, Power & Light Co.
Venice, Ill.—Venice, Madison & Granite City Railway Co.
Willoughby, O.—Cleveland, Painesville & Eastern Railroad Co.
Westwood, Mass.—Norfolk Western Street Railway Co.

After the report of the secretary and treasurer had been accepted and ordered filed the secretary announced that the Kansas City Club and the Elks Club had extended cordial invitations for all the delegates to visit their club rooms, the badges admitting members of the association.

The president then announced the first paper:

THE CONSOLIDATION OF STREET RAILWAYS AND ITS EFFECT UPON THE PUBLIC.

By Daniel B. Holmes, Counsel Metropolitan Street Railway Co., Kansas City, Mo.

It is no part of the purpose of this paper to enter into an extended discussion of street railway consolidations from a legal point of view. It is assumed that no considerable number of those present would be particularly interested in that branch of the subject. Suffice it to say that the laws of nearly if not quite all of the states of the Union are in such condition that practical street railway consolidation may be brought about and made effective by union of companies as a technical consolidation, or by purchase and sale of the corporate property or capital stock or by common ownership of the corporate shares of several companies, or in other ways which might be mentioned.

Whenever consolidation is desired by the parties interested it may be safely assumed that counsel learned in the law will find little or no difficulty in pointing out the way in which that end may be legally accomplished.

Street railway companies may be properly classified as public service corporations, and whenever a union takes place of several such companies, it at once becomes obvious that the interests of the capital invested and of the travelling public may and probably will be positively affected thereby. Therefore these two interests will form the chief basis of what I have thought proper to lay before this convention of practical street railway men, whose calling is such that they never feel at liberty to disregard either the best interests of their stockholders or the welfare of the public, whose constant servants they are. And I may be permitted to add, in the light of an experience and intimate association with street railway managers extending over a period of upwards of twenty years, that no class of men with whom I have come in contact in the active practice of a profession which brings about the most intimate relations with all sorts of men, are so constantly mindful of the best interests of the public they serve by night and by day, as are the street railway men. I am the more pleased to make this acknowledgment because the street railway man has so many impatient masters among the trav-

D. B. HOLMES.

elling public that he is much more often the subject of unjust criticism than of the well-deserved encomiums he would surely receive if the difficulties of his situation and his conscientious efforts to faithfully discharge his company's duty to the public were even half-way understood. Above all men it is his lot to bear the "whips and scorns of time," and if he will but pin his faith to the teachings of the Good Book, he may expect to receive hereafter that reward which in but few cases, I am sorry to say, comes in this life in the shape of an adequate salary for so hard and thankless a job.

That the consolidation of street railway interests affords opportunities for the introduction of many various economies is a truth which is almost axiomatic, and this may be fairly said to have been the controlling consideration which has inspired and accomplished the many consolidations which have taken place in various parts of the country. By this process the managerial force is greatly reduced and the salary list largely diminished. Where three or four presidents, managers or superintendents were required for the successful management of the separate properties, but one officer of each kind is needed in their united state, and while he receives more salary than any one of his predecessors, as of right he ought, because of enlarged duties and more weighty responsibilities, still there is substantial saving over what was previously paid.

But there is in this connection a still more important consideration. As is the case with any other calling in life, the supply of really first-class street railway managers is more or less limited, and the larger salary offered by the consolidated interests naturally commands, and in all probability secures, a higher order of talent than the separate properties could retain even where it had been fortunately possessed. In this way the consolidated properties in nearly every instance are managed with greater ability than was shown by the management of the disconnected parts, and this is a positive gain, the value and importance of which can scarcely be estimated. This successful manager, you may be sure, is truly a remarkable man. The relations existing be-

twen street car companies on the one hand and the municipality or its citizens on the other, are the fruitful source of jealousies and complications constantly arising which can be successfully disposed of by nothing short of the possession of genius for diplomacy, and for affairs and finance all at the same time, in order to be able to satisfy the demands of the public without involving the company in irretrievable financial ruin.

In most instances, the consolidation of street railway properties creates opportunities for marked reduction in the cost of generating motive power. Location is a most important consideration as regards the power station. Unless the power station is so situated that both fuel and water can be delivered to it at minimum cost, the highest degree of economy in developing motive power is altogether impossible. This is greatly facilitated by the union of properties since the car lines are so situated in most cities that but few of them, if independent, could operate from power stations located near steam railroad switches and water courses. A greater or less number of high-priced employes are always necessary around every power station whether large or small, and this is an expense which is greatly curtailed by generating as much power as it is practicable to handle from one station. A company possessed of an extensive system with large mileage has thus presented to it the opportunity of producing power at the minimum cost, a thing altogether impossible on a short line railroad.

But perhaps the most important result from consolidating street railway lines is the great stimulus it affords to street railway traffic. Outside of a few of the very large cities where the problem is not how to get business, but how to successfully handle that business which of necessity must come to the car lines, the street railway companies are quite generally engaged in efforts of all kinds to create travel on the lines artificially by offering to the public attractions of various and sundry kinds. This is all well enough, but one of the most effective means to this end is the consolidation of the street car lines. I believe it is the uniform experience that the aggregate travel on the united lines exceeds by a large percentage the business formerly done by the separate properties. This is partially accounted for by the fact that short distances are now ridden that were formerly walked, because two fares were then necessary in order to ride, and this was considered too great an outlay for the accommodation afforded.

But how stands the case with the public? I am altogether sure it is no different. Indeed the immediate benefit to those who ride upon the cars far exceeds the increased returns to the consolidated company. Where before the union, two and even three fares in some instances had to be paid in order to convey the passenger to his destination, he may now make the same journey for a single fare by means of transfers and through cars, which were previously impossible. Taking Kansas City for an example, 50 per cent of all the passengers who ride on the cars make at least one transfer in every journey, so that it may be truly said 60,000 passengers save 5 cents each and every day in the year in Kansas City alone, and this saving is due solely and directly to the consolidation which took place only a few years ago. And who are the people thus benefitted? It is chiefly the laboring classes who can least afford to spend their hard earned gains unnecessarily. The sons of toil who were formerly compelled to shelter their wives and rear their children in the polluted air and noise and smoke because unable to pay more than a single fare in going to and from their vocations, can, and do now, dwell in the neat little cottage in the suburbs where loved ones breathe the pure air of heaven and bask in the sunshine of life all the day long, and when eventide comes smiles and mirth and joy are the companions who have taken the place of sickness, suffering and grief. Who can estimate the value of blessings like these? If the public welfare is the first and highest duty of the state who can gainsay the immense value to the public of street railway consolidations, and who can say that the state ought to throw any obstacles in their way?

But it is said that competition is the life of trade, and that monopolies are odious. Accepting these as general truths, let us see how it is with the street railroads. Except to a very limited and unimportant degree, there is no such thing as competition in street railroads, and their consolidation is entirely devoid of any objectionable feature of a monopoly. In the very nature of things, street railroads are seldom competitors in business. They were never known to compete in rates, and can only be laid on such

highways as the authorities may determine. The necessity for keeping some streets open for ordinary vehicle traffic keeps the street railroads sufficiently apart as a rule to eliminate any matter of choice on the part of the intending passenger. Each line supplies and accommodates its own peculiar territory, and there is no real choice, and hence no real competition. As to rates, these are universally fixed by the franchise ordinances. They are the same on all roads so that the intending passenger is moved solely by considerations of convenience to himself. In short, he simply takes the line which takes him to his destination with the least inconvenience. Monopolies are only odious when of a character that they do or have the power to fix their own price for what they alone can sell. Not so with the consolidated street railway. So far from having the power to increase the cost of travel, consolidation always results in a practical reduction of cost by giving to the passengers the right to ride for the same single fare the increased distance brought about by consolidation. No thoughtful man would condemn a street railway consolidation, because it neither stifles competition nor increases cost of travel, nor creates a monopoly as that term is generally understood.

There can be no doubt that consolidations of this character are greatly beneficial both to invested capital and the public at large. And happily this is so, because the public is never so likely to have its wants provided for as when it is to the interest of capital to do so. There is no tie so strong as common and mutual interest. This is a principle which would render many conflicts and controversies impossible, if kept always in mind and strictly adhered to in all dealings between public service corporations and the municipality in which they dwell. I commend it to the thoughtful consideration of all who are assembled in this convention, as the firm foundation on which aggregations of capital may safely rest, the Gibraltar of justice and right, garrisoned by an always sound and healthy public sentiment, against which the assaults of prejudice, passion and demagoguery would be hurled in vain.

The meeting then adjourned, the president announcing that the executive committee would then hold a meeting.

RECEPTION AT THE MIDLAND LAST EVENING.

Seldom have the members of the two associations enjoyed a more pleasant occasion than the reception tendered them last evening at the Midland Hotel by the citizens of Kansas City. The evening was spent in informal chat and everyone present will take with them when they leave the most pleasant recollections of Kansas City's warm hospitality. The parlor floor of the hotel was elaborately decorated with palms and American beauty roses, and from behind a perfect bower of hot house plants an orchestra of several pieces dispensed pleasing music. Light refreshments were served and the gathering broke up at a late hour.

Among the prominent ladies serving on the reception committee were: Mrs. Walton Holmes, Mrs. C. F. Holmes, Mrs. Kirkpatrick, Mrs. Derkee, Mrs. Stockham, Mrs. Dr. Crow, Mrs. Gregory and Mrs. Satterlee.

TALLYHO RIDE FOR THE LADIES.

The ladies' reception committee has arranged to give the visiting ladies of the convention a tallyho ride around the city this morning, taking in all the points of interest including the Country Club. The party will leave the Midland Hotel promptly at 9 o'clock and will stop at the Coates and the Baltimore for the guests at those hotels. The gentlemen are cordially invited to attend the meetings of the associations at the Convention Hall and let the ladies enjoy this trip alone.

THEATER PARTY THIS EVENING.

Through the courtesy of the Metropolitan Street Railway Co. the entire seating capacity of the New Coates theater, Broadway and 10th street, has been reserved this evening for delegates and visitors to the convention. Tickets may be secured from the secretary, and it is expected small parties will be made up at the hotels and go in a body to the theater. All parts of the house will be open to the holders of tickets and no seats will be especially reserved. The play is "The Runaway Girl." The curtain rises at 8.

STREET RAILWAY ACCOUNTANTS' ASSOCIATION.

The 4th annual meeting of the Accountants' Association was called to order at 10:45 by President Duffy, who introduced Mr. Daniel V. Kent, auditor of Kansas City. Mr. Kent warmly welcomed the association in a few well-chosen words and after a brief response the president delivered his annual address.

PRESIDENT'S ADDRESS.

Gentlemen of the Association: In welcoming you to the fourth annual convention of the Street Railway Accountants' Association of America in this progressive, hospitable western city, permit me to refer briefly, and with great pride, to the present standing of the association, what it has accomplished and what it should accomplish.

The association is now on a solid foundation. The membership embraces the representative companies of the United States, Canada and Mexico, in addition to companies representing England and Scotland. Whatever may be the political faith or opinions of the Accountants, there can be no doubt that they are thorough "Expansionists" on the question of membership in this association. Notwithstanding the fact that the annual dues have this year been increased from \$10 to \$20, and that numerous consolidations have been effected in the year 1900, I am glad to say that our membership has not been materially affected. The deficit in the treasury, reported at the last convention, has been more than wiped out by the voluntary subscriptions of the members; we have a substantial cash balance on hand and no unpaid bills or other obligations outstanding.

For the fourth time, we are holding our annual convention in the same city, in the same building, at the same time as the American Street Railway Association. We are under many obligations to that association for the hearty support and earnest co-operation they have extended to us, for the privilege of attending their meetings, and for other courtesies that we have enjoyed at their hands. Unquestionably, the attitude of the older association towards this association has brought the operating and accounting departments of street railways in closer touch with each other, to the mutual advantage and benefit of both departments, as well as the good of the companies represented. To the American Street Railway Association we owe much, and I take advantage of this opportunity to express our appreciation of what it has done for us.

The Standard System of Street Railway Accounting of this association, strongly endorsed and unanimously adopted by the Convention of Railroad Commissioners of the United States, is now the standard of that body. All reports to State Boards of Railroad Commissioners (who are members of the National Association) of the fiscal year beginning July 1, 1900, will be made in accordance with the Standard System, thus placing it in the same position with reference to street railways that the Inter-State Commerce classification of accounts occupies with reference to steam railroads.

The Department of Blanks and Forms is now firmly and permanently established and in successful operation. This valuable collection of thousands of blanks and forms, securely bound in books, perfectly arranged and classified, thanks to the genius of our worthy secretary, Mr. Brockway, forms a library of rare and valued books, of which each member is privileged to make use. This feature is of special value and assistance to all members of the association. The exhibit of the blanks and forms at the annual conventions is one of the most interesting and instructive features of our meetings. A valuable addition to our library is the "Railway Official's Private Report and Reference Book," published by an enterprising supply firm and distributed by it gratuitously. The first copy of this book issued, with the name of the association stamped on the cover, was presented to the association by the publishers. In publishing this book, which is pocket size, admirably arranged and a marvel of the printer's skill, the publishers have recognized the growing importance and value of accounting work

in street railways and paid our association a graceful tribute by dedicating the book to it.

In connection with the use of the Standard System of Accounting of this association, we have a strong committee at work, charged with the responsibility of determining a Standard Unit of Comparison. The members who attended the Chicago convention one year ago, will remember the valuable paper on this subject presented by Mr. H. C. Mackay, the able and energetic chairman of the committee, and will recall the animated and interesting discussion that followed the reading of the paper. The committee will present another report to this convention; it is hoped you will give the subject the earnest, thoughtful consideration its importance demands, that there will be a thorough discussion in which every member present will participate, and that we will agree on a Standard Unit of Comparison which will be acceptable from every standpoint and go hand in hand with the Standard System of Accounting.

C. S. DUFFY,
President.

The advantages of membership in the Accountants' Association, to those engaged in the street railway business, are many and varied. No man could ever hope to accomplish, single-handed what the association can accomplish, as a body. The annual conventions give the members an opportunity of meeting each other, interchanging ideas, learning from each other and acquiring knowledge and experience which could not be obtained in any other way. The Classification of Accounts of the association is a self-instructing text book; the Department of Blanks and Forms is a valuable library of reference. Where, outside of the association, could the street railway worker find such advantages? To those of us who struggled through the disadvantages of an unsystematic accounting system, incident to street railways prior to the advent of modern transportation methods, going through the evolution of horse, cable and electric railways, construction and operation, these advantages appeal strongly. What would we not have given to

have had then what we have now? The work of the association, chiefly educational in its character, has only begun.

Having thus referred briefly to the present standing of the association and what it has accomplished, I will now draw your attention to the more important question of what it should accomplish.

Our first and most important duty is to increase the membership. There are some large companies and many small ones not represented on our membership roll, which should be with us. An earnest, determined effort should be made, in a systematic way, to see that every company is solicited to join the association, and that they are made acquainted with the advantages and benefits to be derived from being members. This effort should not only be made by the association as a body, but each member individually should take up the work, as a personal canvass is often successful where other measures fail. The life and success of this association depend upon its membership.

I earnestly recommend that this association consider the question of formulating a standard system of accounting and a standard unit of comparison applicable to the lighting and power business. The growing importance of this industry, owing to the introduction of modern electrical machinery, making it possible to generate current at one central power plant, economically transmit and distribute it at long distances, the increased consumption of current for commercial and domestic purposes and the tendency of the present day to combine the railway, lighting and power business, demand that we give this subject immediate attention. There are a number of our membership companies now engaged in the railway, power, electric lighting and gas business. I would suggest that a committee be appointed, charged with the responsibility of this work and that they be instructed to make their first report to this association at its annual convention in 1901. I would advise that this committee confer and co-operate with a similar committee of the National Electric Light Association, to whom has been delegated the same work for that association. I am pleased to announce that our William F. Ham has been appointed a member of the National Electric Light Association committee. This is a compliment to Mr. Ham, a recognition of the valuable work he has performed for this organization, and an honor to our association of which we may well feel proud.

It would not be amiss to state that the committee on a Standard System of Accounting, at the suggestion of Mr. Brockway, gave this question of a classification of accounts for lighting and power companies some consideration prior to the annual convention of 1899, but decided not to present it to the 1899 convention, as there were other matters of more direct importance to this association to be considered at that convention. This accounts for our association not taking the initiative.

Accounting is one of the vital elements of business. This is being recognized more and more every day. In reading the proceedings of the conventions of different organizations held during the current year, I was so impressed with this fact, that with your permission, I will present for your consideration some of the more important points which were brought out with reference to accounting, as I feel we should take advantage of every opportunity to study this broad subject in all its phases. At the convention of the New York Street Railway Association, held in Buffalo, Sept. 18-19, 1900, Mr. G. Tracy Rogers, the president of the association, in his annual address, said: "Much has been accomplished in the standardization of our accounts which will work out untold benefit to the roads; besides strengthening our securities, it will give confidence to the public, and afford us material for comparison."

In discussing a paper before the Southwestern Gas, Electric and Street Railway Association, the president of a railway and lighting company said in part: "The point of a comprehensive set of accounts to be kept so that the condition of business can at all times be understood is a great deal more important than we imagine until we go into it, and the more you get into it the more information you will get. We are trying to be able to tell the details of the cost of producing a kilowatt-hour from the time the coal leaves the car until the consumer pays for it. This looks at first as if it was uncalled for, and I have had the question raised that it took too much time. After you have once got into it, it does not take any more time than it did a year ago, to make out your monthly report, with a detailed, statement, and you can see any little difference as to where your expenses are increasing or decreasing."

In appointing a committee to formulate a uniform system of

accounting, the National Electric Light Association recognized the advantages of a uniform system that would be a standard for all to conform to. At the convention of this association, held in Chicago, May, 1900, Mr. J. B. Cahoon presented a paper on "Uniform Accounting." He pointed out the necessity of a system of accounting that would show "true costs," not by single companies, but by a great body, all of whom would follow the same method and use the same system of account in determining the cost of production.

In discussing this paper, Mr. Samuel Insull, president of the Chicago Edison Co., said in substance: The first step in this matter is to have our own members, if we can educate them to a uniform system of accounting, state in their accounts what their cost is, and stop them as far as moral suasion will stop them, from working their construction accounts. If moral suasion will not stop them, if we can get copies of their reports, kept on a uniform system of accounting, we should bring them up here in the convention and ask them to explain their accounts, when some company shows an abnormal profit as the result of immoral accounting, fooling itself.

The question of publicity of accounts of corporations, especially companies engaged in operating public utilities, is receiving close attention. At the twelfth annual convention of Railroad Commissioners, held in Milwaukee in May, 1900, to which this association was invited and officially represented, the president advocated the enactment of legislation that would compel street railways in all states to make reports to the railroad commissioners, as steam railroads now do. At the convention of the National Electric Light Association, the point was brought out in Mr. Cahoon's paper on "Uniform Accounting," that there was no objection to publicity of accounts if "true costs" were shown.

At the last convention of this association, it was suggested that we should have not only a standard unit of comparison, in connection with the standard system of accounting, but a standard form of report, full and complete in every particular, a standard system of blanks and forms, and a standard system of accounting methods. I most heartily endorse and approve this proposition in all that it embodies. Now that we have adopted a uniform system of accounts, we should bear in mind one of the fundamental objects of the association, as set forth in Article II. of the Constitution, namely, "To improve the work of the accounting department." On the principle that he who does not go forward, goes backward, it should be the fixed purpose of this association to broaden and perfect the Standard System of Accounting in every feature of its practical working application, so that the best results possible from every standpoint may be attained. How shall we do this? The question of a Standard Unit of Comparison has already received careful consideration from the committee to whom it was referred, and they will report to this convention.

As to a Standard Form of Report, I will say that the matter has received attention and will be submitted for your consideration later.

With reference to a Standard System of Blanks and Forms and a Standard System of Accounting Methods, I would recommend that a committee be appointed, charged with the work of preparing model blanks and forms, general in their adaptability and use, with such explanations and instructions as may be necessary or desirable. These blanks and forms should cover the accounting work of every department. I would suggest that the best form for each specific purpose could be selected from the library of the association, and in that way a book of model forms could be prepared. The necessary explanations and instructions concerning the use of forms should include in a general way, suggestions as to the methods to be pursued in gathering the figures and data that are to be compiled in each specific form. These suggestions must of necessity be general in their application. Special local conditions will require special study and treatment.

In connection with what this association should do as a body, "to improve the work of the accounting department," each member individually, for himself, for the association, and especially for the company he represents, should take up this work and devote to it all the energy, ability and application that he may have. We should be thoroughly posted on the affairs of the company we are connected with and have a general knowledge of the operation of the road in all departments, or our sphere of usefulness and the value of our work will necessarily be limited.

We should closely study the special local conditions which are a part of the operation of every road, so that the accounting problem involved may be correctly solved and the conditions of operation clearly and comprehensively set forth.

We should aim to make our system of accounting practical, complete, thorough and economical. The advantages of modern methods in commercial business, and the introduction of labor-saving devices should be thoroughly investigated and made use of if they can be used to advantage. We cannot be producers of "gross earnings," but we should be increasers of "net earnings." We should be careful not to duplicate work or expend labor that is unnecessary or yields no return. We should not be carried away with a mass of figures and statistics that have no practical value or serve no good purpose, neither should we go to the other extreme of dismissing as useless and valueless, much that may be of vital importance, simply because it increases the work of the accounting department or necessitates the expense of additional clerk hire, when results may be produced which would more than repay the work and expense involved. I believe in an accounting system of such scope and extent that the grasp of the affairs of the company, as well as the operation of the property, is at all times within the hands of the accounting officer in charge; a system that will furnish any information that may be required or desired, promptly; a system that will make it possible to answer any question which may be asked.

There are two propositions that enter into the work of the accounting department; though different, they are intimately connected with each other. One is "accounting," the other is "railroading." Mr. H. H. Vreeland, president of the Metropolitan Street Railway Co., of New York, at our last annual convention, said this about the calling here represented: "I, from my experience, have always looked upon the auditor, or accounting officer, of a railroad as the most important lieutenant and aid of the president or managing officer of the road. I look upon the man at the head of the accounting department as the confidential accounting adviser of the head of the property."

The papers to be presented to this convention deal with practical accounting questions and are along the lines of the work that this association should now take up. The subjects of the papers were selected and the program of the convention was arranged with this special purpose in view. To the gentlemen who have responded to the demands of this convention, we are under many obligations. I desire to express our most sincere thanks and appreciation for their hearty co-operation.

Special mention is due our able and energetic secretary, Mr. W. B. Brockway, for the valuable work he has performed for this organization. To Mr. Brockway's efforts the association owes much of its success.

To the "Street Railway Review" and the Street Railway Journal, and our good friends and honorary members, Messrs. Windsor and Higgins, we are under many obligations for courtesies extended. The columns of the "Review" and Journal have always been open for the publication of anything that would further the interests of this association.

Formal notice has been given, as required by the By-Laws, that a change is proposed in Article VII of the By-Laws. This means that the question of changing the time and place of holding our annual conventions is to be voted on at this convention. I earnestly hope that the question will be fully and thoroughly discussed from every standpoint, and that every member present will express his opinion as to what he thinks is best for this association to do, before the matter is put to a vote.

With reference to the next convention, I am reminded of a question of the utmost importance to the association, and one that has given your present officers much concern. I refer to the assignment of papers. The success of our meetings depends in a large measure on the selection of proper subjects for papers and having the papers prepared and presented to the convention. Any member of this association, when asked to prepare a paper, or perform any other duty assigned to him, should appreciate the honor sufficiently and have the interest of the association at heart in such a degree that he would gladly respond when called on and give the association the benefit of his best efforts. This is a duty that every member owes to his fellow members and the calling he represents, a duty that should not under any circumstances be disregarded or shirked.

In conclusion, permit me to express my appreciation of the honor you have conferred on me, that makes it at once my duty and privilege to preside over the deliberations of the fourth annual convention of this body. To be president of the Accountants' Association is an honor I esteem more than words can express. I thank you for the honor bestowed and for the many acts of kindness and courtesy that I have received from your hands, as well as your valued assistance in many ways. Let me bespeak from you faithful attendance and close attention to the proceedings of the meeting, and especially, full discussion on all subjects. I earnestly hope that this convention will be a fruitful source of information and education, as well as a pleasant reunion for us all. Gentlemen, I commit the business of the convention into your hands.

The secretary and treasurer then submitted his annual report as follows:

REPORT OF THE SECRETARY AND TREASURER.

The report of the work done in this office for a year has become a rather large undertaking, caused by the three divisions into which the office has resolved itself—viz., secretary, treasurer, and the Department of Blanks. In each there has been so much accomplished that it seems better to divide the report so as to cover each section of the work separately. This is without any desire on my part to imitate the well known Poo-Bah, but if any such charge should be made, I would promptly lay it upon the happy faculty the association has of being successful and busy, and keeping the secretary busy, too.

In reporting the membership as it is today, the prophecy made in last year's report as to the effect of consolidation has been, to a large extent, verified; but the applications for membership that have been presented have neutralized the loss, so that, from a numerical standpoint, we are but very little worse off than a year ago.

Applications have been received from the following twenty-one companies:

- Indianapolis Street Railway Co., Indianapolis, Ind.
 - Charleston Consolidated Railway, Gas & Electric Co., Charleston, South Carolina.
 - Louisville Railway Co., Louisville, Ky.
 - St. Joseph & Benton Harbor Electric Railway & Light Co., St. Joseph, Michigan.
 - Union Traction Co. of Indiana, Anderson, Ind.
 - Chicago Consolidated Traction Co., Chicago, Ill.
 - Manchester Corporation Tramways, Manchester, England.
 - St. Louis Transit Co., St. Louis, Mo.
 - Portsmouth, Kittery & York Street Railway Co., Portsmouth, New Hampshire.
 - San Antonio Street Railway Co., San Antonio, Tex.
 - Conestoga Traction Co., Columbia, Pa.
 - Chicago Union Traction Co., Chicago, Ill.
 - Washington Traction & Electric Co., Washington, D. C.
 - Winchester Avenue Railroad Co., West Haven, Conn.
 - Cleveland & Eastern Railroad Co., Cleveland, O.
 - Connecticut Lighting & Power Co., New York, N. Y.
 - Consolidated Traction Co., Pittsburg, Pa.
 - Bridgeport Traction Co., Bridgeport, Conn.
 - Seattle Electric Co., Seattle, Wash.
 - Buffalo Railway Co., Buffalo, N. Y.
 - Erie Transit Co., Erie, Pa.
- Resignations have been received from the following twenty-five companies:
- Southern Electric Co., St. Louis, Mo.
 - Nassau Electric Railway Co., Brooklyn, N. Y.
 - City & Suburban Railway Co., Washington, D. C.
 - Brooklyn, Queens County & Suburban Railway Co., Brooklyn, New York.
 - Citizens' Railway Co., St. Louis, Mo.
 - People's Railway Co., St. Louis, Mo.
 - Lindell Railway Co., St. Louis, Mo.
 - Missouri Railroad Co., St. Louis, Mo.
 - Kokomo City Street Railway Co., Kokomo, Ind.
 - Columbia Railway Co., Washington, D. C.
 - Hamilton Street Railway Co., Hamilton, Ont.
 - Columbus Central Railway, Columbus, O.
 - Metropolitan Railroad, Washington, D. C.
 - Union Depot Co., St. Louis, Mo.

West Chicago Street Railway Co., Chicago, Ill.
 Cleere & Proviso Street Railway Co., Chicago, Ill.
 Hawaiian Tramways Co., Honolulu, H. I.
 Oakland Transit Co., Oakland, Cal.
 Fair Haven & Westville Railway Co., New Haven, Conn.
 Milwaukee, Racine & Kenosha Railway Co., Racine, Wis.
 Syracuse Rapid Transit Co., Syracuse, N. Y.
 North Chicago Street Railroad Co., Chicago, Ill.
 Brightwood Railroad Co., Washington, D. C.
 Central London Railroad Co., London, England.
 Lowell, Lawrence & Haverhill Street Railway Co., Lowell, Mass.

The statement of growth in membership is:

Charter members, Cleveland, March, 1897.....	25
Additions reported at Niagara Falls, October, 1897..	12
Additions reported at Boston, September, 1898.....	32
Additions reported at Chicago, October, 1899.....	34
Additions reported at Kansas City, October, 1900.....	21

Total applied.....	124
Withdrawn.....	28

Membership October 16, 1900.....96

This shows a net loss of but 4 members. But the average number of applications received per year has been 34, while 1900 shows but 21, a drop of 13 in the average. These figures show plainly the need of a definite action on the part of the present members toward the gathering in of every company within reach. It is not so much that a larger showing may be made that this effort seems necessary, as it is to make the association so representative that its deliberations may carry the positiveness which comes from such a larger point of view.

During the year furniture has been added to the equipment of this office, including a second-hand typewriter, a book-case, a copy-press, etc., costing less than \$60.00. All of this was very much needed.

The financial statement is interesting, showing as it does that the increase in dues has been well received by the membership, and that the necessity of a larger income is appreciated.

The receipts have been as follows:

In Bank, Oct. 14, 1899.....	\$ 19.28
Donated account 1899 deficit.....	160.00
Dues for 1900.....	1,570.00
Dues for 1899.....	10.00
Applications..	310.00
Interest on deposits.....	7.65
Total.....	\$2,076.93

The expenses have been as follows:

Salary, secretary....	\$200.00
Secretary, office expenses.....	75.90
Postage.....	62.00
Office furniture..	59.25
Printing 1899 Report.....	260.65
Stenographer, Chicago Report.....	110.00
Printing..	58.05
Department of Blanks.....	12.75
Printing 1899 Standard Report.....	129.50
Note paid..	125.00
Miscellaneous..	88.59
Total.....	\$1,181.69

Balance in bank, October, 1900..... 895.24

Had the dues remained at \$10, and expenses for this year as they are—and it is difficult to see how they can be reduced—the result would have been an income of \$1,120, and a deficit of \$61.69. This income includes \$160 contributed at the last convention; without it, the deficit would have been \$221.69. To take into account that the expenses are \$210.05 less than last year, will make the wisdom of the increase in dues more clear.

At this point I wish to explain, that with his customary liberality, President Duffy has refused to receive his expenses to New Orleans to confer with the secretary in March of this year, or to Milwaukee, to attend the meeting of the National Convention of Railroad Commissioners. In the latter trip, Mr. F. E. Smith, auditor of the Chicago Union Traction Co., took the same action; and it is through the kindness of these gentlemen that the treasurer

is enabled to report a decrease in operating expenses and so large a balance in bank.

For the Department of Blanks and Forms, there is to report a considerable increase in the blanks filed by the addition of the issue of 12 companies and the re-filing of a number of re-issued forms. All of these add to the interest and value of the collection, which has reached such large proportions through your co-operation.

Among the new blanks received is a large set from the Glasgow Corporation tramways, which, on account of the differences in practice, were rather difficult to fit to our classification of blanks, and have been filed in a separate book numbered 15. An examination of this set will be found very interesting.

Owing to economy of space, instances will be noticed where blanks have been filed on top of others, in all cases showing the full size and composition of each; but at times by a similarity of papers, the dividing line could not always be easily distinguished. To remedy this, a light black line has been ruled around every blank, giving a result very noticeable to those who examined the collection at Chicago; and, at a glance, rather than by close scrutiny, the blanks are separated and compared.

The new collection of rubber stamp impressions, while not representative, is an interesting addition and assists to the result aimed at by the department.

Some changes are contemplated in the arrangement of the permanent set and the sets used for requests, all helping in what experience has shown is needed to make the collection a positive benefit, and not let it become merely a curiosity.

It is a pleasure to state that the friendship and help heretofore shown by the officers of the American Street Railway Association and the street railway papers has been continued unwaveringly, and the most cordial thanks are again expressed to them and the many others who have assisted in bringing the association to the position it now occupies.

W. B. BROCKWAY.

In addition to the new members given in the report the secretary stated that there should be added to the list of new members as read, the Washington Power Co., of Seattle, Wash., and the Syracuse Rapid Transit Co., of Syracuse, N. Y., which had resigned and rejoined.

In relation to the list of resignations read, the secretary stated that most of them had been caused by consolidations which were prophesied last year. He thought there were only about 7 of these 25 that resigned on account of the increase in dues.

President Duffy: Gentlemen, you have heard the report of the secretary and treasurer, which is very gratifying when it is considered that we have 98 members, as against 100 last year, and \$895 in the bank, instead of \$75 in red ink. What is your pleasure?

On motion of H. L. Wilson, Boston, the report was accepted and ordered filed.

President Duffy: The next order of business, gentlemen, according to the printed programme, is the appointment of committees. On the Committee on Nominations, I will appoint Mr. H. L. Wilson, of Boston, Chairman; Mr. S. E. Moore, of Pittsburg, and Mr. Simpson, of Augusta. On the Committee on Resolutions, I will appoint Mr. Wm. F. Ham, of Washington; Mr. Chas. M. Hemingway, of New York, and Mr. Suda, of St. Louis.

The next order of business is the paper, or, rather, the address, of Mr. John I. Beggs, general manager of the Milwaukee Electric Railway & Light Co., on "What Does the General Manager Want to Know from the Accounting Department?" and in this connection I desire to say that Mr. Beggs has very kindly filled the place of another gentleman on the programme, at very short notice. Mr. Wyman had this paper assigned to him, but has recently gone out of the street railway business, at least out of the direct charge of a road, and he has been called to Boston, and it was impossible for him either to attend the convention or to prepare a paper, and Mr. Beggs, very kindly consented to address this body on the same subject.

ADDRESS OF MR. BEGGS.

Mr. President and Gentlemen: I must apologize for not having given more time and thought to the subject which you expected to hear discussed by Mr. Wyman. It was only a few days, or possibly a week ago, when I was requested by your executive officers to prepare a paper upon this subject. I have never prepared a paper

in my life, and am almost too old to learn new tricks. Therefore, what I shall say upon this subject will be simply the thoughts that are suggested to me as the manager of one of these public utilities.

What the general manager wishes to know from the Accounting Department, I should narrow and say, "What Does the General Manager Wish to know from the Head of the Accounting Department?" I would not be presumptuous enough to think that I, in the few minutes that I shall occupy, could stand here and tell to you what the general manager wants to know from the accounting department, when so much time has been so well expended by your association for several years past developing and demonstrating just what he should know. The system of blank forms and accounts that you have developed is highly creditable to your association. It will do much to save the industry in which we are all so vitally interested. The first thing the general manager wants to know from the accounting department, in my judgment, is that the accounting department believes in the general manager's policy. He wants to know that he has loyal, enthusiastic, energetic supporters in carrying out what may be the general manager's policy, and that they will aid it conscientiously and fearlessly; and when the head of the accounting department cannot subscribe to the general manager's policy he had better tender his resignation. As a rule the general manager stands for the board of directors, and they are supposed to stand for the stockholders, which is the capital. Unfortunately they have not always done it, but they should do it, and I think that the executive managements of these public utilities are year by year giving a stricter account to the great body of stockholders. In order to do this we must have conscientious, earnest work both on the part of the general manager and of the accounting department. Unfortunately, the general manager is not always a trained accountant; he is too often not competent to analyze and determine whether or not the accounts and the various statements that come to him are made up intelligently, or to analyze and determine whether or not they have been properly kept. And that, in days gone by, has been responsible for the failure of some of these public utilities, and caused them to be re-financed. They have run aground without knowing it; like the mariner whose compass has become disarranged or does not know how to read it, they are cast ashore; they run against the breakers, and it is the easiest thing in the world, because too often it is to the interest of the general manager and the board of directors to make too glowing a statement of what they were doing, and this is particularly the case during the years of construction or development when they have a capital account to be drawn upon.

Capital account has covered multitudes of managerial blunders and extravagances. Therefore, I always take the position that it is best to close up the construction account as quickly as possible. If there is going to be any error made in your accounting departments, gentlemen, let it be on the other side. Have a little more property than you think you have. When a man puts his hand in his pocket and expects to find seventy-five cents, but finds, instead, a dollar, he feels very good. It is not a very large amount, but nevertheless it is on the right side. He has just a little more than he expected. But if he puts his hand in his pocket and finds he has only fifty cents, he is disappointed; he says, "I certainly thought I had that," and such is the case with many of these properties that they go on deluding themselves; because there is a construction account, they charge into that many things that should have gone to operation. It is one of the reasons why many new enterprises seem to show such phenomenal results. I have seen a statement very recently of a certain line running into the city of Chicago, or nearly so, showing the expenses to be down to somewhere about 30 per cent. (Laughter.) Now, we all know how that is produced. Of course, that is not done in order to show what the actual results are. It is produced in order to unload a promoter's property upon an unsuspecting investing public. I only refer to that because that statement has been brought to my attention within a few weeks, being on the market. But very often our properties get into the same condition, because of a lack of intelligence. Therefore, the general manager wishes to know from the head of his accounting department—and I shall deal with the head—that there is an intelligent understanding, and an honest practice in the making up of either the daily, the monthly, or the annual statements.

As I said at the outset, the general manager wishes to know that the head of the accounting department is in sympathy with and believes in his policy, because a general manager should lay down the policy for his corporation. He is put there for that purpose. Now, he must know that his associate who is in charge of the figures believes in that general policy, will help him carry it out, will in every manner so operate with him, will watch and see that there is consistency throughout every department of the company's business.

Some of our properties are in a little more complex condition than others. Take the property with which I am associated; we conduct a very large electric lighting business in three or four different cities, some part of it under our main company, some under a traction company which we operate. Consequently, it is very difficult at times to feel that the same general practice is observed in each one of the co-ordinate companies, possibly under the name of one, and that the head of each particular department observes the same methods as are observed in every other.

In the street railway business it is highly important that the general manager shall have confidence in the integrity, in the vigilance and discrimination and keen perception of the head of the accounting department and know that he will watch that there is no injustice permitted even to the humblest employe of the company, and that the trainmen are held to strict account. The idea should not get abroad among your force of conductors that there are not too many shortages being reported, or that there is too much carelessness in the accounting department. We make it a rule to have the accounting of the trip sheets and the returns of the various conductors directly under the head of our accounting department. We have but one head of "figure wrestlers" as I call them. We do not have it divided into transportation department, and so on, but all is under one head. I am a great believer in centralizing responsibility, and in having one head responsible and giving him the highest degree of confidence. One of the most important things in dealing with the conductors on street railways, is that they have absolute confidence in those who pass upon their daily returns. They should not, every day or two, be brought face to face with the charge, "You have a shortage to-day of a dollar," or fifty cents, whatever it may be; that creates distrust and it soon permeates the whole mass of men. They begin to distrust the accounting departments, and to believe that their methods are not accurate. That comes back, it works almost incalculable harm among our men, and we who are managing these properties to-day are carefully studying that there shall be no cause of unrest, or dissatisfaction among our trainmen. You have seen a number of serious labor troubles among that class of men during the past year. We went through it, four and one-half years ago, one of the first large railway strikes. We have watched it carefully ever since. It very often comes from the accumulation of a multitude of these trivial matters, that give good cause at times for unrest.

These are some of the things we want from the head of the accounting department. I am ignoring your system of blanks entirely. I did not conceive that was what you wanted to hear about, or that it would be a thing of particular value to you, because you are giving labor and conscientious thought to that subject. The blanks are being perfected from year to year, and developing in greater detail. I thoroughly understand that in different corporations there are varying conditions that do not apply to all. Consequently there must be, with your system of accounts, provisions for some flexibility that may suit the peculiar conditions of various corporations, many of which are interested in a variety of things, and have more than one interest to provide for. They must likewise be sufficiently flexible to permit, sometimes, of what may be the peculiar or unreasonable notions of the general manager. He may have an idea that he wants injected into them certain additional features, or, possibly a very good reason from his standpoint, which is not always recognized, perhaps, by the head of the accounting department. The general manager should have the confidence and command the respect of the head of the accounting department to such an extent that, notwithstanding it may cause some additional labor to provide these auxiliary accounts, as we might call them, for his information the work will be cheerfully done. The manager may have better reason for asking for them than appears on the surface, and it may entail, as the head of our own accounting department has sometimes found, a considerable amount of additional labor; but it is not useless; it is

for some good cause. I am well aware that all managers have ideas that are different possibly from those of the heads of their accounting departments because of some previous experience they themselves had in the science of accounting. I use the word "science" advisedly, because accounting is a science, and if the broad, fundamental, underlying science of accounting is thoroughly understood by the head of the accounting department it will be much easier for those charged with the operating of the properties.

I had something to say when this association was being organized as to what should be included, having given considerable attention to the various forms of accounting of this and its kindred industry, electric lighting, for a great many years. In fact, I was one of a committee some fifteen years ago to standardize a system of accounting for electric lighting plants in that early day. They had done more I think in the line of standardizing their accounts, or at least one branch, electric lighting. I speak more particularly of the old Edison Association of Illumination Companies, which was a close corporation and still is I believe, but I was the president of it for seven or eight years and we had a very carefully devised system of accounting whereby we could, with a great degree of accuracy, compare the results of various companies throughout the United States. Though more limited than this association, we demonstrated, at that early day in the electric lighting industry the great advantage of being able to compare accounts. That is highly advantageous, absolutely essential, even in the street railway business. The general manager wants to be assured that the head of his accounting department is watching his expenditures from day to day, watching that the estimates made of construction, or of some piece of reconstruction, do not seriously exceed the requirements, or if they do, that the fact will be brought to the attention of the general manager in order that a proper remedy may be applied; that the practice throughout the various departments of the corporation is uniform, so he may not have, as is sometimes the case, an employe in one department asking to be transferred to some other department in the business of the same corporation for the reason that the practice is different. Such a condition should not exist, and yet it may exist if the comptroller, or the auditor, or the head of the accounting department, by whatever name he may be known officially, does not bring to the attention of the executive head the facts that exist. Take it in our own corporations, where at times our employes number anywhere from two to three thousand men; it is impossible for the general manager to attempt to know what every specific rate of pay is throughout all departments, and that there is uniformity in the pay rolls and uniformity in the hours put in in the various departments. All of these things come directly under the eye of the head of the accounting department, and where irregularities exist it is highly important that he should report them in order that a remedy may be applied.

It is furthermore important that he keep the general manager advised as to how the receipts are on the various lines. While some general managers try to follow those things, they do not all do so. They would not all be competent, because of a lack of early training in the science of accounting, of determining whether the matter was accurately compiled and put in shape. The manager should see that the various lines are being operated with the smallest number of cars in order to produce given results. If on one line a car is earning two dollars per car-hour—you notice, gentlemen, that I said, "car-hour" (laughter)—and on some other line a car is earning only one dollar per car-hour, and that going along month after month, there is some reason for it. It may be a good one, but nevertheless, it is the duty of the accounting department to bring the matter to the attention of the general manager. The accountant may be conversant with the reasons why certain things are so, but as these matters are coming under his eye day after day, if discrepancies exist he should promptly bring them to the attention of the general manager.

The general manager desires, furthermore, to know that the head of the accounting department is taking occasion to correspond with other roads of similar size operated under practically the same conditions, is obtaining copies of their reports, comparing them and bringing to the attention of the general manager features in them which would seem to show that as regards certain features the other lines were being operated more economically than his own. The points wherein we are operating better than the others, I do not care to know about. I arrange to have the heads of de-

partments go away two or three times a year to some other city where perhaps there is a very good system of operation and management and a good system of accounting; I am very glad indeed to have the head of my accounting department take two or three short trips during the year; to go to different cities, and observe their methods, and I always say: "I don't want you to come back and tell me a single thing that we are doing better than they are. I don't want to know that. That will take care of itself. But go and find something that they are doing better than we are, and we will try to copy that, and if possible, improve just on it a little." The managers want to know, and they do not always have the time to investigate for themselves, that this comparison of accounts is made; otherwise, what is the use of this uniformity if you are going to close it up and lock it up in a safe? I want any company, the head of any accounting department, allied to this association, or to the street railway association, to feel that it can send to the Milwaukee Electric Railway & Light Co., or any other company in which I am in an influential position, and obtain any data that we have. (Applause.) We do not consider it a burden to give information to you, if we have to put on a clerk to copy the reports, we will do it. I want, likewise, to feel that if we wish to have some information from any member of this association, or of the street railway association, that they will not feel that we are burdening them when we ask for it. In our practical operation, I many times take time that I could not command for myself, but I do take it, to go over our system and show its various phases to gentlemen who come from a distance to see what we are doing, and I take pleasure in doing it. The exchange of ideas is valuable, and unless these various statements, these various reports and results that are being realized by the various companies, are going to be interchangeable, of what use is this uniformity of accounts? It is for some purpose. It is for the purpose of being able to make fair, intelligent comparisons, that we may know what we are doing. Above all, have the head of your accounting department keep his accounts in such a way that you do not need to fear if at any time your state railroad commissioner, or if perchance there should be a national railroad commission, should order your books closed. Let your accounts be upon the same basis as is adopted by the national banking department at Washington; when an order is given for a statement of accounts, it is not of some day in the future, but always some time in the past, so that there is no opportunity to fix up the books. So our accounts should be. We want particularly to know, or at least I want to know, that if the head of my accounting department and all of his assistants are called hence, that a new set of accountants can go to their desks in the morning and find nothing to clean up for yesterday—that the work is kept up day by day. That is highly essential, and if that were always done, it would not take so long for many managers to get a statement of what their actual condition is. It is highly important to know that there is promptitude with all these accounts, that the work is always right up to date. It will save many errors and many blunders. It is one of the besetting shortcomings of many accounting departments that they are always going to do something, going to prepare some statement sometime in the future. The future is not theirs. Consequently it is highly important that accounts shall always be up; that if the general manager wants to know something he can send with assurance to the head of the accounting department for such and such a statement and it will be forthcoming as soon as it can be transcribed from the books, or from some other statement, or that he can send the original. Two of the most important things that a general manager wants from the accounting department are accuracy and promptitude.

As I said at the outset, I have to apologize, for not having prepared an address such as would no doubt have been prepared by my friend, Mr. C. D. Wyman. I am substituting for him this morning. I have been substituting for him for four years. (Laughter.) I desire, on behalf of the managers of street railways, to extend to this association, my earnest, heartfelt appreciation of the good work your association has done, still is doing, and which I hope it will continue to do. I think no higher compliment could be paid to your association than the co-operation asked for by the steam roads and by other organizations of this kind in their efforts to perfect a standard system of accounts and of forms. This matter of standardizing forms is as important as the standardization of accounts, the forms on which the accounts pass from the

various heads of departments into the accounting department. Much of the accuracy of the accounting department will depend upon the comprehensiveness of the forms that go out from the storerooms, from the heads of the various departments, from the man in the shop as showing the cost of a certain piece of work, and so on down the line. There is quite as much necessity for making these various blanks uniform throughout, as there is for the accounts themselves, because if these various blanks are not fairly uniform it will be much more difficult to make uniform the accounts based upon them. I do not know just what forms the association has adopted. I think in our own practice we subdivide to a somewhat greater extent than is provided for in the standard forms of your association. However, we keep the various heads so thoroughly in accord with the standard system of accounts of this association that they are practically the same, with the exception that I subdivide to a greater extent some of the expenses of maintaining equipment. I have the cost of all labor and all material subdivided.

I can keep the cost of material in my mind. When I see a statement that material costs so much, I can check whether or not that is about right, without asking any additional figures; but they can cover up a multitude of sins in the item of labor, omissions and mistakes, because that is much more difficult to cover. In all work, my suggestion would be that you subdivide and differentiate between the cost of labor entering into any piece of work and the cost of the material entering into it, because the general manager, if he is familiar with his business, knows about the amount of material. If it is putting a set of wheels under a car, I know what those wheels cost. I do not know if the thing comes to me bulked, called wheels and labor; I cannot tell whether the labor has cost \$1.50, which would be about the cost of putting on a pair of wheels, or whether it is \$2.50 or \$3, if it is all covered up in one item. Therefore, I urge upon the Accountants' Association the advisability of subdividing the cost of materials as against the cost of labor that is necessary to put that material into use. We subdivide in our own practice. For car bodies, for instance, we keep carefully the cost of painting, etc., as an item by itself. Likewise the cost of heating, the cost of lighting cars. Many of these things that are coming to him in that way the general manager wants to know in order that he may be able the better to analyze and determine whether these various items are being kept down to the lowest point consistent with the highest degree of perfection in the maintenance of his construction.

Above all, urge upon your municipality and legislative bodies that they shall call for the publication of your accounts. I for one believe you owe it to them. You are simply trustees for certain rights which they give you in the municipalities. You will quiet much of the criticism we hear regarding public utilities when you make public your accounts. We have had a pretty lively time in the city of Milwaukee for several years, as some of you no doubt know. We have finally got them harmonized to a certain extent by having had passed by our municipal legislature, or common council, so called, last winter, an extension of our franchise and the straightening out of certain questions in connection with it, up to Dec. 31, 1935. We are here to-day with a decision from the Supreme Court of Wisconsin, handed down on Friday last, affirming that franchise and quieting all these various questions. It was claimed that we were suppressing our accounts. That our profits were much greater than they ever were, and the Municipal League and other associations went before the legislature some eighteen months ago, at the biennial session, last winter a year ago, to present a bill requiring us to file our accounts, and annual statement, with the officers of the state. They expected that we would antagonize and oppose them, and possibly by underhand means defeat it; instead of this I urged the passage of that act. Our accounts should be kept, as I said before, in such a manner that you do not need fear the closest possible scrutiny, either as to the underlying policy of the corporation or as to the methods employed in working them out. Once be honest and you will quiet much of the criticism in the various localities in which you are operating. Under the law of Wisconsin to-day, every street railway and electric lighting company must file a statement giving in very great detail the results of its operation every year, and we have no hesitation in doing so. We believe that it will do much to bring about a better state of feeling between the general public and the corporation that is serving it. I believe in the broad,

general, underlying principle that a street railway company is, of all corporations, one in which the general public is most vitally interested, and it has a right to be informed as to your methods of operation and of management. We are public servants, and we are the one class of public servants with whom everyone in the community must come in contact. He may escape everything else, he may escape the tax gatherer, except once a year, the undertaker, except once in a lifetime, but the street railway company he is coming intimately into contact with several times a day. In our own city we are carrying at the present time an average of one-half of the entire population every 24 hours. They are vitally interested, gentlemen. Do not attempt to deny it, but proceed upon the broad, general principle that they have a right to know that the property is being conscientiously operated so as to afford them the greatest possible degree of convenience, of comfort, of safety and of reliability, and to this end, the heads of our accounting departments can do much to assist the general manager and relieve him of many of the details of the complex position in which he is placed.

I thank you, gentlemen, for your patience; I thank you for the courtesy of calling upon me to fill the gap left in your programme. I only regret that time has not permitted me to have given to the subject more analytical thought, that I might have presented these views in possibly briefer form, and possibly in form that would have produced what I wish to produce, make your organization more valuable if that is possible to the great interests that we represent. (Applause.)

President Duffy: I wish to especially thank Mr. Beggs in behalf of this association for the able, interesting and instructive address he has given us this morning. Everyone here should go out of this hall with new lessons to learn. If we had more general managers like Mr. John I. Beggs, we would have more accountants like the accountant of his company (applause); we would have more accountants such as accounting officers should be; not machines, not book-keepers, not, as he termed it, but in a different sense, "figure wrestlers," but accountants. The lessons that Mr. Beggs has pointed out to us, each and every one, should take home to himself, and I earnestly hope that we will have more of the gentlemen across the way in attendance; and I again thank Mr. Beggs for coming here and giving us the benefit of the thought that he has so ably expressed here. (Applause.)

Mr. Beggs: Mr. Chairman, just one other word, because I must ask to be excused and return to the other side. I consider the head of my accounting department my most important associate in the management of the property. I always have done so; I do now. I consider him not so much, as is often the case, in the light of an employe, but really an associate in the management of the property; and so, every head of an accounting department should fit himself to be in reality an adviser upon many of these points that are coming to him daily, hourly, day in and day out throughout the entire year. He is to a certain extent, the right hand of the general manager.

President Duffy: Gentlemen, if I may be permitted to digress a little from the regular order of business—it is with great pleasure that I observe that one of the Old Guard is present this morning. He has honored this association by his presence, and further honored it by the presence of his wife. Gentlemen, we have with us Mr. and Mrs. Henry J. Davies, of Cleveland. Mr. Davies, as you all know, was formerly an active member, an extremely active member. He is now an honorary member, but nevertheless we would be very glad indeed, if upon this occasion he would be an active member. Mr. Davies, will you kindly come forward?

Mr. Davies: Mr. President and Gentlemen: I am glad to be with you again. I hope that in some capacity, either as an accountant or as a supply man, I shall continue to meet you yearly as long as your association meets. I am sorry that I did not hear all of Mr. Beggs' address. That which I did hear was good. It must be, it seems to me, a delight, to work as an accountant for a general manager like Mr. Beggs, a general manager who knows what he wants to know, and who knows how to get at it, and appreciates the work involved in getting at it. But when you are an accounting officer of a company whose management, perhaps, does not know what it wants nor how to get at what it thinks it wants, your responsibility is greater and your services are more valuable to that company. Mr. Beggs, in his address, covered the ground

of the topic assigned him, it seems to me, and I can add nothing to it, unless it be to emphasize two or three things that he said. First, the accountant should study the condition of his company, its receipts, its expenses. He should present to his management comparative figures, figures showing what one line does as compared with another line; what the company did this year as compared with last year, this month as compared with last month; what his company did as compared with another company whose lines are similarly situated. Your general manager will not care for all the details, all the process by which you get at results; he probably will not care for all the results at which you arrive, nor would it be wise perhaps to present them all to him. If your lines are all running along about as they should, if there is no remarkable difference between the operation of one line and another, between the operation of your company and another, he won't care to know the process, the figures by which you arrived at that result. A mere statement of the fact is sufficient. But, if in studying your accounts, you find a remarkable difference between the cost of operating one line and the cost of operating another, between the car-mile expenses of one road and the car-mile, or car-hour, expenses of another, present that fact to him as clearly, as emphatically and as startlingly as possible. Let him ascertain why, help him ascertain why, if you can. Gentlemen, I did not mean to make a speech or discuss any subject. (Applause.)

President Duffy: Our friend, Mr. Davies, said something about being a supply man. He is now the secretary of the National Carbon Co. In speaking of the car-hour I presume that he was thinking of the carbon hour. (Laughter.) I have an announcement to make here. The Kansas City Club, at Twelfth and Wyandotte Sts., extends open house to the persons wearing badges. This extends over two weeks.

Mr. Duffy, as chairman of the committee on "A Standard System of Street Railway Accounting," then submitted the following report:

REPORT OF COMMITTEE ON STANDARD SYSTEM OF ACCOUNTING.

No changes in the present classification of accounts or in the forms of monthly and annual reports suggest themselves to the committee; none have been suggested, therefore we recommend that the classification stand as it was adopted at the Chicago convention in 1899, unless this convention directs otherwise.

Your committee received very few queries from members regarding the classification of accounts. These queries were promptly answered. It is assumed that the classification as it stands, in the absence of any information to the contrary, is satisfactory to all. Your committee would be pleased to hear from the members regarding this question.

With reference to the Classification of Material and Supplies, submitted by this committee to the 1899 convention, in a supplementary report, no official action was taken by the association. Your committee, in referring to this matter now, desires to explain that the classification submitted was not intended for anything more than a suggestion to the convention that would possibly aid in dealing with the important subject of material and supply accounts.

The Standard System of Accounting is now in general use, recognized and accepted as the standard for street railways. One of the most valuable features of the system is, that it admits of comparisons between companies. This feature is especially appreciated.

At the convention of the National Electric Light Association, held in Chicago, May, 1900, a paper on "Uniform Accounting" was presented. This paper criticised the Accountants' Association for treating Taxes as a deduction from income, stating Taxes should be considered a part of operating expenses. This position was endorsed in the discussion of the paper, following its reading. Mr. Stuyvesant Fish, president of the Illinois Central Railroad Co., in an article published in the "Street Railway Review," was quoted as saying that the Inter-State Commerce Classification of Accounts did the railroads an injustice and caused them to make misleading reports, because Taxes were not treated as a part of operating expenses. All of this is very interesting in view of the action taken by this association on the question of the classification of taxes. Your committee does not care to provoke any further discussion

regarding this matter, but begs leave to refer to its position as it explained and sustained it, and was sustained by this association at the conventions in 1897, 1898 and 1899. The paper presented to the National Electric Light Association, not only classified "Taxes" as an operating expense, but "Interest on Investment," "Interest on Current Liabilities," "Investment Insurance," (depreciation), and "Reserve for Sinking Fund." These five accounts are all classified as operating expenses, grouped under the heading of "Capital Accounts." The reason for doing this was, it was held these accounts should all be included as a part of operating expenses and not as deductions from income, in order that the "true cost" of production could be determined. Your committee does not wish to do anything more than present this matter for your information and consideration, without comment, further than to refer to the grouping of these five accounts under a heading entitled "Capital Accounts." The gentleman who presented the paper frankly stated that his stand was open to criticism; for that reason, and because your committee believes that this association should not criticise the position taken by other associations on questions of accounting, it is desired that the matter should not be discussed by this convention.

This association was invited to attend the Convention of Railroad Commissioners of the United States, held in Milwaukee, May, 1900. Messrs. H. C. Mackay, F. E. Smith and the chairman of this committee, attended the convention, responding to the rollcall when our association was called. We were officially recorded in the minutes of the meeting as having been present and representing this association. Nothing transpired at the convention of any direct importance or interest to this organization, except that Mr. Ashley W. Cole, chairman of the Board of Railroad Commissioners of the State of New York, a member of the committee on Classification of Construction and Operating Expenses of Electric Railways, reported for the committee that the 1899 convention adopted the committee's report (this report was the classification of accounts adopted by the Accountants' Association). Mr. Cole stated that some of the states recommended that report to the corporations within their jurisdiction, and the state of New York has had that report printed in pamphlet form and is now sending it to all the electric railroad corporations in the state.

Your committee has made a strong effort to induce the Federal Census Bureau to use the Standard System of Accounting of this association, in the work of compiling statistics concerning street railways, in connection with the Census Report of 1900. We hope to succeed in this undertaking and feel encouraged from the following statement of the director of the census, made in a letter dated July 24, 1900: "The subject of street railways is a special one, which will not be taken up for about a year. I will have the letters placed so that they will have full consideration when the proper time comes. I am glad to receive suggestions at any time."

F. E. Smith, Chicago: Mr. President, I move that the report be accepted and be placed on file.

President Duffy: The committee would be very glad to hear from the gentlemen, because this is our only opportunity except through correspondence, and our information through correspondence has been extremely limited. Is there any discussion or deliberation on this report? Are you ready for the question?

The president put the question on the motion and it was carried.

President Duffy: Gentlemen, that about completes the order of business for the morning, but we have a gentleman here with us, whom we all feel very kindly towards, and who has done a great deal for the street railway accountants. I refer to Mr. J. H. McGraw, of the Street Railway Journal. Mr. Higgins is an honorary member and is unable to be present at the Convention, and Mr. McGraw has honored the association with his presence this morning. Mr. McGraw, I would be very much pleased if you would say a few words to us.

Mr. McGraw: Mr. President and gentlemen; I am not going to take your time with any speech whatever, but I assure you I appreciate the honor of being called upon to address this body of gentlemen, forming the Street Railway Accountants' Association of America. I will not attempt, sir, to take up or go into a discussion of your work, which is well known throughout the country, not only to the accountants themselves and the street railway presidents and managers, but to a large body of outsiders who are interested directly or indirectly and are closely watching your

work. I want to commend most highly the work of this association. I am sure, and I know, that it has been thorough and effective, and the respect in which this association is held by the street railways throughout the country, not only the street railways but the bankers, the capitalists represented in street railways with which I come in contact, take occasion frequently, to speak in the highest terms of the work this association is doing. I thank you again for the honor of being called upon and for this opportunity of saying a good word, which I do most heartily, in favor of the work of this association.

President Duffy: Gentlemen, we have a little time yet, with nothing special for this afternoon, and I would be very glad to hear from any gentleman present who would be good enough to give us the benefit of his thought, or suggestion, or criticism, a sort of a brief and informal discussion on any subject pertaining to accounting. We have one here with us that is comparatively new in our association, at least his company is. I will ask him to say a few words. Mr. Moore, of Pittsburg.

Mr. S. E. Moore: Mr. President and gentlemen: I think the president should state what he would like the few words particularly about before he calls on a delegate so unceremoniously as that. I can only say that I am glad to meet with all of the gentlemen of the convention and that I hope to be able to do something before it is over, that may be of use, not only to the accounting end of it, but to the street railway work generally.

Mr. Duffy: Well, gentlemen, we have another new member in our association, Mr. Hemingway, of New York, representing the Connecticut Light & Power Co. Mr. Hemingway, we would be very much pleased to hear from you.

Chas. M. Hemingway: Mr. President, this is my first appearance in the association and I am very much interested indeed in the papers and reports. One subject in your opening address I am very much interested in. That was the uniformity of accounting where the same company operates railways, electric light and gas plants. That comes particularly under my department and I am very much interested to see something put forward in that department. I have nothing else to say just at this time, but I have learned a great deal from the meetings.

President Duffy: Is there any other gentlemen good enough to favor us with a few remarks, or has a suggestion to make, or shall we adjourn. We have established a record for punctuality which we maintain this morning by a very narrow margin. It is ten o'clock until it is eleven. We would like to open to-morrow promptly at ten, and I would ask all of you to make it a point to be on hand early, so as to take your car out on time. If those gentlemen who are on the executive committee will be good enough to go to the Midland Hotel directly, we will have our executive committee meeting so that the report can be presented to-morrow morning.

On motion, adjourned until 10 a. m.

BRILL No. 27 TRUCK PATENT.

The test case brought by J. G. Brill Co. against North Jersey Street Railway Co. to establish the validity of the patents held by the Brill company on its No. 27 truck is expected to be heard in the very near future in the United States Court at Trenton, N. J. It is being defended by the Peckham Motor Truck & Wheel Co., which built the trucks for the North Jersey Street Railway Co. It is claimed by the Brill company that these trucks infringe its patents. If the Brill company succeeds in establishing the validity of this patent, it will control the right to manufacture this style of "swing bolster spring-link suspended" truck, which is probably the most popular and successful truck of the pivotal type that has been brought before the street railway public.

The Brill company advises us that it has already established its priority of invention covering this patent in the interference proceedings of the United States Patent Office against Chas. F. Tebelacker, whose application was brought out by the Peckham Motor Truck & Wheel Co and this company conducted the interference proceedings.

Don't ask—read the "Review" daily.

Yes, we are having a good time, and we won't argue that pro and con because it is up to Walton and Con.

THE CONVENTION IN 1901.

One of the committees to be appointed this morning is to select the next place of meeting and already a number of cities are bidding for the honor of entertaining the associations. Greater New York was the first one in the field, and the delegates from the Manhattan and Brooklyn roads promise they will give the members the best time they have ever had if their city is elected. Judging from the number of buttons bearing Mr. Vreeland's portrait seen at the hall and the hotels, a good many delegates are willing to let them try.

CINCINNATI AN ACTIVE BIDDER.

Cincinnati wants the next convention and sends the heartiest kind of an invitation. The Street Railway is warmly seconded by the Cincinnati League and other commercial bodies, in urging the associations to visit them in 1901. Those of the longer time members have never forgotten—and never will—the magnificent hospitality displayed when we gathered there in 1886. The banquet was one of the three best in all the 19 years. The exposition building one of the largest and finest in the country, would make an ideal place for exhibits, while its central location makes the city easily accessible by a few hours ride from all the states sending large delegations. The associations certainly would have no cause to regret going to Cincinnati.

TRIP OF THE EXECUTIVE COMMITTEE.

Yesterday the Executive Committee of the American Street Railway Association as the guests of Messrs. Walton and C. F. Holmes were driven in carriages around the city, the party stopping for lunch at the Country Club. Although the day was a little cool, the weather did not mar the pleasure of the trip, which was thoroughly enjoyed by those fortunate enough to participate in it.

TRIP TO ARMOUR'S.

Special cars will be in waiting at 8th and Walnut streets this afternoon at 2 o'clock sharp, to take all in attendance at the convention to Armour's Packing House in Kansas City, Kan. Special arrangements have been made for the reception of the visitors and no one should miss this opportunity of visiting one of the largest meat packing plants in this country. The ladies are especially invited.

Armour's establishment is one of the largest in the world and something of its extent may be judged when it is known the plant includes 30 acres of ground, 90 acres of floor space, 30 acres of cold air rooms, a storage capacity for 200,000,000 lb. of meat and 16 ice machines capable of producing 2,500 tons of ice every 24 hours. There are facilities for killing and dressing 12,000 hogs, 4,000 cattle and 5,000 sheep; and 5,000 people are required to keep its various departments in operation.

A trip through these great buildings is by no means altogether unpleasant, and with a little courage and possibly the aid of a perfumed handkerchief, can be made an interesting and profitable excursion.

Leaving the offices the different branches are visited in order, but the trip must be taken to realize the magnitude and diversified nature of the operations that are carried on in a modern packing house. One passes through the carpenter shop, where boxes of all sizes for packing purposes are turned out at the rate of a dozen a minute; through the tin shop, where a strip of tin is fed in at one end of a series of machines and comes out at the other in the shape of finished cans, in which Armour products are to be sent to all parts of the globe; through the ice-making plant; and on to the rendering buildings. Here are performed the many processes that turn what a few years ago was considered waste into valuable by-products and as in other great industries, these by-products now constitute the principal source of profits. A modern packing house not only turns out meat but also hides and pelts, lard and oils, glue, butterine, sausage, beef extract, mince meat, casings for sausage, soups, soap and fertilizers.

The Royton (Eng.) District Council has decided to apply for a provisional order for constructing tramways and supplying electricity within the district.

FIRST DAY AT CONVENTION HALL.

The arrangements of the local committees were excellent and contributed largely to the rapidity and ease with which the registration—always a somewhat tedious although necessary operation—was effected. The list was made in three departments, members of the American, accountants, and the supplymen. There was less delay and confusion than usual, and once the proper button was secured the visitor was free to pass on into the building. This work was in charge of Mr. O'Keefe, chairman of the Bureau of Information, whose office is directly at the left of main entrance. Here are telephones, telegraph and post-office and facilities for checking parcels. The "bureau" has become one of the fixtures at conventions and is as much appreciated as it is convenient.

is fully as large as at Chicago, and expected to be ample, it was necessary a month ago to make a general reduction in allotments of main floor space, and the entire room beneath the first gallery has also been filled.

There are fewer heavy exhibits than usual, although the electric companies have each some generating machinery, but the car and snow plow exhibit is missed, being confined to one snow sweeper built by the McGuire Company.

There are several new exhibitors this year, and all of those we expect to see as a matter of course have new specialties or improved types of standard goods. The manager who wants to keep up with the progress of the art will find it as necessary and valuable as ever to spend his time freely in an examination of the display.

The hall itself is the most pretentious in our convention his-

GENERAL VIEW OF THE EXHIBIT HALL.

Exhibit Hall presents a fine appearance, and at no previous convention have as large a number of exhibits been in so complete a state as this year. There are the usual number of late comers, chiefly small displays, and a few have been disappointed by the railroads, but taken altogether there has been a very decided improvement. The local service of carpenter work, sign painting, decorating and teaming has been unusually satisfactory and prompt. In this connection it is pleasing to note the general improvement each year in the booths and signs. There is less disposition to gaudy ornamentation and hastily lettered signs, and the result is a much neater and dignified appearance as a whole.

The work of the Exhibit Committee is always the heaviest of all the convention committees and calls for a display of real generalship. That the installation was accomplished in so prompt a manner reflects great credit on Chairman Satterlee. Such exhibitors as followed the directions printed in the "Review" found their boxes in their own space ready to open.

If any thought there would be a shortage in the display, a visit to the hall dispelled such an idea. While the floor space

and presents an inspiring picture. The great arches are draped in flags of all nations in which the stars and stripes predominate, while great banners and colored hangings hang from every cross beam and brace. The aisles are of good width and frequently intersected with cross aisles making it easy to reach every part of the building. The effect at night when all the lights are burning is very pleasing.

HAVE YOU HAD A "CUCUMBER"?

Among the debris which was left in town after the Democratic convention had come and gone last summer was a new kind of drink, introduced by the New Orleans delegation. It consists of an ordinary wine glass filled with crushed ice poured two-thirds full of creme de menthe with a top filling of rich cream, producing a color from which comes its appropriate name—"cucumber."

Predictions for today are for fair weather. Con. Holmes claims this kind of atmosphere all the time.

THOSE IN ATTENDANCE.

A. S. R. A.

Allison, Gilea S., Brooklyn Heights R. R. Co.
 Arrowsmith, A. V., Wilmington.
 Anderson, A. A., Youngstown, Ohio.
 Beggs, John I., Gen. Mgr., Milwaukee Elec. Ry. & Light Co.
 Brockway, W. E., Asst. Sec. and Auditor, New Orleans & Carrollton Ry.
 Bayles, R. N., Rockford, Ill.
 Butts, Chas. S., St. Louis, Mo.
 Bendure, J. A., Gen. Mgr. Atchison Ry.
 Bolen, N. A., Div. Supt., Brooklyn Heights R. R. Co.
 Burrington, P. V., Sec. and Auditor, Columbus R. R. Co.
 Bragg, C. A., Lehigh Traction Co.
 Becker, E. G., Kansas City, Mo.
 Butts, Ed W., Kansas City, Mo.
 Boyle, S. G., Louisville, Ky.

DAILY STREET RAILWAY REVIEW

PUBLISHED BY

WINDSOR & KENFIELD PUBLISHING CO.

1014 Wyandotte Street, - - KANSAS CITY, MO.

SUBSCRIPTION, PER YEAR, \$3.00.

CHICAGO OFFICE, - - 324 DEARBORN STREET
NEW YORK OFFICE, - - 123 LIBERTY STREET

H. H. WINDSOR, Editor. F. S. KENFIELD, Business Manager.

Application made for entry as mail matter of the second class.

VOL. X. THURSDAY, OCTOBER 18, 1900. No. 2.

PROGRAM.

American Street Railway Association.

THURSDAY, OCTOBER 18TH.

"Double Truck Cars; How to Equip Them to Obtain Maximum Efficiency Under Varying Conditions." By N. H. Hest, president Meriden Electric Railroad Co., Meriden, Conn.

Election of Officers for ensuing year.

Thursday afternoon, trip to Ft. Leavenworth.

FRIDAY, OCTOBER 19TH.

The entire day has been set apart for the examination of exhibits. Friday night, banquet at Coates House.

Accountants' Association.

THURSDAY, OCTOBER 18TH.

"Material and Supply Accounts." By W. M. Barnaby, accountant Brooklyn Rapid Transit Co., Brooklyn, N. Y.

Informal Discussion upon any subject in street railway accounting.

(This is to be in every sense informal.)

Report of Convention Committees.

Election and installation of officers.

THEATERS.

COATES.—Wednesday, night and matinee, "The Runaway Girl." Thursday, Friday and Saturday nights and Saturday matinee, "At the White House Tavern."

AUDITORIUM.—Every night, Wednesday and Saturday matinees, "The Great Ruby."

ORPHEUM.—Every night, Thursday and Saturday matinees, Vaudeville.

GRAND.—Every night, Thursday and Saturday matinees, "In Old Kentucky."

GILLIS.—Every night, Wednesday and Saturday matinees, "The Night Before Christmas."

STANDARD.—Every night, Saturday matinee, "The Broadway Burlesquers."

Railroad certificates will be ready at the entrance to Convention Hall this morning. Ask F. J. Duffy.

In addition to the distribution of the Daily Street Railway Review at the various city hotels and Convention Hall, a copy is being mailed to each subscriber to the monthly as well as a copy to each European road.

Secretary A. C. Vosburg, of the New Process Rawhide Co., brought no exhibit and is spending his time visiting his many street railway friends.

Mr. H. R. McCullough sales agent for the Stirling Co. of Chicago, is here.

The Green Fuel Co. is represented by Mr. Geo. H. Klumph, of Chicago, Western manager.

John H. Graham and E. C. Foster, Boston, of the Massachusetts Electric Companies, are taking an active interest in all convention work. They are accompanied by their wives; the party are at the Midland.

Mr. E. F. Wickwire, secretary of the Sterling-Meaker Co., is attending the convention.

Mr. Stedman has a new story.

Hon. E. P. Shaw, treasurer of the Commonwealth of Massachusetts, and one of the best known railway men in New England, is at the Midland, accompanied by his wife.

Mr. F. E. Smith, auditor of the Chicago Union Traction Co., and an influential member of the accountants' association, is at the Coates.

Everyone has been wondering at the absence of W. W. Bean and wife. A telegram announces the dangerous illness of Mrs. Bean's mother and their inability to be present. This will be the first convention he has missed, being one of the two or three who have attended all the meetings.

Mr. W. R. Kerschner, representing the Columbia Machine Works of Brooklyn, has booked during the convention several good orders for Columbia specialties, including patent strain anchors, assembled commutators, gear castings, etc. He is giving away card cases.

If you run trallers, see Mr. Van Dorn at space No. 67 C. He makes couplers.

We are aware that some of the names in our printed registration list are not correctly spelled, but if any such will examine their signatures in the register book, they will understand the cause. A curious signature may be hard to imitate, but it is also difficult to decipher. People who on other occasions will write a perfectly legible hand often finish with a signature that resembles the course of a sky-rocket with a crooked stick.

Mr. Chas. E. Coleman, manager of Eugene Munsell & Co., and Mica Insulator Co., of Chicago, is distributing leather pocket books and small miniatures of the gold medal awarded Micanite goods at the Paris Exposition.

H. H. Littell, of Buffalo, arrived to-day. He is the "daddy" of the American Association, and was its first president. He was continuously in street railway work from Nov. 24, 1864, until March 31, 1899—nearly 35 years. He is accompanied by his son, Clarence.

The Parrott Varnish Co. have an interesting exhibit of car panels at the Midland. This company is now working a line of varnishes especially for street car work, which is being introduced in the West by R. E. Mills, whose headquarters are in St. Louis. Mr. Parrott, the venerable founder of the company which bears his name, will make a Western trip next month.

Mr. C. C. Smith, second vice-president of the Falk Co., is keeping open house at Parlor N, Midland Hotel.

Mr. H. S. Cooper didn't like Ithaca so he took a big Eastern syndicate into partnership with him and he now has money to give away.

If you can't do it, Mr. B. S. Barnard conduit. He is representing the American Vitrified Conduit Co., of New York.

Mr. Chas. Scudder, Jr., manager of the railway department Western Electrical Supply Co., St. Louis, is at the Coates.

The John Stephenson Co. of Elizabethport, N. J., is represented by Mr. P. M. Ding, manager.

PERSONAL EXPERIENCES OF WELL KNOWN MANAGERS

BUT HE WILL NOT SUE THE COMPANY.

C. K. Minary, as all street railway men know, is the general manager of the Consolidated of Springfield, Ill. A few weeks ago he had his superintendent put on a lot of new conductors in anticipation of the big crowd which annually visits the state fair. The employes ride free on their badges, but the boys had been getting a little careless about requiring the badge to be worn, so a special order was posted calling attention to the matter, and the new men had the rule especially laid down to them.

A few days later the manager boarded a car down-town. The conductor was a new man who was trying for a steady job all winter. He didn't know the colonel, who looked to him just as any other 5-cent passenger appeared.

He shuffled up to the colonel and extended a grimy paw for the fare.

The treasurer and general manager smiled benignly. "Oh, that's all right," he said, "I'm one of the boys."

"Where's your badge," the young conductor replied with a look that betokened strong skepticism. "Show me your badge."

"I—I don't know that I have one," the colonel answered with a trifle less assurance than he had when he at first accosted the official.

"Well, you'll either have to show me your badge and wear it in the car or pay me your fare. That's the rules." And he reached toward the bell cord.

The general manager was commencing to feel uncomfortable, but he put on a bold front.

"Look here, young man," he said, "don't you know me? I am the treasurer and general manager of this street car line." Then he beamed forth one of the Minary family smiles which ought to be good for a ride on any line in the land.

"I don't give a d—— who you are. You will pay fare or you cannot ride on my car," was the arbitrary reply.

The colonel was squelched. He subsided, and as pocket after pocket was fruitlessly searched for a ticket the smile gradually faded to that tired look, he has when some alderman wants a job for a constit. Meanwhile the car had stopped and the remarks of the impatient passengers conveyed no special sympathy. Then he hunted for a nickel, but all the money he could find was a twenty-dollar bill. This he tendered with a look which plainly showed the incident was closed.

"No you don't, can't work any such gag on me. We don't make change for more'n two dollars. Now get off, and say, mister, next time you come to town just bring your badge along."

And as the treasurer and general manager got off he muttered, "Guess I'll keep that fellow on all winter."

HOW "FATHER-IN-LAW" TOOK HIS TIME.

Every large street railway has at least one quaint, eccentric character, who has worked for the company since nobody knows when, and who is known to every employe and at least half the town. Such an one there was at Indianapolis, and while the census man might have booked him anywhere from 65 to 80, he always gave his age as "Oh, about 25 or 30." Of course, he had a nickname and an odd one it was. "Father-in-law" the boys all called him on account of his joking the conductors about becoming his son-in-law. The name originated way back in the horse car days, and after a score and more of years "Father-in-law" still remained the title by which every man on the road and thousands of people in the city knew the familiar figure. Armed with his pail of "ile," a track broom and his ever-present pipe, he swept the switches and greased the curves in the Hoosier capital, winter and summer, year in and year out. One day the boys enticed "Father-in-law" into a saloon, and under the pretence of getting his measure,

got him fast in an electric machine where the liveliest kind of a current was on tap. When he cooled down the boys sought to make amends by a treat. But he was not to be caught twice and replied, "Not by a dom sight! Yez have got some of the same stuff in the whisky as is in the machine."

Just about that time the genial Tom McLean, now vice-president and general manager of the Toledo Traction Co., took charge of the Indianapolis system, and began a vigorous pruning in the effort to get earnings and expenses somewhere near a level. The directors had charged him to reduce the force to a certain limit, and in the general shuffle "Father-in-law" got the blue pencil. The news reached him out on a curve, and he proceeded forthwith with his outfit to the general office, and, walking boldly in with the pail in one hand and his broom in the other, exclaimed: "Faith, an yez didn't hire me, and I'll be domed if yez can fire me. That's so. Now I'm goin' back to me switches."

And back he went, for the generous manager couldn't find it in his heart to enforce the order, and so "Father-in-law" greased his curves and swept his switches until last summer, when the faithful old man was promoted, and his name was entered upon the pay roll of eternity.

HOW STUBBS FINISHED THE FOURTH.

The manager of an interurban road in Wisconsin tells of an amusing incident which occurred on his line last Fourth of July. It was a very hot day and the members from the rural districts had frequent access to sundry thirst quenchers. However when the fireworks were over the country residents began to round up at the loading platform. Everybody seemed accounted for and the last car was about to start when somebody discovered Stubbs was missing.

Now Stubbs was a specially patriotic American on such occasions and his neighbors with whom he was very popular refused to allow the car to leave without him. So the sober ones got out to hunt Stubbs. He was located after half an hour's search lying in a gutter under a sidewalk crossing where he certainly would have drowned in the storm which was even then almost breaking. They pulled him out,

carried him to the car and put him down on the steps on the side which was closed by an iron gate.

The car started, the storm burst and Stubbs was emphatically "in it." In the course of 40 minutes he began to sober up and when the car stopped at the power house a big arc light shone full in his face. Stubbs spied a friend on the ground and pushing his nose and one hand through the grating called out to him—

"Say, Jim, how long be I in for? Can't you bail me out?"

GUESSED RIGHT THE FIRST TIME.

A dear old woman with soft blue eyes, white ringlets around her ears and a quaint purple gown got on a Third street car during the late torrid wave.

She looked rosy, but cool and comfortable, while the others on the crowded car were mopping their brows, fanning themselves and cursing inwardly.

As Miss '40 got on the car she said to the conductor: "Hi want to get hoff at Hem street."

"All right," said the conductor, and the car went on. Nothing happened until L street was reached, when suddenly the old woman looked up and asked, "His this Heel?"

"You bet it is," said a big, perspiring man.

Mr. Vreeland of New York and his party will leave Kansas City in his private car after the convention closes for a trip across the continent. From San Francisco he will go to Montreal thence to New York.

AMERICAN STREET RAILWAY ASSOCIATION.

WEDNESDAY, OCTOBER 17TH.

The meeting was called to order at 10:50 o'clock by President Roach.

The President: For reasons unnecessary to explain at this time, we have changed the order of business somewhat. The names of the nominating committee have been selected, and the secretary will now read them. This committee will also recommend to the association a place for our next meeting.

The secretary read the names of the Committee on Nominations, as follows: Chairman, John A. Rigg, Reading, Penn.; E. C. Foster, Lynn, Mass.; E. G. Connette, Syracuse, N. Y.; D. B. Dyer, Augusta, Ga., and Robert McCulloch, Chicago, Ill.

The President: I would say to the gentlemen who have any idea of asking the association to hold its next meeting in their city, that they can see Mr. Rigg, the chairman of the Committee on Nominations, any time at their convenience. Mr. Rigg will appoint a time and place for the meeting of the committee.

Secretary Penington: Mr. President, I will state that I have received invitations from the mayor of Cincinnati, the president of the Cincinnati League, and from president Kilgour, of the Cincinnati Street Railway Co., asking us to hold the next convention in that city. I will turn these invitations over to Mr. Rigg.

The President: In the absence of Mr. Bancroft, the secretary will read the next paper.

COMPARISONS OF THE VARIOUS SYSTEMS OF ELECTRICAL DISTRIBUTION FOR STREET RAILWAYS.

By C. F. Bancroft, Electrical Engineer, Massachusetts Electric Companies, Boston.

In preparing a paper on "Comparisons of the Various Systems of Electrical Distribution for Street Railways," the subject selected by the executive committee, I find that the conditions to be met in the numerous localities where the various systems are in use are so widely different, and each system so generally satisfactory, under certain conditions, and so completely unsatisfactory for meeting other conditions, that comparisons are altogether impossible, except in a very general way.

There are six systems of electrical distribution for street railways at present in more or less general use.

First, what may be called the standard 500-volt continuous current system, where the current is generated at from 500 to 600 volts and delivered direct to the car motors, usually by means of a feed-wire and a trolley, third rail or underground conduit.

Second, what may be called the alternating direct current system, where the power is generated as alternating current, usually at high voltages or from 5,000 to 15,000 volts, and transmitted to sub-stations, where the voltage is usually reduced by means of static transformers, transformed into direct current by rotary converters, and delivered to the lines at about 500 volts continuous current.

Third, the "booster" system, where the current is generated usually at about 550 volts and where, by means of an auxiliary generator, usually series wound, called a "booster," additional voltage is generated and compensates for that lost on the line.

Fourth, the so-called three-wire system, where the current is generated at about 1,000 volts, usually by means of two 500-volt generators connected in series, and is delivered to two motors or two groups of motors in series.

Fifth, the alternating current system, where the power is generated as alternating current, usually at high voltage, and transformed down to about 500 volts at the trolley wires by means of static transformers, which may be located on the poles supporting the feed-wire and trolleys, the cars being equipped with alternating current motors.

Sixth, the storage battery system, where the batteries are carried

on the car and charged at the power house or at special points on the line. Storage batteries can also be used to advantage in connection with any of the other systems under certain conditions, and in fact combinations can be made of any or all of these systems.

For any given conditions as to speed, traffic and length of line, some one of the systems named is likely to be much better fitted and more efficient than any of the others; therefore, it seems to me that a comparison of the various systems can best be made by considering the particular conditions most favorable to each. In the distribution of power for street railways the result to be aimed at is usually the maintenance, at variable loads, of an approximately constant pressure of 500 volts on the trolley wire at a minimum total cost of power.

The cost of generating electric power under the same conditions, as regards fuel, depends to a great extent on the amount of power generated and the capacity of the generating apparatus with reference to the average output required. Under ordinary opera-

C. F. BANCROFT.

tive conditions, with the same power factor, that is, the same ratio of output to capacity, the cost of power per kilowatt-hour from stations of less than 500 kw. capacity increases very rapidly as the station decreases in size. With from 500 to 1,500 kw. capacity, the cost of power per kilowatt-hour decreases slowly as the size of the station increases. From 1,500 to 2,500 kw. capacity the cost per kilowatt-hour decreases very little as the output increases, and above 2,500 kw. station capacity the cost of power per kilowatt-hour becomes nearly uniform. This is due to the fact that in small plants the labor item is disproportionately large, and the general efficiency less than in larger ones, while in plants of 1,500 kw. output and larger the cost of labor remains proportionately nearly the same as the plant increases in size. It follows from this that there is often very little or nothing to be gained from an economical standpoint by substituting one station of 5,000 kw. capacity for two of 2,500 kw. capacity each, provided the local conditions, as regards cost of coal, water, etc., are the same.

The system of distribution most suitable to a particular road depends to a great extent on the location of the power station or stations and the nature of the load. It is always expensive to transmit power, the expense being either in interest on copper investment or in fuel or both; and, therefore, other things being equal, the location of the power station or stations should be as near the load or center of distribution as possible. The location of the station is, however, usually governed to a considerable extent by local conditions as regards cost of fuel, water and real estate.

On a large system, requiring an average output of 12,000 kw., even though the load be distributed within a five-mile radius of a practical station location, it will usually be found economical to generate this power at several smaller stations, rather than at one large station, provided the conditions as regard cost of fuel, water and real estate are about the same, as the cost of power station

buildings and machinery per kilowatt of capacity and the cost of generating power per kilowatt-hour, with a station of 5,000 kw. capacity, is about the same as at a station of 10,000 kw. capacity. The interest on the saving in cost of feed-wire by having several stations, each located near its load, would more than offset the slight saving in cost per kilowatt-hour, due to the generation of power at one large station, and it also has the advantage that in case of fire or accident to one station the other can usually be so interconnected as to temporarily carry the entire load, and thereby avoid much of the stoppage of traffic which would occur if the road was supplied entirely from one station.

For an example of what was called the first or standard 500-volt continuous current system of distribution, a city may be cited in which the street railway lines radiate west from the center of the city like the spokes of a half-wheel, with a radius of about five miles. Instead of having one large station at the hub of the wheel, the road is supplied with power from seven stations, distributed throughout the system, having an aggregate capacity of over 26,000 kw.

The generating and distributing system in use in one of our most densely populated cities may be taken as an example of the way in which the system of distribution adopted is governed by conditions outside of those indicated for the most economical generation and distribution of power to the car motors. Although this system is compact and will probably require an average station output of over 30,000 kw., which it would seem to the outside engineer could be more economically distributed and almost as economically generated at several stations, the street railway company is installing a high-tension alternating direct current system of distribution with a main station of 45,000 kw. ultimate capacity, and five rotary converter sub-stations of from 3,000 to 6,000 kw. capacity each. It is probable in this case that the location of the power station and the system of distribution was governed almost entirely by the great cost of real estate at points suitable for separate power stations.

It frequently happens that several miles distant from a street railway system much cheaper power is obtainable than at or near the center of the system. This may be due to an available water power, or to a difference in the cost of fuel, etc., at the two points. In cases of this kind the second, or what may be called the alternating direct current system, is usually the most applicable. To transmit power at 500 volts in any quantity from a distance of 10 miles, or even less, is very expensive, owing to the large amount of copper required and the great loss. For instance, to deliver 500 amperes at 10 miles distance will require about 150 tons of copper, allowing a loss of about 30 per cent in the line. This same amount of power could be transmitted at 5,000 volts by an alternating direct current system with about 5 tons of copper and with a loss of less than 10 per cent in the line.

The weight of copper required to transmit power a given distance, other things being equal, is inversely as the square of the voltage, that is to say, if it takes 100 lb. of copper to transmit a certain amount of power a given distance at 500 volts, it will only take 25 lb. of copper to transmit the same amount of power the same distance with the same loss at 1,000 volts. It is owing to this fact that the alternating direct current system is so applicable where power has to be transmitted for any considerable distance, as it allows of the use of very high voltages on the line, 10,000 volts or more being in general use, which by means of transformers and rotary converters can be reduced to 500 volts direct current for the trolley wire at points where the power is required. For an example of this system of distribution, a street railway system may be cited which derives its power from a waterfall. Here the power is generated at a pressure of 2,200 volts and is stepped up to 11,000 volts for the line. About 6,000 h. p. is transmitted at this voltage for a distance of about 21 miles. The voltage is then reduced to 500 volts, direct current, by means of static transformers and rotary converters at five sub-stations, located at or near points where the power is required.

The third system mentioned, the "booster" system, is chiefly applicable on lines where there is a light average load, but where for short periods an extra heavy load has to be taken care of. It would seldom be economical to supply an entire road with power by means of booster system, as the greater part of the power generated by the booster represents wasted energy, which is usually generated in an extravagant way, as the power required to drive the booster varies as the square of the current in the

feeder, that is to say, if it requires 50 h. p. to drive the booster with a load of 100 amperes, it will require 200 h. p. to drive it if the load is increased 200 amperes. Line losses which necessitate the continuous waste of more energy than could be compensated for by an ordinary compound wound railway generator are seldom economical, even on a portion of a system, but there are many cases where there is sufficient copper installed to take care of the average load economically, but where for a short time each day, or for a few weeks in the year, owing to local conditions, the traffic is very unusually heavy.

In cases such as these, where the heavy traffic is of short duration, a well designed booster system may save a large investment in copper at a total cost of much less than would be required to pay the interest on the copper investment. For an example of this method of distribution I might cite a street railway company which supplies power to its own lines by means of a standard 500-volt direct current system, and which also supplies power to a smaller road about 13 miles distant by means of a three-phase alternating current system, using 5,500 volts on the line. Here the booster system is used in connection with the high tension system. When it became necessary to repair the high tension line, it was found expensive and inconvenient to do the work between the hours of 12 midnight and 4 a. m., the only time when the power was off, and as it was not considered safe to work on the line when it was in operation, a booster system was arranged to supply power to the distant road for short periods at times of light load. A 200-kw. booster was installed at the generating station and was designed to raise the voltage one volt per ampere of current. Switches were installed at the sub-stations so that the high tension line could be connected directly with the 500 volt feeders, some eight miles from generating station, and the booster was arranged so that it could be readily connected to the high tension feeders.

When it was necessary to replace broken insulators or make other repairs on the line the attendants were notified at the generating station and at the sub-stations, and at a pre-arranged signal, made by varying the voltage on the line, the alternators were thrown out and the booster thrown on in such a way that the power was only off from the trolley wire for the fraction of a minute. It was thus found quite practicable to make repairs on the line while the booster was in operation, and the system proved very satisfactory for supplying power at times of light load, while repairs were being made; the load on the booster frequently running as high as 500 amperes, at which time the voltage generated by the booster was about 500, which in addition to the 575 volts of the direct current system gave 1,075 volts at the generating end of the line; the voltage at the sub-station averaging about 450. While it would have been very expensive to run this booster for any great length of time, for the short time it was used the total cost was much less than the interest on the copper investment required to build a duplicate line.

The fourth system mentioned, or three-wire system, is most applicable to double track lines, where one trolley is made positive and the other negative, there being about 1,000 volts potential difference between the two, the current flowing from the positive trolley wire through the car motors to the rail and from the rail through the car motors and the other track to the negative trolley. The track is usually cross-bonded and also connected to the conductor connecting the two generators which are operated in series in the station. This connection with the track forms the third wire and tends to equalize the voltage should there be more cars on one side of the system than on the other. This method of distribution is usually capable of saving from 20 to 40 per cent in copper, according to the character of the track return. If well balanced, it also greatly reduces the electrolytic action on buried conductors, such as water pipes, etc., and is most applicable where there are excessive track losses with fair opportunities for a balanced load.

There are few roads in this country using the three-wire system of distribution, although it is used almost universally by lighting companies. This is probably due to the complications introduced in railway systems by the high voltage, usually about 1,000 volts, between the trolley wire and feeders on different sides of the system and the difficulty of balancing the load. The saving in copper, while not as great as in the three-wire lighting system, is still enough to warrant the extra complication, and under favorable conditions may prove very valuable.

I am only familiar with one example of this system of distribution. In this case there is very heavy traffic over a double track line to a park, about 16 miles from the power station. It was found impossible to handle the increased traffic on the ordinary 500 volt system with the existing feedwire. By reinsulating the line and operating it on the three-wire system, the efficiency of the distributing system was very much improved and they were enabled to easily handle the increased traffic with the existing feedwire.

The fifth system mentioned, or the alternating current system, is practically untried in this country. It seems peculiarly adapted to lines having long runs at uniform speed with few stops, such as lines connecting cities, rather than for ordinary street railway service. The alternating current motors at present in general use are of the polyphase type, and require at least three working conductors, which is a serious objection in many cases for railway work, as it necessitates the use of two trolley wires in addition to the track as conductors. The disadvantages of this system appear to be the necessity for at least two trolley wires and the probable difficulty in building alternating current motors suitable for railway work which will have a good power factor.

The main advantage of the alternating current system is the possibility of feeding lines with stationary transformers which need no supervision, but which can be considered simply as a part of the feeder, thereby multiplying many times the length of line which can economically be supplied with power from one station. The alternating current motor also has the advantage of running at fairly constant speed independent of the load. It will not race going down hill if the power is left on, but will return power to the line, nor will it slow down much in going up hill. There are four or five railway companies using this system, and judging from the reports that appear from time to time in the railway journals it is giving very satisfactory results.

The sixth system referred to, or storage battery system is decidedly more expensive than the usual methods of electrical distribution, owing to the great first cost and the short life of the batteries. Lead is at present the only metal capable of resisting the attacks of sulphuric acid, and modern batteries consist largely of lead, which is very undesirable from a mechanical point of view and is very heavy, so that unless the present type of storage battery is substantially improved, this system is only likely to be used where other systems are not practicable owing to peculiar local conditions or restrictions. The storage battery, however, has a large field in connection with the other systems of electrical distribution for street railways, and under favorable conditions may considerably increase the station capacity and reduce the fuel consumption; and when used on the line may greatly improve the regulation and increase the copper efficiency.

From this brief outline of the various systems it will be seen that each has its peculiar advantages and that no one is suitable under all conditions. It will generally be found that where the traffic is heavy and the distance short, the standard 500-volt system is most applicable. For suburban work, where the distances are greater and the traffic less congested, or where it is necessary to transmit the power for some distance, the polyphase alternating direct current system will usually be found more economical. In special cases, where for short periods of time an unusually large amount of power is required, the "booster" system will often prove very valuable, while for high-speed, long distance, interurban work the three-phase alternating current system may be attractive. The cars on this system, however, would have the great disadvantage of not being able to run over the ordinary direct current street railway lines.

There can be no general rule given that will determine the most advantageous system of distribution to use under the varying conditions to be met in street railway work. Each case must be considered as a separate problem and that method selected which will best meet the peculiar conditions involved.

The President: Gentlemen, we have gathered here for the purpose of disseminating information. You have heard the paper just read. We would be pleased to hear from some of the gentlemen who are present in reference to the subject matter of this paper. I will call upon Mr. E. C. Foster, of Lynn, to open the discussion.

Mr. Foster: Mr. President and gentlemen: I thank you for calling upon me, but as I am not an expert electrician, it seems to me

that I am hardly competent to discuss the merits of the paper which has been read. I think that Mr. Baneroff has treated the subject in a very broad way. He is a very competent man, and is employed by the same companies which employ me. We consider him one of the ablest electrical engineers in the Eastern country. I do not care to undertake to discuss this subject. There are many others here far more competent to do it than I. I thank you for calling me, Mr. President.

The President: I will call upon Mr. E. G. Connette, of Syracuse, N. Y., to give us his views upon the subject.

Mr. Connette: I thank you Mr. President, but I think, like Mr. Foster, that the paper is of such a technical nature, and the ground has been so fully covered, that there is nothing that can be said that would be interesting in addition to what the author has already stated.

The President: I can fully appreciate what the gentlemen have said. It certainly seems to cover the ground quite fully. We would like to hear from Colonel Dyer, of Augusta, Ga.

Mr. Dyer: Gentlemen of the Convention: I am not at all prepared to discuss a technical paper of this character. I think that the subject has been treated most exhaustively, and it is a valuable paper. This association certainly owes a debt of thanks to the gentleman who wrote it. I am wholly unable, however, to go into the details of the paper, and discuss the advantages of the different systems which have been referred to.

Mr. Wason: Mr. President and gentlemen: It seems to me that from the standpoint from which the author of the paper has taken up the subject, there is very little to discuss as to applying the theories of the paper to any particular road. The fact that the condition of each road as it is presented, determines in a great measure the character of the electrical application, there is hardly anything that we can discuss. If we had a road which we desired to equip, then the question would come up as to which one of the several systems presented would, in the minds of the gentlemen present, bring the best results. Under the circumstances, it does not seem to me that there is really anything to discuss.

The President: Gentlemen, you have heard the reading of the paper. What is your pleasure in the matter?

Mr. Connette, Syracuse: I move that the paper be received and the thanks of the convention tendered to the author. Motion carried.

The secretary then read the following paper:

PAINTING, REPAINTING AND MAINTENANCE OF STREET CAR BODIES.

By F. T. C. Brydges, Superintendent of Car Shop, Chicago Union Traction Co.

In giving my views as to the proper manner in which to paint, repaint and maintain street car bodies, I thoroughly realize that it is a subject of the greatest interest to street railway men; and as it is a part of my daily duty to supervise this class of work, the subject is of the greatest interest to me, and I will endeavor to give my views on the three topics separately.

PAINTING.

Our object in painting a street car is two-fold: maintenance and durability of structure, and appearance. It is needless for me to go into the question of the increased life and durability of a street car, when properly painted, repainted or revarnished, as often as necessity may require to keep it up and maintain it in good condition, as it is an admitted fact that painting, repainting or revarnishing, as necessity may require, adds to the life and durability of street cars.

Our methods of painting new cars are simple and, we think, very efficient. We apply our first, or priming coat, on all wood work to be painted, then putty all nail holes and other imperfections, and then sandpaper the priming coat. In place of applying four or five coats of rough stuff to produce a surface, we apply one coat of glaze, or scrape-in coat, as I am of the opinion that the least number of coats of paint applied to produce a surface for painting the better. There is not so much danger then of the finished surface cracking and checking, as when there are four or five coats of Japan or quick drying material used to produce a surface with rough-stuff, which, as a rule, is dry, brittle and non-elastic, and owing to the thickness of the four or five coats, is almost sure to check more or less within a short time after the work is finished. After the

glaze, or scrape-in coat, is thoroughly dry, it is sandpapered down close. The iron sill plates, in the case of open cars, are scraped in with the same quality of material and then sandpapered in the same manner as the wood work surface, the iron plates and all other iron work being thoroughly painted with best quality of Prince's mineral, mixed with raw oil, turpentine and Japan, as the first coat, to prevent rusting of the iron. After the glaze coat has been thoroughly sandpapered to a smooth surface, apply the first coat of body color, consisting of 10 lb. of bleached white lead, 5 lb. of Japan body color, 1 pint of raw oil and then apply the second coat of pure Japan body color and one coat of color varnish, sandpapering slightly with No. ½ or No. 0 sandpaper each coat of color before applying the next coat of color. Dashes and all iron work are painted with Prince's mineral, as above described, as the first coat, to prevent rust and then brought up in the same manner as the wood work, except the glaze or scrape-in coat, which is omitted on all iron work. This exception, however, does not apply to sill plates or any part that is to be finished in connection with the body or wood work. After a coat of varnish color has been applied, which is the last coat of color, the ornamentation and lettering is put on. Our style of ornamentation and lettering, we believe, is simple and yet very neat in design, consisting of a fine line, a broad line, and a small corner ornament worked into the fine line, thus making the ornamentation not expensive, but very neat in appearance. We are of the opinion that expensive and elaborate ornamentations on street cars are needless, a waste of money, and do not appear as well on the cars as a less expensive design. The great objection to expensive designs for ornamentation is not only their original cost, but it is more difficult to touch up when damaged in service by some careless teamster who has punched a hole in the panel with the pole of his wagon, or scratched the entire length of the body and thereby damaged the side of the car. This class of car damage is a very frequent occurrence in the large crowded cities and much increased by careless teamsters. After the lettering and ornamentation is complete, we finish the entire surface with two or three coats of varnish of standard quality, the first coat being rubbing varnish, if two coat work, also the second coat being rubbing varnish, if three coat work, the last coat being finishing varnish. We do no rubbing with pumice stone on the rubbing varnish, as we consider it unnecessary for street car surface to waste time and money in rubbing down finishing varnish. We object to rubbing with pumice stone as, in our opinion, it reduces the life of the varnish.

INTERIOR FINISH ON OPEN OR CLOSED CARS.

Apply one coat of good wood filler for hardwood work. Stain all softwood work for molding or otherwise to such tint as desired, clean up with fine sandpaper and apply a very thin coat of varnish, allowing it to stand about 24 hours. Then sandpaper and apply a second coat of coach rubbing varnish, then sandpaper lightly with No. 0 sandpaper and apply the third coat of varnish. We use no shellac on our soft or hardwood finish. We object to shellac being used in connection with car finish in any particular. We prefer to have the first coat of varnish applied on the wood next to the hardwood filler or applied on the soft wood. Interior of panels are finished with two or three coats of good standard paint applied on the canvas and other unfinished woodwork.

Roofs.—All roofs are painted with three coats of standard paint, or a good brand of white lead, tinted as desired.

Floors.—All floors are painted with two coats of standard floor paint or Prince's mineral paint.

Trucks.—All trucks are painted with one coat of Prince's mineral paint and one coat of standard truck color, striped to some extent if desired on trail cars.

Time Required for Painting Cars.—Cars, open or closed, can be painted and finished ready for service on this system in eight days.

REPAINTING.

Our system for repainting cars, so far as the painted surface is concerned, is about the same as that already described. When their condition requires the old paint to be removed to the wood, we do so by burning off all the old paint to the wood, then scrape the surface smooth to receive the priming coat and then proceed in the same manner as described with glaze coat, color, ornamentation, lettering and then finish with the same number of coats of varnish as in the case of new work. If, however, the old paint is not cracked too much, and the surface has sufficient life to receive new paint, we clean up the entire car by thoroughly washing it,

then sandpaper the surface smooth and apply two coats of body color and a coat of varnish color, on which we put our lettering and ornamentation. We then finish with one coat of rubbing and one coat of finishing varnish. The interior we revarnish with one coat of finishing varnish, except the seats and other hardwood surfaces of open cars, which we revarnish with one coat of varnish, one-half rubbing and one-half finishing. Two coats may be applied in the same manner if the condition of the car requires it.

MAINTENANCE OF STREET CAR BODIES.

I am of the opinion that the best manner to maintain the life of street car bodies is:

First.—At the car station from which the cars are run have them properly and thoroughly washed every day with cold water and a good quality of pure non-alkali soap prepared ready for use in liquid form at the paint shop of the company, or some other shop, provided it is of equal quality, avoiding the use of warm water, as there is a great possibility of the car washer using the water too warm and thereby damaging the life and appearance of the varnish. After the car has been thoroughly washed, all the varnished surfaces should be thoroughly rubbed dry to prevent water remaining on the varnished surfaces and thereby causing damage thereto and shortening the life of the varnish.

Second.—All street cars, closed or open, should pass through the car shops once each year for general repairs, and be thoroughly cleaned, touched up and revarnished with one coat of varnish, interior and exterior, two coats of varnish if their condition requires it, and the roof painted with two good coats of white lead or standard roof paint. Floors, platforms and all canvas and unfinished interior wood work should be painted with two coats of paint, and the trucks and all iron work repainted with at least one coat of good standard paint.

The President: Gentlemen, you have heard the paper. What is your pleasure? We would be very much pleased to see some of the gentlemen from different parts of the country discuss this subject. It is quite important.

Mr. Harrington, Camden: I would inquire if Mr. Brydges is here, if so, whether he can give us any of the costs of the work he has referred to?

The President: Mr. Brydges is not here. He is not in very good health and was not able to come to the meeting.

Mr. Harrington: I have prepared some statements of the cost of the various kinds of painting we have done. I made some statements last year at the meeting which seem to be rather low in price. I have prepared these figures from work actually done and took five different operations; took them from our detailed sheet. For instance, the first-class operation, which was for an 18-ft. car body, including the entire repainting of the car, the roof and the trucks, under the contract price, piece work system, the cost was \$28.00 for labor and \$19.79 for material, the total cost being \$47.79. I have here, which I will hand to the secretary, a detailed statement showing the various operations and the material entering into them. On a second-class operation, same work; on a 16-ft. car body, the total cost was practically the same. On a third class operation, a \$14.00 contract cutting in of paint work, varnishing, etc., the total cost was \$24.21, the material being \$10.21. The fourth-class operation was outside painting of vestibules and cutting dashers, touching up main body, blacking off iron work, one coat of finishing varnish, one coat of paint on roof, dashers, floors and platforms and one inside coat of finishing varnish. The contract price for this work was \$8.50 and the materials \$7.71, making a total of \$16.21. The simplest operation is probably the fifth-class operation, outside touching up dashers and main body of car, outside blacking off of iron work, one coat of outside finishing varnish, one coat of roof paint, and one coat of paint on inside of dashers, floors and platform. The contract price for this work is \$4.00, and the material \$5.13, making a total of \$9.13 as an average. This work is done on the piece work system. Under the usual system of hiring labor, we usually found our work cost in labor 50 to 100 per cent more than under the piece work system. I have taken these figures from our books, and have had some talk on the subject with other street railway managers, and they think that the figures are very satisfactory.

The President: Are there any other gentlemen who would care to say anything upon this subject?

Mr. Foster: I would ask through you, Mr. President, the price paid by Mr. Harrington for the labor in doing that contract work.

Mr. Harrington: Twenty-five cents an hour for the painter; the assistant painter gets 15 cents an hour.

The President: There seems to be no further discussion on this paper. What is your pleasure, gentlemen, in regard to it?

Mr. Riggs: I move that the paper be received, and the thanks of the association be extended to Mr. Brydges. Carried.

The secretary announced that on Friday at the Convention Hall there would be a vaudeville entertainment provided by the supply men.

The meeting then adjourned until 11:00 o'clock Thursday morning.

PRICE FRICTION BRAKES.

One of the features of this brake is that the energy for applying the shoes to the wheels is supplied by the moving car itself and hence this is one of the cheapest of power brakes. The pressure between the shoes and wheels is directly proportional to the pressure the motorman puts on the operating lever and thus he can accurately judge of the severity of the application.

The brake applies the shoes to the wheels at full pressure by a movement of the car of only 10 in. and releases them instantly.

The Price brake consists of a simple friction device placed on the car axle with a chain attached, which is connected to the sway bar of the ordinary brake rigging, as usually applied on cars. Efficient means are provided for keeping the friction surfaces, which are cast iron, free from oil, grit and water. The clutch levers are so constructed that any imperfection in the construction of the disks, or uneven wear, which may take place, has no effect on the working of the brake, which will continue to operate with perfect smoothness. The link which connects the brake device on the axle, with that part of the brake, which is attached to the car body, is so designed that the movement of the car up and down on its springs, and the swiveling of the trucks has no effect on the operation of the brake. No screws are used in operating it.

The brake can be applied to any single or double truck where there is as much as 6 in. free space on the axle. It requires adjustment only about once in three months, and no other attention except oiling the bearings every second day. The only parts that could be expected to wear rapidly are the friction disks and in service on the Brooklyn Rapid Transit road where the cars are run 16 hours per day show a wear of less than .003 in. per month; at this rate 24 years would be required to wear the metal provided on the disks. Where the Price brake is used there is no trouble from flat wheels because the friction disks permit the shoes to yield in case the wheels are slightly eccentric, while at the same time the pressure is kept constant.

The advantages claimed for this brake are: firstly, that the amount of brake-shoe pressure can be varied, so that it is properly proportioned to the weight on the wheels, using a higher pressure for a loaded than for an empty car. In this way it becomes quite possible to make as short a stop with a loaded as with an empty car, a condition that is quite impossible to meet in the case of a car upon which the brake-shoe pressure is constant under all variations of load.

Secondly, the simplicity of the mechanism used is such that it is not likely to get out of order, and can be easily and quickly understood by the men who are to have charge and operate it. It requires no especial skill to apply it or to operate it, and hence the cost of maintenance is reduced to a minimum. In fact it has been found that one ordinary, unskilled man can easily take care of and properly maintain fifty or more of these brakes, and that, too, when they are running on different divisions, so that a considerable amount of time is lost in going from one car house to another.

Thirdly, the power consumed in the application of the brake is taken from the momentum of the car itself, and thus assists in the stopping, and does not in any way call upon the electric generating machinery to do the work. It, therefore, avoids all the charges for operating expenses that fall upon those systems of brakes that are driven by a current taken from the main current, either directly or indirectly.

And, finally, it is extremely rapid in application. It has been proved, by repeated tests, that the brake can be fully applied within one-quarter of a second from the time that the motorman

starts to move the brake handle. With these advantages in its favor the mechanism is proving itself to be thoroughly efficient and reliable for the work that it is intended to do.

To adapt it to different styles of cars and service, this brake is constructed of three different styles—styles A, B and C. Style A is designed for use on maximum traction trucks, which use only one motor per truck. Style B is designed for single-truck cars, where the motors are attached to both axles. Style C is designed for double trucks, used for heavy, high-speed service. Among the roads which have used these brakes for several months are the Brooklyn Heights Railroad Co., of Brooklyn, which has 40 equipments in maximum traction trucks, the New York & Queens County Ry., of Long Island City, which has 16 maximum traction trucks equipped with the brakes, and the New Jersey & Hudson River Railway & Ferry Co., of Bergen County, N. J., which is operating ten 45-ft., 14-bench open cars, mounted upon Peckham 14-B-3 short-wheel base trucks, and equipped with four G. E. 57 motors. The grades of this road run from 6 per cent to 10½ per cent, with sharp curves. The People's Tramway Company, of Putnam, Conn., is also using this brake, operating six cars, mounted upon Peckham 14-B-6 trucks, equipped with two Westinghouse 49 motors; as is also the Meriden, Southington & Compounce Railroad Co., of Meriden, Conn., which has four cars, mounted upon Peckham 14-B-6 trucks, with four Westinghouse 49 motors. The company also has a large number of unfilled orders on its books.

Price brakes, which are made by the Peckham Manufacturing Co., have been applied to a number of cars of the Metropolitan Street Railway Co. which will be running each day on the Wyandotte St. line.

TRIP TO HEIM'S BREWERY.

At the invitation of the East Side Electric Ry., which is owned by the Heim Bros., a trip will be made on Friday morning to Heim's Brewery and Electric Park. Cars will leave the corner of 5th and Walnut at 9:30 sharp. The association hadge is good for all the privileges of the brewery.

THE TALLYHO TRIP.

A morning made to order could not have been better than the weather man furnished yesterday for the tallyho trip provided for the ladies. The start was made a little after 10 o'clock, and the route was through the best residence districts and parks. There coaches were required to accommodate the party, which was entertained by the Kansas City ladies. After a three hour's drive the party returned and lunched at the Midland.

SUPPLY MEN WILL CELEBRATE FRIDAY.

The supply men are determined to make the most of their day, and will exert themselves to make Friday the banner day of the meeting. A huge stage has been erected at the north end of the hall and here it is proposed to produce a fine vaudeville performance. The city and neighboring towns will be drawn on for talent, and it is needless to say that anything the supply men offer will be the very best. The show will be a continuous afternoon performance. A surprise will be sprung during the morning, and the entire day will be given over to a good time.

The ladies are especially invited to both afternoon and evening functions.

TRIP TO PACKINGTOWN.

Special cars gaily decked with flags lined up in front of the headquarters hotel at 2 o'clock yesterday, and were quickly filled with a jolly crowd of about 300. The run was made in good time across the river to the Armour plant on the Kansas side. There preparations had been made to conduct the party through the various departments, from pens through the killing and other branches to the finished product in a car ready for shipment and export. The ladies bravely followed their guides and never flinched. The visit was very interesting and certainly instructive, especially to the many who had never visited such a plant before.

Mr. E. Kittle, of the Sprague Electric Co., is in town.

STREET RAILWAY ACCOUNTANTS' ASSOCIATION.

WEDNESDAY, OCTOBER 17TH.

The meeting was called to order at 10:30 a. m. Wednesday by President Duffy, who at once announced the first paper:

THE ROUTINE OF A STREET RAILWAY, ELECTRIC AND GAS LIGHTING COMPANY.

By C. O. Simpson, Auditor Augusta Railway & Electric Co., Augusta, Ga.

In this paper upon the routine of a railway, electric and gas light company, no attempt has been made to go outside of our own office, but I will touch briefly on some points which have come under my observation in the past ten years, or while in the street railway line. I do not, however, confine myself to the street railway business alone, as there are a great many companies like the one with which I am associated, that have the electric light as well as the gas business of the cities in which they are located.

First the railway, starting with the report from the conductor to the accounting department. The office furnishes the train dispatcher the night before with the "Portable" registers, and a list showing the number of same, the register and the register readings. The dispatcher gives out registers only to the daylight and six hour men, as they start out in the morning. All other registers are given out at the office. This list (Form 1) is returned to the office by the dispatcher, not later than 9 a. m. with the name of conductor filled in and certified to by him. This goes to the young man in charge of the car earnings record (Form 2), also the

C. O. SIMPSON.

trip sheets (Form 3) and envelopes (Form 4) containing the conductors remittances after they pass through the cashier's hands. The cash is handled by only one person and goes direct from the conductor to him and from there to bank which furnishes a duplicate deposit slip which is turned over to the chief clerk for entry on general cash book, after a comparison with earnings record.

All money when ready for bank is put up in such shape that it will be accepted by the teller without counting bills, or wrapped silver at time of deposit. Currency is put up in \$50, \$100, and \$250 packages; on the wrapper are marked the company's name, the date and the amount. Silver is also wrapped and marked accordingly, small change to make up balance of deposit is put in envelope.

Cash tickets are checked up with the earning book by the auditor every month and burned. Transfers are counted, and after comparing with the trip sheet are destroyed.

Conductors reports are filed daily, that is, each day is fastened together and kept in a convenient place in the office until the end of month when they are filed in store-room.

A small ledger with index is kept of over and short account. An account is opened with each conductor; the Dr. side is short, and the Cr. side is over. This book is kept where conductors can

see it every day, and if they find a shortage, they make their remittance that much more, or vice versa, to balance the account as shown by this ledger.

The cashier also handles all collections of the electric light and gas departments, keeping a separate petty cash book for each, giving as much detail as possible to the bookkeepers in charge of the different department ledgers, and general cash book (Form 5) into which it is condensed, as the latter is ruled so that only the amounts are necessary, except in the sundry column.

The electric light register (Form 6) is used entirely as a load book, that is, it shows the number of each c. p. light, motor power, fans and if on meter, meter readings in kilowatt hours. The reading of electric meters are recorded on cards (Form 7). These cards are turned over to bookkeeper on the completion of each route, for entry on register.

Bills (Form 8) are made from the register and are then carried to the light ledger, each account is numbered, having the same number in both books. The light ledger (Form 9) shows the balance forward each month, if any; amount of bill for the month; total column, rebate, amount paid and date of payment. These books are made to run six months, with the addition of a short leaf, they can be made to run twelve months, but owing to the accumulation of dead accounts, and new business, this is hardly satisfactory.

The light ledger contains 42 accounts or lines to a page, and the register only 14, which gives three pages equal to one of the ledger, making it easier to balance and check as you go along. The cash column in the ledger is balanced with the general cash book. With this form of ledger, it is not necessary to keep a collection list as the accounts are compact enough if posted regularly every day, from which the collector makes his delinquent list. We use the card system in connection with the changes; that is, one side of the card is used as an order to the electrician (Form 10) the other side (Form 11) shows the work done on the order, and from this entry is made on the light register. At the end of each month a recapitulation is made of the changes to show the loss or gain in any part of the service.

The names of customers are kept in both register and ledger, alphabetically and in the order of the vowels. When transfer is made to new books at the end of six months, we do not give a numbered place in the ledger to accounts that show balance only, but on one of the back pages of the ledger we keep these delinquent accounts under the heading of "Balances." The total being carried under the same heading, and given a number in the front of ledger, until finally paid or written off. Advance customers are treated in a similar manner, except that they are given a number preceded by the letter "A." I also wish to add that all churches and Chinamen are put together under letter "C," but are given a regular number.

The gas books are similar to the electric light books, except the register or load book (Form 12), which only shows the meter reading, past, present, and consumption for both lighting and fuel at the different prices per thousand feet.

The gas bill (Form 13) is almost a copy of the register book, but in addition is ruled to show discount for prompt payment before roth of month, following consumption.

The reading of gas meters are recorded in a book (Form 14) printed and ruled for that purpose. The routes are divided into what we call the up-town and down-town routes, and are read by two men, who alternate every other month. The bookkeeper takes these readings direct to the register or load book.

The recapitulation of the register or load book compared with the register of output at plant will show the leakage.

We use the addressograph in connection with both electric light and gas bills, this machine prints the number, name, address and date of bill, in one tenth the time it formerly took our bookkeepers to do the same work.

We use a bill register (Form 15) in which is recorded all bills due the company for material sold or labor performed. One line is used for each bill and the book is ruled as follows: date of bill, number of bill, against whom item, date rendered, amount, date paid, account credited, and remarks. Each bill (Form 16) is numbered.

All bills and accounts against the company are paid by voucher (Form 17) which gives all the details. There is provision made for inserting a description of each bill and in addition to the description on each voucher, the original approved bill is attached, but the latter never leaves the office. If the voucher is paid through the mail, all bills are attached to a slip, the same size as that of a folded voucher, called a "tracer" (Form 18) and remains there until the voucher is returned, receipted, all papers are then attached to voucher and filed away.

Vouchers are numbered consecutively, commencing with No. 1 each month. The voucher record (Form 19) is ruled to show first voucher number, month, in whose favor, amount of pay roll, or voucher, account charged, store stock, operating expenses, sundries account, etc. The recording of a voucher will occupy as many lines as there are accounts to be charged in the distribution and are charged on the record direct to the operating, construction or other accounts affected. No bill for sundries or material, etc., is vouchered until approved by the purchasing agent and superintendent. It is then made up by the chief clerk and goes to the auditor and president for their approval before recording or payment. The pay roll voucher (Form 20) is made up from reports of time (Form 21) from the heads of departments. The distribution is made and it is entered in the record and filed as a regular voucher.

Unclaimed wages, that is wages uncalled for, after six months are credited back to the account as charged on pay roll, and record made on pay roll accordingly.

General journal entries are made from a manuscript statement, which is a recapitulation of the several books, such as cash, bills and vouchers, and these statements become a part of the permanent file. Therefore the items are not entered in detail in the journal. The traffic statement (Form 22) is made from the car earnings book, and gives all data necessary to make up statistics as to the traffic on the road for the month, but only that portion pertaining to the revenue and how earned is journalized. A recapitulation is also made of the bill book and the entry made charging bills for collection with the total amount of bills and crediting the different accounts, as shown. The recapitulation of the voucher record is made in a little more detail. The operating accounts of the railway and electric light departments are separated as well as the construction and sundry accounts, and the voucher number and amount of each voucher charged to that particular account are given. The entry is then made charging each operating, construction and sundry account with the total for the month and crediting vouchers and pay rolls their respective amounts. The recapitulations of the cash book and light ledger are similar to the others, but more attention is given to the cash book, as it embraces the particulars of receipts and disbursements and clearness in entering transactions is of great importance even in the general cash book.

There are a number of what we call "regular journal entries" such as the transportation of letter carriers. An entry is made charging the United States Post Office Department (which is an open account on the ledger) and crediting the earnings account with one twelfth of our yearly contract and when the quarterly payment is made by the Post Office department it is credited direct to this account on the cash book. Similar entries are made for the rent of power for the operation of a short line running from Augusta over the Savannah River into South Carolina which we do not control. Chartered cars are usually paid for in advance, or on the day following their use and are credited direct to the account through the cash book, if not they are billed and so pass through the bill register. Interest on the bonded indebtedness is charged to "Interest on Bonds" and crediting "Accrued Interest on Bonds." Semi-annually an entry is made charging the latter account, with the semi-annual interest and crediting "Interest-Coupon Account." When remittances are made for this interest to our eastern representatives, it is charged to their open account, and it so stands on the ledger until the coupons are returned to the company, as they are very seldom all paid and returned at one time, or within 30 or 60 days after due. The journal entries then made, or made from time to time as they are returned, are necessarily in detail, giving the series and

numbers of each, charging to Interest-Coupon Account, and crediting our eastern representatives.

We have also an account called "Advanced Expenses" into which we charge direct from voucher when payment is made for such items as taxes, coal, water for power, etc., which are paid quarterly and annually, or extraordinarily heavy purchases of material. An entry is made each month to the respective operating accounts, charging out approximately what would be, or has been used in that month.

The balance of many accounts as shown by the balance sheet the first of each month, for instance the amount in the debit column to gross electric light and power account, will be the same as the total of the balance sheet of the light ledger which comprises something like 1,500 individual accounts. The balance of bills for collection consist of the unpaid bills as shown by the bill register, the balance to vouchers shows those unpaid at that time, also the pay roll account.

We use the ordinary check book, as everything is paid by vouchers, the stubs of which show the name and number of vouchers covered by the corresponding check, which is all that is necessary for entry in the cash book. Separate check books are used, one for the Railway & Electric company, and the other for the Gas Light company, as they are at present separate corporations, but are handled as one as much as possible to reduce expenses.

Monthly statements include the railway and electric lighting departments on one statement, but the earnings and operating accounts of each are shown separate. The Gas Light company's statements are made separate, but the form and accounts correspond with those of the Railway & Electric company as much as possible.

The most valuable of all papers I consider the real estate deeds and plats representing all the realty of the company, whether used in the operation of the road or not. A separate book is used (10 x 14 in. in size) called the Real Estate Book, on the left hand page of which is a plat of ground, and on the right hand, or as many pages following, as is necessary, is a description of the property. The index to this book is complete, indexing perhaps under six or seven headings as the property is referred to a great many times, as the tract of some of its former owners or by the company as the "power house property," "sand pit," "east station," or "west station." The deeds are kept in a bankers' file, and given the same number as per folio in book.

Contracts are also filed in an ordinary bankers file.

Ordinances are usually published in the daily papers, and a copy is pasted in a scrap book; if not printed, a written copy takes its place.

Letters are filed in the ordinary files, but in addition to copying, the stenographer makes a carbon copy of the answer which is attached to the letter before filing.

The stock ledger (Form 23) and the transferring of stock is very simple. The ledger is ruled first giving at the top of the page space for the name, address and any other information as to the payment of dividends, etc. The rest of the ruling shows first date, transferred from, or to; certificate number; Dr. shares; Cr. shares; Cr. balance. All stock certificates when cancelled have written across the face, to whom issued, and number of new certificate. This certificate is then attached to the stub bearing the corresponding number.

As is well understood in this association a frank discussion is invited of the methods and forms I have explained. Any system adopted by a company is more or less a growth evolved from emergencies and circumstances, and side lights thrown by opinions from different points of view are always valuable.

President Duffy: We are very much obliged to Mr. Simpson for his able and instructive paper, and I think it would be well to follow his suggestion concerning the discussion. I will ask Mr. Smith, of Toronto, to open the discussion.

J. M. Smith: This is, I am sorry to say, my first appearance since the organization of the association. I feel somewhat on the outside, with you American gentlemen, for the reason that we do not operate our system altogether as you do here. I think you are all familiar with what they call the coffee-pot system we have over there. We do not use the registers, and in those particulars we are not similarly situated, but we run our accounting departments right in line with yours. We found that we were not in such very bad shape at the time you organized, but we have benefited by the

suggestions of your various committees that have reported from time to time. I enjoyed Mr. Beggs' remarks yesterday and those of Mr. Simpson this morning, and I think we have reason to be very much encouraged from what has been said and done, and the way the efforts of the association have been appreciated by outside concerns.

Mr. Mackay: Mr. President, I would like to ask Mr. Simpson how he handles the meter readings; whether he tries to equalize the lighting bills by reading shorter months in winter time and the longer months in summer time. There is a great difference in the method of reading electric lighting meters. I would like to be informed on that point.

Mr. Simpson: We have always made it a point to start on a certain day of the month. On the 26th we read all our meters, except in the month of February. We make that two days longer. As far as comparing the amount of bills for each month is concerned, we have never had any complaint as to that. The car registers are kept in the accounting department, and go out from there.

Mr. F. E. Smith: And no matter where the car may start, the conductors have to come and get their registers where they first start, early in the morning.

Mr. Simpson: They are sent out from the power house. They are started from there early in the morning. The rest of the day they start from our office. They have the registers there and also get the registers from that point.

Mr. Smith: How about the fellows that get through at one or two o'clock in the morning? Do they leave them in there, too?

Mr. Simpson: No, they are returned to the power house and taken care of there, and returned to us later.

Mr. Smith: Then the register that comes in at one or two o'clock in the morning you are not able to put out again until later in the day?

Mr. Simpson: Yes; we have a double set of registers, using one one day and using another set the other day following.

Secretary Brockway: Mr. Simpson, what style of registers do you have?

Mr. Simpson: We are using the Meaker portable register at present. The first of the year we are going to use the stationary register.

President Duffy: May I ask you what induced you to change your style of register?

Mr. Simpson: I am not in a position to answer because the matter has been heretofore left with the superintendent of the road, and I have paid very little attention to it. As we are situated a man has to come to the office anywhere from a half hour to an hour before hand to get his register and go down and take out his run. Sometimes he is delayed, and that leaves the register in his possession too long in our opinion. That is one reason, I think, why we have made the change.

Mr. Tripp (Seattle): Do you have any difficulty in keeping the expense in the railway department and the light department and your power stations separate?

Mr. Simpson: No, we depend upon our engineers to a great extent. We use very little coal. We use water power, and have two stations, one principally for the electric light and the other for the railway, although we do use the railway station through the day for the alternating current and the day lighting, using what we call the lighting station at night only. We make an arbitrary charge for the station that we run both kinds, making the charge from the electric station to the electric lighting department. We do not subdivide on the Kilowatt-hour basis.

Mr. Mackay: I would like to know how you subdivide your general expenses between your gas, electric and street railway divisions.

Mr. Simpson: Well, it is not charged. I have two sets of books. Being a separate corporation, I make my vouchers on the Gas company. In other words, the railways company pays the expense of the office, the general expense, to a great extent, and I will make my voucher of the gas company in favor of the railway company for its portion, which is arbitrary, and the balance is charged to general expenses, you may say, divided between the two departments equally, railway and electric.

Mr. Mackay: How you arrive at your arbitrary figure? Is it on the basis of earnings?

Mr. Simpson: On the basis of earnings; yes, sir.

Mr. Moore: It might be interesting and supplementary to Mr. Simpson's answer to Mr. Mackay as to meter readings in the matter of light, heat and power, to say that in Pittsburg we read the meters daily, subdividing the city into districts; for instance, taking 20 to 25 meter readers, and each provided with a meter reading book which covers a day's work. Each of the 25 meter readers finishes up his own simple district each day. He follows again the next day, and every 25 days, when the collectable accounts come in they are all in for the current month, and then we put them onto the prepaid meters and simply collect all through the city for the whole amount of prepaid—that is, the slot, meters. When the meter reading books come in in the morning they are passed over to the bill clerks and each one has his day's work allotted; then they pass on to the registry clerks and are entered, and passed out in the mail that night. Thus we are right up to date as to the amount of gas, natural or artificial, or electricity, that has been consumed by the customers in that district every day. Those districts are then allowed 15 days in which to pay, in 10 of which they would get a discount. Five days after that they get a delinquent card. Each clerk having charge of one registry follows up every day, and when he finds, 15 days after he has made his bill, that there is a delinquent customer, the latter then gets his little blue card. They all know what that means. In that way the readings are kept up continuously, the collections are kept up continuously, and I think we have a pretty good system as regards meter reading and billing.

President Duffy: Mr. Moore, may I ask you what particular point you want to cover by having a daily record of the meter readings, or daily reading of them, rather?

Mr. Moore: It is only a daily record every month with each customer. Each house is called on regularly on, say, the fourth of the month, and out of those districts each one comes in, and our revenue comes to us regularly, day after day by the amount of the meters read.

President Duffy: You have meter readers who work daily, but the particular meter in any particular residence is only read once in 30 days?

Mr. Moore: Once every month.

Mr. Heminway: The bills go out every day in every district?

Mr. Moore: Yes; bills continually going out, continual collections.

Mr. Mackay: That has the same effect as though it was a reading of the separate days of the month, only on account of the number of customers you are obliged to record it in that way.

Mr. Moore: Exactly. We pro-rate our work right along, subdivide it daily and close it up.

Mr. Mackay: At the end of the 15 days do you cut a customer off?

Mr. Moore: Provided he has a record, we do.

Mr. Tripp: I would like to hear some more discussion on the question of dividing expenses between the railway and the light department, such as do not divide themselves, as in the case of one power station furnishing current for both the railway and the light department. I would like to hear some one suggest a way to divide the coal or water, general expenses and those things.

Mr. Mackay: I don't understand why the kilowatt-basis is not applicable. You are furnishing so many kilowatt-hours and the same fuel that furnished the railway kilowatt-hour also furnished the light, possibly right at the same time. That is our system. We divide it on the basis of kilowatt-hours.

Mr. Tripp: Suppose a station doesn't have wattmeters?

Mr. B. L. S. Tinglay (American Railway Co., Philadelphia, Pa.): We have one station which is occupied jointly by electric lighting and power plant. We apportion the current by meter, charging the railway company and crediting the light so much per kilowatt-hour for its current. We regularly bill it to them, because in the state where we are operating we are not allowed to consolidate. We charge them a fixed monthly rent for the use of the office, and we apportion the salaries of everything but the station force. That is, the office salaries are apportioned prorata as to the gross receipts of the two companies.

President Duffy: Is there any other gentleman interested in the railway and lighting business that can further enlighten us about apportioning the expenses?

W. F. Ham (Washington, D. C.): We are in the railway and lighting business. We apportion our general expenses of the rail-

way and lighting companies approximately on the basis of gross earnings. It is a fixed scale for the year, however. We do not attempt to change that ratio from month to month. Where there are expenses of a single power station which furnishes power to both railway and lighting companies, the expenses are pro-rated on the basis of the output, except that certain railway companies have fixed contracts with the lighting companies which existed prior to the practical consolidation. In those cases the rate continues as heretofore, and with any increase in the price of coal the railroads get the very much end of the bargain. What is the general custom of the members of this Association, or what is the best way, of filing cancelled coupons? I think that the plan of keeping a record in the general books of the outstanding coupons is an excellent one. I think it is preferable always to keep the general books in such a way as to reflect the exact condition of the companies, and to do away with as many auxiliary books as possible. Therefore, the scheme which Mr. Simpson has outlined shows at all times the coupons which have not been returned cancelled. I would like to know what is the best way to file or to keep the cancelled coupons. The way I have been accustomed to doing it is an expensive way, pasting them in coupon books, and when you have a heavy capitalization, as some of us have, with a great many coupons, it takes much time and considerable expense.

Secretary Brockway: What form of books do you have, Mr. Ham, providing a place for the bond?

Mr. Ham: It is virtually a scrap book. Every page is numbered with the exact coupon which is to go into each space, and it is so arranged that we have at the time of the maturity of a single coupon—not all of one bond to be pasted on one page, but all of one maturity to go on successive pages. For one of our bond issues, we have one book alone for each maturity, 20,000 coupons in a single book; but to sort those and to paste them in the book is a heavy expense. Now, in some cases they file these in boxes or packages, and whether the trustee of the mortgage is satisfied with that record when he is asked to satisfy the mortgage is a question in my mind.

Secretary Brockway: A steam road with which I was once connected filed the two ways, as you are doing, with the maturities, and then when a new issue was made, a very large issue, they adopted the box plan. The Central Trust Co., of New York, accepted it as being conclusive evidence of payment.

Mr. F. E. Smith: The Erie road has been doing that for years. It has a big bond issue.

Secretary Brockway: I use the maturity books, but the books which were in New Orleans when I went there had a page per bond providing a place at the top for the cancelled bond as it came in, or when it does come in. But that required very large books and many of them, heavy and cumbersome, and with our new issue I adopted the maturity plan with one year's maturity; that is, two payments in each book. We do not have 20,000 coupons.

Mr. Ham: Not very long ago I had the coupons audited by a company which I was then with very carefully. They wanted to know that every cancelled coupon which we showed cancelled had been cancelled. Now, if we had attempted to do it with boxes or anything of that kind I think we would have been several months in getting through with it, because that would have meant the recounting of all those coupons. As it was, we had a hundred coupons on a page, and if there was any missing coupon, the blank space would stare you right in the face. So, just as fast as you could turn the pages over you could verify the account. Certainly it is a very nice way, but it is a question whether there is any other way which is equally as good.

Mr. Smith: Suppose you had a box with a number sticking up, say No. 99. You have your number up there instead of your coupon. Wouldn't that satisfy most anybody, if after counting the coupons you found that the original numbers that were in the box agreed with your book account? I should think an auditor would take that.

Secretary Brockway: Yes, if you could satisfy them that all you said were there, were there.

Mr. Smith: I have not attempted to use the box system yet, but I hope to if we get out any more bonds. As I understand it, the Erie road has been doing it for years, is to use a box, say, to hold 1,000 coupons, say, January, 1901, coupons, from such an issue of bonds; blank numbers are stuck in there which are just a little higher than the coupons will be, with the numbers from 1 to 1,000.

As fast as the coupons come in these numbers are taken out and put into the July box and the coupons put in their places. Thus, at all times, they can see the numbers of the coupons which are out, from these little pads that are sticking up. That is the way I am going to do.

President Duffy: Do I understand that you file those coupons in tin boxes like you would throw cash in a tin box?

Mr. Smith: No, in a paper box. Then, when those coupons are all in, have them counted by two or three people and sealed. Then, if anybody comes along, the trustees of the mortgage, you can turn over that sealed box to them. If they are not satisfied with the certificate, let them count them.

President Duffy: Mr. Ham, may I suggest that, in answer to that question as to the verification of the canceled coupons, do you not have a special coupon account deposit with your bank?

Mr. Ham: You might have and you might not.

President Duffy: The point I was getting at was this: If you make a deposit on coupon day, and if your bank book is balanced, and you exhibit that to your expert who examines your books, that in itself is a certificate that a certain number of these coupons have been paid. I think that would cover the point which was raised.

Mr. Ham: In the particular instance to which I referred it would not have answered, but, generally speaking, I should think it would.

Mr. J. M. Smith: I have found a difficulty with my coupons where I have opened a special bank account. There are always a number of these coupons outstanding. I have some outstanding, running over a period of three or four years, and I do not know that that would be proof to the trustees that the whole thing was paid. It is quite an important item. I use a certain file for a certain coupon and paste all the coupons in. As Mr. Ham says, it takes a lot of labor and expense, but I think the trustees would rather see that done than to take for granted that all the coupons are in a box. As the box is a simple method, it is a very good suggestion; but I do not know whether the trustees would accept it.

Mr. Tripp: Is it not a fact that the trustee is usually the man who pays the coupons?

Mr. Smith: Not in all cases.

Mr. Tripp: It generally is with us. In that case it is up to him to show whether it is or not.

Mr. Smith: No; with us there is a trust company that is trustee for the bondholders. We pay through the bank. We have bankers and trustees, so that the trustees have nothing to do with it.

Mr. E. D. Hibbs (Jersey City): We follow the method outlined by Mr. Ham, filing and using a numbered book for the maturity bonds. That is very simple, because the trustees of our mortgage really pay the coupon. We deposit with them the full amount due and open an account with them for each coupon, and on the term of the coupon we credit it. While it does not show the actual number of coupons out, it shows the information which the Manhattan Trust Co., which is our trustee, wants. I do not know of any other methods that would be so satisfactory as the coupon book, the scrap book, and filing.

Mr. W. G. McDele (Cleveland): We had at the time of consolidation three sets, which, of course, are taken care of with the new bonds, but we had them all scattered around and put them in boxes. Each company had different boxes and had them outlined for several years to come. Mr. Davies and myself started the box system. We had a large tin box made of very heavy tin, with little compartments to take care of the coupons still due, and when they came in they were put in that box, putting the date on the outside of the box.

Mr. Mackay then read the following report:

REPORT OF COMMITTEE ON A STANDARD UNIT OF COMPARISON.

H. C. Mackay, Chairman. F. E. Smith and A. H. Ford, Committee.

At the last annual convention of this association, the Unit of Comparison, as treated in the paper presented by Mr. H. C. Mackay, was referred to this committee to report at this convention, action having been deferred for the lack of sufficient time to discuss the matter properly and to admit of further unbiased investigation.

It is a matter that, since the adoption of electricity as a motive power, had received very little serious thought; and the discarding of a unit that had for years been recognized as the standard, naturally brought up questions requiring more study and investigation than could then be given them. It is but fair to say that this committee's opinion was divided as to the merits of the different units advocated, but, after studying the matter in all its bearings, we are convinced that the motor car-hour is the best unit yet advocated; and, being the same on all systems, large or small, it cannot be otherwise than practicable. Since that time, it has been put to practical tests, having been adopted by some of the largest systems; viz., Minneapolis and St. Paul, Minn., and Milwaukee, Wis. This test has demonstrated that the motor car-hour is a stable and correct unit, and it has further conclusively shown that the car-mile is an unreliable unit, even between lines of the same system. To illustrate, we submit the following figures taken from actual service and applied here to comparison of earnings.

Line.	Speed	Earnings	
	per hour.	Per car-mile.	Motor car-hour.
No. 1.....	8.3	33.25 cents	\$2.76
No. 2.....	16.2	28.57 cents	4.63
No. 3.....	10.7	26.79 cents	2.80

The supposition was (up to the time of comparison on the basis of motor car-hours) that line No. 1 was proportionately the best earning line of the three, but the truth is, it is the poorest. This erroneous result was made to appear true on the basis of car-miles, simply because this line was operated at a lower rate of speed, the smaller divisor naturally leaving a greater quotient.

As applied to operating expenses, we submit other figures.

Car mileage	3,653.00
Motor car-hours	350.00
Earnings per day	\$1,367.50
Operating expenses per day (50 per cent).....	683.75
Earnings per car-mile.....	.3743
Earnings per motor car-hour	3.91
Operating expenses per car-mile.....	.1871
Operating expenses per motor car-hour.....	1.955

Reducing the speed of this line 25 per cent, retaining the same equipment and running the same length of day, what is the result? We have, without changing the cost of operation, reduced the mileage made from 3,653 to 2,740.

The expense per car-mile was \$.1871, and is now \$.2495, an apparent increase of \$.0624.

The expense per motor car-hour was \$1.955, and is now \$1.955, showing no change, as none exists.

Speed, then, is shown to be the factor that prevents the car-mile from being used as a correct basis. Speed does not enter into the motor car-hour. The absence of this variable quantity of speed, together with the fact that labor, the principal item of expense, is computed on the basis of the hour, or multiple of the hour, sustains our position.

It is interesting to note the conclusions of the steam railways regarding the use of the car-mile as a unit. The following figures were taken from the report of the 33d annual convention of the American Railway Master Mechanics' Association. The committee emphasized the unreliability of the car-mile by the following comparisons, showing the cost of operating a simple or ordinary engine to be \$.2449 per car-mile and the cost of a compound engine to be \$.2883 per car-mile, an apparent difference of 17 per cent in favor of the simple or ordinary type of engine. Yet, by reason of the greater capacity of the compound engine, the cost per 10,000 ton-miles was \$3.23, as compared with \$4.03 for the ordinary engine, thus showing an actual gain of 24 per cent in the work performed, in favor of the compound.

For special comparisons, it is recognized that special units are required, as for example, the output of a power station would be based on the kilowatt-hour, this being more closely relative to the work, but for all general comparisons of earnings or operating, the motor car-hour is advocated.

As to the question whether a standard unit is practicable or not, it would seem that, given a unit of comparison, which is admitted to be identical in every case, the question is not debatable. If the unit is correct, the result or comparison must be correct, as the component parts of all accounts have already been standardized by this association. It has been claimed that the variation in cost of operating, between a high and low speed line, affects the value

of the motor car-hour as a unit. The high speed line certainly requires more current, and its repairs to electrical equipment are greater, but we are at a loss to understand how this can affect the unit. We could as consistently question the value of the yard as a unit of measurement because one kind of cloth cost 10 cents and another kind 12 cents per yard.

If a manager was shown that the cost of maintenance of electrical equipment of cars was 25 per cent more on his system than on another, it would certainly be to his interest to investigate, to determine whether more improved motors were being used, or if greater care was not being taken in the use of them. Very true, the investigation might develop that the difference in cost was due wholly to greater grades or to excess of travel on his lines, but it would show him the facts, and wherever a difference did exist, would advise him of it. This would be a practical use of a standard unit.

It was contended that the cost of ascertaining the number of motor car-hours would be such as to preclude its use on a large system. As a matter of fact, it is so much more easily determined than is car-mileage, that the cost is naturally less, and the readiness with which it is ascertained is one of the strong arguments in favor of its adoption. Especially is this the case in cities where large numbers of cars are run without reference to schedule time, but wherever and whenever deemed necessary. Experience has shown that reports of mileage made by trainmen are only approximately correct, but the record of the time of the starting and pulling in of a car at the station can be accurately kept and verified by the time of the motormen. The unit of comparison as applied to electric street railways has not kept pace with the rapid changes which have been made in every feature of this industry during the past decade. The unit adopted by the steam railways, the passenger-mile, was adopted by the street railways, but, owing to the impossibility of determining the distance each passenger was carried, that element was discarded, and, though its usefulness as a unit was impaired, it has continued to do duty as a standard unit to the present time. It applied very well to the old horse car, where the variation in speed was an unimportant factor, but time has wrought its changes, and a new unit to fit up-to-date conditions is deemed necessary.

With the past few years, a new problem has arisen owing to the construction and operation of high speed electrical suburban and interurban lines. These are but the forerunners of what will shortly be in active and aggressive competition with the steam railways. These lines will, doubtless, be controlled and operated by the street railway systems of the large cities, or at least in conjunction therewith; hence, creating a necessity for a unit of comparison applicable to both high and low speed lines.

We believe that the objections raised to the car-mile as a standard unit in the paper presented at the last meeting of this association are logical and that the motor car-hour meets all conditions better than any other unit yet advocated.

We herewith offer the following resolution for your consideration: "Resolved, That this association recommends the adoption of the motor car-hour as the Standard Unit of Comparison."

Mr. Mackay then said: In this connection, gentlemen, I wish to say that it is not the intention of our committee to preclude the use of any other unit. We simply wish the car-hour established as a unit of comparison and adopted by all the roads, so that we can make comparisons upon that basis. There is no objection to the use of any other unit, as I say, and we would be glad to hear from you on that subject.

President Duffy: Gentlemen, this is one of the most interesting and valuable reports that we shall have at this convention.

Mr. Dimmock: Mr. President and gentlemen: From the managers' standpoint I consider the adoption of a unit which we can all agree upon is the most important thing in the keeping of the books of an electric railway. When we go to our directors and they wish to know the condition of the road, they will immediately compare the condition of their own road with the condition of other roads, and what brings the conditions about. In our own case we have found that in every instance there has been a difference of opinion and an unsettled feeling as to this unit; but I do feel that we can reach a point where we can all agree upon one unit this association will have done more good for the general managers of the different roads than anything that I can imagine. From my

standpoint, in both departments, I feel if we could get the unit question thoroughly settled we would immediately commence to correspond with one another, especially the managers, as to what their percentages were during the different periods of the year. I was not present when that question was brought up last year, and I would like to hear a brief discussion as to what the motor-hour is based on, or consists of, in order that I may be posted as to what is going on now relative to this question.

Mr. Mackay: The motor car-hour is merely the car-hour for the time that the car is in service. If the car started out at seven o'clock in the morning and ran until ten o'clock, it would be out three car-hours. The only reason why we called it the motor car-hour was that we eliminated the trailer as a factor altogether. It was based upon motor car-hours.

Mr. Wilson: As the car pulls out from the car-house at a certain hour and is returned at a certain hour, supposing it runs 10 trips during that time, and has a lay-over of 10 minutes each trip, do you have some method by which you eliminate the lost time?

Mr. Mackay: Not at all; your expenses are going on just the same.

Mr. Wilson: A great many of your expenses are not.

Mr. Mackay: Your expenses are practically going on, with the exception of your power, and, of course, some maintenance that is eliminated; but that is a feature of operation which is largely controllable, and I do not see that that would alter the case anyway, any more than your mile. If you were using the car-mile your car is remaining stationary, and your expenses are going on in some cases, and not in others.

Mr. Dimmock: The running delays and everything of that kind would be the same for each method, you consider?

Mr. Mackay: It would be about the same on each road.

Mr. Dimmock: Do you divide your total operating expenses pertaining to the service into the number of car-hours, or vice versa?

Mr. Mackay: Using it as a divisor, yes, sir.

Mr. Dimmock: That gives you the cost of one car-hour?

Mr. Mackay: That gives you the cost of one car hour, and as you can readily see, speed cuts no figure in the matter at all.

Mr. Dimmock: If you run three or four cars in one train, do you only consider the hours of the motor, provided there were two or three conductors?

Mr. Mackay: That is a problem, I presume, that the individual road would have to take up. We do not operate, and I think as a general thing two or three cars are not run in a train. Trailers, as a rule, are simply put on to bring the capacity of the motor car up to a certain standard. There are certain cases, and Mr. Duffy's is one of them, I think, in Chicago, where they operate two or three cars together, and in that case it might be necessary to consider each car as a car hour; but that is a matter, for the few roads interested to take up and decide by themselves.

President Duffy: Mr. Smith, of Chicago, is a member of this committee, and he sometimes runs more than one car at a time in a train. Perhaps he can enlighten Mr. Dimmock on this question of whether it should be car-hour or motor car-hour.

Mr. Smith: I do not see why it would not be a car-hour with us. Would it not be with you?

President Duffy: I should think so.

Mr. Smith: I cannot figure on the motor car-hour exactly. I should think it would have to be the car hour.

Mr. Dimmock: You have a conductor on each car in Chicago, probably?

Mr. Smith: But we do not have a motorman. On our cable trains, for instance; four men run four cars. I do not see why we would not have to have it on the car-hour.

Mr. Mackay: It would seem to me that each road would have to decide that for itself. If the car is running its full capacity, and it is simply a question of operation, whether you can pull one car through a street or pull four cars through at the same time; your streets being so crowded, it is a difficult matter to decide how you are to get your cars through and in getting the motor car through, you may just as well pull four or five. It seems to me that is a different proposition altogether from the ordinary railway, which is operating its cars upon regular schedules.

President Duffy: In Chicago some times the third or fourth trail car in a train is a motor car.

Mr. Mackay: Do you mean that there would be three motors followed by a trailer?

President Duffy: No, sir, there is one motor behind three cable cars. It seems to me we would have to use the term car-hour.

Mr. Mackay: You might use the term car-hour, but I think with nearly all roads, with these few exceptions, that the motor car-hour would bring them nearer to a standard basis.

Mr. Tripp: Mr. President, I was not here at the last meeting, and did not hear this discussion. I would like to have an explanation made why speed does not have some effect on the car-hour as a unit.

Mr. Mackay: Because your hour has not the same length.

Mr. Tripp: It costs more to run a car 20 miles an hour than to run it 10 miles?

Mr. Mackay: Certainly, it costs more to run at a higher rate of speed, but your expenses would show in just that same proportion. Now, on the basis of car-miles, the reverse is the case. If you use a car-mile as a basis, and you increase your speed, your divisor is just so much greater, is it not? And instead of showing the actual results, you show that as a decrease. Now, with the car-hour your expenses are increased and your showing is just that much more.

Mr. Tripp: I think that is right.

Mr. Moore: We run trailers in Pittsburg and it seems to me that we would have used the car hour itself, because we would have to man each car. We are like you, we would have to put a man on each car and to get the proper figures we would have to count the car-hours and not motor car-hours.

President Duffy: May I ask you to give us the benefit of your opinion as to the car-hour proposition?

Mr. Moore: It seems to me to be all right, but before following out the car-hour until I would like a year to try them both together side by side, put them in parallel columns as it were.

Secretary Brockway: Mr. Mackay does not contemplate the displacing of one by the other.

Mr. Moore: No, I understand. The resolution might be open to that construction as it is. I would like to try the car-hour right along and I propose to do it when I go home.

Mr. Mackay: In my last paper I think I treated that trailer question pretty thoroughly, and while there are certain exceptions to this rule, as there are to almost any other, I still think that if the equipment were up to the standard, trailers would be a thing of the past, and in that case the motor car-hour does apply to almost all cases. The running of trailers as a general proposition is done simply because of old cars which are really too good for the scrap pile and yet they are out of date.

Mr. F. E. Smith: Are you going to count the motor car and the trailer as one car or as two cars?

Mr. Mackay: As one car.

Mr. Smith: Suppose you put on two trailers?

Mr. Mackay: I would still call it one car, except as I say in the case of your roads.

Mr. Smith: Suppose it was an electric line, say, going to the race track, something of that sort, and they put on a couple of trailers. Now, we have four men, three cars. Are you going to call that one car?

Mr. Mackay: I wouldn't operate it that way.

Mr. Ham: I don't know but that this question of a car-hour is just the same in the car-hour as in the car-mile. What do you call it now? Do you call it motor car-mile or car-mile? It is just the same question, whether you call it motor car-hour or car-hour. If you count your train now as two car-miles for a train-mile where there was a trailer, you would count it just the same with the car-hour. I think that is one point that we might pass upon, and I would suggest as an outcome of that, that where there is an extra crew or an extra conductor, that in that case, we should call it an extra car. If, however, it is operated with one crew, then we could call it a single car. Of course this question is going to become of great importance, especially in an interurban service, where very frequently as time goes on they will undoubtedly operate trains. They do it now on the third rail system where one motor car has a train of three or four cars. Now, in such a case as that I think that each car ought to be treated as a car. As we are situated in Washington, where we have only one crew for the same three cars, and we still continue to operate them, I think that those should be counted as single cars.

But coming back to the main point at issue, a unit should be something which is not variable, if possible. That is what a unit means, something which is not variable. In this matter we cannot get a unit which is not variable under different conditions. Therefore the unit to establish is that unit which is least variable. On the question of expense, for the last year, we have kept our accounts on the basis of the car-hours, or the car-day, which is the same thing, and also upon the basis of the car-mile; and I think that expenses can be determined much more reliably, as to the relation of those expenses to the earnings, on the basis of the car-hour. The platform expense in the operation of a street railroad is the largest single expense that we have. I think it is probably 40 or 50 per cent of the total expense of operating a street railroad. Now, that expense goes on whether the car makes 20 miles an hour or 5 miles an hour, because we pay on the basis of a day or of an hour. Then, the largest item in the expense of a railroad property being the platform expense, putting that in line on the car-hour basis is to put upon the right basis the thing which is the largest item. Now, the other thing to arrive at is maintenance and cost of production of power. I believe those two things are on fully as good basis on the car-hour as on the car-mile. It costs just about as much to run a car in a crowded street in a city, with frequent stops, six miles, as it does to take that same car out in the suburbs and run it twelve miles, where you would make the same time and you have to use about the same power, although in the one case you have only made half the mileage that you have in the other case; and I am told by people who know more about maintenance than I do that the chances are that the car which has been running in the crowded district with frequent stops is liable to require more maintenance than the car that has been running out in the suburbs at higher speed with fewer stops; therefore, that the actual maintenance of that car in the city has been greater than the actual maintenance of the car out in the country, and the speed has been only half as much. I find that the expense of operating a car an hour is a much more permanent quantity than the expense of operating a car mile. The variation is much less between different lines, and I often think that the general manager or the other officials of the company are misled when they see that some particular line is earning only 10 or 11 cents a car-mile, and they say, "Why pull off those cars. They are not getting enough out there to pay expenses, or anything of that kind." Yet, when you can come around and show that you are operating that road for 5 or 6 cents a car-mile on account of the conditions existing there, you are showing that it is a good line to operate. Now, if that same thing were on the car-hour basis you would find that the car was earning up around what the other lines are earning, because, the speed being so much greater, it earns enough in each hour. I only wish we had more of the lines like Mr. Mackay's that earn, say, 30 cents a car-mile, and \$2.96 to \$5.00 a car hour, but ours are not that kind.

President Duffy: Gentlemen, we have Mr. Vreeland with us this morning. Mr. Vreeland, may I ask you to favor us with your impression of the car hour and car mile, or anything else in that connection that you will be good enough to speak on? Mr. Vreeland has a line that earns some times more than 20 or 30 cents a car-mile.

Mr. H. H. Vreeland (New York): Mr. President, I did not come in with the idea of saying anything. I come to gather some wisdom from the deliberations of men who are actually engaged in accounting. It seems to me that they are the men to decide what is the best unit for us to work on. It works out with us with the various kinds of service we have, on exactly the same basis, so far as our purposes of comparison are concerned, whether you put it on a car-mile or a car-hour, because the variation in conditions is equalized by the fact that it does not all go into one pot. Our whole system is operate by divisions or lines. Every particular line we have in New York City is reported, its car mileage, its earnings per car-mile and its cost of operation per car-mile, by the individual lines, so far as the purposes of comparison by the management are concerned. The operating expenses are compiled by lines. The aggregate operations are shown of course lumped, as you may have noticed in our comparisons for the last three or four years of operation. As far as our city is concerned the conditions there are such that men who are deliberating on this modern question do not give me any show. I have four or five thousand horses yet. If you can tell me how to eliminate that proposition

I shall be glad to hear it. I am not modernized enough to enter into any discussion on the high plane of motor car-hours, etc., except to a limited extent. I should certainly very much rather hear from some of the gentlemen that are regularly connected with accounting work in the discussion of this question, because I am one of a number of fellows in this world that do not believe that the combined wisdom and knowledge is all in one man's head.

Mr. Wilson: Mr. President, I regret exceedingly that you have called upon me because because I have not gone into the subject thoroughly enough to express an opinion that would be of interest, and I have not seen the way in which it would be possible for the West End Street Railway Co. to keep the car-hours without an expense which would preclude our adopting it. I should be pleased to be enlightened on any method that could be adopted on our road to give the car-hours with an expense that would warrant its adoption. We run something over 300 different routes each day. One man gives the car-miles for the entire road; the labor of one man? We have a large book in which is entered each day under the different route headings simply the number of trips and the amount that that line has earned. Twice a month a footing is made of the number of trips and of the amount of money. The footing of the trips is multiplied by the length of the route and the money divided by that gives us the earnings per mile. That is all the expense that we have in determining our earnings per mile. Of course the total of that is taken to determine our operating expenses per mile.

President Duffy: Don't you pay your men by the hour?

Mr. Wilson: No, sir; we pay them by the day.

President Duffy: But the day consists of a certain number of hours?

Mr. Wilson: The day consists of not over 10 hours in 12 consecutive hours.

President Duffy: It would be a very easy matter to get the number of days, wouldn't it?

Mr. Wilson: Yes, but what are the hours? One man runs 9 hours and 15 minutes, another runs 9 hours and 30 minutes, another 9 hours and 50 minutes.

President Duffy: Would it not be possible to strike an average of the entire working day, the number of hours put in on all routes?

Mr. Wilson: No, because in Boston, with the congested district that we have in the center of the city, we never know the hours that a man may be out. Mr. Vreeland I think has the same trouble in New York. The car may start out. He is not always sure when that car is going to get back. Mr. Rossiter, I guess, has the same trouble in Brooklyn.

Mr. Mackay: It seems to me, Mr. President, that it is not necessary to know when the car is going to get back. When it does get back it is recorded, and that is all there is to it. All you have to do is to take this record of the time that the car goes out and a record of the time that the car pulls into the station, and you have your complete record. Mr. Wilson, as I understand it, has a record of the number of trips that the car makes, not only a record on this line, but also a record on some other line, because it is liable to be transferred a dozen times during the day. Now, instead of going into all this detail to work that out, all he requires is simply the time that the car starts and the time that the car gets back.

Mr. Wilson: Mr. Mackay, that would require proving each individual car. It might pull into the house once, it might be in three or four times. You would have to make a record perhaps several times a day. As it is, with the plan we have, we simply take the conductor's day card. It is necessary to know the amount of money coming in in order to find out what the earnings are. It only requires one extra column in which to put the number of trips. No return whatever is necessary from any car.

Mr. C. L. Rossiter: Ladies and gentlemen: I am glad to have the result of your arguments. I think Mr. Ham's arguments in regard to the car-hour have a great deal to commend them, yet at the same time I am very firmly convinced that simplicity in the keeping of accounts means a great deal, and I do not think that the car-hour would run into a great deal of additional labor. I cannot quite agree with the chairman that an average will answer the purpose. I think if you are going to have a car-hour, in order to locate your expenses so that your manager can place his services where he requires it, that an average would hardly answer the

purpose unless that average was very correct; and I agree with the speaker in regard to the congested condition of traffic where the cars are making sometimes not one-half, as Mr. Ham stated, but I think really not one-fourth the number of miles in a given time. That certainly would indicate that the car-hour there was a very desirable thing to have. We have, unfortunately, some lines, not like brother Vreeland's, because I think he has no lines that earn less than 30 or 40 cents a car mile, but we do have some lines out in the country that I am sorry to see in the 10 and 12 cent class. While those lines are building up and developing very rapidly, it is quite a problem to so adjust the service to get all the earnings that can be reasonably expected.

I do want to say one thing, that I think this Accountants' Association has done a great deal in the last few years to assist managers in getting information. I appreciate it. I am very glad indeed to have the opportunity of saying so to you gentlemen. I think it means a great deal in the successful operation of a road, having the figures at hand, and I think that you have made very marked progress in enabling us to obtain them.

Mr. W. E. Harrington (Camden): We have some suburban lines and a few city lines where the differences in the car mileage rate were such that it appeared that the suburban lines were running at a considerable loss on the mileage basis, and I was confident that they were. Some time ago, so that we got it in this last fiscal statement, we adopted the car-hour unit in connection with the car-mile unit. It has not increased our office force at all to do it. One of the girls works it up and it comes in each morning with the regular statement of the receipts of the different divisions and lines, each line being considered separate and distinct. I don't see how a road can run without the car-hour unit. The car-mile unit is all right and I use it generally to compare with other roads, because the data are up that way, but I am using entirely for my own comparison, for my own use on our line, the car hour unit.

Secretary Brockway: Mr. President, in New Orleans we have no grades, we do not have to heat our cars, and we have a number of other advantages, but we find that a comparison of units gives us this result:

Line A on a percentage of earnings, is first; on the car mile, it is second; on the car-hour it is second.

Line B on percentage of earnings is third, on car-miles is first and on car-hours is third again.

Line C on percentage is second, car-mileage third and car-hours first.

Line D is fourth in all instances.

Our management wished me to show those three comparisons, and I give them every day, furnishing them all of these details every day, and the line that we thought was our gill edged line on the car mileage basis turns out to be third on car hours. Our speed is very fast in some instances. We run on the neutral ground, and taking all those things into consideration; they feel as though they want all three forms of comparison. We cannot very well tie up to any particular one, which is what Mr. Ford had in mind.

Mr. F. E. Smith: You figure it from three ways. Which is the best paying line?

Secretary Brockway: Line A.

President Duffy: How does that stand on the three units?

Secretary Brockway: It stands first on percentage, second on car-miles and car-hours. Line B is third on two and first on one. Line C is first, second and third. Line D is fourth in all instances.

President Duffy: In answer to what Mr. Rossiter said, that he did not believe in an average, I thoroughly agree with him on that. I believe in the accurate figures if it is possible to get them. I only brought up the question of the average because Mr. Wilson said that it was impossible to get the hours on his road.

Mr. Wilson: I did not say it was impossible. I said I thought the expense would preclude that.

President Duffy: I stand corrected. In Chicago we pay our cablemen by the trip. We pay our electric men by the hour. We know exactly how many hours should be run every day from the time schedules, as well as from the report from the depot that the cars start from. We verify and check and make our payroll according to these records. Consequently, we know actually, not only the hours, but the minutes, run by every man on every car, as a total; so that we can get the hours run absolutely correct. Now, if there is anybody who has such conditions as has Mr. Wilson,

whose company pays its men by the day and for a half or a third of that day, they might be tied up and not work at all—that is a little different proposition. But I think on the ordinary road you can get absolutely and accurately the exact number of minutes that the cars run each day.

Secretary Brockway: My time-keeper furnishes that every day, the actual hours of the motormen and conductors of each line. We have a congestion annually in our Mardi Gras festival, during which practically the whole line, all the lines of the entire city, are tied up near Canal St. In that case the car mileage is not worth anything. Then our car-hour has its advantages. The percentage, of course, still remains the same, because the desire to travel seems to permeate every line in about the same proportion. Everybody goes down to Canal St. at Mardi Gras, but the car mileage is not worth anything as a comparison for that week.

Mr. Ham: Well, Mr. President, the objections which have been raised to this seem to be on the ground of the expense of determining how many car-hours are operated. In the cases of both Brooklyn and Boston I believe that could be obtained very readily with almost no work in the office. Every table is operated on a certain standard. That standard calls for a certain number of trips, a certain number of car-hours. It calls for a certain amount of pay. Now, for all over time above the standard a certain number of hours are made, and that is shown by an increase in the payroll. Mr. Rossiter is very familiar with that. Now, whatever that increase is, it is the item which, added to the standard, gives the total number of hours, and the depot master on the largest division in Brooklyn or Boston could give that information to the auditor on the morning following the day in question. He could have it on his desk at nine o'clock in the morning. Mr. Wilson's scheme of furnishing the total number of car-miles only twice a month, would not answer for the average manager. The manager generally wants to know the following day, if possible what his cars have earned per mile, or per hour if you should adopt that as the standard. Mr. Brockway was asked, and this is something which I think is of importance, which was his best line; and he answered that the best line is the one that has the lowest percentage of operating cost. Now, right there is where we are apt to make a great mistake, and where the management might make a mistake. I think Mr. Vreeland's scheme of finding out the net returns from a line is really the only way. It is possible that with the best line of Mr. Brockway, by reducing the number of cars operated he will decrease the operating expenses, we will say, from 60 per cent to 50 per cent. But what has been the result? Have you as much net earnings? That is what we want to know. What is the final result on net earnings? On the other hand, we may take the line of Mr. Brockway's, which has been operated at 60 per cent, put on extra cars, and bring that up to 70 per cent, and still it may be a better line than it was before, because we are getting more net earnings out of it. That is why we have to be careful, in any of these bases of comparison, to remember that what we are finally looking after is net earnings and not percentages. You have heard the story of the old man who did not know anything about percentages, but he did know, if he sold something for a dollar for which he only paid fifty cents, he was not losing anything.

President Duffy: Mr. Ham, I think you are under a wrong impression as to what Mr. Brockway said.

Secretary Brockway: You misunderstood me.

President Duffy: Mr. Smith asked which was the best line. Mr. Brockway replied line A. Then I asked him if he would state how that best line stood on the three units, and in answer to my question he made that statement.

Secretary Brockway: I am taking income only into consideration. I am not considering the expense at all.

Mr. Ham: Was not your reply based upon the fact that the percentage of cost of operating that line was the lowest of the three lines or four lines?

Secretary Brockway: No; I am taking income only, just treating income in this consideration.

Mr. Ham: Well, how would you determine that, from the gross income?

Secretary Brockway: Gross income, certainly, of the four lines.

President Duffy: He means that the percentage earned by this particular line, of the total amount, was not greater on this particular line than any other. Just the percentage earned; not the percentage of expenses to receipts. Is that correct?

Mr. Brockway: Yes, sir.

Mr. Ham: That may be a longer line. That does not answer it at all. You might have a line that was a mile long, which would naturally be better than another two miles long. That isn't anything at all.

President Duffy: What I wanted to correct was the impression that he was taking that as the better line because of the low percentage. You were mistaken about that.

Mr. Ham: I thought he was, but I do not see that the amount that a line takes in determines the matter.

Secretary Brockway: That bears out what I said, that we cannot tie down to a comparison, we are using the three and showing that only one of the four lines agrees in each of the three comparisons.

Mr. Dimmock: I would like to ask some of the accountants who have been using the car-mile in the past, if, when they had a motor and a trailer in one train and that train should run one mile, if they would consider that two car-miles, if a trailer ran a mile and the motor ran a mile, say, two 16-ft. cars. Now, if it costs you, for illustration, a dollar to run that train one mile, and it actually covered that much ground, would you say that the cost per car-mile was 50 cents? I would like to have that answered.

President Duffy: I will answer that question as far as our company is concerned. We are very much interested in the prorate proposition. To begin with we have three kinds of power, electric, cable and horse. This is further complicated by the fact that some cable trains are operated two cars in a train, some three cars in a train, some four, towing an electric motor car behind a third car on that train. The State St. line is supposed to be a cable line; we run horse night or owl cars on it, we run electric owl cars on it, and cable cars all day, and tow electric cars in day time form 18th St. up. When I first took hold of the accounts there one year ago, I found all these complex elements. I keep a daily record, first, of the number of cars operated, and secondly, the kind of cars. There are grip cars, motor cars, the first cable trailers, second cable trailers, or the first electric trailer, or what I call the tow car. I keep those miles separate, and I show the thing every way. It is the only way that I can get at it understandingly.

Mr. Dimmock: Supposing that you had a road and, to make the question plain, that you just had one train on it, and your road was a mile long, and you made one trip a day one way—that would be making one mile—and there were three cars in the train. Would you have made three car-miles that day, or one car-mile?

President Duffy: You would have made three car-miles and one train mile of three cars.

Mr. Dimmock: We have a suburban car, which is just twice as long, we will say, as a 16-ft. or 18-ft. car, as it might be, holding just double the number of passengers. If you count mileage of trailers and of motors, of the short cars, as against the mileage made by the one car, would that not go to prove that car mileage is imperfect and not of much use to the manager?

President Duffy: That is the argument advanced by Mr. Mackay last year; the special argument was on the trailer.

Mr. Dimmock: The length of the car enters into the car mileage from the fact that if you had two 16-ft. cars, one a motor and one a trailer, and each one would hold 50 passengers and they would run that train one mile; if they should run two car miles and it cost a dollar for expenses the cost per car-mile would be 50 cents, would it not? Now, on the other hand, if a road operated with one car carrying 100 passengers, and the cost was one dollar, that would make the cost per car-mile show so different that it would see that it was almost valueless to make any mention of or for a manager to compare by it.

President Duffy: I think a safe rule to follow would be that every car that is manned, as was discussed here a little while ago, should be called a car. If you have two cars and one motorman and two conductors, that would be two cars.

Mr. Dimmock: I know of many cases as in Omaha, where they run a motor and a trailer and have only one conductor and one motorman.

Mr. Vreeland: We have been a good many years in this work, and I have seen its evolution from the old days when in steam railroading we were like the fellow that kept the store. They asked him why he didn't have a book-keeper. He said he didn't want one. They said, "You might be bankrupt and you wouldn't know it." And he said, "If I was bankrupt I wouldn't want to know it." We are not in that shape. We want to know what our condition is

all the time, and any standard that you gentlemen can arrive at or a thorough discussion of it, is of value. The thing that in my opinion you want to be careful about, and which is very prevalent in street railroad practice—things that 10 or 15 years consideration have been given to by standing committees in steam railroad work, is the attempt of the practical operating men and often of accountants and others to settle, in street railroading, in two hours. I had occasion to speak of this in Buffalo where a subject was up that was up 15 years ago, when I was a member of the American Society of Railroad Superintendents; I was on a committee, and they have a meeting tomorrow in New York, and I was asked to come before that society and speak tomorrow on the same subject that was up at that time. I do not mean to say nothing has been done. It has been carried along. But it was so important a subject that it has been carried from year to year, as a subject of discussion. Our move from a percentage to a car-mile basis was a good move, even if we now go to the hours. A gentleman asked me a few years ago, "What is the cheapest line you have in percent of operation?" I replied, "I have one that operates at 22½ per cent." The man went off and told another man that I didn't know a thing about the business; he said there was not a man in the business who could operate a road for less than 50 per cent. The truth was, it cost me as much per car-mile to operate that as any other under average conditions for 24 hours, paying 25 or 22 cents per car-mile, and percentage did not mean anything there at all, based upon 50, 40, 30 or 20. We are operating many lines now at anywhere from 30 to 35 per cent. Of course the question is entirely one of the average cost per electric car-mile of operation. It stands the same throughout the system. Well, we have made that step since the last seven years, going in New York State entirely from that question of percentage up to the car-mile for a basis. Now, if you gentlemen from your conclusions on this subject show us that the car-hour is a little better, why we assure you we want the best, and we are with you. (Applause.)

Mr. Wilson: While sitting here I have been thinking over the subject a little more deeply, perhaps, than I had in the past. On a big system, a method may possibly be arrived at such that I shall be obliged to take back what I previously said as to the matter of expense. I do not say that it would be absolutely exact, but in the long run it might average so that it would come out in a satisfactory manner. With us there are over 30 car-houses. We are operating over 1,400 cars a day; I might say the 1,400 cars are running on over 30 different routes, the mileage of every one, of course, being different. If we took each car house and had the foreman in charge each hour, or each half hour, simply put down the number of cars that were on the street at that time, and take the total for the day, divided by the hours, or half hours, as the case may be, we would then have very nearly the car-hours of the cars from that house. Of course, it would not be exact, but if a car pulled in five minutes before the half-hour, or the hour, some other car might pull out five minutes afterward, and it might average up.

Mr. F. E. Smith: Why not have your thirty barn foremen send in reports?

Mr. Wilson: They have all they can do now, and a little more.

Mr. Smith: Let some one else send in once a month the regular schedule from each barn.

Mr. Wilson: We haven't any schedule. We have one, but it does not work.

Mr. Smith: Your first man is supposed to make 10 trips a day on some particular run. Now, if all the other men make their regular trips, why can not that first man send in to you every morning the regular schedule time for yesterday? Or if you have to send out an extra tripper, why cannot you say there was an extra made, and so on.

Mr. Wilson: We could, but that is where the trouble comes; there are so many of them, it is an expensive thing to attempt to do anything of that kind. Anything is possible.

Mr. Smith: I didn't think that there would be so many extra trips but that it could be done. Of course, you have regular extras, understand, but I mean trippers.

Mr. Hogarth (Denver): I suppose you are all familiar with the fact that we pay our conductors and motormen every night. We have a system of universal transfers and I would like to talk over later with some of the members here. I find that in the exhibit hall there are registers now providing for fares, transfers and tickets. That is a very important feature with us, and one I would

like to go into and see if it is at all practicable.

President Duffy: Those questions can very well be taken care of in the informal discussion on the last day. I am very glad you mentioned that and brought it up, because it will provide material for discussion there.

Mr. Hogarth: We operate a few trailers, very few. We are joining our grips and trailers, making one large car out of them. The horse ears have been abandoned; the cable has been abandoned. We have nothing but electrical equipment. I think that the hour unit will be the unit for our purposes. The unit ought to be a standard that is not variable, or one that is the least variable. Managers like to make comparisons of their lines with others of the same size. If there are any great discrepancies they wish to know it; they wish to know it quickly; they wish to adjust it; wish to put their lines up to date. I think the hour unit is the coming one. I regret that I am unable to speak more full upon the subject, but I have been with the company only two months, having been theretofore with the steam roads. They have a unit established for freight which is on the basis of the ton-mile; for passengers, the passenger mile. That is the system followed by the Inter-State Commerce Commission, and adopted generally throughout the United States.

Mr. Moore: I would ask Mr. Harrington as to his practice in computing his car-hours, whether he has trailers and whether they are manned by different men, and whether he counts the car-hours for the motor and trailer as well.

Mr. Harrington: We have no trailers and we keep our time right from the conductor's tally sheet, the same as we compute the car-miles. The computation of the car-mileage, of course, is far more difficult by reason of taking the mileage at the different points the cars pass over, but it is very easy to get the number of car-miles from those tally sheets. We pay our men by the hour, and it makes it very easy for us to do that. We have not noticed any increase in the office labor. There has been no complaint on the part of our girls of the additional work thrust upon them, and we have our car-hour and earnings per car-hour on our tally sheet, that is made up by the conductor. As I said before, we have been using it a little over a year and three-quarters and it has proved a great help. We have had suburban lines where the car-mile was low compared with lines in the city which I knew were running at a loss, and it would appear they were running at a loss on the suburban lines, but the cars were running about two and one-half times faster, and by testing it on the car-hour basis it made the resulting figure almost double that which we received in the city, and put it on a basis such that we knew just where we stood.

(Mr. Ham in the chair.)

Mr. Duffy: This closing paragraph on Mr. Mackay's report reads: "We herewith offer the following resolution for your consideration." (Mr. Duffy reads resolution.) I would like to say a few words on this subject. To begin with, I believe that the varying conditions of operation, with the possible exception of speed—and that is the most important and most disturbing element in the proposition—are just as well, if not better, taken care of by the car-hour unit as by the car-mile unit. Certainly we are at no greater disadvantage by using the car-hour unit even to the exclusion of the car-mile unit, than we would be by using the car-mile even to the exclusion of the car-hour unit, and we have the advantage of eliminating the disturbing element of speed. Now, as to the size of the car operated, whether they are operated as single cars or in trains of one, two, or more, these are some of the peculiar local conditions that surround the operation of every road. Every road has its peculiar conditions. They must be studied specially and they must have special treatment. I believe that the safest thing to do is to consider that every car that has a position on a time-table with the run numbered, that is manned by a crew, and sent out for the purpose of hauling passengers, is a car. If you put two of them in a train it makes two cars. We should supply the information as to what that train is made up of. I go further and say that a car is a car whether it makes one trip or ten, whether it is out one hour or twenty, whether it runs at night or whether it runs in the day, whether it is put out for a baseball load or whatever the condition may be. I wish to explain by that that a car that is not on the time-table at all, but is manned by a crew for the purpose of hauling passengers, if it only makes one trip, that is a car; if it only makes one trip or runs one hour it is still a car. If you will establish that as your

starting point you will get the number of cars that are operated daily, the kind of cars they are. I was very glad to hear Mr. Wilson say in his last remarks, that he was satisfied that with his peculiar conditions, which are different from those of any of the rest of us, he could get around the thing; and I have no doubt that anything is possible in the accounting line in Boston, if Mr. Wilson will undertake it. I know that you can get the number of car-hours, the total number of car-hours made per day, more accurately—at least, I believe you can—more easily, more economically, than you can the number of car-miles. Now, why shouldn't we have the car-hour? Mr. Vreeland's remarks, I think, were very good, especially his advice not to start to settle in two hours a question which the steam railroad people have been considering for fifteen years; but it seems to me if you know the number of cars that you operate each day you can very easily keep track of the kind of cars they were, whether they were run in trains or not, how many hours they made, and if you take the schedule speed that your time-tables call for you have something that will give you the number of miles that the car traveled from the car-hour figuring. You may not get it absolutely exact, but you will get it very close. Take a line that has 10 cars on its time-table. Suppose that each one of those cars ran 10 hours. You would there have 100 car-hours. Suppose that, including the lay-over, and including the allowance for stops and other delays, that those 10 cars are scheduled to take 10 hours each out of the 24 on the time-table. They will have run 100 car-hours. If you divide the distance traveled into the number of hours that they are scheduled to require to cover the distance, you get, say, 10 miles an hour. Each car has been in service an average of 10 hours. Each car has traveled an average of 100 car-miles. The other way, you take the distance of the round trip and multiply it by the number of trips that are made. I see very little difference in the basis you are figuring from. I think Mr. Moore's suggestion that we all try it this year is a very good one, and if it meets with the approval of Mr. Mackay, I would suggest that we modify that resolution, that we recommend the adoption of the car-hour, not motor-hour, as a standard unit of comparison in connection with the car-mile, and it is my opinion that this subject should be taken up by each member individually, put in practice and tried for a year. Then we can come to the meeting next year and thresh it out all over again, and recommit this question back to the committee. I thank you for your attention.

Mr. Mackay: The amendment is satisfactory to me.

Mr. Moore: I would like to say just a word for Mr. Mackay's benefit in relation to our own lines. We differ in our equipment from some of the lines that we have spoken of here this morning, inasmuch as we have a new and splendid equipment. The trailers are just as fine cars as the motor cars, just as long and just as good. They are not ready for the scrap pile; they are manned by a conductor, just the same as the motor car is, and in our figures I think it is nothing but fair that they should have hours as well as the motor cars.

President Duffy: I would suggest, Mr. Mackay, that you make that motion with reference to the modification that I suggested, and let the gentlemen act upon it.

Mr. Ham: This resolution as it reads does not say that this shall be the exclusive unit, and therefore I move the adoption of the resolution, reading as follows:

"Resolved, That this association recommends the adoption of the car-hour as a standard unit of comparison."

Mr. J. M. Smith: I think if Mr. Duffy's suggestion were put in force, that if we take it for another year, we would come better prepared, and let each one undertake it, run the year through on both the mileage and the car-hour basis, and bring a report here, I feel satisfied if it is as the gentlemen say, that it will go through without any hesitation whatever.

President Duffy: Mr. Ham, do I understand you that you desire this resolution just that way, without modifying or qualifying it to the extent that it is to be with the understanding that it is to be tried for a year and it is recommitted back to the committee to be reported on again?

Mr. Ham: No, my intention was that we simply adopt it as read, that we move the adoption of that as a standard unit of comparison. That does not eliminate any other standard that we may wish to use or continue to use. It does not interfere with our throwing it out at the end of the year if we wish to. But I

think it is a good thing. If we think, as many of us do, and I believe as most of us do, that it is a good thing to know what the earnings and expenses are per car-hour, then I think we are not making a bad move to recommend the adoption of that as a standard. We will continue to have the car-mile standard, and I do not think we are committing ourselves in favor of it any more than as an auxiliary standard.

Mr. J. M. Smith: I meant to say that while trying it for a year we might get into line with our managers and let them understand this discussion, and consider it with them. Then we can get their views as well as our own. We are not the heads of the roads. I think if we had a year to work with our managers, if it is going to be a success, we can, without any hesitation whatever, adopt it next year.

Mr. Dimmock: If I had not been here and heard this discussion I believe, as the resolution reads, it would be misleading to a manager. He would immediately reach the conclusion that these gentlemen had thoroughly sifted this question, and come to the conclusion that the car-hour was the better unit, while at the same time we have not reached that conclusion until we have tried it longer. My former remarks were made with a view of showing that the mileage basis was misleading in every sense of the word, and that we did need something better, but I do not believe this question has been studied enough to warrant the adoption of the resolution unless it is made in such a way as to show that it is a trial. If the resolution can be made to read so as to not mislead the managers who are not present, when they discover what has been done, then it would be a benefit, and they would immediately say to their auditors and men in charge, "Now let us try this thing. The accountants are reaching a point where they believe this is the best," and yet they will understand that it is only for a trial.

Mr. F. E. Smith: I do not see the use of referring this back to the committee. You cannot change the opinion of the committee on the subject at all. It is for the consideration of the convention; let the convention decide.

Secretary Brockway: That is what the standardization committee said at Boston, and they changed their minds.

President Duffy: The standardization committee didn't change their minds, they changed their classification. I think to recommend is a proper procedure. Does any gentleman wish to make that as an amendment and have it acted upon?

Mr. Wilson: I offer it as an amendment.

Mr. Han: I am perfectly willing to withdraw my motion. That will make it simpler.

President Duffy: My idea would be that this resolution should be, if you will permit the chair to make this suggestion: "Resolved, that this association recommends the adoption of the car-hour as a standard unit of comparison, with the understanding that it is to be put to a practical test by each company represented in the membership of this association, either in connection with the car-mile or not, as they may see fit, and that the committee report back at the 1901 convention."

Mr. Wilson: I don't like that phrase recommending the "adoption." It is true that we go on to explain it afterwards.

President Duffy: Suppose you use the word "use," instead of "adoption."

Mr. Wilson: I think it will be better, possibly.

President Duffy then put the question on the adoption of the resolution as amended, and it was adopted unanimously.

President Duffy: A matter that I would like to speak of is the Railway Officials' Private Report and Reference Book, that I referred to in my Address as President. The publishers, Messrs. Hanna & Gray, have left with Mr. Brockway several copies of the book. Any gentleman belonging to this association who desires one of those books will be very cheerfully supplied, if he will simply fill out one of the cards that Mr. Brockway has, and if he would prefer to have the book stamped with his name, if he will turn the card in Messrs. Hanna & Gray will send the book as soon as they can give the order to the printer. But if members wish the book now, by simply leaving the card with Mr. Brockway, he will provide them.

Secretary Brockway: There is one matter which is very close to my feelings with regard to the association, and that is the membership. It has been, I can almost say, our habit to go away from the

conventions with fifteen or twenty members gained at the convention, and for your information I want to say that we have thus far gained two at Kansas City. We are considerably behind our record, and we are going to need the constant co-operation of all the members to gather in those who are not with us at present; if I can feel sure that everyone is keeping that in mind in talking with other railway men here, I think we can leave here with our usual record.

Mr. J. M. Smith: How would it be for some person or some member of the American Association to take up our cause and speak to the managers who are attending the convention on the other side of the hall, with a view to increasing our membership. There are managers here who could speak for their companies and join us while they are here in convention. If it is left for individuals to go around, we do not meet them to know them at all. I do not know one in ten.

President Duffy: I will speak to the secretary, and see what can be done in relation to that.

Secretary Brockway: We have a plan in mind for securing the co-operation of the secretaries this coming year, the secretary of the American Association working among its members who are not members of this association, and vice versa, but the idea I had in mind was to strike while the iron was hot and while we had them right here, subject to personal influence.

On motion the convention adjourned until 10 o'clock Thursday morning.

COMPRESSED AIR AS A MOTIVE POWER.

In an interview yesterday Mr. Henry W. Cook, president of the Compressed Air Co., said to a "Review" representative that the development of the compressed air motor is proving to be in the best interests of the street railway companies and the public. Already two of the foremost systems in the country are operating compressed air cars. "The Metropolitan Traction Co., of New York," continued Mr. Cook, "has just put 200 air cars on the 28th and 29th St. lines in New York City. That line is entirely operated with air cars. Though the conditions are very exacting, the cars making frequent stops by reason of the many tracks and the narrow streets and also by stopping at any point in the block to pick up passengers, the service is reliable and the cars are a decided improvement over the former cars operated on that line.

"In Chicago air cars have been performing night service between the limits on North Clark St. and the City Hall for the past sixteen months. The motor cars have single truck motors and on North Clark St. when travel is heavy sometimes two trailers are attached.

"The Compressed Air Company is now placing upon the market its double truck 40-ft. motors, and contracts are now pending for these motors to operate upon suburban lines of steam railroads and in cities where the single truck motor cannot meet the requirements of the service. These motors give satisfactory service. There is no noise except in starting, when a slight exhaust is noticeable. This will be overcome when the motorman becomes expert in handling the levers, and does not use more air than is necessary. When the air cars are running they are noiseless, and in this respect they differ from the trolley cars; with the electric cars the noise is greatest when they run most rapidly, and have the heaviest loads.

"Competent engineers who have examined the system endorse it highly, and the fact that the cars are operating in New York and Chicago shows how important the question of air motors now is to the street railway interests of the country. The Compressed Air Co. is controlled by practical street railway and steam railroad men who realize the great value of an independent motor, and believe that the mechanical development of the air motor at this time compares favorably with electricity at the time of its adoption for street railway traction. In many respects the air motor has a decided advantage of all other systems owing to the slow moving character of its machinery, its low cost of maintenance and the fact that it does not require any special track or out-door construction in order to operate its cars. Any good track suffices for the air motor.

"The motors on the 28th and 29th St. lines in New York weigh 19,100 pounds. Those operating in Chicago weigh 18,000 pounds, and being entirely spring supported they save both jar in the mo-

for machinery and track construction. We believe that air with the independent motor will prove a valuable ally to both electricity and cable roads. The cars can be gradually introduced on roads already equipped with other motors, and in such a manner as to improve existing systems to their advantage and the benefit of the public. Favorable reports have already been made by engineers of trunk lines contemplating the adoption of air motors to run in their regular tracks on suburban service.

"It can be truthfully said that air has never been tried in any mechanical position and found wanting, and the air car only proves another demonstration of this fact. Our mechanical department is handled with judgment, care and attention to every detail.

"Theory is one thing, practice is another. In practice the air motors bear out the claims for them, and it is no longer theoretical. So far the Air Company has accomplished a great deal and will accomplish more. It has made a fair start towards winning the confidence of the street railway managers, and I believe that business will follow along these lines and that air motors can be built to fit any required situation. Parties considering the building of new feeder lines or desiring to increase the volume of their business during rush hours may find it to their interest to consider the question of introducing air motors to help them out during these hours. Our company invites careful examination of plans, and the actual operation and results of the motors now in service."

CONCERNING TRUCK PATENTS.

Kansas City, Oct. 17, 1900.

Editor "Review": Referring to the article published in your issue of the 17th inst., page 17, entitled "Brill No. 27 Truck Patent," I desire to state that our company is defending the suit brought by the Brill company against the North Jersey Street Railway Co., and that I am informed by our attorneys that there is no question about their ability to successfully defend this suit; that the half elliptic spring bolster support claimed by the Brill company was shown and patented as far back as 1845, and that this specific arrangement of spiral springs in combination with half elliptic springs is an old carriage spring device and has been in use for years.

As to the priority of invention referred to in the interference suit between Chas. F. Uebelacker and the J. G. Brill Co., the decision in this case was that Mr. Uebelacker was awarded a patent for his specific claims and Mr. Brill one for his, both being awarded patents.

As can be readily seen upon examination of Peckham's No. 14-B-3, short wheel base trucks (made under the patent of Mr. Uebelacker), 50 pairs of which are in use under the cars of the Kansas City railway, the arrangement of bolster springs is different from that shown in the Brill No. 27 truck. The main difference consists in the support of the half elliptic springs upon

PECKHAM No. 14-B-3 TRUCK
Covered by letters patent granted to C. F. Uebelacker.

TRIP TO FT. LEAVENWORTH.

Promptly at 1:30 this afternoon a special train will start from the Union Depot over the Missouri Pacific railway to take all in attendance at the convention to Ft. Leavenworth, Kas., where part of the afternoon will be spent. After visiting the U. S. penitentiary and the government reservation the party will be taken to the Old Soldiers' Home just south of the city of Leavenworth.

THEATER PARTY LAST EVENING.

A delightful theater party was given last evening at the New Coates Theater by the Metropolitan Street Railway Co. The entire house was placed at the disposal of the visitors, who made up small parties and selected their own seats.

The play was "A Runaway Girl," but a few of the hits made by the comedians were not in the original score.

Among those occupying boxes were the Executive Committee of the American Street Railway Association and ladies, Secretary Penington, J. R. Graham, J. A. Rigg and ladies, R. J. Williams and Miss Herford, Mr. Push and ladies, R. E. King and ladies, F. Mae Govern and party, and J. H. Van Brunt.

At a recent meeting of the Dundee tramways committee a communication from the Board of Trade was submitted asking that the speed of cars on certain routes be reduced to four miles an hour. The manager reported he thought six miles an hour was a safe rate and it was resolved to apply to the Board for permission to run at that speed. We wonder why the horse lines in Dundee were ever changed to electricity.

or suspended from the side frames. In the Brill construction the elliptic bolster springs are supported from the side frames by bolts, the heads of which rest directly upon the side frames and not being cushioned become crystallized and break; we have seen Brill trucks of this type in which a large percentage of these suspension bolts broke within a few months after being placed in service. In the Uebelacker construction the elliptic bolster springs are suspended by bolts, the upper ends of which are supported on spiral springs which cushion the shocks received in crossing tracks and switches. The suspension bolts are constructed with eyes at each end through which steel pins are inserted. These pins rest upon the spring caps and are much stronger and less liable to break than bolt heads, and being supported upon springs are relieved from crystallization and breakages caused thereby.

The best evidence of the superiority in design and construction of our No. 14-B-3 truck is the large number (over 2,000) sold since their introduction less than two years ago, to such roads as Metropolitan Railway, of Washington; North Jersey Street Railway Co., of Jersey City; Boston Elevated Railway, of Boston; Union Railroad Co., of Providence; Cleveland City Railway, of Cleveland, O., and the Metropolitan Street Railway, of Kansas City. As you are aware we were the pioneers of the short wheel base truck, which has become so popular and is being copied by the Brill company and the truck manufacturers, who opposed its introduction as not being constructed upon correct lines.

We deplore this newspaper controversy, but it will be evident to all that the statement by the Brill company referred to above compels us in self-defence to explain the true situation.

THE PECKHAM TRUCK CO.

E. Peckham, Pres.

FORT LEAVENWORTH, KAN.

Early in the year 1827, Col. Henry H. Leavenworth, 3d U. S. Infantry received orders from the War Department to proceed with four companies of his regiment to the Missouri River and establish a "permanent cantonment" upon a suitable site within 20 miles of the mouth of the Little Platte. This step was deemed necessary to protect the Santa Fe traders from the incursions of the Indians who had begun to plunder the caravans passing in yearly increasing numbers from the East out into the then unexplored West. The post thus established became at once the Mecca for traders, travelers, paroled soldiers and friendly Indians and during the great hegira to the gold fields of California in 1849, over 70,000 men, women and children passed through the reservation.

The original fort, known as Cantonment Leavenworth, comprised a square, on each of the four corners of which was a log block-house pierced for musketry. In 1832 the name was changed to Fort Leavenworth and the old log buildings gradually gave way to more permanent structures. The character of the post, too, has changed and Fort Leavenworth now partakes more of the nature of an army barrack than of a fort. It is, however, one of the most important home military stations over which the American flag floats. Under normal conditions the barracks are filled with U. S. troops held for reserve duty or fitting out for frontier service, but as a result of the Spanish war and the acquisition of our new foreign possessions, most of the usual occupants of the buildings are doing duty in the Philippines or Cuba, and there remains but a small guard to picket the grounds.

The reservation contains nearly 12,000 acres, distant about three miles north of the city of Leavenworth, and lying along the tops of the bluffs overlooking the Missouri Valley. Within this area are the United States War College, Post Chapel, Barracks, Riding School, Quartermasters' Building, a fine monument to General Grant, a national cemetery and officers' cottages and quarters.

Here also are the United States Penitentiary and a new Federal Prison now being built by convict labor.

The United States Penitentiary was formerly a purely military prison, and so remained, a sort of general guard house for the army, until 1895, when it passed from the control of the War Department to the Department of Justice. The institution comprises a group of three-story stone buildings separated by alleys and court yards, there being round about them all a stone ram-

INFANTRY BARRACKS, KEARNEY AVE.

part pierced by a single sally port, before whose double iron gates a picked sentinel, armed with Spencer repeating shotgun and revolvers, paces every moment of the day and night.

Within these sombre gray walls are confined nearly 1,000 men, who in various ways have brought themselves under the ban of Uncle Sam's displeasure. Some have committed murders, some are counterfeiters, others have violated the neutrality, postal or revenue laws, and a few are serving sentences for willfully misapplying the funds of national banks.

The prison draws its inmates from a section embracing Colorado, New Mexico, Texas, Oklahoma, Indian Territory, Arkansas and Kansas. Included in the number are representatives from the highest walks of life, as well as the lowest, but prison regulations

take no account of past deeds, and here all men are at least equal, if not free. The refined, well-educated bank cashier, who has violated the trust he once enjoyed, lock-steps across the stone paved prison court with the desperado from New Mexico and the murderer from Texas, and it would be hard to pick the one from the other from among the groups of gray-clad, clean-shaven men that file slowly by, each face indelibly stamped an ashen gray hue, known the world over as prison pallor.

The penitentiary is in charge of Maj. R. W. McClaughry, who has given a lifetime to the development of the science of penology. Major McClaughry prefers to call his institution a reformatory,

U. S. PENITENTIARY.

instead of penitentiary, and every rule and regulation for the care and guarding of the prisoners is made, not with the purpose solely of meting out punishment for past wrongdoing, but with the hope and desire that the men may be led to take a higher view of their duties as men and citizens, or at least become convinced of the uselessness and folly of acts contrary to law, to the end that when they leave the institution they may become useful and desirable members of society, or in any event, harmless ones.

But the warden, while working for the good of each of his charges, is not a sentimentalist, and in him the hardened professional criminal finds a stern master, who deals out severe punishment upon the slightest sign of viciousness or insubordination, and if the occasion demands, can shoot as quick and as straight as any crack marksman from the plains.

Somewhat contrary to the usual custom in penal institutions, the prisoners at Ft. Leavenworth do no inside work, with the exception of making their own clothes, but they are taken outside the walls and do general farm work and also railroad constructing. The larger part of the inmates are now engaged in building a new Federal prison nearly two miles from the present buildings, the men going to and from the site under guard.

Although kindness and mild treatment are used wherever possible in dealing with the prisoners, the kindness is re-enforced at every point by iron bars and stone walls and loaded shotguns in the hands of expert marksmen. The work of patrolling the walls, guarding the cells and dormitories, and escorting prisoners when working outside the walls requires the services of 50 guards—a number that on first thought would appear altogether too small to guard a body of men twenty times as large, and including some of the most desperate characters the Southwest can produce. But this proportion is seldom increased, even when the men are taken outside to work, and 30 or 40 convicts, each carrying a hoe or shovel, frequently work all day a mile from the prison with but two guards to watch them. It is probable that if under these conditions a concerted effort to overpower the guards and escape was made, it would be partially successful and some of the prisoners would undoubtedly get away, but there are several circumstances that make such an attempt so improbable that the risk can be safely taken. In the first place, the difficulties in the way of arranging such concerted action are almost insurmountable, for the inmates are never together without at least two pairs of keen eyes watching their every movement. Then each man knows that the first sign of an outbreak would probably mean instant death to several of their number, for the guards shoot to kill, and no one is willing to take the part of martyr. Prison life is a great leveler and the devil-may-care desperado who, in his old life, on a good

pony, with all his weapons and some high sounding nickname to defend, would take any chances that were offered, when shorn of his pomp and equipage is perfectly contented to keep on hoeing corn or laying bricks, and let some one else take risks with the guards' bullets. Just plain 321 of the prison gang is a very different person from the "Killing Bill" or "Deadwood Dick" of the prairies.

The guards all possess high records in both rifle and revolver practice, and for a prisoner to approach an officer nearer than five paces without raising the right hand straight in the air and holding the left rigid at his side is to draw the fire of every guard in the vicinity.

In spite of these precautions outbreaks occasionally occur and then there are lively times. One of the boldest of these attempts to break prison was made a few years ago, but was a dismal failure as far as the inmates were concerned, although its complete success was only prevented by the pluck of one man. The ringleader in the movement was a strapping big convict, who succeeded in smuggling from the table a handful of black pepper. Watching his opportunity while crossing the prison yard from the dining room, he approached a guard as if to ask him a question, and when within a few paces threw the pepper directly into the officer's eyes, at the same time making a dash for the sallyport gate, which stood open for the moment to allow some one to enter. But quick as were his movements the guard was faster, and although suffering intense agony and half blinded, brought his gun to position and fired, killing the convict before he had taken a

R. W. McCLAUGHRY.

dozen steps toward the gate. Another member of the gang, who, realizing what was going on, had started for the opening, was shot through the heart by a guard from another corner of the yard. It was all over in less than a moment, but the effect of such an occurrence lasts for years, as nothing takes the fight out of unruly convicts so quickly as to see one of their fellows killed in this way.

The prison's daily routine is not severe, but it is rigidly enforced. The inmates rise at 6 o'clock, go to work at 7, and are in bed and supposed to be asleep by 9:30 p. m. There is an abundance of good wholesome food, and certain hours for reading, religious services and recreation. The uniform is a plain gray suit, with the man's number stamped on the breast and back.

The grounds for the new prison now being erected contain 1,200 acres, and when the plans are carried out this prison will be one of the most secure and conveniently arranged in the United States. It is 800 ft. x 900 ft., and consists of four long cell-houses, radiating from a central rotunda, from which also leads an enclosed corridor to a separate building, where are the dining room, kitchen, school room, library and chapel. Over the rotunda arises a handsome dome, the top of which will be about 200 ft. from the ground. In the school room and chapel the reformative idea in prison management will be given free scope.

Maj. Robert W. McClaughry, warden, was born in Hancock Co., Ill., July 22, 1830. He enlisted in the 118th Illinois Volunteers in 1862, and served throughout the war. In 1874 he was appointed warden of the Illinois State Penitentiary at Joliet, Ill., but resigned in December, 1888, to take charge of the Pennsylvania Industrial Reformatory, Huntington, Pa. On May 1, 1891, he became chief of the police of Chicago, but in August, 1893, accepted the superintendency of the Illinois State Reformatory at Pontiac, there con-

tinuing until Mar. 1, 1897, when he returned to Joliet to begin his second term as warden. On July 1, 1899, he became warden of the U. S. penitentiary, Fort Leavenworth. Mr. McClaughry deserves special credit for his efforts in introducing the Bertillon system of identifying criminals into the United States, and in establishing the national bureau of identification and the national union of chiefs of police.

The warden is assisted by Mr. Frank H. Lemon, deputy warden.

THE INTERURBAN LINE BETWEEN KANSAS CITY AND LEAVENWORTH, KAN.

The Kansas City-Leavenworth Railway Co. was chartered in April, 1899, and in January, 1900, its road was opened to the public. The line starts at Grand View, Kansas City, Kan., near the terminus of the Metropolitan Street Railway Co.'s Grand View branch, and runs parallel to the Kansas City Northwestern R. R. to Vance, a distance of eight miles. It then crosses the steam line and strikes

GENERAL OFFICES AND CAR HOUSE.

across the country to Wolcott, where are located the general offices, power station and car barns. This town was formerly called Conner, after an old Indian chieftain, but when the electric line was opened the inhabitants by popular vote decided they would rather have the place named after a live street railway manager than a dead Indian, so the town was rechristened in honor of Mr. Herbert W. Wolcott, who was largely instrumental in bringing about the successful completion of the road. Leaving Wolcott the route

CONSTRUCTION CAR

parallels the main line of the Missouri Pacific Ry. nearly to Leavenworth, passing the Kansas State Penitentiary at Lansing, and the National Home for Disabled Volunteer Soldiers about three miles farther north. At Leavenworth connection is made with the Leavenworth Electric R. R., which serves the city of Leavenworth and operates a three-mile line to Ft. Leavenworth.

The road is 23 miles long, single track throughout, with seven turnouts and five Y's for turning cars. The rails are 61-lb. T-section laid on white oak ties placed 2 ft. c. to c. and rock ballasted. American rail joints were used throughout.

The overhead work on straight track is single pole with bracket construction, and on curves double pole with span suspension. Two

POWER STATION.

trolley wires are used to avoid overhead switches. The wires are figure 8, No. 000. All brackets and overhead materials were supplied by the Ohio Brass Co., through the B. R. Electric Co., local agent. The feeder system consists of 350,000-c. m. aluminum cables of which there are 450,000 ft.

The power house contains a 1,000-h. p. simple non-condensing Hamilton-Corliss engine with cylinders 32 x 54 in., belted to two 300-kw. General Electric generators, mounted on one shaft with friction clutches between, by which either machine can be thrown out of service. Steam is taken at 120 lb. from four 250-h. p. Stirling water tube boilers arranged in two batteries.

Car barns and the general offices are in a brick building near the power station. The repair shop occupies one corner of the car

of the tracks in front of the offices at Wolcott, and the reservoirs on the cars are charged after each half trip. The air until recently was compressed by a pump driven from the main engine in the power station, but with this arrangement the entire station had to be started up in the morning a half-hour before the cars were scheduled to leave, in order to have air for the brakes. The compressing is now done by an Ingersoll-Sergeant pump operated by a 10-h. p. vertical engine. Air is stored in the yard tank under 300-lb. pressure, and is carried on the cars at about 200 lb. The vertical

STONE CRUSHER.

engine mentioned also drives a small motor for lighting the offices and power house when the main plant is shut down.

All broken stone used in ballasting the road is crushed in an Austin stone crusher located at a quarry between Wolcott and Kansas City, Kan. The crusher is driven by an electric motor taking power from the line circuit. In building the roadbed regular steam road practice was followed, and in fact a steam locomotive

President.O. D. HENRY
Superintendent.

barn and contains a lathe, drill, punch, blacksmith outfit and small crane for handling armatures, wheels and other small parts.

The company owns six coaches with smoking compartments; four combination express and passenger coaches; three picnic cars; one steam locomotive; one motor construction car; 15 flat freight cars and one box freight car.

The passenger coaches were furnished by the American Car Co., of St. Louis, and are 41 ft. long over bumpers, 31 ft. 8 in. over corner posts, 8 ft. 5 in. wide over sill plates, and weigh complete about 42,000 lb. They are vestibuled at both ends and are fitted with Hale & Kilburn seats; Consolidated electric heaters in all compartments and in the motorman's cab; standard steam locomotive oil headlights; Wilson trolley catcher and Magann air brakes and whistles. Each car is equipped with four 50-h. p. Lorain "Steel" motors geared to 45 miles an hour, and is mounted on Peckham 14 A double trucks; the wheels are 33 in. in diameter with 4¼-in. tread. Wheels were purchased from the Kansas City Car & Foundry Works, which are now owned by the Griffin Wheel Co., of Chicago. The company also has one equipment of Lorain double trucks, type F.

Compressed air for the air brakes is stored in a tank at the side

was purchased and used in the work. The company also owns a motor construction car that has done excellent service in construction and track repair work. This is a regular freight flat car with a cab built in the center to protect the controller and other operating apparatus. The body is 33 ft. long, mounted on Peckham standard double trucks, equipped with four 30-h. p. Lorain "Steel" motors and Magann air brakes. The car has a capacity of 28,000 lb. and will haul six loaded freight cars over a 3 per cent grade.

The officers of the Kansas City-Leavenworth Railway Co. are as follows: President, D. H. Kimberley, Cleveland; vice-president, H. C. Ellison; secretary and general manager, Herbert W. Wolcott; treasurer, Chas. O. Evarts; superintendent, O. D. Henry; electrical engineer, Chas. Steig.

Mr. W. E. Pimlott is representing the J. M. Atkinson Co., of Chicago.

Mr. H. F. J. Porter of the Bethlehem Steel Co. extends a cordial invitation to all street railway and supply men to visit Parlor F at the Midland, where he showing samples of work done by tools treated with the Taylor-White process of hardening steel.

OHIO BRASS CO., MANSFIELD, O.

This company is making an unusually large exhibit of its goods, as follows: Flexible pole brackets of all forms; regular line of overhead material embracing various shapes in which "Dirigo" insulation is made; late forms of round top hangers known as type N, and which have attracted considerable attention and favor-

able comment because of their neatness, compactness and strength: third rail insulators; complete line of Fig. 8 and other special material; double Brooklyn insulators and 3-in. globe strain insulators; emergency hose bridge; Monarch track scraper and adjustable track brush holder; high tension insulators for all conditions.

Messrs. C. R. King, R. F. Byrns, Geo. A. Mead, and A. L. Wilkinson are looking after the company's interests.

ATLAS RAIL JOINTS.

The Atlas Railway Supply Co., of Chicago, is showing samples of joints and braces at space No. 16. Mr. J. G. McMichael, who has charge of the booth, is kept busy greeting old friends and making

new ones, and expresses himself as well pleased with the results of his display. The company is also calling attention to the Atlas primer and surfacer. Messrs. R. B. Kent and E. W. Ash are assisting Mr. McMichael.

BIERBAUM & MERRICK METAL CO.

At this company's space, 10, are displayed samples of "Lumen" bronze bearings and "Ideal" trolley wheels. Lumen is a metal made according to a patented formula, and it is claimed, possesses many qualities as a bearing metal not found in phosphor and other bronzes. According to tests made by Prof. Carpenter, of Cornell University, it has a specific gravity of 6.9; average tensile

strength of over 30,000 pounds per square inch; average compressive strength of over 75,000 pounds per square inch; and electrical conductivity of 22 per cent compared with pure copper. Bulk for bulk is from 15 per cent to 25 per cent lighter than bronze. It will not score or cut the shaft, journal or pin, and runs cool under pressures that crush other alloys. Mr. Edward P. Sharp, of Buffalo, manager of the street railway department, is kept busy explaining the properties of the new composition.

CUTLER-HAMMER MANUFACTURING CO.

One of the newcomers into the street railway field is the Cutler-Hammer Manufacturing Co., of Milwaukee, which is showing at space No. 31 a line of switchboard appliances. The display consists of a standard switchboard for a 500 kw. station, the board comprising a generator panel, a motor panel, feeder panel and automatically controlled booster panel with necessary switches

and instruments. This company's circuit-breakers are of special interest. They are provided with powerful magnets for blowing out the arc and also with time-limit attachments, which allow the breakers to remain closed during a sharp peak in the load, but permit them to open instantly on the flow of a dangerously abnormal current, or of a moderately abnormal current, which lasts long enough to endanger the apparatus in circuit. The breakers are sold under the name of "W. T. L.," meaning with time limit.

Another novel device shown by this concern is an arrangement of solenoid switches for automatically throwing a booster into and out of circuit according as the load demands. The company is represented by Mr. C. H. Nowood, of the Milwaukee office.

Burton-on-Trent, England, is to have electric trams.

Russia has caught the exposition fever and proposes to hold an industrial exhibition at Riga in 1901. Electricity in its various applications will take an important part.

"Serrated Wheels"

(PATENTED)

FOR CARS, SNOW PLOWS AND SWEEPERS

Quincy & Boston Street Railway Company Writes:

"We equipped several plows with 'Serrated Wheels' and ran them in every storm of last winter when all the other plows were stalled because the wheels slipped around. 'Serrated Wheels' are as good to pick snow and ice off of a track as 100 men."

VOL. X. FRIDAY, OCTOBER 19, 1900. No. 3.

PROGRAM.

FRIDAY, OCTOBER 19TH.

The entire day has been set apart for the examination of exhibits. Friday night, banquet at Coates House.

NEW YORK IN 1901.

The opening year of the new century will find the conventions in the largest city on the continent, and we may well expect to have the 1901 gathering a notable one.

The attendance from the Eastern states will naturally be very large, and there is no reason to doubt our Western members will turn out in full force. For the two years past we have met in the Central West, involving long travel and shipment for delegates and exhibits, and next year we shall have to return the compliment with interest. By next year the largest power plant in the world will be in operation in New York and with the various forms of electric traction and air will afford attendants a wealth of interesting studies. The exhibit will certainly be a record breaker, and alone well worth the trip.

The announcement of the selection of New York was received with great applause.

PRESIDENT-ELECT HAM OF THE ACCOUNTANTS.

W. P. Ham, the newly chosen president of the Accountants' Association, is conceded to be one of the brightest of that enterprising body of bright young men. He has taken a very active part in its work from the organization meeting at Cleveland, and as a member of the committee on standardization contributed largely to the creation of the new system.

In response to a very tempting offer he recently left his position in Brooklyn as auditor of the Brooklyn Heights road, to become comptroller of the lines in Washington, D. C. He ranks among the foremost accountants in the country and a better selection could have been made. The compliment of election should be particularly gratifying to Mr. Ham, who has his bride with him to join the circle of accountants' wives, in which she has been warmly welcomed.

SECRETARIES RE-ELECTED.

Both associations re-elected their former secretaries, each of whom has so satisfactorily held office for several years. This is a compliment to these hard working officials, and insures the same good business administration which has heretofore marked the management. On the secretary falls the brunt of the hard work, as well as the performance of many a thankless task. The vote of thanks each received was fairly earned. T. C. Pennington, Chicago, was elected secretary of the American, and W. B. Brockway, New Orleans, of the Accountants'.

The Orpheum theatre management reserved the best seats last night for sale exclusively to railway men. There was a good attendance of our people who had a pleasant social time.

PRESIDENT-ELECT W. H. HOLMES.

Mr. Walton H. Holmes, called to be the next president of the American Street Railway Association, is a gentleman whom it is a pleasure to meet and an honor to know intimately. He was born in Kansas City in 1863, his father being Nehemiah Holmes, founder of the city's street railway system, and he knows the street railway business from the bottom up. At the age of 12 he entered the office of his father's horse railway company in a subordinate position, but before he was 21 years old he was vice-president.

Mr. Holmes received a preliminary education at the Christian Brothers' College in St. Louis. He did not receive more because he was too busy and preferred the activity of practical life to the quiet and monotony of the college room. After his father's death, he, in company with his brother Conway F. Holmes, who has always been closely associated with him, organized the Grand

WALTON H. HOLMES.

Avenue Cable Co. and built the Grand Avenue system. Under their management the company's property increased in extent by consolidations and the building of new lines until 1895 it was merged into the Metropolitan Street Ry., of which Mr. Holmes became vice-president and general manager and later president.

Mr. Holmes has not brought his system to its present prosperous conditions by sitting in his office and dictating orders, but when the snow begins to fly or his presence is required in any quarter he dons mackintosh and boots and knows from personal inspection that proper steps are being taken to relieve the situation, and if a helping hand is needed he does not hesitate to take a place beside the men rubbing a little dirt into his palms.

He believes in spending money to make money. His street railways have not grown as the city has grown, but his lines have been run out over undeveloped territory and have caused the city to grow up to them. Parks, the Convention Hall and public improvements of every nature have always claimed and received his support.

Mr. Holmes is interested in several Kansas City enterprises and is president of the Kansas City Electric Light Co.

The change of exhibitors' day from Friday to Wednesday is one of the best things the association has done in a long time, and it suits everybody. The slow ones will now be forced to be ready early, and any who are not willing to do so should be barred. It is unfair to the prompt ones that a few should each year prosecute their disturbing work after the main show is open.

Charles H. Henningway, New York, cashier of the Albany & Hudson, is one of the new members welcomed by the Accountants'. He is greatly pleased with the work being done by the association.

THIS IS SUPPLY MEN'S DAY, AND THEY
PROMISE A HOT TIME.

The papers have all been read and the discussions discussed. The president's gavel has sounded the end of both convention sessions and today belongs to the supply man. That he will make the most of it goes without saying. In fact anything he undertakes goes.

The trouble will begin about 9 a. m. when the parade will be given. A brass band and other things will march to the Coates, Baltimore, Savoy and Midland and give a musical serenade. At 10 o'clock the band will reach Convention Hall and furnish music for the morning entertainment. Just what this will be is somewhat in the nature of a surprise, but will be well worth taking in.

At 2 o'clock the continuous vaudeville will begin on the large stage at the north end of the building. The boys were busily at work late last night getting things in readiness. In addition to the professionals engaged for the afternoon performance there is liable to be some home-made talent. As we go to press (4 a. m.) the boys had hatched out the following and were still spilling ink:

BETWEEN THE ACTS.

Our President Roach, forming a "Buggy" trust.
Our First Vice-President, on the hunt for a better "Rigg."
Our Second Vice-President, welcoming his foreign friends to America, the "Vreeland" of the world.
Our Third Vice-President Jones. He pays "the freight."
Penington looking for the supply man's "Roll."
The Ladies' Pet. Wait and see "Ross-it-cr."
A Well-known "Sergeant" will appear.
"Holmes," Sweet "Holmes." A Duet.
A test of Bread—"Graham."
A "Tripp" from the East.
A dream of the Supply Man—"Wason."
It might be May "Irwin," but it is not.
A Perpetual Ride by "Vreeland."
A Weighty Problem by "Heft."
Across the Creek by "Brydges."
A Mountain of Supplies by a "Hill."
Historical Comparisons—"Baneroff."
Railroad Stories—"Cy Wyman."
Standard System Pudding—"Duffy."
Why we "put up" with Gas Lighting—"Simpson."
A Large Act—"Littell."
A scene from Hamlet—"McCulloch."
Lullaby by "Rockwell."
A Corner on "Beans"—"St. Joseph Market."
Harvest Time by "McCormick."
The Little Minister—"Parsons."
Black Diamonds—"Coleman."
How to Eat—"Fiest."
Decorations—"Draper."
A Barrel Act—"Cooper."
Electrical Wonders, "Collins."
A Trust in Providence, "Potter-es."
The Wrong Way, "Wright."
A Glove Contest, "Mitten."
How to Make a Touch, "Con Holmes."
A Charitable Act, "Beggs."
An Old Affair, "Young."
A Little Jockeying, "Sloan."
A White Affair, "Miller."
A Dollar Man, "Nichol."
A Moving "Van" around the "Horn."
A Christmas Carol, by "Ely."
Odious Comparisons, "MacKay."
Why "Smith" left Home, "Smith."
Elevated Underground on the Surface, by "Wilson."
A Noted Hold by Himself, "Nelson."
Not Our Mary, but an "Anderson."
Looking for Carl and McDonald, "Barnaby."
Bearding Bennett, "McGraw."
Daily Doings, "Windsor and Kenfield."
Not Baking Powder, but "Price."
Quail Shooting, "Fiske."
Ice Cream and Cucumbers, "Grover."
A Sleepy Act—"Wakeman."

REVIEW DAILY WILL ISSUE SATURDAY.

The Daily Review will be issued at the usual hour to-morrow morning containing a full report of the banquet and illustrations and descriptions of the exhibits.

In addition to delivery at the hotels and Convention Hall, there will be a sufficient supply at the Union Depot so that delegates leaving on the morning train can secure a copy. Don't fail to get one to read on the train.

DATA ON ELECTROLYSIS WANTED.

Mr. Albert B. Herrick, of New York, who has made the question of electrolytic action a special study and has been employed as expert by a number of street railway companies, is in attendance at the convention and desires to meet all delegates who have had any trouble with electrolysis, either real or supposed, for the purpose of obtaining data on the subject. Any information he secures in this way, or any that he may have Mr. Herrick will cheerfully and freely place at the disposal of street railway officials, as he believes that by working together in this way much better results can be secured in defending suits. Mr. Herrick will be at the booth of the Street Railway Review in Convention Hall today from 10 a. m. to 4 p. m.

EXCURSION THIS MORNING.

There will be an excursion this morning over the Heims' line, including a visit to the Heims' brewery and park, and the company's railway plant. General Manager Hands invites us all to come and promises a big time. Guides will meet the party and conduct them through the ice factory, brewery and park. Special cars will leave 5th and Walnut Sts. promptly at 9:30 a. m. Should any miss the special they can go out on the regular service. Badges good for transportation; also ice and amber fluid.

TALLYHO RIDE THIS AFTERNOON.

The delegates to the Accountants' Association and their ladies will take a tallyho ride around the city this afternoon as the guests of Mr. J. A. Harder, auditor of the Metropolitan Street Railway Co., of Kansas City. The party will leave from the Midland Hotel at 10 a. m.

EXCURSION TO FT. LEAVENWORTH.

The excursion to Ft. Leavenworth yesterday was made in a special train which left the Union Depot at 1:30 p. m. About 100 went down on the electric line joining the others at the Fort and making a party of about 400. On arrival the party were met by army officials and conducted through the barracks and fort. The military prison was inspected under the guidance of the warden and assistants, visiting the receiving and examining rooms. From there a visit was made to the mess room where a regulation meal was spread and 100 prisoners marched in. Maj. McClaughey then led the way to the prison chapel where the visitors rested while he explained the details of prison life and the system of identification by means of physical measurements. After a visit to some of the work shops the party took the train to the Soldiers' Home, arriving at five p. m. A fine lunch was waiting and quite acceptable after the journeying. The return was made by steam train and trolley. The day was a perfect one for such an outing, which was one of the most enjoyable of the week.

W. Worth Bean arrived yesterday in time to attend the closing session and save his record as the only delegate who never missed a meeting. Mrs. Bean remains at home on account of the death of her mother.

Mr. E. P. Morris, of Morris Electric Co., had a colored orchestra entertaining the delegates in the McGill, Porter & Berg booth yesterday.

PERSONAL EXPERIENCES OF WELL KNOWN MANAGERS

SORRY HE DIDN'T LOOK SORRY.

General Manager Vining, of the Market Street consolidation, San Francisco, is not only naturally of a genial disposition but always takes time and great pains to treat everyone with marked politeness.

One day, a lady, from the Emerald Isle, took a transfer and then stopped over in the neighborhood of the transfer point for the purpose of doing some shopping. On taking the car an hour or two later she attempted to ride upon her expired transfer. The conductor explained that, in accordance with the terms printed upon its face, the time limit had expired, and he was unable to accept the transfer for passage. The good woman insisted, however, upon riding upon it, and the result was that ultimately she was assisted from the car without the use of an unnecessary degree of force. This led her to visit the general manager, with blood in her eye, and he, in accordance with the duties of his office, attempted to assuage her grief, by explaining as pleasantly as possible the necessity for the rule in question, and the compulsion that the conductor was under to enforce it. After soothing her as well as possible, he wound up with the statement that the rule had been found necessary and the company was obliged to enforce it, but that he was sorry that through a misunderstanding of the subject she had been subjected to annoyance. Whereupon the good lady, rising to her full height—six feet, more or less—retorted, "Sorry! You are not sorry; you don't look like it."

All of which should be a lesson to general managers, not to be too genial on occasions of this kind.

WHAT'S IN A NAME?

When Judge Joshua Jump was appointed receiver of the Terre Haute (Ind.) Electric Railway Co. in the latter part of 1897 he occupied the old office of President (now Lieutenant-Colonel) Russell B. Harrison. Naturally one of the first things he did was to substitute his name for Mr. Harrison's on the placards for the office door and callers were then admonished to

JUMP		JUMP
	or	
IN.		OUT.

as the case might be.

HE GOT HIS PASS.

Tom Lowry, who has controlled the street railways of St. Paul and Minneapolis for the past twenty years, is well known as a great joker and a man of prolific and original ideas. It was he who got hold of Minnehaha Falls after they had gone dry, and made a pretty pleasure resort at the end of one of his lines, and put in pumps to keep the falls falling. He attended the Republican convention at Philadelphia last June as one of the delegates from his state.

Among the other delegates from Minnesota was a member of the state legislature. The two chanced to meet in a hotel corridor. When the member spied him he said to the man with whom he had been talking: "Well, here is Tom Lowry; by thunder, there is no man on earth ever did more for Tom Lowry than I have done. Why, he never asked me for a thing that I did not give it to him. He never wanted anything when I knew it but I went out of my way to get it. I have gone out of my way many a time to do things for him, and do you know, I never got a thing from him; no, sir, I never even got a pass on the Minneapolis street railway. Not even a pass."

"Say, old man," said the Hon. Thomas, "I will tell you what I will do. If you set up the champagne I will give you a pass on the Minneapolis street railroad."

"By Jove, it is a go," said the member of the legislature, and he took the party into the cafe and set up two bottles of champagne. When the wine had been downed the Hon. Thomas drew a nickel from his pocket and, handing it across the table, said: "Here, old man, it's good on any line in Minneapolis, and will take you anywhere you want to go."

THREATENED TO SUE HIMSELF.

A good one is told (now for the first time) on Harry Steadman, the transfer ticket man. A certain manager in the West who had been using the Steadman ticket and was about ready to order again, inclosed one of the transfers and asked for a bid on several hundred thousand. The sample sent was one which had been printed by Steadman, who had, however, in this instance neglected to put his imprint on the ticket. A price came back promptly with an urgent letter to furnish the name of the party who had printed the former supply and which was a distinct infringement on his (Steadman's) patent rights. The "pirate had copied the ticket in every detail, in fact must have made a photographic reproduction to get it so exact" and somebody was going to get the law on somebody else just as quick as he found out who it was.

When the answer went back Steadman concluded not to push the suit.

HERRMANN AND THE CONDUCTOR.

The late Herrmann, the prince of magicians, once had considerable fun with a conductor in St. Louis. Herrmann was on a downtown Washington Ave. car; the conductor came through, collecting fares and Herrmann had in his hand to give him a ten dollar gold piece. The conductor glanced at the coin and said: "I can't change that; is that the smallest you have?" "You can't change that?" said Herrmann, and in his hand was a fifty-cent piece. The conductor glanced suspiciously at him, reached out, taking the coin, when to his surprise it was again a ten dollar gold piece. "Did I not tell you," he said, savagely, handing the coin back to Herrmann, "I could not change it? You will have to give me something smaller or else get off the car. The company does not make change for anything over two dollars." "Well, you will have to change this, then," said Herrmann, and there in his hand was the fifty-cent piece. "Say, what is this, anyway?" said the conductor. "Have I got them?" "I don't know," said Herrmann, "whether you have or not, but if you don't change this coin and stop annoying me, I shall report you to the company." "Well, I'll be damned," said the conductor, as he rang up several fares by mistake, and the crowd who had recognized Herrmann roared with laughter.

RIDE AND REALIZE.

"The manager who neglects to ride frequently on his own cars fails to realize on many a pointer which often is of the greatest possible value," remarked General Manager Nicholl, of Rochester, N. Y. "It may take the bloom off of some pet peach of an idea occasionally, but the practice is a good and meritorious one.

"We were congratulating ourselves on having our transfer system down to a fairly fine point. One night I boarded a car to go home after an unusually hard day, and I made for a vacant seat next to a small boy at the front end of the car. When the conductor began his collection the small boy jabbed me with his elbow and said, 'Say, mister, you don't need to pay no fare; father got off at the transfer point to stay down town, and I got two transfers. You just better keep your money.'

"The conductor had taught us in time to hear the latter part of this speech and effectually put a quietus on the transfer of the transfer with, 'Well, I need just two transfers from a boy about your size,' and lifted them both.

"Now, would you have recognized the well-meant intention of the boy to me in my individual capacity, or reproved him from an official standpoint? Well, I did a little of one and considerable of the other."

ACCOUNTANTS' EXHIBITS OF BLANKS.

Secretary Brockaway has certainly assembled a notable collection of blanks and forms representing every branch of the street railway accounts. Already several thousands have been classified, and are so arranged that one can turn to the desired branch in a moment. The forms are pasted in large hooks of uniform size and made especially to order for the purpose. The accountants' association already has several hundred dollars invested in the books, which could not be duplicated for several times their cost. It is the most complete collection of the kind in existence.

These books are arranged on tables at the north end of the roof garden, and require 150 feet of tables to display the set. Managers as well as accountants will be well repaid in an examination of the exhibit. The books are numbered and the contents are as follows:

- No. 1. Income "A."—Reporting and handling actual cash income, earnings, reports and records.
- No. 2. Income "B."—Tickets, transfers and registers and their records.
- No. 3. Labor "A."—Application, investigation, engaging, disciplining and discharging employees.
- No. 4. Labor "B."—Paying employees, from reports of time to comparisons of pay rolls.
- No. 5. Material only.—From request for, through purchasing, and receipts to inventory.
- No. 6. Maintenance.—Work done, not strictly labor or material, but the result of their combination. Wheels and axles, etc.
- No. 7. Power house.—Labor, maintenance, operation and efficiency.
- No. 8. Transportation "A."—Actual operation of cars and bums, from time tables through handling and running.
- No. 9. Transportation "B."—Miscellaneous needs and result of operation of cars, instructions, secret inspection, lost articles, clearing snow, car mileage, benefit associations etc.
- No. 10. Injuries and damages.—From original report to settlement and records.
- No. 11. Vouchers, bills, journal entries and various office stationery.
- No. 12. Monthly and annual reports.—Comparative statements of earnings and expenses.
- No. 13. Records.—Accounts payable, accounts receivable, check and cash books, general records.
- No. 14. Electric lighting.
- No. 15. Glasgow Corporation Tramway, Glasgow, Scotland.
- No. 16. Rubber stamps.

DEARBORN DRUG & CHEMICAL WORKS.

As is well known this concern has at Chicago one of the finest equipped laboratories in this country where it has perfect facilities for making chemical analysis of feed waters for the purpose of determining the scale forming substances they may contain. After analyzing the water the company is prepared to make vege-

table compounds for neutralizing the galvanic action in each special case as may be shown to be necessary by the analysis.

Samples of scale formation are shown at the Dearborn booth space No. 51, and also vials filled with the company's various high grade oils and lubricants. Messrs. Robt. F. Carr and C. A. Stanfield are making everybody welcome.

GARL ELECTRIC CO., AKRON.

A full line of the Garl electrical signaling instruments and telephones are on view at space No. 9. These include complete apparatus for talking from a car to the dispatcher's office; for calling and speaking with conductors anywhere along the line; for noti-

fying a motorman that another car has entered the same block and for signalling the engineers on a steam road, crossing an electric line that a trolley car is approaching the crossing. Messrs. Max Schumacher and M. Garl are giving demonstrations of how the signals work.

HAM SAND BOXES.

The principal feature of the exhibit made by the Ham Sand Box Co., of Troy, N. Y., is a number of orders for boxes which have

been received in the last 18 months. Although these represent but a small portion of the company's business for that period they show the popularity of these devices. Among the orders are some from the Glasgow Corporation Tramways for 1300 boxes; from the Electric Railway & Tramway Carriage Works, of Preston, Eng., for 4,000; from car builders in America, for 1,500; and many others.

The company which is represented by Mr. H. H. Ham is showing three styles of boxes, Nos. 1, 5 and 7, which are fitted with a new spiral spring hose for feeding the sand to the track. The hose is cleaned of snow and ice by pulling the spring and letting it snap back.

COMPRESSED AIR CO.

Mr. H. W. Cooke, president of this company is keeping open house at space No. 80, where he is kept busy telling about the possibilities of compressed air as a motive power and explaining his

company's apparatus for making these possibilities realities. The Compressed Air Co. is now placing on the market its double truck 40-ft motors which are giving satisfactory service.

CHRISTENSEN ENGINEERING CO.

In space No. 30 are three Christensen compressed-air equipments, installed and in operation as if in regular service. These are as follows:

No. 1 is all the apparatus necessary for the brake mechanism of a 5-car train of heavy elevated cars operated by the Sprague multi-unit system and is the exact duplicate of the equipments being installed at present upon 100 cars of the Boston Elevated Ry. Each car has complete air brake equipment including motor compressor, automatic controller, engineers' valves, etc., and the entire

train may be operated from either end of any car in the train, or be broken into sections of one or more cars, when each car is equipped to take care of itself, without regard to other cars in the train. The brakes on this train are automatic and are supplied with the Christensen quick action triple valves.

No. 2 is a school equipment, showing the operation of the independent motor driven air compressor with brake equipment for single cars, straight air.

No. 3 is a D-4 portable equipment consisting of a 47-cu. ft. compressor with reservoirs, automatic controller, etc., mounted on truck. This compressor also furnishes the air for operating a 6-in. air hoist and a 6-in. air jack.

The company is represented by Messrs. N. A. Christensen, P. C. Randall, Geo. S. Hastings, J. S. Leet, W. J. Richard, J. S. Hamlin, A. Beveridge, J. R. Sutton.

THE B. R. ELECTRIC CO., KANSAS CITY.

This company is agent for the Ohio Brass Co., R. D. Nuttall Co., Hazard Manufacturing Co., Cutter Co. and Packard lamps and transformers. At its booth space No. 63 are samples of the sup-

plies it carries. Messrs. F. M. Bernardin and E. R. Royer are representing the company. Mr. Bernardin is a member of the exhibit committee.

CRANE CO., CHICAGO.

This company's exhibit consists of brass and iron valves of different sizes in gate, globe, angle and check patterns for standard (100 lb.) and extra heavy (250 lb.) pressure; blow-off valves; several valves cut open to show interior construction; several parts

of different valves, standard and extra heavy flanges and flanged fittings.

Mr. J. A. Minnegin, of the home office, is making visitors welcome at space No. 25 A, where he is distributing catalogues and circulars to all interested. A pamphlet issued by this company describes the piping system in the new Armour power plant, Chicago, which was furnished by the Crane Co.

BARRETT JACKS.

The Duff Manufacturing Co., of Allegheny, Pa., has a number of Barrett jacks of various sizes at space No. 25 D. Mr. J. Barrett explains that these devices are positive and quick in action; the movements are simple and easy; and the materials used in their

construction, of the strongest and best. The wearing parts are removable, and readily renewable at slight expense. The jacks are made in 20 different sizes and to lift from 10 to 20 tons. They are used by many leading roads.

WM. WHARTON, JR., & CO., INC.

This concern has a very attractive exhibit of its special work at space No. 82. Although the Wharton company makes all kinds and classes of special track work for street railways and steam roads, in arranging its displays, particular stress has evidently been laid on the importance of manganese steel special

work, which is growing more and more in favor on account of its phenomenal wearing qualities. One manganese frog is shown that has sustained the traffic of 1,657,000 cars on a curve of 44 ft. radius, the head of the rail having been almost entirely worn away while the manganese steel center is still in fair condition. Other features of the exhibit are samples of manganese steel works for girder and T rails; Wharton unbroken main line switches; Nichols protected heel switches; bent pieces of manganese, showing the ductility of the metal; photographs and blue prints of special layouts. The display is in charge of Messrs. Victor Angerer, W. Rodman Wharton and J. C. Robinson.

CINCINNATI FOR 1902.

New York secures the 1901 convention, but the fight put up by Cincinnati makes that city the logical convention city for 1902; it is hinted in fact that such a compromise was effected.

Cincinnati's central location, its enormous permanent convention building and well known hospitality make it an ideal city for the meeting.

A small pocket mirror is being distributed by Mr. E. H. Chapin, of the Fiske Bros. Refining Co., of New York.

Our society editor slipped a cog yesterday and announced Mrs. E. P. Shaw as accompanying her husband to the convention. General regret was expressed by the visiting ladies who so well remember her hospitality at Boston, upon learning that she had not come. Mr. Shaw, who is at the Coates, compliments Kansas City highly upon the excellent manner in which the convention has been cared for.

Mason D. Pratt, street railway engineer of the Pennsylvania Steel Co., is at the Coates.

W. S. Dimmock and wife, of Council Bluffs, are among the arrivals yesterday.

James F. Wattles, secretary of the Rand Avery Supply Co., Boston, is distributing a handsome leather pocket book.

When this city was chosen for the convention there was considerable doubt on the part of usual exhibitors as to the wisdom of coming so far, and some even predicted that the display would be a failure. The result therefore has been genuine surprise, for it is one of the best in years. The supply men do not count on making heavy sales at these meetings, and are not much disappointed when nothing is sold. But this year the general expression from all departments of supplies is that sales have been numerous and some quite large. The orders are far in excess of last year and very gratifying.

One exhibitor decided at the close of last convention not to attempt another exhibit, but at the last moment changed his mind and now says he would not have missed the opportunity for a good deal. Others express themselves as equally well pleased.

Many exhibitors would like to see some action taken toward securing a uniform regulation in regard to signs. Many at present displayed are altogether too large for any necessity and often hide other exhibits. Smaller signs for all would be of equal benefit to each booth, and the managers will find the one sought just as well.

TEST OF MAGANN AIR BRAKES.

All of the delegates who went to Leavenworth yesterday afternoon by the electric line were very much interested in the demonstration of the Magann air braking system with which all the cars on the Kansas City-Leavenworth road are equipped. The long 40-ft. cars were brought to a stop from 40 miles an hour easily and quickly and without jerk. The cars were mounted on Peckham trucks with Lorain "steel" motors.

LAWYERS AS POETS.

A few months ago a Brooklyn road was sued by Mary Harkins, 14 years of age, for \$15,000 damages. In getting off the car Mary says she slipped and sprained her ankle.

The testimony of some of the witnesses for the plaintiff was contradictory. Frank McCann, a boy who had been 17 months in the House of Refuge, and three boys named Moylan, Connor and McLain said they were playing craps on the sidewalk at the time of the accident. Connor said that when the plaintiff fell off the car he remarked:

"Here comes Harkins the Tough."

It was shown by the testimony that the plaintiff had frequented Wallabout Market and that her father had been told if he did not keep her out of the market a complaint would be made to the Children's Society. After rehearsing the testimony Mr. Baldwin, attorney for the street railway, fired a parting shot into the jury as follows:

And now, kind friends, I yield the floor to one
Who'll likely try to undo all I've done.
The testimony need not block the way;
Outside the evidence he'll have most to say.
But if you're fond of verse, 'tis worth the time.
He cannot talk to juries, save in rhyme.
See, there he sits, implacable as Jove!
Aflame to argue Mamie's ailing from a shove.
He'll crown her Virgin Queen of Wallabout,
Her many virtues we'll all hear about.
And interesting it will be, perhaps,
To hear his version of that game of craps,
And how that naughty bud of Teale's court, F. McCann,
Within the House of Refuge bloomed a holy man.
And lastly we may not feel we've had enough
Unless he tells us why she's called "The Tough."

Even the judge smiled. When quiet had been restored, the counsel for the plaintiff gravely arose and returned the compliment in like manner, thusly:

Oh, woman's lovely ankle!
How sweet, how neatly turned!
You kindle all the fires
That Cupid ever burned
On his asbestos altar,
You made King David falter,
Taught him song and psalter,
And at the dance where music floats
In soft and rhythmic strain,
Your flash, through lace and petticoats,
How many hearts has slain?
Take from us all the pictures
That man's hand e'er portrayed,
But leave, ye gods, oh, leave us
The ankle of the maid.

The jury awarded Mary \$100, but the company took an appeal, and her lawyer may have to write some more verses.

A FLIRTATION.

I sat beside her in the car,
She smuggled up to me;
I never saw her face before,
But it was fair to see.

I looked into her soft, blue eyes,
She smiled a little, and
When 'ere the car shot 'round a curve
She grasped me by the hand.

Ah, but no wild, ecstatic thrills
Coursed through me, I confess!
Her mother sat beside her—she
Was seven or so, I guess.

—Chicago Times-Herald.

SPIRIT OF THE RURAL PRESS.

TRACK TO BE "TOOK UP."—Eugene, that lively village which is the head of education and navigation, has lost its boss-car line, or rather one-mule car line, for it never rose to the dignity of a street railway or the luxury of having its citizens ride behind a car drawn by a real team of horses. It is by all odds the prettiest city in the state but its appearance was always marred by that relic of barbarism, bobtail cars drawn by shaven-tailed mules and nobody in the cars. They went along tingling a ghost like bell through the quiet Sunday-like streets of a University city, the residence part of which always bears the air of a deserted village or a summer resort out of season. The track is to be took up and Ira Campbell and Harrison Kincard are to lose their free passes over the mule road and will have to walk just like common people. They can no longer put on the swollen air of a born aristocrat while the boy goes through the cars and makes the lower classes put up their fares or be ejected and liable to be kicked into eternity by a one-eyed mule. Eugene may lose its mules, but it will never lose its editors and so the town will live and flourish with the intensity and strenuousness it has always heretofore manifested. It had too much, anyhow, to have an university, too such editors and a mule-car line besides.—Salem, Ore., Journal.

TROLLEY FOR CHAMBERSBURG.—A little bird tells us that a trolley scheme is dead ripe in town and ready to drop at any minute. Some one said that the move was made only to knock out the automobile line, but hardly anybody would be willing to believe that.—Chambersburg, Pa., Repository.

THEY WERE SO GOOD.—Surely the street car accommodation on circus day could not have been better. How they were so good was a mystery to many who came from other cities.—Madison, Wis., Journal.

COMING OUR WAY.—Detroit papers say we will soon connect with Pontiac by an electric line. Dollars to doughnuts they are right about it. Everything is coming our way now.—Oxford, Mich., Globe.

A SOONER LINE.—The surveying party has finished its work on the trolley line to a point above Lemont and the track laying has begun. It looks like a finish to Lemont soon and "O Let it be Soon" as the song says.—Lamont, Ill., Advertiser.

TROLLEY ROAD GWINE.—We suppose that if the "new trolley road" connects Lebanon with Washington, C. H., it will hit Wilmington, either a gwine or comin'.—Wilmington, O., Republican.

BIG SMASH UP NEAR CHARLEY'S.—Some miserable sneak smashed several of the tile left by the electric road coming south of Charley Mason's one night last week.—Wilmington, O., Enterprise.

DESERVES A FRONT SEAT IN THE MILLENNIUM.

A real genuine candidate for the millennium, one of the advance guard as it were, hails from Syracuse, and his unusual case is related by General Manager Connette.

It seems his company has a little transfer line on Green St., the only one of its kind in the system, on which no fares are collected either way. A few days ago the old gentleman in question called on Mr. Connette to report the conductor. The complaint was he refused to collect the O. G.'s fare. When it was explained this was a free transfer line he replied:

"I understand all that, but I see I have not made myself clear to you. I am getting along in years and somewhat feeble. I do not go downtown every day. But to keep in my own mind the delusion that I am still a man of affairs I set out every morning on the Green street car and ride to the bottom of the hill. A little later I ride back again. And the driver-conductor absolutely declines to accept my 5 cents. I am abundantly able to pay my fare on the car as long as I shall desire to ride. I have no wish to 'sponge' upon the Rapid Transit Co. The object of my call today, sir, is to see if we cannot make some arrangements by which I

may pay you in a lump sum the fares which the driver will not accept."

The manager told him to consider himself the guest of the company and to ride as much as he wished.

AT THE LOST ARTICLE WINDOW.

The applicant had proved up on his 75-cent umbrella, says an exchange, and after tucking it under his arm remained to take an ocular inventory of the contents of the long row of shelves.

"Great place to study character," he remarked. "Do you ever try it?"

"Well, hardly, I have enough else to do," replied he of the lost umbrella stock.

"It's easy though," said the visitor; "just fish out something and I will show you how to amuse yourself on dull days."

So the clerk handed out a purse, explaining a lady had advertised its loss in the morning papers, evidently thinking she had dropped it in the street. The notice stated the finder could keep the money, and claim a reward besides. The clerk had sent her a postal card notice to call and get it.

"Well," exclaimed the visitor, "if women only knew what a revelation of character could be found in a lost purse, they would never run around with their portemonnaies in their hands."

"And it is all so plain," added the visitor, glancing at the miscellany which had been taken out of the lost article. "See now. The owner of this purse is well off. She has literary tastes. I think she is in mourning. She keeps house. She is middle aged and has a circle of desirable acquaintances. She is of a humorous turn of mind. She is a club woman. She is more or less accomplished, and she intends to go to the Paris exposition."

"Oh, you know her then?"

"Not at all. I never heard her name before. I will explain," he said. "That purse of genuine sealskin was evidently a last Christmas gift, from the name and date upon it. A poorer woman would have kept that purse laid away and not carried it habitually as the owner evidently has. Her literary tastes are evinced by the several newspaper clippings. They also bear witness to her humorous turn of mind since I notice the poem of 'Hoch der Kaiser' is among them. Most women have so much religious sentiment and so little political comprehension that they would be shocked at the refrain of der kaiser—'Myself—und Gott.'

"There is a clipping about marketing. Evidently she is a housekeeper. One of her calling cards has the penciled addition to her name 'and daughter.' If she has a daughter old enough to make calls with her she must be middle-aged. If she had not a circle of acquaintances she would not carry cards in her portemonnaie. Here is a receipt for dues paid in the Culture Club, and the address of another club. That settles it as to her being a club woman."

"And the mourning?"

The visitor picked out a sample of black silk and a little cemetery time table card and silently laid them side by side.

"And the trip to Paris to the exposition?" doubtfully suggested the superintendent.

"Observe that receipt for advanced French lessons given by l'Alliance Francaise. The lady is already an accomplished French scholar. She is perfecting herself in order to fit herself for a visit to Paris. Don't you know all the women are com—"

"Excuse me," said a well-bred feminine voice just outside the railing where stood two ladies dressed in black, "but have you a purse here to answer this advertisement? These are the names on a check inside the purse. Oh, thank you, very much! I was afraid I had lost it for good, and I stopped the payment of the check!"

"But, mamma," expostulated the younger lady in a low voice, as they were turning away, "you know you gave the change in the purse to the finder and offered a reward besides."

"But, my dear, that was for anyone who picked up the purse in the street and returned it. I certainly should never pay a street car conductor for being honest. Why, it is only what is expected of him.

"Thank you very much, sir. Good morning."

Over 1,000 admission tickets to Convention Hall had been sold up to 8 o'clock last evening.

HE THOUGHT THE FARES WERE HIGH.

A gentleman who resides in the County of Cook, Illinois, better known as the city of Chicago, had occasion not long ago to visit, for the first time in many years, the scenes of his boyhood in northern Ohio. Not being a street railway man, he possessed neither a pass nor a knowledge of the scheme for handling fares. His wife accompanied him, and when they reached Cleveland it was his wish to complete the journey on one of the electrics in order that she might see the country over which as a boy he had tramped many times. When the first collection was made he paid twice and received from the conductor a couple of paper slips to which he paid no attention, but stuffed them down in a pocket to give the children at home. When he had gone a short distance he discovered an old land-mark, and must needs get off and look it over. So they left the car, and when the next one came along they continued the journey, of course paying again and receiving two more slips which went to join the first. They had not gone more than a mile when he made another discovery, and, stopping the car, got off to gaze. In this manner, with stops every mile or two, they traveled some twenty miles, and the wad of slips made quite a handful. But he was so delighted at the ride and the ability to ride along the old familiar highway that the item of expense didn't count, although he did remark once he guessed the fares down there were more than in Chicago. Finally the old homestead was reached, and the conductor let them off directly in front of the gate, on which, as a boy 30 years ago, he had swung many times. Then the sight of a wagon passing was a great event; now a modern electric car whizzed past every 15 minutes. The following day they concluded to go on to the end of the line some 15 miles further, and this trip occupied a whole day with the former system of getting off every little way. By the time he returned to Cleveland the bunch of slips made a big fist full.

On his return home he was relating the wonderful change in that country to a visitor, and to illustrate something called for one of the slips with which the children were playing. Examination for the first time revealed the fact that each was the unused portion of a return ticket for which he had paid each time he tendered fare.

He has not yet been able to satisfactorily estimate just how many miles are coming to him from that road.

SUNDAY CARS A MORAL FORCE.

In the Evangelist, Rev. Dr. C. E. Jefferson, writing on the question of Sunday cars, gives his views as follows:

Does the Sunday street car in large cities minister to the higher life of man? Undoubtedly it does. When several hundreds of thousands of human beings are crowded together on a few acres of land many things become necessary which were not called for before. A new world is created, and the new world necessitates new forms of activity and gives rise to new obligations and duties. . . . I cannot understand how any man with a Christian heart can think it wrong for these people to escape to the country on Sunday afternoon. . . . The Sunday street car ministers to the social life of our cities. The day of rest from the beginning has been pre-eminently a home day. Such it was among the Hebrews, and such it has been among all English-speaking peoples. It is a day for family reunions. It is a day when the married son and his wife can bring their children and take dinner with grandpa and grandma; when the daughter who lives on the other side of the city can come home and spend a few hours with her widowed mother; when sisters separated by the diameter of the city can come together for an afternoon; when the servant girl, chained all the week to her irksome work, can find relief and new life in the companionship of her mother and sisters in the old home. . . . The Sunday street car ministers to the spiritual life of cities. The problem of the downtown church is difficult at best. Stop the street cars and the problem becomes well-nigh hopeless.

The annual banquet at which the president-elect will be duly installed in office will take place at the Coates House, this evening at 7 p. m. Tickets can be had by applying to Secretary Penington.

AMERICAN STREET RAILWAY ASSOCIATION.

THURSDAY'S SESSION.

The clear air and warm morning sun contributed to a general feeling of good nature, and every-body was in good spirits and attendance was the largest of the week, every chair being occupied.

President Roach called the convention to order at 11:10 a. m. Secretary Penington announced that the following 16 companies had joined at this meeting:

Dallas Consolidated Electric Street Ry. Co., Dallas, Texas.
 Danville Street Railway & Light Co., Danville, Ill.
 Detroit, Rochester, Rome & Lake Orion Ry. Co., Detroit, Mich.
 Jackson Railway, Light & Power Co., Jackson, Mich.
 Kansas City-Leavenworth Railway Co., Kansas City, Kansas.
 Lebanon Valley Street Railway Co., Lebanon, Pa.
 Meridian Street Railroad & Power Co., Meridian, Miss.
 Skuykill Traction Co., Norristown, Pa.
 Hoosac Valley Street Railway Co., North Adams, Mass.
 Ottawa Railway Light & Power Co., Ottawa, Ill.
 Ottawa Electric Railway Co., Ottawa, Ontario.
 Holmesburg, Taconey & Frankfort Electric Railway Co., Philadelphia, Pa.
 Monongahela Street Railway Co., Pittsburg, Pa.
 Rockford Railway, Light & Power Co., Rockford, Ill.
 Saratoga Traction Co., Saratoga, N. Y.
 Terre Haute Electric Co., Terre Haute, Ind.

The President: Gentlemen, we will now proceed to the regular order of business this morning. The paper on the program is entitled:

DOUBLE TRUCK CARS; HOW TO EQUIP THEM TO OBTAIN MAXIMUM EFFICIENCY UNDER VARYING Conditions.

By N. H. Heft, president Meriden Electric Railroad Co., Meriden, Conn.

In order to prepare a paper which would be of any value to the members of this association, it was necessary to learn the conditions governing the operation of double truck cars on different systems. The conditions under which cars are operated, vary to such an extent that it is impossible to construct and equip a car that can be operated with equal economy on all systems. In order to keep within the time allowed by the committee, and the more readily to convey to the members the writer's opinion as to the most desirable double truck car, the subject matter will be taken up under the following divisions: Trucks. Electric motors. Double truck car body and equipment.

TRUCKS.

The double truck for use on street railways has not received the attention it merits. These trucks have been constructed along the lines of the single truck, and to meet the varied views of railway managements. One has only to observe the different styles of trucks now in use to find how at variance have been their views.

The 55 years experience of the steam railroads in the development of the double truck now used by them, should be a warrant to the street railway managements in adopting only trucks that conform to the lines used by these roads: the diameter of wheels, with the tread and depth of flange should be changed only where conditions prevent using the Master Car Builders' standard.

I present drawings of a double truck designed along steam railway lines to meet the varied condition of street railway service. In the design of this truck it has been the aim of the designer to include all known good features of the present street railway truck and to add improvements of value. This truck is constructed with a minimum number of parts consistent with safety, strength, accessibility, lightness and cost of maintenance.

In giving a brief description of this truck, it will not be necessary to mention the wheels further than to say that they are cast chilled, 33 in. in diameter with a 3-in. tread and 1 in. flange,

formed to fit the modern rail, and weight 380 lb. The axles are of forged steel, high in carbon, with a 2-in. hole bored through the entire length. The key seat at the gear wheel-fit is cut above the line of motor bearings and journals, in order not to weaken the axle.

The oil boxes are constructed so that the journal brasses may be readily removed, and with dust guard placed in position from the underside of box. An extra guard is placed from the same side and where it will retain the oil at the highest point.

The journal brasses and boxes are finished in such a manner as to obtain the full journal bearing under all conditions.

The side frames are made from two ¾-in. steel plates, thus allowing the main equalizer to be supported between the two frames on long helical springs. With this arrangement the bar can be removed for repairs without in any way taking the truck apart. This form of frame allows the greatest freedom of access

N. H. HEFT.

to all parts, and the use of the extended equalizer bars gives extended spring movement, with a perfect side movement on curves and at low places in the track, minimizing the blow to the car body, rail joints and special work and reducing the cost of maintenance of track and equipment. The side frame is so strongly constructed at points where the transom joins the frame that it is not necessary to continue frame around the end and connect it with the other side of frame to keep the truck in alignment. This also allows the placing of the truck near the end of the car body without coming in contact with the steps.

The brakes are placed inside of the wheels, without using a brake beam. This position insures the most positive action, with either hand or power and independent braking on each wheel. The wheel base, 5 ft. 6 in., allows the motors to be suspended between axles and transoms.

MOTORS.

The writer, having had experience with heavy and light motors, mounted with two motors on one truck, the other truck being an idle or trail truck, as well as with one motor on each truck, has found that, while greater efficiency is shown with the latter method, the two motors mounted on one truck show a saving in labor, first cost of the trail truck, and cost for maintenance.

Maximum efficiency, with minimum cost of maintenance, with both heavy and light motors, has been obtained by mounting two motors on each truck, making a four-motor equipment. With this form of equipment, higher speed and quicker acceleration are obtained with lower power consumption, both in the average and total for the whole trip.

After an experience extending from the time that the first railway motor was constructed, the writer knows of no mechanical apparatus in which the development has been so rapid and the point of perfection so nearly attained. Yet the future promises even greater development, both in the direct and alternating

current motors. With the great corps of engineers employed by our large manufacturing concerns working with the men who are operating these motors and constantly suggesting and demanding improvements, the ideal commercial car equipment will be developed.

The writer desires to call the attention of electrical and mechanical engineers to improving ventilation, increased copper, insulation, bearings, hollow armature shaft, decreased armature speed and gearless motors.

The controllers have not, as far as space and weight are concerned, kept pace with the motors. This part of the apparatus should receive the attention of the best talent of our manufacturing companies. The four-motor controllers, in their present form, are large cumbersome affairs, placed in that portion of the car body where it is inconvenient and expensive to support. A more satisfactory controller can be produced by using a small pilot controller placed on the platform, with some developed form of main controller underneath the car body.

DOUBLE TRUCK CARS AND EQUIPMENT.

From information furnished by the operating department and from personal observation, the writer is led to believe the following dimensions are the most desirable: Length over all 40 to 50 feet. Width over all 7 ft. 6 in. to 8 ft. 8 in.

With the increasing demand from the traveling public for the extension of present systems to suburban districts with a more frequent service and increased speed, also the construction of long interurban lines, the present managements, to meet this demand, are turning to the double truck car constructed along the lines of the steam railroad coach.

The drawings show a double truck car, which the writer believes will become justly popular. This car combines the largest number of good features and is so constructed as to admit of placing the electrical equipment where it is accessible and less liable to come into contact with the truck or brake equipment.

The car body can be carried at the lowest point and the trucks placed near the end of the body. This car gives the maximum efficiency, durability, speed, safety and seating capacity, attractiveness and ease and comfort to passengers, coupled with the minimum cost of construction and maintenance, and less dead weight per passenger, based on seating capacity.

The total weight is made up as follows: Trucks, 3,970 lb. each; four motors, 2,385 lb. each; car body and equipment, 12,300 lb.; a total weight of 29,780 lb. This amount divided by 63 passengers gives a dead weight of 473 lb. per passenger. The cars of today show a dead weight, based on the seating capacity of 750 lb. to 1,100 lb. per passenger.

While the writer does not claim that the truck and car body described are perfect, yet he believes they are along lines that will become attractive to managers when taking up the cost of operation. Decreased cost of operation can only be obtained by purchasing equipments that are designed to perform a specific duty where all weights and speeds are known.

The President: Gentlemen, we invite the members to come forward and inspect the plans prepared by Colonel Heft at considerable trouble and expense, showing the details of the construction of the car he has spoken of. (A number of the members then inspected the plans of the car.)

President Roach: I would state, gentlemen, for your information, that all of the cuts as shown here will appear in the minutes of the meeting to be printed hereafter and distributed among the street railway men of the United States and Canada. I desire personally to thank Colonel Heft for his able paper that he has read here, and we will be much pleased to hear it discussed by the members of the Association. To start this discussion, I take pleasure in calling upon Mr. E. C. Foster, of Lynn, Mass.

Mr. Foster: I have listened with a great deal of interest to the paper read by Colonel Heft, and have also given a casual glance at the drawings submitted. I think that Colonel Heft is on the right line in the way of making improvements. We all know that it is desirable to have cars constructed as light in weight as possible, and yet to be sufficiently strong to meet all the requirements and conditions. I am very glad that Colonel Heft has taken up this subject. We all know that the varying conditions under which we operate in the various states and municipalities require a different kind of equipment. There are places, of course, on the

interurban lines where an equipment designed similar to that submitted here could, without doubt, be operated very successfully. The Lynn & Boston Railroad Co. is operating lines running into Boston. We operate one line over a distance of 16 miles from a small town on the coast, Marblehead, through Swampscot, Lynn, Revere and Chelsea to Boston. On that line, we are operating 12-bench double-truck open cars, equipped with four motors. The box-car equipment is a 25-ft. box-car, double truck, with four motors. We have been operating over this line about 15 months, and we are running at a maximum speed of 30 miles an hour, and we have found by experience that the operating of four motors is more economical than the operation of two motors over the same line under the same cars and under the same conditions. To be sure, there is an increased consumption of power. We are all willing, I believe, to concede that, and I think Colonel Heft will agree with me, although he shakes his head to the contrary. From tests made, we are sure of it. The operation of four motors, of course, depends upon the speed you wish to attain, and that it is desirable to attain. In operating upon a line where your speed is more than 12 to 15 miles per hour, I question whether it would be wise to adopt the practice of using four motors. We are also operating on many lines, 16, 18, and 20-foot cars. With those cars, we operate, as is customary, the usual two motors. We have various types of motors, but we have learned by our experience that the double truck car, with two motors, or four motors, is more desirable and profitable to operate; and we are now rebuilding some of our smaller cars and converting them into 25-ft. cars. We are doing that successfully. We are also building a large number of new 25-ft. double truck cars.

Mr. Chamberlain (Brooklyn): You will appreciate that the average mechanic in this country has his "hobbies" as well as the average professional man. Without referring to any part of the electrical equipment which Colonel Heft has designed for his peculiar class of cars, there are two or three innovations from the present practice in the construction of the car body, which may well attract attention. With most of us, innovations of this character are subject to adverse criticism. I know of nobody who would be subject to adverse criticism less than the author of this paper, who has had such a vast amount of experience in this direction, and it seems that it is right and proper he should make an innovation of this character. I speak more particularly of the construction of a car without longitudinal truss rods. I think that Colonel Heft has designed a car of something over 42-ft. in length, and gains his body support by a number of cross transoms built in the form of the ordinary iron body bolster, welded at the ends, filled in with wood, and supported through the center with longitudinal I beams running from one end of the car to the other. The author of the paper has evidently, by this plan, succeeded in obtaining the minimum of weight with the maximum carrying capacity, and I think you who are practical men, and you certainly all appear to be, will agree with me that that is the object to be sought.

One question I would ask is with regard to what might be the result of an end collision. I do not know whether this truss running longitudinally through the car from one end to the other, would be adequate, and would perform the functions and give the proper camber to the car, that the ordinary longitudinal truss rods do. You will recollect some years ago, that the managers of the steam roads went wild, in following out the idea of reducing the weights of their rolling stock, until they reached a point where they almost passed the limit of safety factor. Colonel Heft advises me that he has carried through on this device a factor of safety sometimes reaching as high as 25 per cent. If he has done that, he has certainly covered all the ground that is necessary to make the vehicle safe and one that would do good service in actual practice. I was very careful to inquire of the Colonel whether he placed all his strength on a line with the sills. When we have a collision, we do not collide with the clear story of the end of the bonnet; but we generally get it on the end of the buffer. Of course, we all know there are some roads which never have any accidents, and they do not have to experience any difficulties of that kind. I was particular to ask him whether the strength was on a line with the longitudinal timbers, and whether the frame above that included posts and trusses in the framing, and the clear story was lightened up correspondingly. It would be a difficult matter to put all of your strength in your clear story, or on a line with the roof, because when you do that, and your car runs into any ob-

struction, your roof would probably keep going on and the body remain where it was.

Not to occupy any more of the time of the meeting, I would like to ask the author of the paper whether he has sufficient strength with the transverse brace to overcome the difficulties which I have outlined?

Mr. Heft: I have endeavored to get all of the strength longitudinally, lightening the upper portion of the car, but constructing it in such a manner that the upper portion is braced to the lower portion and tied to it, both longitudinally, vertically and otherwise. We have five of these cars under contract and expect that the first one will be turned out in from four to six weeks. We expect to operate this car from Port Chester, N. Y., to New Rochelle, N. Y. I would be very glad to show the car, when in operation, to any of the members of the association. I may be wrong in my ideas concerning this car, but we are putting up our own money to build it. If it is a failure, we will have to foot the bills.

Mr. W. E. Harrington (Camden): The question of four-motor equipments seems to be one of a mooted character. There are a large number of roads using four-motor equipments, but there seems to be relatively very little known as to the number of watt-hours per car-mile which the different equipments require, and with the idea of bringing out that point as a feature of discussion, I would like to place this question before the meeting. What is the experience of those present, who have made tests, as to the watt-hours required by the different equipments mentioned? Mr. Foster says it takes more power with the four-motor equipment, and Colonel Heft says it takes less. They are both highly representative men, and yet they differ on this point. Our road is about to place some equipment orders. I have been urging four-motor equipments, and yet I must confess I am somewhat in the dark as to the relative merits of the different equipments. I know from tests I have made that the double-truck, 40-ft. car equipment, with two 38-h Westinghouse motors, on maximum traction trucks, have taken an average of 2,000 watt-hours per car-mile, whereas the same weight of car, with the center pivotal truck, with No. 49 Westinghouse motors, 35-h. p., under identically the same conditions, takes an average of only 1,200 watt-hours per car-mile; a single truck car, under similar conditions, an 18-ft. body car, takes an average of 900 watt-hours. I would like to know if there are any data from actual test to show the number of watt-hours consumed by these different equipments. I have made a series of tests on different classes of cars, showing the watt-hours. I deem this matter of very great interest, and I will file with the secretary the results secured in these tests. I did not encounter any difficulty in getting information of this character, and I think the information obtained by me would be interesting to the other members, in showing the number of watt-hours per car-mile with the various forms of equipment.

Mr. Heft: I do not remember the figures, but we have made a series of tests during the last three years with double truck cars, equipped with one, two, and four motors, as I have stated in the paper, and we have kept a very close and accurate record of the results. The weights of the different trains on which these tests were made varied from 15 to 250 tons. The speeds varied from 10 to 65 miles an hour.

There is no place where the car is operated with an increase of current with the four-motor equipment, except while accelerating, but you gain a quicker and higher acceleration by this increased consumption of power. The average consumption of the current, however, and even the total consumption of the current, in the running of the cars, is less with the four-motor equipment than with the two-motor equipment. That is beyond dispute. I can furnish data to that effect, and I think the General Electric Co. and the Westinghouse Co. also can furnish any of our members with data which will substantiate that statement. It is unquestionably correct.

Mr. Wason: I would ask if the additional cost for the drilling of the hole through the axle and the armature shaft is commensurate with the results, and whether he is seeking to lighten the axle, or to be assured of the quality of material?

Mr. Heft: I am willing to admit that the drilling of the axle is a debatable question. About five years ago, we commenced to use hollow axles on our high speed motors, and the results have been so favorable in the way of reducing the number of hot boxes, hot journal bearings, and everything of that kind, that we have decided

to adopt that form of axle. It decreases the weight about 25 per cent, with a loss of strength, varying according to the size of the axle, of from only 3 to 5 per cent. We have never had any of them break. We had a great deal of trouble with our axles on our heavy high speed motors, and we found it necessary to increase the diameter and weight of the axles. We were loath to do this, and so we adopted the plan of drilling a hole through the axle to lighten it. We not only lighten the axle, but we get the benefit of having a ventilated axle. It overcomes crystallization in the axle.

Mr. J. I. Beggs: In connection with the statement that four-motors take no more current than two motors, I would ask Colonel Heft whether he meant four-motors of the same size, or two motors having the same capacity as the four might have had?

Mr. Heft: We have made experiments with motors of different capacities, but all of the motors were of the same size, and used on the same class of equipment.

Mr. Beggs: I do not know whether I made myself clear. We made some very exhaustive tests, and they were so opposed to the position which Colonel Heft now takes, that I took occasion to have Mr. B. E. Sunny, the western manager of the General Electric Co., and also Mr. Theodore P. Bailey, the manager of the railway department of the General Electric Co., Chicago, to come and witness the tests made on this mooted question of the amount of current consumed by these different equipments. Of course, this matter is a very important one to all of us.

We adopted double truck cars as a standard for our entire system five years ago. We have been using them ever since, and are continually increasing the number. We have given a great deal of attention to the development of the most advantageous car, the most durable car, the car which will best stand the strains to which Mr. Chamberlain referred, as ours is one of the roads that has collisions and a number of them, unfortunately, and some pretty severe ones. We operate 350 miles of road, and have one electric line 61 miles in length. We try to build the equipment so that it will be interchangeable, in city use or in suburban service, as we have a consolidated system, and we run the cars interchangeably. I must take issue with Mr. Heft's statement, to the effect that four motors do not take more current than two motors. If you equip a car with two G. E. 1600 motors, or four G. E. 1000 motors, I think the four motors will take 20 per cent more current than in the two motors; but the service with the four motors will be 50 per cent better. That has been our experience. Our cars for three years were equipped with two motors. For the past two years, after careful experimenting and taking into account the various costs entering into the matter, of which the smallest is power, we have adopted four motors as a standard, be they of whatever size they may. We can get much better results from 150 h. p. in four motors under a car, than we can with 250 h. p. in two motors under the car. The results may differ in various sections of the country, but with us, the four motors have certainly taken from 20 to 25 per cent more current than the two motors, running exactly similar conditions; not for the purpose of test, but in regular service on long distance or city lines, with wattmeter, voltmeter and ammeter on the car, so as to cover all the points. The use of these four motors is a very important thing on our standard car, which is 41 ft. over all, and seats 44 passengers, with cross seats, and weighs somewhat more than the car referred to by Mr. Heft. I trust that Mr. Heft will succeed in making his car all that he desires.

I was very much interested in the points raised by Mr. Chamberlain as we have found that, in order to put a car on the tracks in our city so that it will stay there, in spite of a head-on collision, as we some times have, even with the greatest degree of care, it requires some weight and strength to withstand the shock so that the car will not be absolutely shattered. We had a case recently with a green motorman on a curve, where our car was thrown off the tracks across the street, with the result that the car was not much injured except that a corner post was knocked off. I think Colonel Heft has seen how our cars are braced. We use the longitudinal truss rod and truss plank, with a rod through it. We do not feel that we can take chances with the longitudinal brace; we want the strongest construction possible to put in the car. Therefore, I should take issue with Mr. Heft on that point.

As stated, the results of the tests made were somewhat contrary to what the experts had led us to believe we might expect would be the draft upon the power plant, and for that reason, I

had Mr. Sunny and Mr. Bailey come to Milwaukee on two or three different occasions to make those tests, not simply tests on a special car, but on the regular service, equipping different cars on our regular service, with different types of motors; two G. E. 57; two G. E. 1000, and four G. E. 1000 under different cars. I do not believe there is any question that the four motors will take more current, but as has been said, you get quicker acceleration. You have no slipping wheels. We are going to put two additional motors on all the cars we equip in the future. The higher speed you can make compensates for the increased power consumed. In the city service where we use these cars, as we do entirely, with blocks running from 200 ft. in length, it is an important matter if you can save a second or two on each street corner in getting the car into rapid motion; and when the car gets on a slight grade, or starts on a slippery rail, it will immediately pick up and get off without spianing the wheels. That is what the four motors will do. I believe that four smaller motors are much more effective than perhaps 50 per cent increased capacity in two heavier motors. We have some 300 of these double truck cars running. We control all the city lines in Milwaukee and Racine, 25 miles south, and run 35 miles south to the city of Waukesha. We run a complicated system, but it is run as one entire system. If we have a call for cars on any of our interurban lines, we can take our city cars for this purpose, because they are interchangeable.

In order to compete with our friends of the steam railroads, we are now giving our attention to the development of a new car that shall be 50 ft. over all, upon which we propose to mount four 75-h. p. motors, such as you will find in the exhibit hall below. The steam railroads throughout our Western country are beginning to realize that they have a real competitor in electric lines for distances of 50 or 60 miles, and as a consequence, they are reducing the rates of fare very materially and putting on additional high speed trains to run short distances. We propose to build an electric car for the double purpose of being able to make 60 miles an hour with four of these motors and with the further purpose that in case we have a congestion of travel on any of the lines running to our summer resorts, we can hitch three or four trailers to the car and make 35 to 40 miles an hour, and to handle a larger body of people at a much reduced cost. We may have peculiar conditions in our city, but that is one of the things we have in mind. With these cars which we are going to build, and under which we are to put four motors, we should want a more substantial construction than the cars shown in the drawings which have been submitted to us, although these cars may be all right for the service for which Mr. Heft designed them.

Mr. Heft: Mr. Beggs' statement is true, judged by his conditions, but I also insist that my statement is true taken from my conditions. Mr. Beggs' cars, I believe are operated largely through city streets and are stopped and started; and as I stated in my reply to Mr. Foster, there would be a greater current consumption in producing the acceleration of the car when starting and stopping so often.

Mr. Beggs: This test was not made on a city line. It was made on our Waukesha line, a 20-mile road, with a train every hour each way. We make the run in 52 minutes, and keep up an hourly service with two cars. The test was made on that high speed line, upon which there are very few stops and sometimes no stops in a distance of ten miles.

Mr. Heft: Then I must insist, under that condition, that my statement is correct. (Laughter.) I will say, to satisfy Mr. Beggs, if he will come down to inspect our system, I will give him an opportunity to witness a test, and if he does not agree with me I will pay his expenses to Meriden and back.

Mr. Beggs: It will be a pleasure and worth all the expense to spend a day with the Colonel, outside of the test; but I shall take advantage of the opportunity he offers to have this test made. I shall, however, want to know how his instruments are calibrated. I shall also want to take some expert along with me to see these tests. I am not an expert in electric railroad matters, except on the commercial side; but I feel sure there is some mistake in the readings of the meters. I was told what the Colonel tells us, but it did not agree with my own practical experience, and what I considered would be the result when I was seriously considering three years ago, this very question of whether or not we could afford to go to the current consumption required for four motors. The first report which came to me from a gentlemen whom I considered to be a highly scientific, technical engineer, harmonized with what

Colonel Heft has told us, and the report went further and said that four motors saved 10 per cent, and he submitted the figures to demonstrate it. Then I concluded I would call in other experts and I did call in Mr. Sunny and Mr. Bailey, and I went on the cars myself with these gentlemen, and spent several days with them, with the result that I found it took fully from 20 to 25 per cent more current with the four motors than with the two motors, on the same character of service, the same cars and load, and running exactly during the same hours as we made the tests on different days so as to get exactly the same conditions.

Mr. Foster: The conditions under which Colonel Heft has been making tests are different from the ordinary conditions under which street railways operate, as I understand it. The conditions there are these: That the test was made upon a steam railroad roadbed, with the stops made at infrequent intervals; that is to say, that the run would be made from one station to another, and it might be two or three, or five, or even ten miles distance. That being so, I think it is possible, and without a doubt it is true that they do operate as he says, without consuming a greater amount of current than they would with two motors. Our experience has been in operating four motors on the same type of car, over the same road, under the same conditions, as near as it is possible to obtain them, that it requires from 15 to 23 per cent more current to operate four motors than two motors. We make tests twice a year, and pay for current on that basis, and we believe that the tests are carefully made, as they are made by the representatives of the Boston Elevated Railway Co., over whose tracks we operate, and which furnishes power to our company, and the tests are also made by experts representing our company.

Mr. Wason: On one of our suburban lines, we started two years ago to put on two 75-h. p. motors on each car, and found it almost impossible to make our time in the city, or in the country where there was any grade. We did that for the purpose of eliminating one-half of the repairs, as we supposed. Later, we removed the two 75-h. p. motors and put on four 50-h. p. motors, with much more satisfactory result, as we were able to make our time, and consumed but a very small amount of power more than the two 75-h. p. motors. The results were very much more satisfactory, and I think there is no question but for all suburban work, four motors are preferable to two motors, no matter what the amount of power you put into the motors is.

The lightening of a car for suburban work seems to me a little questionable. I think Colonel Heft will, a year from now, be able to give us some more definite data on this point. We have been strengthening our cars from the start, rather than making them lighter. They sometimes now leave the track for a shorter road across the fields which is not always advantageous for the rolling stock. It seems to me we ought not to consider making the cars lighter, unless we are running a car shop—possibly some of these gentlemen are interested in the manufacture of cars—and want to have the repairs of our cars or supply us with new equipment. The ordinary railroad man buys his equipment and expects it to last a reasonable length of time, and it seems to me that it must be strong. Of course, the strength should be put in the best possible places, and I think that, rather than making the car lighter, we should make it stronger. In the steam railroad practice the car is cambered up in the center. In the first of our suburban cars, the makers insisted upon putting the camber in the center, but we found after using the car a short time, we could put the camber there ourselves. The trouble was to keep it from hulging up in the center, so that a truss rod in a long car, a 40-ft., was a useless thing.

Mr. Harrington: I would ask Mr. Beggs what the tests showed where they ran two No. 57 motors, compared with four G. E. 1000 motors; whether the results from the four G. E. 1000 motors showed a lesser consumption in power than they had in the use of the two No. 57 motors.

Mr. Beggs: The current was less on the four G. E. 1000 than on the two No. 57.

Mr. Harrington: Did you get better results?

Mr. Beggs: We got quicker acceleration. Whether your service is for eight miles an hour, about the standard for city service—our city service is maintained pretty close to nine miles an hour on the average—whether your service is for eight miles, or fifteen miles, or for fifty miles an hour, put four motors on a double truck car. The distance does not make any difference whatever. The main question with many roads in this matter is the increased in-

vestment, but you will save the interest on the increased investment in reduced cost of maintenance. It costs considerably less to maintain four motors under a car than it does to maintain two motors under the same car. The difference in cost of maintenance will more than offset the interest on the increased cost of the investment.

Mr. Heft: To remove any doubt from Mr. Wason's mind as to this car, I will say that at the present time, I have not a dollar's worth of stock in any car manufacturing plant.

Mr. Connette: Mr. Beggs has just answered the question I was going to ask, whether or not the increase in the efficiency of the motors by reason of having four motors rather than two, would compensate for the increase in the investment. I presumed that would be the case with four motors as compared with two motors. Mr. Beggs states that the maintenance is less. I wanted to know something about that point, and as that question has been answered, I do not think I have anything further to say.

Mr. H. H. Vreeland: Our peculiar conditions in New York are such that we cannot go into the character of construction which warrants the use of the standard double-truck car with four motors. We do it on a number of lines controlled by the syndicate which owns the New York lines, and wherever it is possible, and we are not held down to the matter of a sixteenth of an inch in step heights, as we are in Greater New York, we go to the square body car, and use the four motors. In New York longitudinal lines, by reason of Central Park, have to use very narrow streets. We have to conform to the old type of construction, with sunk panels, to keep the cars moving. We have a number of cross streets through which the important lines operate, and the difference between the sunk panel car and the square body car, means keeping the line in operation all the time, as against stoppages every once in awhile of from ten to twenty minutes, owing to the numerous teams using the streets during the day. Take on our 59th St. line, running across town, if an ordinary truck is standing at the curb, the hub will go under the sunk panel of our car; and if we used a square body car, we should not be able to pass. We also find it necessary to have step raisers.

We are not trying to do gilt-edge railroading in New York. I mean that these things are not necessary. I had a man recently say to me that he thought it was an unwise thing to have step raisers under the control of the motorman of an open car. It means to us on the down-town streets of New York that the motorman can signal the conductor to raise the step and pass a truck without a stoppage of the car, which, under the ordinary conditions of a solid step, means a stoppage of the car, and when you are running the cars five seconds apart as we do in Center St., down-town, it is a great advantage to be able to raise the step and allow the car to pass.

The question under consideration is so local with us in that respect, that to discuss it from the standpoint these gentlemen have discussed it would not amount to much, except as concerns our experience with the consolidated system in New Jersey, where we run high speed, long distance, interurban cars. On that system, we use the large car with four motors. We get the largest carrying capacity car we can with the highest speeds, and do not considering particularly whether there is more or less power consumed, if we can compete successfully with the surrounding steam railroad conditions. We have long lines and in every instance they are in competition with the steam railroads.

We made some experiments and found that, with the same sized motors on single and double truck cars, there was an increase of about 20 per cent in the consumption of current in the double-truck car. I speak of this, because I am uncertain whether it was due to the increased weight of the car or the increased length of the car. As far as the question of general car construction is concerned, which has been discussed here, we have not to consider so much the question of collisions at high speeds, as we have the question of a "hogging" of the cars, as we term it; and as our friend, Mr. Wason, says, it is no trouble at all to get any kind of a camber in our Broadway cars, as the normal condition of the cars is such that my friend Colonel Heft says that he usually prefers to walk down town and leave room for three passengers in the car.

Mr. Sergeant: I have been extremely interested in this paper which Mr. Heft has presented. I want to say that I have seldom seen so much valuable matter so admirably put in such few words. I think this paper is a model of brevity and information. On the

question of power for four-motor cars there seems to be a considerable difference of opinion. While we have had no experience in actual service with four motor cars, for the purpose of determining what the power consumption was, we made some very careful tests, under what would be ordinary conditions, with the ordinary railway motors of different types, two to the car, and under these conditions we found that we got a little better acceleration with the four motors. We got, as a matter of fact, ten per cent decrease in time, better speed, but we had to use 50 per cent additional current to get it. I should suppose the question is one of local conditions. Certain electricians have been trying to persuade me for years that two motors consumed less power than one motor. We have records covering a good many years that one motor consumes less power than two motors.

In regard to our elevated equipment, possibly we have been making a mistake. We are intending to use motor cars having one motor truck with two 150-h. p. motors on that truck. One motor truck and one trailer truck, every car a motor, using the multiple control system. I hope that inside of the next year, if you come to Boston, we can show it to you in successful operation. It will be the only elevated road which will go underground as well as elevated, and we have to overcome long grades of 5 per cent, and have descending grades of eight per cent, and therefore, we feel we want the greatest acceleration we can get.

Mr. Heft: There is a gentleman in the room who has had a great deal of experience making tests with trucks mounted with one and two motors. I think he will give a reason why any car equipped with four motors, with all the eight wheels available as drivers, gives better results than a two-motor equipment. I would like to hear from Mr. Ira A. McCormack, of Cleveland.

Mr. McCormack: While I was with the Brooklyn Rapid Transit Co., the president of that company thought it was advisable to have double-truck cars, and the first car that was built had the wheels all of one size, and the question came up whether it was advisable to put four motors on the car or two motors. Tests were made and it was finally decided to equip the cars with two motors on account of maintenance. An order was placed for double truck car bodies. We had not yet determined whether we had the right kind of truck and whether it was still advisable to use the four motors or to use the two motors. We had some maximum traction trucks on the road, and in making the test in regard to the power and the efficiency in acceleration, it was found that the maximum traction truck was giving much better service. In consequence, we adopted the maximum traction truck, and I believe it was the only truck we could work with two motors and continue the service in Brooklyn. The 15 cars referred to were equipped with wheels which were all of one size, and we had to pull those cars off the road. I complained to the president but he thought I was wedded to the maximum traction trucks and insisted on running them. One day, he happened to be at Richmond Hill going to Brooklyn. It was a 24-minute run from Richmond Hill to Ridgewood. The president got on one of the cars with wheels all the same size, and he was 52 minutes getting there. He thought the wheels traveled a thousand miles. These cars were equipped with two motors. The next day, we discontinued the use of the 15 cars, equipped with these trucks because we had so many delays. They dragged the road and it was found impossible to operate them.

In Cleveland, when I went with that company, I found that all the cars were double truck cars with wheels the same size. Some time ago I had a cyclometer put on the driving wheel, the wheel equipped with the motor, and a cyclometer on the idle wheel, and the record showed that the driving wheel made many more revolutions than the idle wheel. Mr. Heft's paper gives us more food for thought and study than any other paper presented to this association. There is one important thing he speaks of, and that is doing away with the brake beams, having the brakes hung and operated direct without brake beams. I think that is something that can be appreciated, particularly in view of the trouble we have had in regard to chattering brake beams and brake beams catching up rubbish on the road, and sometimes when we have accidents, we will find that brake beams are a large factor in them.

Mr. McCulloch (Chicago). Colonel Heft's paper has been discussed almost entirely on the question of economy in power, and from the standpoint of the strength of the car in its construction to resist damage from collisions. Most of us who have been in the street railroad business a good many years remember when our cars were only 10 ft. in length, and today we have them 46 ft.

in length; then they weighed 4,000 lbs; now they weight 40,000 lbs. Then we had only one horse or two horses; now we have 268 h. p. We did not consider the question of power at all, nor the question of the strength of the car to withstand shocks. We were considering how we should be able to carry more passengers, and how we could better please the man who has the nickel. I do not think it is a question at all of whether we shall use a little more power or not if we can carry in greater safety the passengers who are in our cars, and we can carry a larger number of passengers, we can very well afford to burn an additional bushel of coal, if we can carry a few more passengers to pay for it.

As to the collisions which have been referred to, and the construction of the cars to withstand the shocks, I suppose the only way to prevent collisions is to run a road with only one car. When we have a collision, we do not consider what has become of the car, whether its transverse section is weak, or how much it will cost to repair it. What we do is to institute inquiries to find out whether there was some woman in the car whose transverse section was weak, and we shall have to pay for it. (Laughter.) I move that the paper be received and placed on file, with the thanks of the association to Colonel Heft for having written it.

The secretary announced that the members of the Association were cordially invited to visit the plant and park of the East Side Electric Railway Company. An invitation was also read from the Country Club of Kansas City, Mo., extending the privileges of the club to the members of the Association. A further invitation from the American Stoker Co. was read, inviting the members to visit the power plant of that company.

President Roach: The next order before the convention is the report of the Committee on Nominations. This committee will also include in its report a recommendation as to the next place of meeting.

Mr. McCulloch: With the consent of Mr. Rigg, the chairman of the Committee on Nominations, I would like to make a statement. In suggesting those who shall be our officers for the coming year, some member of our Nominating Committee has guaranteed strict attention to the duties of the office by each one of those we recommend, and we will ask any of the gentlemen who are nominated if he does not mean to attend to the duties of his office, if he is elected thereto, and give his earnest support in helping to carry the association along in a successful way, and give his personal attention to the meetings of the committee, we would like to have him decline the election, and let some one else be put in his place who will attend to the duties of the office.

Mr. Rigg, chairman of the Committee on Nominations, presented the following report:

Your committee respectfully recommends New York City as the next place of meeting, and the following gentlemen for officers of the association for the ensuing year.

President, Walton H. Holmes, president Metropolitan Street Railway Co., Kansas City, Mo.

First Vice-President, Herbert H. Vreeland, president Metropolitan Street Railway Co., New York, N. Y.

Second Vice-President, N. H. Heft, president Meriden Electric Railroad Co., Meriden, Conn.

Third Vice-President, J. B. McClary, general manager Birmingham Street Railway Co., Birmingham, Ala.

Secretary and Treasurer, T. C. Penington, treasurer Chicago City Railway Co., Chicago, Ill.

Executive Committee: The president, the vice-presidents, and John M. Roach, Chicago; F. L. Fuller, Wilkesbarre, Pa.; George W. Baumhoff, St. Louis, Mo.; John R. Graham, Quincy, Mass, and John Harris, Cincinnati, O.

The following resolution was unanimously passed by the Committee:

"Resolved, That the next meeting of the American Street Railway Association be limited to three days instead of four, and that the day set apart for the personal examination, by members, of the supply men's exhibit, be the middle day of the interval."

Mr. Bean, (St. Joseph): I move that the secretary be authorized to cast the unanimous ballot of the meeting for the gentlemen nominated. Carried.

The secretary duly cast the ballot and the president declared the gentlemen nominated to be duly elected as officers of the association for the ensuing year.

President Roach: There will be no further meeting of the asso-

ciation, but we will adjourn until tomorrow night at 7 o'clock to meet at the Coates House for the annual dinner.

I desire to thank the members of this association for their kind consideration while I have been your president, and if there is anything I can do at any time to help the association, I shall be pleased to have you call upon me while here and at home. (Applause.)

I will state in reference to the paper which was to have been presented by Mr. Nicholas S. Hill, Jr., general manager of the Charleston Railway, Gas & Electric Co., of Charleston, S. C., on "The Storeroom and Storeroom Accounts," that Mr. Hill has been ill for a long time, and has been unable to prepare the paper.

On motion of Colonel Heft a vote of thanks was given President Roach, and on motion of Mr. Vreeland a vote of thanks to the Metropolitan Street Railway Co., of Kansas City, and the citizens of the city who have so generously entertained the convention.

Adjourned to meet at the banquet Friday evening.

MAGANN AIR BRAKES.

The G. P. Magann Air Brake Co., of Detroit, made no extended exhibit in Convention Hall but by invitation a number of delegates rode over the new Kansas City-Leavenworth Electric line all the cars of which are equipped with Magann apparatus. The

freedom from complicated parts in this braking system, and its quick and accurate operation won for it many words of commendation. Mr. E. C. Rutherford, of the Detroit office, is in attendance.

The Ohmer Car Register Co., Dayton, O., has mailed a letter to delegates stating it will make no exhibit this year. The company is just completing the installation of a large amount of special machinery in its new factory and will soon have its plant in operation. The intention then is to actively enter the market with a register which gives a printed classified statement of fares collected. It registers transfers issued and collected, passes and any denomination of cash or ticket fare.

Mr. F. G. Bolles, representing the Bullock Electric Manufacturing Co., is in attendance at the convention and has distributed some very popular souvenirs. These were sealed glass tubes with Bullock literature externally applied, some were filled with Kentucky dew, warranted to be as smooth as Bullock machinery, and others contained cigars. We know that Bullock machinery is smooth.

The tickets elected in both associations are received with the greatest satisfaction. Both elections were unanimous and hearty. Mr. Holmes as head of the American, and Mr. Ham of the Accountants are both representative men, representing the younger and progressive element in the industry and will serve with honor to themselves and the bodies over which they preside.

STREET RAILWAY ACCOUNTANTS' ASSOCIATION.

THURSDAY OCTOBER 18TH.

President Duffy called the meeting to order at 10:40 a. m. and at once announced the first paper.

DEPARTMENTAL ACCOUNTS.

By H. L. Wilson, Auditor Boston Elevated Railway Co., Boston, Mass.

In an unguarded moment I yielded to the request of our worthy president and agreed to prepare a paper on what he has seen fit to call Departmental Accounting. Three weeks ago the task was taken up for the first time, and it at once occurred to me that it was too broad a subject to attempt to cover in the limited time that should be devoted to a convention paper, and I so informed him and begged to be allowed to change it, but while he acknowledged it would be a difficult matter to digest, and as he put it, could be extended to the "length of the Holy Bible" he still insisted on my sticking to this title. If I was only sure that a book of this kind would have as large a circulation as the one he mentioned, I would give up accounting and go into the publishing business.

I will try, however, to give simply a rough outline of the system that we have adopted as the best method of handling labor and material accounts so as to have the maximum amount of quickly available information with the minimum amount of clerical help and expense, and trust that the members present will ask any

H. L. WILSON.

questions that may suggest themselves and in that way bring out any important points that may have been overlooked, as this is not submitted as any pet scheme but simply as the best method that experience has suggested up to the present time.

In the first place I am strongly in favor of having all accounting so far as possible, done in the main office of the auditor, rather than at the shops or department headquarters. There are several reasons for this, prominent among which are: That there must always be a responsible head to properly direct the efforts of others, and if it is all done in one place a really bright chief clerk may be employed, to whom a proper salary may be paid, who can have a supervision of all details, and any questions that arise can at once be referred to the auditor for his personal attention. Again there are times when the entire force can be put on some special and important piece of work that it is necessary to have completed at once; there are other times during the month when the pressure of work is such that some of the clerks can be engaged in collecting together the less important matters that have been allowed to accumulate during the busy time.

Another and very important reason is that there may be instances where estimates have been given of what certain work would cost, where the expenditures have greatly exceeded the estimate, and where it might be thought advisable by the head of the

department to make transfers to other and improper accounts in order to substantiate the original figures.

When information is desired a question can as well be asked in one place as another and certainly a more prompt and probably a more intelligent answer can be obtained from the place where all accounting is done than it would be possible to get by consulting several separate departments.

If, as is the case of the Boston Elevated Railway Co., there are several departments, any one of which may do certain work properly chargeable to another, it simplifies the accounting to be able to post the details to the proper account direct, and avoid the trouble of making charges and credits back and forth which would be necessary if the accounting of the departments was done at separate places.

The four departments into which the Construction, Equipment and Maintenance forces are divided are as follows:

Department of Motive Power and Machinery.

Department of Wires and Conduits.

Department of Buildings.

Department of Maintenance of Way.

No claim is made that the system as it is at present arranged is applicable as a whole to all companies, but the fundamental principle which is the order number system can certainly be applied to any road.

The method of issuing order numbers varies somewhat in the different departments.

In the shops the method is to have the superintendent or foreman give each class, and in many instances each piece of work performed, an individual number. The first order is numbered one and then they run along consecutively for two or three years or until there is no chance that by beginning over again the numbers will in any way conflict.

When an order is issued a copy of it is sent to the Bureau of Audit so that the auditor may determine from the nature of the work the account to which it should be charged, entry is then made upon cards provided for this purpose which have headings for the Order Number, Account Charged, Date Issued, Date Completed and Description of the work. Below are printed spaces for the Month, for Labor, for Material and Invoices, for Shop Expense and for a Total of the above charges.

These cards are made double or folded over at the top, so that by using a small carbon sheet a duplicate can be made with only the labor of one entry. The advantage of this system, is that by separating the card when the order is completed you have an opportunity of making any number of separate and complete lists without in any way interfering with the original files which can still be kept in their numerical order.

If you want to know what the charges have been to any account, what kind of work has been done for any department, an alphabetical list of all work or anything of this kind, it only requires a new deal of this extra pack, to have the information in such shape that it can be quickly utilized.

The labor is reported weekly on sheets which have a heading for the Name, for the Date, for the Rate of Pay and for the Occupation; below are provided columns for the Order Number, for the Days of the Week, for the Total Hours and for the Amount. This sheet has some 35 lines and provides in this way for a man who may work on 35 different order numbers during any one week.

The pay roll of course can be made by simply taking the total hours from the bottom of the sheet, while the charges to the order numbers are made by taking the amounts from the Amount column. These labor charges are abstracted on sheets of the same size as the time blanks and all are then bound together in book form with these abstract sheets as the front pages, and the entries made upon the cards from this form. The advantage of this is at once plain: you have the card which shows you the date and you can quickly refer to the abstract and if necessary by referring to

the following pages you can at once tell the names of the men who worked upon the order as well as the days of the week and the hours each day that they devoted to this particular order.

The material used each month is reported on a sheet which has provision made in the printed heading to put in the Order Number, and below spaces for Quantity, Kind of Material, Price and Amount. These sheets are abstracted and bound in the same manner as the time sheets mentioned above.

We require all parties of whom we purchase supplies to use bill heads which we provide. These have spaces at the bottom in which to place all approvals and a space for a notation of the account to which the goods should be charged. Before adopting this idea, bills frequently reached my office in such a condition that it was difficult to read them, they being pretty well covered with rubber stamp impressions and signatures.

When charges apply to any department the bill is entered upon an invoice book which has spaces in which to make a copy of the invoice and enter the total amount, and separate spaces headed with the name of each department. These last spaces are subdivided into columns for Amount and Account to Charge.

By abstracting each of these columns you have all the information necessary to make your entries to the proper accounts and the totals of all will prove the total of the invoice book.

Any general expenses of the shops are charged to an account called shop expense and this is divided each month among the different order numbers under which work is being done.

The Department of Motive Power and Machinery has several subdivisions such as Machine Shop, Car Equipment Shops, Car Repair Shops, Armature and Field Winding Shops, seven Power Stations and has also charge of small maintenance crews in each of the 30 car houses.

I have explained the system of reporting all labor, material, etc., consumed at the shops, and the methods of making returns from the other places are so similar that I will not occupy your time with a description of the minor differences.

Blanks vary somewhat in the headings but the idea that we have attempted to carry out, is to have them all of a nearly uniform size so that they may be bound in the little booklets before referred to.

A large number of them are arranged in manifold books so that there is always an exact copy of what has been sent to the main office and as each blank is numbered we at once know that something has gone astray if they do not run along consecutively.

By having a large cabinet with drawers arranged for each kind of report, ready reference can be made to any or all original time or material sheets.

In order to make a monthly report of the expenditures it is of course necessary to compile the information you have on all these abstracts.

This is done on separate sheets for each shop, power station, etc. By having these sheets graduated in size so that the upper one is the narrowest and each succeeding sheet just one column wider, you have all the totals together in a horizontal line and a grand total is easily and quickly obtained by simply adding across. The widest or bottom sheet has on the right hand side a sufficient space for the Names of the Accounts and a place for the ledger folio. In this manner the necessity of writing the title more than once is obviated and all necessity of journalizing is done away with, as these sheets bound together make a more complete and readily accessible journal than is possible to have by any other method.

For the Department of Wires and Conduits a different system of order numbers is used. It might be well to here call the attention to the fact that the company with which I am connected owns no surface tracks or their equipment, yet has in its immediate control, and operates all the surface lines in the city of Boston and near by suburbs under a lease for a term of years from the West End Street Railway Co.

This lease stipulated that the Elevated company should build no surface lines of its own, but that all additions to the surface lines or their equipment should be charged to and become the property of the West End Street Railway Co. and that credit should be given to the latter for any removals that were made.

It was therefore necessary to have a very complete and exhaustive record of all property, that could be quickly referred to and easily handled, and books of all kinds were considered but none of them seemed to cover both of the above desirable elements.

Cards were then taken under consideration and the great elasticity of this system at once recommended itself.

First index cards were prepared having for headings the names of each street, car house, bridge, etc. on the entire system.

The Electric Line Equipment had always been divided under five general headings: These were Poles and Setting, Overhead Feeder Lines, Overhead Trolley Lines, Underground Cables and Conduits, and Submarine Cables.

Cards were next provided for each separate kind of line equipment, and it was found that to give a complete analysis of the above five accounts would require the use of forty different forms of cards, and for quick reference it was decided to use several colors as well as number each card on a small tab or projection from the top.

For Poles and Setting 13 buff cards were used which are numbered from 1 to 13 consecutively. The first 4 are used only for the 4 sizes of iron poles which are the sole property of the West End company. The next 6 are used for wooden poles which are owned jointly by the West End company, and some other company. No. 11 is used for wooden poles owned exclusively by the company, No. 12 for special poles and bases, and No. 13, for span attachments to buildings.

For Overhead Feeder Lines 8 cards were provided: they are blue in color with tabs numbered from 14 to 21.

The first 5 of these cards are used to designate the amount and size of different kinds of feed and return wire. No. 19 is used for feed taps, No. 20, for switch boxes and No. 21, for track connections.

For Overhead Trolley Lines 3 cards are used, being salmon in color, numbered, 22 which is used for bracket construction, 23 which is used for insulating joints and 24 which is used for trolley wire.

For Underground Cables and Conduits 8 cards were provided: they are buff in color and are numbered from 31 to 38.

The first 2 numbers are used for Feeder Cables, the next 3 for Return Cables, the next for Feeder Cable Connection, the next for record of Conduit and Manholes, and the last for Conduit Connections.

The next 8 cards are used for records of Submarine cable for return wires; the first 4 numbered from 51 up are used for the Feeder Cables, the next 4 are used for Return Cables, and the last for Cable Houses, Switch Boxes, etc.

In order that the Wire and Conduit Department should report its expenditures in such a way that the Accounting Department could make the charges to the proper locations, a system of order numbers was devised to be used whenever additions to or removals from existing construction were made.

First each kind of equipment called for by the cards was given a number which corresponds with that on the tab of the card, and each Street, Car House and Bridge on the entire system was given an individual number commencing with 100. By preceding the number designating the street by the number designating the kind of equipment you at once have all the information necessary to tell to what location and to what account the labor and material should be charged.

This method furnishes many thousands outstanding order numbers anyone of which can be readily selected from the printed list containing less than 600 numbers.

The labor is reported on the same form as that previously mentioned for shops, but the material sheet is somewhat different.

It is impossible for a foreman to always know exactly how much material will be used on any one job, and frequently he is called upon to do work on several locations without going back to the stock room, and thus it is necessary to provide some form by which he can draw stock and report what he uses.

This is provided by a manifest on the face of which is entered the material drawn. The back of this sheet provides for a report of the material used and a report of the Material Returned. The "Note" printed on the front side of the sheet reads as follows, and explains its use:

"NOTE:—This manifest is to be retained by the person responsible for the material issued upon it until every article is accounted for on the opposite side of this form.

"All material issued upon this manifest which is unused on the last day of the month must be returned to the Storekeeper for inspection. The Storekeeper will receipt for it, re-manifest it or stamp this manifest 'Inspected' as occasion requires."

These manifests are made in duplicate by the manifold system, and a correct copy of the original issue of stock is always in the keeping of the storekeeper.

At the end of the month the reports of the Material Used are abstracted on the same form mentioned for shop orders and are bound in the same manner.

The Department of Buildings is chiefly occupied with the repairs and renewals of buildings and in order to answer all questions propounded by the management and by the Bureau of Real Estate a system of order numbers was gotten up for its use. The principle here employed is similar to that of the Department of Wires and Conduits each kind of work has a classification number and each building has one or more numbers which designate the building and in some instances the different portions of the building. The method of reporting labor and material is the same as that used for the shops.

The Department of Maintenance of Way as its name implies, has charge of the repair maintenance, inspection and construction of track and paving.

Order numbers are issued for any new work or for any extensive renewal or repairs by the Civil Engineer, who sends a notice to the head of the Department and also to the Bureau of Audit.

The department is divided into eight Divisions, called sections, and each carries a supply of the material they are continually using.

Each section's stock is carried under the following 13 accounts:

- Gravel
- Paving Stone and Flagging
- Lumber and Ties
- Nails and Spikes
- Rail Fastenings
- Tie Rods and Buttons
- New Rail
- Old Rail
- Special Track Work, Frogs and Switches
- Miscellaneous Material
- Track Welding Material
- Scrap Material and
- Track Wiring Material.

When material is received at a section which is to be included in any of the above stock accounts, the person in charge immediately enters upon a form provided for that purpose, the date, the firm's name or section from which it is received, and the quantity and kind of material.

These reports are numbered consecutively, and are sent to the Bureau of Audit where all bills are entered on an invoice book which is abstracted each month, and from this abstract charges are made to stock accounts or to jobs direct.

When material is used or sent away, entry is made on a form which gives the Date, Where Used or to Whom Sent, Quantity and Kind of Material, Price, Amount, Account to Charges and Account to Credit.

These sheets are abstracted twice, one to get totals for the charges and once to get totals for the credits, and are bound and filed away in the usual manner.

When material is received from track taken up, or is returned from any work, it is entered upon a sheet which provides for the Date, Where From, Quantity and Kind of Material, Price, Amount, Account to Credit and Account to Charge. These are abstracted and bound in the same manner as the Material Sent Away sheets.

All labor is reported on a form which has the usual heading, and provides below for a separation of Maintenance and New Construction charges, as well as the location where the work was done and the particular kind of labor that was performed. These are also abstracted and bound.

We will now suppose we have four kinds of bound books from which we are to make up our monthly report for the department.

We take a report blank and head it with the name of the section. This blank has columns provided for Approved Entries, for Each Kind of Material, for Approved Bills, for Labor, for Total Charges and Credits and for Net Charges and Credits; and down the right hand side has accounts to which charges and credits are to be made.

We then take the abstract of the invoice book and enter with red ink on the first line opposite the headings Approved Bills

Charged to Stock the total charge to each kind of material, next we enter with black ink in the Approved Bill column, all other items on the abstract putting each one on the line opposite to the account to which it is to be charged.

Next we take the Material Used or Sent Away abstracts, and under the proper material heading and opposite the proper accounts, we enter in black ink the credits.

Next we take the Material Taken Up or Returned abstract, and with red ink enter under the proper material heading and opposite the proper account, all these items.

Next we take the labor abstract and enter in red ink under the proper material headings the charge for labor on account of each stock account, and then enter in black ink in the column headed Labor and opposite the proper account all other charge.

There is one other column on the report sheet of which no mention has yet been made; this is the first one on the left hand side, and is headed Approved Entries. This was provided to take care of journal entries, as the use of this report obviates the use of the customary journal.

Any entries necessary to transfer one account to another are made on journal blanks, and these are dated, numbered, bound together and abstracted, and from this abstract entry is made upon the report sheet.

By now footing these sheets across, you get the total charges and credits to each account, the black figures being debits and the red figures credits, and by footing the columns of material up and down you get all the debits and all the credits to each kind of material account; in this instance, however, the red figures are debits and the black figures credits.

Only one section has the accounts printed down the right hand side of the sheets; the others all leave off with the column headed Total Charges and Credits, and by placing these sheets side by side you have all debits and credits from all sections opposite the account, and the net debit or credit can at once be ascertained by adding these amounts together, and by carrying the net result into the column headed Net Charge or Credit you have only one amount for each account.

All items appearing in this column are then posted to their ledger accounts, and the footings of all material columns are debited and credited to their proper ledger accounts, and the sheets are the most complete and compact journal it is possible to have, as you can tell at a glance every item that went to make up the total of any account and what section furnished the labor or material.

When any work of this kind is completed the Superintendent of Tracks sends a report to the Auditor giving the date that the track was finished.

A detailed statement of all labor and material charged is then made up and this is sent to the Civil Engineer who can at once tell from this report whether or not the proper amount of material has been charged, and he reports back in such a form that the information can at once be distributed on the cards provided for a report of the track mileage.

These cards number some 17. The first 4 are used to designate the different kinds of rail and have spaces provided for the Date, Kind of Paving, Remarks, Added, Removed and Amount.

The last 3 are used for a record of the three kinds of special track work namely Girder, T and Tram, and have additional columns in which to record the name of the maker and the type of work.

These cards together with those provided for the electric line equipment are filed in a cabinet back of the proper index cards giving the name of the street or car house.

If at any time you wish to verify the records of any street it is a simple matter to take all the cards for that location put them in your pocket and check them on the spot.

In closing I would say that I have a set of blanks with me which I will be glad to show and explain to any member who wishes to look them over and if it is thought advisable to publish this paper in the report of this convention it will give me great pleasure to arrange them in such a way that they can readily be referred to.

Mr. Hibbs: I would like to ask Mr. Wilson what clerical force he employs. It is rather an elaborate system.

Mr. Wilson: We have fourteen men. It is the system that makes it possible to handle it with that number of men. You avoid a great deal of work that it is customary to do. It might

be interesting to know that in that office, with these 14 men, with the order numbers and the records, are over 60,000 accounts, all of which, are liable to be active at any time.

Mr. F. E. Smith: You file these away from month to month, don't you; what you might call the journals?

Mr. Wilson: Yes.

Mr. Smith: Suppose you do some more work in the following month on the same job. Is there any reference made on the first entry that it is continued in another month?

Mr. Wilson: No. You would take it from your cards, and your cards would show what month it was charged in. All you have to refer to is the report of that particular month. The same order number applies in different months. The order number is fixed like an account number.

Mr. Tripp: I would like to ask Mr. Wilson if he makes two postings, one to the cards and one to the expense ledger. I assumed that he keeps an expense ledger as distinct from the cards.

Mr. Wilson: That comes from this report. As I say, it is made up; you make one posting from that, of details. The details are posted from the cards, the details of your expense ledger.

Mr. Moore: I would like to ask Mr. Wilson, in the case of the storekeeper issuing materials on these manifests, what record or account does he charge that to in his record so as to keep tab of it as it goes out and comes back.

Mr. Wilson: That is done in the manifold book. It is to all intents and purposes in his stock until it is reported consumed or returned.

President Duffy: You spoke of 60,000 accounts, and said each order number had a standing account. Now I would understand that account No. 1, for instance, maintenance of track and roadway, had a certain number of subdivisions. You spoke of some six or seven. Then there is a second number of order numbers in each one of those subdivisions, like the paving, the rails, and so on. Isn't that the way it operates?

Mr. Wilson: No. Any maintenance charges would be charged direct to the operating expense number, unless it was a very large track job, where the street was being relaid or something of that kind, and then the engineer would give it an order number. For the ordinary matters we do not have the order number.

Mr. Tripp: Mr. Wilson, if a street was numbered 100 and the figure 1 represented track maintenance would 1100 mean track work on a certain street?

Mr. Wilson: Yes, the Maintenance of Way Department; we do not use those numbers except for extraordinary work, but number 1100 would mean that it was No. 1 pole on a certain street. If it was 2100 it would mean it was a No. 2 pole on the same street. We have about 100 operating expense accounts. We have no subdivisions of those accounts whatever, but by this system I speak of, by reference to the monthly reports of the department, you at once know every labor item and every material item, or any entry, by referring to the report. If you wish any further information you go to the drawer, pull out this little booklet I referred to, and then, if it is a question of labor, you can tell the men's names, the day of the week and how many hours of each day they worked on it, because it is all there together. In the same way, if you wanted to know the material, you could tell with the minutest detail what the material was.

President Duffy: You have your expenses divided into 100 accounts, where the classification has only 38.

Mr. Wilson: Yes. The Boston Elevated Ry. has not adopted the standard system of street railway accounting because the railroad commissioners of Massachusetts are the only ones in the United States that have not adopted it.

President Duffy: The reading of this paper and the important paper that is to follow suggest something to me that was discussed with us today by a gentleman very prominent in the other association. That is the practice of some associations of printing their papers in advance and sending a printed copy to each member, so that before they come to the association meeting they can digest the papers and can select from them particular things that they want to be informed upon, and can bring up points for discussion. This practice in associations of a similar character to this one has proved to be a wise one, and I think it would be well worth the consideration of those who are to direct the affairs of the Association next year as to whether we should take up this practice.

The next paper is:

MATERIAL AND SUPPLIES ACCOUNT.

By W. M. Barnaby, Accountant, Brooklyn Rapid Transit Co.

I wish at the outset to state just what I am going to try and explain, and also to give the explanation with sufficient clearness to be understood.

Material and Supplies Account is but a branch of the bookkeeping of any concern and the method of keeping is to be determined by the results looked for. Some one has said that "bookkeeping was but common sense properly applied." I trust that I can prove the truth of this saying as applied to the keeping of Material and Supplies Account. In the first place what are the results to be obtained?

A correct record of all material and supplies received, showing kinds, quantities, price and from whom bought. A correct record of how used, showing the quantities and values as applied to operation, maintenance or construction as the case may be.

A record which will show at any time, the quantity of any particular stock on hand. A record that will show the various kinds of materials and their value charged to any particular expense or account.

These I think are the main results looked for in keeping Material and Supplies Account. As a basis for accounting in this department of bookkeeping the Stock Ledger is the first consideration. This book should contain the record of all receipts and all expenditures of Material and Supplies and when inventory time comes around gives the value to material and supplies on hand. A Stock Ledger laid out with three accounts on

W. M. BARNABY

a page is suggested, a book of 800 pages giving some 2400 accounts. This should be opened with the accounts running alphabetically for convenience in locating. This is made so as to give each month practically a separate record. A trial balance can be taken monthly if desired.

The postings to this book are made from the record of materials received and from the consumption sheets which I will explain further on.

After the Stock Ledger, comes the book containing the record of materials received, which for convenience, we will call Book No. 2, the Stock Ledger being No. 1.

This book gives a complete record of all stock received, showing from whom received, quantity, price, kind, value, order number, Reg. No., how shipped, etc., in fact a complete record of each invoice. From this book the postings to the Stock Ledger are made. This book is made on the loose leaf plan, which permits a page, when filled up, to be taken out, allowing the posting to the Stock Ledger without interfering with the work of the receiving department.

We now come to the taking out of stock, and the method of changing to the proper expense or construction account.

All materials and supplies drawn from the stockroom should be drawn by order on the stock clerk, properly signed by those authorized to do so. The form of order is in duplicate, so that each department has a record of what materials or supplies it has used during the month. The order must also state for what purpose drawn. By taking the classification of Expense Accounts, as adopted by the Street Railway Accountants' Association of America, and giving the numbers and letters, the accounting part becomes very simple.

Any special expense or construction account can be kept by the mere giving of some special number or letter to indicate it. In this connection, it should be remembered that labor charges should be similarly treated to have uniformity of accounting.

Orders on the stock clerk are charged daily on the Consumption Blotter, which is made up of a number of sheets properly ruled. The Consumption Blotter is the record of quantities and values of materials and supplies used daily, the name of the materials or supplies being written in the margin and the quantity and the expense account being indicated. The unit of value is also given, being taken from the Stock Ledger.

After orders on the stock clerk have been posted on the Consumption Blotter the amounts thus charged are analyzed; first, as to the amount charged to each expense account; secondly, as to the value of each kind of material charged. The first result is, in turn, posted on blanks which are the final accounting as to expense or construction charged. The various accounts to be charged are written in at the top and the result of the analysis of the Consumption Blotter is set down daily under the proper heading. At the end of the month the footings of these sheets give the cost of materials and supplies charged to each expense or construction account. The second analysis of the Consumption Blotter is transferred to other blanks for the record of amount used daily of each kind of materials or supplies and from this the postings to the Stock Ledger are made, the value of the materials used balancing with the total amount charged to expense or construction accounts. This form has an additional value, in that it shows just the quantity of each material or supply used monthly, which is a good help to the stockkeeper in determining how large a quantity he should carry, and also enables him to make out his requisitions on the purchasing agent, with intelligence. When more than one stock account is kept and goods are being transferred from one store-room to another a proper transfer order should be used which will indicate the kind, quantity and value of stock so transferred, and also indicate from and to what stock account transferred. These orders which should be numbered are treated by the stock clerk the same as any invoice and should be posted in the record of materials and supplies account and charged out in the regular course.

On the question of putting through material and supplies account bills covering large items chargeable to construction such as car bodies, trucks, motors, generators, etc., I think the method of direct charging preferable. At the end of each month the stock clerk should report to the auditor the amount of materials and supplies received giving a list in detail of bills passing through his record of materials received, also the value of materials and supplies received through transfer from other stock-rooms. This blank gives the quantity on hand on the first of the month, shows all debits and all credits to Materials and Supplies Account, and enables the auditor to check the Materials and Supplies Account as shown by the stock clerk with the general books of the company.

In connection with the Stock Ledger a card system is recommended. Each kind of stock having a card showing the quantity on hand also stating the number of the bin, shelf or drawer in which it is kept. As the orders are filled by the stock clerk the cards are credited with the quantity taken out so that the quantity on hand at any time can be ascertained. Some may say that the time involved would not warrant the keeping of such a system of cards, but I can state that a system covering between 5,000 and 6,000 different stock items can be posted in three hours. The value of knowing that a certain article is needed is obvious to any one familiar with the keeping in repair of car and motor equipments. By such knowledge an emergency order for the particular material or supply needed can be given and a "multitude of friction" thus covered. On this card in addition to showing quantity on hand, a provision is made to show the quantity of such materials and supplies ordered, but not received, which provides against duplicate ordering.

In the matter of manufactured articles such as commutator bars, field coils, etc., where the amount made up in a month might be sufficient for a much longer period and it is desired to charge to the expense account only the amount used, the stock clerk would have to set a value upon the product, debit his Material and Supplies Account, the same as for any purchased material or supplies, and set it upon his Stock Ledger and reduce by a

like amount his report of such expense accounts for the month. The custom, I think to charge direct to expense, all material taken out or supplies for such manufacture as though actually used during the month. Only a few of the larger companies do any manufacturing.

I think I have covered the principal features of Material and Supplies Account. It may be that some of the minor details have escaped in condensing this into such a short article, but if there be any particular point not touched upon which someone is interested in, I trust he will not fail to make it known.

In any system of accounting, accuracy is the keystone, and that particular feature should never be lost sight of.

Mr. F. E. Smith: I would like to ask Mr. Barnaby if the material charged out in any one month is charged out at the average prices of the material on hand at the first of the month.

Mr. Barnaby: The unit of value of stock is determined by bringing down what you have on hand at the end of every month, and you establish probably a new unit of value. Of course, in taking up what we call the consumption sheet, we use a certain quantity of any article, which, at the unit of value, gives a figure for the expense, and we bring down the balance in the bin or shelf, and get a value of stock on hand. If it happens to be bolts or gears we know what we have up above, and at a glance can tell whether the price which the unit giving the results, is a fictitious one or not; and it can be adjusted and checked. Practically the unit of value is reset every month, on the first of every month.

Mr. Smith: You might have had a lot of material, say, on the 5th, and used it on the 15th, and that may have changed the price, the average price of what you have on hand. Now if it was used on the 15th, would you charge it out at the average price of the 1st or as of the date that you used it?

Mr. Barnaby: By the use of this consumption blotter, if we had 1,000 on hand at 10 cents, we would charge out the first 1,000 at 10 cents, and just as soon as we got into the next lot we have our price indicated.

Mr. Smith: You charge them off then at two different prices, not as an average?

Mr. Barnaby: We would, then, yes.

Mr. J. A. Harder: Our store-room accounts are not conducted on a very thorough system. We aim to charge out material at an average price and let it go at that, and take an inventory occasionally to see whether we are running short or over and adjust it from that on. We do not keep a very elaborate set of books.

Mr. Stone (Worcester, Mass.): I can say very little to add to the information that is desired on that subject. The road that I represent is a comparatively small one. Our system is accordingly a small one. It is accurate so far as it is carried out. It is a very simple system and would not apply to the larger roads. We charge directly every purchase to the particular account for which it is bought. We take an inventory at the end of each month whereby the stock on hand at the first of the month is given. Added to that is the purchase which has been charged up to the particular account, which is set down, and an inventory is taken at the end of the month both by a book record and by an actual record. At the end of each month we have practically an inventory that covers the maintenance items and the construction items, separated each month and credited back to the several maintenance accounts and the several construction accounts, which ever they may be, and we charge to supplies and credit to operating expenses or construction accounts whatever material remains in hand; charge up each month again and start over. It is very simple and at the same time it is a system that can be applied to a small road so as to arrive at very accurate results. I am quite interested in hearing these papers, particularly the paper that has just been read, because a different system of accounts may be applied to our road later on, and that which applies to the larger roads is what I am particularly interested in.

Mr. Frank J. Suda (St. Louis): All the material that comes into our store-room is given a lot number and we use the card system. On this card we place the lot number, the name of the article, from whom purchased, the date received, the quantity received, the valuation, which is taken from what I call the receiving sheet, which is kept by the storeroom keeper. When the article is given out it is given out by the lot number, and in that way I get the quantity and the valuation. At the same time I get

the account in which the material is charged. Every man that comes into the storeroom gives his individual receipt for the material that he gets, and must state for what this material is used. These little slips are then taken up twice a month, on the 15th and on the 31st, and are entered on what we call our maintenance sheets, which are properly headed with the accounts to which these various items are charged. That also applies to castings. Every casting receives a number. No pattern is made without a number being given it, and when it is charged up or given out, it is given out by this lot number. I lot everything except screws, bolts of all kinds, cotter keys and such minor things as those, and at the end of stock-taking time, I offset one way or the other. So I think on the matter of lotting the articles and the castings I offset at the actual valuation both ways every time. If by some means or other the entry clerk makes a mistake in charging out, if he charges out \$10 too little, when he comes to balance out that particular lot he knows exactly whether he has been charging it properly, on the right valuation, and he can also check the storekeepers at any time by referring to his cards and asking the storekeeper how much material he has of this particular lot, and he knows whether the storekeeper has let any of this material slip through his fingers without getting a charge for it. Our system is not exactly as I would like to have it, and I am looking for some improvement if I can get it.

Mr. P. V. Burlington (Columbus, O.): We do not run a supply house account. We take care of all the purchases and use of material and supplies through general ledger accounts. The larger purchases, such as rails, ties, wheels, poles, perhaps all together 15 or 20 such accounts, we hold in what we term an open account, and we charge out approximately each month what would naturally belong to that month, and so far we have been very successful in approximating and have kept our operating expenses per cent at a very regular figure. We have had no difficulty whatever. Of course we do maintain in our shop our supply account, but it does not come into the audit office. It is simply as a matter of record for the shop department. All other materials, track, overhead, etc., are taken care of as I stated.

Mr. Mitchell (Pittsburg): We run our shop accounts, material and supplies, in about the same way. We find it works very satisfactorily. We take an inventory about once a year.

Mr. W. G. McDole (Cleveland): I would like to ask Mr. Barnaby what he does with his freight and cartage and handling of materials?

Mr. Barnaby: All the trucking we do we run it through a department and they have a car system there, and all the expenses of that department are charged to a trucking account. The cards are analyzed and the value of the truck per day is set down at a sum per day. The cards are charged out, as the cards indicate what work they perform, and it is set up as an expense item, charged to the account, and the trucking is credited. Of course at the end of the month, or a period of months we get a slight debit or credit which we adjust by taking off a slight per centage of the charges. The bigger charges that we have through the trucking department; there is very little of that trucking that we get, as our purchasing agent makes it a rule to purchase everything f. o. b. dock, and the handing of supplies from the shops to any minor jobs we charge to a shop expense account direct.

J. M. Smith (Toronto): Our system of material and supply is somewhat similar to some which have been explained here. I run what we call a material order book in which every requisition for material is first entered, and as the goods are received they are reported to me on a daily sheet, all the materials received. I might say, first, that I control all of the clerical work in connection with it in my department, that I got this daily sheet of all goods received, fully explaining it, giving them a number, etc., and they are checked and entered as against the requisitions, in the material book, so that we have the requisition entered as filled. Then, for any freight, duty, or any charges like that I have separate columns, and that is added to the cost of the goods to give me the price of that material. The material is summed up at the end of the month, and then I have a sheet that is sent to me daily of all materials delivered out of the stores, giving the classification and accounts that these are to be charged to. That is then kept track of in a subsidiary book until the end of the month, and then posted to this material order book and sub-

tracted. That, you will see, leaves me the balance of material that is there in hand and can be taken off, as I do, giving the full detail of all the materials on hand at the end of the month, practically an inventory of the goods. I have found that it was very satisfactory, and I have a pretty good check on the storekeeper, because if he is making any charges that are not correct he will find himself short at the end of the month. I am always open for suggestion and I appreciate this paper read this morning very much.

Mr. Hibbs: I would like to ask Mr. Smith under whose direction or supervision the storekeeper comes. I understand from Mr. Smith that the requisitions go direct to him. Is that as it ought to be?

Mr. Smith: The storekeeper is practically under my own control. All requisitions are made out and then a copy is sent to me; the requisition is forwarded to the merchant and a tissue copy is sent to me and entered.

Mr. Ehrhardt: We charge everything direct as it is purchased and ordered, probably the same as you do, or used to. Of course, we have a storeroom and keep a stock on hand but we make no charges nor entries from that storeroom. Everything is charged as it is purchased.

Mr. Burlington: It seems to me from inquiries made when this paper was brought up that it might be a valuable work for this association to appoint a committee to formulate a uniform system in this particular line. It is a vital question and I realize that the property with which I am connected is getting a little too unwieldy for the plan on which we have been operating our material and supply account, and I am very glad to have the privilege of listening to this discussion, because it is coming right in the line that I desire. I would like to hear some expressions on that. It seems to me that it is a valuable work that this association might take up. We have to have something to further perfect our system of accounting, and would it not be proper and wise to give this matter some attention?

Mr. Mackay: I would suggest that we might take up in each meeting a few of the necessary blanks and forms, and establish those few. We could standardize a few of the forms, and in that way gradually get the whole thing in shape.

As far as our storeroom accounts are concerned, I think I explained at the last meeting that we charge out all reconstruction work direct, the items not passing through the storeroom account at all. In all expense accounts most of the items pass through the storehouse, but where an item is purchased and sent direct to the work, for instance, oils or material for power plant, it is charged direct to the plant. We always make it a point to charge it out. Anything that goes through the storehouse is charged out at a figure which exceeds the cost sufficiently to take care of the cost of handling and to take care of the breakage or depreciation in the value. In that way at the end of the year our inventory always runs in excess of the ledger account.

Mr. Tinglan: I think however that on the intake I can give you a little light. Our requisitions are all made in duplicate. On the back of the duplicate requisition there are ruled columns for the data of the receipt of the material, the quantity, price, and if it comes in car load lots there is a place for the car initial, number and weights and a complete record up to the date of the receipt of the invoice. We use our own invoice forms, which is in duplicate, the duplicate remaining in the city railroad office, the original returning to my office. On the face of that is a place for freight charges, the initials of the man who receives the goods, the certification that they are correct as to quantity and quality and the approval of the superintendent and the account to which it is to be charged. All our purchase orders are issued in triplicate. On the back of the triplicate purchasing order is a ruling identical with that on the back of the duplicate requisition. We take the bill which is returned to our office, and keep a duplicate record of the receipt of the material and all the details that go on the back of the original. The storeroom ledger is kept in the subsidiary office. We keep a storeroom account on our general ledger for that particular office in my office. These two ledgers must balance at the end of the month. On each job the foreman gets from the superintendent what our boys call a green goods order. It is a duplicate order numbered consecutively, but in front of the number is a place left for a letter designating the class of accounts, "a" being for track, "b" for ties, and so on.

When a man comes to the storeroom with this order, the letter is put in front of it, he gives that up and receives a material sheet on which is entered all the material drawn from the storeroom. There is a place for a credit back if he returns any and a place for this order number. That is all he knows. He does not know anything about the account. He is given a number and a letter by the superintendent, and that is placed on his storeroom order. When his material is returned the proper credit is given him at the storeroom for any return, and that sheet is at once sent to the office. If it is a running job we have what we call standing orders for the track repair man and the overhead repair man, but any special job is returned as soon as it is completed. At the end of the month these are formulated and on the report which comes to my office is a charge from the storeroom for each bit of material, giving the quantity and price. From that we check up our storeroom account on our ledger. That is, in substance, the way we keep it. My record in my storehouse, I am frank to confess, is a little bit lame, and I came here with the hope that I would get some information.

Mr. Wilson: I would like to ask Mr. Barnaby one question. He said it took about three hours to post on the cards the material that was issued during the day. I thought it was your road that had the cards upon the bins.

Mr. Barnaby: That has been discontinued. It has been decided that it was easier for a man to have the cards, and get a better result than to go upon a ladder and try to post that card on the bin, more apt to get correct posting.

Mr. Wilson: Do you attempt to find all the issues of one stock and make one posting on the card, or do you make as many as may be necessary?

Mr. Barnaby: No. In analyzing the consumption blotter where it is first entered you get the entire quantity used that day.

Mr. Wilson: From this blotter, you cannot analyze your stock, but you put it down in such a way that you know what the charges are to be from the blotter.

Mr. Barnaby: On the consumption blotter is indicated the value charged to any expense account. As the orders are analyzed they are entered twice. That is, the first analysis is as to the charge that the goods are to be put to. That is indicated as the samples show there, (referring to exhibits accompanying Mr. Barnaby's paper,) the job number and the value. That is then tabulated to get the quantity of any particular material put on this consumption sheet as against that material. From that the cards are posted, so that with the quantity of goods set up on the card and the daily postings, from this analysis of the consumption blotter one can tell at a glance, as soon as these cards are posted, what is still left on hand of those particular goods.

Mr. Wilson: Then you practically analyze it twice?

Mr. Barnaby: It has to be analyzed twice practically, once for the charge and once for the quantity of goods.

Mr. Ham: I would like to ask Mr. Barnaby whether the clerks who do this storeroom accounting are subordinate to the storekeeper.

Mr. Barnaby: They are subordinate to the storekeeper and now the storekeeper is subordinate to the auditor. That is something, that, when you were there Mr. Ham, was not so.

Mr. Ham: The point is whether there is any scheme yet devised which is a check upon the storekeeper, or whether we still have to rely upon the honesty of the storekeeper. That is one of the objects of the storeroom accounts; and I am quite strongly of the opinion that it is a physical impossibility to check the storekeeper.

Mr. Barnaby: In that regard I refer to Mr. Wilson's paper. As I take it, his orders that he receives direct from his storekeepers must be certified by someone in charge. Of course, honesty in accounting finally resolves itself into whether it is the clerk who is the honest man or the auditor. At some point the honesty has got to be determined. The signing of the order under Mr. Wilson's plan is the point where the honesty has to be determined, and if he knows that that man is honest, his accounting is honest, for he takes his result, and it is a final accounting.

Mr. Ham: That is only one-half of it. The other half is the receipt of the material.

Mr. Barnaby: You have the same thing in reference to the receipt for the goods? Someone is in authority to receipt the voucher as to the goods received.

Mr. Ham: I am not criticizing the method at all. But I wish to know it is possible to check the storeroom keeper with any sys-

tem of accounts. I have found that possibly we thought we were doing this but were succeeding very poorly, and I am galled to give it up. I do not think it is practicable, for the same reason that we see an immense department store with very little of that kind of accounting; as I understand it, none at all. But we are attempting, as Mr. Suda of St. Louis, said, to keep track of all of these items, and he says that if there is a mistake on the part of his storekeeper he can locate it on the particular account; but after he has located it the question is what good it has done. The real point in this that appeals to me is whether it is wise to keep separate accounts of individual articles. I mean by that, a separate ledger account or separate accounts to show stock on hand of each article. It entails an immense amount of work. Is it necessary or can we get the same results by surrounding the storeroom itself with every safeguard, that is, as to material going in and material going out? Many of us have possibly kept accounts very carefully in storerooms where the storeroom itself was laid out in such a way that anybody could go in and help himself to material. It seems to me that it is the storeroom itself that should be watched. I would like an expression of opinion on this. I am keeping these individual accounts, and if possible I would like to do away with them.

Mr. Wilson: When I started storekeeping a number of years ago I started with the idea that you must keep an account of the different kinds of material, and I continued it for some two or three years, but give it up. At the present time the entire material in our stockroom is simply one lump of stock. Since doing so the results have been very satisfactory indeed. The material is received from the persons from whom we purchase goods and certified to on the bottom of these invoices. If you recall to mind my paper, I stated that we require everybody from whom we purchase goods to use our bill heads and not theirs. There is a place on the bottom of these bill heads for the approval of the person who receives the goods, for the approval of the head of the department who has the requisition for it, of the clerk who has entered it and the purchasing agent, who states that he ordered the goods and that the price is correct. Then all these bills are charged direct to the storekeeper, or to the storeroom. Material that is delivered is never delivered on any order or requisition signed by simply an employe of the company, but it must be by the foreman or person in charge. I think that answers practically Mr. Ham's question as to having a responsible person whom you can hold for the goods which have been issued. By having these original orders and demanding personal requisitions signed by the person in charge of the shop or department, it must be collusion between him and the storekeeper to work any mischief which it would be a difficult thing ever to guard against; or if it was a question of the receipt of goods, between the storekeeper and the person he would receive them from. That would be a safeguard which it would be difficult to provide.

Mr. J. M. Smith: In that regard there is one thing I did not mention. I have a check on the goods received, for the reason that I do not let an invoice go in the storeroom house at all. I said I had a daily report come to me of all goods received. They are given a number, each package just as it comes in on the counter, and are entered on this sheet. The requisition is referred to the merchant whom these goods are received from and then it is sent to my office; so that they do not get the invoice at all. I know that the requisition has been received by myself, and then that invoice is treated in my department, is given its proper number, and forwarded to them to check the prices; the storekeeper being the one who has purchased the goods, knows all about the prices. So that I get a full check and know that everything is received. If an invoice comes in that has not been advised of, I can call him to time, but our record shows it at once.

Mr. Harder: Following up one of the questions Mr. Ham asked of Mr. Barnaby, I would like to know how many companies in this association have the storekeeper under the jurisdiction of the auditor so far as the storeroom accounts are concerned.

A poll showed 18 where he was and 2 where he was not.

Mr. Mackay: I seem to be quite a minority here. In our company the storekeeper is really under the general manager, so that, while in a certain sense the auditor is brought in relation with it, still he is under the general manager.

Mr. Barnaby: I would think that it would be well to ask Mr. Ham and Mr. Tripp who are members of the committee appointed by the association to report on a system of account for lighting.

gas and power companies, to report to us next year as to action taken.

Mr. F. E. Smith: I move that a committee be appointed to prepare a uniform set of blanks for the approval of the association on stores, from the purchase to the inventory.

Mr. Mackay seconded the motion which was carried unanimously.

President Duffy: I will appoint on that committee Mr. Burlington, Mr. E. F. Smith and Mr. Tinglay.

There is another important matter here that should be taken care of at once. That is, the proposition to change the by-laws, as to the time and place of meeting.

It was moved and seconded that there be no change. The motion was carried unanimously.

The executive committee reported that it had held two meetings; that it had taken three mail votes, admitting 25 companies to membership; that the books of the treasurer had been audited and found correct.

The report was accepted.

The Committee on Resolutions reported resolutions of thanks to the hosts of the convention in Kansas City, which were unanimously adopted.

Mr. Wilson, of the Nominating Committee submitted the following list:

President, Wm. F. Ham, comptroller Washington Traction & Electric Co., Washington, D. C.

First Vice President, J. A. Harder, auditor Metropolitan Street Railway Co., Kansas City, Mo.

Second Vice-President, J. M. Smith, comptroller Toronto Railway Co., Toronto, Canada.

Third Vice-President, W. G. McDole, auditor Cleveland City Railway Co., Cleveland, Ohio.

Secretary and Treasurer, W. B. Brockway, assistant secretary, New Orleans & Carrollton Ry., New Orleans, La.

Executive Committee: C. N. Duffy, auditor Chicago City Ry.; C. S. Mitchell, auditor United Traction Co., Pittsburg; C. M. Hemingway, cashier Connecticut Lighting & Power Co., New York; D. E. Tripp, auditor Seattle Electric Co., Seattle, Wash.

The gentlemen recommended were elected, the secretary casting the ballot of the association.

Mr. Harder then extended an invitation to the accountants to bring their wives, sweethearts and sisters and go for a trolley ride on Friday. The party will leave from the Midland Hotel at 10 a. m.

Mr. Ham was invited to the platform, and President Duffy said: Mr. Ham, permit to turn the chair over to you and to congratulate both the association and yourself.

President-elect Ham: Gentlemen of the Association; I wish to thank you for this honor. I consider that everyone of us should be proud of this Association. Personally, I have devoted some time to it, some hard work, but for every stroke of work that I have put in I have been amply repaid. If I have done anything for the association, it has done ten-fold more for me, and I believe that any man who can come to the conventions of our association will be greatly benefitted, and his company will be benefitted. It is by coming in contact with other men in the same line of work that we are enabled to free ourselves from the dust and cobwebs which accumulate in our craniums, and I think that accountants, bookkeepers, something like school teachers, are very apt to get in ruts. Each one of you can help the association very materially by doing anything in your power toward increasing our membership, in order that it may be a representative membership. We have 98 companies, and I was very sorry that we could not have made it 100 at this convention; but if each member would take a little interest in it to see that his immediate neighbors, or the companies with which he has some influence, or can get some influence in some indirect way—if he can present the matter to them and they can be advised of the work that we are doing, I think no company will care to remain outside of our association.

I am very glad that we have decided to meet at the same time that the American Association meets, as much as anything for the reason that we are brought in contact with the general managers and the general managers are brought in contact with us. I think that the effect of that will be that our work will be more appreciated, that we will come into closer touch with the operating department, be more valuable to the street railroad work, and that

the position of accounting officer will become a more dignified and honorable one.

Mr. Moore: Mr. President, it seems to me that inasmuch as the various consolidations of street railway and traction companies have not reduced our membership, as we expected it would a year ago, and as our treasury is fairly full, it would be proper at this moment to recognize in some measure the work of our efficient Secretary. To that end, I make a motion that the salary of the secretary for the incoming year be advanced from \$200 per annum to \$300 as a recognition for his attention to duty.

Mr. Harder: I second the motion.

Mr. F. E. Smith: I would like to amend that. I do not think it is enough. I wouldn't do it for that, and I don't believe there are many here that would. I will move to amend by making it \$500.

Mr. Moore: I will accept the amendment.

President Ham: I understand, then, that the original motion is withdrawn and that the motion now before the house is that the salary of the secretary and treasurer for the present year be \$500.

The president put the question and the motion was carried unanimously.

A resolution of thanks to the association's hosts in Kansas City was passed, it was ordered that the portrait of the ex-president be inserted in the published proceedings, and the convention then adjourned.

KNELL AIR BRAKE .

The Knell Air Brake Co., of Battle Creek, Mich., has a very interesting exhibit of its apparatus at space No. 26 B, which has attracted much attention. The accompanying illustration shows a view of the Knell axle-driver compressor with the upper part

of the casing removed. The gear case is dust proof and is partially filled with oil, the movement of the crank carries the oil to every part of the mechanism insuring the thorough lubrication of the crank pin, cross head pin, cylinder and gears. At the front end of the cylinder is an automatic pressure regulating valve; when the pressure of the main reservoir on the car has reached

the fixed maximum, the compressor cylinder is connected with the atmosphere, and the piston then works against atmospheric pressure only till the reservoir pressure falls to the determined minimum. The Knell system of air brakes has been in use for some months by the Michigan Traction Co., of Kalamazoo, and has given satisfaction.

JEWETT CAR CO.

The Jewett Car Co. has recently completed its new works at Newark, O., and the whole plant is now running at full capacity. The company in designing the new plant carefully arranged the various buildings and yards so as to reduce the cost and labor of handling the material as much as possible. The various buildings comprise a drying kiln 40 x 100 ft., wood machine and cabinet shop with a floor area of 10,600 sq. ft., four erecting and finishing

shops having an aggregate area of 58,600 sq. ft., blacksmith shop 60 x 80 ft., machine shop, storeroom, office building, and lumber sheds. All the shops are equipped with the most improved types of machinery, arranged for economy of time and labor. The shops are lighted throughout with electricity, and the works have a complete water and sewer system.

The Jewett Car Co. has a most enviable reputation for turning out the best-built cars to be found on the market and has grown

FOR NIGHT CONSTRUCTION WORK.

In these days of injunctions and sharp legal maneuvers the success or failure of a promising street railway enterprise sometimes depends on the ability of a company to get ahead of the other fellow by building stretches of track during the hours between sun

down and sun-rise, and it is also often necessary to make repairs in the early hours of the morning while cars are not operating. To aid in this work the White Manufacturing Co. of Chicago, makes a blast light that will illuminate for a distance of several hundred feet and by which track and overhead construction can be carried on during the darkest night. The apparatus is simple and durable and in cases of emergency the flame can be used as a source of heat for welding, melting solder, etc.

The tank is strongly built of the best materials but weighs so little that it can be carried without difficulty by two men and its capacity is large enough to keep the flame going for several hours without recharging. A portable blast light would seem to be an indispensable part of the equipment of an up-to-date road.

A POPULAR TYPE OF CAR BUILT BY THE JEWETT CAR CO.

to be one of the largest concerns in the country. Among recent orders are 30 cars for the South Side Elevated, Chicago, and cars for the Steubenville, Mingo & Ohio Valley Traction Co.; the Cincinnati, Lawrenceburg & Aurora Ry.; the Detroit, Monroe & Toledo Ry.; the Buffalo & Hamburg Ry. The illustrations herewith show exterior and interior views of a very popular style of double truck car for city service.

The officers of the company are: President, W. S. Wright, Wheeling, W. Va.; secretary, H. S. Sands, Wheeling, W. Va.; manager and treasurer, A. H. Sisson; superintendent, Neil Paulson.

FENDER FACTS.

It is interesting to note the steady change in sentiment during the past few years as regards the question of fenders; many managers who were once opposed to their adoption are now equipped with safety devices. There has been however a good reason for this, for not a little of the opposition to the fender was founded not on the theory but the practice. In other words, when the fenders available were unmechanical, there was good reason to believe they were able to do as much harm as good.

The fact that there are on the market only two or three fenders where formerly there were nearly a score bears out the principle of the survival of the fittest. Some of them certainly had no claim to warrant their existence.

Col. A. P. Woodworth, president of the Consolidated Car Fender Co., Providence, has given more practical study to the fender problem than any other person, and has brought to that study of conditions and requirements a mechanical experience which has earned for the Providence fender the indorsement of the best managers. That this fender is in daily use on 7,000 cars on 91 roads in this country is the strongest indorsement of their merit. Further investigation will show these roads to include the largest in mileage and carrying capacity, and operating under all the varying conditions from a small hamlet on an inter-urban line to the great Metropolitan system in New York City.

Manager Lardner, of the Davenport-Rock Island lines, said yesterday as he discussed fenders with an interested group: "We are using the Providence fenders, and while we have had them only a few months they have already saved us more than the entire cost of equipment. We consider them one of the best investments we ever made." The same testimony is furnished by a dozen of managers.

P. & B. PRODUCTS.

The Standard Paint Co., of New York and Chicago, has at spaces No. 77 and 78, a full line of its materials including "electrical compound," paints for the preservation of iron and wood, water-proof insulating tape, P. & B. armature and field coil varnish,

"Giant" insulating papers and "Ruberoïd" motor cloth. It also has samples of P. & B. "Ruebroid" roofing which has been very extensively used for covering street railway and electric light plants, as it is not affected by the fumes of gas, noxious vapors or steam.

One feature of the exhibit is a fine oak counter with trimmings, which the company will use as a permanent stand in the future whenever it makes exhibits at conventions or expositions. Messrs. J. C. Shainwald and J. F. Hicks are extending a cordial welcome to all visitors.

MANVILLE COVERING CO.

The Manville Covering Co., of Chicago, western representative of the H. W. Johns Manufacturing Co., is displaying the following goods in a tastefully arranged booth at space No. 27: Moulded mica line insulators, clips, ears, and other overhead materials; "Noark" fuses and cut-outs; "Vulcaheston" insulating sheets and insulating pieces for motors and controllers; and "Johns" electric car-heaters. Practical demonstrations of the noiseless and safe operation of the Sach's "Noark" fuses are made and all visitors to the convention are cordially invited to make themselves at home at the company's booth. Those in attendance are Messrs.

A. Hall Berry and Joseph Sachs, of New York, D. T. Dickson and J. W. Perry, of Philadelphia, H. D. Bayne, of Pittsburg, all representing the H. W. Johns Manufacturing Co.; E. B. Hatch, of the Johns-Pratt Co., Hartford, Conn., and S. H. Finney, manager electric department, Manville Covering Co., Chicago.

CONCERNING TRUCK PATENTS.

Kansas City, Mo., Oct. 18, 1900.

Editor Review: I have seen in your paper of to-day, page 49 a letter written by Mr. Peckham in connection with a patent suit which is now in the courts between the Peckham Truck and Motor Co. and ourselves. I do not want to take up the time of your readers in a long discussion on a subject of this kind. The question of the validity of our patents is one the courts will properly decide, as they have just done in sustaining our patent for the combination of spiral and plate springs for single trucks.

There are, however, one or two items in Mr. Peckham's letter in which he is evidently not fully conversant with the situation. In the latter part of his letter he cites the fact that his company was the pioneer on short wheel base trucks. The facts of the case are these, we sold the first of these short wheel base trucks to Mr. David Young, of the North Jersey Street Railway Co., in whose employ Mr. Febelacker had been. Mr. Febelacker on hearing of this called upon Mr. Young and stated to him that he had made a mistake in purchasing a truck of this kind, and that he would in a very short time have to put them in the scrap heap. It was the successful operation of these trucks, sold Mr. Young by the Brill company, that caused Mr. Febelacker to go into the matter and design a truck on the same principles, using the cast steel sides and other things and naming it the Jersey Street Railway's special. These facts are all matters of record and are easily substantiated.

We do not intend to make an endless discussion upon matters of this kind which are properly between the Peckham Truck Co. and ourselves, but simply make this statement of facts, as we think it is just that our purchasers should know the exact status of the case.

G. MARTIN BRILL,
Pres. J. G. Brill Co.

General Otto H. Falk, vice-president of the Falk Co., is in attendance. The General seemed to be having a splendid time on the trip to Fort Leavenworth yesterday renewing many acquaintances.

Mr. William Silver, of New York, is also here. He began going to conventions 17 years ago, but doesn't look it. The boys were wondering if his side partner, Ed. Lawless, had quit them, but Silver says Ed. was too busy taking orders to come.

DAILY STREET RAILWAY REVIEW

VOL. X. SATURDAY, OCTOBER 20, 1900. No. 4.

LIVING PICTURES.

In the October souvenir edition of the "Review," among our collection of good-looking men appeared the portraits of Superintendent Satterlee and Electrician Grover, of the Metropolitan, this city. We expected an immediate and large increase in the subscription list and were not disappointed. But some unmitigated Chicago scoundrel—probably some supply man—plotted to bring about an estrangement between our above named good friends and ourselves. What did he do but cut out the portraits, and send them to the Chicago Chief of Police with a statement that these were two dangerous characters who were planning to attend the street car convention in Kansas City, and were liable to get away with the whole shooting match.

The aforesaid chief promptly forwarded the pictures and advices to the Kansas City chief, who detailed a new man to lay for them. This sleuth polished up his eagle eye, and taking his life in one hand and the pictures in the other, concealed himself behind a trolley pole. Presently he spied a strong resemblance to the portrait, but the suspected one looked so much like Mr. Satterlee he paused to hesitate. Inquiry confirmed his guess so he let his victim escape. Soon after he caught a glimpse of Grover, whom he did not know, and anxious to bag somebody to take home to the chief he sailed in. Grover claimed exemption on account of having served on a petit jury some years ago, likewise that one of the motors on 6th Street was sparking badly and needed immediate attention. He finally bought the cop off and since he induced John O'Keefe not to let any more minions through the door, is breathing freely again.

Now Grover says it is up to us and we therefore hereby offer a year's subscription for information which will lead to the apprehension of the guilty party.

VAUDEVILLE AT CONVENTION HALL.

The vaudeville show was a hummer and witnessed by 3,000 persons. The whole convention was present in nice front seats and the others were residents of the city. The entertainment began at 2 o'clock and was continuous until 4:30. Like the supply men, it didn't stop until the performers were through. The program included singing, dancing, tumbling, trick dogs, etc. At the close Secretary Penington proposed three cheers for the supply men, which were given with a will, also a tiger.

The ladies turned out in full force and occupied the boxes and reserved seats. The orchestral music was excellent.

As a leader to the show a brass band of 20 pieces marched through the Coates and Midland, and several business streets. G. E. Pratt acted as drum major. In the procession were a group of negroes wearing heads of elephants and monkeys. Then a lot of signs, one of which was 30 ft. long telling all about the show. This colored contingent was headed by Elmer Morris. The chief of police in a fierce uniform was John Granger.

Bleacher Barnard, 78 inches high, rode the donk, 36 inches high. It was fun for Barnard, but tough on the donk. On reaching the hall a band concert was given.

The menu card for the banquet was very handsome; the front cover symbolized the start and was engraved in gold and several colors. The back cover showed the finish in plain black and white; aside from the menu proper, the intervening pages contained the list of officers and committees.

SHALL SUPPLY MEN ORGANIZE?

The Time Considered Ripe for Such an Association—Benefits to be Derived—Exhibitors Can Handle the Problem More Easily Than Street Railway Officials—Interviews With Leading Supply Men Show Great Interest in the Scheme.

"The time has come when we need an organization of the supply men to take the burden of the exhibit hall and its contents off the shoulders of the local officials. The display has now reached mammoth proportions and is constantly growing. We know what we want and how to handle the innumerable details connected with the show much better than any one who has not been through the mill."

It was Maj. Evans, of the Lorain Steel Co., one of the most prominent of the supply men and who has had years of experience in exhibiting at our conventions who made the foregoing remark as the curtain rang down on the vaudeville show in Convention hall yesterday afternoon. Several exhibitors, who were present, instantly voiced their approval, and at their request the "Review" representative undertook to ascertain the views of as many others as could be reached in the limited time remaining before the banquet. The result of this canvass is given, and of all the persons interviewed only three—who requested not to be quoted—were very much pleased with the idea. These three took pains to state they were not opposed to the idea, but not prepared to endorse it until they had either taken more time to consider or know more of the details.

The situation is this: When exhibits were few and small 15 years ago a small room, usually one, commonly used by travelling men to show goods in the headquarters' hotel, was ample for the display. Then the builders began to bring a few cars which were set out on a piece of temporary track in the street in front of the hotel, gradually the idea was expanded and the display increased until a store room was needed. Usually one could be found near the hotel. At Pittsburg, no other space being available, a river barge was anchored three blocks from the hotel and the display made on board. When electricity became a practical motive power a big jump was made and it became necessary to use skating rinks and similar ground floor structures which afforded large space. From the drummer's room at the hotel which cost nothing to the present day requirements which are so great as to bar some cities out of being considered for convention, has been a long time. In the early days the local roads furnished the banquet free, but when it became necessary to pay from \$1,000 to \$2,000 for an exhibit building the burden was too heavy. Now the inviting company furnishes the hall, turns it over to the association to rent out, and entertains in other ways than the banquet which is managed by the association.

With the steadily increasing number of exhibits which at Chicago were valued at \$250,000 there came an immense amount of detail work for some one on the ground to do. Changes had to be made in the building; stronger floors built; wide doors cut; wires run for light and power; arrangements for teaming hundreds of tons of appliances and machinery; carpenter work which in the aggregate would build a house, provided. Sign painters, electricians, machinists, printers, decorators and painters, furniture men and florists, telegraph operators, messengers, and telephones. All these now have to be in readiness. Then the correspondence involved between the convention city and exhibitors, covering several weeks and involving the dictating of hundreds of letters, all these things have followed in the wake of the expansion of the exhibit idea, which, within the experience of the writer, was limited to a few rope harness, patent horse medicine and a few bell punches.

The burden of the work alluded to above naturally falls on some railway official, usually the manager of the inviting road. He is always a busy man and the additional burden which the convention imposes is little realized by any but those who have been through it. The supply men feel they should not ask it and are perfectly willing to relieve the manager of his work.

Another feature which handicaps the local committee on exhibits is that the meeting goes to a different place each year, and the committee there has it all to learn just as some one did in another city the year before. It is asking a good deal in spite of the willing spirit in which the work has always been done.

The plan now proposed is to organize the supply men next

year at New York and put things on a permanent and uniform basis. Elect a standing committee to take entire charge of the hall and everything in it except the meeting rooms of the two associations. The committee would engage some experienced, thoroughly competent man for several weeks in advance of the convention. He would take charge of affairs. Would make the contracts in the name of the supply men's Association for all teaming, labor, power, etc. Each exhibitor would feel perfectly free to use this man without feeling they were imposing on the good nature of a busy manager. If anything did go wrong they need not hesitate to enter a complaint to their own committee and get an adjustment. This article is not written in any spirit of criticism—far from that; nor have there been any shortcomings here at Kansas City to suggest it. In all our convention experience there has never been less friction and annoyance than here, but there has been in the past and is liable to be in the future. There are many things which bear down on the exhibitor which never come to the knowledge of the railway people. For instance: the local committee contract for carpenter work. They select the best they can. An exhibitor puts in a requisition for a platform and booth. The order is turned over to the contractor who then deals exclusively with the exhibitor. Through some carelessness in book-keeping we will say, and during past years many times with direct intention the contractor takes advantage of the emergencies and necessities of the exhibitor and tucks an extra \$10 or \$20 on his bill. The exhibitor feels a reluctance to complain to the local railway manager with whom he may have, or hopes to have dealings, so he says nothing pays his bill and sometimes contents himself with cuss words. The illustration is no fairy tale. It goes all along the line of teaming, wiring, sign painting, and down the whole list.

We do not mean to say that every exhibitor gets stuck on every one of the above items, though several times it has been nearly as bad as this. But the trouble lies in the lack of any authority to whom the exhibitor feels at liberty to appeal. With an association, its superintendent is the association's hired man, and bound to take up such matters and adjust them. It is no favor asked of him—he is paid to attend to just such things.

Another advantage would be the possibility of adopting and enforcing a standard set of rules as to the size, appearance and location of signs, which at present are very nondescript. Signs of all sizes and previous conditions of servitude touch ends with the one inlaid with gold letters and polished wood, canvas, tin, boards, "any old thing" goes. To bring these signs into some sort of uniformity would not cost anybody very much, and would improve the effect as a whole several hundred per cent. One exhibitor would not be allowed to build a canvas wall to shut out from view somebody else, sometimes a competitor. Signs are necessary and lots of them, but there are signs and bill boards.

In the question of freight to convention a marked saving can be made. As an association its committee is in position to deliver to the road offering the best rates and time shipment, practically the whole freight, and secure for its members concessions which their individual shipments would not warrant. For instance all the shipments from New York to Chicago last year could have been lumped and sent over one road with several routes to choose from.

The exhibitors complain bitterly at the lack of attention paid them by the railway delegates. Organize and send a committee upstairs and they will receive a ready bearing and this matter can be improved. Tell the railway body what it has cost to do all this; and that we are getting to a point where the game is hardly worth the candle. When they understand these things they will devote more time down stairs.

And while the committee is there maybe the railway people would like to arrange for a little less noise during the business sessions, so those sitting back of the front 3 rows of seats could hear the discussion instead of, as this week, getting it by the lip reading method. Now the exhibitors did not intentionally intrude on the deliberations, but if they had only gone up in the tent room a few minutes we believe they would have hurried back and turned on some quiet.

The foregoing touches only on the outer edges of many reforms, improvements and advances possible with organization. The single exhibitor has no voice at present in the present associations, nor does he ask it, and he could not go as such. But as an exhibitor his committee can go, leaving all individuality below, and protest, request and suggest with dignity and propriety.

In the steam road field such an organization has been in existence for years, and has contributed in a large measure to the success, strength, longevity and pleasure of the parent association. There is no reason why the same should not be repeated in our case.

The following interviews were all it was possible to secure in the limited time. Almost without exception the person interviewed insisted that it be distinctly understood what he said was in no spirit of criticism on the management of the local committees here in Kansas City. Chairman Satterlee was accorded high praise. There has never been less friction and annoyance than here. It is the future and the expansion of the exhibit feature that it is desired to provide for.

Maj. Evans: I am most heartily in favor of an organization of the supply men. There can be no possible objection and the advantages are numerous. They have been exhibiting for years, know what they want better than anyone else, and have abundant talent among their numbers to form an executive board which will be acceptable to all. There are scores of things which we can do as an organization which is impossible as individuals, and I have been in favor of one for years.

Elmer P. Morris: I do not think it fair to put the burden any longer on the local committee of exhibits. Since the display has grown to such proportions it really requires the entire time of one man on the ground for several weeks, and we ought not to ask the manager of a big railway system—always a busy man—to lay aside his work to attend to this. As an organization we can regulate the size of signs and many things we ought now to do. We should of course work in perfect harmony with the American Association—in fact in conjunction with it, but we can do many things for ourselves better than they can do it for us. We are not asking for the revenue the association receives for floor space but would like to have the handling of details, and in short the management of the exhibit hall.

W. R. Garton: I think we should by all means have a supply men's association.

W. S. Rugg, Westinghouse Co.: I think it would be a good move to make.

Geo. D. Casgrain, Griffin Wheel Co.: There ought to be a uniform system for many features of exhibiting which can only be secured through organization. I am in favor of it.

G. R. Scrugham, Creaghead Engineering Co.: I consider an organization of the supply men a practical necessity. It would be a great relief to the local committee and the obliging secretary of the American Association, and would result in good not only to the convention but to the supply men themselves.

J. V. Titus, Garton-Daniels Co.: I am heartily in favor of it.

John Taylor, Taylor Truck Co.: I am very much in favor of it if we could arrange so that day times the exhibits could be viewed. One day is not enough for everybody to see each exhibit. You have to interview a great many people individually. The exhibitors here have spent easily \$50,000 in making this display and it is a lot of money and deserves more attention. The time now allotted is too short. With an organization we could have our committee represent us before the Railway Association and present our claims, and I hope secure arrangements which would be better than ever before.

Arthur Davis: I want it. We need a committee to arrange freight matters, and other things of mutual interest.

Mr. Garl, Garl Electric Co.—I favor it with a standing committee to make arrangements and attend to details, such as signs of uniform size, which will prevent one exhibitor cutting off the view from another. I favor smaller signs than now used.

General Electric.—We heartily approve of the plan and will be glad to join in any arrangement satisfactory to all.

H. T. Bigelow, Hale & Kilborn.—Such an association will do much to facilitate the work of exhibitors, and relieve the local committee of a multitude of details.

John High, Pantasote Co.—Those are my sentiments.

H. J. Davies, National Carbon Co.—That is what we ought to have by all means. The right kind of an organization, rightly officered and conducted, would be a great thing, and we have plenty of good men from whom to choose.

E. Peckham, president Peckham Co.—I have always been in favor of just such an organization, and it is something which should have been done years ago. I am heartily in favor of it and hope

something will come of the agitation this time. The exhibitors certainly do not receive the consideration to which they are entitled. These exhibitors have gone to thousands of dollars to present something instructive and interesting and while we receive our share of attention I speak of the display as a whole and express the universal opinion that the program should be made to allow much more time in the hall. Many have told me they were tempted never to make another exhibit, and others are taking small spaces than formerly. I appreciate the fact that this is a condition which has been a matter of growth and is not the result of any one to intentionally slight the supply men. But that makes it none the less disappointing to those who have gone to much expense and trouble to provide something interesting. We need an organization which can be represented by a committee and secure the recognition which the exposition deserves. The present time allowed us is altogether too short.

Geo. C. Bailey, Roebbling Co.—Such an organization would be conducive of great good to the supply interests, and reduce expenses.

Victor Angerer, Wharton Co.—If properly organized and managed it would be a good thing. If the majority want it I am with them.

D. A. Johnson, Jos. Dixon Crucible Co.—The supply men's interests are now so large in these conventions they should get together and can save money and improve the display by so doing.

Max Berg, McGill, Pomeroy & Berg.—That's just what we need. Let us have it.

E. S. Nethercut, Paige Iron Works.—Yes, I favor such an organization. It would find plenty to do and everybody would be benefited.

Consolidated Rail Joint Co.—We heartily agree with the plan as proposed to us.

Consolidated Car Heating Co.—We are in favor of the plan to form such an organization.

Chas. W. Cobb, Chicago Mica Co.—An excellent idea. I would like to see a uniformity in signs which should also be placed in a line and at a uniform distance from the floor.

J. W. Perry, H. W. Johns Co.—It is well worth taking up. Would relieve the local committee and result in a more systematic arrangement all around, and facilitate matters for everybody.

T. C. White, Central Union Brass Co.—A good thing; push it along.

G. R. Pratt, Star Brass Works.—By all means. Have something along the line of the M. C. B. supply men's association. That has been a success for years. I will gladly bear my share of any work or expense.

J. R. Wiley, Standard Underground Cable Co.—I think this exhibit business should be governed by an organization of its own, and so done would result in benefit all around.

F. A. Estep, R. D. Nuttall Co.—I am in favor of the plan. Such an organization, with its executive board or restraining committee, would make another place of our annual display. Heretofore and now there is a heterogeneous mass of signs of all sizes and colors. Such a motley collection would be classed in New York as belonging to a county fair. I favor an association of supply men.

D. B. Dean: Yes, I favor an organization if everybody will go in and unite on a plan, and there is no reason why we should not do so. Others have with good results.

R. H. Ham, Ham Sand Box Co.—Am in favor of what is outlined and think it would be a good thing.

Scott H. Blewett, American Car & Foundry Co.—The booths should be more uniform, the signs of a uniform height, lettering of a uniform size and color. So far as possible exhibitors of the same class should be grouped together. These and many other desirable improvements can be brought about by a supply men's association and would greatly improve appearance and save money. It has been done for years in the steam road field and their display is not so large as this.

Harold P. Brown: The plan as stated to me is needed and should be carried out. There is a great deal to be gained in many ways, and as an association we are in a position to secure many concessions that comes to large propositions and are denied individuals. It need not be a cumbersome affair, and its annual meeting consume little time, but the possible results will be recognized by everyone who makes an exhibit. I hope to see the organization effected.

F. W. Edmunds, Q. & C. Co: I favor your plan. We have the

same thing in steam road supplies in the Trackmasters' Association, the Master Car Builders, and also Master Mechanics Associations and have had for years. It is simply indispensable in those lines. The exhibiting concerns are taxed pro rata on their space or booths and the fund collected the first day by the treasurer. The committee thus have a fund for use in case of emergency without going round with the hat. In these conventions there is no local entertainer as in the case of the street railways, and it devolves upon supply men to provide carriage drives, flowers and theatre parties for the ladies. I assume the entertaining street railway company would always want to entertain as heretofore, therefore the necessary expenses of a street railway supply men's association would be nominal, although I think the exhibitors have always stood ready to contribute to the American Association if their help had ever been needed. There is usually some surplus left which is paid back pro rata to the exhibitors. For example our tax this year was \$39, and we were rebated \$7 after the convention which lasted a full week, closed. The committee is elected each year, does its work without friction and everybody is satisfied. It contracts for all the usual hall expenses, teaming, carpenters, etc., and secures low rates for the whole job. Each exhibitor is charged for what he gets.

The supply men held an annual meeting for election and any other business and this takes place during one of the business sessions of the main association. The two organizations are entirely separate, but the committee from the supply men can always take up and arrange any desired features with the main association. The plan has worked like a charm for years, and there is no reason why our supply men should not work together on the same basis.

W. H. Gray.—It's a good thing if we can get the right kind of men in control. I should favor a membership vested in companies or concerns, so that the large concerns cannot come in and vote 10 or 15 representatives against an equal number of small firms with only one representative present. There should be a committee elected annually from the members, of say three or five to carry out the work of the association along the lines of a policy decided by the members. If the plan is carefully matured and can be presented for action at next year's convention there would be something tangible to act on, and an intelligent action taken on the advisability or otherwise of effecting the association. I hope to see it worked out.

J. T. McMichael, Atlas Rail Joint.—Yes, I am in favor of the organization.

W. J. Cook, McGuire Co.—Mr. Cook was not interviewed but has so often expressed himself to the writer that we take the liberty of committing him in good earnest. His long experience in the steam road supply associations has convinced him of the benefits to be derived.

Only five street railway men were interviewed but each one was pleased with the idea.

Walton H. Holmes said, speaking as a railway man and not as an officer of the American Association that he considered it a good thing and would enable the supply men undoubtedly to secure many improvements which the local street railway men would not be likely to think of. If the supply men took hold of the matter it would be ably conducted.

T. C. Penington, speaking for himself, expressed the same views.

F. G. Jones, vice-president of the Memphis street railway, and also a member of the executive committee for the past year, said: From now on the supply men and the street railway men will be more closely drawn together. I think it is an excellent idea and hope the boys will carry it out.

W. Worth Bean hoped the organization would be effected. He recalled the time when there was considerable discussion about the supply men coming in as associate members. This was at Montreal when the boys offered to raise the debt of the association in full, a matter of some \$4,000. He urged them at that time to organize one of their own, and has wondered why it was not done long ago.

The last interview was with W. W. Satterlee, chairman of the local committee of exhibits. He has worked night and day and Sundays for nearly a month past, and the result of this has been evident in the rapid and systematic installation of exhibits. He has good reason to be proud of his efforts, and every supply man is grateful and appreciates his work. Mr. Satterlee expressed himself as heartily in favor of the new plan. He was sure the local railway people wherever the convention met would feel the same

way, and be only too glad to be relieved of a most trying position, and one which really requires more of a manager's time if rightly done, than he can spare in justice to himself. He appreciated highly all the pleasant things which exhibitors had said expressive of satisfaction at his efforts, and desired to thank them one and all through the "Review."

Mr. F. W. Darlington had parlors at the Coates House and was kept busy answering questions about the electric fountains which he makes for street railway parks and pleasure resorts. Among the places where Darlington fountains are installed are Willow Park, Philadelphia. The Plaza, Brooklyn, Schenley Park, Pittsburgh and Crystal Palace, London.

TRIP TO THE HEIMS' PLANT.

One of the most enjoyable entertainments provided yesterday was the trip to the plant and park of the East Side Electric Railway Co., better known locally as the Heims' Line. Special cars were in waiting at 5th and Walnut Streets, the city terminus, at the appointed time and a large number of the railway men took advantage of the opportunity to inspect the road. After an enjoyable ride the visitors were welcomed by the superintendent, Mr. W. O. Hands, who first conducted them through the large brewery of the Heim Brothers. Later the guests were introduced to the Messrs. Heim and then visited Electric Park and the power house. The electric fountain at the park was very interesting because of its mechanical simplicity, notwithstanding that it is equipped for living picture work as well as the ordinary water and color effects of such fountains.

The power house and line were described in our monthly issue for October. Leather purses were the visible souvenirs brought away by the visitors.

HAM IS ALL RIGHT.

The cog slipped again yesterday and the type setting machine made us say of President Ham of the Accountants' Association that "a better selection could have been made." Hereafter in printing in a strange garret we shall NOT construct our sentences so as to give the machine operator or the cub-editor any such chance.

D. B. Dean has accepted charge of the western territory for the J. G. Brill Co.

The Accountants were greatly disappointed at the unavoidable absence of J. F. Calderwood, of Minneapolis.

A very practical and unusual souvenir is being given out by Hanna & Gray. It is a record book, good for 21 years, for managers private use, providing for comparative records of every department of the business. The compilation is dedicated to the Accountants' Association and built along standard lines. Copies are being sent to managers with their name in gold on the cover. It is the only work of the kind in print, and is edited by a prominent street railway accountant.

The Brill Co. distributed a neat and serviceable fountain pen, which is much prized by recipients.

We are pleased to recognize the excellent work rushed out for us by the Kansas City engraving firm of Teachener & Bartberger. Quick work did not seem to injure quality. The same should be said of our printers, the Hudson & Kimberly Publishing Co.

The Knell Air Brake Co. distributed flowers to the ladies who attended the Convention Hall vaudeville.

After New York got what she came after, she was obliged to take an early train and could not attend the banquet.

The Electrical Installation Co., of Chicago, did a great deal of the track and overhead work in Kansas City. The work is all labelled and will bear inspection. For further particulars apply to J. A. Brett or F. H. Fitch, who are in attendance.

THE BANQUET.

The Kansas City Convention Closes in a Big Blaze of Glory and a Gale of Eloquence—President Roach Being Called Home, on Business, Vice-President Rigg Presides—About Three Hundred Present.

The hall was a scene of beauty, decorated as it was with bunting, and the tables were covered with ferns and cut flowers.

There can be no doubt but that the banquet of last evening was the liveliest function of this nature in the history of the association. President-elect Holmes believes that there is nothing like music and song to put a company in good humor with themselves and the world and he provided for this accessory in abundance, and with the happiest results.

One of the most novel as well as enjoyable features of the entertainment was furnished by 25 members of Epperson's Megaphone Minstrels. This organization numbers about 125 members, all of the most prominent men in Kansas City; it takes its name from the father of the idea, Mr. U. S. Epperson. This organization can always be relied upon to help Kansas City out of any difficulties, thus when Convention Hall was burned in April last the Minstrels were among the first to step into the traces. It is proper to mention here that President Holmes was an active member of the building committee.

A number of selections were rendered by the Minstrels and also by a quartette of their number.

At 10 o'clock the Virginia quintette, consisting of President Holmes, H. Arnold, F. Fosha, Dr. Walter Jackson and J. M. Sessions sang "Old Fashioned Home."

The entire company was at all times ready to join in the chorus, and grasped the spirit of Mr. Holmes so that the waiters usually walked to ragtime.

At 11 o'clock Vice-President Rigg mounted the platform of the car behind his chair—"Kansas City, 1900"—and announced that President Roach had at 5 p. m. appointed him as conductor of the car and requested that he get a good motorman. He then introduced D. B. Holmes to act as toastmaster.

Mr. Holmes: Ladies and Gentlemen, you may well appreciate my embarrassment at being called upon to conduct these exercises to their conclusion, under the circumstances which have been mentioned by the gentleman who has just preceded me. I was about to say that no one could regret more than I the absence of the distinguished retiring president of this association this evening and upon reflection I am convinced that all of my auditors will regret it more than I do.

Before we proceed with the program of toasts, I desire to say in behalf of Kansas City, that all of its inhabitants feel highly honored by the distinguished association which has assembled in its midst, and which is this evening concluding its deliberations. While we feel honored in that respect we feel still more honored in the fact that one of our own fellow citizens has been selected to preside over your association during the ensuing year. (Great applause.) Surely no higher compliment could have been paid to our city and surely none could be more appreciated than it will by all of us. (Applause.)

You have heard the praises of Kansas City by our distinguished mayor in welcoming you in our midst, and I will not undertake to repeat any of the good things which he said. I think you are ready to hear the words of wisdom and of wit which are to be made before you at this time, and that you would prefer to listen to the speakers who are to respond to the toasts than to any extended remarks from me.

The first toast to be responded to this evening is that of "Looking Backward." It is not a very pleasant thing for most of us to look backward—many of us have regrets and reminiscences which are not altogether pleasant things under all circumstances; but I have to say, ladies and gentlemen, that we have with us this evening a man who, if anybody, can make it pleasant for us to look backward; and I have the pleasure of introducing Mr. W. S. Gilbert, who will now address you on the toast "Looking Backward."

Mr. Gilbert: Mr. Toastmaster, Ladies and Gentlemen: It would be intensely interesting to know many things about the daily life of our ancestors which the stately muse of history has failed to chronicle. You who are assembled here tonight would like to

LIVING PICTURES.

In the October souvenir edition of the "Review," among our collection of good-looking men appeared the portraits of Superintendent Satterlee and Electrician Grover, of the Metropolitan, this city. We expected an immediate and large increase in the subscription list and were not disappointed. But some unmitigated Chicago scoundrel—probably some supply man—plotted to bring about an estrangement between our above named good friends and ourselves. What did he do but cut out the portraits, and send them to the Chicago Chief of Police with a statement that these were two dangerous characters who were planning to attend the street car convention in Kansas City, and were liable to get away with the whole shooting match.

The aforesaid chief promptly forwarded the pictures and advices to the Kansas City chief, who detailed a new man to lay for them. This sleuth polished up his eagle eye, and taking his life in one hand and the pictures in the other, concealed himself behind a trolley pole. Presently he spied a strong resemblance to the portrait, but the suspected one looked so much like Mr. Satterlee he paused to hesitate. Inquiry confirmed his guess so he let his victim escape. Soon after he caught a glimpse of Grover, whom he did not know, and anxious to bag somebody to take home to the chief he sailed in. Grover claimed exemption on account of having served on a petit jury some years ago, likewise that one of the motors on 6th Street was sparking badly and needed immediate attention. He finally bought the cop off and since he induced John O'Keefe not to let any more minions through the door, is breathing freely again.

Now Grover says it is up to us and we therefore hereby offer a year's subscription for information which will lead to the apprehension of the gully party.

VAUDEVILLE AT CONVENTION HALL.

The vaudeville show was a hummer and witnessed by 3,000 persons. The whole convention was present in nice front seats and the others were residents of the city. The entertainment began at 2 o'clock and was continuous until 4:30. Like the supply men, it didn't stop until the performers were through. The program included singing, dancing, tumbling, trick dogs, etc. At the close Secretary Penington proposed three cheers for the supply men, which were given with a will, also a tiger.

The ladies turned out in full force and occupied the boxes and reserved seats. The orchestral music was excellent.

As a leader to the show a brass band of 20 pieces marched through the Coates and Midland, and several business streets. G. E. Pratt acted as drum major. In the procession were a group of negroes wearing heads of elephants and monkeys. Then a lot of signs, one of which was 30 ft. long telling all about the show. This colored contingent was headed by Elmer Morris. The chief of police in a fierce uniform was John Granger.

Bleecher Barnard, 78 inches high, rode the donk. 36 inches high. It was fun for Barnard, but tough on the donk. On reaching the hall a band concert was given.

The menu card for the banquet was very handsome; the front cover symbolized the start and was engraved in gold and several colors. The back cover showed the finish in plain black and white; aside from the menu proper, the intervening pages contained the list of officers and committees.

SHALL SUPPLY MEN ORGANIZE?

The Time Considered ripe for Such an Association—Benefits to be Derived—Exhibitors Can Handle the Problem More Easily Than Street Railway Officials—Interviews With Leading Supply Men Show Great Interest in the Scheme.

"The time has come when we need an organization of the supply men to take the burden of the exhibit hall and its contents off the shoulders of the local officials. The display has now reached mammoth proportions and is constantly growing. We know what we want and how to handle the innumerable details connected with the show much better than any one who has not been through the mill."

It was Maj. Evans, of the Lorain Steel Co., one of the most prominent of the supply men and who has had years of experience in exhibiting at our conventions who made the foregoing remark as the curtain rang down on the vaudeville show in Convention hall yesterday afternoon. Several exhibitors, who were present, instantly voiced their approval, and at their request the "Review" representative undertook to ascertain the views of as many others as could be reached in the limited time remaining before the banquet. The result of this canvass is given, and of all the persons interviewed only three—who requested not to be quoted—were very much pleased with the idea. These three took pains to state they were not opposed to the idea, but not prepared to endorse it until they had either taken more time to consider or know more of the details.

The situation is this: When exhibits were few and small 15 years ago a small room, usually one, commonly used by traveling men to show goods in the headquarters' hotel, was ample for the display. Then the builders began to bring a few cars which were set out on a piece of temporary track in the street in front of the hotel, gradually the idea was expanded and the display increased until a store room was needed. Usually one could be found near the hotel. At Pittsburg, no other space being available, a river barge was anchored three blocks from the hotel and the display made on board. When electricity became a practical motive power a big jump was made and it became necessary to use skating rinks and similar ground floor structures which afforded large space. From the drummer's room at the hotel which cost nothing to the present day requirements which are so great as to bar some cities out of being considered for convention, has been a long time. In the early days the local roads furnished the banquet free, but when it became necessary to pay from \$1,000 to \$2,000 for an exhibit building the burden was too heavy. Now the inviting company furnishes the hall, turns it over to the association to rent out, and entertains in other ways than the banquet which is managed by the association.

With the steadily increasing number of exhibits which at Chicago were valued at \$250,000 there came an immense amount of detail work for some one on the ground to do. Changes had to be made in the building; stronger floors built; wide doors cut; wires run for light and power; arrangements for teaming hundreds of tons of appliances and machinery; carpenter work which in the aggregate would build a house, provided. Sign painters, electricians, machinists, printers, decorators and painters, furniture men and florists, telegraph operators, messengers, and telephones. All these now have to be in readiness. Then the correspondence involved between the convention city and exhibitors, covering several weeks and involving the dictating of hundreds of letters, all these things have followed in the wake of the expansion of the exhibit idea, which, within the experience of the writer, was limited to a few rope harness, patent horse medicine and a few bell punches.

The burden of the work alluded to above naturally falls on some railway official, usually the manager of the inviting road. He is always a busy man and the additional burden which the convention imposes is little realized by any but those who have been through it. The supply men feel they should not ask it and are perfectly willing to relieve the manager of his work.

Another feature which handicaps the local committee on exhibits is that the meeting goes to a different place each year, and the committee there has it all to learn just as some one did in another city the year before. It is asking a good deal in spite of the willing spirit in which the work has always been done.

The plan now proposed is to organize the supply men next

year at New York and put things on a permanent and uniform basis. Elect a standing committee to take entire charge of the hall and everything in it except the meeting rooms of the two associations. The committee would engage some experienced, thoroughly competent man for several weeks in advance of the convention. He would take charge of affairs. Would make the contracts in the name of the supply men's Association for all teaming, labor, power, etc. Each exhibitor would feel perfectly free to use this man without feeling they were imposing on the good nature of a busy manager. If anything did go wrong they need not hesitate to enter a complaint to their own committee and get an adjustment. This article is not written in any spirit of criticism—far from that; nor have there been any shortcomings here at Kansas City to suggest it. In all our convention experience there has never been less friction and annoyance than here, but there has been in the past and is liable to be in the future. There are many things which bear down on the exhibitor which never come to the knowledge of the railway people. For instance: the local committee contract for carpenter work. They select the best they can. An exhibitor puts in a requisition for a platform and booth. The order is turned over to the contractor who then deals exclusively with the exhibitor. Through some carelessness in book-keeping we will say, and during past years many times with direct intention the contractor takes advantage of the emergencies and necessities of the exhibitor and tucks an extra \$10 or \$20 on his bill. The exhibitor feels a reluctance to complain to the local railway manager with whom he may have, or hopes to have dealings, so he says nothing pays his bill and sometimes contents himself with cuss words. The illustration is no fairy tale. It goes all along the line of teaming, wiring, sign painting, and down the whole list.

We do not mean to say that every exhibitor gets stuck on every one of the above items, though several times it has been nearly as bad as this. But the trouble lies in the lack of any authority to whom the exhibitor feels at liberty to appeal. With an association, its superintendent is the association's hired man, and bound to take up such matters and adjust them. It is no favor asked of him—he is paid to attend to just such things.

Another advantage would be the possibility of adopting and enforcing a standard set of rules as to the size, appearance and location of signs, which at present are very nondescript. Signs of all sizes and previous conditions of servitude touch ends with the one inlaid with gold letters and polished wood, canvas, tin, boards, "any old thing" goes. To bring these signs into some sort of uniformity would not cost anybody very much, and would improve the effect as a whole several hundred per cent. One exhibitor would not be allowed to build a canvas wall to shut out from view somebody else, sometimes a competitor. Signs are necessary and lots of them, but there are signs and bill boards.

In the question of freight to convention a marked saving can be made. As an association its committee is in position to deliver to the road offering the best rates and time shipment, practically the whole freight, and secure for its members concessions which their individual shipments would not warrant. For instance all the shipments from New York to Chicago last year could have been lumped and sent over one road with several routes to choose from.

The exhibitors complain bitterly at the lack of attention paid them by the railway delegates. Organize and send a committee upstairs and they will receive a ready hearing and this matter can be improved. Tell the railway body what it has cost to do all this; and that we are getting to a point where the game is hardly worth the candle. When they understand these things they will devote more time down stairs.

And while the committee is there maybe the railway people would like to arrange for a little less noise during the business sessions, so those sitting back of the front 3 rows of seats could hear the discussion instead of, as this week, getting it by the lip reading method. Now the exhibitors did not intentionally intrude on the deliberations, but if they had only gone up in the tent room a few minutes we believe they would have hurried back and turned on some quiet.

The foregoing touches only on the outer edges of many reforms, improvements and advances possible with organization. The single exhibitor has no voice at present in the present associations, nor does he ask it, and he could not go as such. But as an exhibit body his committee can go, leaving all individuality below, and pretest, request and suggest with dignity and propriety.

In the steam road field such an organization has been in existence for years, and has contributed in a large measure to the success, strength, longevity and pleasure of the parent association. There is no reason why the same should not be repeated in our case.

The following interviews were all it was possible to secure in the limited time. Almost without exception the person interviewed insisted that it be distinctly understood what he said was in no spirit of criticism on the management of the local committees here in Kansas City. Chairman Satterlee was accorded high praise. There has never been less friction and annoyance than here. It is the future and the expansion of the exhibit feature that it is desired to provide for.

Maj. Evans: I am most heartily in favor of an organization of the supply men. There can be no possible objection and the advantages are numerous. They have been exhibiting for years, know what they want better than anyone else, and have abundant talent among their numbers to form an executive board which will be acceptable to all. There are scores of things which we can do as an organization which is impossible as individuals, and I have been in favor of one for years.

Elmer P. Morris: I do not think it fair to put the burden any longer on the local committee of exhibits. Since the display has grown to such proportions it really requires the entire time of one man on the ground for several weeks, and we ought not to ask the manager of a big railway system—always a busy man—to lay aside his work to attend to this. As an organization we can regulate the size of signs and many things we ought now to do. We should of course work in perfect harmony with the American Association—in fact in conjunction with it, but we can do many things for ourselves better than they can do it for us. We are not asking for the revenue the association receives for floor space but would like to have the handling of details, and in short the management of the exhibit hall.

W. R. Garton: I think we should by all means have a supply men's association.

W. S. Rugg, Westinghouse Co.: I think it would be a good move to make.

Geo. D. Casgrain, Griffin Wheel Co.: There ought to be a uniform system for many features of exhibiting which can only be secured through organization. I am in favor of it.

G. R. Scragham, Creaghead Engineering Co.: I consider an organization of the supply men a practical necessity. It would be a great relief to the local committee and the obliging secretary of the American Association, and would result in good not only to the convention but to the supply men themselves.

J. V. Titus, Garton-Daniels Co.: I am heartily in favor of it.

John Taylor, Taylor Truck Co.: I am very much in favor of it if we could arrange so that day times the exhibits could be viewed. One day is not enough for everybody to see each exhibit. You have to interview a great many people individually. The exhibitors here have spent easily \$50,000 in making this display and it is a lot of money and deserves more attention. The time now allotted is, too short. With an organization we could have our committee represent us before the Railway Association and present our claims, and I hope secure arrangements which would be better than ever before.

Arthur Davis: I want it. We need a committee to arrange freight matters, and other things of mutual interest.

Mr. Carl, Carl Electric Co.—I favor it with a standing committee to make arrangements and attend to details, such as signs of uniform size, which will prevent one exhibitor cutting off the view from another. I favor smaller signs than now used.

General Electric.—We heartily approve of the plan and will be glad to join in any arrangement satisfactory to all.

H. T. Bigelow, Hale & Kilborn.—Such an association will do much to facilitate the work of exhibitors, and relieve the local committee of a multitude of details.

John High, Pantasote Co.—Those are my sentiments.

H. J. Davies, National Carbon Co.—That is what we ought to have by all means. The right kind of an organization, rightly officered and conducted, would be a great thing, and we have plenty of good men from whom to choose.

E. Peckham, president Peckham Co.—I have always been in favor of just such an organization, and it is something which should have been done years ago. I am heartily in favor of it and hope

something will come of the agitation this time. The exhibitors certainly do not receive the consideration to which they are entitled. These exhibitors have gone to thousands of dollars to present something instructive and interesting and while we receive our share of attention I speak of the display as a whole and express the universal opinion that the program should be made to allow much more time in the hall. Many have told me they were tempted never to make another exhibit, and others are taking smaller spaces than formerly. I appreciate the fact that this is a condition which has been a matter of growth and is not the result of any one to intentionally slight the supply men. But that makes it none the less disappointing to those who have gone to much expense and trouble to provide something interesting. We need an organization which can be represented by a committee and secure the recognition which the exposition deserves. The present time allowed us is altogether too short.

Geo. C. Bailey, Roebling Co.—Such an organization would be conducive of great good to the supply interests, and reduce expenses.

Victor Angerer, Wharton Co.—If properly organized and managed it would be a good thing. If the majority want it I am with them.

D. A. Johnson, Jos. Dixon Crucible Co.—The supply men's interests are now so large in these conventions they should get together and can save money and improve the display by so doing.

Max Berg, McGill, Pomeroy & Berg.—That's just what we need. Let us have it.

E. S. Nethercut, Paige Iron Works.—Yes, I favor such an organization. It would find plenty to do and everybody would be benefited.

Consolidated Rail Joint Co.—We heartily agree with the plan as proposed to us.

Consolidated Car Heating Co.—We are in favor of the plan to form such an organization.

Chas. W. Cobb, Chicago Mica Co.—An excellent idea. I would like to see a uniformity in signs which should also be placed in a line and at a uniform distance from the floor.

J. W. Perry, H. W. Johns Co.—It is well worth taking up. Would relieve the local committee and result in a more systematic arrangement all around, and facilitate matters for everybody.

T. C. White, Central Union Brass Co.—A good thing; push it along.

G. R. Pratt, Star Brass Works.—By all means. Have something along the line of the M. C. B. supply men's association. That has been a success for years. I will gladly bear my share of any work or expense.

J. R. Wiley, Standard Underground Cable Co.—I think this exhibit business should be governed by an organization of its own, and so done would result in benefit all around.

F. A. Estep, R. D. Nuttall Co.—I am in favor of the plan. Such an organization, with its executive board or restraining committee, would make another place of our annual display. Heretofore and now there is a heterogeneous mass of signs of all sizes and colors. Such a motley collection would be classed in New York as belonging to a county fair. I favor an association of supply men.

D. B. Dean: Yes, I favor an organization if everybody will go in and unite on a plan, and there is no reason why we should not do so. Others have with good results.

R. H. Ham, Ham Sand Box Co.—Am in favor of what is outlined and think it would be a good thing.

Scott H. Blewett, American Car & Foundry Co.—The booths should be more uniform, the signs of a uniform height, lettering of a uniform size and color. So far as possible exhibitors of the same class should be grouped together. These and many other desirable improvements can be brought about by a supply men's association and would greatly improve appearance and save money. It has been done for years in the steam road field and their display is not so large as this.

Harold P. Brown: The plan as stated to me is needed and should be carried out. There is a great deal to be gained in many ways, and as an association we are in a position to secure many concessions that comes to large propositions and are denied individuals. It need not be a cumbersome affair, and its annual meeting consume little time, but the possible results will be recognized by everyone who makes an exhibit. I hope to see the organization effected.

F. W. Edmunds, Q. & C. Co: I favor your plan. We have the

same thing in steam road supplies in the Trackmasters' Association, the Master Car Builders, and also Master Mechanics Associations and have had for years. It is simply indispensable in those lines. The exhibiting concerns are taxed pro rata on their space or booths and the fund collected the first day by the treasurer. The committee thus have a fund for use in case of emergency without going round with the hat. In these conventions there is no local entertainer as in the case of the street railways, and it devolves upon supply men to provide carriage drives, flowers and theatre parties for the ladies. I assume the entertaining street railway company would always want to entertain as heretofore, therefore the necessary expenses of a street railway supply men's association would be nominal, although I think the exhibitors have always stood ready to contribute to the American Association if their help had ever been needed. There is usually some surplus left which is paid back pro rata to the exhibitors. For example our tax this year was \$30, and we were rebated \$7 after the convention which lasted a full week, closed. The committee is elected each year, does its work without friction and everybody is satisfied. It contracts for all the usual hall expenses, teaming, carpenters, etc., and secures low rates for the whole job. Each exhibitor is charged for what he gets.

The supply men hold an annual meeting for election and any other business and this takes place during one of the business sessions of the main association. The two organizations are entirely separate, but the committee from the supply men can always take up and arrange any desired features with the main association. The plan has worked like a charm for years, and there is no reason why our supply men should not work together on the same basis.

W. H. Gray.—It's a good thing if we can get the right kind of men in control. I should favor a membership vested in companies or concerns, so that the large concerns cannot come in and vote 10 or 15 representatives against an equal number of small firms with only one representative present. There should be a committee elected annually from the members, of say three or five to carry out the work of the association along the lines of a policy decided by the members. If the plan is carefully matured and can be presented for action at next year's convention there would be something tangible to act on, and an intelligent action taken on the advisability or otherwise of effecting the association. I hope to see it worked out.

J. T. McMichael, Atlas Rail Joint.—Yes, I am in favor of the organization.

W. J. Cook, McGuire Co.—Mr. Cook was not interviewed but has so often expressed himself to the writer that we take the liberty of committing him in good earnest. His long experience in the steam road supply associations has convinced him of the benefits to be derived.

Only five street railway men were interviewed but each one was pleased with the idea.

Walton H. Holmes said, speaking as a railway man and not as an officer of the American Association that he considered it a good thing and would enable the supply men undoubtedly to secure many improvements which the local street railway men would not be likely to think of. If the supply men took hold of the matter it would be ably conducted.

T. C. Penington, speaking for himself, expressed the same views.

F. G. Jones, vice-president of the Memphis street railway, and also a member of the executive committee for the past year, said: From now on the supply men and the street railway men will be more closely drawn together. I think it is an excellent idea and hope the boys will carry it out.

W. Worth Bean hoped the organization would be effected. He recalled the time when there was considerable discussion about the supply men coming in as associate members. This was at Montreal when the boys offered to raise the debt of the association in full, a matter of some \$4,000. He urged them at that time to organize one of their own, and has wondered why it was not done long ago.

The last interview was with W. W. Satterlee, chairman of the local committee of exhibits. He has worked night and day and Sundays for nearly a month past, and the result of this has been evident in the rapid and systematic installation of exhibits. He has good reason to be proud of his efforts, and every supply man is grateful and appreciates his work. Mr. Satterlee expressed himself as heartily in favor of the new plan. He was sure the local railway people wherever the convention met would feel the same

way, and be only too glad to be relieved of a most trying position, and one which really requires more of a manager's time if rightly done, than he can spare in justice to himself. He appreciated highly all the pleasant things which exhibitors had said expressive of satisfaction at his efforts, and desired to thank them one and all through the "Review."

Mr. F. W. Darlington had parlors at the Coates House and was kept busy answering questions about the electric fountains which he makes for street railway parks and pleasure resorts. Among the places where Darlington fountains are installed are Willow Park, Philadelphia. The Plaza, Brooklyn, Schenley Park, Pittsburgh and Crystal Palace, London.

TRIP TO THE HELMS' PLANT.

One of the most enjoyable entertainments provided yesterday was the trip to the plant and park of the East Side Electric Railway Co., better known locally as the Helms' Line. Special cars were in waiting at 5th and Walnut Streets, the city terminus, at the appointed time and a large number of the railway men took advantage of the opportunity to inspect the road. After an enjoyable ride the visitors were welcomed by the superintendent, Mr. W. O. Hands, who first conducted them through the large brewery of the Heim Brothers. Later the guests were introduced to the Messrs. Heim and then visited Electric Park and the power house. The electric fountain at the park was very interesting because of its mechanical simplicity, notwithstanding that it is equipped for living picture work as well as the ordinary water and color effects of such fountains.

The power house and line were described in our monthly issue for October. Leather purses were the visible souvenirs brought away by the visitors.

HAM IS ALL RIGHT.

The cog slipped again yesterday and the type setting machine made us say of President Ham of the Accountants' Association that "a better selection could have been made." Hereafter in printing in a strange garret we shall NOT construct our sentences so as to give the machine operator or the cub-editor any such chance.

D. B. Dean has accepted charge of the western territory for the J. G. Brill Co.

The Accountants were greatly disappointed at the unavoidable absence of J. F. Calderwood, of Minneapolis.

A very practical and unusual souvenir is being given out by Hanna & Gray. It is a record book, good for 21 years, for managers private use, providing for comparative records of every department of the business. The compilation is dedicated to the Accountants' Association and built along standard lines. Copies are being sent to managers with their name in gold on the cover. It is the only work of the kind in print, and is edited by a prominent street railway accountant.

The Brill Co. distributed a neat and servicable fountain pen, which is much prized by recipients.

We are pleased to recognize the excellent work rushed out for us by the Kansas City engraving firm of Teacher & Bartberger. Quick work did not seem to injure quality. The same should be said of our printers, the Hudson & Kimberly Publishing Co.

The Knell Air Brake Co. distributed flowers to the ladies who attended the Convention Hall vaudeville.

After New York got what she came after, she was obliged to take an early train and could not attend the banquet.

The Electrical Installation Co., of Chicago, did a great deal of the track and overhead work in Kansas City. The work is all labelled and will bear inspection. For further particulars apply to J. A. Brett or F. H. Fitch, who are in attendance.

THE BANQUET.

The Kansas City Convention Closes in a Big Blaze of Glory and a Gale of Eloquence—President Roach Being Called Home, on Business, Vice-President Rigg Presides—About Three Hundred Present.

The hall was a scene of beauty, decorated as it was with bunting, and the tables were covered with ferns and cut flowers.

There can be no doubt but that the banquet of last evening was the liveliest function of this nature in the history of the association. President-elect Holmes believes that there is nothing like music and song to put a company in good humor with themselves and the world and he provided for this accessory in abundance, and with the happiest results.

One of the most novel as well as enjoyable features of the entertainment was furnished by 25 members of Epperson's Megaphone Minstrels. This organization numbers about 125 members, all of the most prominent men in Kansas City; it takes its name from the father of the idea, Mr. U. S. Epperson. This organization can always be relied upon to help Kansas City out of any difficulties, thus when Convention Hall was burned in April last the Minstrels were among the first to step into the traces. It is proper to mention here that President Holmes was an active member of the building committee.

A number of selections were rendered by the Minstrels and also by a quartette of their number.

At 10 o'clock the Virginia quintette, consisting of President Holmes, H. Arnold, F. Fosha, Dr. Walter Jackson and J. M. Sessions sang "Old Fashioned Home."

The entire company was at all times ready to join in the chorus, and grasped the spirit of Mr. Holmes so that the waiters usually walked to ragtime.

At 11 o'clock Vice-President Rigg mounted the platform of the car behind his chair—"Kansas City, 1900"—and announced that President Roach had at 5 p. m. appointed him as conductor of the car and requested that he get a good motorman. He then introduced D. B. Holmes to act as toastmaster.

Mr. Holmes: Ladies and Gentlemen, you may well appreciate my embarrassment at being called upon to conduct these exercises to their conclusion, under the circumstances which have been mentioned by the gentleman who has just preceded me. I was about to say that no one could regret more than I the absence of the distinguished retiring president of this association this evening and upon reflection I am convinced that all of my auditors will regret it more than I do.

Before we proceed with the program of toasts, I desire to say in behalf of Kansas City, that all of its inhabitants feel highly honored by the distinguished association which has assembled in its midst, and which is this evening concluding its deliberations. While we feel honored in that respect we feel still more honored in the fact that one of our own fellow citizens has been selected to preside over your association during the ensuing year. (Great applause.) Surely no higher compliment could have been paid to our city and surely none could be more appreciated than it will by all of us. (Applause.)

You have heard the praises of Kansas City by our distinguished mayor in welcoming you in our midst, and I will not undertake to repeat any of the good things which he said. I think you are ready to hear the words of wisdom and of wit which are to be made before you at this time, and that you would prefer to listen to the speakers who are to respond to the toasts than to any extended remarks from me.

The first toast to be responded to this evening is that of "Looking Backward." It is not a very pleasant thing for most of us to look backward—many of us have regrets and reminiscences which are not altogether pleasant things under all circumstances; but I have to say, ladies and gentlemen, that we have with us this evening a man who, if anybody, can make it pleasant for us to look backward; and I have the pleasure of introducing Mr. W. S. Gilbert, who will now address you on the toast "Looking Backward."

Mr. Gilbert: Mr. Toastmaster, Ladies and Gentlemen: It would be intensely interesting to know many things about the daily life of our ancestors which the stately muse of history has failed to chronicle. You who are assembled here tonight would like to

PECKHAM TRUCKS.

The Peckham Truck Co.'s exhibit at Convention Hall consisted mainly of Mr. Peckham's system of double trucks designed for city, suburban, elevated and high speed trunk line service, the only single truck shown being a Peckham extra long cantilever extension truck as constructed for the Omaha Electric Railway, of Omaha, Neb., which has a large number of them in use. The system of double trucks on exhibition comprised one "Standard" maximum traction, style 14-D-3; one extra strong maximum traction, style 14-D-5; one pair extra strong maximum traction, style 14-D-8; one short wheel base, style "Standard" 14-B-3; one short wheel base, style "Special" 14-B-6; one short wheel base, style "Boston Special"; one short wheel base, style "Kansas City Special"; one extra strong long wheel base No. 26.

The Peckham maximum traction trucks are constructed upon the same general lines with center-bearing swing bolsters and

motors suspended outside of wheel base. The brake mechanism is so constructed that the brakes can be operated with either the small or large wheels leading. The extra strong 14-D-5, and 14-D-8, are constructed with inside brakes, and are provided with extra strong angle bar cross-sections, so connected to the side frames as to prevent the trucks from getting out of square.

Although the construction of these trucks is such that the center bearing bolsters can be so located as to apply the necessary weight to the small wheels to prevent them leaving the rails, the cross end section is so arranged that Peckham's patent half elliptic spring traction adjuster can be attached if desired.

The Peckham Truck Co. claims to be the pioneer of the short wheel base trucks so universally used by electric railways. These styles are constructed with center bearing swing holsters, the

motors being supported outside of the axles. The short wheel base allows the wheels to radiate between the car sills and the height of the car body from the ground to be reduced so that only one step is necessary. The Peckham Company makes several different modifications of this truck. Those on exhibition were one "Standard" construction, style 14-B-3; one "Kansas City Special," designed expressly for the Metropolitan Street Railway Co., of Kansas City, and embodying certain features desired by its master mechanic—the Metropolitan Company has purchased 200 pairs of these and has 75 in service; one "Boston Special," designed expressly for the Boston Elevated Railway Co., of Boston, Mass., which has 250 of them in service.

These trucks are constructed for either one or two motors as desired. When constructed for one motor the brakes are so arranged as to apply the necessary power without skidding the wheels.

For heavy high speed suburban cars the Peckham Company had on exhibition its extra strong No. 26; this truck is constructed with the Peckham patent bridge trussed side frames, which are capable of supporting a load of 100 tons per truck as has been proven by actual tests.

GARTON-DANIELS CO., KEOKUK, IA.

This company's specialties were shown in a booth on the main aisle and received full attention. The main feature was the "Automotoneer" for regulating the speed with which the controller can be moved. This device is now perfected and orders

are coming in at a lively rate. A novelty shown was an extension circuit ringer, which automatically resets itself. The booth was in charge of Messrs. V. J. E. Titus, L. J. Titus and V. J. Van Horn.

TAYLOR TRUCKS.

The Taylor Electric Truck Co., of Troy, N. Y., showed a heavy 6-ft. wheel base, single truck, and latest design of swing motion double truck; also extra heavy double truck for high speed and heavy service. These were in charge of Mr. John Taylor, manager, and Robt. Kasson.

PAIGE IRON WORKS, CHICAGO.

Mr. E. S. Netherent, of Chicago, did the honors for this company and distributed a small pamphlet describing the work it has done on the Chicago elevated railways.

BAKER-VAWTER CO., ATCHISON, KAN.

A new system of loose leaf accounting books shown by Messrs. C. H. Smalley, B. T. Bean and T. H. Waller of this company, aroused much interest, as it possesses many advantages for street railway work.

CHICAGO MICA CO.

The Chicago Mica Co., of Valparaiso, Ind., had samples of standard forms of insulation for street railway motors and gen-

erators; also a line of the well-known "Mica Bond" insulation and "Champion" cloths and papers. The booth was in charge of Mr. Charles W. Cobb, ably assisted by Cobb, Jr.

HAROLD P. BROWN, NEW YORK.

Mr. Brown had a good location on the main aisle devoted to the display of plastic bonds, where he spent his time telling about these money-savers, what they are and what they have done. He

also exhibited a new voltmeter that is even more sensitive than the one he had last year. This instrument will measure the drop in one-eighth of an inch of 90-lb. rail carrying 10 amperes of current.

CONTINUOUS RAIL JOINT CO., NEWARK, N. J.

Samples of continuous rail joints for girder and T rails were exhibited at the north end of the hall by Messrs. L. F. Braine, H. M. Montgomery, F. C. Schmitz, W. E. Clark, J. G. Miller and C. E. Erwin, of the Continuous Rail Joint Co. All of these gentlemen were well pleased with the results of the convention.

CONANT TESTING APPARATUS.

One of the Conant testing boxes for determining the drop in rail joints was shown in the space of the Frank Riddon Co. The Mayer & England Co., of Philadelphia, has recently taken the general sales agency for these devices and is introducing them on a number of roads.

AMERICAN VITRIFIED CONDUIT CO.

This company whose general office is at New York had a stand near the hall entrance where were shown the new standard round

hole single and multiple conduits, made by the American Vitrified Conduit Co., of New York. These embody the advantages of the single and multiple duct systems, and can be laid with dowel pin or mandrel. Mr. B. S. Barnard was in attendance.

LORAIN STEEL CO.

This company had prominent space at the entrance to Convention Hall, where it had the following: Two No. 34, 50-h. p. mo-

tors shown in operation on a type "F" du Pont double truck, with a No. 38-A improved controller; one No. 18, 25-h. p. motor; one No. 27, 37-h. p. motor; one No. 18, 25-h. p. motor; and an armature and field coil for the No. 34 motor.

The special work department exhibited two steam railroad crossings, girder crossing switches, etc., and the rail department showed samples of various sections of rails.

The Lorain Company has a large amount of its apparatus in use in Kansas City and vicinity, including du Pont single trucks which are standard on the Metropolitan Street Railway, rails, motors, etc.

Those representing the company were: Messrs. P. M. Boyd, secretary, R. T. Lane, sales agent, F. A. Merrick, manager of the motor department, H. C. Evans, of the New York sales office, A. S. Littlefield and D. J. Evans, of the Chicago office, S. R. S. Ellis, of Pittsburg, and W. W. Kingston, of Atlanta.

The United States Electric Signal Co., of Watertown, Mass., brought out a new signal system for electric railways. The good points were explained by Messrs. Frederick E. Withee and J. J. Ruddick.

ALBANY GREASE.

LEA HEADLIGHT.

The well-known Albany lubricants and grease cups were represented by Winne & Kellogg, the Chicago agents.

AMERICAN BRAKE SHOES.

The American Brake Shoe Co. is represented at the convention by Messrs. F. W. Sargent, E. L. Adreon and A. Gemunder, who are explaining at space No. 13, all about the "Diamond S" and "U" brake shoes.

PANTASOTE CO.

The car curtains and seat coverings made by this company were shown in connection with the display of the Curtain Supply Co. Pantasote has steadily gained in favor since last convention and is now in use on roads throughout the world, its pleasing appearance and cleanliness making it desirable from the standpoint of both company and patrons. Messrs. J. M. High and H. M. Grler represented the makers.

W. R. GARTON CO., CHICAGO.

Mr. Garton was in attendance and had with him a number of his specialties, including headlights with "multiplex" reflectors; general equipment circuit breakers; Fiest trolley head, etc. The reflector shown will be used to illuminate the Montgomery Ward tower in Chicago. The breakers are the type used at the Rock Island Arsenal.

An enclosed arc headlight exhibited by the Lea Electric Manufacturing Co., of Elwood, Ind., has a number of novel points. It is entirely self-contained, its feed mechanism is automatic and it burns directly across a 500 volt circuit with high efficiency and without extra resistance. The voltage at the arc is from 280 to 300 volts and the lamp only requires 1 ampere, although it may be adjusted to consume more, depending upon the light required by the railway. Although the arc is thin and long the lamp gives excellent light, being equipped with a parabolic reflector. A door in the upper portion allows easy access to the working parts and the carbons may be reached for trimming by opening a glass door in front of the reflector, and removing the inner globe. The manufacturers believe this lamp will be of especial interest to the trade because it does not require feeding by hand, does not need an auxiliary resistance on the platform of the car and on account of its very high efficiency, due to the utilization of the energy at the arc of the lamp where it will give light, instead of its consumption in useless resistance. Photographs and prices of the headlight will be furnished on application.

WALWORTH MANUFACTURING CO.

This concern is general contractor for furnishing and erecting power-house piping and showed a large number of tools for making boiler and pipe repairs of all kinds; blow off cock; and a new method of applying flanges to pipes. It also had a Smith track drill. Mr. H. L. Rideout was in attendance.

STANDARD UNDERGROUND CABLE CO.

The Standard Underground Cable Co. has on exhibition four large handsome cabinets of samples which attracted much attention at the National Exposition at Philadelphia, and for which that company received a Medal and Blue Ribbon as being the most complete exhibition of its kind ever seen. The company's space is No. 11, where Mr. J. R. Wiley, of Chicago, western manager, is in attendance.

KALAMAZOO TROLLEY WHEELS.

The Star Brass Works, of Kalamazoo, Mich., maker of the "Kalamazoo" trolley wheel, is represented by Mr. G. E. Pratt. At the company's booth, space No. 60, Mr. Pratt has arranged on a tastefully draped board, a number of wheels, forming a large star suggestive of the makers' name.

These wheels are made of pure copper treated by a secret process and they have made highly satisfactory records. A sign under the star states that a 6-in. wheel has run 25,000 miles and is still in service; a 4-in. wheel has run 23,000 miles with three bushings; and another 4-in. wheel ran 19,000 miles with one bushing. The Kalamazoo trolley harp is also shown.

WEBER RAIL JOINTS.

The Weber Railway Joint Manufacturing Co., of New York has space No. 14, where it is showing samples of Weber joints for T and girder rails; compromise or step joints for use where a rail is to butt up against a rail of larger cross section; and other models for special conditions.

The booth is in charge of Messrs. J. C. Barr, of New York, Fred. A. Poor, of Chicago, and E. W. Penfield, of New York, who are kept busy meeting the many customers and friends of the company.

NEW HAVEN REGISTERS.

One of the most complete and attractive displays at the convention was made by the New Haven Car Register Co., of New Haven, Conn. The company was represented by Willis M. Anthony, president, F. Coleman Boyd, vice-president and general manager, John S. Bradley, secretary and treasurer, and H. E. Beach. It displayed a full line of square, single, double and triple fare registers, and its new round single and double machines. It also showed a special double register for co-operative use by two companies operating the same car over two roads. Another feature was a register which had registered over 10,900,000 times on rapidly moving machinery. This record speaks volumes for the durability of New Haven goods. A full line of the special supplies handled by the company completed the exhibit.

AMERICAN STANDARD RAIL JOINTS.

The Chisholm & Moore Manufacturing Co., of Cleveland, maker of the American joints, was represented by Mr. W. E. Ludlow, who gave a handsome paper weight as a souvenir. Samples of joints were exhibited and also water color drawings of overhead hoists, pneumatic tools, etc.

CONSOLIDATED CAR HEATERS.

The Consolidated Car Heating Co., of Albany, N. Y., has an interesting exhibit at space No. 32, where it is showing some of the valuable features of its efficient electric heating apparatus. Two panels are displayed on which are mounted representative types of the company's heaters, from which an excellent idea of the general mechanical construction and design can be obtained. There are also exhibited standard types of "Consolidated" heaters for cars having longitudinal seats with risers, and temperature-regulating switches which are operated by a single handle, that may be turned in either direction, contacts being made and broken by a positive snap. As a practical example of its system a complete 12-heater equipment is shown in operation. Messrs. W. P. Casper and C. S. Hawley, general agents, and W. H. Fulton, mechanical inspector are in attendance.

GENERAL ELECTRIC CO.

The General Electric exhibit consisted of the following: One G. E. 54, 25-h. p. motor; one G. E. 67, 38-h. p. motor; one G. E. 57, 50-h. p. motor; one G. E. 73, 75-h. p. motor; one K-10 series parallel controller for two-motor equipments; one K-12 series parallel controller for four-motor equipments; one B-23 electric brake controller for two-motor equipments; one 600-kw., 500-volt rotary converter; three 250-kw. air blast step-down transformers; one A. C. and D. C. panel for 600-kw. rotary converter; full line of overhead material and supply parts for railway motors.

The following representatives were present: J. R. Lovejoy, A. H. Armstrong, W. G. Carey, J. G. Barry, S. W. Trawick, J. C. Calisch, Theo. P. Bailey, F. N. Boyer, R. A. Swain, C. C. Peirce, R. E. Moore, F. H. Strichy, H. E. Russell, Geo. D. Rosenthal, J. H. Shaefer, W. T. Osborn, C. R. Croninger.

THE FRANK RIDLON CO., BOSTON.

This company, which is represented by C. N. Wood, of Boston, calls attention to the Beverly vertical brake wheel for vestibuled cars; the Conant rail-joint testing instrument; the Electric Railway Equipment Co.'s slow feed controller handle, by which the handle can be turned but one point at a time; the Kilbourn sanding device, which works with any kind of sand, wet or dry, fine or coarse; and the Wilson trolley catcher, of which thousands are in use. Mr. Burt Horton, of the Electric Railway Equipment Co., of Cincinnati, is also in attendance.

WESTINGHOUSE CO.

Westinghouse headquarters are at space No. 7, where are shown the following: One 650-kw. direct current engine-type railway generator; one 200-kw. rotary converter, 7,200 alternations for street railway work; one 5-panel switchboard complete, with lightning arrester, switches, circuit-breaker and instruments; railway motors, types 49, 69, 50-c., 56 and 68; fuse blocks and diverters.

The company's staff in attendance includes Messrs. F. H. Taylor, N. W. Storer, G. Berentsen, W. H. Wells, W. M. Probasco, P. N. Jones, R. S. Brown, C. S. Powell, C. A. Bragg, J. R. Gordon, C. B. Humphrey, G. Tantaleoni, H. C. Ebert, F. C. Newell, W. S. Rugg and T. A. Hall.

JOS. DIXON CRUCIBLE CO., JERSEY CITY.

This company has a small live stock exhibit in the shape of a large blind pig. Samples of the world famous Dixon products are displayed on tables, but these are merely tails as it were to the pig. Messrs. Mayer, Haasis, Johnson, St. John, Allen and Lewis, of the Dixon Company, are dispensing printed matter and hospitality to all visitors.

PECKHAM TRUCKS.

The Peckham Truck Co.'s exhibit at Convention Hall consisted mainly of Mr. Peckham's system of double trucks designed for city, suburban, elevated and high speed trunk line service, the only single truck shown being a Peckham extra long cantilever extension truck as constructed for the Omaha Electric Railway, of Omaha, Neb., which has a large number of them in use. The system of double trucks on exhibition comprised one "Standard" maximum traction, style 14-D-3; one extra strong maximum traction, style 14-D-5; one pair extra strong maximum traction, style 14-D-8; one short wheel base, style "Standard" 14-B-3; one short wheel base, style "Special" 14-B-6; one short wheel base, style "Boston Special"; one short wheel base, style "Kansas City Special"; one extra strong long wheel base No. 26.

The Peckham maximum traction trucks are constructed upon the same general lines with center-bearing swing bolsters and

motors suspended outside of wheel base. The brake mechanism is so constructed that the brakes can be operated with either the small or large wheels leading. The extra strong 14-D-5, and 14-D-8, are constructed with inside brakes, and are provided with extra strong angle bar cross-sections, so connected to the side frames as to prevent the trucks from getting out of square.

Although the construction of these trucks is such that the center bearing bolsters can be so located as to apply the necessary weight to the small wheels to prevent them leaving the rails, the cross end section is so arranged that Peckham's patent half elliptic spring traction adjuster can be attached if desired.

The Peckham Truck Co. claims to be the pioneer of the short wheel base trucks so universally used by electric railways. These styles are constructed with center bearing swing bolsters, the

motors being supported outside of the axles. The short wheel base allows the wheels to radiate between the car sills and the height of the car body from the ground to be reduced so that only one step is necessary. The Peckham Company makes several different modifications of this truck. Those on exhibition were one "Standard" construction, style 14-B-3; one "Kansas City Special," designed expressly for the Metropolitan Street Itailway Co., of Kansas City, and embodying certain features desired by its master mechanic—the Metropolitan Company has purchased 200 pairs of these and has 75 in service; one "Boston Special," designed expressly for the Boston Elevated Itailway Co., of Boston, Mass., which has 250 of them in service.

These trucks are constructed for either one or two motors as desired. When constructed for one motor the brakes are so arranged as to apply the necessary power without skidding the wheels.

For heavy high speed suburban cars the Peckham Company had on exhibition its extra strong No. 26; this truck is constructed with the Peckham patent bridge trussed side frames, which are capable of supporting a load of 100 tons per truck as has been proven by actual tests.

GARTON-DANIELS CO., KEOKUK, IA.

This company's specialties were shown in a booth on the main aisle and received full attention. The main feature was the "Automotoneer" for regulating the speed with which the controller can be moved. This device is now perfected and orders

are coming in at a lively rate. A novelty shown was an extension circuit ringer, which automatically resets itself. The booth was in charge of Messrs. V. J. E. Titus, L. J. Titus and V. J. Van Horn.

TAYLOR TRUCKS.

The Taylor Electric Truck Co., of Troy, N. Y., showed a heavy 8-ft. wheel base, single truck, and latest design of swing motion double truck; also extra heavy double truck for high speed and heavy service. These were in charge of Mr. John Taylor, manager, and Robt. Kasson.

PAIGE IRON WORKS, CHICAGO.

Mr. E. S. Nethercut, of Chicago, did the honors for this company and distributed a small pamphlet describing the work it has done on the Chicago elevated railways.

BAKER-VAWTER CO., ATCHISON, KAN.

A new system of loose leaf accounting books shown by Messrs. C. H. Smalley, B. T. Bean and T. H. Waller of this company, aroused much interest, as it possesses many advantages for street railway work.

CHICAGO MICA CO.

The Chicago Mica Co., of Valparaiso, Ind., had samples of standard forms of insulation for street railway motors and gen-

erators; also a line of the well-known "Mica Bond" insulation and "Champion" cloths and papers. The booth was in charge of Mr. Charles W. Cobb, ably assisted by Cobb, Jr.

HAROLD P. BROWN, NEW YORK.

Mr. Brown had a good location on the main aisle devoted to the display of plastic bonds, where he spent his time telling about these money-savers, what they are and what they have done. He

also exhibited a new voltmeter that is even more sensitive than the one he had last year. This instrument will measure the drop in one-eighth of an inch of 90-lb. rail carrying 10 amperes of current.

CONTINUOUS RAIL JOINT CO., NEWARK, N. J.

Samples of continuous rail joints for girder and T rails were exhibited at the north end of the hall by Messrs. L. F. Braine, H. M. Montgomery, F. C. Schmitz, W. E. Clark, J. G. Miller and C. E. Erwin, of the Continuous Rail Joint Co. All of these gentlemen were well pleased with the results of the convention.

CONANT TESTING APPARATUS.

One of the Conant testing boxes for determining the drop in rail joints was shown in the space of the Frank Riddon Co. The Mayer & England Co., of Philadelphia, has recently taken the general sales agency for these devices and is introducing them on a number of roads.

AMERICAN VITRIFIED CONDUIT CO.

This company whose general office is at New York had a stand near the hall entrance where were shown the new standard round

hole single and multiple conduits, made by the American Vitrified Conduit Co., of New York. These embody the advantages of the single and multiple duct systems, and can be laid with dowel pin or mandrel. Mr. B. S. Barnard was in attendance.

LORAIN STEEL CO.

This company had prominent space at the entrance to Convention Hall, where it had the following: Two No. 34, 50-h. p. mo-

tors shown in operation on a type "F" du Pont double truck, with a No. 38-A improved controller; one No. 18, 25-h. p. motor; one No. 27, 37-h. p. motor; one No. 18, 25-h. p. motor; and an armature and field coil for the No. 34 motor.

The special work department exhibited two steam railroad crossings, girder crossing switches, etc., and the rail department showed samples of various sections of rails.

The Lorain Company has a large amount of its apparatus in use in Kansas City and vicinity, including du Pont single trucks which are standard on the Metropolitan Street Railway, rails, motors, etc.

Those representing the company were: Messrs. P. M. Boyd, secretary, R. T. Lane, sales agent, F. A. Merrick, manager of the motor department, H. C. Evans, of the New York sales office, A. S. Littlefield and D. J. Evans, of the Chicago office, S. R. S. Ellis, of Pittsburg, and W. W. Kingston, of Atlanta.

The United States Electric Signal Co., of Watertown, Mass., brought out a new signal system for electric railways. The good points were explained by Messrs. Frederick E. Withee and J. J. Ruddick.

ALBANY GREASE.

The well-known Albany Inbricants and grease cups were represented by Winne & Kellogg, the Chicago agents.

AMERICAN BRAKE SHOES.

The American Brake Shoe Co. is represented at the convention by Messrs. F. W. Sargent, E. L. Adreon and A. Gemunder, who are explaining at space No. 13, all about the "Diamond S" and "U" brake shoes.

PANTASOTE CO.

The car curtains and seat coverings made by this company were shown in connection with the display of the Curtain Supply Co. Pantasote has steadily gained in favor since last convention and is now in use on roads throughout the world, its pleasing appearance and cleanliness making it desirable from the standpoint of both company and patrons. Messrs. J. M. High and H. M. Grier represented the makers.

W. R. GARTON CO., CHICAGO.

Mr. Garton was in attendance and had with him a number of his specialties, including beadlights with "multiplex" reflectors; general equipment circuit breakers; Fiest trolley head, etc. The reflector shown will be used to illuminate the Montgomery Ward tower in Chicago. The breakers are the type used at the Rock Island Arsenal.

LEA HEADLIGHT.

An enclosed arc headlight exhibited by the Lea Electric Manufacturing Co., of Elwood, Ind., has a number of novel points. It is entirely self-contained, its feed mechanism is automatic and it burns directly across a 500 volt circuit with high efficiency and without extra resistance. The voitage at the arc is from 250 to 300 volts and the lamp only requires 1 ampere, although it may be adjusted to consume more, depending upon the light required by the railway. Although the arc is thin and long the lamp gives excellent light, being equipped with a parabolic reflector. A door in the upper portion allows easy access to the working parts and the carbons may be reached for trimming by opening a glass door in front of the reflector, and removing the inner globe. The manufacturers believe this lamp will be of especial interest to the trade because it does not require feeding by hand, does not need an auxiliary resistance on the platform of the car and on account of its very high efficiency, due to the utilization of the energy at the arc of the lamp where it will give light, instead of its consumption in useless resistance. Photographs and prices of the headlight will be furnished on application.

WALWORTH MANUFACTURING CO.

This concern is general contractor for furnishing and erecting power-house piping and showed a large number of tools for making boiler and pipe repairs of all kinds; blow off cock; and a new method of applying flanges to pipes. It also had a Smith track drill. Mr. H. L. Rideout was in attendance.

STANDARD UNDERGROUND CABLE CO.

The Standard Underground Cable Co. has on exhibition four large handsome cabinets of samples which attracted much attention at the National Exposition at Philadelphia, and for which that company received a Medal and Blue Ribbon as being the most complete exhibition of its kind ever seen. The company's space is No. 11, where Mr. J. R. Wiley, of Chicago, western manager, is in attendance.

KALAMAZOO TROLLEY WHEELS.

The Star Brass Works, of Kalamazoo, Mich., maker of the "Kalamazoo" trolley wheel, is represented by Mr. G. E. Pratt. At the company's booth, space No. 60, Mr. Pratt has arranged on a tastefully draped board, a number of wheels, forming a large star suggestive of the makers' name.

These wheels are made of pure copper treated by a secret process and they have made highly satisfactory records. A sign under the star states that a 6-in. wheel has run 35,000 miles and is still in service; a 4-in. wheel has run 23,000 miles with three bushings; and another 4-in. wheel ran 19,000 miles with one bushing. The Kalamazoo trolley harp is also shown.

WEBER RAIL JOINTS.

The Weber Railway Joint Manufacturing Co., of New York has space No. 14, where it is showing samples of Weber joints for T and girder rails; compromise or step joints for use where a rail is to butt up against a rail of larger cross section; and other models for special conditions.

The booth is in charge of Messrs. J. C. Barr, of New York, Fred. A. Poor, of Chicago, and E. W. Penfield, of New York, who are kept busy meeting the many customers and friends of the company.

NEW HAVEN REGISTERS.

One of the most complete and attractive displays at the convention was made by the New Haven Car Register Co., of New Haven, Conn. The company was represented by Willis M. Anthony, president, F. Coleman Boyd, vice-president and general manager, John S. Bradley, secretary and treasurer, and H. E. Beach. It displayed a full line of square, single, double and triple fare registers, and its new round single and double machines. It also showed a special double register for co-operative use by two companies operating the same car over two roads. Another feature was a register which had registered over 10,900,000 times on rapidly moving machinery. This record speaks volumes for the durability of New Haven goods. A full line of the special supplies handled by the company completed the exhibit.

AMERICAN STANDARD RAIL JOINTS.

The Chisholm & Moore Manufacturing Co., of Cleveland, maker of the American joints, was represented by Mr. W. E. Ludlow, who gave a handsome paper weight as a souvenir. Samples of joints were exhibited and also water color drawings of overhead hoists, pneumatic tools, etc.

CONSOLIDATED CAR HEATERS.

The Consolidated Car Heating Co., of Albany, N. Y., has an interesting exhibit at space No. 32, where it is showing some of the valuable features of its efficient electric heating apparatus. Two panels are displayed on which are mounted representative types of the company's heaters, from which an excellent idea of the general mechanical construction and design can be obtained. There are also exhibited standard types of "Consolidated" heaters for cars having longitudinal seats with risers, and temperature-regulating switches which are operated by a single handle, that may be turned in either direction, contacts being made and broken by a positive snap. As a practical example of its system a complete 12-heater equipment is shown in operation. Messrs. W. P. Casper and C. S. Hawley, general agents, and W. H. Fulton, mechanical inspector are in attendance.

GENERAL ELECTRIC CO.

The General Electric exhibit consisted of the following: One G. E. 54, 25-h. p. motor; one G. E. 67, 38-h. p. motor; one G. E. 57, 50-h. p. motor; one G. E. 73, 75-h. p. motor; one K-10 series parallel controller for two-motor equipments; one K-12 series parallel controller for four-motor equipments; one B-23 electric brake controller for two-motor equipments; one 600-kw., 500-volt rotary converter; three 250-kw. air blast step-down transformers; one A. C. and D. C. panel for 600-kw. rotary converter; full line of overhead material and supply parts for railway motors.

The following representatives were present: J. R. Lovejoy, A. H. Armstrong, W. G. Carey, J. G. Barry, S. W. Trawick, J. C. Caliseh, Theo. P. Bailey, F. N. Boyer, R. A. Swain, C. C. Peirce, R. E. Moore, F. H. Strieby, H. E. Russell, Geo. D. Rosenthal, J. H. Shaefer, W. T. Osborn, C. R. Croninger.

THE FRANK RIDLON CO., BOSTON.

This company, which is represented by C. N. Wood, of Boston, calls attention to the Beverly vertical brake wheel for vestibuled cars; the Conant rail-joint testing instrument; the Electric Railway Equipment Co.'s slow feed controller handle, by which the handle can be turned but one point at a time; the Kllbourn sanding device, which works with any kind of sand, wet or dry, fine or coarse; and the Wilson trolley catcher, of which thousands are in use. Mr. Burt Horton, of the Electric Railway Equipment Co., of Cincinnati, is also in attendance.

WESTINGHOUSE CO.

Westinghouse headquarters are at space No. 7, where are shown the following: One 650-kw. direct current engine-type railway generator; one 200-kw. rotary converter, 7,200 alternations for street railway work; one 5-panel switchboard complete, with lightning arrester, switches, circuit-breaker and instruments; railway motors, types 49, 69, 50-c., 56 and 68; fuse blocks and diverters.

The company's staff in attendance includes Messrs. F. H. Taylor, N. W. Storer, G. Berentsen, W. H. Wells, W. M. Probasco, P. N. Jones, R. S. Brown, C. S. Powell, C. A. Bragg, J. R. Gordon, C. B. Humphrey, G. Tantaleoni, H. C. Ebert, F. C. Newell, W. S. Rugg and T. A. Hall.

JOS. DIXON CRUCIBLE CO., JERSEY CITY.

This company has a small live stock exhibit in the shape of a large blind pig. Samples of the world famous Dixon products are displayed on tables, but these are merely tails as it were to the pig. Messrs. Mayer, Haasis, Johnson, St. John, Allen and Lewis, of the Dixon Company, are dispensing printed matter and hospitality to all visitors.

ST. LOUIS REGISTER.

Mr. Giles S. Allison, of New York, had charge of the exhibit of the St. Louis Register Co., of St. Louis, which comprised one No. 20 self-recording register and one No. 23 self-recording double register. These machines give a printed record of the number of fares at the end of the trip or day, and do away with the necessity of trip sheets and possible errors by conductors in transcribing.

McGILL, PORTER & BERG.

The display of McGill, Porter & Berg can be found at space No. 24, main aisle, where a very interesting and attractive exhibit of goods is made. This house caters to the street railway trade exclusively and delegates are invited to carefully inspect the supplies and specialties it carries, prominent among which are: 1-T-E circuit breakers, Ohio brass overhead material, Morris rail bonds, National car heaters, M. P. & B. trolley wheels, Speer carbon brushes, and Chicago Mica Co.'s products. Members of the association should secure a copy of the Convention Menu, which Messrs. McGill, Porter and Berg are distributing.

This concern has recently been appointed selling agents for their territory of the American Brake Shoe Co., which owns the "Diamond S" patents and the "Diamond S" brake shoes. The shoes are made under license by the Sargent Co., Chicago; the Ramapo Iron Works, Hilburn, N. Y., and Parker & Topping, St. Paul, Minn.

SERRATED WHEELS.

One of the street railway devices exhibited this year is the "serrated" car wheel shown at space No. 45, by the Burnham & Duggan Railway Appliance Co., of 60 State Street, Boston. The serrations are in the flange and adapt the wheel for digging ice, snow or dirt from the groove of the rail, and thus secure good traction and electrical contact. The evident advantages of the better traction are longer life for wheels and motors and a saving of time and electric current. The Burnham & Duggan Company has supplied these wheels to the Boston Elevated, the Quincy & Boston, the Portland (Me.) Railway, the Massachusetts Electrical Companies, the Metropolitan Street Railway, of New York, and other companies. The wheels are for use under both cars and snow plows. The company has received a number of strong testimonial letters among which is one from Mr. G. S. Waterhouse, acting superintendent of the Quincy & Boston Street Railway Co., which reads: "The snow plow equipped with 'serrated' wheels was the only one we could operate in the big storm of February 1st. The plow made the run from East Milton to Neponset and returned running at the ordinary rate of speed, when the other plows were all stuck fast."

ALUMINUM WIRE.

The Pittsburg Reduction Co., of Pittsburg, had a very complete exhibit of the different styles of aluminum electric conductors. It called especial attention to different sizes of aluminum street railway feeders, but also showed aluminum for power transmission, telephone and telegraph lines. Street railway feeders can be furnished by the company either bare or insulated, and samples of both styles were in the exhibit.

Particular attention also is paid to the question of jointing street railway feeders and the joints that are displayed prove conclusively that this question as raised by certain engineers has been completely solved by the Pittsburg Reduction Co. Soldered

joints, mechanical joints and compression joints are all to be seen, any one of which will meet the complete requirements of joints for street railroad feeder purposes.

The following officials of the company are in attendance at the convention: Arthur V. Davis, general manager; Alvah K. Lawrie, general sales agent; and James A. Rutherford, of the Cleveland office.

HALE & KILBURN.

A number of seats made by the Hale & Kilburn Manufacturing Co., of Philadelphia, were shown in the booth of the Curtain Supply Co. These seats are so well known as to require no description and Mr. H. T. Bigelow, of Chicago, who represented the company, stated that its factory is working overtime to keep up with orders.

CORRESPONDENCE.

We cordially invite correspondence on all subjects of interest to those engaged in any branch of street railway work, and will gratefully appreciate any marked copies of papers or news items our street railway friends may send us, pertaining either to companies or officers.

DOES THE MANAGER WANT ANYTHING?

If you contemplate the purchase of any supplies or material, we can save you much time and trouble. Drop a line to THE REVIEW, stating what you are in the market for, and you will promptly receive bids and estimates from all the best dealers in that line. We make no charge for publishing such notices in our Bulletin of Advance News, which is sent to all manufacturers.

This paper is a member of the Chicago Trade Press Association.

Entered at the Post Office at Chicago as Second Class Matter.

VOL. X.

NOVEMBER 15, 1900.

NO. 11

The "Daily Street Railway Review" was certainly one of the distinct features of the convention. Each morning at daylight it appeared with 24 pages of reading matter, including a full verbatim report of everything said in both conventions the previous day. In addition all the happenings of interest up to midnight were chronicled. Since the convention closed scores of letters have been received from officials in all parts of the country who were unable to attend and who all voice one sentiment that "to read the 'Daily' was the next best to being present in person."

Next year, in New York City, we shall issue the "Daily" again, and we hope with additional features and improvements not possible this year.

The decision of the Accountants' Association to make no change in its by-laws and, as heretofore, to hold the annual meeting at the same time and in the same city as the convention of the American Association is, we believe, a very wise one. The distractions at a separate meeting might be fewer, but there are compensating advantages in the opportunity given the delegates for getting acquainted with managers, in the lower railway rates than could be otherwise secured, and in the entertainments. As to the distractions we think the accountants do plenty of work as it is.

From the supply man's point of view the Kansas City convention was a record breaker. The exhibit was all that could be asked as regards quantity and quality, but above all the supply men closed some orders which is not the usual thing at conventions.

Next year the supply men are to have the second day instead of the last one devoted to them and the arrangement will doubtless prove most satisfactory to all parties.

The experience of street railway companies that have provided club rooms for the use of their employes shows that in every case the investment is a good one. The companies that have gone into this matter most extensively are the large ones, but the club room

will be found to be just as desirable on the small road. We recently received a letter from the manager of a company having 36 trainmen on its rolls, in which he related his experience with a reading room. In the room where his men reported for duty he placed a table and some chairs and copies of such scientific journals as he had subscribed for. The result was that from two to six of the men are now always to be found in this room when off duty; before, there was never an extra man about the premises except at reporting time. The next day one of the men reported that he had subscribed for a daily paper to be delivered at the reading room—others brought books and magazines and within a week a bookcase became a necessity.

The presidential election has been held with results which exceeded the largest hopes of those citizens who stand for good government and sound money. Business interests generally were less affected than usual by the inevitable feeling of uncertainty which we seem doomed to experience every four years. This was due to the confidence felt that the result would not change the conditions and national policy of the past four years. To this declaration of the largest majority ever expressed at the polls the great army of street railway employes contributed in no small degree. The continuation of conditions which insure activity along industrial and manufacturing lines means just as much to the men on the car platforms as it does to the holders of securities.

During the past four years most of the roads in receiver's hands have been placed on a self-sustaining or paying basis, and in a large number of instances wages have been materially advanced.

The amount of new construction work for 1900 is smaller than was anticipated. This was due to two conditions: capitalists hesitated on account of election year, and materials were very high. It is reasonable to expect that new roads aggregating several hundred miles of track will now be able to float their securities on favorable terms, while the indications are that the important items of rails and ties will be purchasable for delivery early in 1901 at prices much more favorable to buyers than a year ago. The price of rail is still unsettled, but probably will be not far either way from \$28 per ton for T sections.

As during the past two years the greater mileage of new track will be outside the cities, but there will also be much work done in enlarging power stations and rebuilding tracks for city lines. The outlook is equally bright for the operator and the material man in our field.

A remunerative class of business which most interurban roads can handle to advantage is the transportation of cut flowers from green houses to the city dealers. Investigation of this subject presents the following conditions.

The business of growing cut flowers for city markets has reached proportions little imagined by the average person. The hot houses are usually located some distance from the city to secure cheap land and favorable climatic conditions. Shipments are made to city dealers once or twice a day regularly. Special rush orders call for additional shipments almost every day. The grower places his flowers in boxes with little care to guard against damage to the delicate blossoms in shipment. When thus packed they are loaded into a wagon and hauled in to town, or as is more often the case sent by express. This involves one loading into wagon; one unloading at express office; loading into car; unloading to delivery wagon; unloading to sidewalk; a total of at the very least five handlings. This number is more often increased to eight or ten and each time there is the usual throwing of the box and jarring of the contents. The damage from each handling makes a distinct and computable loss. It is evident therefore that any reduction in the number of times the box must be handled is a positive saving in values for which the shipper and dealer are equally willing to pay. It would be supposed the grower would take the same care in preparing for shipment that the retailer does, but the fact is they universally do not and will not.

Now if the grower could deliver to a trolley express which runs not only into town but close to the consignee, the boxes will require but two handlings instead of five or ten, and the saving to even the ordinary dealer would amount to hundreds of dollars annually. Hence he is willing to pay a liberal rate for trolley express service. Another desirable feature is that the trolley express can

make special trips and much more frequent than the old line express companies which are limited to certain trains on the steam roads.

There are doubtless many of our readers who can work up a large and profitable business from this source. The matter is well worth investigating and taking up with local growers and dealers.

It must be admitted that the discussions before the American Association were disappointing. Of the four papers, only one elicited any interest, so far as a reader may judge from the verbatim reports. What is the reason for this? Were the subjects ill-chosen or were the men present ill-prepared to debate the questions?

Take Mr. Holmes' paper on "Consolidations," for instance. This is a subject of vital interest to street railway men and to the public—it may even be said that it is a part of the trust question, one of the "paramount" issues of our late political campaign. It was a question to which the men present surely must have given thought and the paper itself was suggestive, yet not a word was submitted in discussion.

The other three papers were all on technical subjects but only one was discussed to any extent. To have the results of one man's experience is good, but to have the results of 10 men's experience is very much better. The Kansas City report would have been greatly enhanced in value had every road with a paint shop or double truck cars submitted such data as did Mr. Harrington, of the Camden & Suburban.

We think that this result is largely due to the fact that the papers are not given to the members in advance of the meeting as is the case in most other scientific and technical societies. Where the members of an association are all actively engaged in the work with which the papers before it deal, it is very easy for them to enter into the discussion without previous special preparation, but with the American Association the case is different. The delegates to the convention are for the most part managers and other executive officers who cannot be expected to carry in their heads all of the details as to the practice on their respective roads in technical matters. But if given an opportunity to read the papers in advance of the meeting, they could inform themselves concerning details and be prepared to give other members the benefit of their companies' experience. With a little preparation most of the delegates could become specialists, for the time being, on any of the technical subjects brought before the association.

The Accountants' Association had the question of advance publication under consideration, but no decision was reached. Though there is less need for prior publication in the case of the Accountants' papers, we trust that this association or its executive committee will take favorable action in the matter.

The delegates at these meetings who really have something to say, and do not take advantage of the opportunity, not only prevent the association from attaining to its full power for the good of the industry, but, in a negative way, do themselves injury. To print a list of the changes in executive officers and heads of departments of street railways, that have taken place within the past year would require perhaps 15 pages of the "Review." Other changes will be made as time goes on. The conventions offer a great opportunity for the young man in the business to become known to the men (perhaps we ought to say the other young men) who have positions to fill, and the opportunity ought not to be wasted.

In our eastern contemporary Mr. A. O. Kittredge comments on the doings of the Accountants' Association and criticizes it for devoting so much time to what he terms "mere account classification" and "details of bookkeeping" instead of discussing "real accounting." We have read those comments and are somewhat mystified, being in the dark as to just what "real accounting" may be.

We do not distinguish between bookkeeping and accounting. The object of keeping books of account should be to correctly show the state of the business and property. Popularly, any clerk in the bookkeeping department is a "bookkeeper," so that is just as well perhaps to call the man in charge an "accountant," but he is none the less a bookkeeper.

Mr. Kittredge censures the Accountants' Association for not discussing principles entirely divorced from blanks and forms, books and reports. Whether this attitude is justified will appear from a glance at the state of street railway bookkeeping four years ago and what has been accomplished by the Accountants' Association.

There are principles of accounting and there are details. At the outset the Accountants were confronted with a chaotic condition as to both principles and details. In the rapid transition from animal to electric power, practically no provision was made for a suitable accounting department, and none whatever for a uniform system. Indeed it is doubtful if any uniform system of accounts could have been secured during the period of evolution in which the engineering and operating departments were experimenting, constantly changing, and trying to determine to what accounts scores of expense items really did belong. We all know the bookkeeping which was ample for a road operating with horses, was as inadequate for the same road electrically operated, as the horse car barn was unsuited for the power house, or the horse hospital for a repair shop. The evolution had scarcely ceased when the Accountants organized and undertook the discouraging task of trying to straighten out the universal tangle. Their success in doing this has been astonishing and the rapidity of movement no less so. The American Association made several attempts and abandoned the undertaking in despair. It remained for the young men who had been called into the auditing departments to work out the problem.

The principles which should govern the separation of expense from capital accounts, probably more important than any other one thing in street railway accounting, are determined for the accountant by the policy of his company, and hence in the Accountants' Association are purely academic questions. With the details of keeping the accounts it is different, however, and these subjects should be authoritatively handled by the Association. The Accountants had the option of spending their time in telling what they thought or in doing what they could, and very wisely chose the latter. Even now comparatively few in the other departments realize the amount of thought and work involved. A leading manager remarked at Kansas City that he doubted if \$15,000 would have paid the bill had the work done by the Accountants in standardizing been ordered from some expert; and, he quickly added, it would have been impossible for any one or two men to have achieved the broad results already obtained where so many contributed.

We hope the time may soon come when the practical details of street railway bookkeeping will be so far perfected that the Accountants will have time for discussing the ethics of the subject, and are satisfied that when that time does come the members of this association will not be backward in dealing with the theory.

Mr. Kittredge thinks that someone should have taken the idea from Mr. Beggs' address on "What Does the General Manager Want to Know from the Accounting Department?" Mr. Beggs said some excellent things—things that should have the hearty approval of every street railway man—and one of them was "be honest with yourself and with the public and your troubles will grow less," or words to that effect. Yet, nevertheless, Mr. Beggs' summary of what the manager wants from the accounting department leaves very little freedom of action to his accountant; he wants three things, (1) to know that the accountant is in sympathy with the manager and believes in his policy, (2) speed, and (3) accuracy. With the first of these requirements in mind ethical discussion of accounting becomes a bit hampered.

SHALL SUPPLY MEN ORGANIZE?

The Time Considered Ripe for Such an Association—Benefits to be Derived—Exhibitors Can Handle the Problem More Easily Than Street Railway Officials—Interviews With Leading Supply Men Show Great Interest in the Scheme.

"The time has come when we need an organization of the supply men to take the burden of the exhibit hall and its contents off the shoulders of the local officials. The display has now reached mammoth proportions and is constantly growing. We know what we want and how to handle the innumerable details connected with the show much better than any one who has not been through the mill."

It was Major Evans, of the Lorain Steel Co., one of the most prominent of the supply men and who has had years of experience in exhibiting at our conventions who made the foregoing remark as the curtain rang down on the vaudeville show in Convention Hall Friday afternoon. Several exhibitors, who were present, in-

stantly voiced their approval, and at their request the "Review" representative undertook to ascertain the views of as many others as could be reached in the limited time remaining before the banquet. The result of this canvass is given, and of all the persons interviewed all but three—who requested not to be quoted—were very much pleased with the idea. These three took pains to state they were not opposed to the idea, but were not prepared to endorse it until they had either taken more time to consider or know more of the details.

The situation is this: When exhibits were few and small, 15 years ago, a small room, usually one commonly used by traveling men to show goods in the headquarters hotel, was ample for the display. Then the builders began to bring a few cars which were set out on a piece of temporary track in the street in front of the hotel, gradually the idea was expanded and the display increased until a store room was needed. Usually one could be found near the hotel. At Pittsburg, no other space being available, a river barge was anchored three blocks from the hotel and the display made on board. When electricity became a practical motive power a big jump was made and it became necessary to use skating rinks and similar ground floor structures which afforded large space. From the drummer's room at the hotel which cost nothing, to the present day requirements which are so great as to bar some cities from being considered for the convention, the advance has been great. In the early days the local roads furnished the banquet free, but when it became necessary to pay from \$1,000 to \$2,000 for an exhibit building the burden was too heavy. Now the inviting company furnishes the hall, turns it over to the association to rent out, and entertains in other ways than the banquet which is managed by the association.

With the steadily increasing number of exhibits, which at Chicago were valued at \$250,000, there came an immense amount of detail work for some one on the ground to do. Changes had to be made in the building; stronger floors built; wide doors cut; wires run for light and power; arrangements made for teaming hundreds of tons of appliances and machinery; carpenter work which in the aggregate would build a house, provided. Sign painters, electricians, machinists, printers, decorators and painters, furniture men and florists, telegraph operators, messengers, and telephones, all these now have to be in readiness. The correspondence involved between the convention city and exhibitors, covers several weeks and involves the dictating of hundreds of letters. Such is the present result of the expansion of the exhibit feature, which, within the experience of the writer, was limited to a few rope harness, patent horse medicine and bell punches.

The burden of the work alluded to naturally falls on some railway official, usually the manager of the inviting road. He is always a busy man and the additional burden which the convention imposes is little realized by any but those who have been through it. The supply men feel they should not ask it and are perfectly willing to relieve the manager of this work.

Another feature which handicaps the local committee on exhibits is that the meeting goes to a different place each year, and the committee there has it all to learn just as some one did in another city the year before. It is asking a good deal in spite of the willing spirit in which the work has always been done.

The plan now proposed is to organize the supply men next year at New York and put things on a permanent and uniform basis. Elect a standing committee to take entire charge of the hall and everything in it except the meeting rooms of the two associations. The committee would engage some experienced, thoroughly competent man for several weeks in advance of the convention. He would take charge of affairs and make the contracts in the name of the Supply Men's Association for all teaming, labor, power, etc. All exhibitors would be perfectly free to use this man without feeling they were imposing on the good nature of a busy manager. If anything did go wrong they need not hesitate to enter a complaint to their own committee and get an adjustment. This article is not written in any spirit of criticism—far from that; nor have there been any shortcomings here at Kansas City to suggest it. In all our conventions there has never been less friction and annoyance than here, but there has been trouble in the past and is liable to be in the future. There are many things which bear hard on the exhibitor which never come to the knowledge of the railway people. For instance, the local committee contracts for carpenter work; it does the best it can. An exhibitor puts in a requisition for a

platform and booth. The order is turned over to the contractor who then deals exclusively with the exhibitor. Through some carelessness in bookkeeping we will say, and during past years many times with direct intention, the contractor takes advantage of the emergencies and necessities of the exhibitor and tacks an extra \$10 or \$20 on his bill. The exhibitor feels a reluctance to complain to the local railway manager with whom he may have, or hopes to have dealings, so he says nothing, pays his bill and sometimes contents himself with cuss words. The illustration is no fairy tale. It goes all along the line of teaming, wiring, sign painting, and down the whole list.

We do not mean to say that every exhibitor gets stuck on every one of these items, but several times it has been nearly as bad as this. But the trouble lies in the lack of any authority to whom the exhibitor feels at liberty to appeal. With an association, its superintendent is the association's hired man, and bound to take up such matters and adjust them. It is no favor asked of him—he is paid to attend to just such things.

Another advantage would be the possibility of adopting and enforcing a standard set of rules as to the size, appearance and location of signs, which at present are very nondescript. Signs of all sizes and previous conditions of servitude touch ends; one is inlaid with gold letters and polished wood, another is of canvas, tin or boards—"any old thing" goes. To bring these signs into some sort of uniformity would not cost anybody very much, and would improve the effect as a whole several hundred per cent. One exhibitor would not be allowed to build a canvas wall to shut out from view somebody else, sometimes a competitor. Signs and lots of them are necessary, but there are signs and bill boards.

In the matter of freight to the convention a marked saving can be made. With an association its committee is in position to deliver to the road offering the best rates and time of shipment practically the whole freight, and secure for its members concessions which their individual shipments would not warrant. For instance all the shipments from New York to Chicago last year could have been lumped and sent over one road with several routes to choose from.

The exhibitors complain bitterly at the lack of attention paid them by the railway delegates. Organize and send a committee upstairs and it will receive a ready hearing and this matter can be improved. Tell the railway body what it has cost to do all this; and that we are getting to a point where the game is hardly worth the candle. When they understand these things they will devote more time down stairs.

And while the committee is there maybe the railway people would like to arrange for a little less noise during the business sessions, so those sitting back of the front three rows of seats could hear the discussion instead of, as this week, getting it by the lip reading method. Now the exhibitors did not intentionally intrude on the deliberations, but if they had only gone up in the tent room a few minutes we believe they would have hurried back and turned on some quiet.

The foregoing touches only on the outer edges of many reforms, improvements and advances possible with organization. The single exhibitor has no voice at present in the present association, nor does he ask it, and he could not go as such. But as an exhibit body his committee can go, leaving all individuality below, and protest, request and suggest with dignity and propriety.

In the steam road field such an organization has been in existence for years, and has contributed in a large measure to the success, strength and pleasure of the parent association. There is no reason why the same should not be repeated in our case.

The following interviews were all it was possible to secure in the limited time. Almost without exception the person interviewed insisted that it be distinctly understood what he said was in no spirit of criticism on the management of the local committees here in Kansas City. Chairman Satterlee was accorded high praise. There has never been less friction and annoyance than here. It is the future and the expansion of the exhibit feature that it is desired to provide for.

Major Evans: I am most heartily in favor of an organization of the supply men. There can be no possible objection and the advantages are numerous. They have been exhibiting for years, know what they want better than anyone else, and have abundant talent among their numbers to form an executive board which will be acceptable to all. There are scores of things which we

can do as an organization which is impossible as individuals, and I have been in favor of one for years.

Elmer P. Morris: I do not think it fair to put the burden any longer on the local committee of exhibits. Since the display has grown to such proportions it really requires the entire time of one man on the ground for several weeks, and we ought not to ask the manager of a big railway system—always a busy man—to lay aside his work to attend to this. As an organization we can regulate the size of signs and many things we ought now to do. We should of course work in perfect harmony with the American Association—in fact in conjunction with it, but we can do many things for ourselves better than they can do it for us. We are not asking for the revenue the association receives for floor space but would like to have the handling of details, and in short the management of the exhibit hall.

W. R. Garton: I think we should by all means have a supply men's association.

W. S. Rugg, Westinghouse Co.: I think it would be a good move to make.

Geo. D. Casgrain, Griffin Wheel Co.: There ought to be a uniform system for many features of exhibiting which can only be secured through organization. I am in favor of it.

G. R. Scragham, Craghead Engineering Co.: I consider an organization of the supply men a practical necessity. It would be a great relief to the local committee and the obliging secretary of the American Association, and would result in good not only to the convention but to the supply men themselves.

J. V. E. Titus, Garton-Daniels Co.: I am heartily in favor of it.

John Taylor, Taylor Truck Co.: I am very much in favor of it if we could arrange so that day times the exhibits could be viewed. One day it not enough for everybody to see each exhibit. You have to interview a great many people individually. The exhibitors here have spent easily \$50,000 in making this display and it is a lot of money and deserves more attention. The time now allotted is too short. With an organization we could have our committee represent us before the American Association and present our claims, and I hope secure arrangements which would be better than ever before.

Arthur Davis: I want it. We need a committee to arrange freight matters, and other things of mutual interest.

M. Garl, Garl Electric Co.: I favor it with a standing committee to make arrangements and attend to details, such as signs of uniform size, which will prevent one exhibit cutting off the view from another. I favor smaller signs than now used.

General Electric Co.: We heartily approve of the plan and will be glad to join in any arrangement satisfactory to all.

H. T. Bigelow, Hale & Kilburn: Such an association will do much to facilitate the work of exhibitors, and relieve the local committee of a multitude of details.

John High, Pantasote Co.: Those are my sentiments.

H. J. Davies, National Carbon Co.: That is what we ought to have by all means. The right kind of an organization, rightly officered and conducted, would be a great thing, and we have plenty of good men from whom to choose. This from a supply man's point of view. I can also speak from the other side. As a member and secretary of the local committee of arrangements for the Cleveland Convention, in 1892, I had charge of the renting and assigning of space for exhibits, the correspondence, the arranging of exhibits on arrival, etc., and know something of the amount of work involved in preparations for these annual exhibitions. It is too much to ask or expect, gratuitously or otherwise, from any local committee. Street railway men are too busy. And each local committee has to learn the business—usually without a teacher or a text book. Perhaps the work could not be done better by a committee of supply men, but it could be more easily done after a year or two of experience, if not at once.

E. Peckham, president Peckham Mfg. Co.: I have always believed in having just such an organization, and it is something which should have been done years ago. I am heartily in favor of it and hope something will come of the agitation this time. The exhibitors certainly do not receive the consideration to which they are entitled. These exhibitors have expended thousands of dollars to present something instructive and interesting and while we receive our share of attention I speak of the display as a whole and voice the universal opinion that the program should be made to allow much more time in the hall. Many have told me they were

tempted never to make another exhibit, and others are taking smaller spaces than formerly. I appreciate the fact that this is a condition which has been a matter of growth and is not the result of an intention to slight the supply men. But that makes it none the less disappointing to those who have gone to much expense and trouble to provide something interesting. We need an organization which can be represented by a committee and secure the recognition which the exposition deserves. The present time allowed us is altogether too short.

Geo. C. Bailey, Roebing Co.—Such an organization would be productive of great good to the supply interests, and reduce expenses.

Victor Angerer, Wharton Co.: If properly organized and managed it would be a good thing. If the majority want it I am with them. As the next convention is to be held at New York it might be well to consult the street railway men in that city.

D. A. Johnson, Jos. Dixon Crucible Co.: The supply men's interests are now so large in these conventions they should get together and can save money and improve the display by so doing.

Max Berg, McGill, Porter & Berg.: That's just what we need. Let us have it.

E. S. Nethercut, Paige Iron Works: Yes, I favor such an organization. It would find plenty to do and everybody would be benefitted.

Continuous Rail Joint Co.: We heartily agree with the plan as proposed to us.

Consolidated Car Heating Co.: We are in favor of the plan to form such an organization.

Chas. W. Cobb, Chicago Mica Co.: An excellent idea. I would like to see a uniformity in signs, which should also be placed in a line and think it would be a good thing.

J. W. Perry, H. W. Johns Co.: It is well worth taking up. It would relieve the local committee and result in a more systematic arrangement all around, and facilitate matters for everybody.

T. C. White, Central Union Brass Co.—A good thing; push it along.

G. R. Pratt, Star Brass Works: By all means. Have something along the line of the M. C. B. supply men's association. That has been a success for years. I will gladly bear my share of any work or expense.

J. R. Wiley, Standard Underground Cable Co.: I think this exhibit business should be governed by an organization of its own, and so done would result in benefit all around.

F. A. Estep, R. D. Nuttall Co.: I am in favor of the plan. Such an organization, with its executive board or restraining committee, would make another place of our annual display. Heretofore and now there is a heterogeneous mass of signs of all sizes and colors. Such a motley collection would be classed in New York as belonging to a county fair. I favor an association of supply men.

D. B. Dean: Yes, I favor an organization if everybody will go in and unite on a plan, and there is no reason why we should not do so. Others have with good results.

R. H. Ham, Ham Sand Box Co.: Am in favor of what is outlined and think it would be a good thing.

Scott H. Blewett, American Car & Foundry Co.: The booths should be more uniform, the signs of a uniform height, lettering of a uniform size and color. So far as possible exhibitors of the same class should be grouped together. These and many other desirable improvements can be brought about by a supply men's association and would greatly improve appearances and save money. It has been done for years in the steam road field and their display is not so large as this.

Harold P. Brown: The plan as stated to me is needed and should be carried out. There is a great deal to be gained in many ways, and as an association we are in a position to secure many concessions that comes to large propositions and are denied individuals. It need not be a cumbersome affair, and its annual meeting consume little time, but the possible results will be recognized by everyone who makes an exhibit. I hope to see the organization effected.

F. W. Edmunds, Q & C Co.: I favor your plan. We have the same thing in steam road supplies in the Trackmasters' Association, the Master Car Builders, and also Master Mechanics Associations and have had for years. It is simply indispensable in those lines. The exhibiting concerns are taxed pro rata on their space or booths and the fund collected the first day by the treasurer. The

committee thus has a fund for use in case of emergency without going round with the hat. In these conventions there is no local entertainer as in the case of the street railways, and it devolves upon supply men to provide carriage drives, flowers and theater parties for the ladies. I assume the entertaining street railway company would always wish to entertain as heretofore, therefore the necessary expenses of a street railway supply men's association would be nominal, although I think the exhibitors have always stood ready to contribute to the American Association if their help had ever been needed. There is usually some surplus left which is paid back pro rata to the exhibitors. For example our tax this year was \$30, and we were rebated \$7 after the convention which lasted a full week, closed. The committee is elected each year, does its work without friction, and everybody is satisfied. It contracts for all the usual hall expenses, teaming, carpenters, etc., and secures low rates for the whole job. Each exhibitor is charged for what he gets. The supply men hold an annual meeting for election and any other business and this takes place during one of the business sessions of the main association. The two organizations are entirely separate, but the committee from the supply men can always take up and arrange any desired features with the main association. The plan has worked like a charm for years, and there is no reason why our supply men should not work together on the same basis.

W. H. Gray: It's a good thing if we can get the right kind of men to control. I should favor a membership vested in companies or concerns, so that the large concerns cannot come in and vote 10 or 15 representatives against an equal number of small firms with only one representative present. There should be a committee elected annually from the members, of say three or five to carry out the work of the association along the lines of a policy decided by the members. If the plan is carefully matured and can be presented for action at next year's convention there would be something tangible to act on, and an intelligent action taken on the advisability or otherwise of affecting the association. I hope to see it worked out.

J. G. McMichael, president Atlas Railway Supply Co.: I am, and always have been in favor of such an organization. I believe that it would greatly relieve the American Street Railway Association as well as benefit the supply men. I heartily agree with the remarks of Mr. Taylor, of the Taylor Truck Co., concerning the limited time allowed for inspection of the exhibits, and with Major Evans' statement. There are scores of things connected with the exhibition which should be done by the exhibitors and relieve the Street Railway Association.

Only five street railway men were interviewed but each one was pleased with the idea.

Walton H. Holmes said, speaking as a railway man and not as an officer of the American Association that he considered it a good thing and would enable the supply men undoubtedly to secure many improvements which the local street railway men would not be likely to think of. If the supply men took hold of the matter it would be ably conducted.

T. C. Pennington, speaking for himself, expressed the same views.

F. G. Jones, vice-president of the Memphis street railway, and also an officer of the association for the past year, said: From now on the supply men and the street railway men will be more closely drawn together. I think it is an excellent idea and hope the boys will carry it out.

W. Worth Bean hoped the organization would be effected. He recalled the time when there was considerable discussion about the supply men coming in as associate members. This was at Montreal when the boys offered to raise the debt of the association in full, a matter of some \$4,000. He urged them at that time to organize one of their own, and has wondered why it was not done long ago.

The last interview was with W. A. Satterlee, chairman of the local committee of exhibits. He has worked night and day and Sundays for nearly a month past, and the result of this has been evident in the rapid and systematic installation of exhibits. He has good reason to be proud of his efforts, and every supply man is grateful and appreciates his work. Mr. Satterlee expressed himself as heartily in favor of the new plan. He was sure the local railway people wherever the convention met would feel the same way, and be only too glad to be relieved of a most trying position, and one which really requires more of a manager's time if rightly

done, than he can spare in justice to himself. He appreciated highly all the pleasant things which exhibitors had said expressive of satisfaction at his efforts, and desired to thank them one and all through the "Review"

Since the convention we have heard from the following:

Van Dorn & Dutton Co.: We believe that such an organization would relieve the Street Railway Association of much detail work that must be a great annoyance, and that it would be a good thing for the supply men. We would willingly do our share towards making it a success.

Triumph Electric Co.: We think the scheme a very good one and believe that such an association would facilitate matters and make it easier for exhibitors. The idea has our hearty approval.

N. H. Colwell, general manager R. Bliss Manufacturing Co.: It has been my opinion for several years that the supply men should have an organization, and in the past I have spoken to a number of gentlemen advocating this subject, but did not find many who thought the time opportune to effect an organization. We shall be pleased to co-operate and to assist in such an organization, and the sooner it is done, we believe, the better.

W. J. Cooke, McGuire Manufacturing Co.: I am heartily in favor of such an association. The exhibits at the street railway conventions have attained such magnitude that it would be a very great advantage to all parties concerned to have our own man or men on the ground to superintend the placing of exhibits and look after the details. This is to my mind a necessity, and our company will be glad to do everything in its power to forward the movement.

Michigan Electric Co.: While we are not exhibitors at the railway conventions, yet as the writer attends most of them, and is much interested in the exhibits made, I would state as my opinion that a supply men's organization would be a good thing if it is governed by a board which properly represents a sufficient number of prominent exhibitors to make it truly representative of all exhibitors' interests and prevents showing undue favoritism to any firm or individual, and further bears such relation to the American Street Railway Association as will provide for working thoroughly in harmony with that Association. This last could possibly be accomplished by having one or two members of the Street Railway Association elected each year to the controlling committee of the Supply Men's Association; such members to be selected preferably from those living at or near the city where that year's convention is to be held. Supply men certainly are best fitted for looking after all matters pertaining to exhibits and arranging the details of freight rates, cartage, etc., on a basis which will be most convenient and less expensive for the exhibitors, and if such arrangements are made for all exhibitors by a committee authorized to do so, they undoubtedly would get better terms than individual exhibitors could otherwise secure. I would be pleased to do anything I can to further the proposed supply men's organization.

George W. Lord: We have taken considerable interest in the numerous expressions of opinion in regard to effecting a permanent organization of supply dealers, who in the past have placed exhibits at the annual conventions of street railway men. We have not been represented at these conventions mainly because of the various objections mentioned by others, but all of which could, no doubt, be overcome. As it is necessary for someone to start the ball rolling in a matter of this kind, we take the liberty of making the following suggestion: It would seem to be entirely appropriate if you and the editor of the Street Railway Journal, of New York, should request, say, three prominent supply men, who have been exhibitors in the past, to act with you. This committee of five could place themselves in communication with the individual concerns composing the general supply trade and from the various suggestions which would, no doubt, be received, they might be able to formulate some definite plan, according to which a permanent organization might be effected to the advantage of all concerned. The expenses of this committee would be inconsiderable and we would be willing to contribute towards paying them.

November 1st the Springfield (Mass.) Street Ry. put in effect an order prohibiting smoking in its closed cars.

The Exeter, Hampton & Amesbury Street Railway.

BY C. B. FAIRCHILD.

One of the most interesting cross country railway systems to be found in New England, is that of the Exeter, Hampton & Amesbury Street Ry., the lines of which connect Exeter with Amesbury, Hampton and Hampton Beach. The track in Exeter makes a loop about the central portion of the village, passing the depot of the

two miles to Little Boar's Head, where connection is made with the lines of the Portsmouth Street Railway Co. This portion of the state embraces what is known as "Historical New Hampshire," and while a trip over the line presents many interesting and beautiful scenes, at the same time one is reminded of many stirring events connected with the early settlement of the region, which have been recorded in history, song and story. Exeter, a town of about 5,000 inhabitants, is some fifty miles from Boston and about the same distance from Portland. The first settlement of Exeter dates from 1637, when John Wheelwright, who had been banished from the Massachusetts Colony on account of his alleged heretical religious views, came to the vicinity of Exeter and in 1638 selected as the site of the new town the falls in the Squamscott River, now the head of the tide water navigation. From this section went the ancestors of Daniel Webster; here Lewis Cass was born; here lived many families that have sent out men to make American history; here was the birthplace and home of Whittier, who afterward lived at Amesbury where he is buried. At Exeter is located the celebrated Phillips Exeter Academy, which was founded and formally opened by John Phillips in May, 1783, and which has always maintained a high standing as a preparatory school for college. The Academy buildings are delightfully located in the center of the village and the ample grounds are well kept and shaded by stately elms. The campus is bounded on one side by a beautiful

new public library, built of cream-colored brick and on the opposite side by a large stone church and in front by colonial houses with acres of lawns and a forest of shade trees. Nearby on the same street, is a church bearing a tablet, which reads, "The First Church in Exeter. Founded in 1638. Reorganized in 1698. This house erected in 1798." Hampton the other town from which the line

MAP OF THE SYSTEM.

Boston & Maine R. R., returning and completing the loop in front of the office of the operating company, where is also a waiting room. The line then crosses a bridge in an easterly direction and runs through a prosperous farming country about eight miles to Whittier's, a notable wayside inn. Here the line branches, one track going to Amesbury, nine miles distant, along the old

CASINO AND HOTEL, HAMPTON BEACH.

post road from Portsmouth to Boston. The other continues three miles to Hampton Beach, where on reaching the shore the tracks again branch, one section running south along the shore line about two miles in front of cottages and hotels to the terminal in front of the Casino, and the other north along the shore about

takes its name, has a population of about 2,000, while Amesbury is a prosperous manufacturing city of about 12,000 population, which is located on the Merrimac River a few miles above its mouth.

While both of the branches, as well as the main line, are through a well settled part of the country, and a number of villages besides

those noted above, the road does not depend entirely upon local traffic for its income, but it draws a pleasure traffic from the whole Merrimac Valley, and also enjoys a very liberal patronage from the summer tourists and seashore cottagers from Hampton, Rye and Salisbury Beaches, who find it a pleasant pastime to make daily trips inland on the "electrics," as the cars are called in all this region. Until recently, comparatively few people realized how many attractions this region possessed, but thanks to the "electrics," it is now brought within easy reach of a great multitude. In order to fully describe it, however, one must necessarily employ a vocabulary equal to that overheard at times on the cars from the groups of feminine tourists. It is not enough to say that everywhere along the line is the most beautiful farm scenery in all New England, with old colonial farm houses and stone walls on every hand, but one must say lovely, grand, delicious, entrancing, beautiful, fascinating, as at different turns in the road one

THE OLD WAY.

has an extended view over a neighboring valley, or sees some mountain peaks in the distance, or as the cars whirl through a group of native pines or passes through long rows of well laden apple trees (the principal border trees along the route) or some spreading or historical elm comes into view. It is safe to say that when city people come to know of the almost ideal beauty and interest which this region possesses and its accessibility, greatly larger numbers of tourists will favor the line with their patronage. The road approaches the coast over an extensive salt marsh, then proceeds to the south for a considerable distance paralleling the shore behind a ridge of gravel, sand or rocks, that have been thrown up by the sea, then behind the Great Boars Head, then along the beach proper as it makes a long bend inland and in front of a long row of hotels, cottages and stores, to the casino and hotel, already mentioned, which are owned and run by the street railway company. These buildings are near the middle of a curved sandy beach, which extends a mile or two farther south to Hampton River, and which is controlled by the railway company. The entire coast line of New Hampshire is only about 18 miles. In front of the casino, and for a mile or two in each direction, the beach slopes so gently, that it seems almost level, making it one of the finest and safest beaches for bathing to be found on the whole coast. There is no undertow, and no life lines or safety lines are required; bathing is safe at any stage of the tide. From the board-walk in front of the casino there is a stretch of fine, white, soft sand, extending about 130 ft. to the ordinary tide line; then there is a stretch of firm sand, about 500 ft. wide at low tide, without a shell or a pebble, and so firm and solid as to form a perfect carriage drive and a most delightful bicycle path. Here horse races are held and on some sections may be seen games of croquet, hall games by the lads, and the ordinary seashore amusements.

The buildings were erected by the street railway company about two years ago. First there is a large casino about 400 ft. in length, with a double row of piazzas all around. Adjoining this to the right is a fine hotel, with 50 rooms, which is run on the European plan, the guests taking their meals in the dining room at the casino. The casino is divided on the first floor into offices, and concessions for fruit venders, and there is a small dining room and kitchen. The main dining room is on the second floor, and adjoining it is an enclosed theater, with stage and modern fixtures,

for plays and vaudeville entertainments. At the south end on the ground floor is a large billiard room and bowling alley, while above these is a very pleasant large hall designed for concerts, political meetings, dancing parties and other entertainments. Vaudeville shows are given every afternoon and evening in the theater.

SPREADING ELM AND TYPICAL FARM HOUSE.

the troupes being furnished by the Gorman Amusement Agency, of Boston. A charge of 10 cents is made for the vaudeville entertainments and for dancing parties a charge of 35 cents is made for tickets, which admit a gentleman and lady. Adjoining the casino is a large pavilion divided into dressing rooms for bathers. Behind the casino and on the edge of the extensive salt marsh, is a fine base ball ground, and when match games are being played a charge of 5 cents is made for those who wish to watch the game from the piazza of the casino. On Sundays grand concerts are given. On pleasant days the cars carry about 10,000 people to the beach, and on special occasions, as many as 15,000 people have been counted on the beach at one time. Special rates of fare are offered by the railway company to excursion parties from neighboring cities and parties frequently come in on the steam

SUMMER CAR

cars to Exeter or Amesbury and then go by the electrics to the beach.

It is quite the fashion for some of the large stores and factories at Amesbury to close for a day and give the employes a free excursion to the beach. Merchants associations and other organized bodies frequently make excursions to the beach and are entertained at the casino. During one week in August, the Rockingham County Musical Association gave public concerts at the hall, the singers being entertained at the hotel. From this it will be seen that the street railway lines caters to a very large patronage, and that its officers are fully awake to the future possibilities of Hampton Beach.

One of the most conspicuous objects of Hampton Beach is

Great Boar's Head. It is a moraine or mound of glacial drift 1,300 ft. long and about 50 ft. high, thrust out into the ocean from the coast line. All about the base of the Head and for quite a distance on each side the shore line is strewn with boulders of all sizes, supposed to have been washed in from the undermining of the Head, as it was at one time probably of very much

sections are on a private right-of-way. On both the Exeter and Amesbury branches the tracks cross a steam railway line by means of wooden bridges, with earth approaches. These bridges were put in last year. The region is gently rolling, but none of the grades are very long or steep. The turnouts and each of the stations are provided with telephones, which are housed in

POWER HOUSE AND CAR BARN.

greater area. The Head divides the beach into two parts. The north beach extends about two miles to little Boar's Head and the south beach to Hampton River. From the point of the Head the shore swings back on both sides in a sharp curve, as shown in the illustration. There are several hotels located on and near the Head.

iron boxes on the posts and are of the type made by Couch & Seely, of Boston. The overhead hangers and attachments are for the most part from the Ohio Brass Co. At the turnouts, Johnson switches are provided, and when cars are run in groups, each conductor is obliged to tell the waiting conductor on the siding how many, if any, cars are following. In this matter the rules

are very strict, the men not being allowed to signal the number to the waiting conductors, but are required to call out and wait for the number to be repeated by the other conductor. In case any conductor is not sure that the line is clear, he is required to stay on the siding and telephone for instructions and always wait for instructions. When cars are running in groups, no car is allowed to approach the leading car nearer than five poles.

The power for operating the system is principally generated at a single station, which is located in Hampton Township, about eight miles from Exeter. In busy hours extra current is rented from a station in Amesbury for operating the Amesbury division, as the distance from the power house to the terminal in Amesbury is about 14 miles. The power house is a one story, brick structure and adjoining it is the principal car house. The ground dimensions of the power house are 100 x 80 ft., and it is divided by fireproof walls into engine room, boiler room, pump and condenser room. It is located in an isolated region, near a small pond, from which feed and condensing water is obtained. In front of the station is a wide, well kept lawn, with a fountain and numerous flower beds. The brick chimney is 150 ft. high, with a 5-ft. flue, giving excellent draft. Power is generated not only for operating the railway station, but for street and commercial lighting in Exeter, Hampton and Hampton Beach. The engine equipment consists of four machines, three single and one compound. The latter was recently added to the station. All the engines are from the works of the Buckeye Engine Co., of Salem, O. The

250-KW. UNIT—BUCKEYE ENGINE—GENERAL ELECTRIC GENERATOR.

PHYSICAL FEATURES.

The line is single track with turnouts for cars running at intervals of 15 minutes. The rails are 60-lb., in 60-ft. lengths. The track is, for most of the distance, on the public highway, but some

new engine is a horizontal cross compound machine with cylinders $16\frac{1}{2}$ and $30\frac{1}{2}$ x 30 in., and is rated at 400 h. p. when running at 120 revolutions, with a steam pressure of 120 lb. This machine is direct coupled to a General Electric multipolar generator of 250 kw. capacity. The voltage is 550. Two single engines of 185 h. p. each, with cylinders $15\frac{1}{4}$ x 24, and running at 160 revolutions drive by means of belts, two Keystone generators of 125 kw. capacity. A third engine of the same capacity drives by belts the lighting generator, which is a new machine, and one of the latest put on the market by the General Electric Co. In this machine the fields revolve and the speed is 600 r. p. m. and from it by means of a tank converter, currents for both the arc and incandescent lamps are obtained. The tank converter contains 280 gallons of oil and is of 100 light capacity. The lighting current is transmitted about six miles from Exeter and about the same distance in the opposite direction to Hampton Beach.

The boiler equipment comprises three Ames horizontal tubular boilers, 72 in. by 18 ft., and one Dickenson, each of 150 h. p. capacity. There is a combined condenser and feed water heater, designed by L. C. Lamphear, of Boston, Mass. In the primary division of this heater the engine exhaust is used and in the secondary, the exhaust steam from the pumps so that a temperature of 220° F. is obtained for the feed water. There are two M. T. Davidson feed pumps, one of which is a deep-well pump, for use in case the pond supply should fail; the well is 150 ft. deep. There are also a Knowles feed pump and a Davidson high pressure pump, with a capacity of 1,000 gallons a minute. This is used for fire protection. The water is lifted into a 10,000-gallon tank, mounted on a steel tower 80 ft. high. One-half of this supply is available for daily station purposes, for wetting down the coal, washing floors, etc., while the other 5,000 gallons is in reserve for fire purposes and for operating the Grinnell dry air fire sprinkler system, with which the neighboring car house and repair shop are equipped.

thus drawn off; every two weeks the boilers are cleaned and examined.

Coal is delivered by rail at Hampton depot, three miles away, and is hauled by wagon to the car station. Hard coal screenings, mixed with Georges Creek soft coal, is used as fuel. In ordinary traffic the mixture is half and half by weight. On occasions of

HAMPTON BEACH—BOATS HEAD IN THE DISTANCE.

extra heavy traffic, only one-third of screenings is used to two-thirds of soft coal. An oil house is constructed in the base of the water tower, and is provided with a concrete floor. Here the oil barrels are placed on an elevated stand and by means of a pipe the oil tank in the engine room is filled by gravity.

CAR HOUSES.

Two houses are provided for storing cars. The principal one is adjacent to the power house in Hampton. This is of wood, with

GENERAL VIEW OF POWER HOUSE, HAMPTON.

There is a duplicate system of feed water pipes, and in case all the feed pumps should be disabled the engineer has resort to a fire hose from the elevated tank to feed the boilers. The feed water is reasonably pure, but the engineer uses a little soda ash, which is introduced into the boiler once a week, through the heater. All tubes are blown out every morning, two gages of water being

metal shingles, and has ground dimensions of 50 x 215 ft., and is provided with four tracks. The second house is of brick and is located in the suburbs of Amesbury, and is of about the same size as the first. The repair pits of the former are constructed with brick walls and cement bottom, while 48 ft., of the floor space in front, on one side, is of concrete where the cars are washed.

The repair shop and stockroom are at the rear end of the building, separated by a fireproof wall and automatic sliding doors, and as before noted, both houses are equipped with an automatic fire sprinkler system. The superintendent's office is in front of the building, where is also a waiting room for car men. The tools in the repair shop are driven by a small electric motor, which also drives an air pump for charging the sprinkler pipes. All motor repairs are made in the shop. For winding the field coils on the metal shields which are used with the Steel motors, the foreman has devised an arrangement shown in one of our illustrations. It consists of an ordinary cone lathe head, which is driven by a belt from an overhead shaft and provided with an auxiliary adjustable

as they get their mail several hours in advance of the former service, by the old method. Three Taunton snow plows and a plow made by Smith & Wallace, with several flat cars, complete the equipment.

During the hours of heavy traffic 20 cars are frequently operated at one time. The winter cars have H. W. John's electric heaters, and all are provided with New Haven registers.

The through fare from Exeter to the Beach or from Amesbury to the Beach is 15 cents, but is collected in 5-cent payments at different stages. It requires one hour to make the trip in either direction between Exeter and the Beach; one hour between Amesbury and the Beach, and one and one-half hours between Exeter and Amesbury.

An interesting feature of this road is the care taken in the selection and management of all employes. The company's officials and the men are on excellent terms, and the company does everything possible to continue and increase this good feeling. One of the iron-clad rules of the road that is appreciated by the public is the one requiring every employe to show constant and unflinching courtesy to every man, woman and child that may use the service in any way.

At present the company employs 19 motormen and 19 conductors, who are paid 17½ cents an hour, and work 10 hours a day.

The officers of the Exeter, Hampton & Amesbury Street Railway Co. are: President, Warren Brown; treasurer, E. L. Pride; general manager, A. E. McReel; chief engineer, H. C. Mason; electrical engineer, J. C. Herlick. The company has an authorized capital of \$250,000 and \$203,000 in first mortgage bonds.

The general offices are in Folsom's block, Water St., Exeter.

MAIL CAR—EXETER, HAMPTON AND AMESBURY.

shaft, with reducing gears on each end. This shaft is so mounted in rocker bearings, that it can be thrown into mesh by means of a foot lever. In normal position it is held out of mesh by means of a spring, as shown. One or two reels of wire are placed in position, as shown, and a braking or tension device is provided to give the necessary stress on the wire. By this means the field coils are readily formed.

ROLLING STOCK.

The summer equipment comprises 8 double truck, 45-ft. 14-bench open cars, with double steps and 13 single truck open cars. All the large cars have Standard air brakes, with geared axle-driven compressors; these have been running for nearly two years, and are said to be giving excellent satisfaction. For winter use there are 9 single truck box cars; some are vestibuled and 4 have cross seats with center aisles. There is also one Duplex type of car, which is used chiefly as a parlor car and for clubs and for private parties. It is decorated with a number of red incandescent lamps, and when trimmed up with flags, presents a brilliant appearance. The brakes on this Duplex car and some of the vestibuled cars are operated by means of a vertical hand wheel, connected to the spindle by beveled gears. This is known as the Beverly brake, and is made by the Beverly Engine & Machine Co., Beverly, Mass.

The long cars have two trolley poles; a hook is placed at each end above the hood of the car to hold down the idle pole. The Wilson trolley catchers furnished by the Frank Ridlon Co., of Boston, are employed on all cars, and are in great favor with the car men and the manager, who all say, "It is a great thing." All the cars were built by the Briggs Carriage Co., of Amesbury, Mass., and the double, as well as single cars, are mounted on Du Pont trucks, furnished by the Lorain Steel Co., of Johnstown, Pa.; all are equipped with Steel motors furnished by the same company. The motors are No. 22, No. 34 and No. C. The car equipment also includes a fine mail car, which was designed by the manager. This is divided into two compartments, and is provided with racks for holding the mail bags and all the usual appliances for assorting the mail. This car has the right of way over all other cars and makes three trips each way, every day, connecting with the mail trains on the steam roads. This mail service is in high favor with the people in all the small villages,

DEVICE FOR WINDING FIELD COILS.

Here are finely arranged offices for the superintendent and the bookkeepers, and also a large private office for the use of the directors, and a commodious waiting-room for passengers. Here also is kept a large and complete stock of electrical supplies of all kinds for sale, as well as for the company's use. The Western Union Telegraph Co. has an office in one corner of the waiting-room. There is also an office and large waiting-room on Market Sq. in Amesbury. At the town of Seabrook, on the Amesbury branch, arrangements have been made with the proprietor of an old curiosity shop to use his store as a waiting-room. This is mutually satisfactory, as it saves the company the expense of renting or erecting a building and at the same time brings possible customers into the shop. The storekeeper does a large business selling relics and souvenirs of the region and its many famous characters.

The street railway system, as well as the Hampton Beach buildings and attractions, are under the direct supervision of Mr. McReel, the general manager, with headquarters at Exeter. Mr. McReel goes over the line every day and spends a good deal of time overseeing the crowds and terminal arrangements at the Beach. No pains are spared by the manager to keep the discipline up to a high standard, and to favor the patrons in every way, so that every one in all this region, and especially the summer tourist, has a good word for the management.

RECENT STREET RAILWAY DECISIONS.

EDITED BY J. L. ROSENBERGER, ATTORNEY AT LAW, CHICAGO.

CONDUCTOR'S PLACE IS ON PLATFORM WHEN CAR STOPS.

Nash v. Canal & Claiborne Railroad Co. (La.), 27 So. Rep. 661 Apr. 2, 1900.

The supreme court of Louisiana says that it takes it that the place of the conductor is on the platform when the car stops, to enable passengers to alight. Or, as it otherwise puts it, when a stop is made to permit a passenger to alight, ordinarily the conductor should be on the platform of the car. And, if he is called at the time, he should be able, in case of an accident, to account for his absence.

ARREST PROCURED BY CONDUCTOR FOR KEEPING ANOTHER'S CHANGE NOT MALICIOUS PROSECUTION.

Barry v. Third Avenue Railroad Co. (N. Y.), 64 N. Y. Supp. 615, May 11, 1900.

A passenger gave a conductor a quarter of a dollar, and received two ten-cent pieces in change. Another passenger got on the car, as the first one sat there, and also gave to the conductor a 25-cent piece to pay his fare. After a short time this second passenger asked the conductor for his change, but the conductor claimed that he had given the change to the first-mentioned passenger, and insisted on that passenger paying it to the second one. Thereupon there arose a dispute between the parties, which resulted in the conductor calling a policeman, and having the first passenger arrested. The policeman, accompanied by the conductor, took the man to the station house, where, after some delay, he was brought before a police justice, but no complaint was made and he was discharged. Following this, he sued the railroad company for malicious prosecution and false imprisonment, but at the trial elected to proceed for malicious prosecution, and not for false imprisonment. His complaint was then dismissed, and the appellate division, first department, of the supreme court of New York holds properly so. It does not think that upon the evidence above recited an action for malicious prosecution could be maintained. It says that there was no doubt but that the arrest, made by the policeman at the request of the conductor, was utterly illegal, and that such an arrest would undoubtedly afford a good ground for an action for false imprisonment against the officer who procured the arrest to be made. But, it adds, the mere fact of an illegal arrest and detention is not sufficient to sustain an action for malicious prosecution. Unless the arrest is followed by some sort of a judicial proceeding, which it was not in this case, there can be, it says, no malicious prosecution, and the plaintiff must seek his remedy in an action for false imprisonment. Again, it says that the charge against the plaintiff, if it were a crime at all, was only a misdemeanor, and hence no justification for an arrest, without a warrant, by an officer who was not present when the offense was committed or attempted.

LIABILITY UNDER ORDINANCE AND EVIDENCE FOR NOT RUNNING CARS AS REQUIRED AFTER MIDNIGHT.

City of New York v. Union Railway Co. (N. Y.), 64 N. Y. Supp. 483, May 1, 1900.

Sections 595 and 596 of the Revised Ordinances of the City of New York, approved March 30, 1897, the appellate term of the supreme court of New York says, clearly evince the purpose to compel all street surface railroads then operating within the municipality, under a penalty of \$100 for each neglect or refusal, to run cars, at intervals of not less than 20 minutes, over the entire road, between 12 o'clock midnight and 6 o'clock in the morning, and it holds that these sections must be treated as the declaration of the local legislative authority with respect to the subjects which they embrace at the time of their approval, viz., March 30, 1897, and not 1890, when the original ordinance in the identical language of

these sections was adopted, referring to companies "now" running cars, as do these sections.

Then, it appeared from a certain agreement, bearing date the 2d day of July, 1892, that certain street surface railroads, including "the road, tracks," etc., were consolidated, and became known as the "Union Railway Company of the City of New York," and among the thoroughfares affected thereby was Westchester avenue. The evidence showed, furthermore, that this avenue began at Third avenue, and continued to the Southern boulevard; that, during the daytime of the period in suit, cars bearing the name "Union Railway Company" were run along this avenue; and that no cars except those bearing such name were operated thereon. It also appeared from the testimony of a police officer that on a certain date he covered his post from Prospect avenue to Third avenue, which extended over and along Westchester avenue; that he was not off post from past 1 until half past 5 o'clock in the morning; and that during this time no cars passed him. Under these circumstances, it must be held, the court declares, that the Union Railway Company of the City of New York did not, during the time in question, run any car whatever, and hence incurred the penalty. It was during that part of the night bound to run cars over its entire tracks at intervals of 20 minutes each, and it could not, the court holds, escape liability upon the plea that the proof showed a failure or neglect to operate only a portion of its line.

CONCERNING ALLEGED RIGHT TO GO ON FROM SHORT TRIP CAR WITHOUT TRANSFER TICKET.

Little Rock Traction & Electric Railway Co. v. Trainer (Ark.), 56 S. W. Rep. 789, Apr. 21, 1900.

A woman boarded a car on Main street, intending to go on that and another street called West Markham. She testified that she asked the conductor if that car went to West Markham, or was for West Markham, and, being answered in the affirmative by him, she paid her fare. When, however, the car reached Markham street, he informed her that his car would go no further, but that an approaching car indicated to her by him would take her on West Markham street. She then alighted from the first car and when the second one moved up and took its place, boarded it. But the conductor on the second car demanded fare, which she refused to pay, informing him that she had paid her fare on the car from which she had alighted. The conductor insisted that she must pay, or get off, and, she still refusing, he ran the car back to police headquarters, where he called to his assistance a policeman, but the chief of police appearing on the scene disposed of the case at that point by paying the fare. An action for damages, laid at \$5,000, followed, resulting in a verdict and judgment for \$200 against the company, which the latter, on appeal, has got reversed by the supreme court of Arkansas.

At the plaintiff's request, the judge instructed the jury: "If you believe from the evidence that it was the rule or custom of the company to require a transfer ticket at the point at which plaintiff made the change, but you should further find that her entering the car without procuring a transfer ticket was the result of the negligent conduct of the conductor of the first car, and that the plaintiff, as a reasonably prudent person, had a right, under the circumstances, to assume from the conduct and statements of the first conductor that she would be carried on West Markham without such transfer ticket or further payment of fare, then she was entitled to be carried by the second car without further payment of fare." This is not discussed in the case.

The company asked to have this instruction given: "The regulation of the defendant company that persons transferred from one car to another can ride upon the second car without paying fare only upon the production of a transfer check from the conductor of the first car is a reasonable, valid, and binding regulation; and if the plaintiff knew of it, and transferred from one car to another without asking the conductor for a transfer check, and without his telling her none was necessary, she cannot recover." There was ample evidence, the supreme court says, to sustain the

instruction, and it holds that the company was entitled to it, without modification, as presenting its case, or its side of the case, and that it was error for the judge when he gave it to modify it by adding the words, "unless she was induced to do so by the conduct and statements of the conductor of the first car."

The evidence which the court refers to as ample to sustain the instruction as asked was that of the manager of the company, which was substantially uncontradicted, that, under the rules and regulations of the company, a conductor was not authorized to pass a passenger from another car without the production of a transfer ticket except in case of emergency, such as a breakdown or something of that kind. If a car was running extra on Main street to Markham, as was the case in this instance, the conductor on the latter car had no authority to pass him except on a transfer ticket. If any person, having paid on one car, wished to ride on another without paying a second fare, he must ask and get a transfer ticket. He also stated that these rules and regulations were kept posted in all the cars for a long time, and they were so posted at a certain point on Main up to the time of the trial. Besides, the woman herself testified that she was well acquainted with the rules as to transfers; that she knew that when she went from one car to another she had to pay, or have a transfer; that there was a notice in the cars stating that persons wanting to transfer must ask the conductor for a transfer check.

The supreme court also holds that, at the company's request, the judge should have instructed the jury, without the words he added, which are here indicated by being inclosed in a parenthesis, that "if, by the custom or regulation of the defendant company, passengers paying on one car could ride on another one by presenting upon the second car a transfer check procured from the first, and the plaintiff failed to procure such transfer check and present it on the car to which she transferred, then she was not entitled to ride on the car to which she transferred, without the payment of fare. The conductor was not authorized to allow her to ride on his car without the payment of fare or the presentation of such transfer check, (and the company would not be liable unless the jury should find that her entering the car was the result of the conduct of the conductor on the Main street car, and further find that she, as a usually prudent and business person, had a right to suppose from the conduct and statement of the first car conductor that she would be carried on West Markham street without such transfer ticket or further payment of fare)."

The modification, the court says, changed the issue from that made in the complaint and answer, from mistreatment on the part of the conductor on the second car, to a charge against the conductor of the first car. Nor does it consider that there was any evidence to support the theory that the conductor on the first car had produced or been the cause of the alleged injury on the second car. Which of the two, the conductor or the woman, should have taken the initiative in regard to the transfer ticket was a matter of dispute between the latter and the company, and, the court holds, could only be settled by the evidence and instructions thereon.

Furthermore, the court holds that, if it was sought to make the statements of the first car conductor to serve the place of representations which would justify the woman in refusing to present a transfer ticket or pay fare on the second car, as seemed to be the effort in this connection, it could not be permitted, for she ought not to rely on representations of the servant which she knew were in contravention of the rules and regulations of the company on the subject.

RELATIVE RIGHTS UNDER EXCLUSIVE FRANCHISE AND "RESERVED POWER OF REVOCATION."

Wilmington City Railway Co. v. Wilmington & Brandywine Springs Railway Co. (Del.), 46 Atl. Rep. 12. Apr. 11, 1900.

For many years the question has been discussed by lawyers in Delaware as to the precise meaning and effect of the latter portion of the provision in the constitution of that state of 1831 that no act of incorporation except for the renewal of existing corporations should be enacted without the concurrence by two thirds of each branch of the legislature; "and with a reserved power of revocation by the legislature." A long review of the authorities that might be expected to shed light on it, is made by the court of chancery of Delaware, which says that it shows that there is no decision of any

sort in opposition to the plain, logical interpretation of the phrase, "reserved power of revocation by the legislature," as meaning the power to revoke, at the pleasure of the legislature, any or all of the franchises granted to a corporation, the power to recall all the rights, privileges, or franchises granted to a corporation, or any number less than all, or any single right, privilege, or franchise; that it cannot mean less than this, and that it cannot mean more; and that it differs from the commonly reserved power "to alter, amend, or repeal the charter" in not including the power to regulate or control corporations in the manner held in certain cases to appertain to the latter power. It further holds that the revocation can be either direct, or, by necessary implication, by the passage of an act necessarily inconsistent with some right or privilege possessed by some existing corporation. For example, it holds that a grant to another company of authority to construct and operate a street railway in certain streets of a city would, under such reserved power, revoke proportionately any exclusive right which a company claiming the exclusive right to locate, construct and maintain a street railway in the city may have had.

But such an exclusive right, the court holds, is a property right, entitled to the same protection as any other property right, giving the company to which it was granted a standing in a court of equity to raise, by an application for an injunction, the question say of the forfeiture of the charter of a new company granted antagonistic rights in certain streets, as above suggested.

Now, on the question of forfeiture, the court holds that where a company was required by its charter to build within a certain time its railway, from without a city, to the boundary line of the city on a certain street, and was authorized, when that was done, to build and extend its railway from the point at which it so intersected the boundary line of the city to, through, and along a certain other named street, etc., the company forfeited its franchise by not building to the boundary line on the first-named street, but building, instead, to the boundary line on the second-named street. Nor does the court consider that it made any difference in this respect that to have built the road as prescribed would have made an acute angle in it.

The grant to a corporation of the exclusive right and privilege of locating, constructing, operating and maintaining a city railway within the city limits, the court holds gave it a monopoly to build within the city, notwithstanding a certain route was prescribed, it being granted the further privilege to build anywhere within the city, on condition of its first obtaining the consent of the council of the city. And while the court considers the policy of the law to be strongly against grants of exclusive rights or monopolies, it remarks that the most serious objections to them disappear when they are accompanied by a reservation of power of revocation, such as first above discussed.

Nor does the court agree with the contention that such an exclusive grant as the one just described could not operate to exclude another city railway from operating an electric railway within the city limits, because electricity was not used as a motive power at the time the grant was made.

It would seem, the court says, that when the broad term "city railway" is used in such a grant the term must be taken to mean only what is essential to the definition of the term, and obviously no particular motive power is essential. Whenever a statute specifies the motive power to be used, the expression of that power may be construed to exclude any other. Indeed, the general rule of construction seems to require this. But, when an exclusive right is given in general terms to a city railway, the effort to confine it to the particular motive powers in use at the time, the court declares, would seem to be as artificial and unauthorized as to confine it to the kind of rails then in use, excluding the idea of modern rails of steel and of great weight, or to limit the size and shape and quality of cars to those known at the time. All these things, including the motive power, are subordinate,—mere means to make the franchise effective; and yet the expression of any of them might be so made as to so limit the grant. Wherefore, the court holds, when no kind of motive power is mentioned, it should be taken to indicate that the legislature means what it says, "a city railway," however propelled, whether by powers then familiar, or those they know not of; in fact, any kind of power which the ingenuity of man may contrive that does not constitute an additional burden upon the highway, or an injury and annoyance to the public.

But it was argued here that it was shown that the motive power was intended to be limited to steam or horses by a provision "that steam power shall not be used to propel the cars of said company unless with the consent of city council, and that, in order to prevent accidents, suitable bells shall be attached to the horses drawing the cars." Not so, however, thinks the court. Taking this proviso in connection with the general terms of the grant, it holds that it would rather indicate that, omitting mention of motive power in the grant, and afterwards regulating the use of the two powers with the use of which they were practically familiar, the legislature left all other possible powers to be treated as experience might prove to be desirable.

A court of equity, the court here further holds, will not enforce by injunction such a contract between two companies as one whereby one of them agrees not to extend its tracks into or within the city in which the other is located say for a period of 25 years. Nor does it consider that it should make any difference that the company making such agreement had express legislative sanction to its making a traffic agreement with the other company, especially when the legislature later granted it a franchise to extend its line within the city.

MILWAUKEE FRANCHISE HELD VALID.

The Supreme Court of Wisconsin has passed on the so-called Trentlage injunction issued in January last to prevent the acceptance by the Milwaukee Electric Railway & Light Co. of the franchise ordinance passed Dec. 18, 1899, by the Milwaukee council. The court finds that discretionary power resides in the council to grant the use of streets and bridges to street railway corporations, and to determine what terms shall be attached to the grant, and that the exercise of this discretionary power can not be controlled by a taxpayer or any body of taxpayers. It finds therefore that as taxpayers the plaintiffs in this case had no cause of action stated in their complaint. It finds also that the prevention of the railway company from accepting the franchise, thereby annulling the whole grant, was in no way necessary to protect whatever right the plaintiffs might have as abutting property owners, and that in this aspect of the case the injunction was "an exercise of arbitrary power which cannot be defended for a moment." With regard to the claims of irregularity in the council's proceedings during the passage of the ordinance, the court finds that these questions can not be raised at the suit of private parties and adds that "upon the facts presented it is not at all certain that the present franchise would be set aside at the suit of the state."

As the result of the decision the company, being secure in its rights till 1934, will at once proceed to make extensive improvements.

PROPOSED EXTENSION IN MONTREAL.

In order to give the public easy access to the dock the Montreal Street Ry. proposes building an extension which will be a novelty in the way of electric railway construction in Canada. The intention is to extend the tracks on trestle work from the permanent roadway at the edge of the guard pier, out as far as the water front, where a platform will be built with wide stairways leading down to the docks. This will fill a long felt want in Montreal, where the ascent from the docks is very steep, and if carried into effect will overcome difficulties with which the street railway company has been struggling for a number of years past.

FIRE ON MT. TOM.

On the night of October 8th, the Mt. Tom Pavilion on the summit of Mt. Tom, near Holyoke, Mass., was completely destroyed by fire. This was a most popular summer resort. It was built by the Mt. Tom Railroad Co. at a cost of \$20,000, and \$5,000 more was spent in furnishing it. The pavilion was operated under lease by the Holyoke Street Ry.

The building was completed in June, 1897, and was illustrated in our issue for July, 1897, page 426.

The Cleveland (O.) City Ry. has ordered 65 new double truck cars.

FIRE AT THE PAIGE IRON WORKS.

The plant of the Paige Iron Works, Chicago, was partially destroyed by fire, October 27th, the loss amounting to \$75,000, fully covered by insurance. The origin of the fire, which was discovered shortly after six o'clock Saturday evening, is not certainly known though it is believed to have been set by a lighted cigar stump carelessly thrown among inflammable stuff on the premises. So soon as the insurance shall be adjusted contracts will be awarded for the building of the works, a fine and fireproof plant being projected to replace the burned building. The new Paige Iron Works will be completed, it is estimated, in four or six weeks. No delay in the filling of orders on hand is anticipated.

FLOWERS BY TROLLEY.

In a recent issue the Florists' Review comments on the advantages of using interurban electric lines for shipping flowers, as follows:

"Quicker and more frequent express service from suburban points into the large cities is of very great importance to growers of cut flowers and the electric roads who put on express cars will no doubt find liberal patrons in the growers their lines reach, provided, of course, that charges are not excessive.

"And what a saving and advantage it would be if electric express cars would deliver the grower's product direct to the doors of the wholesalers in 28th St., New York, or at Wabash Ave. and Randolph St., Chicago. It would certainly be a vast improvement over having the boxes tumbled from the express car to an express wagon and then shaken up by a trip over the stone pavements."

COMPRESSED AIR CARS.

It was very manifest during convention week at Kansas City, that compressed air for street railway service was attracting wide and intelligent interest and investigation. There are so many problems which the successful introduction of this power will solve, both in the street and general railway service, that no railway man should fail to appreciate its significance. Suburban lines of limited mileage are now being operated by steam at great expense, a great portion of which can be saved if the air motor can be substituted for the present locomotive. It is not necessary to amplify this statement; it will naturally commend itself to any experienced railroad man. Without considering the question whether or not it is likely to supersede the overhead or underground electric system, it must be conceded that it is capable of performing good auxiliary service on established electrical lines, during the rush hours, or late at night; this work is now done at an unnecessary cost. That this system has survived the experimental period and has come to stay, is made apparent by its operation on 28th and 29th Sts. in New York, which is perhaps the most difficult stretch of surface railway to handle in the United States, by reason of the fact that the streets being well paved with asphalt are very popular for vehicular traffic although they are narrow, and because the cars are required to stop whenever signalled by a passenger instead of halting at the street corners as customary on other routes.

Twenty air motors of the Hardie type have been running on these streets for the past two months having replaced other motors which failed to perform the service with satisfaction. Each car has averaged 97.6 miles per day and carried 1,100 passengers. This very extraordinary showing is a surprise even to those who had most faith; moreover it is stated that the cars make less noise than any others in service, start without the slightest jerk or inconvenience to the passengers, and the air brake is so marked a feature of the motor that it is likely to be introduced upon lines now operated by electricity.

CROWDED CARS IN TORONTO.

Last year the Board of Control of Toronto began a suit against the Toronto Railway Co. to prevent the overcrowding of the street cars; October 26th the City Council directed that the suit be dropped. It was considered that the only effect of a judgment against the company would be to transform the strap-holders into curb holders.

MILFORD, ATTLEBORO & WOONSOCKET STREET RAILWAY.

The region in which the different branches of this system are located embraces the southern part of Massachusetts just above the northeast corner of Rhode Island and terminates at Woonsocket in the state of Rhode Island. This territory owing to the numerous manufacturing villages and the topography of the country is regarded by experts as a most favorable one for a profitable electric railway enterprise and the receipts for the first year of the operation of this road are very gratifying to its promoters. The length of the line, thus far constructed, is 32½ miles and the different branches serve a population of over 77,000 people. The two principal lines run nearly at right angles to each other. The most northern point is Hopkinton near Echo Lake; from here the line extends in a southeasterly direction through the towns of Milford, Bellingham and Franklin to Wrentham, where it branches, one section running to the town line of Attleboro farther south, and the other to the town line of Foxboro three miles directly east from Wrentham. The second branch starts at Caryville and runs in a southwesterly direction through North Bellingham, Bellingham

or past attractive farms, then through a series of low hills, giving charming views, especially along the Charles River with its numerous cotton and woollen factories. Included in the scenic features are extensive marshes, groves of willows and small lakes. On one of these, Hoag Lake, the street railway company owns and operates a beautiful park which is situated on an island of about eight acres and at which are the usual park attractions, including a rustic theater with a seating capacity of over 1,200, a dance hall, boating facilities and merry-go-rounds.

The scenic features of the system naturally draw a large pleasure and tourist patronage, which, with the advantages stated, make the system a very promising one. The line is single track with turnouts, and is one of the best constructed lines of its character to be found in New England. The rails are 60-lb. T and are laid on ties spaced 2 ft. c. to c. The trestles and bridges are all of substantial construction. The power house and principal car house are located at Unionville near Franklin, and near by these are the Worcester textile mills. The buildings are both of brick with steel truss roofs and are practically fireproof.

The basement of the power house has its floor on a level with the grade line and is provided with large windows so that the pumps,

POWER HOUSE OF MILFORD, ATTLEBORO & WOONSOCKET STREET RAILWAY—FILER & STOWELL ENGINES.

and Blackstone to the city line of Woonsocket. At all the terminal towns and at Franklin connections are made with other street railway systems, some of which connect with towns farther north in Massachusetts and with points in Rhode Island so that certain parts of the system form links in the trolley ride that may be made from Providence to Boston.

Milford is a manufacturing town of about 11,000 inhabitants, the principal products being shoes, straw goods and the famous Milford pink granite products. It has a theater, good hotels and attractive shops. At Hopedale is the manufacturing establishment of the Draper Co. which employs about 3,000 operators and makes cotton mill machinery. Bellingham and Medway are known as farming towns, but also have several woollen mills. The population of Franklin is about 5,000 and the numerous factories turn out rubber, cotton, woollen and straw goods; here is located the celebrated Dean Academy, popular in New England. At Wrentham are manufactories of jewelry and straw goods, and near this town the tracks run by Lake Pearl, an attractive pleasure resort. Woonsocket has a population of about 31,000 and here and at Blackstone are cotton and woollen goods factories.

The line is built principally on the public highways, but in some sections is on private right of way, running through wild woods

and condensors and piping which are placed there are lighted on all sides; this with the ample head room, makes it convenient for operation and repairs. The chimney is of brick 120 ft. high and 12 ft. in diameter at the base; the core is 5 ft. 6 in. in diameter inside.

The power equipment for this station, consisting of engines, boilers, electrical apparatus, together with their appurtenances, is all of the latest and most approved type and designs. The contract for the engines was awarded the Filer & Stowell Co., of Milwaukee, Wis., through T. W. Phillips, manager of the eastern department, with offices at No. 4 Market Sq., Providence, R. I.

The engines are two in number. One is of the simple condensing type with cylinder 18 in. in diameter and 42-in. stroke, and has a balance wheel 14 ft. in diameter, weighing 30,000 lb.; it operates at a speed of 120 r. p. m. The other engine is of the cross-compound condensing type with high-pressure cylinder 16 in. in diameter, low pressure cylinder 30 in. in diameter, and both of 48-in. stroke; this engine has a balance wheel 16 ft. in diameter, weighing 40,000 lb., and operates at a speed of 100 r. p. m.

The single cylinder engine is direct connected to a 250-kw. generator, and the compound engine to a 325-kw. generator. The engines are of the Filer & Stowell Co.'s heavy duty type, with a design of valve gear at variance with that of other Corliss engines,

provision being made to operate it at much higher speed if so desired without impairing the integrity of the mechanism, and of special construction throughout to meet the exacting requirements of railroad work. The cylinders of the engines present a pleasing appearance, being completely covered with planished sheet steel with finished corner strips, and polished false heads are provided for covering the back cylinder heads. The frames are of the full tangye type with bored guides and of massive construction throughout. The frame, pillow block and guides are cast in one piece, giving a foundation contact the entire length and making but one joint (where attached to the cylinder) and insuring absolute rigidity and perfect alignment under all conditions. The main bearings are lined with genuine babbitt metal, provision being made for taking up wear on the quarter boxes; there is an oil reservoir with chain oilers to give continuous lubrication of these parts and the bottom shells are furnished with water circulating pipes to prevent heating. Nugent pendulum center oilers are used for lubricating the crankpins. The pistons are made of cast iron with self-acting packing rings and adjustable junk ring, and the piston rod is provided with Tripp's metallic packing. The crossheads are made of special semi-steel, of the box pattern and fitted with ad-

EXTERIOR VIEW OF POWER HOUSE.

justable babbitted shoes. The crosshead shoes are turned and accurately fitted to the guides, and these being cylindrical it allows an adjustment around the center line of the engine. The connecting rods are of the solid end type, adjustable at both ends, and with solid phosphor bronze boxes at the crosshead and phosphor bronze boxes babbitted at the crank pin end. The cranks are of the disk form, counterbalanced on the back side, and turned and polished. The valve gear is of the liberating type, and so designed that the governor controls the point of cut-off from zero to three-quarters stroke. Large wearing surfaces are provided, and the patented drop lever which constitutes a part of the valve mechanism is keyed to the valve stem and supported in the bonnet, thus relieving the steam valve stem from all transverse strain. The latch dies are of hardened steel with eight wearing surfaces, and provided with a patented adjustment, whereby the amount of lap of the dies can be reduced or increased while the engine is in operation. Multi-ported valves are used, and separate steam and exhaust eccentrics are provided for actuating the steam and exhaust valves of each cylinder. The wrist plates of each cylinder are provided with unhooking device, which admits of all the valves being worked by hand, a feature which is thoroughly appreciated by engineers. The fly-wheel of each engine is of the square-rim

type, made in halves and held together with bolts at the hub, and at each rim joint by wrought iron rings shrunk on.

Considerable care was taken in the design of the piping and arrangement of pumps and condensers, etc., that the highest efficiency might be realized in the operation of the station and the cost of maintenance reduced to a minimum. All the main steam piping is of extra heavy wrought iron with very heavy cast iron flanged fittings and wrought iron long turn bends. Mosher separators are used and all valves in this system of piping are extra heavy gates with outside screw and yoke. The auxiliary steam piping is of standard weight iron and fitted with globe valves, and all feed piping used for hot water is of brass. A Hartford feed water heater is placed in the exhaust of each engine and a Gleaner auxiliary heater takes the exhaust from the pumps and condensers. A Dean Brothers' independent condensing apparatus is provided for the simple as well as the compound engine. In the rear of the station is the boiler house containing three Babcock & Wilcox boilers. The station is so situated that coal may be delivered on a side track from the adjacent steam road, and deposited in front of the boilers.

Richard P. Jenks, designing and constructing engineer, with office at 930 Banigan building, Providence, furnished the plans and specifications for the power house, and the construction as well as the entire installation of the station was under his direct supervision. The plant is considered a model one in point of design and equipment. The motors as well as the generators and all electric equipment are of the Westinghouse make. The cars were all built by the Wason Manufacturing Co., of Springfield, Mass. W. H. Tylee & Co., of Worcester, were the general contractors, and Hodges & Harrington, of Boston, were the engineers for the road construction.

The officers of the company are G. W. Higgins, president; E. K. Ray, treasurer and general manager; William H. Tylee, secretary.

GOLDSCHMIDT WELDING PROCESS.

In our September issue was a brief description of the Goldschmidt process of obtaining high temperatures by the combustion of aluminum. Mr. Ernest F. Lange in a paper before the Iron and Steel Institute (England) describes the various applications of the process, some of which are quite novel. Thus defective castings can be repaired, broken teeth of gear wheels replaced, etc. In the new works of the Chemische Thermo-Industrie in Essen, the steam service pipes are welded on this system.

Details as to welding 7-in. girder rails are given as follows: A good joint having been made between the two ends, strong clamps were then secured to the rails, some 9 in. or 10 in. from the joint, and connected with each other by means of a strong bolt on each side of the rail. The sheet-iron form was then brought round the part to be welded, and backed round with fireclay. The reaction was then started in a crucible capable of taking 15 kg. (33 lb.) of the aluminium-iron-oxide mixture (known as thermit P), and at the end of the reaction, which lasted about a couple of minutes, the contents of the crucible were poured into the sheet-iron form surrounding the joint, care being taken that the slag made first contact with the cold surfaces. After waiting another couple of minutes, the rail ends were judged to be sufficiently heated, and a few turns of the nuts on the tension bolts were given equally and simultaneously, and the weld effected. An important feature about this welding process is that the layer of slag or corundum which first forms round the part to be welded also protects the joint from oxidation. After the welding, the solidified mass can be knocked away by a few light blows from a hammer; but, as a rule, it is better to allow it to remain on for some time, so as to allow of a more gradual cooling of the rail-joint. On knocking away the mass, it was seen that the sheet-iron form was so little damaged that it could be used over and over again.

With regard to the comparative cost of the joint as compared with a fishplate joint, Dr. Goldschmidt has got out some figures in which consideration is taken of the cost of maintenance of the fishplate joint, and makes out a favorable case for the welded joint.

The New Jersey & Hudson River Railway & Power Co., operating the "Hudson River Line," has issued a card containing a list of the autumn leaves, berries and flowers growing wild on the Palisades; both common and scientific names are given.

SUSPENDED RAILWAY AT PARIS.

The Continental Gesellschaft fuer Elektrische Unternehmungen, of Nuremberg, had on exhibition at the Vincennes Annex of the Paris Exposition a working length of a monorail suspended railway. The exhibit comprised two spans of 100 ft. each and a car of

SUSPENDED RAILWAY AT PARIS.

the type similar to those running on the Barmen-Elberfeld line illustrated in our issues for March and April last. The illustration is reproduced from *Engineering*, London, which paper states that this section will, after the Exposition, be utilized as a part of a line the company is constructing.

CHATTANOOGA RAPID TRANSIT CO.

Pres. S. W. Divine of the Chattanooga (Tenn.) Rapid Transit Co., while on a recent visit to Philadelphia, induced the stockholders of his company to purchase the electric railway on Lookout Mountain, the Lookout Mountain inclines, and the roadbed and other property of the Chattanooga & Lookout Mountain R. R. It is announced that the Chattanooga Rapid Transit lines will be extended to the top of Lookout Mountain, that a line will be built to Lulu Lake, on the mountain, and that an extension will be made from Sherman Heights to Boyce. All the Lookout Mountain property was purchased from Capt. J. T. Crass, and will be greatly improved, so that there will be a direct service over the lines of the Rapid Transit Co. to the center of Chattanooga. Mr. Divine has announced that the power plant which has been rebuilt on an extended scale since the company's fire of July 23d, will be equipped to have three times the capacity of the burned plant. These changes and improvements will place the Chattanooga Rapid Transit lines among the best of the many modern and progressive street railways in the South.

THE ENGINEER.

Under date of October 22d the Engineer Publishing Co., of Cleveland, announces that Mr. W. R. C. Smith and Mr. C. S. McMahan, for many years western managers of the *American Electrician* and *Street Railway Journal*, respectively, have severed their connections with these papers and associated themselves by purchase with the *Engineer*. Mr. Smith will be vice-president and general manager, and Mr. McMahan, secretary and business manager. The company will have offices in the Tribune Bldg., New York, and in the Monadnock Block, Chicago.

NEW CAR HOUSE IN CHICAGO.

The Chicago Union Traction Co. is now building on North Clark St., north of Devon Ave., Chicago, a car house covering almost three acres. The building is 127 ft. 3 in. wide, and about 1,000 ft. long, 1,006 ft. on one side and 981 ft. 9 in. on the other. The front end is two stories high, the second floor having an area of about 7,500 ft., and here will be offices for the superintendent and the receiver and locker and toilet rooms for the trainmen. The front wall is to be of pressed brick, terra cotta and ornamental iron work and will present a handsome appearance when completed. The side walls are of brick and the roof is covered with tar and gravel.

The roof is supported on four rows of posts spaced 18 ft. apart longitudinally and dividing the floor space into five bays each with two tracks. Over the middle is a monitor. All the foundations and side walls have been made heavy enough to permit a second story to be added and used for car storage. Where the building is more than one story high the posts have cast iron caps on which the second story posts rest, thus eliminating the effect that shrinkage of the floor timbers would otherwise have.

A second track 170 ft. long with its center line 10 in. from the center of the main track, has been laid in front of the building, and from this off-set track the barn tracks branch. The special work required was furnished by the Falk Co., of Milwaukee.

The five rolling doors, each 25 ft. wide, for the front will be furnished by the Kinnear Manufacturing Co., of Columbus, O.

SECOND CLASS FUNERAL CAR.

The popularity of funeral cars in Mexico and the attention which is being paid to funeral cars in this country show that the subject is one that deserves the attention of street railway managers. The car illustrated is one of 14 shipped within the present month to one of the Mexican railways from the works of the J. G. Brill Co.

It is 13 ft. long by 8 ft. 2 in. wide and is mounted on a No. 21 E truck with a 6 ft. 6 in. wheel base. The road is standard gage. The cars are fitted with two G. E. 1000 motors so that they could haul a considerable number of trailers if necessary. The weight

MEXICAN FUNERAL CAR—J. G. BRILL CO.

of the car without the motors is 7,860 lb. Radial draw bars are used with angle iron buffers. The step is placed at each corner of the car. The roof is supported by four stout corner posts which are strengthened by wrought iron corner braces. The decorations for the car consist of black curtains, draperies, etc., which are furnished and put on by the company. There are also crucifixes and other religious decorations. These cars take the place of the hearse in American cities and as the company furnishes transportation for the mourners as well as for the coffin, the revenue derived from this source is a large one.

Pickpockets are working the Chicago street cars and have had considerable success.

AMERICAN STREET RAILWAY ASSOCIATION.

The 19th Annual Convention Held at Kansas City
October 16-19, 1900—Nearly 800 Persons Registered the First Two Days—100 Ladies in Attendance—New York in 1900—W. H. Holmes Chosen President—Secretary Penington Re-elected—Successful Banquet Friday Night.

TUESDAY, OCTOBER 16th.

The 19th annual convention of the American Street Railway Association was called to order at half past eleven by President J. M. Roach. Notwithstanding the late arrival of a large number of the delegates, the large room in the roof garden of Convention Hall was well filled, and the attendance steadily increased until adjournment. The meeting room was on the west side of the building, and while the association as a body was never before so near the sky, the ascent was reached by a series of easy inclines not at all tiresome. The speaker's platform was tastefully ornamented with potted plants and cut flowers.

The delegates almost reluctantly gave up the social greetings of old friends to take up business at the sound of the gavel. The representation this year was excellent and came from almost every state. If anyone had doubted the wisdom of selecting so distant a point as Kansas City that doubt was wholly dissipated the first morning. There was the same earnest interest in the meeting which had been the case at former years, and the somewhat chilly temperature of the room was not reflected in the attention paid the speakers, some of whom were interrupted frequently by the "hum of industry" from the exhibit section.

After calling the meeting to order the president introduced Mayor Reed, of Kansas City.

ADDRESS OF MAYOR REED.

Mr. President and Gentlemen: I do not know whether I can make you hear me this morning or not. My voice, which usually is as soft and as musical as the notes of a flute wafted over moonlit waters, has been laid out on the altar of my country to such an extent in the last few days that I imagine it bears a distinct resemblance to the inharmonious blending of the sounds of a cracked fiddle and the roar of a buzz-saw. If I could make you hear, and say something to make you feel at home in this city, I shall be delighted.

I esteem it, Mr. President and gentlemen, a great honor to address this body of distinguished gentlemen, and I trust that your meeting here in this roof garden is not being held under that part of the scriptures which states that "The wicked dwell in high places." (Laughter.)

Of course, I do not know much about street car men, except our friends, Con and Walton Holmes; but I have heard it rumored on the street that that is not Mr. Con Holmes' proper name at all—that his first name has been acquired by virtue of his various and intricate business transactions in this city, and his ability to talk franchises out of the council, and when he gets them to immediately put them into execution. (Laughter.)

In the little I have to say to you, I shall not bore you with a speech, because I do not know what purpose a speech serves on an occasion of this kind. When the old Egyptians had a feast and everybody was feeling hilarious and good-natured, there was a pleasant custom of passing around a skull and saying to each of the guests, "Remember you are mortal; remember you are mortal." I apprehend I was brought here to represent the skull and cross-bones on this occasion. You are here to transact important business, having important objects in view, and it is not a time for

speech-making. It is a time when you desire to deliberate and get to business.

I wish to say on behalf of this city that Kansas City, as much as any other city in the world, welcomes to her midst the representative business men of all other cities. We in the West believe that it requires capital and brains and courage to build cities. We in the West know that if capital comes to us it must come because it expects a fair remuneration; and I wish to call your attention, gentlemen, to the fact that you are in Missouri; and, notwithstanding the fact that all of the states that surround us, in times past, in those troublous times when there were hard financial conditions existing, nearly all of the Western states placed upon their statute books laws aimed at the destruction of the wealth of financial institutions, there never has been a syllable, line, or sentence of what we commonly denominate crank legislation placed upon the statute books of Missouri. (Applause.)

We in this state believe that capital should receive its fair remuneration; but we believe, at the same time, of course, that

WALTON H. HOLMES,
President, 1900-1901.

these great institutions which you represent owe some duties to the citizens of the cities, and that it is their business and duty to serve the citizens and serve them well. We at the same time realize that great financial institutions must be secure in their profits, and that all the people have the right to ask of them is a policy of "Live and let live," a policy of serving the people and in turn of being benefitted by the people. That is Missouri doctrine, and it is Kansas City doctrine. We in Kansas City know what Eastern capital has done for us. We know that fifteen or sixteen years ago we scarcely had in Kansas City a mile of paved streets. We know that it took a great deal of money to pave our streets; of course that was paid for by our citizens, but it took money to create the great plants for the purpose of paving our streets. While we insist, and shall insist, that these institutions should treat our people fairly, at the same time the people of Kansas City are willing that they shall receive a fair remuneration upon their capital invested. Our people have done this and the result has been that for the size of the city, we have paved more streets than any other city in the world. (Applause.)

We believe in inviting the capital of the East here for the purpose of investing in great public buildings. I do not think a single

man lives who came to Kansas City and used ordinarily good business judgment in the matter of his investment in great public buildings, but to-day is receiving splendid dividends upon that investment. Of course, there were men who came here during the "boom" days when the whole town and the whole country had gone mad, who bought property without regard to business judgment, and paid fabulous prices and lost money; but the men who came with business judgment and with business care, and invested their money as men ought to invest it, have all received fair dividends.

We had a few years ago in this town two streaks of rust and five teams of mules, drawing horse cars, that meandered slowly and laboriously up and down the almost inaccessible cliffs of this town. This was called a railroad system, and it was said that the cars were run for many years for the purpose of holding the franchise. I do not know what the object or purpose of the railroad was, but I do know that everybody who was in a hurry was obliged to walk. (Laughter.)

About the period referred to, fifteen or sixteen years ago, there was begun the building of the present street car system of Kansas City—built first with a cable equipment, and Mr. Holmes will tell you here in your secret meetings, if you can have any with your walls of canvas, of the struggles, I presume, that his road underwent in overcoming the natural difficulties of this town; but to-day, in riding over this street car system, you, better than I, will judge whether any progress has been made in that respect. And as far as dividends are concerned, I apprehend that Mr. Holmes can tell you all about that, if he only will.

The point I wish to impress upon you, gentlemen, and I do it with a selfish purpose of convincing, as far as I can each man in this audience, that Kansas City is a good a place to invest money; that every legitimate enterprise where the men have come and used good business judgment, has been a success in this city. We have no warfare to make upon capital. Of course, as I said before, we do insist that capital shall treat us fairly, and as a general proposition, capital has treated us fairly. I would call your attention to the fact that Kansas City lies in the very center of the richest agricultural country that God ever spread out beneath the canopy of the skies. In whatever direction you go, for hundreds of miles, you pass through the finest arable land there is in the United States of America. I want to call your attention to the fact that there is scarcely a town or village for hundreds of miles in either direction from Kansas City but is, by force of our railroad system, compelled to pay its tribute to the center.

From this city down to the Southern coast and down to the Gulf we have various railroad lines. This city is the outlet for all of the grain, all of the cattle, and all of the farm products of every description of the entire West and Northwest and as soon as the Nicaragua Canal is built, if it is ever built, and I hope when it is built it will be built by the American Government (applause), and that crowning over all, at each end, and wherever is necessary between those ends, will be American forts and American cannons (applause)—and that great waterway is added to the lines of vessels that already ply from these Southern ports, this city must receive the greatest benefit that any city in the United States receives from the building of that canal. The reason for this is that the railroads are already built here, and they will not be torn up, and having already been built here, all of the grain and all of the farm products of the great West and Northwest, and much of the Southwest, will flow through the gateway of Kansas City to these direct lines leading down to the Gulf.

Another reason why we are going to succeed here is because of the qualities of our people. Each of you lives in a city and each one thinks his city is "it." Each of you gentlemen thinks your city is the best city, and I have nothing to say against your city; but I hold, with all due modesty, that it can be said that this is the most typically American city on the continent. Here in our state and city is the parent stock of the very best blood of the South, and grafted on to that we have the genius of the Yankee, the men from the Middle States and the men from the Eastern States, and from all parts of this country; and whenever you come to Kansas City, you will touch elbows as you pass upon the street, with men from every state in this nation. I might say we have a few Greeks and Turks whom we keep for exhibition purposes. What does this mean in the upbuilding of a city? We have always heard it said that the "horizon of civilization was covered

with the white caps of progress;" that it is the boy who has brains and genius and courage, who leaves his home in the East and comes to the West and develops into the great man representing the type which has made this country what it is. In the progress of the nation, every time that the milk of humanity has been skimmed, the West has been favored with the creamy side of the dish. The result is that there is such energy, such determination to succeed, such an indomitable will back of everything that our people undertake, that Kansas City has made a splendid success in the few years she has been a city. Let me give you one illustration, and with that I close. At a tremendous expense for a town of this size, with not very many extremely wealthy men in it, we built this Convention Hall. We built it as a public enterprise, and into it went the money of the capitalist, and the money of all our citizens, even down to the men who carry the dinner-pail, not always so full, either; into this Convention Hall went the dollars of the laboring men. (Applause.) It was destroyed by fire, we had invited the National Democratic Convention to meet here on the 4th of July. This hall was burned, if I recollect aright, exactly 90 days before that convention met. Before the building had been on fire an hour, thousands and thousands of dollars had been subscribed to rebuild it, and in the 90 days which intervened between the burning of the building and the 4th day of July the new hall was erected. We had to make our contracts as rush orders, and you street railway men will understand what a "rush" order means, and how much it costs, but when the 4th of July rolled around, this building had risen from the ashes of the former building and was completed as you see it here at this minute. (Applause.) A lot of "lobsters," gentlemen, do not do that kind of work, if you will pardon the use of a slang phrase. It is because we have that kind of people that we are succeeding here; we are glad to have you come here, and ask you to look this city over, and see whether it is not about the best place in the United States in which to make money. If you come here, you will be treated fairly by our citizens.

I need not extend to you the liberty of this city. That old phrase died years ago, and then I never saw a lot of street car magnates in my life that needed the liberties of a city—they generally know how to get them (laughter); but you are welcome among us, and I know you will be made to feel at home because I know the Messrs. Holmes and their associates in business will make you feel at home. You may have read something in the papers here of the police outrages, but if, perchance you lose your way, for that is all would ever happen to so distinguished a body of gentlemen as you are—if perchance you do lose your way, I guarantee you that some good police officer, like a good Samaritan, will conduct you to your hotel in peace and with due dignity and if necessary will take you up the back way.

President Roach: Mr. Mayor, on behalf of the association, I desire to thank you for your eloquent words of welcome spoken to us, and also to give you my personal thanks.

The first business at this meeting is the calling of the roll. If it is the pleasure of the meeting, instead of taking time to call the roll, the official registration of the secretary will be deemed the calling of the roll. That has been the custom in the past, and will be considered as applying at this time, if there is no objection. We now extend an invitation to those companies represented at this meeting which do not belong to our association, if there be any here of that class, to join us; or if the representatives of such companies have not time to do this at present, they can do so later by applying to Secretary Penington.

President Roach then delivered his annual address:

PRESIDENT'S ADDRESS.

Gentlemen: It gives me great pleasure to meet with you in this magnificent western city. I have every assurance that nothing will be left undone to make our visit most pleasant and profitable. There is a breadth of character and freedom of personality in this young metropolis of the plains, which is peculiarly appealing to the business man who has large interests entrusted to his care, and I believe the members of this association will show their appreciation of the many pleasant things provided for their entertainment while in this community. When this 19th annual convention of the American Street Railway Association shall have finished its labors, I am sure I may safely say to Mayor Reed that none of you will have regretted the accept-

ance of the hospitality of the people of Kansas City, so graciously extended by him.

I see before me representative men from all the leading cities of this country. To your hands are entrusted street railway investments aggregating hundreds of millions of dollars and the welfare of over a million persons. From the single-track one-horse car of forty years ago the business in which you are engaged has grown to a magnitude where nearly all fields of human endeavor are called upon to perfect its equipment or aid in its management. It has outgrown ridicule and financial instability and in the rapid whirl of events has built cities, enriched its promoters and made possible a freer, healthier and happier life for its patrons. Each day the street car is entering more and more into the business life and pleasures of the community, and each day its benefits are becoming more apparent to the general public.

The street railways of America now represent the enormous investment in bonds and stocks of \$1,800,000,000, upon which investors are receiving annually over \$70,000,000 in interest and dividends. Salaries and wages amounting to \$250,000,000 a year are distributed among the 300,000 employes necessary to equip, operate and manage this great industry, repair its 20,000 miles of track, handle its 60,000 cars and meet the ever-pressing demands for improvement. Directly and indirectly over 1,200,000 persons depend upon the traction interests of America for their livelihood.

An industry of such proportions penetrates and more or less affects all other enterprises in the country which sustains it. Nine-tenths of the business men and women of the United States look to the management of street railway companies to furnish them with swift, comfortable and safe transportation to and from business. Still a greater per cent of pleasure-seekers demand and receive from the same management service to and from the theater, casino, park and suburb and the transportation is of such elegance of equipment and so efficient as to satisfy the most exacting. It has required heroism and patience on the part of the street railway men to meet, with so little friction, the demands of a critical patronage in so excellent a manner as is being accomplished by them at the present time.

On all sides we hear the cry of improvement and in every direction we hear the sound of the busy car shop as it responds to the demand for more modern equipment. The public is becoming more exacting and there is need for the most perfect knowledge and the widest experience to successfully cope with the ever-changing situations which confront the street railway manager. Street railway companies have frequently, at great cost, increased their miles of tracks and added to an expensive equipment, primarily for the sole purpose of accommodating the public, by extensions into outlying districts, unwarranted by additional business to be acquired in such territory. This policy has proved wise in nearly every instance. It requires considerable pluck on the part of a company to back a temporary loss in order to please its patrons. Those companies which have pursued such a course have generally been rewarded by more liberality on the part of municipalities, more good nature and praise from patrons and an early increase in the new districts acquired, which soon brought those lines to a paying basis.

In thus catering to the wishes of the public the street railway industry of the United States has been brought to a high standard of excellence and has kept safely in advance of traffic. The aggregate of miles of track has grown from a few hundred miles of single track, confined mainly to business centers, to many thousands of miles of thoroughly equipped double tracks, which have brought the country districts within quick and active touch with the larger cities. Such energy and management must and will be appreciated and fairly treated by the communities benefitted.

It may be declared that corporations are without soul, but it cannot truthfully be said that managers of street railway corporations are lacking in good sense or business principles. False economic doctrines yield to and flee before rapid development and prosperity. A well equipped street railway with modern service, which seeks to oblige the people, operated in any community, will develop the best resources thereof and bring prosperity to its people with such rapidity as to utterly confuse and put to flight all false economic doctrines.

Newspapers, reviews, magazines, periodicals and journals of this country, indeed of many parts of the world, are entitled to

the thanks of this association for the fair and generous treatment accorded in their columns to the street railway men and their interests during the year. It is the province of these publications to exploit the great industries of the land. If upon one day we are able to congratulate ourselves upon their unstinted praise, we should patiently bear the publicity given to our faults, if any there be, in the next issue.

The last year has been a period of notable activity and healthy progress, with but few disturbances of a serious nature. The managers of large street railway properties should shape their policy toward their employes and the public so that disturbances between employer and employe will be entirely eliminated from their history. The management of the great corporations of the country can best retain the adherence and loyalty of employes by adopting toward them a policy at all times just, and at the same time courteous, kind and conciliatory. The good will of your employes and of your patrons will be found an asset of great value in the days of trouble and most desirable at all times.

A business so widespread in its usefulness, holding and judiciously employing as it does so great a portion of the capital of the country and so essential to the best interests and prosperity of the trade centers, should, and I believe in good time will, possess the very necessary good will and hearty support of the municipalities it so faithfully serves. Our interests and those of the public are inseparably interwoven and naturally harmonious. If the relations become strained and in conflict, such conditions are unnatural and illogical, therefore it should become one of the leading features of our association to suggest a uniform policy for street railway companies, and of so broad a gauge that the mutuality of the best interests of the public and of the company shall be as apparent to the people as to the street railway managers themselves.

I take pride in announcing that the condition of your association, both as to membership and finances, is improving each year. I wish to urge you to make this gathering of use to our association and of importance to the street railway industry. This may be accomplished by a full attendance upon and participation in the business meetings. The executive committee has selected members who have prepared papers on important subjects, and I urge upon you the advisability of entering into full discussion and analysis of these subjects, so that a clear understanding of all questions presented may be carried home with you. I also urge the association to show appreciation for our friends, the supply men, who have produced for this annual meeting their splendid exhibit. Allow me to request your hearty support in the work of the Accountants' Association, which meets in annual convention here at this time. Its work is of great importance and is worthy of your most serious consideration.

To the secretary and members of the executive committee our thanks are due for the satisfactory manner in which they have assisted in conducting the affairs of this association. Personally their efforts have been highly appreciated.

The honor of having acted as your president for the last year has been most gratifying to me and shall ever remain one of the pleasant recollections of my life as a street railway man. For my successor I bespeak the same courtesy and cordial cooperation which it has been my good fortune to enjoy.

The secretary then read the report of the Executive Committee. The committee recommended the following rules of procedure:

1. No member will be recognized by the president unless he shall announce distinctly his name and address.
2. Speeches will be limited to 10 minutes, unless the time shall be extended by the convention.
3. Members who desire to offer resolutions or other matters to be considered by the convention, are requested to submit them in writing over their signatures, to the secretary.

Regarding banquet tickets the committee endorsed the action of former years, to-wit: "There shall be two tickets issued to each member company of the association when there are two or more official representatives; when there is only one representative, only one ticket, and when a company is not officially represented, no ticket shall be issued on account of said company."

It was recommended that, because of the satisfactory condition of the finances of the association, the admission fee be waived in the case of any company joining the association at this meeting.

The president had appointed Messrs. John A. Rigg and C. W. Wason as a committee on Memorials of Deceased Members.

Mr. C. K. Durbin, having left the street railway business, resigned from the executive committee of the association, and was succeeded by Mr. W. H. Holmes.

On motion of Mr. Dyer, of Augusta, the report of the executive committee was adopted.

REPORT OF THE SECRETARY AND TREASURER.

The report of the secretary and treasurer, T. C. Penington, showed a balance Oct. 10, 1899, of \$5,658.87, receipts of \$6,564.55, expenses of \$5,222.67, and a balance Oct. 10, 1900, of \$7,000.75.

Oct. 11, 1899, the number of member companies was 165; since then 32 new companies have joined the association, 2 have been suspended and 31 have withdrawn.

The new members are:

Atchison, Kan.—Atchison Railway, Light & Power Co.
 Aurora, Ill.—Aurora Street Railway Co.
 Asbury Park, N. Y.—Atlantic Coast Railroad Co.
 Bridgeton, N. J.—Bridgeton & Millville Traction Co.
 Chicago, Ill.—Chicago Electric Traction Co.
 Columbia, Pa.—Conestoga Traction Co.
 Detroit, Mich.—Detroit & Pontiac Railway Co.
 Dayton, O.—Dayton & Western Traction Co.
 Elgin, Ill.—Elgin City, Carpenterville & Aurora Railway Co.
 Fond du Lac, Wis.—Fond du Lac Street Railway & Light Co.
 Ft. Wayne, Ind.—Ft. Wayne Traction Co.
 Galesburg, Ill.—Galesburg Electric Motor & Power Co.
 Hamilton, O.—Cincinnati & Hamilton Electric Street Railway Co.
 Highwood, Ill.—Chicago & Milwaukee Electric Railway Co.
 Joliet, Ill.—Joliet Railway Co.
 Kansas City, Mo.—East Side Electric Railway Co.
 Knoxville, Tenn.—Knoxville Traction Co.
 Montreal, Canada.—Montreal Street Railway Co.
 Oakland, Cal.—Oakland Transit Company.
 Pasadena, Cal.—Los Angeles & Pasadena Electric Railway Co.
 Pittsburg, Pa.—Consolidated Traction Co.
 Peoria, Ill.—Peoria & Pekin Terminal Railway Co.
 Pueblo, Col.—Pueblo Traction & Electric Co.
 Schenectady, N. Y.—Schenectady Railway Co.
 Sioux City, Ia.—Sioux City Traction Co.
 St. Louis, Mo.—St. Louis Transit Co.
 Seattle, Wash.—Seattle Electric Co.
 South Bend, Ind.—Indiana Railway Co.
 Vicksburg, Miss.—Vicksburg Railroad, Power & Light Co.
 Venice, Ill.—Venice, Madison & Granite City Railway Co.
 Willoughby, O.—Cleveland, Painesville & Eastern Railroad Co.
 Westwood, Mass.—Norfolk Western Street Railway Co.

After the report of the secretary and treasurer had been accepted and ordered filed the secretary announced that the Kansas City Club and the Elks Club had extended cordial invitations for all the delegates to visit their club rooms, the badges admitting members of the association.

The president then announced the first paper:

THE CONSOLIDATION OF STREET RAILWAYS AND ITS EFFECT UPON THE PUBLIC.

By Daniel B. Holmes, Counsel Metropolitan Street Railway Co., Kansas City, Mo.

It is no part of the purpose of this paper to enter into an extended discussion of street railway consolidations from a legal point of view. It is assumed that no considerable number of those present would be particularly interested in that branch of the subject. Suffice it to say that the laws of nearly if not quite all of the states of the Union are in such condition that practical street railway consolidation may be brought about and made effective by union of companies as a technical consolidation, or by purchase and sale of the corporate property or capital stock or by common ownership of the corporate shares of several companies, or in other ways which might be mentioned. Whenever consolidation is desired by the parties in interest it may be safely assumed that counsel learned in the law will find little or no difficulty in pointing out the way in which that end may be legally accomplished.

Street railway companies may be properly classified as public service corporations, and whenever a union takes place of several such companies, it at once becomes obvious that the interests of the capital invested and of the traveling public may and probably will be positively affected thereby. Therefore these two interests will form the chief basis of what I have thought proper to lay before this convention of practical street railway men, whose calling is such that they never feel at liberty to disregard either the best interests of their stockholders or the welfare of the public, whose constant servants they are. And I may be permitted to add, in the light of an experience and intimate association with street railway managers extending over a period of upwards of twenty years, that no class of men with whom I have come in contact in the active practice of a profession which brings about the most intimate relations with all sorts of men, are so constantly mindful of the best interests of the public they serve by night and by day, as are the street railway men. I am the more pleased to make this acknowledgment because the street railway man has so many impatient masters among the trav-

D. B. HOLMES.

eling public that he is much more often the subject of unjust criticism than of the well-deserved encomiums he would surely receive if the difficulties of his situation and his conscientious efforts to faithfully discharge his company's duty to the public were even half-way understood. Above all men it is his lot to bear the "whips and scorns of time," and if he will but pin his faith to the teachings of the Good Book, he may expect to receive hereafter that reward which in but few cases, I am sorry to say, comes in this life in the shape of an adequate salary for so hard and thankless a job.

That the consolidation of street railway interests affords opportunities for the introduction of many various economies is a truth which is almost axiomatic, and this may be fairly said to have been the controlling consideration which has inspired and accomplished the many consolidations which have taken place in various parts of the country. By this process the managerial force is greatly reduced and the salary list largely diminished. Where three or four presidents, managers or superintendents were required for the successful management of the separate properties, but one officer of each kind is needed in their united state, and while he receives more salary than any one of his predecessors, as of right he ought, because of enlarged duties and more weighty responsibilities, still there is substantial saving over what was previously paid.

But there is in this connection a still more important consideration. As is the case with any other calling in life, the supply of really first-class street railway managers is more or less limited, and the larger salary offered by the consolidated interests naturally commands, and in all probability secures, a higher order of talent than the separate properties could retain even where it had been fortunately possessed. In this way the consolidated properties in nearly every instance are managed with greater ability than was shown by the management of the disconnected parts, and this is a positive gain, the value and importance of which can scarcely be estimated. This successful manager, you may be sure, is truly a remarkable man. The relations existing between street car companies on the one hand and the municipality or its citizens on the other, are the fruitful source of jealousies

and complications constantly arising which can be successfully disposed of by nothing short of the possession of genius for diplomacy, and for affairs and finance all at the same time, in order to be able to satisfy the demands of the public without involving the company in irretrievable financial ruin.

In most instances, the consolidation of street railway properties creates opportunities for marked reduction in the cost of generating motive power. Location is a most important consideration as regards the power station. Unless the power station is so situated that both fuel and water can be delivered to it at minimum cost, the highest degree of economy in developing motive power is altogether impossible. This is greatly facilitated by the union of properties since the car lines are so situated in most cities that but few of them, if independent, could operate from power stations located near steam railroad switches and water courses. A greater or less number of high-priced employes are always necessary around every power station whether large or small, and this is an expense which is greatly curtailed by generating as much power as it is practicable to handle from one station. A company possessed of an extensive system with large mileage has thus presented to it the opportunity of producing power at the minimum cost, a thing altogether impossible on a short line railroad.

But perhaps the most important result from consolidating street railway lines is the great stimulus it affords to street railway traffic. Outside of a few of the very large cities where the problem is not how to get business, but how to successfully handle that business which of necessity must come to the car lines, the street railway companies are quite generally engaged in efforts of all kinds to create travel on the lines artificially by offering to the public attractions of various and sundry kinds. This is all well enough, but one of the most effective means to this end is the consolidation of the street car lines. I believe it is the uniform experience that the aggregate travel on the united lines exceeds by a large percentage the business formerly done by the separate properties. This is partially accounted for by the fact that short distances are now ridden that were formerly walked, because two fares were then necessary in order to ride, and this was considered too great an outlay for the accommodation afforded.

But how stands the case with the public? I am altogether sure it is no different. Indeed the immediate benefit to those who ride upon the cars far exceeds the increased returns to the consolidated company. Where before the union, two and even three fares in some instances had to be paid in order to convey the passenger to his destination, he may now make the same journey for a single fare by means of transfers and through cars, which were previously impossible. Taking Kansas City for an example, 50 per cent of all the passengers who ride on the cars make at least one transfer in every journey, so that it may be truly said 60,000 passengers save 5 cents each and every day in the year in Kansas City alone, and this saving is due solely and directly to the consolidation which took place only a few years ago. And who are the people thus benefited? It is chiefly the laboring classes who can least afford to spend their hard earned gains unnecessarily. The sons of toil who were formerly compelled to shelter their wives and rear their children in the polluted air and noise and smoke because unable to pay more than a single fare in going to and from their vocations, can, and do now, dwell in the neat little cottage in the suburbs where loved ones breathe the pure air of heaven and bask in the sunshine of life all the day long, and when evening comes smiles and mirth and joy are the companions who have taken the place of sickness, suffering and grief. Who can estimate the value of blessings like these? If the public welfare is the first and highest duty of the state who can gainsay the immense value to the public of street railway consolidations, and who can say that the state ought to throw any obstacles in their way?

But it is said that competition is the life of trade, and that monopolies are odious. Accepting these as general truths, let us see how it is with the street railroads. Except to a very limited and unimportant degree, there is no such thing as competition in street railroads, and their consolidation is entirely devoid of any objectionable feature of a monopoly. In the very nature of things, street railroads are seldom competitors in business. They were never known to compete in rates, and can only be laid on such highways as the authorities may determine. The necessity for keeping some streets open for ordinary vehicle traffic keeps the street railroads sufficiently apart as a rule to eliminate any matter

of choice on the part of the intending passenger. Each line supplies and accommodates its own peculiar territory, and there is no real choice, and hence no real competition. As to rates, these are universally fixed by the franchise ordinances. They are the same on all roads so that the intending passenger is moved solely by considerations of convenience to himself. In short, he simply takes the line which takes him to his destination with the least inconvenience. Monopolies are only odious when of a character that they do or have the power to fix their own price for what they alone can sell. Not so with the consolidated street railway. So far from having the power to increase the cost of travel, consolidation always results in a practical reduction of cost by giving to the passengers the right to ride for the same single fare the increased distance brought about by consolidation. No thoughtful man would condemn a street railway consolidation, because it neither stifles competition nor increases cost of travel, nor creates a monopoly as that term is generally understood.

There can be no doubt that consolidations of this character are greatly beneficial both to invested capital and the public at large. And happily this is so, because the public is never so likely to have its wants provided for as when it is to the interest of capital to do so. There is no tie so strong as common and mutual interest. This is a principle which would render many conflicts and controversies impossible, if kept always in mind and strictly adhered to in all dealings between public service corporations and the municipality in which they dwell. I commend it to the thoughtful consideration of all who are assembled in this convention, as the firm foundation on which aggregations of capital may safely rest, the Gibraltar of justice and right, garrisoned by an always sound and healthy public sentiment, against which the assaults of prejudice, passion and demagoguery would be hurled in vain.

The meeting then adjourned, the president announcing that the executive committee would then hold a meeting.

WEDNESDAY, OCTOBER 17TH.

The meeting was called to order at 10:50 o'clock by President Roach.

The President: For reasons unnecessary to explain at this time, we have changed the order of business somewhat. The names of the nominating committee have been selected, and the secretary will now read them. This committee will also recommend to the association a place for our next meeting.

The secretary read the names of the Committee on Nominations, as follows: Chairman, John A. Rigg, Reading, Penn.; E. C. Foster, Lynn, Mass.; E. G. Connette, Syracuse, N. Y.; D. B. Dyer, Augusta, Ga., and Robert McCulloch, Chicago, Ill.

The President: I would say to the gentlemen who have any idea of asking the association to hold its next meeting in their city, that they can see Mr. Rigg, the chairman of the Committee on Nominations, any time at their convenience. Mr. Rigg will appoint a time and place for the meeting of the committee.

Secretary Penington: Mr. President, I will state that I have received invitations from the mayor of Cincinnati, the president of the Cincinnati League, and from president Kilgour, of the Cincinnati Street Railway Co., asking us to hold the next convention in that city. I will turn these invitations over to Mr. Rigg.

The President: In the absence of Mr. Bancroft, the secretary will read the next paper.

COMPARISONS OF THE VARIOUS SYSTEMS OF ELECTRICAL DISTRIBUTION FOR STREET RAILWAYS.

By C. F. Bancroft, Electrical Engineer, Massachusetts Electric Companies, Boston.

In preparing a paper on "Comparisons of the Various Systems of Electrical Distribution for Street Railways," the subject selected by the executive committee, I find that the conditions to be met in the numerous localities where the various systems are in use are so widely different, and each system so generally satisfactory, under certain conditions, and so completely unsatisfactory for meeting other conditions, that comparisons are altogether impossible, except in a very general way.

There are six systems of electrical distribution for street railways at present in more or less general use.

First, what may be called the standard 500-volt continuous current system, where the current is generated at from 500 to 600 volts and delivered direct to the car motors, usually by means of a feed-wire and a trolley, third rail or underground conduit.

Second, what may be called the alternating direct current system, where the power is generated as alternating current, usually at high voltages or from 5,000 to 15,000 volts, and transmitted to sub-stations, where the voltage is usually reduced by means of static transformers, transformed into direct current by rotary converters, and delivered to the lines at about 500 volts continuous current.

Third, the "booster" system, where the current is generated usually at about 550 volts and where, by means of an auxiliary generator, usually series wound, called a "booster," additional voltage is generated and compensates for that lost on the line.

Fourth, the so-called three-wire system, where the current is generated at about 1,000 volts, usually by means of two 500-volt generators connected in series, and is delivered to two motors or two groups of motors in series.

Fifth, the alternating current system, where the power is generated as alternating current, usually at high voltage, and transformed down to about 500 volts at the trolley wires by means of static transformers, which may be located on the poles supporting the feed-wire and trolleys, the cars being equipped with alternating current motors.

C. F. BANCROFT.

Sixth, the storage battery system, where the batteries are carried on the car and charged at the power house or at special points on the line. Storage batteries can also be used to advantage in connection with any of the other systems under certain conditions, and in fact combinations can be made of any or all of these systems.

For any given conditions as to speed, traffic and length of line, some one of the systems named is likely to be much better fitted and more efficient than any of the others; therefore, it seems to me that a comparison of the various systems can best be made by considering the particular conditions most favorable to each. In the distribution of power for street railways the result to be aimed at is usually the maintenance, at variable loads, of an approximately constant pressure of 500 volts on the trolley wire at a minimum total cost of power.

The cost of generating electric power under the same conditions, as regards fuel, depends to a great extent on the amount of power generated and the capacity of the generating apparatus with reference to the average output required. Under ordinary operative conditions, with the same power factor, that is, the same ratio of output to capacity, the cost of power per kilowatt-hour from stations of less than 500 kw. capacity increases very rapidly as the station decreases in size. With from 500 to 1,500 kw. capacity, the cost of power per kilowatt-hour decreases slowly as the size of the station increases. From 1,500 to 2,500 kw. capacity the cost per kilowatt-hour decreases very little as the output increases, and above 2,500 kw. station capacity the cost of power per kilowatt-hour becomes nearly uniform. This is due to the fact that in small plants the labor item is disproportionately large, and the general efficiency less than in larger ones, while in plants of 1,500 kw. output and larger the cost of labor remains proportionately nearly the same as the plant increases in size. It follows from this that there is often very little or nothing to be gained

from an economical standpoint by substituting one station of 5,000 kw. capacity for two of 2,500 kw. capacity each, provided the local conditions, as regards cost of coal, water, etc., are the same.

The system of distribution most suitable to a particular road depends to a great extent on the location of the power station or stations and the nature of the load. It is always expensive to transmit power, the expense being either in interest on copper investment or in fuel or both; and, therefore, other things being equal, the location of the power station or stations should be as near the load or center of distribution as possible. The location of the station is, however, usually governed to a considerable extent by local conditions as regards cost of fuel, water and real estate.

On a large system, requiring an average output of 12,000 kw., even though the load be distributed within a five-mile radius of a practical station location, it will usually be found economical to generate this power at several smaller stations, rather than at one large station, provided the conditions as regard cost of fuel, water and real estate are about the same, as the cost of power station buildings and machinery per kilowatt of capacity and the cost of generating power per kilowatt-hour, with a station of 5,000 kw. capacity, is about the same as at a station of 10,000 kw. capacity. The interest on the saving in cost of feed-wire by having several stations, each located near its load, would more than offset the slight saving in cost per kilowatt-hour, due to the generation of power at one large station, and it also has the advantage that in case of fire or accident to one station the other can usually be so interconnected as to temporarily carry the entire load, and thereby avoid much of the stoppage of traffic which would occur if the road was supplied entirely from one station.

For an example of what was called the first or standard 500-volt continuous current system of distribution, a city may be cited in which the street railway lines radiate west from the center of the city like the spokes of a half-wheel, with a radius of about five miles. Instead of having one large station at the hub of the wheel, the road is supplied with power from seven stations, distributed throughout the system, having an aggregate capacity of over 26,000 kw.

The generating and distributing system in use in one of our most densely populated cities may be taken as an example of the way in which the system of distribution adopted is governed by conditions outside of those indicated for the most economical generation and distribution of power to the car motors. Although this system is compact and will probably require an average station output of over 30,000 kw., which it would seem to the outside engineer could be more economically distributed and almost as economically generated at several stations, the street railway company is installing a high-tension alternating direct current system of distribution with a main station of 45,000 kw. ultimate capacity, and five rotary converter sub-stations of from 3,000 to 6,000 kw. capacity each. It is probable in this case that the location of the power station and the system of distribution was governed almost entirely by the great cost of real estate at points suitable for separate power stations.

It frequently happens that several miles distant from a street railway system much cheaper power is obtainable than at or near the center of the system. This may be due to an available water power, or to a difference in the cost of fuel, etc., at the two points. In cases of this kind the second, or what may be called the alternating direct current system, is usually the most applicable. To transmit power at 500 volts in any quantity from a distance of 10 miles, or even less, is very expensive, owing to the large amount of copper required and the great loss. For instance, to deliver 500 amperes at 10 miles distance will require about 150 tons of copper, allowing a loss of about 30 per cent in the line. This same amount of power could be transmitted at 5,000 volts by an alternating direct current system with about 5 tons of copper and with a loss of less than 10 per cent in the line.

The weight of copper required to transmit power a given distance, other things being equal, is inversely as the square of the voltage, that is to say, if it takes 100 lb. of copper to transmit a certain amount of power a given distance at 500 volts, it will only take 25 lb. of copper to transmit the same amount of power the same distance with the same loss at 1,000 volts. It is owing to this fact that the alternating direct current system is so applicable where power has to be transmitted for any considerable distance, as it allows of the use of very high voltages on the line, 10,000 volts or more being in general use, which by means of

transformers and rotary converters can be reduced to 500 volts direct current for the trolley wire at points where the power is required. For an example of this system of distribution, a street railway system may be cited which derives its power from a waterfall. Here the power is generated at a pressure of 2,200 volts and is stepped up to 11,000 volts for the line. About 6,000 h. p. is transmitted at this voltage for a distance of about 21 miles. The voltage is then reduced to 500 volts, direct current, by means of static transformers and rotary converters at five sub-stations, located at or near points where the power is required.

The third system mentioned, the "booster" system, is chiefly applicable on lines where there is a light average load, but where for short periods an extra heavy load has to be taken care of. It would seldom be economical to supply an entire road with power by means of booster system, as the greater part of the power generated by the booster represents wasted energy, which is usually generated in an extravagant way, as the power required to drive the booster varies as the square of the current in the feeder, that is to say, if it requires 50 h. p. to drive the booster with a load of 100 amperes, it will require 200 h. p. to drive it if the load is increased 200 amperes. Line losses which necessitate the continuous waste of more energy than could be compensated for by an ordinary compound wound railway generator are seldom economical, even on a portion of a system, but there are many cases where there is sufficient copper installed to take care of the average load economically, but where for a short time each day, or for a few weeks in the year, owing to local conditions, the traffic is very unusually heavy.

In cases such as these, where the heavy traffic is of short duration, a well designed booster system may save a large investment in copper at a total cost of much less than would be required to pay the interest on the copper investment. For an example of this method of distribution I might cite a street railway company which supplies power to its own lines by means of a standard 500-volt direct current system, and which also supplies power to a smaller road about 13 miles distant by means of a three-phase alternating current system, using 5,500 volts on the line. Here the booster system is used in connection with the high tension system. When it became necessary to repair the high tension line, it was found expensive and inconvenient to do the work between the hours of 12 midnight and 4 a. m., the only time when the power was off, and as it was not considered safe to work on the line when it was in operation, a booster system was arranged to supply power to the distant road for short periods at times of light load. A 200-kw. booster was installed at the generating station and was designed to raise the voltage one volt per ampere of current. Switches were installed at the sub-stations so that the high tension line could be connected directly with the 500 volt feeders, some eight miles from generating station, and the booster was arranged so that it could be readily connected to the high tension feeders.

When it was necessary to replace broken insulators or make other repairs on the line the attendants were notified at the generating station and at the sub-stations, and at a pre-arranged signal, made by varying the voltage on the line, the alternators were thrown out and the booster thrown on in such a way that the power was only off from the trolley wire for the fraction of a minute. It was thus found quite practicable to make repairs on the line while the booster was in operation, and the system proved very satisfactory for supplying power at times of light load, while repairs were being made; the load on the booster frequently running as high as 500 amperes, at which time the voltage generated by the booster was about 500, which in addition to the 575 volts of the direct current system gave 1,075 volts at the generating end of the line; the voltage at the sub-station averaging about 450. While it would have been very expensive to run this booster for any great length of time, for the short time it was used the total cost was much less than the interest on the copper investment required to build a duplicate line.

The fourth system mentioned, or three-wire system, is most applicable to double track lines, where one trolley is made positive and the other negative, there being about 1,000 volts potential difference between the two, the current flowing from the positive trolley wire through the car motors to the rail and from the rail through the car motors and the other track to the negative trolley. The track is usually cross-bonded and also connected to the conductor connecting the two generators which are operated in

series in the station. This connection with the track forms the third wire and tends to equalize the voltage should there be more cars on one side of the system than on the other. This method of distribution is usually capable of saving from 20 to 40 per cent in copper, according to the character of the track return. If well balanced, it also greatly reduces the electrolytic action on buried conductors, such as water pipes, etc., and is most applicable where there are excessive track losses with fair opportunities for a balanced load.

There are few roads in this country using the three-wire system of distribution, although it is used almost universally by lighting companies. This is probably due to the complications introduced in railway systems by the high voltage, usually about 1,000 volts, between the trolley wire and feeders on different sides of the system and the difficulty of balancing the load. The saving in copper, while not as great as in the three-wire lighting system, is still enough to warrant the extra complication, and under favorable conditions may prove very valuable.

I am only familiar with one example of this system of distribution. In this case there is very heavy traffic over a double track line to a park, about 16 miles from the power station. It was found impossible to handle the increased traffic on the ordinary 500 volt system with the existing feedwire. By reinsulating the line and operating it on the three-wire system, the efficiency of the distributing system was very much improved and they were enabled to easily handle the increased traffic with the existing feedwire.

The fifth system mentioned, or the alternating current system, is practically untried in this country. It seems peculiarly adapted to lines having long runs at uniform speed with few stops, such as lines connecting cities, rather than for ordinary street railway service. The alternating current motors at present in general use are of the polyphase type, and require at least three working conductors, which is a serious objection in many cases for railway work, as it necessitates the use of two trolley wires in addition to the track as conductors. The disadvantages of this system appear to be the necessity for at least two trolley wires and the probable difficulty in building alternating current motors suitable for railway work which will have a good power factor.

The main advantage of the alternating current system is the possibility of feeding lines with stationary transformers which need no supervision, but which can be considered simply as a part of the feeder, thereby multiplying many times the length of line which can economically be supplied with power from one station. The alternating current motor also has the advantage of running at fairly constant speed independent of the load. It will not race going down hill if the power is left on, but will return power to the line, nor will it slow down much in going up hill. There are four or five railway companies using this system, and judging from the reports that appear from time to time in the railway journals it is giving very satisfactory results.

The sixth system referred to, or storage battery system is decidedly more expensive than the usual methods of electrical distribution, owing to the great first cost and the short life of the batteries. Lead is at present the only metal capable of resisting the attacks of sulphuric acid, and modern batteries consist largely of lead, which is very undesirable from a mechanical point of view and is very heavy, so that unless the present type of storage battery is substantially improved, this system is only likely to be used where other systems are not practicable owing to peculiar local conditions or restrictions. The storage battery, however, has a large field in connection with the other systems of electrical distribution for street railways, and under favorable conditions may considerably increase the station capacity and reduce the fuel consumption; and when used on the line may greatly improve the regulation and increase the copper efficiency.

From this brief outline of the various systems it will be seen that each has its peculiar advantages and that no one is suitable under all conditions. It will generally be found that where the traffic is heavy and the distance short, the standard 500-volt system is most applicable. For suburban work, where the distances are greater and the traffic less congested, or where it is necessary to transmit the power for some distance, the polyphase alternating direct current system will usually be found more economical. In special cases, where for short periods of time an unusually large amount of power is required, the "booster" system will often prove very valuable, while for high-speed, long distance, interurban

work the three-phase alternating current system may be attractive. The cars on this system, however, would have the great disadvantage of not being able to run over the ordinary direct current street railway lines.

There can be no general rule given that will determine the most advantageous system of distribution to use under the varying conditions to be met in street railway work. Each case must be considered as a separate problem and that method selected which will best meet the peculiar conditions involved.

The President: Gentlemen, we have gathered here for the purpose of disseminating information. You have heard the paper just read. We would be pleased to hear from some of the gentlemen who are present in reference to the subject matter of this paper. I will call upon Mr. E. C. Foster, of Lynn, to open the discussion.

Mr. Foster: Mr. President and gentlemen: I thank you for calling upon me, but as I am not an expert electrician, it seems to me that I am hardly competent to discuss the merits of the paper which has been read. I think that Mr. Bancroft has treated the subject in a very broad way. He is a very competent man, and is employed by the same companies which employ me. We consider him one of the ablest electrical engineers in the Eastern country. I do not care to undertake to discuss this subject. There are many others here far more competent to do it than I. I thank you for calling me, Mr. President.

The President: I will call upon Mr. E. G. Connette, of Syracuse, N. Y., to give us his views upon the subject.

Mr. Connette: I thank you Mr. President, but I think, like Mr. Foster, that the paper is of such a technical nature, and the ground has been so fully covered, that there is nothing that can be said that would be interesting in addition to what the author has already stated.

The President: I can fully appreciate what the gentlemen have said. It certainly seems to cover the ground quite fully. We would like to hear from Colonel Dyer, of Augusta, Ga.

Mr. Dyer: Gentlemen of the Convention: I am not at all prepared to discuss a technical paper of this character. I think that the subject has been treated most exhaustively, and it is a valuable paper. This association certainly owes a debt of thanks to the gentleman who wrote it. I am wholly unable, however, to go into the details of the paper, and discuss the advantages of the different systems which have been referred to.

Mr. Wason: Mr. President and gentlemen: It seems to me that from the standpoint from which the author of the paper has taken up the subject, there is very little to discuss as to applying the theories of the paper to any particular road. The fact that the condition of each road as it is presented, determines in a great measure the character of the electrical application, there is hardly anything that we can discuss. If we had a road which we desired to equip, then the question would come up as to which one of the several systems presented would, in the minds of the gentlemen present, bring the best results. Under the circumstances, it does not seem to me that there is really anything to discuss.

The President: Gentlemen, you have heard the reading of the paper. What is your pleasure in the matter?

Mr. Connette, Syracuse: I move that the paper be received and the thanks of the convention tendered to the author. Motion carried.

The secretary then read the following paper:

PAINTING, REPAINTING AND MAINTENANCE OF STREET CAR BODIES.

By F. T. C. Brydges, Superintendent of Car Shop, Chicago Union Traction Co.

In giving my views as to the proper manner in which to paint, repaint and maintain street car bodies, I thoroughly realize that it is a subject of the greatest interest to street railway men; and as it is a part of my daily duty to supervise this class of work, the subject is of the greatest interest to me, and I will endeavor to give my views on the three topics separately.

PAINTING.

Our object in painting a street car is two-fold: maintenance and durability of structure, and appearance. It is needless for me to go

into the question of the increased life and durability of a street car, when properly painted, repainted or revarnished, as often as necessity may require to keep it up and maintain it in good condition, as it is an admitted fact that painting, repainting or revarnishing, as necessity may require, adds to the life and durability of street cars.

Our methods of painting new cars are simple and, we think, very efficient. We apply our first, or priming coat, on all wood work to be painted, then putty all nail holes and other imperfections, and then sandpaper the priming coat. In place of applying four or five coats of rough stuff to produce a surface, we apply one coat of glaze, or scrape-in coat, as I am of the opinion that the least number of coats of paint applied to produce a surface for painting the better. There is not so much danger then of the finished surface cracking and checking, as when there are four or five coats of Japan or quick drying material used to produce a surface with rough-stuff, which, as a rule, is dry, brittle and non-elastic, and owing to the thickness of the four or five coats, is almost sure to check more or less within a short time after the work is finished. After the glaze, or scrape-in coat, is thoroughly dry, it is sandpapered down close. The iron sill plates, in the case of open cars, are scraped in with the same quality of material and then sandpapered in the same manner as the wood work surface, the iron plates and all other iron work being thoroughly painted with best quality of Prince's mineral, mixed with raw oil, turpentine and Japan, as the first coat, to prevent rusting of the iron. After the glaze coat has been thoroughly sandpapered to a smooth surface, apply the first coat of body color, consisting of 10 lb. of bleached white lead, 5 lb. of Japan body color, 1 pint of raw oil and then apply the second coat of pure Japan body color and one coat of color varnish, sandpapering slightly with No. ½ or No. 0 sandpaper each coat of color before applying the next coat of color. Dashes and all iron work are painted with Prince's mineral, as above described, as the first coat, to prevent rust and then brought up in the same manner as the wood work, except the glaze or scrape-in coat, which is omitted on all iron work. This exception, however, does not apply to sill plates or any part that is to be finished in connection with the body or wood work. After a coat of varnish color has been applied, which is the last coat of color, the ornamentation and lettering is put on. Our style of ornamentation and lettering, we believe, is simple and yet very neat in design, consisting of a fine line, a broad line, and a small corner ornament worked into the fine line, thus making the ornamentation not expensive, but very neat in appearance. We are of the opinion that expensive and elaborate ornamentations on street cars are needless, a waste of money, and do not appear as well on the cars as a less expensive design. The great objection to expensive designs for ornamentation is not only their original cost, but it is more difficult to touch up when damaged in service by some careless teamster who has punched a hole in the panel with the pole of his wagon, or scratched the entire length of the body and thereby damaged the side of the car. This class of car damage is a very frequent occurrence in the large crowded cities and much increased by careless teamsters. After the lettering and ornamentation is complete, we finish the entire surface with two or three coats of varnish of standard quality, the first coat being rubbing varnish, if two coat work, also the second coat being rubbing varnish, if three coat work, the last coat being finishing varnish. We do no rubbing with pumice stone on the rubbing varnish, as we consider it unnecessary for street car surface to waste time and money in rubbing down finishing varnish. We object to rubbing with pumice stone as, in our opinion, it reduces the life of the varnish.

INTERIOR FINISH ON OPEN OR CLOSED CARS.

Apply one coat of good wood filler for hardwood work. Stain all softwood work for molding or otherwise to such tint as desired, clean up with fine sandpaper and apply a very thin coat of varnish, allowing it to stand about 24 hours. Then sandpaper and apply a second coat of coach rubbing varnish, then sandpaper lightly with No. 0 sandpaper and apply the third coat of varnish. We use no shellac on our soft or hardwood finish. We object to shellac being used in connection with car finish in any particular. We prefer to have the first coat of varnish applied on the wood next to the hardwood filler or applied on the soft wood. Interior of panels are finished with two or three coats of good standard paint applied on the canvas and other unfinished woodwork.

Roofs.—All roofs are painted with three coats of standard paint, or a good brand of white lead, tinted as desired.

Floors.—All floors are painted with two coats of standard floor paint or Prince's mineral paint.

Trucks.—All trucks are painted with one coat of Prince's mineral paint and one coat of standard truck color, striped to some extent if desired on trail cars.

Time Required for Painting Cars.—Cars, open or closed, can be painted and finished ready for service on this system in eight days.

REPAINTING.

Our system for repainting cars, so far as the painted surface is concerned, is about the same as that already described. When their condition requires the old paint to be removed to the wood, we do so by burning off all the old paint to the wood, then scrape the surface smooth to receive the priming coat and then proceed in the same manner as described with glaze coat, color, ornamentation, lettering and then finish with the same number of coats of varnish as in the case of new work. If, however, the old paint is not cracked too much, and the surface has sufficient life to receive new paint, we clean up the entire car by thoroughly washing it, then sandpaper the surface smooth and apply two coats of body color and a coat of varnish color, on which we put our lettering and ornamentation. We then finish with one coat of rubbing and one coat of finishing varnish. The interior we revarnish with one coat of finishing varnish, except the seats and other hardwood surfaces of open cars, which we revarnish with one coat of varnish, one-half rubbing and one-half finishing. Two coats may be applied in the same manner if the condition of the car requires it.

MAINTENANCE OF STREET CAR BODIES.

I am of the opinion that the best manner to maintain the life of street car bodies is:

First.—At the car station from which the cars are run have them properly and thoroughly washed every day with cold water and a good quality of pure non-alkali soap prepared ready for use in liquid form at the paint shop of the company, or some other shop, provided it is of equal quality, avoiding the use of warm water, as there is a great possibility of the car washer using the water too warm and thereby damaging the life and appearance of the varnish. After the car has been thoroughly washed, all the varnished surfaces should be thoroughly rubbed dry to prevent water remaining on the varnished surfaces and thereby causing damage thereto and shortening the life of the varnish.

Second.—All street cars, closed or open, should pass through the car shops once each year for general repairs, and be thoroughly cleaned, touched up and revarnished with one coat of varnish, interior and exterior, two coats of varnish if their condition requires it, and the roof painted with two good coats of white lead or standard roof paint. Floors, platforms and all canvas and unfinished interior wood work should be painted with two coats of paint, and the trucks and all iron work repainted with at least one coat of good standard paint.

Mr. Harrington, Camden: I would inquire if Mr. Brydges is here, if so, whether he can give us any of the costs of the work he has referred to?

The President: Mr. Brydges is not here. He is not in very good health and was not able to come to the meeting.

Mr. Harrington: I have prepared some statements of the cost of the various kinds of painting we have done. I made some statements last year at the meeting which seem to be rather low in price. I have prepared these figures from work actually done and took five different operations; took them from our detailed sheet. This work is done on the piece work system. Under the usual system of hiring labor, we usually found our work cost in labor 50 to 100 per cent more than under the piece work system. I have taken these figures from our books, and have had some talk on the subject with other street railway managers, and they think that the figures are very satisfactory.

COST OF CAR PAINTING.

Camden & Suburban Ry., Camden, N. J.

First Class Operation.

18-ft. Body. Contract, \$28.00. Bonus \$10.

1. Outside, burning off old paint.
2. Outside, sandpapering.

3. Outside, two coats of priming.
4. Outside, four coats of surfacer or rough stuff
5. Outside, rub to a smooth surface.
6. Outside, first coat of color.
7. Outside, second coat of color.
8. Color and varnish.
9. Outside, striping and lettering.
10. Outside, one coat rubbing varnish.
11. Outside, one coat finishing varnish.
12. Outside, blacking off iron work.
13. Roof, one coat of paint.
14. Inside dashers, one coat paint.
15. Floors and platforms, one coat paint.
16. Inside, one coat rubbing varnish.
17. Inside, one coat finishing varnish.

Material.

6 sheets No. 1½ sandpaper.....	\$ 03
6 sheets No. 2 sandpaper.....	03
25 lb. priming color.....	1 63
½ gallon coralline or rough stuff.....	1 25
16½ lb. cream color.....	99
6½ lb. special red.....	2 99
4 books gold leaf.....	1 40
1½ books aluminum leaf.....	18
2½ spools Coe's ribbon gold.....	2 18
¼ lb. golden ochre.....	07
½ lb. sizing.....	24
¼ lb. white paint.....	02
¼ lb. drop black.....	08
¾ lb. Venetian red.....	19
2½ quarts rubbing varnish.....	2 20
2 quarts inside finishing varnish.....	1 76
1 quart black iron varnish.....	19
2 gallons red rubber paint.....	2 34
2 quarts outside finishing varnish.....	2 02
Material, \$19.79; labor, \$27.90; Bonus, \$10. Total, \$47.79.	

Second Class Operation.

16-ft. Body. Contract, \$22.50. Bonus, \$2.41.

1. Burning off.
2. Outside, sandpapering.
3. Outside, one coat of priming.
4. Outside, three coats of surfacer or rough stuff.
5. Outside, rub to a smooth surface.
6. Outside, first coat of color.
7. Outside, second coat of color.
8. Outside, color and varnish.
9. Outside, striping and lettering.
10. Outside, one coat rubbing varnish.
11. Outside, one coat finishing varnish.
12. Outside, blacking off iron work.
13. Roof, one coat paint.
14. Inside dashers, one coat paint.
15. Floors and platforms, one coat paint.
16. Inside, one coat finishing varnish.

Material.

4 Sheets No. 1½ sandpaper.....	\$0 02
4 sheets No. 2 sandpaper.....	02
14 lb. priming.....	91
3 pints coralline or rough stuff.....	94
16½ lb. cream color.....	99
6½ lb. special red.....	2 99
4 books gold leaf.....	1 40
1½ books aluminum leaf.....	18
2½ spools Coe's ribbon gold.....	2 18
¼ lb. golden ochre.....	07
½ lb. sizing.....	24
¼ lb. white paint.....	02
¼ lb. drop black.....	08
¾ lb. Venetian red.....	19
1¾ quarts rubbing varnish.....	1 54
2 quarts inside finishing varnish.....	1 75
1 quart black iron varnish.....	19
2 gallons red rubber paint.....	2 34
2 quarts outside finishing varnish.....	2 02
Material, \$18.07; Labor, \$17.08; bonus, \$2.41; total, \$37.56.	

Flurd Class Operation.

Contract, \$14.60 Bonus, \$1.02.

1. Outside, painting vestibule and dashers.
2. Outside, cutting in all painted work.
3. Outside, relettering and striping dashers.
4. Outside, blacking off iron work.
5. Outside, one coat rubbing varnish.
6. Outside, one coat finishing varnish.
7. Roof, one coat paint.
8. Inside dashers, one coat paint.
9. Floor and platforms, one coat paint.
10. Inside, one coat finishing varnish.

Material.

4 lb. special red	\$1 84
8 lb. cream color	48
2½ books of gold leaf	88
½ spool Coe's ribbon gold	44
¼ lb. golden ochre	07
¼ lb. sizing	12
¼ lb. white paint	02
¼ lb. drop black	08
¾ lb. Venetian red	19
1 quart black iron varnish	19
1¾ quart rubbing varnish	1 54
2 gallons red rubber paint	2 34
2 quarts outside finishing varnish	2 02
Material, \$10.21; labor, \$12.38; bonus, \$1.02; total, \$24.21.	

Fourth Class Operation.

Contract, \$8.50. Bonus, \$1.42.

1. Outside, painting vestibules and cutting in dashers.
2. Outside, touching up main body.
3. Outside, blacking off iron work.
4. Outside, one coat finishing varnish.
5. Roof, one coat paint.
6. Inside dashers, one coat paint.
7. Floors and platforms, one coat paint.
8. Inside, one coat finishing varnish.

Material.

2½ lb. special red	\$1 15
2 lb. cream color	12
½ lb. Venetian red	13
1 quart black iron varnish	19
2 gallons red rubber paint	2 34
2 quarts outside finishing varnish	2 02
2 quarts inside finishing varnish	1 70
Material, \$7.71; labor, \$8.50; bonus, \$1.42; total, \$17.63.	

Fifth Class Operation.

Contract, \$4.00. Bonus, \$66.

1. Outside, touching up dashers and main body of car.
2. Outside, blacking off iron work.
3. Outside, one coat finishing varnish.
4. Roof, one coat paint.
5. Inside, dashers one coat paint.
6. Floors and platform, one coat paint.

Material.

1½ lb. white paint	\$0 12
1 lb. special red	46
1 quart black iron varnish	19
2 gallons red rubber paint	2 34
2 quarts outside finishing varnish	2 02
Material, \$5.13; labor, \$4; bonus, \$66; total, \$9.79.	

Mr. Foster: I would ask through you, Mr. President, the price paid by Mr. Harrington for the labor in doing that contract work.

Mr. Harrington: Twenty-five cents an hour for the painter; the assistant painter gets 15 centst an hour.

Mr. Riggs: I move that the paper be received, and the thanks of the association be extended to Mr. Brydges. Carried.

The secretary announced that on Friday at the Convention Hall there would be a vaudeville entertainment provided by the supply men.

The meeting then adjourned until 11:00 o'clock Thursday morning.

THURSDAY, OCTOBER 18th.

The clear air and warm morning sun contributed to a general feeling of good nature, and every-body was in good spirits and attendance was the largest of the week, every chair being occupied.

President Roach called the convention to order at 11:10 a. m. Secretary Penington announced that the following 16 companies had joined at this meeting:

Dallas Consolidated Electric Street Ry. Co., Dallas, Texas.
 Danville Street Railway & Light Co., Danville, Ill.
 Detroit, Rochester, Rome & Lake Orion Ry. Co., Detroit, Mich.
 Jackson Railway, Light & Power Co., Jackson, Mich.
 Kansas City-Leavenworth Railway Co., Kansas City, Kansas.
 Lebanon Valley Street Railway Co., Lebanon, Pa.
 Meridian Street Railroad & Power Co., Meridian, Miss.
 Skuykill Traction Co., Norristown, Pa.
 Hoosac Valley Street Railway Co., North Adams, Mass.
 Ottawa Railway Light & Power Co., Ottawa, Ill.
 Ottawa Electric Railway Co., Ottawa, Ontario.
 Holmesburg, Taconey & Frankfort Electric Railway Co., Philadelphia, Pa.

Monongahela Street Railway Co., Pittsburg, Pa.
 Rockford Railway, Light & Power Co., Rockford, Ill.
 Saratoga Traction Co., Saratoga, N. Y.
 Terre Haute Electric Co., Terre Haute, Ind.

The President: Gentlemen, we will now proceed to the regular order of business this morning. The paper on the program is entitled:

DOUBLE TRUCK CARS; HOW TO EQUIP THEM TO OBTAIN MAXIMUM EFFICIENCY UNDER VARYING CONDITIONS.

By N. H. Heft, president Meriden Electric Railroad Co., Meriden, Conn.

In order to prepare a paper which would be of any value to the members of this association, it was necessary to learn the conditions governing the operation of double truck cars on different systems. The conditions under which cars are operated, vary to such an extent that it is impossible to construct and equip a car that can be operated with equal economy on all systems. In order to keep within the time allowed by the committee, and the more readily to convey to the members the writer's opinion as to the most desirable double truck car, the subject matter will be taken up under the following divisions: Trucks. Electric motors. Double truck car body and equipment.

TRUCKS.

The double truck for use on street railways has not received the attention it merits. These trucks have been constructed along the lines of the single truck, and to meet the varied views of railway managements. One has only to observe the different styles of trucks now in use to find how at variance have been their views.

The 55 years experience of the steam railroads in the development of the double truck now used by them, should be a warrant to the street railway managements in adopting only trucks that conform to the lines used by these roads; the diameter of wheels, with the tread and depth of flange should be changed only where conditions prevent using the Master Car Builders' standard.

I present drawings of a double truck designed along steam railway lines to meet the varied condition of street railway service. In the design of this truck it has been the aim of the designer to include all known good features of the present street railway truck and to add improvements of value. This truck is constructed with a minimum number of parts consistent with safety, strength, accessibility, lightness and cost of maintenance.

In giving a brief description of this truck, it will not be necessary to mention the wheels further than to say that they are cast chilled, 33 in. in diameter with a 3-in. tread and 1 in. flange, formed to fit the modern rail, and weight 380 lb. The axles are of forged steel, high in carbon, with a 2-in. hole bored through the entire length. The key seat at the gear wheel-fit is cut above the line of motor bearings and journals, in order not to weaken the axle.

The oil boxes are constructed so that the journal brasses may be

readily removed, and with dust guard placed in position from the underside of box. An extra guard is placed from the same side and where it will retain the oil at the highest point.

The journal brasses and boxes are finished in such a manner as to obtain the full journal bearing under all conditions.

The side frames are made from two $\frac{3}{4}$ -in. steel plates, thus allowing the main equalizer to be supported between the two frames on long helical springs. With this arrangement the bar can be removed for repairs without in any way taking the truck apart. This form of frame allows the greatest freedom of access to all parts, and the use of the extended equalizer bars gives extended spring movement, with a perfect side movement on curves and at low places in the track, minimizing the blow to the car body, rail joints and special work and reducing the cost of maintenance of track and equipment. The side frame is so strongly constructed at points where the transom joins the frame that it is not necessary to continue frame around the end and

N. H. HEFT.

connect it with the other side of frame to keep the truck in alignment. This also allows the placing of the truck near the end of the car body without coming in contact with the steps.

The brakes are placed inside of the wheels, without using a brake beam. This position insures the most positive action, with either hand or power and independent braking on each wheel. The wheel base, 5 ft. 6 in., allows the motors to be suspended between axles and transoms.

MOTORS.

The writer, having had experience with heavy and light motors, mounted with two motors on one truck, the other truck being an idle or trail truck, as well as with one motor on each truck, has found that, while greater efficiency is shown with the latter method, the two motors mounted on one truck show a saving in labor, first cost of the trail truck, and cost for maintenance.

Maximum efficiency, with minimum cost of maintenance, with both heavy and light motors, has been obtained by mounting two motors on each truck, making a four-motor equipment. With this form of equipment, higher speed and quicker acceleration are obtained with lower power consumption, both in the average and total for the whole trip.

After an experience extending from the time that the first railway motor was constructed, the writer knows of no mechanical apparatus in which the development has been so rapid and the point of perfection so nearly attained. Yet the future promises even greater development, both in the direct and alternating current motors. With the great corps of engineers employed by our large manufacturing concerns working with the men who are operating these motors and constantly suggesting and demanding improvements, the ideal commercial car equipment will be developed.

The writer desires to call the attention of electrical and mechanical engineers to improving ventilation, increased copper, insulation, bearings, hollow armature shaft, decreased armature speed and gearless motors.

The controllers have not, as far as space and weight are concerned, kept pace with the motors. This part of the apparatus should receive the attention of the best talent of our manufacturing companies. The four-motor controllers, in their present

form, are large cumbersome affairs, placed in that portion of the car body where it is inconvenient and expensive to support. A more satisfactory controller can be produced by using a small pilot controller placed on the platform, with some developed form of main controller underneath the car body.

DOUBLE TRUCK CARS AND EQUIPMENT.

From information furnished by the operating department and from personal observation, the writer is led to believe the following dimensions are the most desirable: Length over all 40 to 50 feet. Width over all 7 ft. 6 in. to 8 ft. 8 in.

With the increasing demand from the travelling public for the extension of present systems to suburban districts with a more frequent service and increased speed, also the construction of long interurban lines, the present managements, to meet this demand, are turning to the double truck car constructed along the lines of the steam railroad coach.

The drawings show a double truck car, which the writer believes will become justly popular. This car combines the largest number of good features and is so constructed as to admit of placing the electrical equipment where it is accessible and less liable to come into contact with the truck or brake equipment.

The car body can be carried at the lowest point and the trucks placed near the end of the body. This car gives the maximum efficiency, durability, speed, safety and seating capacity, attractiveness and ease and comfort to passengers, coupled with the minimum cost of construction and maintenance, and less dead weight per passenger, based on seating capacity.

The total weight is made up as follows: Trucks, 3,970 lb. each; four motors, 2,385 lb. each; car body and equipment, 12,300 lb.; a total weight of 29,780 lb. This amount divided by 63 passengers gives a dead weight of 473 lb. per passenger. The cars of today show a dead weight, based on the seating capacity of 750 lb. to 1,100 lb. per passenger.

While the writer does not claim that the truck and car body described are perfect, yet he believes they are along lines that will become attractive to managers when taking up the cost of operation. Decreased cost of operation can only be obtained by purchasing equipments that are designed to perform a specific duty where all weights and speeds are known.

The President: Gentlemen, we invite the members to come forward and inspect the plans prepared by Colonel Heft at considerable trouble and expense, showing the details of the construction of the car he has spoken of. (A number of the members then inspected the plans of the car.)

President Roach: I would state, gentlemen, for your information, that all of the cuts as shown here will appear in the minutes of the meeting to be printed hereafter and distributed among the street railway men of the United States and Canada. I desire personally to thank Colonel Heft for his able paper that he has read here, and we will be much pleased to hear it discussed by the members of the Association. To start this discussion, I take pleasure in calling upon Mr. E. C. Foster, of Lynn, Mass.

Mr. Foster: I have listened with a great deal of interest to the paper read by Colonel Heft, and have also given a casual glance at the drawings submitted. I think that Colonel Heft is on the right line in the way of making improvements. We all know that it is desirable to have cars constructed as light in weight as possible, and yet to be sufficiently strong to meet all the requirements and conditions. I am very glad that Colonel Heft has taken up this subject. We all know that the varying conditions under which we operate in the various states and municipalities require a different kind of equipment. There are places, of course, on the interurban lines where an equipment designed similar to that submitted here could, without doubt, be operated very successfully. The Lynn & Boston Railroad Co. is operating lines running into Boston. We operate one line over a distance of 16 miles from a small town on the coast, Marblehead, through Swampscot, Lynn, Revere and Chelsea to Boston. On that line, we are operating 12-bench double-truck open cars, equipped with four motors. The box-car equipment is a 25-ft. box-car, double truck, with four motors. We have been operating over this line about 15 months, and we are running at a maximum speed of 30 miles an hour, and we have found by experience that the operating of four motors is more economical than the operation of two motors over the same

line under the same cars and under the same conditions. To be sure, there is an increased consumption of power. We are all willing, I believe, to concede that, and I think Colonel Heft will agree with me, although he shakes his head to the contrary. From tests made, we are sure of it. The operation of four motors, of course, depends upon the speed you wish to attain, and that it is desirable to attain. In operating upon a line where your speed is more than 12 to 15 miles per hour, I question whether it would be wise to adopt the practice of using four motors. We are also operating on many lines, 16, 18, and 20-foot cars. With those cars, we operate, as is customary, the usual two motors. We have various types of motors, but we have learned by our experience that the double truck car, with two motors, or four motors, is more desirable and profitable to operate; and we are now rebuilding some of our smaller cars and converting them into 25-ft. cars. We are doing that successfully. We are also building a large number of new 25-ft. double truck cars.

Mr. Chamberlain (Brooklyn): You will appreciate that the average mechanic in this country has his "hobbles" as well as the average professional man. Without referring to any part of the electrical equipment which Colonel Heft has designed for his peculiar class of cars, there are two or three innovations from the present practice in the construction of the car body, which may well attract attention. With most of us, innovations of this character are subject to adverse criticism. I know of nobody who would be subject to adverse criticism less than the author of this paper, who has had such a vast amount of experience in this direction, and it seems that it is right and proper he should make an innovation of this character. I speak more particularly of the construction of a car without longitudinal truss rods. I think that Colonel Heft has designed a car of something over 42-ft. in length, and gains his body support by a number of cross transoms built in the form of the ordinary iron body bolster, welded at the ends, filled in with wood, and supported through the center with longitudinal I beams running from one end of the car to the other. The author of the paper has evidently, by this plan, succeeded in obtaining the minimum of weight with the maximum carrying capacity, and I think you who are practical men, and you certainly all appear to be, will agree with me that that is the object to be sought.

One question I would ask is with regard to what might be the result of an end collision. I do not know whether this truss running longitudinally through the car from one end to the other, would be adequate, and would perform the functions and give the proper camber to the car, that the ordinary longitudinal truss rods do. You will recollect some years ago, that the managers of the steam roads went wild, in following out the idea of reducing the weights of their rolling stock, until they reached a point where they almost passed the limit of safety factor. Colonel Heft advises me that he used an ample factor of safety. If he has done that, he has certainly covered all the ground that is necessary to make the vehicle safe and one that would do good service in actual practice. I was very careful to inquire of the Colonel whether he placed all his strength on a line with the sills. When we have a collision, we do not collide with the clear story of the end of the bonnet; but we generally get it on the end of the buffer. Of course, we all know there are some roads which never have any accidents, and they do not have to experience any difficulties of that kind. I was particular to ask him whether the strength was on a line with the longitudinal timbers, and whether the frame above that included posts and trusses in the framing, and the clear story was lightened up correspondingly. It would be a difficult matter to put all of your strength in your clear story, or on a line with the roof, because when you do that, and your car runs into any obstruction, your roof would probably keep going on and the body remain where it was.

Not to occupy any more of the time of the meeting, I would like to ask the author of the paper whether he has sufficient strength with the transverse brace to overcome the difficulties which I have outlined?

Mr. Heft: I have endeavored to get all of the strength longitudinally, lightening the upper portion of the car, but constructing it in such a manner that the upper portion is braced to the lower portion and tied to it, both longitudinally, vertically and otherwise. We have five of these cars under contract and expect that the first

one will be turned out in from four to six weeks. We expect to operate this car from Port Chester, N. Y., to New Rochelle, N. Y. I would be very glad to show the car, when in operation, to any of the members of the association. I may be wrong in my ideas concerning this car, but we are putting up our own money to build it. If it is a failure, we will have to foot the bills.

Mr. W. E. Harrington (Camden): The question of four-motor equipments seems to be one of a mooted character. There are a large number of roads using four-motor equipments, but there seems to be relatively very little known as to the number of watt-hours per car-mile which the different equipments require, and with the idea of bringing out that point as a feature of discussion, I would like to place this question before the meeting. What is the experience of those present, who have made tests, as to the watt-hours required by the different equipments mentioned? Mr. Foster says it takes more power with the four-motor equipment, and Colonel Heft says it takes less. They are both highly representative men, and yet they differ on this point. Our road is about to place some equipment orders. I have been urging four-motor equipments, and yet I must confess I am somewhat in the dark as to the relative merits of the different equipments. I know from tests I have made that the double-truck, 40-ft. car equipment, with two 3S-B Westinghouse motors, on maximum traction trucks, have taken an average of 2,000 watt-hours per car-mile, whereas the same weight of car, with the center pivotal truck, with No. 49 Westinghouse motors, 35-h. p., under identically the same conditions, takes an average of only 1,200 watt-hours per car-mile; a single truck car, under similar conditions, an 18-ft. body car, takes an average of 900 watt-hours. I would like to know if there are any data from actual test to show the number of watt-hours consumed by these different equipments. I have made a series of tests on different classes of cars, showing the watt-hours. I deem this matter of very great interest, and I will file with the secretary the results secured in these tests. I did not encounter any difficulty in getting information of this character, and I think the information obtained by me would be interesting to the other members, in showing the number of watt-hours per car-mile with the various forms of equipment.

Mr. Heft: I do not remember the figures, but we have made a series of tests during the last three years with double truck cars, equipped with one, two, and four motors, as I have stated in the paper, and we have kept a very close and accurate record of the results. The weights of the different trains on which these tests were made varied from 15 to 250 tons. The speeds varied from 10 to 65 miles an hour.

There is no place where the car is operated with an increase of current with the four-motor equipment, except while accelerating, but you gain a quicker and higher acceleration by this increased consumption of power. The average consumption of the current, however, and even the total consumption of the current, in the running of the cars, is less with the four-motor equipment than with the two-motor equipment. That is beyond dispute. I can furnish data to that effect, and I think the General Electric Co. and the Westinghouse Co. also can furnish any of our members with data which will substantiate that statement. It is unquestionably correct.

Mr. Wason: I would ask if the additional cost for the drilling of the hole through the axle and the armature shaft is commensurate with the results, and whether he is seeking to lighten the axle, or to be assured of the quality of material?

Mr. Heft: I am willing to admit that the drilling of the axle is a debatable question. About five years ago, we commenced to use hollow axles on our high speed motors, and the results have been so favorable in the way of reducing the number of hot boxes, hot journal bearings, and everything of that kind, that we have decided to adopt that form of axle. It decreases the weight about 25 per cent, with a loss of strength, varying according to the size of the axle, of from only 3 to 5 per cent. We have never had any of them break. We had a great deal of trouble with our axles on our heavy high speed motors, and we found it necessary to increase the diameter and weight of the axles. We were loath to do this, and so we adopted the plan of drilling a hole through the axle to lighten it. We not only lighten the axle, but we get the benefit of having a ventilated axle. It overcomes crystallization in the axle.

Mr. J. I. Beggs: In connection with the statement that four-motors take no more current than two motors, I would ask Colonel

DATA ON WATT-HOURS PER CAR-MILE REQUIRED WITH DIFFERENT EQUIPMENTS. SUBMITTED BY W. E. HARRINGTON, GENERAL MANAGER CAMDEN & SUBURBAN RY. CO., CAMDEN, N. J.

Heft whether he meant four-motors of the same size, or two motors having the same capacity as the four might have had?

Mr. Heft: We have made experiments with motors of different capacities, but all of the motors were of the same size, and used on the same class of equipment.

Mr. Beggs: I do not know whether I made myself clear. We made some very exhaustive tests, and they were so opposed to the position which Colonel Heft now takes, that I took occasion to have Mr. B. E. Sunny, the western manager of the General Electric Co., and also Mr. Theodore P. Bailey, the manager of the railway department of the General Electric Co., Chicago, to come and witness the tests made on this mooted question of the amount of current consumed by these different equipments. Of course, this matter is a very important one to all of us.

We adopted double truck cars as a standard for our entire system five years ago. We have been using them ever since, and are continually increasing the number. We have given a great deal of attention to the development of the most advantageous car, the most durable car, the car which will best stand the strains to which Mr. Chamberlain referred, as ours is one of the roads that has collisions and a number of them, unfortunately, and some pretty severe ones. We operate 350 miles of road, and have one electric line 61 miles in length. We try to build the equipment so that it will be interchangeable, in city use or in suburban service, as we have a consolidated system, and we run the cars interchangeably. I must take issue with Mr. Heft's statement, to the effect that four motors do not take more current than two motors. If you equip a car with two G. E. 1000 motors, or four G. E. 1000 motors, I think the four motors will take 20 per cent more current than in the two motors; but the service with the four motors will be 50 per cent better. That has been our experience. Our cars for three years were equipped with two motors. For the past two years, after careful experimenting and taking into account the various costs entering into the matter, of which the smallest is power, we have adopted four motors as a standard, be they of whatever size they may. We can get much better results from 150 h. p. in four motors under a car, than we can with 250 h. p. in two motors under the car. The results may differ in various sections of the country, but with us, the four motors have certainly taken from 20 to 25 per cent more current than the two motors, running exactly similar conditions; not for the purpose of test, but in regular service on long distance or city lines, with wattmeter, voltmeter and ammeter on the car, so as to cover all the points. The use of these four motors is a very important thing on our standard car, which is 41 ft. over all, and seats 44 passengers, with cross seats, and weighs somewhat more than the car referred to by Mr. Heft. I trust that Mr. Heft will succeed in making his car all that he desires.

I was very much interested in the points raised by Mr. Chamberlain as we have found that, in order to put a car on the tracks in our city so that it will stay there, in spite of a head-on collision, as we some times have, even with the greatest degree of care, it requires some weight and strength to withstand the shock so that the car will not be absolutely shattered. We had a case recently with a green motorman on a curve, where our car was thrown off the tracks across the street, with the result that the car was not much injured except that a corner post was knocked off. I think Colonel Heft has seen how our cars are braced. We use the longitudinal truss rod and truss plank, with a rod through it. We do not feel that we can take chances with the longitudinal brace; we want the strongest construction possible to put in the car. Therefore, I should take issue with Mr. Heft on that point.

As stated, the results of the tests made were somewhat contrary to what the experts had led us to believe we might expect would be the draft upon the power plant, and for that reason, I had Mr. Sunny and Mr. Bailey come to Milwaukee on two or three different occasions to make those tests, not simply tests on a special car, but on the regular service, equipping different cars on our regular service, with different types of motors; two G. E. 57; two G. E. 1000, and four G. E. 1000 under different cars. I do not believe there is any question that the four motors will take more current, but as has been said, you get quicker acceleration. You have no slipping wheels. We are going to put two additional motors on all the cars we equip in the future. The higher speed you can make compensates for the increased power consumed. In the city service where we use these cars, as we do entirely, with

blocks running from 200 ft. in length, it is an important matter if you can save a second or two on each street corner in getting the car into rapid motion; and when the car gets on a slight grade, or starts on a slippery rail, it will immediately pick up and get off without spinning the wheels. That is what the four motors will do. I believe that four smaller motors are much more effective than perhaps 50 per cent increased capacity in two heavier motors. We have some 300 of these double truck cars running. We control all the city lines in Milwaukee and Racine, 25 miles south, and run 35 miles south to the city of Waukesha. We run a complicated system, but it is run as one entire system. If we have a call for cars on any of our interurban lines, we can take our city cars for this purpose, because they are interchangeable.

In order to compete with our friends of the steam railroads, we are now giving our attention to the development of a new car that shall be 50 ft. over all, upon which we propose to mount four 75-h. p. motors, such as you will find in the exhibit hall below. The steam railroads throughout our Western country are beginning to realize that they have a real competitor in electric lines for distances of 50 or 60 miles, and as a consequence, they are reducing the rates of fare very materially and putting on additional high speed trains to run short distances. We propose to build an electric car for the double purpose of being able to make 60 miles an hour with four of these motors and with the further purpose that in case we have a congestion of travel on any of the lines running to our summer resorts, we can hitch three or four trailers to the car and make 35 to 40 miles an hour, and to handle a larger body of people at a much reduced cost. We may have peculiar conditions in our city, but that is one of the things we have in mind. With these cars which we are going to build, and under which we are to put four motors, we should want a more substantial construction than the cars shown in the drawings which have been submitted to us, although these cars may be all right for the service for which Mr. Heft designed them.

Mr. Heft: Mr. Beggs' statement is true, judged by his conditions, but I also insist that my statement is true taken from my conditions. Mr. Beggs' cars, I believe are operated largely through city streets and are stopped and started; and as I stated in my reply to Mr. Foster, there would be a greater current consumption in producing the acceleration of the car when starting and stopping so often.

Mr. Beggs: This test was not made on a city line. It was made on our Waukesha line, a 20-mile road, with a train every hour each way. We make the run in 52 minutes, and keep up an hourly service with two cars. The test was made on that high speed line, upon which there are very few stops and sometimes no stops in a distance of ten miles.

Mr. Heft: Then I must insist, under that condition, that my statement is correct. (Laughter.) I will say, to satisfy Mr. Beggs, if he will come down to inspect our system, I will give him an opportunity to witness a test, and if he does not agree with me I will pay his expenses to Meriden and back.

Mr. Beggs: It will be a pleasure and worth all the expense to spend a day with the Colonel, outside of the test; but I shall take advantage of the opportunity he offers to have this test made. I shall, however, want to know how his instruments are calibrated. I shall also want to take some expert along with me to see these tests. I am not an expert in electric railroad matters, except on the commercial side; but I feel sure there is some mistake in the readings of the meters. I was told what the Colonel tells us, but it did not agree with my own practical experience, and what I considered would be the result when I was seriously considering three years ago, this very question of whether or not we could afford to go to the current consumption required for four motors. The first report which came to me from a gentleman whom I considered to be a highly scientific, technical engineer, harmonized with what Colonel Heft has told us, and the report went further and said that four motors saved 10 per cent, and he submitted the figures to demonstrate it. Then I concluded I would call in other experts and I did call in Mr. Sunny and Mr. Bailey, and I went on the cars myself with these gentlemen, and spent several days with them, with the result that I found it took fully from 20 to 25 per cent more current with the four motors than with the two motors, on the same character of service, the same cars and load, and running exactly during the same hours as we made the tests on different days so as to get exactly the same conditions.

Mr. Foster: The conditions under which Colonel Heft has been making tests are different from the ordinary conditions under which street railways operate, as I understand it. The conditions there are these: That the test was made upon a steam railroad roadbed, with the stops made at infrequent intervals; that is to say, that the run would be made from one station to another, and it might be two or three, or five, or even ten miles distance. That being so, I think it is possible, and without a doubt it is true that they do operate as he says, without consuming a greater amount of current than they would with two motors. Our experience has been in operating four motors on the same type of car, over the same road, under the same conditions, as near as it is possible to obtain them, that it requires from 15 to 23 per cent more current to operate four motors than two motors. We make tests twice a year, and pay for current on that basis, and we believe that the tests are carefully made, as they are made by the representatives of the Boston Elevated Railway Co., over whose tracks we operate, and which furnishes power to our company, and the tests are also made by experts representing our company.

Mr. Wason: On one of our suburban lines, we started two years ago to put on two 75-h. p. motors on each car, and found it almost impossible to make our time in the city, or in the country where there was any grade. We did that for the purpose of eliminating one-half of the repairs, as we supposed. Later, we removed the two 75-h. p. motors and put on four 50-h. p. motors, with much more satisfactory result, as we were able to make our time, and consumed but a very small amount of power more than the two 75-h. p. motors. The results were very much more satisfactory, and I think there is no question but for all suburban work, four motors are preferable to two motors, no matter what the amount of power you put into the motors is.

The lightening of a car for suburban work seems to me a little questionable. I think Colonel Heft will, a year from now, be able to give us some more definite data on this point. We have been strengthening our cars from the start, rather than making them lighter. They sometimes now leave the track for a shorter road across the fields which is not always advantageous for the rolling stock. It seems to me we ought not to consider making the cars lighter, unless we are running a car shop—possibly some of these gentlemen are interested in the manufacture of cars—and want to have the repairs of our cars or supply us with new equipment. The ordinary railroad man buys his equipment and expects it to last a reasonable length of time, and it seems to me that it must be strong. Of course, the strength should be put in the best possible places, and I think that, rather than making the car lighter, we should make it stronger. In the steam railroad practice the car is cambered up in the center. In the first of our suburban cars, the makers insisted upon putting the camber in the center, but we found after using the car a short time, we could put the camber there ourselves. The trouble was to keep it from bulging up in the center, so that a truss rod in a long car, a 40-ft., was a useless thing.

Mr. Harrington: I would ask Mr. Beggs what the tests showed where they ran two No. 57 motors, compared with four G. E. 1000 motors; whether the results from the four G. E. 1000 motors showed a lesser consumption in power than they had in the use of the two No. 57 motors.

Mr. Beggs: The current was less on the four G. E. 1000 than on the two No. 57.

Mr. Harrington: Did you get better results?

Mr. Beggs: We got quicker acceleration. Whether your service is for eight miles an hour, about the standard for city service—our city service is maintained pretty close to nine miles an hour on the average—whether your service is for eight miles, or fifteen miles, or for fifty miles an hour, put four motors on a double truck car. The distance does not make any difference whatever. The main question with many roads in this matter is the increased investment, but you will save the interest on the increased investment in reduced cost of maintenance. It costs considerably less to maintain four motors under a car than it does to maintain two motors under the same car. The difference in cost of maintenance will more than offset the interest on the increased cost of the investment.

Mr. Heft: To remove any doubt from Mr. Wason's mind as to this car, I will say that at the present time, I have not a dollar's worth of stock in any car manufacturing plant.

Mr. Connette: Mr. Beggs has just answered the question I was going to ask, whether or not the increase in the efficiency of the motors by reason of having four motors rather than two, would compensate for the increase in the investment. I presumed that would be the case with four motors as compared with two motors. Mr. Beggs states that the maintenance is less. I wanted to know something about that point, and as that question has been answered, I do not think I have anything further to say.

Mr. H. H. Vreeland: Our peculiar conditions in New York are such that we cannot go into the character of construction which warrants the use of the standard double-truck car with four motors. We do it on a number of lines controlled by the syndicate which owns the New York lines, and wherever it is possible, and we are not held down to the matter of a sixteenth of an inch in step heights, as we are in Greater New York, we go to the square body car, and use the four motors. In New York longitudinal lines, by reason of Central Park, have to use very narrow streets. We have to conform to the old type of construction, with sunk panels, to keep the cars moving. We have a number of cross streets through which the important lines operate, and the difference between the sunk panel car and the square body car, means keeping the line in operation all the time, as against stoppages every once in awhile of from ten to twenty minutes, owing to the numerous teams using the streets during the day. Take on our 59th St. line, running across town, if an ordinary truck is standing at the curb, the hub will go under the sunk panel of our car; and if we used a square body car, we should not be able to pass. We also find it necessary to have step raisers.

We are not trying to do gilt-edge railroading in New York. I mean that these things are not necessary. I had a man recently say to me that he thought it was an unwise thing to have step raisers under the control of the motorman of an open car. It means to us on the down-town streets of New York that the motorman can signal the conductor to raise the step and pass a truck without a stoppage of the car, which, under the ordinary conditions of a solid step, means a stoppage of the car, and when you are running the cars five seconds apart as we do in Center St., down-town, it is a great advantage to be able to raise the step and allow the car to pass.

The question under consideration is so local with us in that respect, that to discuss it from the standpoint these gentlemen have discussed it would not amount to much, except as concerns our experience with the consolidated system in New Jersey, where we run high speed, long distance, interurban cars. On that system, we use the large car with four motors. We get the largest carrying capacity car we can with the highest speeds, and do not consider particularly whether there is more or less power consumed, if we can compete successfully with the surrounding steam railroad conditions. We have long lines and in every instance they are in competition with the steam railroads.

We made some experiments and found that, with the same sized motors on single and double truck cars, there was an increase of about 20 per cent in the consumption of current in the double-truck car. I speak of this, because I am uncertain whether it was due to the increased weight of the car or the increased length of the car. As far as the question of general car construction is concerned, which has been discussed here, we have not to consider so much the question of collisions at high speeds, as we have the question of a "hogging" of the cars, as we term it; and as our friend, Mr. Wason, says, it is no trouble at all to get any kind of a camber in our Broadway cars, as the normal condition of the cars is such that my friend Colonel Heft says that he usually prefers to walk down town and leave room for three passengers in the car.

Mr. Sergeant: I have been extremely interested in this paper which Mr. Heft has presented. I want to say that I have seldom seen so much valuable matter so admirably put in such few words. I think this paper is a model of brevity and information. On the question of power for four-motor cars there seems to be a considerable difference of opinion. While we have had no experience in actual service with four motor cars, for the purpose of determining what the power consumption was, we made some very careful tests, under what would be ordinary conditions, with the ordinary railway motors of different types, two to the car, and under these conditions we found that we got a little better acceleration with the four motors. We got, as a matter of fact, ten per cent decrease in

time, better speed, but we had to use 50 per cent additional current to get it. I should suppose the question is one of local conditions. Certain electricians have been trying to persuade me for years that two motors consumed less power than one motor. We have records covering a good many years that one motor consumes less power than two motors.

In regard to our elevated equipment, possibly we have been making a mistake. We are intending to use motor cars having one motor truck with two 150-h. p. motors on that truck. One motor truck and one trailer truck, every car a motor, using the multiple control system. I hope that inside of the next year, if you come to Boston, we can show it to you in successful operation. It will be the only elevated road which will go underground as well as elevated, and we have to overcome long grades of 5 per cent, and have descending grades of eight per cent, and therefore, we feel we want the greatest acceleration we can get.

Mr. Heft: There is a gentleman in the room who has had a great deal of experience making tests with trucks mounted with one and two motors. I think he will give a reason why any car equipped with four motors, with all the eight wheels available as drivers, gives better results than a two-motor equipment. I would like to hear from Mr. Ira A. MacCormack, of Cleveland.

Mr. McCormack: While I was with the Brooklyn Rapid Transit Co., the president of that company thought it was advisable to have double-truck cars, and the first car that was built had the wheels all of one size, and the question came up whether it was advisable to put four motors on the car or two motors. Tests were made and it was finally decided to equip the cars with two motors on account of maintenance. An order was placed for double truck car bodies. We had not yet determined whether we had the right kind of truck and whether it was still advisable to use the four motors or to use the two motors. We had some maximum traction trucks on the road, and in making the test in regard to the power and the efficiency in acceleration, it was found that the maximum traction truck was giving much better service. In consequence, we adopted the maximum traction truck, and I believe it was the only truck we could work with two motors and continue the service in Brooklyn. The 15 cars referred to were equipped with wheels which were all of one size, and we had to pull those cars off the road. I complained to the president but he thought I was wedded to the maximum traction trucks and insisted on running them. One day, he happened to be at Richmond Hill going to Brooklyn. It was a 24-minute run from Richmond Hill to Ridgewood. The president got on one of the cars with wheels all the same size, and he was 52 minutes getting there. He thought the wheels traveled a thousand miles. These cars were equipped with two motors. The next day, we discontinued the use of the 15 cars, equipped with these trucks because we had so many delays. They dragged the road and it was found impossible to operate them.

In Cleveland, when I went with that company, I found that all the cars were double truck cars with wheels the same size. Some time ago I had a cyclometer put on the driving wheel, the wheel equipped with the motor, and a cyclometer on the idle wheel, and the record showed that the driving wheel made many more revolutions than the idle wheel. Mr. Heft's paper gives us more food for thought and study than any other paper presented to this association. There is one important thing he speaks of, and that is doing away with the brake beams, having the brakes hung and operated direct without brake beams. I think that is something that can be appreciated, particularly in view of the trouble we have had in regard to chattering brake beams and brake beams catching up rubbish on the road, and sometimes when we have accidents, we will find that brake beams are a large factor in them.

Mr. McCulloch (Chicago). Colonel Heft's paper has been discussed almost entirely on the question of economy in power, and from the standpoint of the strength of the car in its construction to resist damage from collisions. Most of us who have been in the street railroad business a good many years remember when our cars were only 10 ft. in length, and today we have them 46 ft. in length; then they weighed 4,000 lbs; now they weigh 40,000 lbs. Then we had only one horse or two horses; now we have 268 h. p. We did not consider the question of power at all, nor the question of the strength of the car to withstand shocks. We were considering how we should be able to carry more passengers, and how we could better please the man who has the nickel. I do not think it is a question at all of whether we shall use a little more

power or not if we can carry in greater safety the passengers who are in our cars, and we can carry a larger number of passengers, we can very well afford to burn an additional bushel of coal, if we can carry a few more passengers to pay for it.

As to the collisions which have been referred to, and the construction of the cars to withstand the shocks, I suppose the only way to prevent collisions is to run a road with only one car. When we have a collision, we do not consider what has become of the car, whether its transverse section is weak, or how much it will cost to repair it. What we do is to institute inquiries to find out whether there was some woman in the car whose transverse section was weak, and we shall have to pay for it. (Laughter.) I move that the paper be received and placed on file, with the thanks of the association to Colonel Heft for having written it.

The secretary announced that the members of the Association were cordially invited to visit the plant and park of the East Side Electric Railway Company. An invitation was also read from the Country Club of Kansas City, Mo., extending the privileges of the club to the members of the Association. A further invitation from the American Stoker Co. was read, inviting the members to visit the power plant of that company.

President Roach: The next order before the convention is the report of the Committee on Nominations. This committee will also include in its report a recommendation as to the next place of meeting.

Mr. McCulloch: With the consent of Mr. Rigg, the chairman of the Committee on Nominations, I would like to make a statement. In suggesting those who shall be our officers for the coming year, some member of our Nominating Committee has guaranteed strict attention to the duties of the office by each one of those we recommend, and we will ask any of the gentlemen who are nominated if he does not mean to attend to the duties of his office, if he is elected thereto, and give his earnest support in helping to carry the association along in a successful way, and give his personal attention to the meetings of the committee, we would like to have him decline the election, and let some one else be put in his place who will attend to the duties of the office.

Mr. Rigg, chairman of the Committee on Nominations, presented the following report:

Your committee respectfully recommends New York City as the next place of meeting, and the following gentlemen for officers of the association for the ensuing year.

President, Walton H. Holmes, president Metropolitan Street Railway Co., Kansas City, Mo.

First Vice-President, Herbert H. Vreeland, president Metropolitan Street Railway Co., New York, N. Y.

Second Vice-President, N. H. Heft, president Meriden Electric Railroad Co., Meriden, Conn.

Third Vice-President, J. B. McClary, general manager Birmingham Street Railway Co., Birmingham, Ala.

Secretary and Treasurer, T. C. Penington, treasurer Chicago City Railway Co., Chicago, Ill.

Executive Committee: The president, the vice-presidents, and John M. Roach, Chicago; F. L. Fuller, Wilkesbarre, Pa.; George W. Baumhoff, St. Louis, Mo.; John R. Graham, Quincy, Mass, and John Harris, Cincinnati, O.

The following resolution was unanimously passed by the Committee:

"Resolved, That the next meeting of the American Street Railway Association be limited to three days instead of four, and that the day set apart for the personal examination, by members, of the supply men's exhibit, be the middle day of the interval."

Mr. Bean, (St. Joseph): I move that the secretary be authorized to cast the unanimous ballot of the meeting for the gentlemen nominated. Carried.

The secretary duly cast the ballot and the president declared the gentlemen nominated to be duly elected as officers of the association for the ensuing year.

President Roach: There will be no further meeting of the association, but we will adjourn until tomorrow night at 7 o'clock to meet at the Coates House for the annual dinner.

I desire to thank the members of this association for their kind consideration while I have been your president, and if there is anything I can do at any time to help the association, I shall be pleased to have you call upon me while here and at home. (Applause.)

I will state in reference to the paper which was to have been presented by Mr. Nicholas S. Hill, Jr., general manager of the Charleston Railway, Gas & Electric Co., of Charleston, S. C., on "The Storeroom and Storeroom Accounts," that Mr. Hill has been ill for a long time, and has been unable to prepare the paper.

On motion of Colonel Heft a vote of thanks was given President Roach, and on motion of Mr. Vreeland a vote of thanks to the Metropolitan Street Railway Co., of Kansas City, and the citizens of the city who have so generously entertained the convention.

Adjourned to meet at the banquet Friday evening.

THE ENTERTAINMENTS.

The entertainments as provided by the local committees and outlined in the official program included a reception at the headquarters hotel, the Midland, on Tuesday evening, a trip to Armour's packing houses Wednesday afternoon, a theater party Wednesday night, an excursion to Ft. Leavenworth on Thursday and a shopping trip for the ladies Friday morning. The guests were glad to avail themselves of these entertainments and voted Kansas Cityans the best of hosts.

In addition to these there were other things not on the program. The Messrs. Holmes entertained the executive committee at the County Club on Tuesday. A trolley ride was given for the visiting ladies on Wednesday. Friday morning the Messrs. Heim received visitors at their brewery and street railway plant. Friday afternoon the Accountants' Association with the ladies in attendance were the guests of Mr. J. A. Harder, auditor of the Metropolitan company, who gave a trolley party. The Kansas City Club, the Country Club and the Elks' Club extended the courtesies of their houses to the wearers of buttons.

The supply men owned Convention Hall Friday afternoon and their vaudeville entertainment was a great success.

Friday evening the annual banquet was held at the Coates House, Vice-President John A. Rigg presiding in the absence of President Roach, and this function was a happy climax. Mr. D. B. Holmes acted as toastmaster and the speakers of the evening were: W. S. Gilbert, Judge McAnany, J. H. Stedman, Frank B. Walsh, and Chester Snider. The new officers were then installed and the Convention of 1900 passed into history.

PENNSYLVANIA STATE MEETING.

The ninth annual meeting of the Pennsylvania Street Railway Association was held at Reading, Pa., October 10th. Mayor Leader delivered the address of welcome and Pres. W. B. Given responded. "Railway Joints and Track" was discussed in a paper by George L. Hall, of the Weber Rail Joint Manufacturing Co., and "The Successful Station Manager and His Responsibilities," by S. D. Missimer, chief engineer of the United Power & Transportation Co., Reading.

Officers were elected as follows: President, John A. Rigg, Reading; first vice-president, E. H. Davis, Williamsport; second vice-president, A. L. Johnson, Allentown; secretary, S. P. Light, Lebanon; treasurer, W. H. Lanier, York; executive committee, John A. Rigg, Reading; William B. Given, Lancaster; W. H. Lanier, York; B. F. Meyers, Harrisburg.

In the evening the association was given a banquet by the United Traction Co.

TRAMWAY AND RAILWAY WORLD.

Our London contemporary, the Tramway and Railway World was the only foreign paper represented at the American Street Railway Convention in Kansas City. The World had headquarters at space No. 42 where Mr. Charles H. Perrine, its Chicago representative, did the honors. All those who had the pleasure of meeting Mr. A. M. Willcox, the editor of the Tramway World, at the Chicago convention last year regret that he could not have been present also. It must be remembered, however, that Mr. Willcox has had two conventions nearer home to look after. The International Tramway and Light Railway Exposition in London in June and July last was arranged by the Tramway and Railway World, and the International Tramway Congress at Paris also demanded attention.

STREET RAILWAY ACCOUNTANTS' ASSOCIATION.

Fourth Annual Convention Held in Kansas City,
October 16-19, 1900—Large Attendance at the
Meeting—Association in a Prosperous
Condition—No Change in By-Laws
—W. F. Ham Elected Presi-
dent—Secretary Brock-
way Re-elected.

TUESDAY, OCTOBER 16th.

The 4th annual meeting of the Accountants' Association was called to order at 10:45 by President Duffy, who introduced Mr. Daniel V. Kent, auditor of Kansas City. Mr. Kent warmly welcomed the association in a few well-chosen words and after a brief response the president delivered his annual address.

PRESIDENT'S ADDRESS.

Gentlemen of the Association: In welcoming you to the fourth annual convention of the Street Railway Accountants' Association of America in this progressive, hospitable western city, permit me to refer briefly, and with great pride, to the present standing of the association, what it has accomplished and what it should accomplish.

The association is now on a solid foundation. The membership embraces the representative companies of the United States, Canada and Mexico, in addition to companies representing England and Scotland. Whatever may be the political faith or opinions of the Accountants, there can be no doubt that they are thorough "Expansionists" on the question of membership in this association. Notwithstanding the fact that the annual dues have this year been increased from \$10 to \$20, and that numerous consolidations have been effected in the year 1900, I am glad to say that our membership has not been materially affected. The deficit in the treasury, reported at the last convention, has been more than wiped out by the voluntary subscriptions of the members; we have a substantial cash balance on hand and no unpaid bills or other obligations outstanding.

For the fourth time, we are holding our annual convention in the same city, in the same building, at the same time as the American Street Railway Association. We are under many obligations to that association for the hearty support and earnest co-operation they have extended to us, for the privilege of attending their meetings, and for other courtesies that we have enjoyed at their hands. Unquestionably, the attitude of the older association towards this association has brought the operating and accounting departments of street railways in closer touch with each other, to the mutual advantage and benefit of both departments, as well as the good of the companies represented. To the American Street Railway Association we owe much, and I take advantage of this opportunity to express our appreciation of what it has done for us.

The Standard System of Street Railway Accounting of this association, strongly endorsed and unanimously adopted by the Convention of Railroad Commissioners of the United States, is now the standard of that body. All reports to State Boards of Railroad Commissioners (who are members of the National Association) of the fiscal year beginning July 1, 1900, will be made in accordance with the Standard System, thus placing it in the same position with reference to street railways that the Inter-State Commerce classification of accounts occupies with reference to steam railroads.

The Department of Blanks and Forms is now firmly and permanently established and in successful operation. This valuable collection of thousands of blanks and forms, securely bound in books, perfectly arranged and classified, thanks to the genius of our worthy secretary, Mr. Brockway, forms a library of rare and valued books, of which each member is privileged to make use.

This feature is of special value and assistance to all members of the association. The exhibit of the blanks and forms at the annual conventions is one of the most interesting and instructive features of our meetings. A valuable addition to our library is the "Railway Official's Private Report and Reference Book," published by an enterprising supply firm and distributed by it gratuitously. The first copy of this book issued, with the name of the association stamped on the cover, was presented to the association by the publishers. In publishing this book, which is pocket size, admirably arranged and a marvel of the printer's skill, the publishers have recognized the growing importance and value of accounting work in street railways and paid our association a graceful tribute by dedicating the book to it.

In connection with the use of the Standard System of Accounting of this association, we have a strong committee at work, charged with the responsibility of determining a Standard Unit of Comparison. The members who attended the Chicago convention one year ago, will remember the valuable paper on this subject presented by Mr. H. C. Mackay, the able and energetic chairman of

W. F. HAM,
President, 1900-1901.

the committee, and will recall the animated and interesting discussion that followed the reading of the paper. The committee will present another report to this convention; it is hoped you will give the subject the earnest, thoughtful consideration its importance demands, that there will be a thorough discussion in which every member present will participate, and that we will agree on a Standard Unit of Comparison which will be acceptable from every standpoint and go hand in hand with the Standard System of Accounting.

The advantages of membership in the Accountants' Association, to those engaged in the street railway business, are many and varied. No man could ever hope to accomplish, single-handed, what the association can accomplish, as a body. The annual conventions give the members an opportunity of meeting each other, interchanging ideas, learning from each other and acquiring knowledge and experience which could not be obtained in any other way. The Classification of Accounts of the association is a self-instructing text book; the Department of Blanks and Forms is a valuable library of reference. Where, outside of the association, could the street railway worker find such advantages? To those of us who struggled through the disadvantages of an unsystematic accounting system, incident to street railways prior to the advent of modern transportation methods, going through the evolution of horse, cable and electric railways, construction and operation, these advantages appeal strongly. What would we not have given to have had then what we have now? The work of the association, chiefly educational in its character, has only begun.

Having thus referred briefly to the present standing of the association and what it has accomplished, I will now draw your attention to the more important question of what it should accomplish.

Our first and most important duty is to increase the membership. There are some large companies and many small ones not represented on our membership roll, which should be with us. An earnest, determined effort should be made, in a systematic way, to see that every company is solicited to join the association, and that they are made acquainted with the advantages and benefits to be derived from being members. This effort should not only be made by the association as a body, but each member individually should take up the work, as a personal canvass is often successful where other measures fail. The life and success of this association depend upon its membership.

I earnestly recommend that this association consider the question of formulating a standard system of accounting and a standard unit of comparison applicable to the lighting and power business. The growing importance of this industry, owing to the introduction of modern electrical machinery, making it possible to generate current at one central power plant, economically transmit and distribute it at long distances, the increased consumption of current for commercial and domestic purposes and the tendency of the present day to combine the railway, lighting and power business, demand that we give this subject immediate attention. There are a number of our membership companies now engaged in the railway, power, electric lighting and gas business. I would suggest that a committee be appointed, charged with the responsibility of this work and that they be instructed to make their first report to this association at its annual convention in 1901. I would advise that this committee confer and co-operate with a similar committee of the National Electric Light Association, to whom has been delegated the same work for that association. I am pleased to announce that our William F. Ham has been appointed a member of the National Electric Light Association committee. This is a compliment to Mr. Ham, a recognition of the valuable work he has performed for this organization, and an honor to our association of which we may well feel proud.

It would not be amiss to state that the committee on a Standard System of Accounting, at the suggestion of Mr. Brockway, gave this question of a classification of accounts for lighting and power companies some consideration prior to the annual convention of 1899, but decided not to present it to the 1899 convention, as there were other matters of more direct importance to this association to be considered at that convention. This accounts for our association not taking the initiative.

Accounting is one of the vital elements of business. This is being recognized more and more every day. In reading the proceedings of the conventions of different organizations held during the current year, I was so impressed with this fact, that with your permission, I will present for your consideration some of the more important points which were brought out with reference to accounting, as I feel we should take advantage of every opportunity to study this broad subject in all its phases. At the convention of the New York Street Railway Association, held in Buffalo, Sept. 18-19, 1900, Mr. G. Tracy Rogers, the president of the association, in his annual address, said: "Much has been accomplished in the standardization of our accounts which will work out untold benefit to the roads; besides strengthening our securities, it will give confidence to the public, and afford us material for comparison."

In discussing a paper before the Southwestern Gas, Electric and Street Railway Association, the president of a railway and lighting company said in part: "The point of a comprehensive set of accounts to be kept so that the condition of business can at all times be understood is a great deal more important than we imagine until we go into it, and the more you get into it the more information you will get. We are trying to be able to tell the details of the cost of producing a kilowatt-hour from the time the coal leaves the car until the consumer pays for it. This looks at first as if it was uncalled for, and I have had the question raised that it took too much time. After you have once got into it, it does not take any more time than it did a year ago, to make out your monthly report, with a detailed, statement, and you can see any little difference as to where your expenses are increasing or decreasing."

In appointing a committee to formulate a uniform system of accounting, the National Electric Light Association recognized the advantages of a uniform system that would be a standard for all

to conform to. At the convention of this association, held in Chicago, May, 1900, Mr. J. B. Cahoon presented a paper on "Uniform Accounting." He pointed out the necessity of a system of accounting that would show "true costs," not by single companies, but by a great body, all of whom would follow the same method and use the same system of account in determining the cost of production.

In discussing this paper, Mr. Samuel Insull, president of the Chicago Edison Co., said in substance: The first step in this matter is to have our own members, if we can educate them to a uniform system of accounting, state in their accounts what their cost is, and stop them as far as moral suasion will stop them, from working their construction accounts. If moral suasion will not stop them, if we can get copies of their reports, kept on a uniform system of accounting, we should bring them up here in the convention and ask them to explain their accounts, when some company shows an abnormal profit as the result of immoral accounting, fooling itself.

The question of publicity of accounts of corporations, especially companies engaged in operating public utilities, is receiving close attention. At the twelfth annual convention of Railroad Commissioners, held in Milwaukee in May, 1900, to which this association was invited and officially represented, the president advocated the enactment of legislation that would compel street railways in all states to make reports to the railroad commissioners, as steam railroads now do. At the convention of the National Electric Light Association, the point was brought out in Mr. Cahoon's paper on "Uniform Accounting," that there was no objection to publicity of accounts if "true costs" were shown.

At the last convention of this association, it was suggested that we should have not only a standard unit of comparison, in connection with the standard system of accounting, but a standard form of report, full and complete in every particular, a standard system of blanks and forms, and a standard system of accounting methods. I most heartily endorse and approve this proposition in all that it embodies. Now that we have adopted a uniform system of accounts, we should bear in mind one of the fundamental objects of the association, as set forth in Article II. of the Constitution, namely, "To improve the work of the accounting department." On the principle that he who does not go forward, goes backward, it should be the fixed purpose of this association to broaden and perfect the Standard System of Accounting in every feature of its practical working application, so that the best results possible from every standpoint may be attained. How shall we do this? The question of a Standard Unit of Comparison has already received careful consideration from the committee to whom it was referred, and they will report to this convention.

As to a Standard Form of Report, I will say that the matter has received attention and will be submitted for your consideration later.

With reference to a Standard System of Blanks and Forms and a Standard System of Accounting Methods, I would recommend that a committee be appointed, charged with the work of preparing model blanks and forms, general in their adaptability and use, with such explanations and instructions as may be necessary or desirable. These blanks and forms should cover the accounting work of every department. I would suggest that the best form for each specific purpose could be selected from the library of the association, and in that way a book of model forms could be prepared. The necessary explanations and instructions concerning the use of forms should include in a general way, suggestions as to the methods to be pursued in gathering the figures and data that are to be compiled in each specific form. These suggestions must of necessity be general in their application. Special local conditions will require special study and treatment.

In connection with what this association should do as a body, "to improve the work of the accounting department," each member individually, for himself, for the association, and especially for the company he represents, should take up this work and devote to it all the energy, ability and application that he may have. We should be thoroughly posted on the affairs of the company we are connected with and have a general knowledge of the operation of the road in all departments, or our sphere of usefulness and the value of our work will necessarily be limited.

We should closely study the special local conditions which are a part of the operation of every road, so that the accounting

problem involved may be correctly solved and the conditions of operation clearly and comprehensively set forth.

We should aim to make our system of accounting practical, complete, thorough and economical. The advantages of modern methods in commercial business, and the introduction of labor-saving devices should be thoroughly investigated and made use of if they can be used to advantage. We cannot be producers of "gross earnings," but we should be increasers of "net earnings." We should be careful not to duplicate work or expend labor that is unnecessary or yields no return. We should not be carried away with a mass of figures and statistics that have no practical value or serve no good purpose, neither should we go to the other extreme of dismissing as useless and valueless, much that may be of vital importance, simply because it increases the work of the accounting department or necessitates the expense of additional clerk hire, when results may be produced which would more than repay the work and expense involved. I believe in an accounting system of such scope and extent that the grasp of the affairs of the company, as well as the operation of the property, is at all times within the hands of the accounting officer in charge; a system that will furnish any information that may be required or desired, promptly; a system that will make it possible to answer any question which may be asked.

There are two propositions that enter into the work of the accounting department; though different, they are intimately connected with each other. One is "accounting," the other is "railroading." Mr. H. H. Vreeland, president of the Metropolitan Street Railway Co., of New York, at our last annual convention, said this about the calling here represented: "I, from my experience, have always looked upon the auditor, or accounting officer, of a railroad as the most important lieutenant and aid of the president or managing officer of the road. I look upon the man at the head of the accounting department as the confidential accounting adviser of the head of the property."

The papers to be presented to this convention deal with practical accounting questions and are along the lines of the work that this association should now take up. The subjects of the papers were selected and the program of the convention was arranged with this special purpose in view. To the gentlemen who have responded to the demands of this convention, we are under many obligations. I desire to express our most sincere thanks and appreciation for their hearty co-operation.

Special mention is due our able and energetic secretary, Mr. W. B. Brockway, for the valuable work he has performed for this organization. To Mr. Brockway's efforts the association owes much of its success.

To the "Street Railway Review" and the Street Railway Journal, and our good friends and honorary members, Messrs. Windsor and Higgins, we are under many obligations for courtesies extended. The columns of the "Review" and Journal have always been open for the publication of anything that would further the interests of this association.

Formal notice has been given, as required by the By-Laws, that a change is proposed in Article VII of the By-Laws. This means that the question of changing the time and place of holding our annual conventions is to be voted on at this convention. I earnestly hope that the question will be fully and thoroughly discussed from every standpoint, and that every member present will express his opinion as to what he thinks is best for this association to do, before the matter is put to a vote.

With reference to the next convention, I am reminded of a question of the utmost importance to the association, and one that has given your present officers much concern. I refer to the assignment of papers. The success of our meetings depends in a large measure on the selection of proper subjects for papers and having the papers prepared and presented to the convention. Any member of this association, when asked to prepare a paper, or perform any other duty assigned to him, should appreciate the honor sufficiently and have the interest of the association at heart in such a degree that he would gladly respond when called on and give the association the benefit of his best efforts. This is a duty that every member owes to his fellow members and the calling he represents, a duty that should not under any circumstances be disregarded or shirked.

In conclusion, permit me to express my appreciation of the honor you have conferred on me, that makes it at once my duty and privilege to preside over the deliberations of the fourth annual con-

vention of this body. To be president of the Accountants' Association is an honor I esteem more than words can express. I thank you for the honor bestowed and for the many acts of kindness and courtesy that I have received from your hands, as well as your valued assistance in many ways. Let me bespeak from you faithful attendance and close attention to the proceedings of the meeting, and especially, full discussion on all subjects. I earnestly hope that this convention will be a fruitful source of information and education, as well as a pleasant reunion for us all. Gentlemen, I commit the business of the convention into your hands.

The secretary and treasurer then submitted his annual report as follows:

REPORT OF THE SECRETARY AND TREASURER.

The report of the work done in this office for a year has become a rather large undertaking, caused by the three divisions into which the office has resolved itself—viz., secretary, treasurer, and the Department of Blanks. In each there has been so much accomplished that it seems better to divide the report so as to cover each section of the work separately. This is without any desire on my part to imitate the well known Poo-Bah, but if any such charge should be made, I would promptly lay it upon the happy faculty the association has of being successful and busy, and keeping the secretary busy, too.

In reporting the membership as it is today, the prophecy made in last year's report as to the effect of consolidation has been, to a large extent, verified; but the applications for membership that have been presented have neutralized the loss, so that, from a numerical standpoint, we are but very little worse off than a year ago.

Applications have been received from the following twenty-one companies:

Indianapolis Street Railway Co., Indianapolis, Ind.
 Charleston Consolidated Railway, Gas & Electric Co., Charleston, South Carolina.
 Louisville Railway Co., Louisville, Ky.
 St. Joseph & Benton Harbor Electric Railway & Light Co., St. Joseph, Michigan.
 Union Traction Co. of Indiana, Anderson, Ind.
 Chicago Consolidated Traction Co., Chicago, Ill.
 Manchester Corporation Tramways, Manchester, England.
 St. Louis Transit Co., St. Louis, Mo.
 Portsmouth, Kittery & York Street Railway Co., Portsmouth, New Hampshire.
 San Antonio Street Railway Co., San Antonio, Tex.
 Conestoga Traction Co., Columbia, Pa.
 Chicago Union Traction Co., Chicago, Ill.
 Washington Traction & Electric Co., Washington, D. C.
 Winchester Avenue Railroad Co., West Haven, Conn.
 Cleveland & Eastern Railroad Co., Cleveland, O.
 Connecticut Lighting & Power Co., New York, N. Y.
 Consolidated Traction Co., Pittsburg, Pa.
 Bridgeport Traction Co., Bridgeport, Conn.
 Seattle Electric Co., Seattle, Wash.
 Buffalo Railway Co., Buffalo, N. Y.
 Erie Transit Co., Erie, Pa.

Resignations have been received from the following twenty-five companies:

Southern Electric Co., St. Louis, Mo.
 Nassau Electric Railway Co., Brooklyn, N. Y.
 City & Suburban Railway Co., Washington, D. C.
 Brooklyn, Queens County & Suburban Railway Co., Brooklyn, New York.
 Citizens' Railway Co., St. Louis, Mo.
 People's Railway Co., St. Louis, Mo.
 Lindell Railway Co., St. Louis, Mo.
 Missouri Railroad Co., St. Louis, Mo.
 Kokomo City Street Railway Co., Kokomo, Ind.
 Columbia Railway Co., Washington, D. C.
 Hamilton Street Railway Co., Hamilton, Ont.
 Columbus Central Railway, Columbus, O.
 Metropolitan Railroad, Washington, D. C.
 Union Depot Co., St. Louis, Mo.
 West Chicago Street Railway Co., Chicago, Ill.
 Cicero & Proviso Street Railway Co., Chicago, Ill.
 Hawaiian Tramways Co., Honolulu, H. I.

Oakland Transit Co., Oakland, Cal.
 Fair Haven & Westville Railway Co., New Haven, Conn.
 Milwaukee, Racine & Kenosha Railway Co., Racine, Wis.
 Syracuse Rapid Transit Co., Syracuse, N. Y.
 North Chicago Street Railroad Co., Chicago, Ill.
 Brightwood Railroad Co., Washington, D. C.
 Central London Railroad Co., London, England.
 Lowell, Lawrence & Haverhill Street Railway Co., Lowell, Mass.

The statement of growth in membership is:

Charter members, Cleveland, March, 1897.....	25
Additions reported at Niagara Falls, October, 1897..	12
Additions reported at Boston, September, 1898.....	32
Additions reported at Chicago, October, 1899.....	31
Additions reported at Kansas City, October, 1900....	21

Total applied.....	124
Withdrawn.....	28

Membership October 16, 1900.....	96
----------------------------------	----

This shows a net loss of but 4 members. But the average number of applications received per year has been 34, while 1900 shows but 21, a drop of 13 in the average. These figures show plainly the need of a definite action on the part of the present members toward the gathering in of every company within reach. It is not so much that a larger showing may be made that this effort seems necessary, as it is to make the association so representative that its deliberations may carry the positiveness which comes from such a larger point of view.

During the year furniture has been added to the equipment of this office, including a second-hand typewriter, a book-case, a copy-press, etc., costing less than \$60.00. All of this was very much needed.

The financial statement is interesting, showing as it does that the increase in dues has been well received by the membership, and that the necessity of a larger income is appreciated.

The receipts have been as follows:

In Bank, Oct. 14, 1899.....	\$ 19.28
Donated account 1899 deficit.....	160.00
Dues for 1900.....	1,570.00
Dues for 1899.....	10.00
Applications..	310.00
Interest on deposits.....	7.65

Total.....	\$2,076.93
------------	------------

The expenses have been as follows:

Salary, secretary....	\$200.00
Secretary, office expenses.....	75.90
Postage.....	62.00
Office furniture..	59.25
Printing 1899 Report.....	260.65
Stenographer, Chicago Report.....	110.00
Printing..	58.05
Department of Blanks.....	12.75
Printing 1899 Standard Report.....	129.50
Note paid..	125.00
Miscellaneous.	88.59

Total.....	\$1,181.69
------------	------------

Balance in bank, October, 1900.....	895.24
-------------------------------------	--------

Had the dues remained at \$10, and expenses for this year as they are—and it is difficult to see how they can be reduced—the result would have been an income of \$1,120, and a deficit of \$61.69. This income includes \$160 contributed at the last convention; without it, the deficit would have been \$221.69. To take into account that the expenses are \$210.05 less than last year, will make the wisdom of the increase in dues more clear.

At this point I wish to explain, that with his customary liberality, President Duffy has refused to receive his expenses to New Orleans to confer with the secretary in March of this year, or to Milwaukee, to attend the meeting of the National Convention of Railroad Commissioners. In the latter trip, Mr. F. E. Smith, auditor of the Chicago Union Traction Co., took the same action; and it is through the kindness of these gentlemen that the treasurer is enabled to report a decrease in operating expenses and so large a balance in bank.

For the Department of Blanks and Forms, there is to report a

considerable increase in the blanks filed by the addition of the issue of 12 companies and the re-filing of a number of re-issued forms. All of these add to the interest and value of the collection, which has reached such large proportions through your co-operation.

Among the new blanks received is a large set from the Glasgow Corporation Tramways, which, on account of the differences in practice, were rather difficult to fit to our classification of blanks, and have been filed in a separate book numbered 15. An examination of this set will be found very interesting.

Owing to economy of space, instances will be noticed where blanks have been filed on top of others, in all cases showing the full size and composition of each; but at times by a similarity of papers, the dividing line could not always be easily distinguished. To remedy this, a light black line has been ruled around every blank, giving a result very noticeable to those who examined the collection at Chicago; and, at a glance, rather than by close scrutiny, the blanks are separated and compared.

The new collection of rubber stamp impressions, while not representative, is an interesting addition and assists to the result aimed at by the department.

Some changes are contemplated in the arrangement of the permanent set and the sets used for requests, all helping in what experience has shown is needed to make the collection a positive benefit, and not let it become merely a curiosity.

It is a pleasure to state that the friendship and help heretofore shown by the officers of the American Street Railway Association and the street railway papers has been continued unwaveringly, and the most cordial thanks are again expressed to them and the many others who have assisted in bringing the association to the position it now occupies.

W. B. BROCKWAY.

In addition to the new members given in the report the secretary stated that there should be added to the list of new members as read, the Washington Power Co., of Seattle, Wash., and the Syracuse Rapid Transit Co., of Syracuse, N. Y., which had resigned and rejoined.

In relation to the list of resignations read, the secretary stated that most of them had been caused by consolidations which were prophesied last year. He thought there were only about 7 of these 25 that resigned on account of the increase in dues.

President Duffy: Gentlemen, you have heard the report of the secretary and treasurer, which is very gratifying when it is considered that we have 98 members, as against 100 last year, and \$895 in the bank, instead of \$75 in red ink. What is your pleasure?

On motion of H. L. Wilson, Boston, the report was accepted and ordered filed.

President Duffy: The next order of business, gentlemen, according to the printed programme, is the appointment of committees. On the Committee on Nominations, I will appoint Mr. H. L. Wilson, of Boston, Chairman; Mr. S. E. Moore, of Pittsburg, and Mr. Simpson, of Augusta. On the Committee on Resolutions, I will appoint Mr. Wm. F. Ham, of Washington; Mr. Chas. M. Hemingway, of New York, and Mr. Suda, of St. Louis.

The next order of business is the paper, or, rather, the address, of Mr. John I. Beggs, general manager of the Milwaukee Electric Railway & Light Co., on "What Does the General Manager Want to Know from the Accounting Department?" and in this connection I desire to say that Mr. Beggs has very kindly filled the place of another gentleman on the programme, at very short notice. Mr. Wyman had this paper assigned to him, but has recently gone out of the street railway business, at least out of the direct charge of a road, and he has been called to Boston, and it was impossible for him either to attend the convention or to prepare a paper, and Mr. Beggs, very kindly consented to address this body on the same subject.

ADDRESS OF MR. BEGGS.

Mr. President and Gentlemen: I must apologize for not having given more time and thought to the subject which you expected to hear discussed by Mr. Wyman. It was only a few days, or possibly a week ago, when I was requested by your executive officers to prepare a paper upon this subject. I have never prepared a paper in my life, and am almost too old to learn new tricks. Therefore, what I shall say upon this subject will be simply the thoughts

that are suggested to me as the manager of one of these public utilities.

What the general manager wishes to know from the Accounting Department, I should narrow and say, "What Does the General Manager Wish to Know from the Head of the Accounting Department?" I would not be presumptuous enough to think that I, in the few minutes that I shall occupy, could stand here and tell to you what the general manager wants to know from the accounting department, when so much time has been so well expended by your association for several years past developing and demonstrating just what he should know. The system of blank forms and accounts that you have developed is highly creditable to your association. It will do much to save the industry in which we all are so vitally interested. The first thing the general manager wants to know from the accounting department, in my judgment, is that the accounting department believes in the general manager's policy. He wants to know that he has loyal, enthusiastic, energetic supporters in carrying out what may be the general manager's policy, and that they will aid it conscientiously and fearlessly; and when the head of the accounting department cannot subscribe to the general manager's policy he had better tender his resignation. As a rule the general manager stands for the board of directors, and they are supposed to stand for the stockholders, which is the capital. Unfortunately they have not always done it, but they should do it, and I think that the executive man-

JOHN I. BEGGS.

agements of these public utilities are year by year giving a stricter account to the great body of stockholders. In order to do this we must have conscientious, earnest work both on the part of the general manager and of the accounting department. Unfortunately, the general manager is not always a trained accountant; he is too often not competent to analyze and determine whether or not the accounts and the various statements that come to him are made up intelligently, or to analyze and determine whether or not they have been properly kept. And that, in days gone by, has been responsible for the failure of some of these public utilities, and caused them to be re-financed. They have run aground without knowing it; like the mariner whose compass has become disarranged or does not know how to read it, they are cast ashore; they run against the breakers, and it is the easiest thing in the world, because too often it is to the interest of the general manager and the board of directors to make too glowing a statement of what they were doing, and this is particularly the case during the years of construction or development when they have a capital account to be drawn upon.

Capital account has covered multitudes of managerial blunders and extravagances. Therefore, I always take the position that it is best to close up the construction account as quickly as possible. If there is going to be any error made in your accounting departments, gentlemen, let it be on the other side. Have a little more property than you think you have. When a man puts his hand in his pocket and expects to find seventy-five cents, but finds, instead, a dollar, he feels very good. It is not a very large amount, but nevertheless it is on the right side. He has just a little more than he expected. But if he puts his hand in his pocket and finds he has only fifty cents, he is disappointed; he says, "I certainly thought I had that," and such is the case with many of these properties that they go on deluding themselves; because there is a con-

struction account, they charge into that many things that should have gone to operation. It is one of the reasons why many new enterprises seem to show such phenomenal results. I have seen a statement very recently of a certain line running into the city of Chicago, or nearly so, showing the expenses to be down to somewhere about 30 per cent. (Laughter.) Now, we all know how that is produced. Of course, that is not done in order to show what the actual results are. It is produced in order to unload a promoter's property upon an unsuspecting investing public. I only refer to that because that statement has been brought to my attention within a few weeks, being on the market. But very often our properties get into the same condition, because of a lack of intelligence. Therefore, the general manager wishes to know from the head of his accounting department—and I shall deal with the head—that there is an intelligent understanding, and an honest practice in the making up of either the daily, the monthly, or the annual statements.

As I said at the outset, the general manager wishes to know that the head of the accounting department is in sympathy with and believes in his policy, because a general manager should lay down the policy for his corporation. He is put there for that purpose. Now, he must know that his associate who is in charge of the figures believes in that general policy, will help him carry it out, will in every manner co-operate with him, will watch and see that there is consistency throughout every department of the company's business.

Some of our properties are in a little more complex condition than others. Take the property with which I am associated; we conduct a very large electric lighting business in three or four different cities, some part of it under our main company, some under a traction company which we operate. Consequently, it is very difficult at times to feel that the same general practice is observed in each one of the co-ordinate companies, possibly under the name of one, and that the head of each particular department observes the same methods as are observed in every other.

In the street railway business it is highly important that the general manager shall have confidence in the integrity, in the vigilance and discrimination and keen perception of the head of the accounting department, and know that he will watch that there is no injustice permitted even to the humblest employe of the company, and that the trainmen are held to strict account. The idea should not get abroad among your force of conductors that there are not too many shortages being reported, or that there is too much carelessness in the accounting department. We make it a rule to have the accounting of the trip sheets and the returns of the various conductors directly under the head of our accounting department. We have but one head of "figure wrestlers" as I call them. We do not have it divided into transportation department, and so on, but all is under one head. I am a great believer in centralizing responsibility, and in having one head responsible and giving him the highest degree of confidence. One of the most important things in dealing with the conductors on street railways, is that they have absolute confidence in those who pass upon their daily returns. They should not, every day or two, be brought face to face with the charge, "You have a shortage to-day of a dollar," or fifty cents, whatever it may be; that creates distrust and it soon permeates the whole mass of men. They begin to distrust the accounting departments, and to believe that their methods are not accurate. That comes back, it works almost incalculable harm among our men, and we who are managing these properties to-day are carefully studying that there shall be no cause of unrest, of dissatisfaction among our trainmen. You have seen a number of serious labor troubles among that class of men during the past year. We went through it, four and one-half years ago, one of the first large railway strikes. We have watched it carefully ever since. It very often comes from the accumulation of a multitude of these trivial matters, that give good cause at times for unrest.

These are some of the things we want from the head of the accounting department. I am ignoring your system of blanks entirely. I did not conceive that was what you wanted to hear about, or that it would be a thing of particular value to you, because you are giving labor and conscientious thought to that subject. The blanks are being perfected from year to year, and developing in greater detail. I thoroughly understand that in different corporations there are varying conditions that do not apply to all. Consequently there must be, with your system of accounts,

provisions for some flexibility that may suit the peculiar conditions of various corporations, many of which are interested in a variety of things, and have more than one interest to provide for. They must likewise be sufficiently flexible to permit, sometimes, of what may be the peculiar or unreasonable notions of the general manager. He may have an idea that he wants injected into them certain additional features, or, possibly a very good reason from his standpoint, which is not always recognized, perhaps, by the head of the accounting department. The general manager should have the confidence and command the respect of the head of the accounting department to such an extent that, notwithstanding it may cause some additional labor to provide these auxiliary accounts, as we might call them, for his information the work will be cheerfully done. The manager may have better reason for asking for them than appears on the surface, and it may entail, as the head of our own accounting department has sometimes found, a considerable amount of additional labor; but it is not useless; it is for some good cause. I am well aware that all managers have ideas that are different possibly from those of the heads of their accounting departments because of some previous experience they themselves had in the science of accounting. I use the word "science" advisedly, because accounting is a science, and if the broad, fundamental, underlying science of accounting is thoroughly understood by the head of the accounting department it will be much easier for those charged with the operating of the properties.

I had something to say when this association was being organized as to what should be included, having given considerable attention to the various forms of accounting of this and its kindred industry, electric lighting, for a great many years. In fact, I was one of a committee some fifteen years ago to standardize a system of accounting for electric lighting plants in that early day. They had done more I think in the line of standardizing their accounts, or at least one branch, electric lighting. I speak more particularly of the old Edison Association of Illumination Companies, which was a close corporation and still is I believe, but I was the president of it for seven or eight years and we had a very carefully devised system of accounting whereby we could, with a great degree of accuracy, compare the results of various companies throughout the United States. Though more limited than this association, we demonstrated, at that early day in the electric lighting industry the great advantage of being able to compare accounts. That is highly advantageous, absolutely essential, even in the street railway business. The general manager wants to be assured that the head of his accounting department is watching his expenditures from day to day, watching that the estimates made of construction, or of some piece of reconstruction, do not seriously exceed the requirements, or if they do, that the fact will be brought to the attention of the general manager in order that a proper remedy may be applied; that the practice throughout the various departments of the corporation is uniform, so he may not have, as is sometimes the case, an employe in one department asking to be transferred to some other department in the business of the same corporation for the reason that the practice is different. Such a condition should not exist, and yet it may exist if the comptroller, or the auditor, or the head of the accounting department, by whatever name he may be known officially, does not bring to the attention of the executive head the facts that exist. Take it in our own corporations, where at times our employes number anywhere from two to three thousand men; it is impossible for the general manager to attempt to know what every specific rate of pay is throughout all departments, and that there is uniformity in the pay rolls and uniformity in the hours put in in the various departments. All of these things come directly under the eye of the head of the accounting department, and where irregularities exist it is highly important that he should report them in order that a remedy may be applied.

It is furthermore important that he keep the general manager advised as to how the receipts are on the various lines. While some general managers try to follow those things, they do not all do so. They would not all be competent, because of a lack of early training in the science of accounting, of determining whether the matter was accurately compiled and put in shape. The manager should see that the various lines are being operated with the smallest number of cars in order to produce given results. If on one line a car is earning two dollars per car-hour—you notice, gentlemen, that I said, "car-hour" (laughter)—and on some other

line a car is earning only one dollar per car-hour, and that going along month after month, there is some reason for it. It may be a good one, but nevertheless, it is the duty of the accounting department to bring the matter to the attention of the general manager. The accountant may be conversant with the reasons why certain things are so, but as these matters are coming under his eye day after day, if discrepancies exist he should promptly bring them to the attention of the general manager.

The general manager desires, furthermore, to know that the head of the accounting department is taking occasion to correspond with other roads of similar size operated under practically the same conditions, is obtaining copies of their reports, comparing them and bringing to the attention of the general manager features in them which would seem to show that as regards certain features the other lines were being operated more economically than his own. The points wherein we are operating better than the others, I do not care to know about. I arrange to have the heads of departments go away two or three times a year to some other city where perhaps there is a very good system of operation and management and a good system of accounting; I am very glad indeed to have the head of my accounting department take two or three short trips during the year: to go to different cities, and observe their methods, and I always say: "I don't want you to come back and tell me a single thing that we are doing better than they are. I don't want to know that. That will take care of itself. But go and find something that they are doing better than we are, and we will try to copy that, and if possible, improve on it just a little." The managers want to know, and they do not always have the time to investigate for themselves, that this comparison of accounts is made; otherwise, what is the use of this uniformity if you are going to close it up and lock it up in a safe? I want any company, the head of any accounting department, allied to this association, or to the street railway association, to feel that it can send to the Milwaukee Electric Railway & Light Co., or any other company in which I am in an influential position, and obtain any data that we have. (Applause.) We do not consider it a burden to give information to you, if we have to put on a clerk to copy the reports, we will do it. I want, likewise, to feel that if we wish to have some information from any member of this association, or of the street railway association, that they will not feel that we are burdening them when we ask for it. In our practical operation, I many times take time that I could not command for myself, but I do take it, to go over our system and show its various phases to gentlemen who come from a distance to see what we are doing, and I take pleasure in doing it. The exchange of ideas is valuable, and unless these various statements, these various reports and results that are being realized by the various companies, are going to be interchangeable, of what use is this uniformity of accounts? It is for some purpose. It is for the purpose of being able to make fair, intelligent comparisons, that we may know what we are doing. Above all, have the head of your accounting department keep his accounts in such a way that you do not need to fear if at any time your state railroad commissioner, or if perchance there should be a national railroad commission, should order your books closed. Let your accounts be upon the same basis as is adopted by the national banking department at Washington; when an order is given for a statement of accounts, it is not of some day in the future, but always some time in the past, so that there is no opportunity to fix up the books. So our accounts should be. We want particularly to know, or at least I want to know, that if the head of my accounting department and all of his assistants are called hence, that a new set of accountants can go to their desks in the morning and find nothing to clean up for yesterday—that the work is kept up day by day. That is highly essential, and if that were always done, it would not take so long for many managers to get a statement of what their actual condition is. It is highly important to know that there is promptitude with all these accounts, that the work is always right up to date. It will save many errors and many blunders. It is one of the hesetting shortcomings of many accounting departments that they are always going to do something, going to prepare some statement sometime in the future. The future is not theirs. Consequently it is highly important that accounts shall always be up; that if the general manager wants to know something he can send with assurance to the head of the accounting department for such and such a statement and it will be forthcoming as soon as it can be transcribed

from the books, or from some other statement, or that he can send the original. Two of the most important things that a general manager wants from the accounting department are accuracy and promptitude.

As I said at the outset, I have to apologize, for not having prepared an address such as would no doubt have been prepared by my friend, Mr. C. D. Wyman. I am substituting for him this morning. I have been substituting for him for four years. (Laughter.) I desire, on behalf of the managers of street railways, to extend to this association, my earnest, heartfelt appreciation of the good work your association has done, still is doing, and which I hope it will continue to do. I think no higher compliment could be paid to your association than the co-operation asked for by the steam roads and by other organizations of this kind in their efforts to perfect a standard system of accounts and of forms. This matter of standardizing forms is as important as the standardization of accounts, the forms on which the accounts pass from the various heads of departments into the accounting department. Much of the accuracy of the accounting department will depend upon the comprehensiveness of the forms that go out from the storerooms, from the heads of the various departments, from the man in the shop as showing the cost of a certain piece of work, and so on down the line. There is quite as much necessity for making these various blanks uniform throughout, as there is for the accounts themselves, because if these various blanks are not fairly uniform it will be much more difficult to make uniform the accounts based upon them. I do not know just what forms the association has adopted. I think in our own practice we subdivide to a somewhat greater extent than is provided for in the standard forms of your association. However, we keep the various heads so thoroughly in accord with the standard system of accounts of this association that they are practically the same, with the exception that I subdivide to a greater extent some of the expenses of maintaining equipment. I have the cost of all labor and all material subdivided.

I can keep the cost of material in my mind. When I see a statement that material costs so much, I can check whether or not that is about right, without asking any additional figures; but they can cover up a multitude of sins in the item of labor, omissions and mistakes, because that is much more difficult to cover. In all work, my suggestion would be that you subdivide and differentiate between the cost of labor entering into any piece of work and the cost of the material entering into it, because the general manager, if he is familiar with his business, knows about the amount of material. If it is putting a set of wheels under a car, I know what those wheels cost. I do not know if the thing comes to me bulked, called wheels and labor; I cannot tell whether the labor has cost \$1.50, which would be about the cost of putting on a pair of wheels, or whether it is \$2.50 or \$3, if it is all covered up in one item. Therefore, I urge upon the Accountants' Association the advisability of subdividing the cost of materials as against the cost of labor that is necessary to put that material into use. We subdivide in our own practice. For car bodies, for instance, we keep carefully the cost of painting, etc., as an item by itself. Likewise the cost of heating, the cost of lighting cars. Many of these things that are coming to him in that way the general manager wants to know in order that he may be able the better to analyze and determine whether these various items are being kept down to the lowest point consistent with the highest degree of perfection in the maintenance of his construction.

Above all, urge upon your municipality and legislative bodies that they shall call for the publication of your accounts. I for one believe you owe it to them. You are simply trustees for certain rights which they give you in the municipalities. You will quiet much of the criticism we hear regarding public utilities when you make public your accounts. We have had a pretty lively time in the city of Milwaukee for several years, as some of you no doubt know. We have finally got them harmonized to a certain extent by having had passed by our municipal legislature, or common council, so called, last winter, an extension of our franchise and the straightening out of certain questions in connection with it, up to Dec. 31, 1935. We are here to-day with a decision from the Supreme Court of Wisconsin, handed down on Friday last, affirming that franchise and quieting all these various questions. It was claimed that we were suppressing our accounts. That our profits were much greater than they ever were, and the Municipal

League and other associations went before the legislature some eighteen months ago, at the biennial session, last winter a year ago, to present a bill requiring us to file our accounts, and annual statement, with the officers of the state. They expected that we would antagonize and oppose them, and possibly by underhand means defeat it; instead of this I urged the passage of that act. Our accounts should be kept, as I said before, in such a manner that you do not need fear the closest possible scrutiny, either as to the underlying policy of the corporation or as to the methods employed in working them out. Once be honest and you will quiet much of the criticism in the various localities in which you are operating. Under the law of Wisconsin to-day, every street railway and electric lighting company must file a statement giving in very great detail the results of its operation every year, and we have no hesitation in doing so. We believe that it will do much to bring about a better state of feeling between the general public and the corporation that is serving it. I believe in the broad, general, underlying principle that a street railway company is, of all corporations, one in which the general public is most vitally interested, and it has a right to be informed as to your methods of operation and of management. We are public servants, and we are the one class of public servants with whom everyone in the community must come in contact. He may escape everything else, he may escape the tax gatherer, except once a year, the undertaker, except once in a lifetime, but the street railway company he is coming intimately into contact with several times a day. In our own city we are carrying at the present time an average of one-half of the entire population every 24 hours. They are vitally interested, gentlemen. Do not attempt to deny it, but proceed upon the broad, general principle that they have a right to know that the property is being conscientiously operated so as to afford them the greatest possible degree of convenience, of comfort, of safety and of reliability, and to this end, the heads of our accounting departments can do much to assist the general manager and relieve him of many of the details of the complex position in which he is placed.

I thank you, gentlemen, for your patience; I thank you for the courtesy of calling upon me to fill the gap left in your programme. I only regret that time has not permitted me to have given to the subject more analytical thought, that I might have presented these views in possibly briefer form, and possibly in form that would have produced what I wish to produce, make your organization more valuable if that is possible to the great interests that we represent. (Applause.)

President Duffy: I wish to especially thank Mr. Beggs in behalf of this association for the able, interesting and instructive address he has given us this morning. Everyone here should go out of this hall with new lessons to learn. If we had more general managers like Mr. John I. Beggs, we would have more accountants like the accountant of his company (applause); we would have more accountants such as accounting officers should be; not machines, not book-keepers, not, as he termed it, but in a different sense, "figure wrestlers," but accountants. The lessons that Mr. Beggs has pointed out to us, each and every one, should take home to himself, and I earnestly hope that we will have more of the gentlemen across the way in attendance; and I again thank Mr. Beggs for coming here and giving us the benefit of the thought that he has so ably expressed here. (Applause.)

Mr. Beggs: Mr. Chairman, just one other word, because I must ask to be excused and return to the other side. I consider the head of my accounting department my most important associate in the management of the property. I always have done so; I do now. I consider him not so much, as is often the case, in the light of an employe, but really an associate in the management of the property; and so, every head of an accounting department should fit himself to be in reality an adviser upon many of these points that are coming to him daily, hourly, day in and day out throughout the entire year. He is to a certain extent, the right hand of the general manager.

President Duffy: Gentlemen, if I may be permitted to digress a little from the regular order of business—it is with great pleasure that I observe that one of the Old Guard is present this morning. He has honored this association by his presence, and further honored it by the presence of his wife. Gentlemen, we have with us Mr. and Mrs. Henry J. Davies, of Cleveland. Mr. Davies, as you

all know, was formerly an active member, an extremely active member. He is now an honorary member, but nevertheless we would be very glad indeed, if upon this occasion he would be an active member. Mr. Davies, will you kindly come forward?

Mr. Davies: Mr. President and Gentlemen; I am glad to be with you again. I hope that in some capacity, either as an accountant or as a supply man, I shall continue to meet you yearly as long as your association meets. I am sorry that I did not hear all of Mr. Beggs' address. That which I did hear was good. It must be, it seems to me, a delight, to work as an accountant for a general manager like Mr. Beggs, a general manager who knows what he wants to know, and who knows how to get at it, and appreciates the work involved in getting at it. But when you are an accounting officer of a company whose management, perhaps, does not know what it wants nor how to get at what it thinks it wants, your responsibility is greater and your services are more valuable to that company. Mr. Beggs, in his address, covered the ground of the topic assigned him, it seems to me, and I can add nothing to it, unless it be to emphasize two or three things that he said. First, the accountant should study the condition of his company, its receipts, its expenses. He should present to his management comparative figures, figures showing what one line does as compared with another line; what the company did this year as compared with last year, this month as compared with last month; what his company did as compared with another company whose lines are similarly situated. Your general manager will not care for all the details, all the process by which you get at results; he probably will not care for all the results at which you arrive, nor would it be wise perhaps to present them all to him. If your lines are all running along about as they should, if there is no remarkable difference between the operation of one line and another, between the operation of your company and another, he won't care to know the process, the figures by which you arrived at that result. A mere statement of the fact is sufficient. But, if in studying your accounts, you find a remarkable difference between the cost of operating one line and the cost of operating another, between the car-mile expenses of one road and the car-mile, or car-hour, expenses of another, present that fact to him as clearly, as emphatically and as startlingly as possible. Let him ascertain why, help him ascertain why, if you can. Gentlemen, I did not mean to make a speech or discuss any subject. (Applause.)

President Duffy: Our friend, Mr. Davies, said something about being a supply man. He is now the secretary of the National Carbon Co. In speaking of the car-hour I presume that he was thinking of the carbon hour. (Laughter.) I have an announcement to make here. The Kansas City Club, at Twelfth and Wyan-dotte Sts., extends open house to the persons wearing badges. This extends over two weeks.

Mr. Duffy, as chairman of the committee on "A Standard System of Street Railway Accounting," then submitted the following report:

REPORT OF COMMITTEE ON STANDARD SYSTEM OF ACCOUNTING.

No changes in the present classification of accounts or in the forms of monthly and annual reports suggest themselves to the committee; none have been suggested, therefore we recommend that the classification stand as it was adopted at the Chicago convention in 1899, unless this convention directs otherwise.

Your committee received very few queries from members regarding the classification of accounts. These queries were promptly answered. It is assumed that the classification as it stands, in the absence of any information to the contrary, is satisfactory to all. Your committee would be pleased to hear from the members regarding this question.

With reference to the Classification of Material and Supplies, submitted by this committee to the 1899 convention, in a supplementary report, no official action was taken by the association. Your committee, in referring to this matter now, desires to explain that the classification submitted was not intended for anything more than a suggestion to the convention that would possibly aid in dealing with the important subject of material and supply accounts.

The Standard System of Accounting is now in general use, recognized and accepted as the standard for street railways. One

of the most valuable features of the system is, that it admits of comparisons between companies. This feature is especially appreciated.

At the convention of the National Electric Light Association, held in Chicago, May, 1900, a paper on "Uniform Accounting" was presented. This paper criticised the Accountants' Association for treating Taxes as a deduction from income, stating Taxes should be considered a part of operating expenses. This position was endorsed in the discussion of the paper, following its reading. Mr. Stuyvesant Fish, president of the Illinois Central Railroad Co., in an article published in the "Street Railway Review," was quoted as saying that the Inter-State Commerce Classification of Accounts did the railroads an injustice and caused them to make misleading reports, because Taxes were not treated as a part of operating expenses. All of this is very interesting in view of the action taken by this association on the question of the classification of taxes. Your committee does not care to provoke any further discussion regarding this matter, but begs leave to refer to its position as it explained and sustained it, and was sustained by this association at the conventions in 1897, 1898 and 1899. The paper presented to the National Electric Light Association, not only classified "Taxes" as an operating expense, but "Interest on Investment," "Interest on Current Liabilities," "Investment Insurance," (depreciation), and "Reserve for Sinking Fund." These five accounts are all classified as operating expenses, grouped under the heading of "Capital Accounts." The reason for doing this was, it was held these accounts should all be included as a part of operating expenses and not as deductions from income, in order that the "true cost" of production could be determined. Your committee does not wish to do anything more than present this matter for your information and consideration, without comment, further than to refer to the grouping of these five accounts under a heading entitled "Capital Accounts." The gentleman who presented the paper frankly stated that his stand was open to criticism; for that reason, and because your committee believes that this association should not criticize the position taken by other associations on questions of accounting, it is desired that the matter should not be discussed by this convention.

This association was invited to attend the Convention of Railroad Commissioners of the United States, held in Milwaukee, May, 1900. Messrs. H. C. Mackay, F. E. Smith and the chairman of this committee, attended the convention, responding to the rollcall when our association was called. We were officially recorded in the minutes of the meeting as having been present and representing this association. Nothing transpired at the convention of any direct importance or interest to this organization, except that Mr. Ashley W. Cole, chairman of the Board of Railroad Commissioners of the State of New York, a member of the committee on Classification of Construction and Operating Expenses of Electric Railways, reported for the committee that the 1899 convention adopted the committee's report (this report was the classification of accounts adopted by the Accountants' Association). Mr. Cole stated that some of the states recommended that report to the corporations within their jurisdiction, and the state of New York has had that report printed in pamphlet form and is now sending it to all the electric railroad corporations in the state.

Your committee has made a strong effort to induce the Federal Census Bureau to use the Standard System of Accounting of this association, in the work of compiling statistics concerning street railways, in connection with the Census Report of 1900. We hope to succeed in this undertaking and feel encouraged from the following statement of the director of the census, made in a letter dated July 24, 1900: "The subject of street railways is a special one, which will not be taken up for about a year. I will have the letters placed so that they will have full consideration when the proper time comes. I am glad to receive suggestions at any time."

F. E. Smith, Chicago: Mr. President, I move that the report be accepted and be placed on file.

The president put the question on the motion and it was carried.

President Duffy: Gentlemen, that about completes the order of business for the morning, but we have a gentleman here with us, whom we all feel very kindly towards, and who has done a great deal for the street railway accountants. I refer to Mr. J. H. McGraw, of the Street Railway Journal. Mr. Higgins is an honorary member and is unable to be present at the Convention, and Mr.

McGraw has honored the association with his presence this morning. Mr. McGraw, I would be very much pleased if you would say a few words to us.

Mr. McGraw: Mr. President and gentlemen; I am not going to take your time with any speech whatever, but I assure you I appreciate the honor of being called upon to address this body of gentlemen, forming the Street Railway Accountants' Association of America. I will not attempt, sir, to take up or go into a discussion of your work, which is well known throughout the country, not only to the accountants themselves and the street railway presidents and managers, but to a large body of outsiders who are interested directly or indirectly and are closely watching your work. I want to commend most highly the work of this association. I am sure, and I know, that it has been thorough and effective, and the respect in which this association is held by the street railways throughout the country, not only the street railways but the bankers, the capitalists represented in street railways with which I come in contact, take occasion frequently, to speak in the highest terms of the work this association is doing. I thank you again for the honor of being called upon and for this opportunity of saying a good word, which I do most heartily, in favor of the work of this association.

President Duffy: Gentlemen, we have a little time yet, with nothing special for this afternoon, and I would be very glad to hear from any gentleman present who would be good enough to give us the benefit of his thought, or suggestion, or criticism, a sort of a brief and informal discussion on any subject pertaining to accounting. We have one here with us that is comparatively new in our association, at least his company is. I will ask him to say a few words. Mr. Moore, of Pittsburg.

Mr. S. E. Moore: Mr. President and gentlemen: I think the president should state what he would like the few words particularly about before he calls on a delegate so unceremoniously as that. I can only say that I am glad to meet with all of the gentlemen of the convention and that I hope to be able to do something before it is over, that may be of use, not only to the accounting end of it, but to the street railway work generally.

Mr. Duffy: Well, gentlemen, we have another new member in our association, Mr. Hemingway, of New York, representing the Connecticut Light & Power Co. Mr. Hemingway, we would be very much pleased to hear from you.

Chas. M. Hemingway: Mr. President, this is my first appearance in the association and I am very much interested indeed in the papers and reports. One subject in your opening address I am very much interested in. That was the uniformity of accounting where the same company operates railways, electric light and gas plants. That comes particularly under my department and I am very much interested to see something put forward in that department. I have nothing else to say just at this time, but I have learned a great deal from the meetings.

President Duffy: Is there any other gentlemen good enough to favor us with a few remarks, or has a suggestion to make, or shall we adjourn. We have established a record for punctuality which we maintain this morning by a very narrow margin. It is ten o'clock until it is eleven. We would like to open to-morrow promptly at ten, and I would ask all of you to make it a point to be on hand early, so as to take your car out on time. If those gentlemen who are on the executive committee will be good enough to go to the Midland Hotel directly, we will have our executive committee meeting so that the report can be presented to-morrow morning.

On motion, adjourned until 10 a. m.

WEDNESDAY, OCTOBER 17TH.

The meeting was called to order at 10:30 a. m. Wednesday by President Duffy, who at once announced the first paper:

THE ROUTINE OF A STREET RAILWAY, ELECTRIC AND GAS LIGHTING COMPANY.

By C. O. Simpson, Auditor Augusta Railway & Electric Co., Augusta, Ga.

In this paper upon the routine of a railway, electric and gas light company, no attempt has been made to go outside of our own office, but I will touch briefly on some points which have come

under my observation in the past ten years, or while in the street railway line. I do not, however, confine myself to the street railway business alone, as there are a great many companies like the one with which I am associated, that have the electric light as well as the gas business of the cities in which they are located.

First the railway, starting with the report from the conductor to the accounting department. The office furnishes the train dispatcher the night before with the "Portable" registers, and a list showing the number of same, the register and the register readings. The dispatcher gives out registers only to the daylight and six hour men, as they start out in the morning. All other registers are given out at the office. This list (Form 1) is returned to the office by the dispatcher, not later than 9 a. m. with the name of conductor filled in and certified to by him. This goes to the young man in charge of the car earnings record (Form 2), also the trip sheets (Form 3) and envelopes (Form 4) containing the conductors remittances after they pass through the cashier's hands. The cash is handled by only one person and goes direct from the conductor to him and from there to bank which furnishes a duplicate deposit slip which is turned over to the chief clerk for entry on general cash book, after a comparison with earnings record.

All money when ready for bank is put up in such shape that it will be accepted by the teller without counting bills, or wrapped silver at time of deposit. Currency is put up in \$50, \$100, and \$250 packages; on the wrapper are marked the company's name, the

C. O. SIMPSON.

date and the amount. Silver is also wrapped and marked accordingly, small change to make up balance of deposit is put in envelope.

Cash tickets are checked up with the earning book by the auditor every month and burned. Transfers are counted, and after comparing with the trip sheet are destroyed.

Conductors reports are filed daily, that is, each day is fastened together and kept in a convenient place in the office until the end of month when they are filed in store-room.

A small ledger with index is kept of over and short account. An account is opened with each conductor; the Dr. side is short, and the Cr. side is over. This book is kept where conductors can see it every day, and if they find a shortage, they make their remittance that much more, or vice versa, to balance the account as shown by this ledger.

The cashier also handles all collections of the electric light and gas departments, keeping a separate petty cash book for each, giving as much detail as possible to the bookkeepers in charge of the different department ledgers, and general cash book (Form 5) into which it is condensed, as the latter is ruled so that only the amounts are necessary, except in the sundry column.

The electric light register (Form 6) is used entirely as a load book, that is, it shows the number of each c. p. light, motor power, fans and if on meter, meter readings in kilowatt hours. The reading of electric meters are recorded on cards (Form 7). These cards are turned over to bookkeeper on the completion of each route, for entry on register.

Bills (Form 8) are made from the register and are then carried to the light ledger, each account is numbered, having the same number in both books. The light ledger (Form 9) shows the balance forward each month, if any; amount of bill for the month; total column, rebate, amount paid and date of payment. These books are made to run six months, with the addition of a short

leaf, they can be made to run twelve months, but owing to the accumulation of dead accounts, and new business, this is hardly satisfactory.

The light ledger contains 42 accounts or lines to a page, and the register only 14, which gives three pages equal to one of the ledger, making it easier to balance and check as you go along. The cash column in the ledger is balanced with the general cash book. With this form of ledger, it is not necessary to keep a collection list as the accounts are compact enough if posted regularly every day, from which the collector makes his delinquent list. We use the card system in connection with the changes; that is, one side of the card is used as an order to the electrician (Form 10) the other side (Form 11) shows the work done on the order, and from this entry is made on the light register. At the end of each month a recapitulation is made of the changes to show the loss or gain in any part of the service.

The names of customers are kept in both register and ledger, alphabetically and in the order of the vowels. When transfer is made to new books at the end of six months, we do not give a numbered place in the ledger to accounts that show balance only, but on one of the back pages of the ledger we keep these delinquent accounts under the heading of "Balances." The total being carried under the same heading, and given a number in the front of ledger, until finally paid or written off. Advance customers are treated in a similar manner, except that they are given a number preceded by the letter "A." I also wish to add that all churches and Chinamen are put together under letter "C," but are given a regular number.

The gas books are similar to the electric light books, except the register or load book (Form 12), which only shows the meter reading, past, present, and consumption for both lighting and fuel at the different prices per thousand feet.

The gas bill (Form 13) is almost a copy of the register book, but in addition is ruled to show discount for prompt payment before 10th of month, following consumption.

The reading of gas meters are recorded in a book (Form 14) printed and ruled for that purpose. The routes are divided into what we call the up-town and down-town routes, and are read by two men, who alternate every other month. The bookkeeper takes these readings direct to the register or load book.

The recapitulation of the register or load book compared with the register of output at plant will show the leakage.

We use the addressograph in connection with both electric light and gas bills, this machine prints the number, name, address and date of bill, in one tenth the time it formerly took our bookkeepers to do the same work.

We use a bill register (Form 15) in which are recorded all bills due the company for material sold or labor performed. One line is used for each bill and the book is ruled as follows: date of bill, number of bill, against whom item, date rendered, amount, date paid, account credited, and remarks. Each bill (Form 16) is numbered.

All bills and accounts against the company are paid by voucher (Form 17) which gives all the details. There is provision made for inserting a description of each bill and in addition to the description on each voucher, the original approved bill is attached, but the latter never leaves the office. If the voucher is paid through the mail, all bills are attached to a slip, the same size as that of a folded voucher, called a "tracer" (Form 18) and remains there until the voucher is returned, receipted, all papers are then attached to voucher and filed away.

Vouchers are numbered consecutively, commencing with No. 1 each month. The voucher record (Form 19) is ruled to show first voucher number, month, in whose favor, amount of pay roll, or voucher, account charged, store stock, operating expenses, sundries account, etc. The recording of a voucher will occupy as many lines as there are accounts to be charged in the distribution and are charged on the record direct to the operating, construction or other accounts affected. No bill for sundries or material, etc., is vouchered until approved by the purchasing agent and superintendent. It is then made up by the chief clerk and goes to the auditor and president for their approval before recording or payment. The pay roll voucher (Form 20) is made up from reports of time (Form 21) from the heads of departments. The distribution is made and it is entered in the record and filed as a regular voucher.

Unclaimed wages, that is wages uncalled for, after six months

are credited back to the account as charged on pay roll, and record made on pay roll accordingly.

General journal entries are made from a manuscript statement, which is a recapitulation of the several books, such as cash, bills and vouchers, and these statements become a part of the permanent file. Therefore the items are not entered in detail in the journal. The traffic statement (Form 22) is made from the car earnings book, and gives all data necessary to make up statistics as to the traffic on the road for the month, but only that portion pertaining to the revenue and how earned is journalized. A recapitulation is also made of the bill book and the entry made charging bills for collection with the total amount of bills and crediting the different accounts, as shown. The recapitulation of the voucher record is made in a little more detail. The operating accounts of the railway and electric light departments are separated as well as the construction and sundry accounts, and the voucher number and amount of each voucher charged to that particular account are given. The entry is then made charging each operating, construction and sundry account with the total for the month and crediting vouchers and pay rolls their respective amounts. The recapitulations of the cash book and light ledger are similar to the others, but more attention is given to the cash book, as it embraces the particulars of receipts and disbursements and clearness in entering transactions is of great importance even in the general cash book.

There are a number of what we call "regular journal entries" such as the transportation of letter carriers. An entry is made charging the United States Post Office Department (which is an open account on the ledger) and crediting the earnings account with one twelfth of our yearly contract and when the quarterly payment is made by the Post Office department it is credited direct to this account on the cash book. Similar entries are made for the rent of power for the operation of a short line running from Augusta over the Savannah River into South Carolina which we do not control. Chartered cars are usually paid for in advance, or on the day following their use and are credited direct to the account through the cash book, if not they are billed and so pass through the bill register. Interest on the bonded indebtedness is charged to "Interest on Bonds" and crediting "Accrued Interest on Bonds." Semi-annually an entry is made charging the latter account, with the semi-annual interest and crediting "Interest-Coupon Account." When remittances are made for this interest to our eastern representatives, it is charged to their open account, and it so stands on the ledger until the coupons are returned to the company, as they are very seldom all paid and returned at one time, or within 30 or 60 days after due. The journal entries then made, or made from time to time as they are returned, are necessarily in detail, giving the series and numbers of each, charging to Interest-Coupon Account, and crediting our eastern representatives.

We have also an account called "Advanced Expenses" into which we charge direct from voucher when payment is made for such items as taxes, coal, water for power, etc., which are paid quarterly and annually, or extraordinarily heavy purchases of material. An entry is made each month to the respective operating accounts, charging out approximately what would be, or has been used in that month.

The balance of many accounts is shown by the balance sheet the first of each month, for instance the amount in the debit column to gross electric light and power account, will be the same as the total of the balance sheet of the light ledger which comprises something like 1,500 individual accounts. The balance of bills for collection consist of the unpaid bills as shown by the bill register, the balance to vouchers shows those unpaid at that time, also the pay roll account.

We use the ordinary check book, as everything is paid by vouchers, the stubs of which show the name and number of vouchers covered by the corresponding check, which is all that is necessary for entry in the cash book. Separate check books are used, one for the Railway & Electric company, and the other for the Gas Light company, as they are at present separate corporations, but are handled as one as much as possible to reduce expenses.

Monthly statements include the railway and electric lighting departments on one statement, but the earnings and operating accounts of each are shown separate. The Gas Light company's statements are made separate, but the form and accounts correspond with those of the Railway & Electric company as much as possible.

The most valuable of all papers I consider the real estate deeds

and plats representing all the realty of the company, whether used in the operation of the road or not. A separate book is used (10 x 14 in. in size) called the Real Estate Book, on the left hand page of which is a plat of ground, and on the right hand, or as many pages following, as is necessary, is a description of the property. The index to this book is complete, indexing perhaps under six or seven headings as the property is referred to a great many times, as the tract of some of its former owners or by the company as the "power house property," "sand pit," "east station," or "west station." The deeds are kept in a bankers' file, and given the same number as per folio in book.

Contracts are also filed in an ordinary bankers file.

Ordinances are usually published in the daily papers, and a copy is pasted in a scrap book; if not printed, a written copy takes its place.

Letters are filed in the ordinary files, but in addition to copying, the stenographer makes a carbon copy of the answer which is attached to the letter before filing.

The stock ledger (Form 23) and the transferring of stock is very simple. The ledger is ruled first giving at the top of the page space for the name, address and any other information as to the payment of dividends, etc. The rest of the ruling shows first date, transferred from, or to; certificate number; Dr. shares; Cr. shares; Cr. balance. All stock certificates when cancelled have written across the face, to whom issued, and number of new certificate. This certificate is then attached to the stub bearing the corresponding number.

As is well understood in this association a frank discussion is invited of the methods and forms I have explained. Any system adopted by a company is more or less a growth evolved from emergencies and circumstances, and side lights thrown by opinions from different points of view are always valuable.

President Duffy: We are very much obliged to Mr. Simpson for his able and instructive paper, and I think it would be well to follow his suggestion concerning the discussion. I will ask Mr. Smith, of Toronto, to open the discussion.

J. M. Smith: This is, I am sorry to say, my first appearance since the organization of the association. I feel somewhat on the outside, with you American gentlemen, for the reason that we do not operate our system altogether as you do here. I think you are all familiar with what they call the coffee-pot system we have over there. We do not use the registers, and in those particulars we are not similarly situated, but we run our accounting departments right in line with yours. We found that we were not in such very bad shape at the time you organized, but we have benefited by the suggestions of your various committees that have reported from time to time. I enjoyed Mr. Beggs' remarks yesterday and those of Mr. Simpson this morning, and I think we have reason to be very much encouraged from what has been said and done, and the way the efforts of the association have been appreciated by outside concerns.

Mr. Mackay: Mr. President, I would like to ask Mr. Simpson how he handles the meter readings; whether he tries to equalize the lighting bills by reading shorter months in winter time and the longer months in summer time. There is a great difference in the method of reading electric lighting meters. I would like to be informed on that point.

Mr. Simpson: We have always made it a point to start on a certain day of the month. On the 26th we read all our meters, except in the month of February. We make that two days longer. As far as comparing the amount of bills for each month is concerned, we have never had any complaint as to that. The car registers are kept in the accounting department, and go out from there.

Mr. F. E. Smith: And no matter where the car may start, the conductors have to come and get their registers where they first start, early in the morning.

Mr. Simpson: They are sent out from the power house. They are started from there early in the morning. The rest of the day they start from our office. They leave the registers there and also get the registers from that point.

Mr. Smith: How about the fellows that get through at one or two o'clock in the morning? Do they leave them in there, too?

Mr. Simpson: No, they are returned to the power house and taken care of there, and returned to us later.

Mr. Smith: Then the register that comes in at one or two o'clock in the morning you are not able to put out again until later in the day?

Mr. Simpson: Yes; we have a double set of registers, using one one day and using another set the other day following.

Secretary Brockway: Mr. Simpson, what style of registers do you have?

Mr. Simpson: We are using the Meaker portable register at present. The first of the year we are going to use the stationary register.

President Duffy: May I ask you what induced you to change your style of register?

Mr. Simpson: I am not in a position to answer because the matter has been heretofore left with the superintendent of the road, and I have paid very little attention to it. As we are situated a man has to come to the office anywhere from a half hour to an hour before hand to get his register and go down and take out his run. Sometimes he is delayed, and that leaves the register in his possession too long in our opinion. That is one reason, I think, why we have made the change.

Mr. Tripp (Seattle): Do you have any difficulty in keeping the expense in the railway department and the light department and your power stations separate?

Mr. Simpson: No, we depend upon our engineers to a great extent. We use very little coal. We use water power, and have two stations, one principally for the electric light and the other for the railway, although we do use the railway station through the day for the alternating current and the day lighting, using what we call the lighting station at night only. We make an arbitrary charge for the station that we run both kinds, making the charge from the electric station to the electric lighting department. We do not subdivide on the kilowatt-hour basis.

Mr. Mackay: I would like to know how you subdivide your general expenses between your gas, electric and street railway divisions.

Mr. Simpson: Well, it is not charged. I have two sets of books. Being a separate corporation, I make my vouchers on the Gas company. In other words, the railways company pays the expense of the office, the general expense, to a great extent, and I will make my voucher of the gas company in favor of the railway company for its portion, which is arbitrary, and the balance is charged to general expenses, you may say, divided between the two departments equally, railway and electric.

Mr. Mackay: How you arrive at your arbitrary figure? Is it on the basis of earnings?

Mr. Simpson: On the basis of earnings; yes, sir.

Mr. Moore: It might be interesting and supplementary to Mr. Simpson's answer to Mr. Mackay as to meter readings in the matter of light, heat and power, to say that in Pittsburg we read the meters daily, subdividing the city into districts; for instance, taking 20 to 25 meter readers, and each provided with a meter reading book which covers a day's work. Each of the 25 meter readers finishes up his own simple district each day. He follows again the next day, and every 25 days, when the collectable accounts come in they are all in for the current month, and then we put them onto the prepaid meters and simply collect all through the city for the whole amount of prepaid—that is, the slot, meters. When the meter reading books come in in the morning they are passed over to the bill clerks and each one has his day's work allotted; then they pass on to the registry clerks and are entered, and passed out in the mail that night. Thus we are right up to date as to the amount of gas, natural or artificial, or electricity, that has been consumed by the customers in that district every day. Those districts are then allowed 15 days in which to pay, in 10 of which they would get a discount. Five days after that they get a delinquent card. Each clerk having charge of one registry follows up every day, and when he finds, 15 days after he has made his bill, that there is a delinquent customer, the latter then gets his little blue card. They all know what that means. In that way the readings are kept up continuously, the collections are kept up continuously, and I think we have a pretty good system as regards meter reading and billing.

President Duffy: Mr. Moore, may I ask you what particular point you want to cover by having a daily record of the meter readings, or daily reading of them, rather?

Mr. Moore: It is only a daily record every month with each cus-

toomer. Each house is called on regularly on, say, the fourth of the month, and out of those districts each one comes in, and our revenue comes to us regularly, day after day by the amount of the meters read.

President Duffy: You have meter readers who work daily, but the particular meter in any particular residence is only read once in 30 days?

Mr. Moore: Once every month.

Mr. Heminway: The bills go out every day in every district?

Mr. Moore: Yes; bills continually going out, continual collections.

Mr. Mackay: That has the same effect as though it was a reading of the separate days of the month, only on account of the number of customers you are obliged to record it in that way.

Mr. Moore: Exactly. We pro-rate our work right along, subdivide it daily and close it up.

Mr. Mackay: At the end of the 15 days do you cut a customer off?

Mr. Moore: Provided he has a record, we do.

Mr. Tripp: I would like to hear some more discussion on the question of dividing expenses between the railway and the light department, such as do not divide themselves, as in the case of one power station furnishing current for both the railway and the light department. I would like to hear some one suggest a way to divide the coal or water, general expenses and those things.

Mr. Mackay: I don't understand why the kilowatt-basis is not applicable. You are furnishing so many kilowatt-hours and the same fuel that furnished the railway kilowatt-hour also furnished the light, possibly right at the same time. That is our system. We divide it on the basis of kilowatt-hours.

Mr. Tripp: Suppose a station doesn't have wattmeters?

Mr. B. L. S. Tingley (American Railway Co., Philadelphia, Pa.): We have one station which is occupied jointly by electric lighting and power plant. We apportion the current by meter, charging the railway company and crediting the light so much per kilowatt-hour for its current. We regularly bill it to them, because in the state where we are operating we are not allowed to consolidate. We charge them a fixed monthly rent for the use of the office, and we apportion the salaries of everything but the station force. That is, the office salaries are apportioned prorata as to the gross receipts of the two companies.

President Duffy: Is there any other gentleman interested in the railway and lighting business that can further enlighten us about apportioning the expenses?

W. F. Ham (Washington, D. C.): We are in the railway and lighting business. We apportion our general expenses of the railway and lighting companies approximately on the basis of gross earnings. It is a fixed scale for the year, however. We do not attempt to change that ratio from month to month. Where there are expenses of a single power station which furnishes power to both railway and lighting companies, the expenses are pro-rated on the basis of the output, except that certain railway companies have fixed contracts with the lighting companies which existed prior to the practical consolidation. In those cases the rate continues as heretofore, and with any increase in the price of coal the railroads get the very much end of the bargain. What is the general custom of the members of this Association, or what is the best way, of filing cancelled coupons? I think that the plan of keeping a record in the general books of the outstanding coupons is an excellent one. I think it is preferable always to keep the general books in such a way as to reflect the exact condition of the companies, and to do away with as many auxiliary books as possible. Therefore, the scheme which Mr. Simpson has outlined shows at all times the coupons which have not been returned cancelled. I would like to know what is the best way to file or to keep the cancelled coupons. The way I have been accustomed to doing it is an expensive way, pasting them in coupon books, and when you have a heavy capitalization, as some of us have, with a great many coupons, it takes much time and considerable expense.

Secretary Brockway: What form of books do you have, Mr. Ham, providing a place for the bond?

Mr. Ham: It is virtually a scrap book. Every page is numbered with the exact coupon which is to go into each space, and it is so arranged that we have at the time of the maturity of a single coupon—not all of one bond to be pasted on one page, but all of one maturity to go on successive pages. For one of our bond

issues, we have one book alone for each maturity, 20,000 coupons in a single book; but to sort those and to paste them in the book is a heavy expense. Now, in some cases they file these in boxes or packages, and whether the trustee of the mortgage is satisfied with that record when he is asked to satisfy the mortgage is a question in my mind.

Secretary Brockway: A steam road with which I was once connected filed the two ways, as you are doing, with the maturities, and then when a new issue was made, a very large issue, they adopted the box plan. The Central Trust Co., of New York, accepted it as being conclusive evidence of payment.

Mr. F. E. Smith: The Erie road has been doing that for years. It has a big bond issue.

Secretary Brockway: I use the maturity books, but the books which were in New Orleans when I went there had a page per bond providing a place at the top for the cancelled bond as it came in, or when it does come in. But that required very large books and many of them, heavy and cumbersome, and with our new issue I adopted the maturity plan with one year's maturity; that is, two payments in each book. We do not have 20,000 coupons.

Mr. Ham: Not very long ago I had the coupons audited by a company which I was then with very carefully. They wanted to know that every cancelled coupon which we showed cancelled had been cancelled. Now, if we had attempted to do it with boxes or anything of that kind I think we would have been several months in getting through with it, because that would have meant the recounting of all those coupons. As it was, we had a hundred coupons on a page, and if there was any missing coupon, the blank space would stare you right in the face. So, just as fast as you could turn the pages over you could verify the account. Certainly it is a very nice way, but it is a question whether there is any other way which is equally as good.

Mr. Smith: Suppose you had a box with a number sticking up, say No. 99. You have your number up there instead of your coupon. Wouldn't that satisfy most anybody, if after counting the coupons you found that the original numbers that were in the box agreed with your book account? I should think an auditor would take that.

Secretary Brockway: Yes, if you could satisfy them that all you said were there, were there.

Mr. Smith: I have not attempted to use the box system yet, but I hope to if we get out any more bonds. As I understand it, the Erie road has been doing it for years, is to use a box, say, to hold 1,000 coupons, say, January, 1901, coupons, from such an issue of bonds; blank numbers are stuck in there which are just a little higher than the coupons will be, with the numbers from 1 to 1,000. As fast as the coupons come in these numbers are taken out and put into the July box and the coupons put in their places. Thus, at all times, they can see the numbers of the coupons which are out, from these little pads that are sticking up. That is the way I am going to do.

President Duffy: Do I understand that you file those coupons in tin boxes like you would throw cash in a tin box?

Mr. Smith: No, in a paper box. Then, when those coupons are all in, have them counted by two or three people and sealed. Then, if anybody comes along, the trustees of the mortgage, you can turn over that sealed box to them. If they are not satisfied with the certificate, let them count them.

President Duffy: Mr. Ham, may I suggest that, in answer to that question as to the verification of the canceled coupons, do you not have a special coupon account deposit with your bank?

Mr. Ham: You might have and you might not.

President Duffy: The point I was getting at was this: If you make a deposit on coupon day, and if your bank book is balanced, and you exhibit that to your expert who examines your books, that in itself is a certificate that a certain number of these coupons have been paid. I think that would cover the point which was raised.

Mr. Ham: In the particular instance to which I referred it would not have answered, but, generally speaking, I should think it would.

Mr. J. M. Smith: I have found a difficulty with my coupons where I have opened a special bank account. There are always a number of these coupons outstanding. I have some outstanding, running over a period of three or four years, and I do not know that that would be proof to the trustees that the whole thing was

paid. It is quite an important item. I use a certain file for a certain coupon and paste all the coupons in. As Mr. Ham says, it takes a lot of labor and expense, but I think the trustees would rather see that done than to take for granted that all the coupons are in a box. As the box is a simple method, it is a very good suggestion; but I do not know whether the trustees would accept it.

Mr. Tripp: Is it not a fact that the trustee is usually the man who pays the coupons?

Mr. Smith: Not in all cases.

Mr. Tripp: It generally is with us. In that case it is up to him to show whether it is or not.

Mr. Smith: No; with us there is a trust company that is trustee for the bondholders. We pay through the bank. We have bankers and trustees, so that the trustees have nothing to do with it.

Mr. E. D. Hibbs (Jersey City): We follow the method outlined by Mr. Ham, filing and using a numbered book for the maturity bonds. That is very simple, because the trustees of our mortgage really pay the coupon. We deposit with them the full amount due and open an account with them for each coupon, and on the term of the coupon we credit it. While it does not show the actual number of coupons out, it shows the information which the Manhattan Trust Co., which is our trustee, wants. I do not know of any other methods that would be so satisfactory as the coupon book, the scrap book, and filing.

Mr. W. G. McDele (Cleveland): We had at the time of consolidation three sets, which, of course, are taken care of with the new bonds, but we had them all scattered around and put them in boxes. Each company had different boxes and had them outlined for several years to come. Mr. Davies and myself started the box system. We had a large tin box made of very heavy tin, with little compartments to take care of the coupons still due, and when they came in they were put in that box, putting the date on the outside of the box.

Mr. Mackay then read the following report:

REPORT OF COMMITTEE ON A STANDARD UNIT OF COMPARISON.

H. C. Mackay, Chairman, F. E. Smith and A. H. Ford, Committee.

At the last annual convention of this association, the Unit of Comparison, as treated in the paper presented by Mr. H. C. Mackay, was referred to this committee to report at this convention, action having been deferred for the lack of sufficient time to discuss the matter properly and to admit of further unbiased investigation.

It is a matter that, since the adoption of electricity as a motive power, had received very little serious thought; and the discarding of a unit that had for years been recognized as the standard, naturally brought up questions requiring more study and investigation than could then be given them. It is but fair to say that this committee's opinion was divided as to the merits of the different units advocated, but, after studying the matter in all its bearings, we are convinced that the motor car-hour is the best unit yet advocated; and, being the same on all systems, large or small, it cannot be otherwise than practicable. Since that time, it has been put to practical tests, having been adopted by some of the largest systems; viz., Minneapolis and St. Paul, Minn., and Milwaukee, Wis. This test has demonstrated that the motor car-hour is a stable and correct unit, and it has further conclusively shown that the car-mile is an unreliable unit, even between lines of the same system. To illustrate, we submit the following figures taken from actual service and applied here to comparison of earnings.

Line.	Speed per hour.	Earnings	
		Per car-mile.	Motor car-hour.
No. 1.....	8.3	33.25 cents	\$2.76
No. 2.....	16.2	28.57 cents	4.63
No. 3.....	10.7	26.79 cents	2.86

The supposition was (up to the time of comparison on the basis of motor car-hours) that line No. 1 was proportionately the best earning line of the three, but the truth is, it is the poorest. This erroneous result was made to appear true on the basis of car-miles, simply because this line was operated at a lower rate of speed, the smaller divisor naturally leaving a greater quotient.

As applied to operating expenses, we submit other figures.

Car mileage	3,653.00
Motor car-hours	350.00
Earnings per day.....	\$1,367.50
Operating expenses per day (50 per cent).....	683.75
Earnings per car-mile.....	.3743
Earnings per motor car-hour	3.91
Operating expenses per car-mile.....	.1871
Operating expenses per motor car-hour.....	1.955

Reducing the speed of this line 25 per cent, retaining the same equipment and running the same length of day, what is the result? We have, without changing the cost of operation, reduced the mileage made from 3,653 to 2,740.

The expense per car-mile was \$.1871, and is now \$.2495, an apparent increase of \$.0624.

The expense per motor car-hour was \$1.955, and is now \$1.955, showing no change, as none exists.

Speed, then, is shown to be the factor that prevents the car-mile from being used as a correct basis. Speed does not enter into the motor car-hour. The absence of this variable quantity of speed, together with the fact that labor, the principal item of expense, is computed on the basis of the hour, or multiple of the hour, sustains our position.

It is interesting to note the conclusions of the steam railways regarding the use of the car-mile as a unit. The following figures were taken from the report of the 33d annual convention of the American Railway Master Mechanics' Association. The committee emphasized the unreliability of the car-mile by the following comparisons, showing the cost of operating a simple or ordinary engine to be \$.2449 per car-mile and the cost of a compound engine to be \$.2883 per car-mile, an apparent difference of 17 per cent in favor of the simple or ordinary type of engine. Yet, by reason of the greater capacity of the compound engine, the cost per 10,000 ton-miles was \$3.23, as compared with \$4.03 for the ordinary engine, thus showing an actual gain of 24 per cent in the work performed, in favor of the compound.

For special comparisons, it is recognized that special units are required, as for example, the output of a power station would be based on the kilowatt-hour, this being more closely relative to the work, but for all general comparisons of earnings or operating, the motor car-hour is advocated.

As to the question whether a standard unit is practicable or not, it would seem that, given a unit of comparison, which is admitted to be identical in every case, the question is not debatable. If the unit is correct, the result or comparison must be correct, as the component parts of all accounts have already been standardized by this association. It has been claimed that the variation in cost of operating, between a high and low speed line, affects the value of the motor car-hour as a unit. The high speed line certainly requires more current, and its repairs to electrical equipment are greater, but we are at a loss to understand how this can affect the unit. We could as consistently question the value of the yard as a unit of measurement because one kind of cloth cost 10 cents and another kind 12 cents per yard.

If a manager was shown that the cost of maintenance of electrical equipment of cars was 25 per cent more on his system than on another, it would certainly be to his interest to investigate, to determine whether more improved motors were being used, or if greater care was not being taken in the use of them. Very true, the investigation might develop that the difference in cost was due wholly to greater grades or to excess of travel on his lines, but it would show him the facts, and wherever a difference did exist, would advise him of it. This would be a practical use of a standard unit.

It was contended that the cost of ascertaining the number of motor car-hours would be such as to preclude its use on a large system. As a matter of fact, it is so much more easily determined than is car-mileage, that the cost is naturally less, and the readiness with which it is ascertained is one of the strong arguments in favor of its adoption. Especially is this the case in cities where large numbers of cars are run without reference to schedule time, but wherever and whenever deemed necessary. Experience has shown that reports of mileage made by trainmen are only approximately correct, but the record of the time of the starting and pulling in of a car at the station can be accurately kept and verified by the time of the motormen. The unit of comparison as applied to electric street railways has not kept pace with the rapid changes

which have been made in every feature of this industry during the past decade. The unit adopted by the steam railways, the passenger mile, was adopted by the street railways, but, owing to the impossibility of determining the distance each passenger was carried, that element was discarded, and, though its usefulness as a unit was impaired, it has continued to do duty as a standard unit to the present time. It applied very well to the old horse car, where the variation in speed was an unimportant factor, but time has wrought its changes, and a new unit to fit up-to-date conditions is deemed necessary.

With the past few years, a new problem has arisen owing to the construction and operation of high speed electrical suburban and interurban lines. These are but the forerunners of what will shortly be in active and aggressive competition with the steam railways. These lines will, doubtless, be controlled and operated by the street railway systems of the large cities, or at least in conjunction therewith; hence, creating a necessity for a unit of comparison applicable to both high and low speed lines.

We believe that the objections raised to the car-mile as a standard unit in the paper presented at the last meeting of this association are logical and that the motor car-hour meets all conditions better than any other unit yet advocated.

We herewith offer the following resolution for your consideration: "Resolved, That this association recommends the adoption of the motor car-hour as the Standard Unit of Comparison."

Mr. Mackay then said: In this connection, gentlemen, I wish to say that it is not the intention of our committee to preclude the use of any other unit. We simply wish the car-hour established as a unit of comparison and adopted by all the roads, so that we can make comparisons upon that basis. There is no objection to the use of any other unit, as I say, and we would be glad to hear from you on that subject.

President Duffy: Gentlemen, this is one of the most interesting and valuable reports that we shall have at this convention.

Mr. Dimmock: Mr. President and gentlemen: From the managers' standpoint I consider the adoption of a unit which we can all agree upon is the most important thing in the keeping of the books of an electric railway. When we go to our directors and they wish to know the condition of the road, they will immediately compare the condition of their own road with the condition of other roads, and what brings the conditions about. In our own case we have found that in every instance there has been a difference of opinion and an unsettled feeling as to this unit; but I do feel that we can reach a point where we can all agree upon one unit this association will have done more good for the general managers of the different roads than anything that I can imagine. From my standpoint, in both departments, I feel if we could get the unit question thoroughly settled we would immediately commence to correspond with one another, especially the managers, as to what their percentages were during the different periods of the year. I was not present when that question was brought up last year, and I would like to hear a brief discussion as to what the motor-hour is based on, or consists of, in order that I may be posted as to what is going on now relative to this question.

Mr. Mackay: The motor car-hour is merely the car-hour for the time that the car is in service. If the car started out at seven o'clock in the morning and ran until ten o'clock, it would be out three car-hours. The only reason why we called it the motor car-hour was that we eliminated the trailer as a factor altogether. It was based upon motor car-hours.

Mr. Wilson: As the car pulls out from the car-house at a certain hour and is returned at a certain hour, supposing it runs 10 trips during that time, and has a lay-over of 10 minutes each trip, do you have some method by which you eliminate the lost time?

Mr. Mackay: Not at all; your expenses are going on just the same.

Mr. Wilson: A great many of your expenses are not.

Mr. Mackay: Your expenses are practically going on, with the exception of your power, and, of course, some maintenance that is eliminated; but that is a feature of operation which is largely controllable, and I do not see that that would alter the case anyway, any more than your mile. If you were using the car-mile your car is remaining stationary, and your expenses are going on in some cases, and not in others.

Mr. Dimmock: The running delays and everything of that kind would be the same for each method, you consider?

Mr. Mackay: It would be about the same on each road.

Mr. Dimmock: Do you divide your total operating expenses pertaining to the service into the number of car-hours, or vice versa?

Mr. Mackay: Using it as a divisor, yes, sir.

Mr. Dimmock: That gives you the cost of one car-hour?

Mr. Mackay: That gives you the cost of one car hour, and as you can readily see, speed cuts no figure in the matter at all.

Mr. Dimmock: If you run three or four cars in one train, do you only consider the hours of the motor, provided there were two or three conductors?

Mr. Mackay: That is a problem, I presume, that the individual road would have to take up. We do not operate, and I think as a general thing two or three cars are not run in a train. Trailers, as a rule, are simply put on to bring the capacity of the motor car up to a certain standard. There are certain cases, and Mr. Duffy's is one of them, I think, in Chicago, where they operate two or three cars together, and in that case it might be necessary to consider each car as a car hour; but that is a matter, for the few roads interested to take up and decide by themselves.

President Duffy: Mr. Smith, of Chicago, is a member of this committee, and he sometimes runs more than one car at a time in a train. Perhaps he can enlighten Mr. Dimmock on this question of whether it should be car-hour or motor car-hour.

Mr. Smith: I do not see why it would not be a car-hour with us. Would it not be with you?

President Duffy: I should think so.

Mr. Smith: I cannot figure on the motor car-hour exactly. I should think it would have to be the car hour.

Mr. Dimmock: You have a conductor on each car in Chicago, probably?

Mr. Smith: But we do not have a motorman. On our cable trains, for instance; four men run four cars. I do not see why we would not have to have it on the car-hour.

Mr. Mackay: It would seem to me that each road would have to decide that for itself. If the car is running its full capacity, and it is simply a question of operation, whether you can pull one car through a street or pull four cars through at the same time; your streets being so crowded, it is a difficult matter to decide how you are to get your cars through and in getting the motor car through, you may just as well pull four or five. It seems to me that is a different proposition altogether from the ordinary railway, which is operating its cars upon regular schedules.

President Duffy: In Chicago some times the third or fourth trail car in a train is a motor car.

Mr. Mackay: Do you mean that there would be three motors followed by a trailer?

President Duffy: No, sir; there is one motor behind three cable cars. It seems to me we would have to use the term car-hour.

Mr. Mackay: You might use the term car-hour, but I think with nearly all roads, with these few exceptions, that the motor car-hour would bring them nearer to a standard basis.

Mr. Tripp: Mr. President, I was not here at the last meeting, and did not hear this discussion. I would like to have an explanation made why speed does not have some effect on the car-hour as a unit.

Mr. Mackay: Because your hour has not the same length.

Mr. Tripp: It costs more to run a car 20 miles an hour than to run it 10 miles?

Mr. Mackay: Certainly, it costs more to run at a higher rate of speed, but your expenses would show in just that same proportion. Now, on the basis of car-miles, the reverse is the case. If you use a car-mile as a basis, and you increase your speed, your divisor is just so much greater, is it not? And instead of showing the actual results, you show that as a decrease. Now, with the car-hour your expenses are increased and your showing is just that much more.

Mr. Tripp: I think that is right.

Mr. Moore: We run trailers in Pittsburg and it seems to me that we would have used the car hour itself, because we would have to man each car. We are like you, we would have to put a man on each car and to get the proper figures we would have to count the car-hours and not motor car-hours.

President Duffy: May I ask you to give us the benefit of your opinion as to the car-hour proposition?

Mr. Moore: It seems to me to be all right, but before following out the car-hour unit I would like a year to try them both together side by side, put them in parallel columns as it were.

Secretary Brockway: Mr. Mackay does not contemplate the displacing of one by the other.

Mr. Moore: No, I understand. The resolution might be open to that construction as it is. I would like to try the car-hour right along and I propose to do it when I go home.

Mr. Mackay: In my last paper I think I treated that trailer question pretty thoroughly, and while there are certain exceptions to this rule, as there are to almost any other, I still think that if the equipment were up to the standard, trailers would be a thing of the past, and in that case the motor car-hour does apply to almost all cases. The running of trailers as a general proposition is done simply because of old cars which are really too good for the scrap pile and yet they are out of date.

Mr. F. E. Smith: Are you going to count the motor car and the trailer as one car or as two cars?

Mr. Mackay: As one car.

Mr. Smith: Suppose you put on two trailers?

Mr. Mackay: I would still call it one car, except as I say in the case of your roads.

Mr. Smith: Suppose it was an electric line, say, going to the race track, something of that sort, and they put on a couple of trailers. Now, we have four men, three cars. Are you going to call that one car?

Mr. Mackay: I wouldn't operate it that way.

Mr. Ham: I don't know but that this question of a car-hour is just the same in the car-hour as in the car-mile. What do you call it now? Do you call it motor car-mile or car-mile? It is just the same question, whether you call it motor car-hour or car-hour. If you count your train now as two car-miles for a train-mile where there was a trailer, you would count it just the same with the car-hour. I think that is one point that we might pass upon, and I would suggest as an outcome of that, that where there is an extra crew or an extra conductor, that in that case, we should call it an extra car. If, however, it is operated with one crew, then we could call it a single car. Of course this question is going to become of great importance, especially in an interurban service, where very frequently as time goes on they will undoubtedly operate trains. They do it now on the third rail system where one motor car has a train of three or four cars. Now, in such a case as that I think that each car ought to be treated as a car. As we are situated in Washington, where we have only one crew for the same three cars, and we still continue to operate them, I think that those should be counted as single cars.

But coming back to the main point at issue, a unit should be something which is not variable, if possible. That is what a unit means, something which is not variable. In this matter we cannot get a unit which is not variable under different conditions. Therefore the unit to establish is that unit which is least variable. On the question of expense, for the last year, we have kept our accounts on the basis of the car-hours, or the car-day, which is the same thing, and also upon the basis of the car-mile; and I think that expenses can be determined much more reliably, as to the relation of those expenses to the earnings, on the basis of the car-hour. The platform expense in the operation of a street railroad is the largest single expense that we have. I think it is probably 40 or 50 per cent of the total expense of operating a street railroad. Now, that expense goes on whether the car makes 20 miles an hour or 5 miles an hour, because we pay on the basis of a day or of an hour. Then, the largest item in the expense of a railroad property being the platform expense, putting that in line on the car-hour basis is to put upon the right basis the thing which is the largest item. Now, the other thing to arrive at is maintenance and cost of production of power. I believe those two things are on fully as good basis on the car-hour as on the car-mile. It costs just about as much to run a car in a crowded street in a city, with frequent stops, six miles, as it does to take that same car out in the suburbs and run it twelve miles, where you would make the same time and you have to use about the same power, although in the one case you have only made half the mileage that you have in the other case; and I am told by people who know more about maintenance than I do that the chances are that the car which has

been running in the crowded district with frequent stops is liable to require more maintenance than the car that has been running out in the suburbs at higher speed with fewer stops; therefore, that the actual maintenance of that car in the city has been greater than the actual maintenance of the car out in the country, and the speed has been only half as much. I find that the expense of operating a car an hour is a much more permanent quantity than the expense of operating a car mile. The variation is much less between different lines, and I often think that the general manager or the other officials of the company are misled when they see that some particular line is earning only 10 or 11 cents a car-mile, and they say, "Why pull off those cars. They are not getting enough out there to pay expenses, or anything of that kind." Yet, when you can come around and show that you are operating that road for 5 or 6 cents a car-mile on account of the conditions existing there, you are showing that it is a good line to operate. Now, if that same thing were on the car-hour basis you would find that the car was earning up around what the other lines are earning, because, the speed being so much greater, it earns enough in each hour. I only wish we had more of the lines like Mr. Mackay's that earn, say, 30 cents a car-mile, and \$2.96 to \$5.00 a car hour, but ours are not that kind.

President Duffy: Gentlemen, we have Mr. Vreeland with us this morning. Mr. Vreeland, may I ask you to favor us with your impression of the car hour and car mile, or anything else in that connection that you will be good enough to speak on? Mr. Vreeland has a line that earns some times more than 20 or 30 cents a car-mile.

Mr. H. H. Vreeland (New York): Mr. President, I did not come in with the idea of saying anything. I come to gather some wisdom from the deliberations of men who are actually engaged in accounting. It seems to me that they are the men to decide what is the best unit for us to work on. It works out with us with the various kinds of service we have, on exactly the same basis, so far as our purposes of comparison are concerned, whether you put it on a car-mile or a car-hour, because the variation in conditions is equalized by the fact that it does not all go into one pot. Our whole system is operate by divisions or lines. Every particular line we have in New York City is reported, its car mileage, its earnings per car-mile and its cost of operation per car-mile, by the individual lines, so far as the purposes of comparison by the management are concerned. The operating expenses are compiled by lines. The aggregate operations are shown of course lumped, as you may have noticed in our comparisons for the last three or four years of operation. As far as our city is concerned the conditions there are such that men who are deliberating on this modern question do not give me any show. I have four or five thousand horses yet. If you can tell me how to eliminate that proposition I shall be glad to hear it. I am not modernized enough to enter into any discussion on the high plane of motor car-hours, etc., except to a limited extent. I should certainly very much rather hear from some of the gentlemen that are regularly connected with accounting work in the discussion of this question, because I am one of a number of fellows in this world that do not believe that the combined wisdom and knowledge is all in one man's head.

Mr. Wilson: Mr. President, I regret exceedingly that you have called upon me because because I have not gone into the subject thoroughly enough to express an opinion that would be of interest, and I have not seen the way in which it would be possible for the West End Street Railway Co. to keep the car-hours without an expense which would preclude our adopting it. I should be pleased to be enlightened on any method that could be adopted on our road to give the car-hours with an expense that would warrant its adoption. We run something over 300 different routes each day. One man gives the car-miles for the entire road; the labor of one man? We have a large book in which is entered each day under the different route headings simply the number of trips and the amount that that line has earned. Twice a month a footing is made of the number of trips and of the amount of money. The footing of the trips is multiplied by the length of the route and the money divided by that gives us the earnings per mile. That is all the expense that we have in determining our earnings per mile. Of course the total of that is taken to determine our operating expenses per mile.

President Duffy: Don't you pay your men by the hour?

Mr. Wilson: No, sir; we pay them by the day.

President Duffy: But the day consists of a certain number of hours?

Mr. Wilson: The day consists of not over 10 hours in 12 consecutive hours.

President Duffy: It would be a very easy matter to get the number of days, wouldn't it?

Mr. Wilson: Yes, but what are the hours? One man runs 9 hours and 15 minutes, another runs 9 hours and 30 minutes, another 9 hours and 50 minutes.

President Duffy: Would it not be possible to strike an average of the entire working day, the number of hours put in on all routes?

Mr. Wilson: No, because in Boston, with the congested district that we have in the center of the city, we never know the hours that a man may be out. Mr. Vreeland I think has the same trouble in New York. The car may start out. He is not always sure when that car is going to get back. Mr. Rossiter, I guess, has the same trouble in Brooklyn.

Mr. Mackay: It seems to me, Mr. President, that it is not necessary to know when the car is going to get back. When it does get back it is recorded, and that is all there is to it. All you have to do is to take this record of the time that the car goes out and a record of the time that the car pulls into the station, and you have your complete record. Mr. Wilson, as I understand it, has a record of the number of trips that the car makes, not only a record on this line, but also a record on some other line, because it is liable to be transferred a dozen times during the day. Now, instead of going into all this detail to work that out, all he requires is simply the time that the car starts and the time that the car gets back.

Mr. Wilson: Mr. Mackay, that would require proving each individual car. It might pull into the house once, it might be in three or four times. You would have to make a record perhaps several times a day. As it is, with the plan we have, we simply take the conductor's day card. It is necessary to know the amount of money coming in in order to find out what the earnings are. It only requires one extra column in which to put the number of trips. No return whatever is necessary from any car.

Mr. C. L. Rossiter: Ladies and gentlemen: I am glad to have the result of your arguments. I think Mr. Ham's arguments in regard to the car-hour have a great deal to commend them, yet at the same time I am very firmly convinced that simplicity in the keeping of accounts means a great deal, and I do not think that the car-hour would run into a great deal of additional labor. I cannot quite agree with the chairman that an average will answer the purpose. I think if you are going to have a car-hour, in order to locate your expenses so that your manager can place his services where he requires it, that an average would hardly answer the purpose unless that average was very correct; and I agree with the speaker in regard to the congested condition of traffic where the cars are making sometimes not one-half, as Mr. Ham stated, but I think really not one-fourth the number of miles in a given time. That certainly would indicate that the car-hour there was a very desirable thing to have. We have, unfortunately, some lines, not like brother Vreeland's, because I think he has no lines that earn less than 30 or 40 cents a car mile, but we do have some lines out in the country that I am sorry to see in the 10 and 12 cent class. While those lines are building up and developing very rapidly, it is quite a problem to so adjust the service to get all the earnings that can be reasonably expected.

I do want to say one thing, that I think this Accountants' Association has done a great deal in the last few years to assist managers in getting information. I appreciate it. I am very glad indeed to have the opportunity of saying so to you gentlemen. I think it means a great deal in the successful operation of a road, having the figures at hand, and I think that you have made very marked progress in enabling us to obtain them.

Mr. W. E. Harrington (Camden): We have some suburban lines and a few city lines where the differences in the car mileage rate were such that it appeared that the suburban lines were running at a considerable loss on the mileage basis, and I was confident that they were. Some time ago, so that we got it in this last fiscal statement, we adopted the car-hour unit in connection with the car-mile unit. It has not increased our office force at all to do it. One of the girls works it up and it comes in each morning with the regular statement of the receipts of the different divisions and

lines, each line being considered separate and distinct. I don't see how a road can run without the car-hour unit. The car-mile unit is all right and I use it generally to compare with other roads, because the data are up that way, but I am using entirely for my own comparison, for my own use on our line, the car hour unit.

Secretary Brockway: Mr. President, in New Orleans we have no grades, we do not have to heat our cars, and we have a number of other advantages, but we find that a comparison of units gives us this result:

Line A on a percentage of earnings, is first; on the car mile, it is second; on the car-hour it is second.

Line B on percentage of earnings is third, on car-miles is first and on car-hours is third again.

Line C on percentage is second, car-mileage third and car-hours first.

Line D is fourth in all instances.

Our management wished me to show those three comparisons, and I give them every day, furnishing them all of these details every day, and the line that we thought was our gilt edged line on the car mileage basis turns out to be third on car hours. Our speed is very fast in some instances. We run on the neutral ground, and taking all those things into consideration; they feel as though they want all three forms of comparison. We cannot very well tie up to any particular one, which is what Mr. Ford had in mind.

Mr. F. E. Smith: You figure it from three ways. Which is the best paying line?

Secretary Brockway: Line A.

President Duffy: How does that stand on the three units?

Secretary Brockway: It stands first on percentage, second on car-miles and car-hours. Line B is third on two and first on one. Line C is first, second and third. Line D is fourth in all instances.

President Duffy: In answer to what Mr. Rossiter said, that he did not believe in an average, I thoroughly agree with him on that. I believe in the accurate figures if it is possible to get them. I only brought up the question of the average because Mr. Wilson said that it was impossible to get the hours on his road.

Mr. Wilson: I did not say it was impossible. I said I thought the expense would preclude that.

President Duffy: I stand corrected. In Chicago we pay our cablemen by the trip. We pay our electric men by the hour. We know exactly how many hours should be run every day from the time schedules, as well as from the report from the depot that the cars start from. We verify and check and make our payroll according to these records. Consequently, we know actually, not only the hours, but the minutes, run by every man on every car, as a total; so that we can get the hours run absolutely correct. Now, if there is anybody who has such conditions as has Mr. Wilson, whose company pays its men by the day and for a half or a third of that day, they might be tied up and not work at all—that is a little different proposition. But I think on the ordinary road you can get absolutely and accurately the exact number of minutes that the cars run each day.

Secretary Brockway: My time-keeper furnishes that every day, the actual hours of the motormen and conductors of each line. We have a congestion annually in our Mardi Gras festival, during which practically the whole line, all the lines of the entire city, are tied up near Canal St. In that case the car mileage is not worth anything. Then our car-hour has its advantages. The percentage, of course, still remains the same, because the desire to travel seems to permeate every line in about the same proportion. Everybody goes down to Canal St. at Mardi Gras, but the car mileage is not worth anything as a comparison for that week.

Mr. Ham: Well, Mr. President, the objections which have been raised to this seem to be on the ground of the expense of determining how many car-hours are operated. In the cases of both Brooklyn and Boston I believe that could be obtained very readily with almost no work in the office. Every table is operated on a certain standard. That standard calls for a certain number of trips, a certain number of car-hours. It calls for a certain amount of pay. Now, for all over time above the standard a certain number of hours are made, and that is shown by an increase in the payroll. Mr. Rossiter is very familiar with that. Now, whatever that increase is, it is the item which, added to the standard, gives the total number of hours, and the depot master on the largest division in Brooklyn or Boston could give that information to the audi-

tor on the morning following the day in question. He could have it on his desk at nine o'clock in the morning. Mr. Wilson's scheme of furnishing the total number of car-miles only twice a month, would not answer for the average manager. The manager generally wants to know the following day, if possible what his cars have earned per mile, or per hour if you should adopt that as the standard. Mr. Brockway was asked, and this is something which I think is of importance, which was his best line; and he answered that the best line is the one that has the lowest percentage of operating cost. Now, right there is where we are apt to make a great mistake, and where the management might make a mistake. I think Mr. Vreeland's scheme of finding out the net returns from a line is really the only way. It is possible that with the best line of Mr. Brockway, by reducing the number of cars operated he will decrease the operating expenses, we will say, from 60 per cent to 50 per cent. But what has been the result? Have you as much net earnings? That is what we want to know. What is the final result on net earnings? On the other hand, we may take the line of Mr. Brockway's, which has been operated at 60 per cent, put on extra cars, and bring that up to 70 per cent, and still it may be a better line than it was before, because we are getting more net earnings out of it. That is why we have to be careful, in any of these bases of comparison, to remember that what we are finally looking after is net earnings and not percentages. You have heard the story of the old man who did not know anything about percentages, but he did know, if he sold something for a dollar for which he only paid fifty cents, he was not losing anything.

President Duffy: Mr. Ham, I think you are under a wrong impression as to what Mr. Brockway said.

Secretary Brockway: You misunderstood me.

President Duffy: Mr. Smith asked which was the best line. Mr. Brockway replied line A. Then I asked him if he would state how that best line stood on the three units, and in answer to my question he made that statement.

Secretary Brockway: I am taking income only into consideration. I am not considering the expense at all.

Mr. Ham: Was not your reply based upon the fact that the percentage of cost of operating that line was the lowest of the three lines or four lines?

Secretary Brockway: No; I am taking income only, just treating income in this consideration.

Mr. Ham: Well, how would you determine that, from the gross income?

Secretary Brockway: Gross income, certainly, of the four lines.

President Duffy: He means that the percentage earned by this particular line, of the total amount, was not greater on this particular line than any other. Just the percentage earned; not the percentage of expenses to receipts. Is that correct?

Mr. Brockway: Yes, sir.

Mr. Ham: That may be a longer line. That does not answer it at all. You might have a line that was a mile long, which would naturally be better than another two miles long. That isn't anything at all.

President Duffy: What I wanted to correct was the impression that he was taking that as the better line because of the low percentage. You were mistaken about that.

Mr. Ham: I thought he was, but I do not see that the amount that a line takes in determines the matter.

Secretary Brockway: That bears out what I said, that we cannot tie down to a comparison, we are using the three and showing that only one of the four lines agrees in each of the three comparisons.

Mr. Dimmock: I would like to ask some of the accountants who have been using the car-mile in the past, if, when they had a motor and a trailer in one train and that train should run one mile, if they would consider that two car-miles, if a trailer ran a mile and the motor ran a mile, say, two 16-ft. cars. Now, if it costs you, for illustration, a dollar to run that train one mile, and it actually covered that much ground, would you say that the cost per car-mile was 50 cents? I would like to have that answered.

President Duffy: I will answer that question as far as our company is concerned. We are very much interested in the prorate proposition. To begin with we have three kinds of power, electric, cable and horse. This is further complicated by the fact that some cable trains are operated two cars in a train, some three cars in a train, some four, towing an electric motor car behind a third car

on that train. The State St. line is supposed to be a cable line; we run horse night or owl cars on it, we run electric owl cars on it, and cable cars all day, and tow electric cars in day time from 18th St. up. When I first took hold of the accounts there one year ago, I found all these complex elements. I keep a daily record, first, of the number of cars operated, and secondly, the kind of cars. There are grip cars, motor cars, the first cable trallers, second cable trallers, or the first electric traller, or what I call the tow car. I keep those miles separate, and I show the thing every way. It is the only way that I can get at it understandingly.

Mr. Dimmock: Supposing that you had a road and, to make the question plain, that you just had one train on it, and your road was a mile long, and you made one trip a day one way—that would be making one mile—and there were three cars in the train. Would you have made three car-miles that day, or one car-mile?

President Duffy: You would have made three car-miles and one train mile of three cars.

Mr. Dimmock: We have a suburban car, which is just twice as long, we will say, as a 16-ft. or 18-ft. car, as it might be, holding just double the number of passengers. If you count mileage of trallers and of motors, of the short cars, as against the mileage made by the one car, would that not go to prove that car mileage is imperfect and not of much use to the manager?

President Duffy: That is the argument advanced by Mr. Mackay last year; the special argument was on the traller.

Mr. Dimmock: The length of the car enters into the car mileage from the fact that if you had two 16-ft. cars, one a motor and one a traller, and each one would hold 50 passengers and they would run that train one mile; if they should run two car miles and it cost a dollar for expenses the cost per car-mile would be 50 cents, would it not? Now, on the other hand, if a road operated with one car carrying 100 passengers, and the cost was one dollar, that would make the cost per car-mile show so different that it would see that it was almost valueless to make any mention of or for a manager to compare by it.

President Duffy: I think a safe rule to follow would be that every car that is manned, as was discussed here a little while ago, should be called a car. If you have two cars and one motorman and two conductors, that would be two cars.

Mr. Dimmock: I know of many cases as in Omaha, where they run a motor and a traller and have only one conductor and one motorman.

Mr. Vreeland: We have been a good many years in this work, and I have seen its evolution from the old days when in steam railroading we were like the fellow that kept the store. They asked him why he didn't have a book-keeper. He said he didn't want one. They said, "You might be bankrupt and you wouldn't know it." And he said, "If I was bankrupt I wouldn't want to know it." We are not in that shape. We want to know what our condition is all the time, and any standard that you gentlemen can arrive at or a thorough discussion of it, is of value. The thing that in my opinion you want to be careful about, and which is very prevalent in street railroad practice—things that 10 or 15 years consideration have been given to by standing committees in steam railroad work, is the attempt of the practical operating men and often of accountants and others to settle, in street railroading, in two hours. I had occasion to speak of this in Buffalo where a subject was up that was up 15 years ago, when I was a member of the American Society of Railroad Superintendents; I was on a committee, and they have a meeting tomorrow in New York, and I was asked to come before that society and speak tomorrow on the same subject that was up at that time. I do not mean to say nothing has been done. It has been carried along. But it was so important a subject that it has been carried from year to year, as a subject of discussion. Our move from a percentage to a car-mile basis was a good move, even if we now go to the hours. A gentleman asked me a few years ago, "What is the cheapest line you have in percent of operation?" I replied, "I have one that operates at 22 1/2 per cent." The man went off and told another man that I didn't know a thing about the business; he said there was not a man in the business who could operate a road for less than 50 per cent. The truth was, it cost me as much per car-mile to operate that as any other under average conditions for 24 hours, paying 25 or 22 cents per car-mile, and percentage did not mean anything there at all, based upon 50, 40, 30 or 20. We are operating many lines now at anywhere from 30 to 35 per cent. Of course the questions is en-

tirely one of the average cost per electric car-mile of operation. It stands the same throughout the system. Well, we have made that step since the last seven years, going in New York State entirely from that question of percentage up to the car-mile for a basis. Now, if you gentlemen from your conclusions on this subject show us that the car-hour is a little better, why we assure you we want the best, and we are with you. (Applause.)

Mr. Wilson: While sitting here I have been thinking over the subject a little more deeply, perhaps, than I had in the past. On a big system, a method may possibly be arrived at such that I shall be obliged to take back what I previously said as to the matter of expense. I do not say that it would be absolutely exact, but in the long run it might average so that it would come out in a satisfactory manner. With us there are over 30 car-houses. We are operating over 1,400 cars a day; I might say the 1,400 cars are running on over 30 different routes, the mileage of every one, of course, being different. If we took each car house and had the foreman in charge each hour, or each half hour, simply put down the number of cars that were on the street at that time, and take the total for the day, divided by the hours, or half hours, as the case may be, we would then have very nearly the car-hours of the cars from that house. Of course, it would not be exact, but if a car pulled in five minutes before the half-hour, or the hour, some other car might pull out five minutes afterward, and it might average up.

Mr. F. E. Smith: Why not have your thirty barn foremen send in reports?

Mr. Wilson: They have all they can do now, and a little more.

Mr. Smith: Let some one else send in once a month the regular schedule from each barn.

Mr. Wilson: We haven't any schedule. We have one, but it does not work.

Mr. Smith: Your first man is supposed to make 10 trips a day on some particular run. Now, if all the other men make their regular trips, why can not that first man send in to you every morning the regular schedule time for yesterday? Or if you have to send out an extra tripper, why cannot you say there was an extra made, and so on.

Mr. Wilson: We could, but that is where the trouble comes; there are so many of them, it is an expensive thing to attempt to do anything of that kind. Anything is possible.

Mr. Smith: I didn't think that there would be so many extra trips but that it could be done. Of course, you have regular extras, understand, but I mean trippers.

Mr. Hogarth (Denver): I suppose you are all familiar with the fact that we pay our conductors and motormen every night. We have a system of universal transfers and I would like to talk over later with some of the members here. I find that in the exhibit hall there are registers now providing for fares, transfers and tickets. That is a very important feature with us, and one I would like to go into and see if it is at all practicable.

President Duffy: Those questions can very well be taken care of in the informal discussion on the last day. I am very glad you mentioned that and brought it up, because it will provide material for discussion there.

Mr. Hogarth: We operate a few trailers, very few. We are joining our grips and trailers, making one large car out of them. The horse cars have been abandoned; the cable has been abandoned. We have nothing but electrical equipment. I think that the hour unit will be the unit for our purposes. The unit ought to be a standard that is not variable, or one that is the least variable. Managers like to make comparisons of their lines with others of the same size. If there are any great discrepancies they wish to know it; they wish to know it quickly; they wish to adjust it; wish to put their lines up to date. I think the hour unit is the coming one. I regret that I am unable to speak more fully upon the subject, but I have been with the company only two months, having been theretofore with the steam roads. They have a unit established for freight which is on the basis of the ton-mile; for passengers, the passenger mile. That is the system followed by the Inter-State Commerce Commission, and adopted generally throughout the United States.

Mr. Moore: I would ask Mr. Harrington as to his practice in computing his car-hours, whether he has trailers and whether they are manned by different men, and whether he counts the car-hours for the motor and trailer as well.

Mr. Harrington: We have no trailers and we keep our time

right from the conductor's tally sheet, the same as we compute the car-miles. The computation of the car-mileage, of course, is far more difficult by reason of taking the mileage at the different points the cars pass over, but it is very easy to get the number of car-miles from those tally sheets. We pay our men by the hour, and it makes it very easy for us to do that. We have not noticed any increase in the office labor. There has been no complaint on the part of our girls of the additional work thrust upon them, and we have our car-hour and earnings per car-hour on our tally sheet, that is made up by the conductor. As I said before, we have been using it a little over a year and three-quarters and it has proved a great help. We have had suburban lines where the car-mile was low compared with lines in the city which I knew were running at a loss, and it would appear they were running at a loss on the suburban lines, but the cars were running about two and one-half times faster, and by testing it on the car-hour basis it made the resulting figure almost double that which we received in the city, and put it on a basis such that we knew just where we stood.

(Mr. Ham in the chair.)

Mr. Duffy: This closing paragraph on Mr. Mackay's report reads: "We herewith offer the following resolution for your consideration." (Mr. Duffy reads resolution.) I would like to say a few words on this subject. To begin with, I believe that the varying conditions of operation, with the possible exception of speed—and that is the most important and most disturbing element in the proposition—are just as well, if not better, taken care of by the car-hour unit as by the car-mile unit. Certainly we are at no greater disadvantage by using the car-hour unit even to the exclusion of the car-mile unit, than we would be by using the car-mile even to the exclusion of the car-hour unit, and we have the advantage of eliminating the disturbing element of speed. Now, as to the size of the car operated, whether they are operated as single cars or in trains of one, two, or more, these are some of the peculiar local conditions that surround the operation of every road. Every road has its peculiar conditions. They must be studied specially and they must have special treatment. I believe that the safest thing to do is to consider that every car that has a position on a time-table with the run numbered, that is manned by a crew, and sent out for the purpose of hauling passengers, is a car. If you put two of them in a train it makes two cars. We should supply the information as to what that train is made up of. I go further and say that a car is a car whether it makes one trip or ten, whether it is out one hour or twenty, whether it runs at night or whether it runs in the day, whether it is put out for a baseball load or whatever the condition may be. I wish to explain by that that a car that is not on the time-table at all, but is manned by a crew for the purpose of hauling passengers, if it only makes one trip, that is a car; if it only makes one trip or runs one hour it is still a car. If you will establish that as your starting point you will get the number of cars that are operated daily, the kind of cars they are. I was very glad to hear Mr. Wilson say in his last remarks, that he was satisfied that with his peculiar conditions, which are different from those of any of the rest of us, he could get around the thing; and I have no doubt that anything is possible in the accounting line in Boston, if Mr. Wilson will undertake it. I know that you can get the number of car-hours, the total number of car-hours made per day, more accurately—at least, I believe you can—more easily, more economically, than you can the number of car-miles. Now, why shouldn't we have the car-hour? Mr. Vreeland's remarks, I think, were very good, especially his advice not to start to settle in two hours a question which the steam railroad people have been considering for fifteen years; but it seems to me if you know the number of cars that you operate each day you can very easily keep track of the kind of cars they were, whether they were run in trains or not, how many hours they made, and if you take the schedule speed that your time-tables call for you have something that will give you the number of miles that the car traveled from the car-hour figuring. You may not get it absolutely exact, but you will get it very close. Take a line that has 10 cars on its time-table. Suppose that each one of those cars ran 10 hours. You would then have 100 car-hours. Suppose that, including the lay-over, and including the allowance for stops and other delays, that those 10 cars are scheduled to take 10 hours each out of the 24 on the time-table. They will have run 100 car-hours. If you divide the

distance traveled into the number of hours that they are scheduled to require to cover the distance, you get, say, 10 miles an hour. Each car has been in service an average of 10 hours. Each car has traveled an average of 100 car-miles. The other way, you take the distance of the round trip and multiply it by the number of trips that are made. I see very little difference in the basis you are figuring from. I think Mr. Moore's suggestion that we all try it this year is a very good one, and if it meets with the approval of Mr. Mackay, I would suggest that we modify that resolution, that we recommend the adoption of the car-hour, not motor-hour, as a standard unit of comparison in connection with the car-mile, and it is my opinion that this subject should be taken up by each member individually, put in practice and tried for a year. Then we can come to the meeting next year and thresh it out all over again, and recommit this question back to the committee. I thank you for your attention.

Mr. Mackay: The amendment is satisfactory to me.

Mr. Moore: I would like to say just a word for Mr. Mackay's benefit in relation to our own lines. We differ in our equipment from some of the lines that we have spoken of here this morning, inasmuch as we have a new and splendid equipment. The trailers are just as fine cars as the motor cars, just as long and just as good. They are not ready for the scrap pile; they are manned by a conductor, just the same as the motor car is, and in our figures I think it is nothing but fair that they should have hours as well as the motor cars.

President Duffy: I would suggest, Mr. Mackay, that you make that motion with reference to the modification that I suggested, and let the gentlemen act upon it.

Mr. Ham: This resolution as it reads does not say that this shall be the exclusive unit, and therefore I move the adoption of the resolution, reading as follows:

"Resolved, That this association recommends the adoption of the car-hour as a standard unit of comparison."

Mr. J. M. Smith: I think if Mr. Duffy's suggestion were put in force, that if we take it for another year, we would come better prepared, and let each one undertake it, run the year through on both the mileage and the car-hour basis, and bring a report here, I feel satisfied if it is as the gentlemen say, that it will go through without any hesitation whatever.

President Duffy: Mr. Ham, do I understand you that you desire this resolution just that way, without modifying or qualifying it to the extent that it is to be with the understanding that it is to be tried for a year and it is recommitted back to the committee to be reported on again?

Mr. Ham: No, my intention was that we simply adopt it as read, that we move the adoption of that as a standard unit of comparison. That does not eliminate any other standard that we may wish to use or continue to use. It does not interfere with our throwing it out at the end of the year if we wish to. But I think it is a good thing. If we think, as many of us do, and I believe as most of us do, that it is a good thing to know what the earnings and expenses are per car-hour, then I think we are not making a bad move to recommend the adoption of that as a standard. We will continue to have the car-mile standard, and I do not think we are committing ourselves in favor of it any more than as an auxiliary standard.

Mr. J. M. Smith: I meant to say that while trying it for a year we might get into line with our managers and let them understand this discussion, and consider it with them. Then we can get their views as well as our own. We are not the heads of the roads. I think if we had a year to work with our managers, if it is going to be a success, we can, without any hesitation whatever, adopt it next year.

Mr. Dimmock: If I had not been here and heard this discussion I believe, as the resolution reads, it would be misleading to a manager. He would immediately reach the conclusion that these gentlemen had thoroughly sifted this question, and come to the conclusion that the car-hour was the better unit, while at the same time we have not reached that conclusion until we have tried it longer. My former remarks were made with a view of showing that the mileage basis was misleading in every sense of the word, and that we did need something better, but I do not believe this question has been studied enough to warrant the adoption of the resolution unless it is made in such a way as to show that it is a trial. If the resolution can be made to read so

as to not mislead the managers who are not present, when they discover what has been done, then it would be a benefit, and they would immediately say to their auditors and men in charge, "Now let us try this thing. The accountants are reaching a point where they believe this is the best," and yet they will understand that it is only for a trial.

Mr. F. E. Smith: I do not see the use of referring this back to the committee. You cannot change the opinion of the committee on the subject at all. It is for the consideration of the convention; let the convention decide.

Secretary Brockway: That is what the standardization committee said at Boston, and they changed their minds.

President Duffy: The standardization committee didn't change their minds, they changed their classification. I think to recommit is a proper procedure. Does any gentleman wish to make that as an amendment and have it acted upon?

Mr. Wilson: I offer it as an amendment.

Mr. Ham: I am perfectly willing to withdraw my motion. That will make it simpler.

President Duffy: My idea would be that this resolution should be, if you will permit the chair to make this suggestion: "Resolved, that this association recommends the adoption of the car-hour as a standard unit of comparison, with the understanding that it is to be put to a practical test by each company represented in the membership of this association, either in connection with the car-mile or not, as they may see fit, and that the committee report back at the 1901 convention."

Mr. Wilson: I don't like that phrase recommending the "adoption." It is true that we go on to explain it afterwards.

President Duffy: Suppose you use the word "use," instead of "adoption."

Mr. Wilson: I think it will be better, possibly.

President Duffy then put the question on the adoption of the resolution as amended, and it was adopted unanimously.

President Duffy: A matter that I would like to speak of is the Railway Officials' Private Report and Reference Book, that I referred to in my Address as President. The publishers, Messrs. Hanna & Gray, have left with Mr. Brockway several copies of the book. Any gentleman belonging to this association who desires one of those books will be very cheerfully supplied, if he will simply fill out one of the cards that Mr. Brockway has, and if he would prefer to have the book stamped with his name, if he will turn the card in Messrs. Hanna & Gray will send the book as soon as they can give the order to the printer. But if members wish the book now, by simply leaving the card with Mr. Brockway, he will provide them.

Secretary Brockway: There is one matter which is very close to my feelings with regard to the association, and that is the membership. It has been, I can almost say, our habit to go away from the conventions with fifteen or twenty members gained at the convention, and for your information I want to say that we have thus far gained two at Kansas City. We are considerably behind our record, and we are going to need the constant co-operation of all the members to gather in those who are not with us at present; if I can feel sure that everyone is keeping that in mind in talking with other railway men here, I think we can leave here with our usual record.

Mr. J. M. Smith: How would it be for some person or some member of the American Association to take up our cause and speak to the managers who are attending the convention on the other side of the hall, with a view to increasing our membership. There are managers here who could speak for their companies and join us while they are here in convention. If it is left for individuals to go around, we do not meet them to know them at all. I do not know one in ten.

President Duffy: I will speak to the secretary, and see what can be done in relation to that.

Secretary Brockway: We have a plan in mind for securing the co-operation of the secretaries this coming year, the secretary of the American Association working among its members who are not members of this association, and vice versa, but the idea I had in mind was to strike while the iron was hot and while we had them right here, subject to personal influence.

On motion the convention adjourned until 10 o'clock Thursday morning.

THURSDAY OCTOBER 18TH.

President Duffy called the meeting to order at 10:40 a. m. and at once announced the first paper.

DEPARTMENTAL ACCOUNTS.

By H. L. Wilson, Auditor Boston Elevated Railway Co., Boston, Mass.

In an unguarded moment I yielded to the request of our worthy president and agreed to prepare a paper on what he has seen fit to call Departmental Accounting. Three weeks ago the task was taken up for the first time, and it at once occurred to me that it was too broad a subject to attempt to cover in the limited time that should be devoted to a convention paper, and I so informed him and begged to be allowed to change it, but while he acknowledged it would be a difficult matter to digest, and as he put it, could be extended to the "length of the Holy Bible" he still insisted on my sticking to this title. If I was only sure that a book of this kind would have as large a circulation as the one he mentioned, I would give up accounting and go into the publishing business.

I will try, however, to give simply a rough outline of the system that we have adopted as the best method of handling labor and material accounts so as to have the maximum amount of quickly available information with the minimum amount of clerical help and expense, and trust that the members present will ask any

H. L. WILSON.

questions that may suggest themselves and in that way bring out any important points that may have been overlooked, as this is not submitted as any pet scheme but simply as the best method that experience has suggested up to the present time.

In the first place I am strongly in favor of having all accounting so far as possible, done in the main office of the auditor, rather than at the shops or department headquarters. There are several reasons for this, prominent among which are: That there must always be a responsible head to properly direct the efforts of others, and if it is all done in one place a really bright chief clerk may be employed, to whom a proper salary may be paid, who can have a supervision of all details, and any questions that arise can at once be referred to the auditor for his personal attention. Again there are times when the entire force can be put on some special and important piece of work that it is necessary to have completed at once; there are other times during the month when the pressure of work is such that some of the clerks can be engaged in collecting together the less important matters that have been allowed to accumulate during the busy time.

Another and very important reason is that there may be instances where estimates have been given of what certain work would cost, where the expenditures have greatly exceeded the estimate, and where it might be thought advisable by the head of the department to make transfers to other and improper accounts in order to substantiate the original figures.

When information is desired a question can as well be asked in one place as another and certainly a more prompt and probably a more intelligent answer can be obtained from the place where all accounting is done than it would be possible to get by consulting several separate departments.

If, as is the case of the Boston Elevated Railway Co., there are several departments, any one of which may do certain work properly chargeable to another, it simplifies the accounting to be able to post the details to the proper account direct, and avoid the trouble of making charges and credits back and forth which would be necessary if the accounting of the departments was done at separate places.

The four departments into which the Construction, Equipment and Maintenance forces are divided are as follows:

Department of Motive Power and Machinery.

Department of Wires and Conduits.

Department of Buildings.

Department of Maintenance of Way.

No claim is made that the system as it is at present arranged is applicable as a whole to all companies, but the fundamental principle which is the order number system can certainly be applied to any road.

The method of issuing order numbers varies somewhat in the different departments.

In the shops the method is to have the superintendent or foreman give each class, and in many instances each piece of work performed, an individual number. The first order is numbered one and then they run along consecutively for two or three years or until there is no chance that by beginning over again the numbers will in any way conflict.

When an order is issued a copy of it is sent to the Bureau of Audit so that the auditor may determine from the nature of the work the account to which it should be charged, entry is then made upon cards provided for this purpose which have headings for the Order Number, Account Charged, Date Issued, Date Completed and Description of the work. Below are printed spaces for the Month, for Labor, for Material and Invoices, for Shop Expense and for a Total of the above charges.

These cards are made double or folded over at the top, so that by using a small carbon sheet a duplicate can be made with only the labor of one entry. The advantage of this system, is that by separating the card when the order is completed you have an opportunity of making any number of separate and complete lists without in any way interfering with the original files which can still be kept in their numerical order.

If you want to know what the charges have been to any account, what kind of work has been done for any department, an alphabetical list of all work or anything of this kind, it only requires a new deal of this extra pack, to have the information in such shape that it can be quickly utilized.

The labor is reported weekly on sheets which have a heading for the Name, for the Date, for the Rate of Pay and for the Occupation; below are provided columns for the Order Number, for the Days of the Week, for the Total Hours and for the Amount. This sheet has some 35 lines and provides in this way for a man who may work on 35 different order numbers during any one week.

The pay roll of course can be made by simply taking the total hours from the bottom of the sheet, while the charges to the order numbers are made by taking the amounts from the Amount column. These labor charges are abstracted on sheets of the same size as the time blanks and all are then bound together in book form with these abstract sheets as the front pages, and the entries made upon the cards from this form. The advantage of this is at once plain; you have the card which shows you the date and you can quickly refer to the abstract and if necessary by referring to the following pages you can at once tell the names of the men who worked upon the order as well as the days of the week and the hours each day that they devoted to this particular order.

The material used each month is reported on a sheet which has provision made in the printed heading to put in the Order Number, and below spaces for Quantity, Kind of Material, Price and Amount. These sheets are abstracted and bound in the same manner as the time sheets mentioned above.

We require all parties of whom we purchase supplies to use bill heads which we provide. These have spaces at the bottom in which to place all approvals and a space for a notation of the account to which the goods should be charged. Before adopting this idea, bills frequently reached my office in such a condition that it was difficult to read them, they being pretty well covered with rubber stamp impressions and signatures.

When charges apply to any department the bill is entered upon

an invoice book which has spaces in which to make a copy of the invoice and enter the total amount, and separate spaces headed with the name of each department. These last spaces are subdivided into columns for Amount and Account to Charge.

By abstracting each of these columns you have all the information necessary to make your entries to the proper accounts and the totals of all will prove the total of the invoice book.

Any general expenses of the shops are charged to an account called shop expense and this is divided each month among the different order numbers under which work is being done.

The Department of Motive Power and Machinery has several subdivisions such as Machine Shop, Car Equipment Shops, Car Repair Shops, Armature and Field Winding Shops, seven Power Stations and has also charge of small maintenance crews in each of the 30 car houses.

I have explained the system of reporting all labor, material, etc., consumed at the shops, and the methods of making returns from the other places are so similar that I will not occupy your time with a description of the minor differences.

Blanks vary somewhat in the headings but the idea that we have attempted to carry out, is to have them all of a nearly uniform size so that they may be bound in the little booklets before referred to.

A large number of them are arranged in manifold books so that there is always an exact copy of what has been sent to the main office and as each blank is numbered we at once know that something has gone astray if they do not run along consecutively.

By having a large cabinet with drawers arranged for each kind of report, ready reference can be made to any or all original time or material sheets.

In order to make a monthly report of the expenditures it is of course necessary to compile the information you have on all these abstracts.

This is done on separate sheets for each shop, power station, etc. By having these sheets graduated in size so that the upper one is the narrowest and each succeeding sheet just one column wider, you have all the totals together in a horizontal line and a grand total is easily and quickly obtained by simply adding across. The widest or bottom sheet has on the right hand side a sufficient space for the Names of the Accounts and a place for the ledger folio. In this manner the necessity of writing the title more than once is obviated and all necessity of journalizing is done away with, as these sheets bound together make a more complete and readily accessible journal than is possible to have by any other method.

For the Department of Wires and Conduits a different system of order numbers is used. It might be well to here call the attention to the fact that the company with which I am connected owns no surface tracks or their equipment, yet has in its immediate control, and operates all the surface lines in the city of Boston and near by suburbs under a lease for a term of years from the West End Street Railway Co.

This lease stipulated that the Elevated company should build no surface lines of its own, but that all additions to the surface lines or their equipment should be charged to and become the property of the West End Street Railway Co. and that credit should be given to the latter for any removals that were made.

It was therefore necessary to have a very complete and exhaustive record of all property, that could be quickly referred to and easily handled, and books of all kinds were considered but none of them seemed to cover both of the above desirable elements.

Cards were then taken under consideration and the great elasticity of this system at once recommended itself.

First index cards were prepared having for headings the names of each street, car house, bridge, etc. on the entire system.

The Electric Line Equipment had always been divided under five general headings: These were Poles and Setting, Overhead Feeder Lines, Overhead Trolley Lines, Underground Cables and Conduits, and Submarine Cables.

Cards were next provided for each separate kind of line equipment, and it was found that to give a complete analysis of the above five accounts would require the use of forty different forms of cards, and for quick reference it was decided to use several colors as well as number each card on a small tab or projection from the top.

For Poles and Setting 13 buff cards were used which are num-

bered from 1 to 13 consecutively. The first 4 are used only for the 4 sizes of iron poles which are the sole property of the West End company. The next 6 are used for wooden poles which are owned jointly by the West End company, and some other company. No. 11 is used for wooden poles owned exclusively by the company, No. 12 for special poles and bases, and No. 13, for span attachments to buildings.

For Overhead Feeder Lines 8 cards were provided: they are blue in color with tabs numbered from 14 to 21.

The first 5 of these cards are used to designate the amount and size of different kinds of feed and return wire. No. 19 is used for feed taps, No. 20, for switch boxes and No. 21, for track connections.

For Overhead Trolley Lines 3 cards are used, being salmon in color, numbered, 22 which is used for bracket construction, 23 which is used for insulating joints and 24 which is used for trolley wire.

For Underground Cables and Conduits 8 cards were provided: they are buff in color and are numbered from 31 to 38.

The first 2 numbers are used for Feeder Cables, the next 3 for Return Cables, the next for Feeder Cable Connection, the next for record of Conduit and Manholes, and the last for Conduit Connections.

The next 8 cards are used for records of Submarine cable for return wires; the first 4 numbered from 51 up are used for the Feeder Cables, the next 4 are used for Return Cables, and the last for Cable Houses, Switch Boxes, etc.

In order that the Wire and Conduit Department should report its expenditures in such a way that the Accounting Department could make the charges to the proper locations, a system of order numbers was devised to be used whenever additions to or removals from existing construction were made.

First each kind of equipment called for by the cards was given a number which corresponds with that on the tab of the card, and each Street, Car House and Bridge on the entire system was given an individual number commencing with 100. By preceding the number designating the street by the number designating the kind of equipment you at once have all the information necessary to tell to what location and to what account the labor and material should be charged.

This method furnishes many thousands outstanding order numbers any one of which can be readily selected from the printed list containing less than 600 numbers.

The labor is reported on the same form as that previously mentioned for shops, but the material sheet is somewhat different.

It is impossible for a foreman to always know exactly how much material will be used on any one job, and frequently he is called upon to do work on several locations without going back to the stock room, and thus it is necessary to provide some form by which he can draw stock and report what he uses.

This is provided by a manifest on the face of which is entered the material drawn. The back of this sheet provides for a report of the material used and a report of the Material Returned. The "Note" printed on the front side of the sheet reads as follows, and explains its use:

"NOTE:—This manifest is to be retained by the person responsible for the material issued upon it until every article is accounted for on the opposite side of this form.

"All material issued upon this manifest which is unused on the last day of the month must be returned to the Storekeeper for inspection. The Storekeeper will receipt for it, re-manifest it or stamp this manifest 'Inspected' as occasion requires."

These manifests are made in duplicate by the manifold system, and a correct copy of the original issue of stock is always in the keeping of the storekeeper.

At the end of the month the reports of the Material Used are abstracted on the same form mentioned for shop orders and are bound in the same manner.

The Department of Buildings is chiefly occupied with the repairs and renewals of buildings and in order to answer all questions propounded by the management and by the Bureau of Real Estate a system of order numbers was gotten up for its use. The principle here employed is similar to that of the Department of Wires and Conduits each kind of work has a classification number and each building has one or more numbers which designate the building and in some instances the different portions of the building. The

method of reporting labor and material is the same as that used for the shops.

The Department of Maintenance of Way as its name implies, has charge of the repair maintenance, inspection and construction of track and paving.

Order numbers are issued for any new work or for any extensive renewal or repairs by the Civil Engineer, who sends a notice to the head of the Department and also to the Bureau of Audit.

The department is divided into eight Divisions, called sections, and each carries a supply of the material they are continually using.

Each section's stock is carried under the following 13 accounts:

- Gravel
- Paving Stone and Flagging
- Lumber and Ties
- Nails and Spikes
- Rail Fastenings
- Tie Rods and Buttons
- New Rail
- Old Rail
- Special Track Work, Frogs and Switches
- Miscellaneous Material
- Track Welding Material
- Scrap Material and
- Track Wiring Material.

When material is received at a section which is to be included in any of the above stock accounts, the person in charge immediately enters upon a form provided for that purpose, the date, the firm's name or section from which it is received, and the quantity and kind of material.

These reports are numbered consecutively, and are sent to the Bureau of Audit where all bills are entered on an invoice book which is abstracted each month, and from this abstract charges are made to stock accounts or to jobs direct.

When material is used or sent away, entry is made on a form which gives the Date, Where Used or to Whom Sent, Quantity and Kind of Material, Price, Amount, Account to Charge and Account to Credit.

These sheets are abstracted twice, once to get totals for the charges and once to get totals for the credits, and are bound and filed away in the usual manner.

When material is received from track taken up, or is returned from any work, it is entered upon a sheet which provides for the Date, Where From, Quantity and Kind of Material, Price, Amount, Account to Credit and Account to Charge. These are abstracted and bound in the same manner as the Material Sent Away sheets.

All labor is reported on a form which has the usual heading, and provides below for a separation of Maintenance and New Construction charges, as well as the location where the work was done and the particular kind of labor that was performed. These are also abstracted and bound.

We will now suppose we have four kinds of bound books from which we are to make up our monthly report for the department.

We take a report blank and head it with the name of the section. This blank has columns provided for Approved Entries, for Each Kind of Material, for Approved Bills, for Labor, for Total Charges and Credits and for Net Charges and Credits; and down the right hand side has accounts to which charges and credits are to be made.

We then take the abstract of the invoice book and enter with red ink on the first line opposite the headings Approved Bills Charged to Stock the total charge to each kind of material; next we enter with black ink in the Approved Bill column, all other items on the abstract putting each one on the line opposite to the account to which it is to be charged.

Next we take the Material Used or Sent Away abstracts, and under the proper material headings and opposite the proper accounts, we enter in black ink these items.

Next we take the Material Taken Up or Returned abstract, and with red ink enter under the proper material heading and opposite the proper account, all these items.

Next we take the labor abstract and enter in red ink under the proper material headings the charges for labor on account of each stock account, and then enter in black ink in the column headed Labor and opposite the proper account, all other charges.

There is one other column on the report sheet of which no mention has yet been made; this is the first one on the left hand side, and is headed Approved Entries. This was provided to take care of journal entries, as the use of this report obviates the use of the customary journal.

Any entries necessary to transfer one account to another are made on journal blanks, and these are dated, numbered, bound together and abstracted, and from this abstract entry is made upon the report sheet.

By now footing these sheets across, you get the total charges and credits to each account, the black figures being debits and the red figures credits, and by footing the columns of material up and down you get all the debits and all the credits to each kind of material account; in this instance, however, the red figures are debits and the black figures credits.

Only one section has the accounts printed down the right hand side of the sheets; the others all leave off with the column headed Total Charges and Credits, and by placing these sheets side by side you have all debits and credits from all sections opposite the account, and the net debit or credit can at once be ascertained by adding these amounts together, and by carrying the net result into the column headed Net Charge or Credit you have only one amount for each account.

All items appearing in this column are then posted to their ledger accounts, and the footings of all material columns are debited and credited to their proper ledger accounts, and the sheets are the most complete and compact journal it is possible to have, as you can tell at a glance every item that went to make up the total of any account and what section furnished the labor or material.

When any work of this kind is completed the Superintendent of Tracks sends a report to the Auditor giving the date that the track was finished.

A detailed statement of all labor and material charged is then made up and this is sent to the Civil Engineer who can at once tell from this report whether or not the proper amount of material has been charged, and he reports back in such a form that the information can at once be distributed on the cards provided for a report of the track mileage.

These cards number some 17. The first 4 are used to designate the different kinds of rail and have spaces provided for the Date, Kind of Paving, Remarks, Added, Removed and Amount.

The last 3 are used for a record of the three kinds of special track work namely Girder, T and Tram, and have additional columns in which to record the name of the maker and the type of work.

These cards together with those provided for the electric line equipment are filed in a cabinet back of the proper index cards giving the name of the street or car house.

If at any time you wish to verify the records of any street it is a simple matter to take all the cards for that location, put them in your pocket and check them on the spot.

In closing I would say that I have a set of blanks with me which I will be glad to show and explain to any member who wishes to look them over and if it is thought advisable to publish this paper in the report of this convention it will give me great pleasure to arrange them in such a way that they can readily be referred to.

Mr. Hibbs: I would like to ask Mr. Wilson what clerical force he employs. It is rather an elaborate system.

Mr. Wilson: We have fourteen men. It is the system that makes it possible to handle it with that number of men. You avoid a great deal of work that it is customary to do. It might be interesting to know that in that office, with these 14 men, with the order numbers and the records, are over 60,000 accounts, all of which, are liable to be active at any time.

Mr. F. E. Smith: You file these away from month to month, don't you; what you might call the journals?

Mr. Wilson: Yes.

Mr. Smith: Suppose you do some more work in the following month on the same job. Is there any reference made on the first entry that it is continued in another month?

Mr. Wilson: No. You would take it from your cards, and your cards would show what month it was charged in. All you have to refer to is the report of that particular month. The same order number applies in different months. The order number is fixed like an account number.

Mr. Tripp: I would like to ask Mr. Wilson if he makes two postings, one to the cards and one to the expense ledger. I assumed that he keeps an expense ledger as distinct from the cards.

Mr. Wilson: That comes from this report. As I say, it is made up; you make one posting from that, of details. The details are posted from the cards, the details of your expense ledger.

Mr. Moore: I would like to ask Mr. Wilson, in the case of the storekeeper issuing materials on these manifests, what record or account does he charge that to in his record so as to keep tab of it as it goes out and comes back.

Mr. Wilson: That is done in the manifold book. It is to all intents and purposes in his stock until it is reported consumed or returned.

President Duffy: You spoke of 60,000 accounts, and said each order number had a standing account. Now I would understand that account No. 1, for instance, maintenance of track and roadway, had a certain number of subdivisions. You spoke of some six or seven. Then there is a second number of order numbers in each one of those subdivisions, like the paving, the rails, and so on. Isn't that the way it operates?

Mr. Wilson: No. Any maintenance charges would be charged direct to the operating expense number, unless it was a very large track job, where the street was being relaid or something of that kind, and then the engineer would give it an order number. For the ordinary matters we do not have the order number.

Mr. Tripp: Mr. Wilson, if a street was numbered 100 and the figure 1 represented track maintenance would 1100 mean track work on a certain street?

Mr. Wilson: Yes, the Maintenance of Way Department; we do not use those numbers except for extraordinary work, but number 1100 would mean that it was No. 1 pole on a certain street. If it was 2100 it would mean it was a No. 2 pole on the same street. We have about 100 operating expense accounts. We have no subdivisions of those accounts whatever, but by this system I speak of, by reference to the monthly reports of the department, you at once know every labor item and every material item, or any entry, by referring to the report. If you wish any further information you go to the drawer, pull out this little booklet I referred to, and then, if it is a question of labor, you can tell the men's names, the day of the week and how many hours of each day they worked on it, because it is all there together. In the same way, if you wanted to know the material, you could tell with the minutest detail what the material was.

President Duffy: You have your expenses divided into 100 accounts, where the classification has only 38.

Mr. Wilson: Yes. The Boston Elevated Ry. has not adopted the standard system of street railway accounting because the railroad commissioners of Massachusetts are the only ones in the United States that have not adopted it.

President Duffy: The reading of this paper and the important paper that is to follow suggest something to me that was discussed with us today by a gentleman very prominent in the other association. That is the practice of some associations of printing their papers in advance and sending a printed copy to each member, so that before they come to the association meeting they can digest the papers and can select from them particular things that they want to be informed upon, and can bring up points for discussion. This practice in associations of a similar character to this one has proved to be a wise one, and I think it would be well worth the consideration of those who are to direct the affairs of the Association next year as to whether we should take up this practice.

The next paper is:

MATERIAL AND SUPPLIES ACCOUNT.

By W. M. Barnaby, Accountant, Brooklyn Rapid Transit Co.

I wish at the outset to state just what I am going to try and explain, and also to give the explanation with sufficient clearness to be understood.

Material and Supplies Account is but a branch of the bookkeeping of any concern and the method of keeping is to be determined by the results looked for. Some one has said that "bookkeeping was but common sense properly applied." I trust that I can prove the truth of this saying as applied to the keeping of

Material and Supplies Account. In the first place what are the results to be obtained?

A correct record of all material and supplies received, showing kinds, quantities, price and from whom bought. A correct record of how used, showing the quantities and values as applied to operation, maintenance or construction as the case may be.

A record which will show at any time, the quantity of any particular stock on hand. A record that will show the various kinds of materials and their value charged to any particular expense or account.

These I think are the main results looked for in keeping Material and Supplies Account. As a basis for accounting in this department of bookkeeping the Stock Ledger is the first consideration. This book should contain the record of all receipts and all expenditures of Material and Supplies and when inventory time comes around gives the value to material and supplies on hand. A Stock Ledger laid out with three accounts on a page is suggested, a book of 800 pages giving some 2400 accounts. This should be opened with the accounts running alphabetically for convenience in locating. This is made so as to give each month practically a separate record. A trial balance can be taken monthly if desired.

The postings to this book are made from the record of materials received and from the consumption sheets which I will explain further on.

After the Stock Ledger, comes the book containing the record of materials received, which for convenience, we will call Book No. 2, the Stock Ledger being No. 1.

This book gives a complete record of all stock received, showing from whom received, quantity, price, kind, value, order num-

W. M. BARNABY.

ber, Reg. No., how shipped, etc., in fact a complete record of each invoice. From this book the postings to the Stock Ledger are made. This book is made on the loose leaf plan, which permits a page, when filled up, to be taken out, allowing the posting to the Stock Ledger without interfering with the work of the receiving department.

We now come to the taking out of stock, and the method of changing to the proper expense or construction account.

All materials and supplies drawn from the stockroom should be drawn by order on the stock clerk, properly signed by those authorized to do so. The form of order is in duplicate, so that each department has a record of what materials or supplies it has used during the month. The order must also state for what purpose drawn. By taking the classification of Expense Accounts, as adopted by the Street Railway Accountants' Association of America, and giving the numbers and letters, the accounting part becomes very simple.

Any special expense or construction account can be kept by the mere giving of some special number or letter to indicate it. In this connection, it should be remembered that labor charges should be similarly treated to have uniformity of accounting.

Orders on the stock clerk are charged daily on the Consumption Blotter, which is made up of a number of sheets properly ruled. The Consumption Blotter is the record of quantities and values of materials and supplies used daily, the name of the materials or supplies being written in the margin and the quantity

and the expense account being indicated. The unit of value is also given, being taken from the Stock Ledger.

After orders on the stock clerk have been posted on the Consumption Blotter the amounts thus charged are analyzed; first, as to the amount charged to each expense account; secondly, as to the value of each kind of material charged. The first result is, in turn, posted on blanks which are the final accounting as to expense or construction charged. The various accounts to be charged are written in at the top and the result of the analysis of the Consumption Blotter is set down daily under the proper heading. At the end of the month the footings of these sheets give the cost of materials and supplies charged to each expense or construction account. The second analysis of the Consumption Blotter is transferred to other blanks for the record of amount used daily of each kind of materials or supplies and from this the postings to the Stock Ledger are made, the value of the materials used balancing with the total amount charged to expense or construction accounts. This form has an additional value, in that it shows just the quantity of each material or supply used monthly, which is a good help to the stockkeeper in determining how large a quantity he should carry, and also enables him to make out his requisitions on the purchasing agent, with intelligence. When more than one stock account is kept and goods are being transferred from one store-room to another a proper transfer order should be used which will indicate the kind, quantity and value of stock so transferred, and also indicate from and to what stock account transferred. These orders which should be numbered are treated by the stock clerk the same as any invoice and should be posted in the record of materials and supplies account and charged out in the regular course.

On the question of putting through material and supplies account bills covering large items chargeable to construction such as car bodies, trucks, motors, generators, etc., I think the method of direct charging preferable. At the end of each month the stock clerk should report to the auditor the amount of materials and supplies received giving a list in detail of bills passing through his record of materials received, also the value of materials and supplies received through transfer from other stock-rooms. This blank gives the quantity on hand on the first of the month, shows all debits and all credits to Materials and Supplies Account, and enables the auditor to check the Materials and Supplies Account as shown by the stock clerk with the general books of the company.

In connection with the Stock Ledger a card system is recommended. Each kind of stock having a card showing the quantity on hand also stating the number of the bin, shelf or drawer in which it is kept. As the orders are filled by the stock clerk the cards are credited with the quantity taken out so that the quantity on hand at any time can be ascertained. Some may say that the time involved would not warrant the keeping of such a system of cards, but I can state that a system covering between 5,000 and 6,000 different stock items can be posted in three hours. The value of knowing that a certain article is needed is obvious to any one familiar with the keeping in repair of car and motor equipments. By such knowledge an emergency order for the particular material or supply needed can be given and a "multitude of friction" thus covered. On this card in addition to showing quantity on hand, a provision is made to show the quantity of such materials and supplies ordered, but not received, which provides against duplicate ordering.

In the matter of manufactured articles such as commutator bars field coils, etc., where the amount made up in a month might be sufficient for a much longer period and it is desired to charge to the expense account only the amount used, the stock clerk would have to set a value upon the product, debit his Material and Supplies Account, the same as for any purchased material or supplies, and set it upon his Stock Ledger and reduce by a like amount his report of such expense accounts for the month. The custom is, I think to charge direct to expense, all material taken out of supplies for such manufacture as though actually used during the month. Only a few of the larger companies do any manufacturing.

I think I have covered the principal features of Material and Supplies Account. It may be that some of the minor details have escaped in condensing this into such a short article, but if there be any particular point not touched upon which someone is interested in, I trust he will not fail to make it known.

In any system of accounting, accuracy is the keystone, and that particular feature should never be lost sight of.

Mr. F. E. Smith: I would like to ask Mr. Barnaby if the material charged out in any one month is charged out at the average prices of the material on hand at the first of the month.

Mr. Barnaby: The unit of value of stock is determined by bringing down what you have on hand at the end of every month, and you establish probably a new unit of value. Of course, in taking up what we call the consumption sheet, we use a certain quantity of any article, which, at the unit of value, gives a figure for the expense, and we bring down the balance in the bin or shelf, and get a value of stock on hand. If it happens to be bolts or gears we know what we have up above, and at a glance can tell whether the price which the unit gives the results, is a fictitious one or not; and it can be adjusted and checked. Practically the unit of value is reset every month, on the first of every month.

Mr. Smith: You might have had a lot of material, say, on the 5th, and used it on the 15th, and that may have changed the price, the average price of what you have on hand. Now if it was used on the 15th, would you charge it out at the average price of the 1st or as of the date that you used it?

Mr. Barnaby: By the use of this consumption blotter, if we had 1,000 on hand at 10 cents, we would charge out the first 1,000 at 10 cents, and just as soon as we got into the next lot we have our price indicated.

Mr. Smith: You charge them off then at two different prices, not as an average?

Mr. Barnaby: We would, then, yes.

Mr. J. A. Harder: Our store-room accounts are not conducted on a very thorough system. We aim to charge out material at an average price and let it go at that, and take an inventory occasionally to see whether we are running short or over and adjust it from that on. We do not keep a very elaborate set of books.

Mr. Stone (Worcester, Mass.): I can say very little to add to the information that is desired on that subject. The road that I represent is a comparatively small one. Our system is accordingly a small one. It is accurate so far as it is carried out. It is a very simple system and would not apply to the larger roads. We charge directly every purchase to the particular account for which it is bought. We take an inventory at the end of each month whereby the stock on hand at the first of the month is given. Added to that is the purchase which has been charged up to the particular account, which is set down, and an inventory is taken at the end of the month both by a book record and by an actual record. At the end of each month we have practically an inventory that covers the maintenance items and the construction items, separated each month and credited back to the several maintenance accounts and the several construction accounts, which ever they may be, and we charge to supplies and credit to operating expenses or construction accounts whatever material remains in hand; charge up each month again and start over. It is very simple and at the same time it is a system that can be applied to a small road so as to arrive at very accurate results. I am quite interested in hearing these papers, particularly the paper that has just been read, because a different system of accounts may be applied to our road later on, and that which applies to the larger roads is what I am particularly interested in.

Mr. Frank J. Suda (St. Louis): All the material that comes into our storeroom is given a lot number and we use the card system. On this card we place the lot number, the name of the article, from whom purchased, the date received, the quantity received, the valuation, which is taken from what I call the receiving sheet, which is kept by the storeroom keeper. When the article is given out it is given out by the lot number, and in that way I get the quantity and the valuation. At the same time I get the account in which the material is charged. Every man that comes into the storeroom gives his individual receipt for the material that he gets, and must state for what this material is used. These little slips are then taken up twice a month, on the 15th and on the 31st, and are entered on what we call our maintenance sheets, which are properly headed with the accounts to which these various items are charged. That also applies to castings. Every casting receives a number. No pattern is made without a number being given it, and when it is charged up or given out, it is given out by this lot number. I lot everything except screws, bolts of all kinds, cotter keys and such minor things as those, and at the

end of stock-taking time, I offset one way or the other. So I think on the matter of lotting the articles and the castings I offset at the actual valuation both ways every time. If by some means or other the entry clerk makes a mistake in charging out, if he charges out \$10 too little, when he comes to balance out that particular lot he knows exactly whether he has been charging it properly, on the right valuation, and he can also check the storekeepers at any time by referring to his cards and asking the storekeeper how much material he has of this particular lot, and he knows whether the storekeeper has let any of this material slip through his fingers without getting a charge for it. Our system is not exactly as I would like to have it, and I am looking for some improvement if I can get it.

Mr. P. V. Burlington (Columbus, O.): We do not run a supply house account. We take care of all the purchases and use of material and supplies through general ledger accounts. The larger purchases, such as rails, ties, wheels, poles, perhaps all together 15 or 20 such accounts, we hold in what we term an open account, and we charge out approximately each month what would naturally belong to that month, and so far we have been very successful in approximating and have kept our operating expenses per cent at a very regular figure. We have had no difficulty whatever. Of course we do maintain in our shop our supply account, but it does not come into the audit office. It is simply as a matter of record for the shop department. All other materials, track, overhead, etc., are taken care of as I stated.

Mr. Mitchell (Pittsburg): We run our shop accounts, material and supplies, in about the same way. We find it works very satisfactorily. We take an inventory about once a year.

Mr. W. G. McDole (Cleveland): I would like to ask Mr. Barnaby what he does with his freight and cartage and handling of materials?

Mr. Barnaby: All the trucking we do we run it through a department and they have a card system there, and all the expenses of that department are charged to a trucking account. The cards are analyzed and the value of the truck per day is set down at a sum per day. The cards are charged out, as the cards indicate what work they perform, and it is set up as an expense item, charged to the account, and the trucking is credited. Of course at the end of the month, or a period of months we get a slight debit or credit which we adjust by taking off a slight percentage of the charges. The bigger trucking charges go through the trucking department; there is very little of that trucking that we get, as our purchasing agent makes it a rule to purchase everything f. o. b. dock, and the handing of supplies from the shops to any minor jobs we charge to a shop expense account direct.

J. M. Smith (Toronto): Our system of material and supply is somewhat similar to some which have been explained here. I run what we call a material order book in which every requisition for material is first entered, and as the goods are received they are reported to me on a daily sheet, all the materials received. I might say, first, that I control all of the clerical work in connection with it in my department, that I got this daily sheet of all goods received, fully explaining it, giving them a number, etc., and they are checked and entered as against the requisitions, in the material book, so that we have the requisition entered as filled. Then, for any freight, duty, or any charges like that I have separate columns, and that is added to the cost of the goods to give me the price of that material. The material is summed up at the end of the month, and then I have a sheet that is sent to me daily of all materials delivered out of the stores, giving the classification and accounts that these are to be charged to. That is then kept track of in a subsidiary book until the end of the month, and then posted to this material order book and subtracted. That, you will see, leaves me the balance of material that is there in hand and can be taken off, as I do, giving the full detail of all the materials on hand at the end of the month, practically an inventory of the goods. I have found that it was very satisfactory, and I have a pretty good check on the storekeeper, because if he is making any charges that are not correct he will find himself short at the end of the month. I am always open for suggestion and I appreciate this paper read this morning very much.

Mr. Hibbs: I would like to ask Mr. Smith under whose direction or supervision the storekeeper comes. I understand from

Mr. Smith that the requisitions go direct to him. Is that as it ought to be?

Mr. Smith: The storekeeper is practically under my own control. All requisitions are made out and then a copy is sent to me; the requisition is forwarded to the merchant and a tissue copy is sent to me and entered.

Mr. Ehrhardt: We charge everything direct as it is purchased and ordered, probably the same as you do, or used to. Of course, we have a storeroom and keep a stock on hand but we make no charges nor entries from that storeroom. Everything is charged as it is purchased.

Mr. Burlington: It seems to me from inquiries made when this paper was brought up that it might be a valuable work for this association to appoint a committee to formulate a uniform system in this particular line. It is a vital question and I realize that the property with which I am connected is getting a little too unwieldy for the plan on which we have been operating our material and supply account, and I am very glad to have the privilege of listening to this discussion, because it is coming right in the line that I desire. I would like to hear some expressions on that. It seems to me that it is a valuable work that this association might take up. We have to have something to further perfect our system of accounting, and would it not be proper and wise to give this matter some attention?

Mr. Mackay: I would suggest that we might take up in each meeting a few of the necessary blanks and forms, and establish those few. We could standardize a few of the forms, and in that way gradually get the whole thing in shape.

As far as our storeroom accounts are concerned, I think I explained at the last meeting that we charge out all reconstruction work direct, the items not passing through the storeroom account at all. In all expense accounts most of the items pass through the storehouse, but where an item is purchased and sent direct to the work, for instance, oils or material for power plant, it is charged direct to the plant. We always make it a point to charge it out. Anything that goes through the storehouse is charged out at a figure which exceeds the cost sufficiently to take care of the cost of handling and to take care of the breakage or depreciation in the value. In that way at the end of the year our inventory always runs in excess of the ledger account.

Mr. Tinglan: I think however that on the intake I can give you a little light. Our requisitions are all made in duplicate. On the back of the duplicate requisition there are ruled columns for the date of the receipt of the material, the quantity, price, and if it comes in car load lots there is a place for the car initial, number and weights and a complete record up to the date of the receipt of the invoice. We use our own invoice form, which is in duplicate, the duplicate remaining in the city railroad office, the original returning to my office. On the face of that is a place for freight charges, the initials of the man who receives the goods, the certification that they are correct as to quantity and quality and the approval of the superintendent and the account to which it is to be charged. All our purchase orders are issued in triplicate. On the back of the triplicate purchasing order is a ruling identical with that on the back of the duplicate requisition. We take the bill which is returned to our office, and keep a duplicate record of the receipt of the material and all the details that go on the back of the original. The storeroom ledger is kept in the subsidiary office. We keep a storeroom account on our general ledger for that particular office in my office. These two ledgers must balance at the end of the month. On each job the foreman gets from the superintendent what our boys call a green goods order. It is a duplicate order numbered consecutively, but in front of the number is a place left for a letter designating the class of accounts, "a" being for track, "b" for ties, and so on. When a man comes to the storeroom with this order, the letter is put in front of it, he gives that up and receives a material sheet on which is entered all the material drawn from the storeroom. There is a place for a credit back if he returns any and a place for this order number. That is all he knows. He does not know anything about the account. He is given a number and a letter by the superintendent, and that is placed on his storeroom order. When his material is returned the proper credit is given him at the storeroom for any return, and that sheet is at once sent to the office. If it is a running job we have what we call standing orders for the track repair man and the overhead repair man, but

any special job is returned as soon as it is completed. At the end of the month these are formulated and on the report which comes to my office is a charge from the storeroom for each bit of material, giving the quantity and price. From that we check up our storeroom account on our ledger. That is, in substance, the way we keep it. My record in my storehouse, I am frank to confess, is a little bit lame, and I came here with the hope that I would get some information.

Mr. Wilson: I would like to ask Mr. Barnaby one question. He said it took about three hours to post on the cards the material that was issued during the day. I thought it was your road that had the cards upon the bins.

Mr. Barnaby: That has been discontinued. It has been decided that it was easier for a man to have the cards, and get a better result than to go upon a ladder and try to post that card on the bin, more apt to get correct posting.

Mr. Wilson: Do you attempt to find all the issues of one stock and make one posting on the card, or do you make as many as may be necessary?

Mr. Barnaby: No. In analyzing the consumption blotter where it is first entered you get the entire quantity used that day.

Mr. Wilson: From this blotter, you cannot analyze your stock, but you put it down in such a way that you know what the charges are to be from the blotter.

Mr. Barnaby: On the consumption blotter is indicated the value charged to any expense account. As the orders are analyzed they are entered twice. That is, the first analysis is as to the charge that the goods are to be put to. That is indicated as the samples show there, (referring to exhibits accompanying Mr. Barnaby's paper.) the job number and the value. That is then tabulated to get the quantity of any particular material put on this consumption sheet as against that material. From that the cards are posted, so that with the quantity of goods set up on the card and the daily postings, from this analysis of the consumption blotter one can tell at a glance, as soon as these cards are posted, what is still left on hand of those particular goods.

Mr. Wilson: Then you practically analyze it twice?

Mr. Barnaby: It has to be analyzed twice practically, once for the charge and once for the quantity of goods.

Mr. Ham: I would like to ask Mr. Barnaby whether the clerks who do this storeroom accounting are subordinate to the storekeeper.

Mr. Barnaby: They are subordinate to the storekeeper and now the storekeeper is subordinate to the auditor. That is something, that, when you were there Mr. Ham, was not so.

Mr. Ham: The point is whether there is any scheme yet devised which is a check upon the storekeeper, or whether we still have to rely upon the honesty of the storekeeper. That is one of the objects of the storeroom accounts; and I am quite strongly of the opinion that it is a physical impossibility to check the storekeeper.

Mr. Barnaby: In that regard I refer to Mr. Wilson's paper. As I take it, his orders that he receives direct from his storekeepers must be certified by someone in charge. Of course, honesty in accounting finally resolves itself into whether it is the clerk who is the honest man or the auditor. At some point the honesty has got to be determined. The signing of the order under Mr. Wilson's plan is the point where the honesty has to be determined, and if he knows that that man is honest, his accounting is honest, for he takes his result, and it is a final accounting.

Mr. Ham: That is only one-half of it. The other half is the receipt of the material.

Mr. Barnaby: You have the same thing in reference to the receipt for the goods? Someone is in authority to receipt the voucher as to the goods received.

Mr. Ham: I am not criticizing the method at all. But I wish to know it is possible to check the storeroom keeper with any system of accounts. I have found that possibly we thought we were doing this but were succeeding very poorly, and I am satisfied to give it up. I do not think it is practicable, for the same reason that we see an immense department store with very little of that kind of accounting; as I understand it, none at all. But we are attempting, as Mr. Suda of St. Louis, said, to keep track of all of these items, and he says that if there is a mistake on the part of his storekeeper he can locate it on the particular account; but after he has located it the question is what good it has done. The real point in this that appeals to me is whether it is wise to keep

separate accounts of individual articles. I mean by that, a separate ledger account or separate accounts to show stock on hand of each article. It entails an immense amount of work. Is it necessary or can we get the same results by surrounding the storeroom itself with every safeguard, that is, as to material going in and material going out? Many of us have possibly kept accounts very carefully in storerooms where the storeroom itself was laid out in such a way that anybody could go in and help himself to material. It seems to me that it is the storeroom itself that should be watched. I would like an expression of opinion on this. I am keeping these individual accounts, and if possible I would like to do away with them.

Mr. Wilson: When I started storekeeping a number of years ago I started with the idea that you must keep an account of the different kinds of material, and I continued it for some two or three years, but give it up. At the present time the entire material in our stockroom is simply one lump of stock. Since doing so the results have been very satisfactory indeed. The material is received from the persons from whom we purchase goods and certified to on the bottom of these invoices. If you recall to mind my paper, I stated that we require everybody from whom we purchase goods to use our bill heads and not theirs. There is a place on the bottom of these bill heads for the approval of the person who receives the goods, for the approval of the head of the department who has the requisition for it, of the clerk who has entered it and the purchasing agent, who states that he ordered the goods and that the price is correct. Then all these bills are charged direct to the storekeeper, or to the storeroom. Material that is delivered is never delivered on any order or requisition signed by simply an employe of the company, but it must be by the foreman or person in charge. I think that answers practically Mr. Ham's question as to having a responsible person whom you can hold for the goods which have been issued. By having these original orders and demanding personal requisitions signed by the person in charge of the shop or department, it must be collusion between him and the storekeeper to work any mischief which it would be a difficult thing ever to guard against; or if it was a question of the receipt of goods, between the storekeeper and the person he would receive them from. That would be a safeguard which it would be difficult to provide.

Mr. J. M. Smith: In that regard there is one thing I did not mention. I have a check on the goods received, for the reason that I do not let an invoice go in the storeroom house at all. I said I had a daily report come to me of all goods received. They are given a number, each package just as it comes in on the counter, and are entered on this sheet. The requisition is referred to the merchant whom these goods are received from and then it is sent to my office; so that they do not get the invoice at all. I know that the requisition has been received by myself, and then that invoice is treated in my department, is given its proper number, and forwarded to them to check the prices; the storekeeper being the one who has purchased the goods, knows all about the prices. So that I get a full check and know that everything is received. If an invoice comes in that has not been advised of, I can call him to time, but our record shows it at once.

Mr. Harder: Following up one of the questions Mr. Ham asked of Mr. Barnaby, I would like to know how many companies in this association have the storekeeper under the jurisdiction of the auditor so far as the storeroom accounts are concerned.

A poll showed 18 where he was and 2 where he was not.

Mr. Mackay: I seem to be quite a minority here. In our company the storekeeper is really under the general manager, so that, while in a certain sense the auditor is brought in relation with it, still he is under the general manager.

Mr. Barnaby: I would think that it would be well to ask Mr. Ham and Mr. Tripp who are members of the committee appointed by the association to report on a system of account for lighting, gas and power companies, to report to us next year as to action taken.

Mr. F. E. Smith: I move that a committee be appointed to prepare a uniform set of blanks for the approval of the association on stores, from the purchase to the inventory.

Mr. Mackay seconded the motion which was carried unanimously.

President Duffy: I will appoint on that committee Mr. Burlington, Mr. F. E. Smith and Mr. Tinglay.

There is another important matter here that should be taken care of at once. That is, the proposition to change the by-laws, as to the time and place of meeting.

It was moved and seconded that there be no change. The motion was carried unanimously.

The executive committee reported that it had held two meetings; that it had taken three mail votes, admitting 25 companies to membership; that the books of the treasurer had been audited and found correct.

The report was accepted.

The Committee on Resolutions reported resolutions of thanks to the hosts of the convention in Kansas City, which were unanimously adopted.

Mr. Wilson, of the Nominating Committee submitted the following list:

President, Wm. F. Ham, comptroller Washington Traction & Electric Co., Washington, D. C.

First Vice President, J. A. Harder, auditor Metropolitan Street Railway Co., Kansas City, Mo.

Second Vice-President, J. M. Smith, comptroller Toronto Railway Co., Toronto, Canada.

Third Vice-President, W. G. McDole, auditor Cleveland City Railway Co., Cleveland, Ohio.

Secretary and Treasurer, W. B. Brockway, assistant secretary, New Orleans & Carrollton Ry., New Orleans, La.

Executive Committee: C. N. Duffy, auditor Chicago City Ry.; C. S. Mitchell, auditor United Traction Co., Pittsburg; C. M. Hemingway, cashier Connecticut Lighting & Power Co., New York; D. E. Tripp, auditor Seattle Electric Co., Seattle, Wash.

The gentlemen recommended were elected, the secretary casting the ballot of the association.

Mr. Harder then extended an invitation to the accountants to bring their wives, sweethearts and sisters and go for a trolley ride on Friday.

Mr. Ham was invited to the platform, and President Duffy said: Mr. Ham, permit to turn the chair over to you and to congratulate both the association and yourself.

President-elect Ham: Gentlemen of the Association; I wish to thank you for this honor. I consider that everyone of us should be proud of this Association. Personally, I have devoted some time to it, some hard work, but for every stroke of work that I have put in I have been amply repaid. If I have done anything for the association, it has done ten-fold more for me, and I believe that any man who can come to the conventions of our association will be greatly benefitted, and his company will be benefitted. It is by coming in contact with other men in the same line of work that we are enabled to free ourselves from the dust and cobwebs which accumulate in our craniums, and I think that accountants, bookkeepers, something like school teachers, are very apt to get in ruts. Each one of you can help the association very materially by doing anything in your power toward increasing our membership, in order that it may be a representative membership. We have 98 companies, and I was very sorry that we could not have made it 100 at this convention; but if each member would take a little interest in it to see that his immediate neighbors, or the companies with which he has some influence, or can get some influence in some indirect way—if he can present the matter to them and they can be advised of the work that we are doing, I think no company will care to remain outside of our association.

I am very glad that we have decided to meet at the same time that the American Association meets, as much as anything for the reason that we are brought in contact with the general managers and the general managers are brought in contact with us. I think that the effect of that will be that our work will be more appreciated, that we will come into closer touch with the operating department, be more valuable to the street railroad work, and that the position of accounting officer will become a more dignified and honorable one.

Mr. Moore: Mr. President, it seems to me that inasmuch as the various consolidations of street railway and traction companies have not reduced our membership, as we expected it would a year ago, and as our treasury is fairly full, it would be proper at this moment to recognize in some measure the work of our efficient Secretary. To that end, I make a motion that the salary of the secretary for the incoming year be advanced from \$200 per annum to \$300 as a recognition for his attention to duty.

Mr. Harder: I second the motion.

Mr. F. E. Smith: I would like to amend that. I do not think it is enough. I wouldn't do it for that, and I don't believe there are many here that would. I will move to amend by making it \$500.

Mr. Moore: I will accept the amendment.

President Ham: I understand, then, that the original motion is withdrawn and that the motion now before the house is that the salary of the secretary and treasurer for the present year be \$500.

The president put the question and the motion was carried unanimously.

A resolution of thanks to the association's hosts in Kansas City was passed, it was ordered that the portrait of the ex-president be inserted in the published proceedings, and the convention then adjourned.

DEPARTMENT OF BLANKS AND FORMS.

Like the American Association, the Accountants' devoted Friday to the inspection of exhibits and in their case the display included Secretary Brockway's collection of Blanks and Forms. These blanks have all been properly classified and conveniently arranged

EXHIBIT OF BLANKS AND FORMS.

in 15 large books, which were arranged along the north wall of the roof garden of Convention Hall, over 150 lineal feet of tables being required. Our engraving gives a very good idea of the exhibit of this department.

STANDARD PAINT CO.

The remarkable increase in the business of the Standard Paint Co. during the past year may be taken as a certain indication that the excellence of the P & B products is fully appreciated by the trade. The demand has grown to such an extent that within the year the company's plant has been increased to almost three times its former capacity. The principal manufactures are the "P & B" preservative and roof paints, insulating compounds, insulating and sheathing papers, insulating tape, ruberoid, ruberoid roofing, motor cloth and car roofing, and armature and field coil varnish. These are made at both the American and European factories.

The company is always well represented at important industrial expositions and has never failed to receive proper recognition for its exhibits. At Paris, in addition to exhibits in the American section and the Civil Engineering and Transportation Department, it erected a pavilion composed entirely of ruberoid, which was occupied by the Paris municipal customs officers. At the American Street Railway convention in Kansas City there was a full line of the company's materials, and Messrs. J. C. Shainwald and J. F. Hicks were in attendance.

A tramway is to be built from Ymir, B. C., to the Tamarack mine, at a cost of \$10,000. The contract has been awarded and the work will be finished within two months.

LONDON LETTER.

(From Our Own Special Correspondent.)

London, Oct. 22, 1900.

The problem of rapid transit in the heart of London appears to have been solved. The colossal success of the Central London Ry. shows that the citizens of this, the first city of the world, have found what they have long been looking for. Although strictly speaking, the Central London is not a street railway—since it is underground—the traffic it deals with is purely that of the streets, and its *raison d'être* is simply the relief of the traffic in one of our most congested thoroughfares, under which it runs for its whole length. Owing to the enormous rush of traffic which it is called upon to deal with, the 3½ minutes' service with which it was started, has already been altered to a 2½ minutes' service. Mr. Stevens, the chief engineer of the line, told me the other day, that they could well do with another double track, the full length of the line.

A stranger in London during August, must have thought that the "tuppenny tube," as it is affectionately termed, had a most enterprising advertising agent. Every paper in London contained paragraphs about it, and the most influential journals sang its praises in their editorial columns. But the cause of this was not advertisement, the Londoners were pleased with their new toy, and the newspaper men knew it, and so naturally led them up with tit-bits of information about it, until their imaginations ran dry.

The latest electric traction scheme in London is the Charing Cross-Hampstead railway, the rights of which have been acquired by the Yerkes syndicate. In the course of an interview the other day, Mr. H. C. Davis, of New York, who is vice-chairman of the syndicate, stated that none of the necessary capital—between \$15,000,000 and \$20,000,000—would be subscribed in England, as the American syndicate was prepared to find the lot. The work is probably to start in February next, and will take about two years to complete.

There will be two sets of line, one starting from Hampstead, the other from the Midland Railway station at Kentish Town. These will meet at Camden Town High St. and run to the Euston Station of the London & North Western Ry., thence under Tottenham Court Road to Oxford St., where they will make connection with the Central London, and thence to Charing Cross. Thus the line will form a connecting link between the Midland, London & North Western, Central London, and South Eastern Rys. It cannot fail to be an enormous financial success.

The power station is to be situated in Highgate Road. The trains are to be worked on the multiple unit system, each car carrying its own motors, so that there will be no locomotives, and nothing to limit the length of the trains. An all night service of trains will be run—the first in London—and during the day time trains will run in each direction every 2½ minutes.

The Margate, Broadstairs & Ramsgate Electric Ry. is nearly completed, and will shortly be opened for traffic. This line consists of a double track, about seven miles long, connecting up the three towns named, and running round the coast. Margate—as everyone knows—is the Mecca of the cockney "out for a holiday," and the passenger traffic during the summer months is sure to be very heavy. The company is also undertaking the illumination of the principal streets of these three towns, so that the extra demand for current from this source, during the winter months, will tend to largely make up for the loss of traction load during the slack season. This scheme was promoted by Mr. Murphy, the chairman of the Dublin United Tramway Co. and of the Cork Electric Tramways; the capital is found by a syndicate, of which I believe the larger part is Mr. Murphy, but I hear that some American capitalists are negotiating for the purchase of the concern and it is very probable that it will change hands, shortly after it is opened for traffic.

The three-phase plant for the Margate-Ramsgate road has been supplied by the Thompson-Houston Co. So this is yet another monument to American enterprise in England, and to the complete failure of the large English manufacturing firms, to rise to the occasion, and supply the ever increasing demand in their own country for multiphase power distribution plant.

A sad fatality took place on the Central London Ry. on October 6th. A conductor, named Field, wishing to see if a passenger was smoking in a non-smoking compartment, opened the gates at the

side of the platform of the car, and put his head out into the tunnel to look in at the side window of the carriage. His head struck one of the lamps at the side of the tunnel, and he was knocked off the car. He was picked up insensible and suffering from numerous shocking injuries, which proved fatal shortly afterwards.

The authorities of the Prussian State Railways have recently carried out some interesting tests of an electrically driven locomotive, which has been built for them by the Allgemeine Co., and is to be used for shunting in their yard at Eleimtz. The locomotive, which weighs nine tons, is of 3 ft. 11 in. gage; it has four coupled wheels of 43¼ in. diameter, and a wheel base of 4 ft. 11 in., and the motor has a double reduction gear of 1:5 and 1:4½. The duty it has to do is to haul 100 tons at a rate of 1 meter per second on a level track, with the power of running as low as ¾ meter per second and as high as 2 meters per second. It was originally designed to work at a pressure of 220 volts, but as this was found too low, the pressure was raised to 320 volts. When starting with no load, the motors took from 50 to 55 amperes at 310 volts; and when running light at full speed, from 19 to 20 amperes at 310 to 315 volts. When pulling a train of 16 trucks weighing over 100 tons, the starting current was 60 to 80 amperes at 300 volts and when running at full speed, 28 to 35 amperes at 300 volts. The highest speed attained when running light was 11.1 ft. per second and when fully loaded 6.25 ft. per second. The cost of this locomotive was \$2,500, and of the overhead equipment of the yard \$3,500. The total cost of running works out at about 60 per cent less than for a steam locomotive of the same power.

VAUGHAN.

AMERICAN STEEL & WIRE CO. AT PARIS.

The exhibit of American Steel & Wire Co. at the Paris Exposition was one of the most complete and interesting of the entire show. The installation was in the departments of Mines and Metallurgy, and was not placed with the other exhibits from the United States for lack of space.

On the main floor the exhibit occupied a space 50 x 50 ft. It comprised iron ores and coal from the company's mines in Michigan, Minnesota, Wisconsin and Pennsylvania; limestone from its quarries; coke from its ovens; pig iron from its blast furnaces, the quality and nature of the pig iron being illustrated by fractures; ingots, blooms and billets from bessemer and open hearth steel mills were also shown. All of these were compactly grouped near the entrance to the exhibit. In the center was an ornamental bronze pagoda with art glass roof in which pagoda are panels illustrating various manufactured products such as sections of beams, channels, angles and bars; sections of shafting, rail splices and frog fillings, horse shoes, spikes, nails and tacks, barbed wires, bale ties, fine copper wires, music wires, fine spooled wires, all sorts of chains and rivets, coiled, spiral and flat springs, clock springs, wire ropes, insulated wires and cables, sections of submarine cables, etc.

The gallery or auxiliary exhibit consisted of forty large panels, 6 x 5 ft., on which were artistically grouped products of the various departments, while in glass cases beneath the panels additional samples and test pieces were shown, the entire square being surmounted with 50 large photographic reproductions or birds-eye views of the various mines, furnaces, steamships and manufacturing establishments owned and operated by the company.

The entire exhibit was certainly a credit to the American Steel & Wire Co. It was designed and arranged under the personal supervision of Mr. P. W. Moon, 3d vice-president, and Mr. F. H. Daniels, chief engineer. The exhibit was erected at the Worcester works, then taken down, shipped to Paris, and reconstructed.

The company received four grand prizes and two gold medals, and collaborative gold medals were awarded to President Palmer, and to Mr. Daniels. The grand prizes were: Class 26, iron, steel and copper wires. Class 7, music wire. Class 63, ores, iron and coke. Class 64, pig iron, ingots, plates, bars, rods, etc. The gold medals were: Class 39, bicycle and carriage wire. Class 65, general metallurgical class including nails, tacks, barbed wire, chains, springs, woven wire products, etc. A grand prize was voted the company in Class 65, but withdrawn because it had already been awarded grand prizes in Classes 63 and 64, very closely allied to Class 65.

DEATH FROM CONTACT WITH THIRD RAIL.

October 9th an employe of the Brooklyn Rapid Transit Co. fell across the third rail on the elevated structure and when picked up was found to be dead. This is the fourth fatality from this cause in three months and is quite remarkable when we take into consideration the experience on the Chicago elevateds, and on the New York, New Haven & Hartford, where we believe there have not been any fatal accidents, and the employes regard a contact with the live rail as merely an interesting experience to be avoided in the future

CRANE CO. AT PARIS.

One of the exhibits at the Paris Exposition which attracted wide attention was that of Crane Co., of Chicago. This exhibit occupied a desirable position in the Palace of Machinery and Electricity, on the Champs de Mars, and comprised brass and iron valves and

B. J. ARNOLD'S EUROPEAN TRIP.

Mr. Bion J. Arnold, president of the Arnold Power Station Co., Chicago, was one of the delegates representing the American Institute of Electrical Engineers at the electrical congresses held in connection with the Paris Exposition, and while abroad he took occasion to visit and inspect many of the most interesting electric railway installations in Europe. His itinerary included Liverpool, London, Paris, Zurich, Basel, Lucerne, Berne, Geneva, Chamouny, Interlaeken, Milan, Rome, Naples, Venice, Munich, Vienna, Budapest, Prague, Berlin, Amsterdam, Rotterdam and Brussel.

Mr. Arnold states that from what he could learn the various three-phase electric lines in Switzerland are eminently successful in their practical operation. On the Burgdorf-Thun line a speed of 25 miles per hour is maintained. The engineers say that no practical difficulty has arisen because of the small air gap that is necessary if a good efficiency is expected of the three-phase motors, and the apparatus has proved to be reliable either when

EXHIBIT OF CRANE CO. AT PARIS.

cocks for all pressures, brass and iron fittings, steam specialties, engineers' supplies, and steam and gas fitters' tools. The exhibit was tastefully arranged, and gave an especially good opportunity to visitors to study approved modern methods of piping, flanged work, etc., for power plants—a branch of the business of this company which has become very important. The Crane Co., which is, we believe the largest makers of valves and fittings in the world, was the only exhibitor of this class to receive a gold medal.

A new engine built by the E. P. Allis Co. for the Aurora & Geneva Ry. at Aurora, Ill., began operating on October 23d.

Three-cent fares are to have a trial in Sedalia, Mo., the receiver of the Sedalia Electric & Railway Co. having determined to issue books of 100 tickets for \$3.00, passengers using these tickets not being entitled to free transfers. If the result is satisfactory the low rate will be made permanent.

acting as a motor or as an electric brake when the car is descending steep grades. The overhead work, especially at crossings and switches, is more complicated for the three-phase lines, but it presents no very serious difficulty. He heard but little concerning interference with telephone wires.

Mr. Arnold considers the principal objections to alternating current motors for railway work to be the limitations as to speed and the low efficiency at starting. The low efficiency at starting, due to losses in the resistances and also to losses in the motor windings, would perhaps make these motors impracticable for use on lines where there are many stops.

There is much activity in Europe in building light railways, what we call interurbans, and a great market for steam and electrical machinery. The British and Continental makers are beginning to realize how serious American competition is liable to become, in fact has already become, but Mr. Arnold thinks that our people have the very decided advantages of cheaper materials, more efficient workmen and better shop organization and methods.

NEW CONTACT SPRING FOR TROLLEY HARPS.

The illustration herewith shows a new electrical contact spring for trolley harps, a patent upon which has recently been granted to C. S. McMahan, formerly western manager of the Street Railway Journal, 1520 Monadnock Block, Chicago. The invention comprises a spring of conducting material pivoted centrally on the pin of the harp and adapted to press against the inner side of the harp arm and with three or more curved radial arms which bear against the trolley wheel near its periphery at points equally spaced about the wheel. The usual washer is inserted between the spring and the harp arm. The ends of the spring arms remain fixed at given points on the periphery of the wheel and revolve with it; the friction due to the rotation of the wheel and spring occurs between the spring and the washer which is inserted between the spring and the harp arm.

To replace a spring a rod is used which is of the same diameter as the harp pin, the rod gradually tapering to a point. Springs, washers and wheel are first placed approximately in position between the harp arms and the pointed tapering rod passed through to bring all parts to a common center when the harp pin will pass through without obstruction. The spring is applicable to any of the existing forms of trolley harps.

The chief advantages claimed for the device are that it requires no riveting to the harp; that it can be replaced in a moment without the necessity of removing the harp from the trolley pole; that it will prevent wobbling of the trolley wheel; that it will wear longer than the old form, and with its three or more points of connection with the trolley wheel largely increase the contact surface between the wheel and the pole, a feature which is especially desirable on large cars using heavy currents.

IRON BOX TELEPHONES FOR RAILWAY USE.

In describing the street railways of Portland, Me., in our September issue, mention was made of the telephone despatching system used, and the following description of the apparatus will be interesting.

These telephones are usually located at turnouts along the line and sometimes at intermediate points as may be necessary in

COUCH & SEELEY TELEPHONE.

order to permit communication from any point along the line to the power house, or offices without a considerable delay in obtaining the connection.

The instrument shown in the illustration is contained in a heavy iron box which is weather proof, and damage proof so far as it is possible to make it. All of these instruments are equipped with heavy 4-bar generators, and there are lines in use where upwards of 50 telephones are connected on one circuit. By means

of a special device the telephone is cut out of the circuit when the door of the box is closed, thus preventing damage from electric storms or by reason of the telephone wires coming in contact with other electric wires carrying high tension currents.

The operator's set consists of a hand micro telephone which in itself is a distinct feature, this being so arranged that when the receiver is placed to the ear the mouthpiece comes into proper position for talking and so close to the mouth that even if used in a very strong wind or where there is a great deal of noise, the sounds of speech will still be transmitted perfectly. Another desirable feature is that this combination of transmitter and receiver connected to the instrument by means of a flexible cord places the transmitter always in the proper position for securing the best efficiency regardless of whether the person using it is tall or short, and further, so long as the receiver is held to the ear it is impossible to get away from the transmitter. This is held in one hand, leaving the other free to make memoranda when required.

Dry batteries are used and are guaranteed to last one year under ordinary conditions of operation, and can generally be depended upon to last from 18 to 24 months without replenishing.

This instrument as well as other types of telephone equipment adapted to street railway uses, is made by the Couch & Seeley Co., of Boston, Mass. It is guaranteed for a period of one year. The company states that if there is any weak point in the instrument it will develop within that period of time, and refers to the large number of street railways already equipped with this apparatus as the best argument for its high efficiency and durability. The company will be glad to submit quotations for street railway equipment, including portable sets for use on snow plows, work cars, etc., also for standard wall and desk sets adapted to use in power houses, offices, waiting rooms, etc.

ROEBLING'S CO. AT PARIS.

The John A. Roebling's Sons Co., of Trenton, N. J., received two Grand Prix and two gold medals for its display at the Paris Exposition. The company had two exhibits, one showing the product of the electrical department, and the other giving a comprehensive idea of all the Roebling products other than the electrical.

The principal feature of the electrical exhibit was a full size model of an underground conduit street railway track. In addition there were telephone wires and cables, shown connected and mounted, and beautiful samples of every kind of wire used in electrical work.

In the second exhibit was a model of the Brooklyn Bridge, made at the express request of the U. S. Commission. The first model of the bridge that was built for the Exposition was lost with the unfortunate "Paulliac" which was reported near her destination some six days after sailing and was never heard from afterward. The Roebling company, however, built a second model in six weeks and had it in its place about a month after the Exposition opened. The bridge was entirely built at the Roebling plant and is very graceful and pleasing to the eye. It surmounts the exhibit proper.

The company has exhibited at all the prominent expositions for a number of years and possesses many awards conferred, including gold and other medals. At the Centennial, at the World's Fair in Chicago, and at the Philadelphia Export Exposition, the excellence of its manufactures was generously acknowledged.

TUNNEL BETWEEN NEW YORK AND BROOKLYN.

October 18th the Rapid Transit Commission announced its plan for a tunnel under East River. The Brooklyn-Manhattan road now proposed will, from a point near the intersection of Whitehall and South Sts., in Manhattan, proceed under the East River to Joralemon St., in Brooklyn; thence under Joralemon St. to Fulton St., near Borough Hall; thence under Fulton St. to Flatbush Ave. and under Flatbush Ave. to Atlantic Ave., near the station of the Long Island Railroad. The cost, as the Board is advised, will not exceed \$8,000,000.

The Milwaukee Electric Railway & Light Co. is considering building a more direct line to Kenosha.

FOREIGN FACTS.

The electric tramways in Bunley, Eng., are to be reconstructed.

A new system of electric tramways will be constructed in Chester, Eng.

Street cars in Southport, Eng., are to be fitted with patent seats which are always dry.

An extensive system of electric tramways is projected for Lowestoft, in Norfolk, Eng.

Matanzas, Cuba, is advertising for bids for street railway and electric lighting franchises.

The Bournbrook electric tramway at Birmingham, Eng., is being equipped with the overhead trolley system.

The railway from Athens to Pire, Greece, is required by its charter to adopt electric traction within three years.

Traffic will soon be resumed on Bologna-San Felice Ry., in Italy which is being equipped as an electric road.

Traffic on the new Dudley-Gradley Heath electric tramway, near Stourbridge, Eng., has been temporarily suspended.

In Melbourne the cable railways may be supplemented by a system of electric lines, to be built between all the suburbs.

An electric power station will be built at Greenhill, near Oldham, Eng., to supply current for local tramways, and lighting plants.

The British Electric Traction Co. has installed a new schedule, an improved service on its street railway in South Staffordshire.

The Urban Electric Supply Co. will construct the proposed electric tramways through the city of Glossop, in Gloucestershire, Eng.

The council of Eccles, near Bradford, Eng., is promoting a bill authorizing the alteration of existing tramways and the construction of new lines in that city.

An electric tramway will be built to connect Redcar, in Yorkshire, Eng., and Saltburn. The road will probably be owned and operated by the municipality of Redcar.

The application of the United Electric Light & Traction Co. for electric tramway rights through Stratford-on-Avon, Eng., is meeting with the opposition of the local authorities.

Messrs. Massey & Allpress, of Westminster, Eng., consulting engineers, have been engaged to complete the preliminary work on the proposed street railways in Colchester.

A street railway strike is in progress in Kingston, Jamaica, the conductors and motormen demanding an increase of wages of from 3 to 6d. All lines in the city are reported tied up.

A 14-mile electric line to connect Blackburn (Eng.), Rishton, Whalley and Burnley. C. Chadwell of Blackburn represents the promoters. The road is estimated to cost £154,000.

The project to equip the street cars operating in Portsmouth, Eng., with electric brakes has been abandoned. The safety brake at present in use has been declared sufficient.

At Blackpool, Eng., the arrangements have been made by which the Corporation tramways will obtain electric power from the Blackpool & Fleetwood Tramroad Co. at 2d per kw. h.

An electric tramway is projected in Folkestone, Kent, Eng., to be built at a cost of £93,000. The conduit system will be employed in the down town district, and the overhead system through the suburbs.

The electric tramway in the city of Seoul, in Corea, is being operated with great success. Seoul has now the largest electric plant in the far east with the exception of that at Tokio, Japan.

Fifty miles of street car lines in Adelaide, Australia, are to be equipped for electric traction if the bill presented to Parliament by Messrs. Callenders and the Westinghouse Companies be passed.

An improved mail service has been installed in Frankfort, Germany, the tramway company having recently adopted seven automobile cars and seven trailer cars to the street railway mail service.

The old steam tramways of Sydney, Australia, are being replaced by electric lines. The opening of the new electric line to Cook's River, was celebrated by the Electrical Association of New South Wales, recently.

Dissatisfaction with the cable system may occasion the promoters of the proposed line between Edinburgh, Musselburgh and Joppa to equip that road for electric instead of cable traction as was at first projected.

The municipal council of Pietermaritzburg, South Africa, will build a system of electric tramways, obtaining the power for their operation from the electric light department. Eight wheeled double deck cars will be put in service.

A number of important tramway extensions are to be made in Glasgow. The Lorain Steel Co. has the contract for special track work and McCartney, McElroy & Co. will proceed at once with the installation of the overhead equipment.

The council of Devonport, Devonshire, Eng., will lease the lines of the Devonport & District Tramway Co. for a term of years. Mr. C. Chadwell has secured an extension of time in which to build the proposed St. Budeaux tramway which will center in Devonport.

Early in October the city of Wellington, New Zealand, acquired possession of the tramway system. No action will be taken on the proposition to adopt electric traction until the return in December of Mr. W. Ferguson who has been making investigations in America and Europe. Tenders will be invited from American and English firms.

The Paraguay Development Co., incorporated with \$500,000 capital under the laws of the State of New Jersey and having headquarters in Philadelphia, has been granted by the Paraguayan Government a concession to light the city of Asuncion and to run tram cars by electric power. The concession is for twenty-five years, and the light and traction service must be open to the public within two years from Aug. 30, 1900. The representative of the company in Paraguay is Mr. Carlos R. Santos, late delegate to the Philadelphia Museum exposition.

The installation of a system of electric traction over a canal about 47 miles long, between Bethune and the Scheldt, Holland, has been undertaken by the Societe de Traction Electrique Sur Voies Navigables and will result in a great reduction in the cost of transportation over this route. Six locks are comprised on the route and the former price, by steam or horse traction, was 0045 franc per ton kilometer. This tariff has been reduced since the installation of electric traction over a portion of the route, to 003 franc. Two stations have been put in operation furnishing a total of 400 h. p. The continuous current at 500 volts is produced by eight generators of 30 kw. capacity.

Within about a year the Chicago Union Traction Co. has settled over 1,000 damage suits, many of which were of long standing in the courts.

A Wisconsin judge has held that under the statute requiring suits against street railways to be begun within one year, the provision withholding the operation of the statute of limitations does not apply to infants.

PERSONAL.

MR. EDWIN DUFFY was appointed receiver of the Cortland (N. Y.) & Homer Traction Co. on October 16th.

MR. W. A. HELLAR, it is reported, will probably become superintendent of the Dayton & Xenia Traction Co.

MR. GEORGE R. THOMPSON, of Elgin, has been appointed superintendent of the Lincoln (Ill.) Electric Street Railway Co.

MR. D. H. LOUDERBACK sailed for London on November 9th; he will have an active part in the construction of Mr. Yerkes' London road.

MR. C. H. SMITH, formerly superintendent of the Troy division of the United Traction Co., of Albany, N. Y., has been reappointed to that position.

MR. A. K. WARREN, mechanical and electrical engineer, has associated himself with Mr. A. B. Herrick with offices at 120 Liberty St., New York.

MR. B. FRANK HIRE, superintendent of the Bridgeton (N. J.) & Millville Traction Co., was seriously injured recently in a runaway at Newport.

MR. W. W. SARGENT, superintendent of the Fitchburg (Mass.) & Leominster Street Railway Co., was on October 16th chosen a director of the company.

MR. D. F. CARVER, formerly engineer in charge of buildings for the Brooklyn Rapid Transit Co., has been appointed chief engineer of the Cleveland Electric Ry.

MR. LEE D. FISHER, mechanical engineer of the Columbus, London & Springfield Electric Ry., was on November 27th married to Miss Lillian Udell of St. Louis.

MR. THOMAS H. McLEAN, general manager of the Toledo Traction Co., called on the "Review" when in Chicago last month. He had been making a two weeks trip in the West.

INVITATIONS are out for the wedding of Mr. Samuel McClintock Hamill to Miss Marie Woodward Baldwin, which will take place at Grace Church, Baltimore, Tuesday, November 27th.

MR. T. W. SHELTON, formerly connected with the Indianapolis (Ind.) Street Railway Co., has succeeded Mr. David W. Pell as electrical engineer of the Northern Ohio Traction Co. at Akron.

MR. C. DENSMORE WYMAN, Boston, was a "Review" caller last week. Mr. Wyman is returning from an inspection trip which has lasted three months and taken him from the Atlantic to the Pacific coast, and from northern Michigan to the Gulf.

MR. C. B. BUCHANAN informs us that he and other stockholders in the Meridian (Miss.) Street Railway & Power Co. have transferred that property to Mr. John Kamper, of Enterprise, Miss. Mr. Buchanan has resigned as general manager of the road.

MR. R. D. BLACK, one of the promoters and a large stockholder of the Indianapolis (Ind.) & Greenfield Electric Ry., was killed while attempting to board one of the company's cars. He mounted on the wrong side and was struck by a center pole.

MR. J. SHIRLEY EATON, statistician of the Lehigh Valley Railroad Co., has been engaged to give a course of lectures during January before the students of the Tuck School of Dartmouth College upon the "Theory and Practice of Railroad Statistics."

MR. E. D. SMITH, of the Blanchester, O., bank, has been made president of the Dayton & Maysville Electric Railway Co.,

which has been reincorporated, and its charter made to include a branch line from South Lebanon to Cincinnati. The main line is projected from Dayton through Lebanon, Morrow, Blanchester, Georgetown and Ripley to Maysville, Ky.

MR. JOHN M. ROACH, president of the Union Traction Co., Chicago, has just returned from a two weeks' trip to his island in the Gulf of Mexico. Mr. Roach has one of the most beautiful and unique winter homes to be found anywhere in the United States.

MR. GEORGE E. TRACY, Newark, N. J., has been appointed superintendent of the Camden, Gloucester & Woodbury Traction Co. to succeed Mr. William H. Wilson who has been transferred to the superintendency of the Camden Electric Lighting Works.

MR. SAMUEL C. MOREHOUSE, of New Haven, Conn., treasurer of the Ohio Central Traction Co., at Galion, O., will, it is reported, be chosen to succeed the late Israel A. Kelsey as president of that road. Mr. Morehouse recently made a trip of inspection over the lines of the Ohio Central Traction Co.

MR. A. B. SOUTHARD, superintendent of the San Francisco & San Mateo Electric Ry., San Francisco, is making a trip east inspecting interurban lines, after having spent several days in Chicago. He reports an enormous increase in traffic during the past year and on his return will lay 20 miles of track to double track a present line, and while away will also place orders for new cars and other material.

MR. BRET HARTER, formerly superintendent of the Detroit, Rochester, Romeo & Lake Orion Ry., has been appointed mechanical and electrical engineer for the various roads built and projected by the Winter, Law & Andrews syndicate. These include the Detroit, Rochester, Romeo & Lake Orion Ry., the Grand Rapids & Holland Electric Ry. and the Saugatuck, Douglas & Lake Shore Ry.

MR. EDWARD C. SPRING has recently been appointed superintendent of the Newton & Boston Street Ry., succeeding Mr. L. H. McLain. Mr. Spring was formerly superintendent of the Norfolk Suburban Street Ry., and later had a similar position with the Norfolk Western Street Ry. and the Medfield & Medway Street Ry., which he resigned to go with Newton & Boston. On leaving, the employes presented him with a handsome gold watch.

MR. W. CARYL ELY, president of the International Traction Co., of Buffalo, is in Paris promoting a project for a number of European excursions to the Pan-American Exposition. Through Mr. Ely's efforts interest in the great exposition to be held in Buffalo next year has been heightened, not only in the French capital but in all the countries on the continent, and as a result many thousands of foreigners will view the wonders of the empire state in July.

MR. C. S. McMAHAN, who for several years has been the western representative of the Street Railway Journal, with headquarters in Chicago, has resigned and taken the position of business manager of The Engineer, published in Cleveland. Although a competitor and a strong one, he has conducted his work along lines to command our esteem and respect, and we join with his many friends in the railway field in predicting and wishing for him in his enlarged opportunity the success which his efforts deserve and his ability insures.

MR. A. F. HAAS, secretary and general manager of the Seattle City Railway Co., accompanied by his wife, is visiting friends in Chicago. He will visit eastern cities before returning home. Mr. Haas is taking his first vacation since 1873, and has earned a place among the foremost managers on the Pacific coast which entitles him to a well deserved rest. He reports his city as growing rapidly, to which both the Klondike and our new Western possessions are contributing to a large extent. His company has been steadily improved physically during the past few years.

MR. W. R. MORRISON, in charge of the track work of the Wichita (Kan.) Electric Railway & Light Co., was married recently to Miss Alice O'Neil, of Bay City.

MR. GORDON CAMPBELL, for seven years past the purchasing agent of the North Jersey Street Railway Co., has been appointed general superintendent of the Union Railroad Co., Providence, R. I.

MR. SIMEON W. CANTRIL, formerly superintendent of the Denver Cable Ry. and since last December division superintendent of the Denver City Tramway Co., has been appointed superintendent of the latter company, succeeding Mr. C. K. Durbin.

ELECTIONS.

THE TRI-CITY RAILWAY CO., Davenport, Ia., has re-elected its officers as follows: E. E. Cook, president; F. C. A. Denkmann, vice-president, and James F. Lardner, secretary and treasurer.

THE ROANOKE (VA.) RAILWAY & ELECTRIC CO. has elected the following officers: J. B. Fishburne, president; James F. Heyward, vice president; J. W. Hancock, secretary and Edward L. Stone, treasurer.

THE WORCESTER (MASS.) & WEBSTER STREET RAILWAY CO. has elected the following officers: Edgar S. Hill, of Webster, president; Fred Thayer, of Pawtucket, R. I., vice-president; W. A. Bailey, of Worcester, treasurer, and Edmund Parker, of Worcester, auditor.

THE ENFIELD & LONG MEADOW ELECTRIC RAILWAY CO., Thompsonville, Conn., has re-elected C. E. Graham, president; George T. Mathewson, vice-president; and Lyman A. Upson, secretary and treasurer. The following directors were also elected: C. E. Graham, L. A. Upson, J. J. Lawton, S. H. Wagner, G. T. Mathewson, C. H. Briscoe, and J. W. Johnson.

NEW PUBLICATIONS.

WESTINGHOUSE RAILWAY MOTORS is a recent publication of the Westinghouse Electric & Manufacturing Co., and illustrates the standard railway motors made by the company and also a few typical Westinghouse railway power stations. Attention is called to recent improvements in design which enable the motors to meet the severer demands of modern service.

STEEL PLATE FANS. Issued by the B. F. Sturtevant Co., Boston, Mass. This is the third edition of Catalog No. 96 published by the company and comprises 132 pages illustrating and describing the various types of fans and blowers for which this company is so well and favorably known. A smaller publication is devoted to a description of the Sturtevant system of heating, ventilating and moistening textile manufactories.

WE HAVE RECEIVED a copy of the Album di Elettricisti, published at Milan by the editors of L'Elettricita. The album contains some 200 portraits of prominent electricians from nearly every country in the world, and should certainly be a valuable acquisition to the library of all who are interested in electrical industries. Among the portraits we noted with especial interest those of B. J. Arnold and G. W. Knox. The book measures 12 x 9 in., contains 52 pages, and is most attractively bound in buff cloth, embellished with gold.

"THE ELECTRICIAN" ELECTRICAL TRADES' DIRECTORY & HANDBOOK for 1901. Published by the Electrician, Salisbury Court, Fleet St., London, England.—The editors of Electricity announce that the 19th annual edition of this directory is soon to be published. Copy must be received by Dec. 20, 1900; for later corrections particulars must be received by Jan. 16, 1901. One entry in both alphabetical and classified trades sections is given free; other entries are charged for at the rates of 1s. to

2s. 6d. per entry, according to the type used. It is earnestly requested that all persons and firms in the electrical trades will communicate with the editors of the "Big Blue Book," as this directory is known, at once.

STREET PAVEMENTS AND PAVING MATERIALS. A Manual of City Pavements; the Methods and Materials of Their Construction. By George W. Tillson, C. E., Mem. Am. Soc. C. E., Principal Assistant Engineer, Department of Highways, Brooklyn, N. Y. Published by John Wiley & Sons, New York. Octavo; 544 pages; cloth, \$4.00. The author has been actively engaged in the construction of municipal public works for over twenty years and in this book answers some of the questions presented to him in the course of his experience, and which could be solved only by actual trial. An idea of the scope can best be given by enumerating the chapter headings which are: History and Development of Pavements; Stone, Asphalt, Brick-clays and the Manufacture of Paving Brick; Cement, Cement Mortar and Concrete; The Theory of Pavements; Cobble and Stone-block Pavements; Asphalt Pavements; Brick Pavements; Wood Pavements; Broken-stone Pavements; Plans and Specifications; The Construction of Street-car Tracks in Paved Streets; Width of Streets and Roadways, Curbs, Sidewalks, etc.; Asphalt Plants. In the chapter on "Construction of Street-car Tracks" is a convenient resume of the paving requirements in various cities, and of the practice of the street railways in track construction.

POOR'S MANUAL OF RAILROADS. Published by H. V. and H. W. Poor, 44 Broad St., New York; 33d Annual Number; price, \$10.—The Manual for 1900, which has just been issued, covers 1,954 pages, of which 987 pages are devoted to the presentation of the statements of 2,026 steam railroad companies; 209 pages to the statements of 1,132 street railroad and traction companies; 84 pages to the statements of 166 leading industrial corporations, and 132 pages are taken up with the Department of State, City and County Debts, covering the affairs of 367 corporations. The editor, John P. Meany, presents in pages xvii to cvi of the introduction "A Study in Railway Statistics" which is an exhaustive analytical review of railroad affairs during the past twenty years, and brings to the surface many points of information that would be hidden to the ordinary inquirer after such facts. The sub-headings to certain sections of the "Study" are (1) "Railroad Consolidations"; (2) "Formation of Railway Systems," which contains a table showing the growth of 53 railroad companies from 59,429 miles in 1880 to 131,798 miles, Jan. 1, 1899; (3) "Statistics of Trunk Lines, 1870-1899"; (4) "Railroad Capitalization and Return Thereon"; (5) "Investigation into Productive and Non-Productive Stocks and Bonds"; (6) "Detailed Review of Receiverships and Foreclosure Sales, 1884-1899"; and (7) "Relation of Fixed Charges to Capitalization."

The most important new feature introduced into the Manual in recent years is one first presented in this year's edition and is entitled a "Ready Reference Bond List" and covers 86 pages of the Manual—from 1,296 to 1,381 inclusive. Its distinctive features are (1) showing amount of annual charge on each issue; (2) arrangement of dates of interest payments, which in addition to giving for each separate road the usual data, enables a bond clerk to run down any column, say that headed "J.J." and ascertain at once all railroad coupons that fall due on the first of January or July; (3) "Property Covered," giving the terminal points and mileage of the lines covered by each separate mortgage together with the average amount (in dollars) of bonds outstanding per mile of railroad, and (4) the names and addresses of the trustees for each mortgage.

Our readers are naturally most interested in the Department of Street Railways. This covers over 1,100 companies in the United States and Canada, giving data as to history, capitalization, equipment, financial results, officers, etc., conveniently arranged according to states and towns. There is also a table giving the dividends paid by 137 of the leading street railway companies for the last eight years, and a table showing the close of fiscal year, date of annual meeting, date of closing transfer books, place of meeting, registrar of stock and transfer agent for 500 street railway companies.

The price of the Manual has been increased to \$10, which the publishers explain has been necessary because of the greater volume of the work and the advance in cost of paper, materials and labor.

BOYER & RADFORD DROP TRACK JACK.

Our illustration shows the 20-ton drop track jack made for electric, cable and horse railways by Boyer & Radford of Dayton, O. This jack was designed by practical roadmasters, who thoroughly understood the requirements, and it has been tested in service with entire satisfaction. The No. 20 has a rise of 11½ in., weighs 50 lb., and has a capacity of 10 tons. The bar has 7-16-in. teeth and can be raised or lowered one or two notches at a time. The floating

NO. 20 DROP TRACK JACK.

hook attached to the upper pawl is for the purpose of holding this retaining pawl out of position by pushing it down and in so that it will fasten the floating hook and the operator can then step back out of danger, and raise the lever the least bit which releases the lower pawl and the bar drops easily, making a perfect sure drop track jack that can be relied upon in any emergency.

Boyer & Radford control the Maxon patents on lever and ratchet screw lifting jacks for all kinds of lifting.

THE STURTEVANT ENCLOSED ELECTRIC MOTOR.

The bipolar type of enclosed motor the internal construction of which is illustrated in the accompanying engraving, is made both as a motor directly connected to a propeller fan and as an inde-

STURTEVANT ENCLOSED MOTOR.

pendent machine. For the former purpose it is used on all sizes of fans up to and including the 54-in. For larger sizes the four and eight-pole types are employed.

The motor is entirely enclosed, and thereby protected from dust, a most important element in a machine used under these conditions. In order to avoid the excessive temperature which is incident to the operation of most enclosed motors, this type has been very carefully designed, so that a low temperature rise can be maintained without greatly increasing the size and weight above that of the ordinary open type.

This machine is capable of continuous operation for 10 hours, with a maximum temperature rise not exceeding 60° F. Yokes extending out from the field ring support the armature shaft. The end casings are entirely independent and can be instantly removed to give access to the entire interior. The bearings and brushes can be reached by simply removing the caps in the center of the casings.

The brushes are of hard carbon, in holders of a modified reaction type, which allows of easy adjustment when it becomes necessary to reverse the direction of rotation of the motor. The bearings are self-oiling and self-aligning, and fitted with composition sleeves, which are removable from the outer ends of the boxes. These motors, in sizes from 1-6 to 5 h. p., are built by the B. F. Sturtevant Co., Boston, Mass.

NEW AUTOMATIC BLOCK SIGNAL.

An automatic block signal system for electric railways, designed to show, without the possibility of mistake, whether the section

to the next turnout is free or occupied by another car, has recently been put on the market, and is attracting favorable comment for the simplicity and accuracy of its operation. The signal proper consists of a cast iron box conveniently located near the turnout and electrically connected with the signals at the next turnouts. Each signal has two operating magnets, five or six times more powerful than necessary for the operation of the signal, thus giving a good margin for safety.

Each box is fitted with two windows, one covered by a red glass and the other by a white or green glass, and behind the windows are placed two incandescent lamps. When the car approaches the block section, one series of signals is operated by the contact of the trolley wheel with an automatic switch on the trolley wire, and displays a white or green light at the entering point and a red light at the other end. The armature of the lighting magnet is mechanically locked in place until the car has reached the other end of the section, and in the same manner a signal set for the opposite direction is mechanically locked out of service. The red lamp at one end is in series with the white or green lamp at the other end and it is thus impossible to set one signal without also setting the corresponding signal. The motorman, entering the block and seeing the white or green light, knows that the red signal at the other end is displayed. The lights can be permanently extinguished only when the car has reached the end of the section and operated the put-out magnet, and should they be extinguished through failure of current will immediately be relighted when the current returns. This system has been perfected after years of study, and has the advantage of economy. It can be applied to existing roads with small expense. It is the invention of J. J. Ruddick and is made by the United States Electric Signal Co., of Watertown, Mass.

The Dayton (O.) & Western Traction Co. is issuing 1,000-mile tickets at the rate of one cent per mile.

McGUIRE COMPANY AT KANSAS CITY.

One of the best exhibits seen at the Kansas City convention was that of the McGuire Manufacturing Co., of Chicago. The first thing that caught the attention of the visitor was the McGuire sweeper, which occupied a position directly in front of the main entrance to Convention Hall. This sweeper was one of 15 sold to the Metropolitan Street Railway Co., of Kansas City, and was very generally examined and favorably commented upon by all who saw it. It was the only exhibit of this kind on the ground. The long distance and the great cost of handling a ma-

COMBINED SNOW PLOW AND SWEEPER

chine of this kind that weighs 24,000 lb., make it an expensive exhibit. There are over 500 of these machines in service throughout the country, and it is acknowledged to be a thoroughly up-to-date and practical sweeper.

In the Westinghouse exhibit was shown the McGuire A1 suspension truck (Pittsburgh type), equipped with the Pittsburgh standard motor. This exhibit was very carefully examined by a great many people on account of the record of this entire equipment. There are over 800 of this type in use in Pittsburgh alone. It is the standard also in Havana, Cuba, and in many other places. It may be mentioned here that the service in Pittsburgh is very severe because of the many heavy grades in that city. On some of the hills there are 12 per cent grades, calling for the most efficient brake arrangement and general stability of construction.

The company's main exhibit was under the galleries. The first truck was the No. 39, and was one of the hundred now being built for the Chicago Union Traction Co., where it is the standard, as it is in many other important places throughout the coun-

SOLID STEEL COLUMBIAN TRUCK.

try. This truck is the standard of the Indiana Railway Co., of South Bend, where they are required to make a schedule speed of 40 miles per hour, sometimes reaching 50 miles per hour. This truck has cast steel sides and bolsters and is built as nearly on Master Car Builders' lines as it is possible for an electric truck, the motors being hung outside of the axles. Its short wheel base

—4 ft. 4 in., or 4 ft. 4 in.—permits it to swing inside of the sills, bringing the car body within 26 in. of the rail, necessitating but one step.

The next truck in the exhibit was the maximum traction truck. This truck is also made of cast steel with swing bolster and of the adjustable traction type. It is so constructed that as much as 75 per cent of the load may be put on the driving wheels if

NO. 35 DOUBLE TRUCK

desired, with a cam and roller attachment which shifts a part of the load to the rear wheels on curves, completely overcoming the objection to most of the maximum traction trucks.

The company also exhibited one of its solid steel "Columbian" trucks, which is the standard on so many of the railroads throughout the country. The McGuire Manufacturing Co. claims to be the first to build solid steel frame trucks, which have been imitated by all the truck makers who have acquired any standing. This

A 1 SUSPENSION TRUCK—PITTSBURGH TYPE.

truck is so designed and constructed that its carrying capacity can be adjusted to any required load. The frame consists of solid steel sides of any required wheel base and has eight spiral and four three-quarter elliptic springs. The pedestal, spring cups, and spring caps are all cast in one piece, forming the end of each side frame, and is welded to rolled steel pieces 2 x 4 in., by which the length of the wheel base is regulated. The minimizing of parts is carried to its fullest extreme in the construction of this truck frame.

NO. 39 MOTOR TRUCK.

All these different trucks are equipped with standard brakes, which include the McGuire "Elastic" brake hanger, which is a very popular feature of the trucks, and absolutely prevents kicking, chattering, or rattling of brakes, and automatically takes up its own wear and lost motion.

The "Royal Flush" fender came in for a very generous inspec-

tion, as nearly every railroad man is very much interested in this subject. This fender seems to do everything that the more expensive types will do, and has the advantage of being a simple and low-priced fender, which is a taking feature. Mr. McGuire christened the fender the "Royal Flush," because he says he thinks it is hard to beat.

There were also exhibited the latest types of "Columbia" car heaters, one of which sets over the seat and the other in the seat. This is a very handsome piece of car furniture and is being very generally used throughout the country. In Chicago alone there are over 900 of them in service. In connection with the fender exhibit was a section of platform showing the spring guard, which is now being used by many roads. The North and West Side roads of Chicago have them on all their equipment. Several of the lines in Dayton and other places are using them and report most favorably upon their use. The exhibit also included brake handles. Take it all in all, the company had one of the most creditable exhibits at the convention. It was represented by Mr. W. J. Cooke, vice-president of the company, and Mr. T. J. Callinan. Mr. Cooke reports that they made many sales of sweepers, trucks, fenders, and stoves, an unusual occurrence at a convention.

MONTREAL STREET RAILWAY REPORT.

The report of President L. J. Forget to the directors of the Montreal Street Railway Co. for the fiscal year ending Sept. 30, 1900, shows a very satisfactory condition of the property. During the year a new car shed has been built, and a fireproof addition made to the William St. power house. Fifty-six closed motor cars, 45 open motor cars, 1 stores car, 7 supply cars, 80 trucks, 128 motors and 83 controllers have been added to the equipment.

The company's capital stock is \$5,497,055 and its bonded debt \$973,333. Four 2½ per cent dividends were paid during the year. Payments to the city were: Tax on earnings and other taxes, \$84,423.71; on account of snow cleaning, \$84,256.22; total, \$168,679.93. The table shows further comparative data.

	1900	1899	1898	1897	1896	1895	1894	1893	1892
Gross Receipts	\$1,269,912.24	\$1,467,371.93	\$1,451,813.50	\$1,711,257.78	\$1,762,895.35	\$1,192,227.31	\$194,999.89	\$195,231.24	\$181,494
Increase 1900 over 1899	196,139.56								
Operating Expenses	962,910.81	81,839.94	784,814.35	756,428.80	718,154.79	625,811.74	627,891.14	662,041.21	656,612.10

ELECTRICITY FOR METROPOLITAN RY., LONDON.

London dispatches of November 8th state that the Metropolitan District Railway Co., operating the old underground road, will on December 1st award contracts for the rebuilding of 50 miles of track and its equipment for electrical operation. The total expenditure is estimated at £5,000,000. Among the competitors are the Westinghouse, the General Electric and the Thomson-Houston companies, Mather & Platt, the Brush (British) Electric Co., Crompton & Co., Thomas Parker & Co., Dick, Kerr & Co., Allgemeine Electricitaets Gesellschaft, Siemens Bros., Schulkert & Co., Bregguet Electric Co., Hontin & Leblanc.

Sir William Preece is the consulting engineer for the railway.

A collision between a street car and a hose wagon in Milwaukee, recently, came near resulting fatally to several firemen. Chief Foley of the Board of Fire and Police Commissioners will hold an investigation to decide whether or not the company was at fault.

COMPLEX FORGED TRUCK SIDE.

The accompanying engraving was made from a photograph of a new solid forged wrought iron truck side of one piece made by the J. G. Brill Co. for its No. 27 G truck. Heretofore complex truck sides of this pattern have been made of steel. For a long time there has been a desire both on the part of the maker and street railway men to obtain solid forgings in the place of steel. It is generally recognized that forgings for all ordinary sizes have considerable advantages over steel, and can be made lighter and much more shapely. The great expense of forgings, however, has in most cases prevented their use for such complex work as the No. 27 G side.

It will be noticed that the truck ends are dropped down very low upon the jaws; this is for the purpose of enabling the truck

FORGED TRUCK SIDE.

to turn under open cars and to bring the truck side so low as to clear the steps. The forgings are very smooth and have repeatedly been mistaken for castings on account of their accuracy and the absence of hammer marks. Each jaw is fitted with a gib or wearing piece. This enables the jaws to be renewed to their original size with little difficulty and expense. Just inside of the jaw on the main bar are seen the seats for the links; these come so near the center line of the jaws that the weight of the body is carried but a very short distance through the frame, practically less than 12 in. The strains, therefore, in this important member of the truck frame are reduced to a minimum.

Considered as a piece of blacksmith work this forging is quite remarkable and will command attention wherever it is seen by experts in the handling of wrought iron. The fact that so complicated a piece of work can be produced at anywhere near the price of steel makes it even more worthy of notice.

CANADIAN NOTES.

The Montreal Street Railway Co. is reconstructing a portion of its line on one of the principal streets with 83-lb. rails secured to steel ties imbedded in concrete. This is the first use of steel ties in Canada and if they prove satisfactory they will be used in all new construction. The company has about half its line cast-welded.

The citizens of Hamilton, Ont., will vote on a by-law, in the near future, to decide whether or no they will pay the Hamilton, Guelph & Galt Electric Railway Co. a bonus of \$90,000, in return for the construction of an extension to the present line. It is confidently expected that the bonus will be granted, and that the work will be pushed to completion in the early spring.

A serious strike is in progress in Kingston, Jamaica, where the employes of the street railway company have struck for higher wages and shorter hours. The company made an effort to run the cars as usual, but the new men were assaulted and roughly handled, and traffic is practically at a standstill. A few cars are running under police protection, and a strong force has been called out to protect the workers from assault.

Mr. F. P. Brothers, formerly manager of the construction for the Montreal Street Railway Co., has left for Havana, Cuba, to superintend the construction of about 600 miles of steam road for the Cuban company. Mr. Brothers is well known in the street railway world, for in addition to his connection with the Montreal road he has had control of the building of electric railways in St. John, N. B., Kingston, Jamaica, and Georgetown, Demerara. Railroad contractors who are idle during the winter months may

benefit by communicating with Mr. Roberts, as he is letting a great deal of work in Cuba by contract, and contemplates commencing operations immediately.

The shareholders of the Hamilton, Grimsby & Beamsville Electric Railway Co. are applying to the Ontario Legislature to have the special act of the company amended by giving it power to continue its line of railway to St. Catharines, Niagara, and Niagara-on-the-Lake, to issue bonds of the company not exceeding in amount \$10,000 per mile of the whole line, and to give instructions to the directors as to the construction of said extension.

Mr. James Ross, vice-president and managing director of the Montreal Street Railway Co., has just returned from Birmingham, England, where he has been arranging for the installation of an electric trolley road. The existing street railway system in Birmingham has been controlled by Mr. Ross and some Canadian associates for some years past, but they have only now succeeded in convincing the municipal authorities that the electric trolley system was the best adapted for the wants of that great center. Reconstruction of the present system is now in full swing, and Mr. Ross expects to have a portion of the line open for traffic by the first of the new year.

A serious accident, by which a number of people were more or less severely injured, occurred in Montreal the afternoon of Sunday, November 4th. As a heavily loaded car on one of the mountain lines was on its way up the hill, the trolley wheel jumped the wire, and before the brake could be applied the car started to run backward down the steep incline. The passengers, seeing another car close behind, and fearing collision, rushed into the forward end of the car, and crowding around the motorman, made it impossible for him to regain control of his car. The cars following the runaway up the hill reversed as soon as it was seen what the trouble was, but were overtaken, and three cars were more or less damaged. The passengers had become panic stricken in the crash down the hill, and jumped, and it was in this manner that most of the injuries were sustained, as the employes, who stuck to their posts, were unscathed, and had it not been for the interference of the passengers in their first mad rush for safety, there is little doubt but that the motorman would have been able to have controlled the car, as the brakes, upon investigation, were found to be in perfect order.

IMPROVEMENTS IN LOS ANGELES.

Since the owners of the Los Angeles (Cal.) Ry. acquired the Mt. Lowe railroad property their engineers have been preparing plans for the improvement and extension of that unique line. The intention now is to straighten the line from Altadena to the base of Echo Mountain, lay heavy rails and make the road practicable for heavy cars. Mr. C. W. Smith, general manager of the Los Angeles Ry. says: "Ultimately a trolley road from the top of Echo Mountain to the Alpine Tavern will be extended across the ridge and up to Wilson's peak. We have found it is perfectly feasible to carry this road to the summit by way of Martin's camp, and it will surely be done."

SEMI-WEEKLY TOURIST SLEEPERS CHICAGO TO BOSTON.

The Wabash Road now operates a line of tourist sleepers between these cities, leaving Chicago Mondays and Thursdays at 9:25 a. m., and arriving in Boston 5:20 p. m. next day. New York passengers can occupy these cars as far as Rotterdam Junction, N. Y. (where the train arrives at 11 a. m.), reaching New York at 3:15 p. m. No excess fare required. Write for reservations. Ticket office, 97 Adams St., Chicago.

The ordinance regulating the speed of street cars and limiting the number of passengers to be carried, recently passed by the council of Tacoma, Wash., has been vetoed by the mayor on the ground that its enforcement "would work great inconvenience to the public and cause no end of trouble to the officials of the street car company and its patrons and to the city officials, without corresponding benefit or protection to the public."

BARGAINS IN ELECTRICAL APPARATUS.

The Gregory Electric Co., 54 62 S. Clinton St., Chicago, has recently purchased the entire stock of completed machines, instruments and supplies of the Siemens & Halske Electric Co. of America, and also the entire stock of completed machines of the Gibbs Electric Manufacturing Co., of Milwaukee, and these additions to the regular stock of machines enable the Gregory company to offer some exceptionally good bargains to intending purchasers.

IMPROVED CURTAIN FIXTURE.

The sectional drawing herewith shows the construction of an improved curtain fixture on which a patent has recently been granted to James W. Patterson, 4100 N. Ashland Boulevard, Chicago. The important feature of this fixture which makes it superior to those heretofore used is the rigid position of the heads on the curtain rod; there is no end play to the rod so that it is not pulled from the grooves in the window jamb and the rod is at right angles to the joints. A hollow rod, or a solid rod with tubular ends is used. The head of the fixture has projecting arms

PATTERSON CURTAIN FIXTURE.

with rollers at each end, and this head is secured to the end of a milled screw, so that the latter is free to turn. The screw fits the interior of the hollow curtain rod and is thus easily adjusted to the jamb; the curtain itself covers the head of the screw and prevents meddling by passengers, and if desired a lock nut could also be used. The friction feet are held in the heads and mounted on rods passing through the milled nuts mentioned and are pressed against the window jamb by springs contained in the tubular rod; the tension of these springs can of course be anything desired.

THE MILFORD (MASS.), HOLLISTON & FRAMINGHAM STREET RAILWAY CO. has elected the following directors: John T. Manson, J. Willis Downs, H. C. Fuller and Charles E. Graham, all of New Haven, Conn.; Sidney Harwood, of Boston, James E. Walker, of Milford, and Arthur R. Tait, of Uxbridge. At a subsequent meeting the following officers were elected: John T. Manson, president; Sidney Harwood, vice-president; James E. Walker, auditor; Wendell Williams, clerk; E. W. Goss, treasurer and general manager, and Maxham E. Nash, superintendent.

ANNOUNCEMENT.

The Southern Pacific Co. announces that Sunset Limited service to California for the season was resumed November 8th, and will be tri-weekly, leaving New Orleans 10:45 a. m. Mondays, Thursdays and Saturdays.

Detailed information at the company's offices, 238 Clark St., Chicago. W. G. Neimyer, G. W. A.

HALF FARES.

Burlington, Ia., has a street railway mail service.

Talk of building an electric line between Richmond, Va., and Petersburg has been revived.

The Decatur (Ill.) Traction & Electric Co. has bought two new 250-kw. General Electric generators.

The Ohio Southern Traction Co. recently suffered the loss of 406 ft. of trolley wire taken by thieves.

A new car house at Watertown, now building by the Boston Elevated Ry., will be completed in the spring.

The Tacoma (Wash.) Railway & Power Co. has reduced fares on its Tacoma and Puyallup line from one-fourth to one-third.

The St. Louis Transit Co. and the St. Louis & Suburban Railway Co. have together subscribed \$250,000 to the World's Fair fund.

The city of Kalamazoo, Mich., has been successful in a suit brought to compel the Michigan Traction Co. to lay grooved rails.

The City Electric Railway Co., of Port Huron, Mich., is about to purchase property for a park which will be fitted up for a summer resort.

Raymond & Co. and the First National Bank have obtained judgments against the Suburban Street Railway Co., Austin, Tex., for \$50,000.

The American Express Co. has closed its office at Cuyahoga Falls, O., the contract with the Northern Ohio Traction Co. having expired.

The Holyoke (Mass.) Northampton Electric Ry., which was recently opened, furnishes through service between Springfield and Northampton.

Those interested in the interurban electric roads entering Indianapolis, Ind., are considering the establishment of a union depot for trolley freight.

Four persons were injured in a collision between a freight car and an electric car, at the Hocking Valley crossing in Columbus, O., October 30th.

It is announced that the Milwaukee Electric Railway & Light Co. will soon let contracts for a four story car house and office building to cost \$500,000.

Work on the water power plant of the Lake Superior Power Co. at Sault Ste. Marie is progressing quite rapidly, the foundations being nearly completed.

Mr. Wilmer H. Shields, of Natchez, Miss., is reported to represent local and foreign capitalists who propose building an extensive electric railway in Natchez.

It is announced that the Denver City Tramway Co. has acceded to the request of its motormen and conductors for an advance in their wages of 3 cents per hour.

On October 20th John B. McDonald received a check of \$265,000 as the first installment of money in payment for the work on the New York Rapid Transit tunnel.

An improved system of street railway mail service between the cities in Hudson County, N. J., with the exception of West Hudson, went into effect October 15th.

The Board of Public Works of Columbus, O., has taken a determined stand that none but grooved or "Trilby" rails will be allowed on the Mt. Vernon Ave. extension of the Columbus Railway Co.

Thomas L. Childs, of Akron, O., states that the rights of way for the proposed Akron-Canton line have nearly all been secured. This road is to be completed by June 1, 1901.

The Indiana Railway Co. has installed an express service between South Bend and Goshen. The service is received with enthusiasm by the merchants along the line.

The ordinance to compel the street railway companies in New Orleans to operate separate cars for the colored people was defeated in the council by a vote of 12 to 4.

The Brooklyn Rapid Transit Co. has changed its organization, dividing the lines into six divisions, each in charge of a division superintendent, instead of two as formerly.

Autumn leaves on the rails, by preventing a quick stop, caused a rear end collision on the Bay View line at Milwaukee, October 21st. Several persons were slightly injured.

The Milwaukee Electric Railway & Light Co. recently installed a 2,000-h. p. generator in its power house, which will increase the capacity of the plant from 4,000 to 6,000 h. p.

The Worcester (Mass.) Consolidated Street Railway Co. has made a new contract with the post office department under which letter carriers in uniform need not pay fare.

The Palmer (Mass.) & Monson Street Railway Co. has reduced the fare between Palmer and Ware from 15 to 10 cents. Five cents will be charged from Palmer to Forest Lake.

The Syracuse (N. Y.) Rapid Transit Railway Co. is equipping its cars with vestibules, sand boxes and transparent signs in preparation for the winter's inclement weather.

The Toledo (O.) Traction Co. has received four of the eight new double truck cars which were ordered from the east. The cars will be put in service on the Cherry St. line.

The Nunnery Hill Street Railway Co., Pittsburg, is suing the United Traction Co.; the former seeks to use the tracks of the latter in certain streets and also to make crossings.

Thomas H. Regan, of Philadelphia, who has the contract to build a street railway in Greenville, S. C., has announced that cars will be running on the proposed line by December 15th.

The street railway mail service on the electric line between Los Angeles, Cal., Ocean Park and Pasadena has been increased by a new postal car which was put on the line October 25th.

The Fitchburg (Mass.) & Suburban Street Railway Co. and the Fitchburg & Leominster Street Railway Co. have paid \$12,500 toward the expense of abolishing grade crossings in that city.

October 16th a passenger car on the Columbia and Renton line of the Seattle Street Ry. collided with a freight car and a number of persons were more or less injured, none fatally, however.

Experiments have been made in transmitting power current a distance of 154 miles over the lines of the Snoqualmie Mills Power Co., between Seattle and Tacoma and Snoqualmie Falls, Wash.

Work of construction on the Grand Rapids, Holland & Lake Michigan road was begun October 29th. Mr. B. S. Hanchett, Jr., vice-president of the company, lifted the first spadeful of earth.

General Manager Crawford, of the Hartford (Conn.) Street Railway Co., has invited a committee of the city council to visit New York and Boston with him and investigate the question of rails.

The question has arisen in Seattle, Wash., whether a dog, whose fare on the street railway is paid by his master, is entitled to a transfer on connecting lines. A suit yet pending settlement has been brought by a man who was denied a transfer for his dog, under such circumstances.

The proposed electric line through Woodbury, Conn., of which Judge Warner of that city is the principal promoter, will be built by a company of New Haven, Boston and New York capitalists.

The Dayton (O.) & Xenia Traction Co. has been sued for \$20,000 by a young lady of Dayton, who claims that in an accident occurring on that line July 30th her beauty was permanently marred.

Dead leaves falling on the street railway tracks in Cincinnati, O., have occasioned the motormen considerable difficulty. The leaves when once ground by the car wheels make the rails very slippery.

The street railways in Galveston, Tex., have resumed service on Market St., West Broadway and Center St., power being furnished from the Brush Co. The car motors destroyed by the storm have been replaced.

The club house erected by the Cincinnati Street Railway Co. on Eastern Ave. for the use of its employees was completed last month. The plans for this building were published in the "Review" for June, page 345.

The Birmingham (Ala.) Railway & Electric Co., the Birmingham Traction Co., and the Birmingham, Powderly & Bessemer Railroad Co. have been consolidated as the Birmingham Railway, Light & Power Co.

On November 14th the power house of the Ohio River Electric Ry. was opened. Mr. John Blair MacAfee, of the Railways Company General and the American Engineering Co., issued invitations for the occasion.

The site for the new power house of the Findlay, Fostoria & Toledo Electric Ry. has been selected at Fostoria and work on the new structure will be begun at once. The grading on this line is progressing nicely.

Joe Murphy, colored, who sued the Atlanta (Ga.) Railway & Power Co. for \$2,500 has been awarded damages to the amount of \$90. Murphy was put off the car for tendering a Columbian half dollar in payment of his fare.

For the year ending June 30, 1900, the Lewiston (Me.), Brunswick & Bath Street Railway Co. reports gross income from operation, \$222,364; operating expenses, \$167,599; passengers carried, 3,416,141; number of employes, 195.

A company proposing to build a very elaborate electric railway system to connect Buffalo, N. Y., with points along the Canadian shore of Lake Erie, as far north as Crystal Beach, has been incorporated under the laws of Delaware.

The International Traction Co.'s tunnel at Newfane, N. Y., has been completed, and cars are running direct from Lockport to Olcott without change. The through route from Buffalo to Olcott will be opened in the early spring.

We are advised that the work of building the Kenosha (Wis.) Street Ry., which was suspended on October 3d, will be resumed as soon as the necessary men can be secured. The line when completed will be a link in the Chicago-Milwaukee road.

The Grand Rapids (Mich.) Street Railway Co. is building a new car house and shop, 220 x 235 ft. The portion to be used for car storage will have a capacity for 80 cars; the other half of the building is divided into carpenter, machine and paint shops.

The stockholders of the proposed line between Chillicothe and Hillsboro, O., have employed an engineer to make the profile and location surveys. There are two or three routes in contemplation out of Chillicothe and those interested desire to know which in every way is the better.

Mr. W. A. Foote, who is chiefly interested in the proposed line between Jackson, Mich., and Kalamazoo, has announced that the

road will be in operation between Jackson, Michigan Center, Wolf Lake and Grass Lake by May 1, 1901. Rapid progress is being made in the grading of the roadbed.

The Bay Cities Consolidated Railway Co., Bay City, Mich., will put tenders on its cars in both Bay City and West Bay City, in accordance with a resolution passed by the council.

On October 27th Judge Johnson refused to make permanent the injunctions preventing the Swarthmore & Philadelphia and the Media, Middletown & Aston Electric Railway Co. from building their lines in the city of Media, Pa. Injunctions granted to property owners restraining these companies were dismissed.

The opening of the Houghton County Street Railway Co.'s electric line through the copper belt of Michigan was celebrated in Hancock, Mich., October 27th with great enthusiasm by all citizens. The entire town was gayly decorated with flags, and thousands of people cheered the first car as it passed over the new road.

Rapid progress is being made on the Grand Rapids, Grand Haven & Muskegon Ry., a large force of men and over 30 teams being at work along the proposed route. J. M. Walker, general superintendent, representing Westinghouse, Church, Kerr & Co., contractors, has secured offices in the Houseman Building, Grand Rapids.

A resolution has been passed unanimously by the Connecticut state board of trade to the effect that hereafter the state board of railroad commissioners should have supervision of electric as well as steam roads throughout Connecticut. The resolution will be presented by committee at the next session of the state legislature.

The trade unions at Marion, Ind., on October 16th, ordered a boycott of the Union Traction Co., with the idea of forcing the recognition of a street railway union. Hacks were run for the accommodation of union men, but these were not patronized, and on November 5th their use was discontinued. The boycott was a failure.

The strike of the employes of the Terre Haute (Ind.) Electric Co., begun October 11th, was settled by arbitration on the 17th. The motormen and conductors had demanded an increase of from 2½ to 7½ cents per hour, and the arbitrators recommended an advance of 1 cent per hour; linemen are to receive an advance of 2½ cents.

Since the opening of the new electric underground railway in London, Eng., restaurant keepers in the vicinity of the Stock Exchange have experienced a considerable falling off in business. Rapid service on the new "underground" makes it possible for the brokers to patronize the fashionable West End restaurants during lunch hour.

The Fox River Valley Electric Railway Co. has acquired the street railway and lighting plants at Appleton, Wis., and it is announced will build a temporary power house to replace the one burned in July last. A permanent power plant will be erected next season; it will be of sufficient capacity to operate the Appleton and Neenah line also.

Pres. James D. Hawks of the Detroit, Ypsilanti & Ann Arbor Ry. and of the proposed Ann Arbor & Jackson Electric Ry. has awarded Barney & Smith of Dayton, O., the contract to supply 10 cars for the latter line. Westinghouse, Church, Kerr & Co. will furnish the electrical equipment, and cars will be running over the line by June 1, 1901.

The Mill Creek Valley Electric Railway Co., of Cincinnati, will make extensive improvements along its line. The line between the Cincinnati "Zoo" and Mitchell Ave. will be entirely reconstructed, 200 men now being engaged on the work. Waiting rooms will be built at Lockland, Mitchell Ave., and an elegant large depot will be constructed at Glendale.

IMPROVED VENTILATOR.

The Perry ventilator, which is the recent invention of E. S. Perry, of New Bedford, Mass., is being introduced on the street railways throughout the eastern states with the most satisfactory results, the street car companies finding, as had been promised, that the Perry ventilator refused to leak in stormy weather and possessed all the other desirable qualities claimed for it. The ventilator is so constructed that all dust raised by the car is drawn under the deflector and out through the ends of the ventilator, thus rendering whisk brooms on street cars superfluous. A strong outward draft removes all impurities, and through the same ventilator a current of fresh air is constantly poured into the car's interior. On smokers, especially, the ventilator has been found most effective in keeping the atmosphere clear and pure, all smoke as well as dust

INSIDE VIEW OF VENTILATOR.

being carried away by the outward draft which performs the office of scavenger while the impouring current affords a fresh supply of air to passengers. Less scrubbing and cleaning are required on cars equipped with the Perry ventilator than on others. It should be stated, moreover, that though the in-coming and out-going currents of air are entirely effective for their purpose, they are also so regulated as to be imperceptible to the passengers.

The American Car & Foundry Co., of Buffalo, N. Y., is building 50 new cars which are to be equipped with the Perry ventilator; the Albany & Hudson R. R. has equipped all its new cars, which were described in the October "Review" with these ventilators, and numerous other orders from steam and electric railway managers have been received.

A TRIP TO CALIFORNIA

For the winter has become the common thing for those who enjoy perpetual summer. In returning from there there is one route that combines far more advantages than any other—the Shasta-Northern Pacific route. The scenic features between San Francisco and Portland are unequalled in the United States. Winding along the upper Sacramento River, and passing over the Siskiyou Mountains one goes wild. Castle Crags form a never to be forgotten panorama. After Castella and Castle Crags are reached frequent glimpses of white robed Shasta are to be had, and ere long the grand mountain is in continuous sight until the Siskiyou are crossed. Black Butte, south of the Siskiyou range, and Rogue River Valley to the north of it also challenge one's admiration. At Portland the Columbia River and Mounts Hood and St. Helens are reached. Beyond, lies the Puget Sound country and Tacoma and Seattle; then comes the passage of the Cascades with Mounts Rainier and Adams mantled in white, standing bold and high. The Spokane country and the Clark Fork region with Lake Pend d'Oreille and the Mission and main Rocky ranges form another great scenic panorama with Helena and Butte added. At Livingston comes the tour through the great Wonderland—Yellowstone National Park, touched only by this line. This is a side trip unequalled anywhere. Then the Yellowstone River and Valley, with the boundless plains of Montana and North Dakota; the picturesque Pyramid Park, the wheat growing Red River Valley and the Minnesota lake region follow in swift succession and your train is at Minneapolis and St. Paul, the giant cities of the great Northwest. Pullman equipment and dining cars are with you the entire distance. Note this all down and see that your return ticket reads via the Shasta-Northern Pacific, and in the meantime send six cents for Wonderland 1900 to Chas. S. Fee, G. P. A., Northern Pacific Ry., St. Paul, Minn. The book is a beauty and describes the whole region and the route.

CALCULATING FEEDERS.

Boston, Mass., Nov. 9, 1900.

Editor "Review": What size feeders would be required for the operation of four or five cars on a suburban line with 30 miles of single track operated as a loop, allowing for not less than 475 volts at the point farthest from the power house which is at one end of the loop? What is copper equivalent of a 50-lb. rail?

L. J. GORDON.

965 Washington St.

(The station capacity in watts required per car may be taken as $100 \times W \times S$, where W is the weight of the car in tons and S the schedule speed in miles per hour. Thus if there be two 27 h. p. motors which will drive a 12-ton car at 23 miles per hour on level track, the schedule speed could be assumed at 12 miles per hour and the station capacity per car would be $100 \times 12 \times 12$ or 14,400 watts. With a station voltage of 550 this would give 26 amperes per car.

The ordinary practice on such a line as that mentioned would be to run three feeders, one to the far end of the loop, and one to the half-way point on each side. Up to the half-way point the trolley wire (assumed to be No. 0, which has an area of 105,000 c. m.) could be counted as part of the feeder capacity; but for the far end of the loop the feeder should be designed to carry the entire current.

For the long feeder we may assume a drop of 75 volts and the area of the feeder would be determined from the formula $\text{Current} = \text{Drop in voltage} \div \text{Resistance}$. The current we have taken to be 26 amperes, and the drop in pressure to be 75 volts. The resistance per mil-mile of copper is 57,850 ohms, so that the resistance of the feeder will be the length in miles times 57,850, divided by the area of the feeder in circular mils. The resistance of the track return may be taken as one-half that of the feeder, so we have the total resistance equal to $1.5 \times 15 \times 57,850 \div (\text{area in c. m.})$. Substituting this value in the formula $\text{Current} = \text{Drop} \div \text{Resistance}$ and solving for the area of the feeder cross-section, we get.

$$\text{c. m.} = (26 \times 1.5 \times 15 \times 57,850) \div 75 = 451,230.$$

For the copper running to the half-way points the formula gives (assuming a drop of 50 volts)

$$\text{c. m.} = (26 \times 1.5 \times 7.5 \times 57,850) \div 50 = 338,423;$$

subtracting the area of a No. 0 wire, 105,000 c. m. gives as the area of each of these feeders, 233,000 c. m. A No. 0000 wire has a cross section of about 212,000 c. m.

A 50-lb. rail has an area of 5 sq. in. equal to 6,350,400 c. m. Iron has about 17 per cent of the electrical conductivity of copper and hence a 50-lb. rail is equivalent to about 1,080,000 c. m. of copper.)

IMPORTANT, IF TRUE.

The St. Louis papers are full of rumors of the contemplated resignation of President Whitaker of the St. Louis Transit Co., to become president of the Boatmen's Bank, of that city; also the resignation of General Manager Baumhoff, of the same company, to be succeeded by Captain McCullough, now general manager of the Chicago City Ry. All three officials, however, positively deny any truth in the rumor.

The New York papers are reporting the probability of John M. Roach, president of the Chicago Union Traction Co., resigning, to become president of the Brooklyn Rapid Transit Co. Mr. Roach states he has no idea of leaving Chicago at present.

THE BETHLEHEM STEEL CO. has again opened an office in St. Louis, and will be represented there by Mr. S. E. Freeman, 930 N. Main St.

THE GARTON-DANIELS CO., of Keokuk, Ia., is highly gratified to find an increase of one-third in its business, over last year, which was double any previous year. The adoption of the company's lightning arresters on many of the prominent new installations of the year is indicative of their high merit. This company expects to place some new specialties on the market in the near future, with which it has been experimenting for the past year.

Business Manager.

CORRESPONDENCE.

We cordially invite correspondence on all subjects of interest to those engaged in any branch of street railway work, and will gratefully appreciate any marked copies of papers or news items our street railway friends may send us, pertaining either to companies or officers.

DOES THE MANAGER WANT ANYTHING?

If you contemplate the purchase of any supplies or material, we can save you much time and trouble. Drop a line to THE REVIEW, stating what you are in the market for, and you will promptly receive bids and estimates from all the best dealers in that line. We make no charge for publishing such notices in our Bulletin of Advance News, which is sent to all manufacturers.

This paper is a member of the Chicago Trade Press Association.

Entered at the Post Office at Chicago as Second Class Matter.

VOL. X. DECEMBER 15, 1900. NO. 12

Our annual index, which is published with this issue, is arranged alphabetically according to subjects and if an article has dealt with more than one topic it has been indexed under all the subjects treated. Descriptions of street railway systems will be found under the city where the company has its principal office. All legal matters, decisions, notices of suits, etc., are indexed under the heading "Law."

We wish to add in this connection a word in reference to the value of saving and binding the numbers of the "Review" for future reference. Many inquiries come to this office asking for information on subjects that have been treated in these columns. We are more than glad to receive these inquiries and always make every endeavor to answer them as fully as possible, but subscribers can save themselves considerable inconvenience and avoid delays by filing each number of the "Review" as it is received and binding them into one or two volumes at the end of the year. With the aid of the index managers will generally be able to turn to an article that will give them just the information they are seeking.

At Indianapolis and Kansas City certain aldermen are trying to get city legislation for half fare in one case and a free ride in the other for standing passengers. The companies might experiment on a seatless car for the Hoosiers and one in which standing was impossible for the hill city riders.

If all the strange and unexpected causes which are made the basis of claims against street railways for alleged damages were compiled, the result would make a very entertaining list. The latest comes from Ohio, where a father sues for \$5,000 on account of a car barn having fallen upon his son, a minor.

Do the undertakers in Atlanta, Ga., think they see their finish in the proposed electric line to the leading cemetery? At all events they have united in a public protest against the construction of the proposed road. Most people are under the impression

that undertakers would be more than amply profit even if they got the present take off on the body.

The city council of Alameda, Cal., passed an ordinance restricting the speed of electric cars to not more than five miles an hour. It did not say how much cost, and the interurban line which passed through the town now moves its cars at a snail's pace while inside the city limits. A might be expected the citizens are up in arms and after the council chamber for a repeal.

Virginia proposed to settle the separate car question by legislative action, and this reflects the civic and local interests of what has of late become a vexing problem. The street railway companies are reported as not in favor of the new law, but there is little prospect that their wishes in the matter will receive much consideration, and in all probability the bill will become a law.

We have a somewhat indistinct recollection that there was a time, which must have been years ago, when the riding public was complaining in the daily papers about refrigerator cars and other Arctic conditions of travel. Evidently the pendulum has swung too far the other way, for a New York daily has a long article on overheated cars, and seats so hot passengers preferred to stand. The electric heater is evidently a warm subject.

The award of six cents in damages in a personal injury suit in a case brought against the Third Avenue road, New York, caused the presiding judge to set aside the verdict. The court held that the amount awarded was inconsequential, and that if any damage whatever was proved it was an amount greater than the six cents. A new trial was ordered.

It has been the understanding by managers generally that a verdict for a few cents was a great victory inasmuch as it prevented or at least discouraged the plaintiff from bringing suit a second time, and the payment of the small sum closed the incident.

It is not so very long ago when an interurban line 15 miles in length was considered quite a remarkable affair. Now they are stretching out indefinitely and it will not be a great while before 100-mile roads will be numerous. In many cases these lines follow old post or government highways. There is a road now building in Indiana which will be 73 miles long and the half-way stop will be made at a point where stands an old fashioned tavern which was the glory of stage drivers 50 years ago. When the road is in operation the old tavern will be rebuilt and travellers will again stop for meals as they did half a century ago.

The hack drivers of Detroit seriously object to the operation by the Detroit street railways of the special car "Yolande," which enables visitors to make a delightful trip all over the city for 25 cents. The corporation counsel has rendered an opinion holding that it is illegal for the street railway to charge more than 5 cents for a ride over any established route but that if the passengers voluntarily pay 25 cents the company is within its rights. The ruling is doubtless very satisfactory to the street railways, and if some passengers declined to pay the fare the roads might easily establish five separate routes over which to run the special car.

We commend the article on "Oil on Highways" to the managers of railways who find the dust nuisance to be serious. The cost of oiling the roadbeds of steam railways in the East is given at \$15 per mile per annum, and Mr. Longden states the average cost of oiling highways in southern California is less than \$150 per annum per mile for strips from 12 to 18 ft. wide. Assuming that water for sprinkling is available, which is not always the case, the cost of keeping down dust with water is probably not much less than \$16 per month per mile of street, the width sprinkled being 18 to 20 ft., where the company's barns and stables are conveniently situated. The difference, therefore, between water and oil is not a very serious one, and if the oil has the superiority claimed for it, it would be cheaper in the long run to use it.

Steam roads have frequently been dictators where some town attempted to take advantage of supposed necessities and try a hold-up game. The remedy has usually been to divert the line to some

opposition town where decent treatment was assured. Many a town has not yet recovered from some such policy of 20 years or more ago, and some never will recover the lost prestige.

It is now probable that the electric interurbans may have occasion to use the same tactics. A certain town in Michigan aspiring to become something of a port, is treating an interurban line which had selected it as a terminal, with anything but fairness, and the promoters of the road threaten to make the terminus at a nearby smaller town which offers to help out, build wharves, etc., and which has an equally good harbor.

The average passenger who does his riding during the rush hours morning and evening would scarcely believe that a whole, able bodied franchise could be put up at auction in a city of any size and not be bid up over one dollar. And yet that was precisely the amount of the highest bid, and the figure at which the franchise for a branch line in Syracuse, N. Y., was knocked down. It was the first franchise ever sold at auction in that city. The commissioner of public works conducted the sale, and an interesting fact in connection therewith is that the city spent \$504 in advertising the sale. A St. Louis paper commenting on this says: "It is only what might have been expected. Franchises are not like corner lots or draught horses. They are desired only by companies expressly organized for the purpose of using them, and such companies cannot be created for the occasion."

The Supreme Court of Missouri has rendered an important decision in the case of a newsboy injured while jumping from a car in motion after offering his papers on the car. The plaintiff claimed he was a passenger because he intended to pay fare "if the conductor asked him." The court rules this alleged intention does not make him a passenger; that the primary object in boarding the car was to sell papers and not to obtain transportation. Hence "a newsboy who hops on a car while at full speed, tries to sell papers, and then hops off again while the car is in rapid motion, is in no sense, either in fact or intention or law, a passenger."

The court rightly reasons that if a newsboy is a passenger he could demand the stopping of the car both to board and to leave it, and if the cars were so stopped for all the newsboys who want to sell papers on the cars the operation of cars would be practically at their mercy, and the company and the public greatly inconvenienced.

The announcement elsewhere in this issue that the Consolidated Traction Co., of Pittsburg, would at the beginning of the year decorate its employes with service stripes, a blue stripe for one year's and a gold stripe for five years' service, calls to mind the unfortunate lack of uniformity in the service stripe regulations of different companies. Thus on the Cincinnati Street Railway a light blue stripe indicates 2 years' service; a light blue stripe with scarlet edging, 4 years; a gold stripe, 5 years; gold with scarlet edging, 10 years; gold with orange edging, 15 years' service. On the Boston Elevated Railway each stripe indicates five years' service, but the stripes are of silver for motormen, gold for conductors, scarlet for linemen, and green for switchmen and watchmen.

The principal object of such decorations is to bestow on the faithful employe a badge that will inform the general public with whom he comes in contact, of his honorable service. Stripes on the sleeve which certify 5, 10, or 15 years of service with a street railway company are also a certificate of honesty, sobriety, industry and competence, and cannot fail to impress the passenger and influence his mental attitude and conduct towards the employe. But by reason of the want of uniformity in the stripes as prescribed in different cities, a passenger riding on a street railway other than in his own city gets no information from service stripes. What Boston man visiting Cincinnati would suppose that the orange border on the gold stripe meant the same thing as three gold stripes at home, or what Cincinnati man in Boston would think that four green stripes meant 20 years' service.

We think that what may be called the transient or visiting traffic is quite large enough to make uniformity in this matter desirable, and believe that this is one of the things that should be settled by the American Street Railway Association. There are no questions of policy or local conditions involved and esthetic preferences for different colors are not very important, so that there

should be no difficulty in a committee of the American Association deciding upon a scheme of service stripes that could be accepted by all members.

The question of making change does not seem to be a troublesome one except where street railway conductors are concerned. Though it is undoubtedly the duty of a purchaser to tender the exact sum due in payment, persons who have goods to sell are always sufficiently anxious to dispose of their wares to waive their rights. The merchant can always find time to go to his neighbors or to a bank and get a bill of large denomination changed; it is the purchaser who is subjected to annoyance because he has to wait. When the passenger on a street car offers the conductor a \$20 bill he feels much aggrieved if the latter cannot change it. There have been several decisions in the courts to the effect that the common rule of furnishing change to the amount of \$2 only is a reasonable one, but occasionally a passenger with a large bill who has been ejected wishes to try the matter again. At Seattle, Wash., recently a suit against the Consolidated Street Railway Co., brought by a man who had been ejected because he persisted in offering the conductor \$10 in payment of his fare, was decided in favor of the company; the court held that the \$5 change rule of the company was reasonable. The general manager has since promulgated a new rule, and hereafter conductors are to accept a large bill when offered, give a receipt, and direct the passenger to call at the office of the company to get his change. This should prove an easy and effective quietus on the large bill fiend.

We fear that Dr. Franklin would not rest easy in his grave could he read some of the alleged scientific essays that now appear in the Saturday Evening Post (founded by Benjamin Franklin in 1728). On the editorial page of a recent issue of that paper was an article, signed by John Habberton, on "Running the World Without Coal." Some extracts are as follows:

"Reports continue to come from the Paris Exposition that a cheap and convenient means has been devised for separating common air into its component gases so that the oxygen may be burned to create light and heat. * * * The 'decomposer' of air for lighting is said to be so small in proportion to the service done by it that one no larger than an egg will light a room brilliantly for hours; hitherto this effect has required the consumption of a cubic foot of coal or a quart of oil or a lot of naphtha, or some other of the ill-smelling things that are used by the gas companies. * * * The source of fuel, instead of being in widely separated forests and mines, will be within reach anywhere and everywhere, so battleships and cruisers will no longer be 'tied to a coal-heap,' all steamers of the mercantile marine can be fast yet not lessen their freight capacity by setting aside hundreds of cubic yards of space for coal bunkers, and locomotives will never be obliged to slow or stop to 'coal up.' * * * Also within the general understanding is a fact almost as cheering; without coal or the demand for coal there can be no more miners' strikes, to take food from the mouths of women and children, array class against class, and stimulate the latent meanness and brutality of both classes, give demagogues a chance to make money and political capital out of the conflicting interests while widening the breach between them, and lessening respect for human nature in all spectators of the contest."

If the editor has a mission other than that of filling the columns of his paper each publication day, we suggest that the space taken by Mr. Habberton might have been used to better advantage by pointing out that even if oxygen is to be used as "fuel," "steamers and locomotives" would have to carry something to combine with it, which something would probably be carbon in the form of coal.

The "Review" has from time to time made mention of street railway funerals at various cities, including among others, Milwaukee, St. Louis, Oshkosh, Wis., Chicago, Mexico City, Hartford, Detroit and Cleveland, and in this issue we describe a funeral car in Baltimore. We believe the electric railway is soon to find a broadening sphere of usefulness in this direction. And why not?

It has well been said that funeral customs and prevailing modes of treating the dead may be taken as evidence of the modes of thinking and the degree of civilization of a people. History points out that as nations have risen above the plane of superstition and

ignorance they have laid aside something of the elaborate ceremonies surrounding the burial of the bodies of departed ones, and have been willing to mold their funeral customs more in accordance with common sense and a due regard for the comfort and convenience of the living. The funeral pyre and open bier have given way to embalming and the sealed germ-proof casket.

In this country for many years relatives and friends of the deceased followed the body on foot in couples, the body being carried on a bier on the shoulders of men. The first funeral in Salem where a hearse was used occurred in 1817. Coaches were not employed until 1830, and even for some time after that date it was considered an unfeeling and indecorous custom to ride to the grave of a friend.

But as this sentiment in time disappeared, we believe also that any lingering disapproval of the funeral by trolley, that may be manifested now, will be overcome as soon as the advantages are more generally known. For instance, why should a funeral party be subjected to all the jolting and discomforts of a long ride in uncomfortable, unheated and ill-ventilated coaches, often over the worst kinds of roads, when it is possible to take a clean, well-heated funeral car at the door and ride in one-half the time to the gate of the cemetery. And when it is considered a car built as the one in Baltimore, described in this issue, will accommodate 32 persons in addition to the casket, or a capacity equivalent to eight carriages and a hearse, another potent argument is introduced, for the car costs but \$20 to \$25, and the carriages for the same occasion would cost \$50 to \$75. And after all why should there be any more sentiment against carrying a body to the grave on an electric car than in sending it in the baggage car of a railroad train?

We believe managers can take up this question of providing funeral facilities with profit to themselves and with real benefit to the community.

SPECIAL SCHOOL RATES PROPOSED FOR SAN FRANCISCO.

The Board of Supervisors of San Francisco has been making determined efforts to enact legislation of some sort that will effect a reduction in street car fares. Some time ago the program was to have cheap fares for wage-earners going to or returning from work. More recently a bill providing that only half-fare should be charged for standing room, was proposed. Both of these ordinances failed, the street railways being able to satisfy the Board that the roads could not afford the reduction in their incomes that would follow. Now the proposition is to give low fares to school children.

INTERURBANS ENTERING COLUMBUS, O.

The number of street railway companies proposing to make Columbus, O., the center of operations for extensive interurban lines, or trying to effect an entrance into Columbus has increased during the past year until now there are 16 such companies. The latest of these are the Columbus, Lima & Northwestern Railway Co., recently incorporated to extend the Columbus, Lima & Milwaukee, a steam road, to Columbus and Lake View, 21 miles; the Columbus, Winchester & Lancaster Traction Co., which will expend \$700,000 for the construction of a line to Lancaster, and is being promoted by Howard C. Park and David Beggs; the Columbus, Mount Sterling & Washington C. H. Electric Railway Co., which was recently incorporated by C. P. West and D. T. Worthington; the Columbus & Portsmouth Electric Ry., which will run through Shadeville, Lockbourne and Chillicothe to Portsmouth; and the Columbus Suburban Electric Railway, the Columbus & Southern Electric Railway, the Columbus & Xenia Traction, and the Urbana, Mechanicsburg & Columbus Electric Railway Cos. Other interurban roads seeking entrance into Columbus have been noted in the "Review" during the current year in chronological order. They are: The Columbus, London & Springfield Ry.; the Columbus & Lancaster Traction; the Grove City & Green Lawn Street Ry.; the Columbus, New Albany & Johnstown Traction; the Columbus, Buckeye Lake & Newark Traction; the Chillicothe, Clarksburg & Columbus Ry.; the Worthington, Clintonville

& Columbus Street Ry., and the Chillicothe, Mount Sterling & Columbus Ry. Such of these roads as will effect an entrance into the capital over the lines of the Columbus Railway Co. will operate under what is known as the "Dayton plan," by which the Columbus company will provide the tracks and power, receiving as compensation 3 cents for each passenger carried over the city lines on the interurban cars.

Satisfactory progress is being made by most of the interurbans in obtaining necessary rights, and the construction of many of them is well under way. When they shall be completed and in operation Columbus will be the equal of any of the larger cities in the matter of extensive interurban street railway service.

TRIAL TRIP ON MANHATTAN ELEVATED.

Experimental trips over the Manhattan Elevated Railway, New York, were made on November 19th, 20th and 21st, with an electric train of six cars, and the equipment was found to work with perfect satisfaction. The two end cars are each equipped with four 150-h. p. motors, giving a total of 1,200 h. p. for the train, and both motor cars are controlled from one end on the General Electric Co's. multiple unit system. The two motor cars weighed 66,000 lb. each, and the four intermediate cars about 29,000 lb. each. The couplers used were the Van Dorn No. 3 and No. 4, and it is reported that they worked so smoothly that the train was like a single car; these couplers were illustrated in our October issue.

Among those present on the trial trips were: W. E. Baker, general superintendent of electrical construction for the Manhattan; President Vreeland, of the Metropolitan Street Ry.; President Rositter, of the Brooklyn Rapid Transit Co.; J. S. Doyle, master mechanic of the Metropolitan; W. A. Potter, of the General Electric Co.; W. T. Van Dorn.

STREET RAILWAYS ARE CORPORATIONS FOR PECUNIARY PROFIT.

The general incorporation law of Illinois provides for the incorporation of societies "not for pecuniary profit," and an attempt was made by C. L. Bonney, of the Chicago General Railway Co.; Lyman M. Paine and Emil A. Bazner to incorporate as the Citizens' Street Railway Association. The secretary of state refused to grant the license, and application was made to the Supreme Court for leave to file a petition for a writ of mandamus against the secretary of state.

December 5th the Supreme Court denied the motion, saying that a street railway or a heat and power company cannot be organized and put in operation without the expenditure of a large amount of money, and that the difference between a corporation organized for profit and one not for profit seems to be that if the corporation is organized for the purpose of gain upon the investment, then it is a corporation for profit.

ELECTRICAL GARDEN OF EDEN.

Dwellers in the Southland are justly proud of what Mother Nature has done for them, but it has remained for Mr. Geo. H. Conklin, claim agent of the Augusta (Ga.) Railway & Electric Co., to discover that the Garden of Eden is now located in his city. He writes:

"We have an odd pair of names in our armature room. There are but two winders; they came to the shop at different times, and were placed in that department entirely by accident, and they had been there several months before attention was called to the significance of their being together. One is John H. Adam, and the other is O. B. Eve."

The City & Suburban Railway Co., Portland, Ore., has placed in operation on its Mount Tabor line four new cars, made in the shops of the railway company.

The managers of the Milwaukee Electric Railway & Light Co. and of the Higgins street railway system, at Manitowoc, are contemplating a number of extensions which will ultimately place Milwaukee in direct electric railway communication with Sturgeon Bay, over a route 125 miles long.

The New Jersey & Hudson River Railway & Ferry Co.

The railway of the New Jersey & Hudson River Railway & Ferry Co. is locally known as "The Hudson River Line," and it is claimed by the managers that a trip over their lines presents the most picturesque trolley ride to be found in America. Be that as it may, it is certainly a very interesting system, both from scenic and engineering standpoints. Starting from the New York side at 130th St., the passenger after leaving the 125th St. or Boulevard cars of the Third Avenue R. R., passes under the new viaduct of the Riverside Drive, and arrives at Fort Lee Ferry on the Hudson. This ferry is owned and operated by the railway company, and is the only ferry crossing the Hudson River above 42d St. The boats are large and are of about the same type as those operated by other New York ferry companies. The landing at Edgewater on the New Jersey shore is directly under the bluff of the Palisades, that strange formation of trap rock which is one of the principal natural features that make the shores of the Hudson famous. From the deck of the ferry-boat, in crossing, one gets an extended view of the river, up and down, including the most interesting portions of the Palisades. The ferry house on the Jersey shore is a commodious structure with a single slip, and in a portion of the building is the office of the superintendents of the railway and of the ferry. There is also a storeroom for street railway supplies. The tracks are directly in front of the ferry house, and here the cars are always in waiting on the arrival of

East River and a ridge of hills on Long Island are clearly seen. Strangers on making this trip for the first time are charmed with the scenic effects, and are surprised to find that there is a place

NEW YORK TERMINUS.

so wild in its environment so near New York City, and from which so much of the city can be seen.

On reaching the top of the bluff the line passes the border of a new park of seventy acres recently laid out by the railway company, and then plunges into a dense forest and continues through an avenue of trees in a northerly direction parallel with the Hudson two miles to the village of Fort Lee, which is located on the highest point of the Palisades at about half a mile from the river. From Fort Lee the line passes down and across a valley to the heights beyond, and then descends a long 10 per cent grade into the valley of Overpeck Creek, giving to the passenger on the way a most beautiful view across this valley and that of the Hackensack River to the Ramapo mountains, 12 or 15 miles distant. At the foot of the hill near Leonia the main line turns north, and terminates at Englewood, and near the same point from which the turn is made a branch that was constructed during the present season turns west, across the marshes of Overpeck Creek, then over the Teaneck Ridge and across the marshes bordering the Hackensack, and on across the Hackensack River to the town of the same name three miles from the main line. The Englewood branch passes the grounds of the Englewood Golf Club, and past numerous truck farms and cottages, when it enters Englewood, a town of 8,000 inhabitants.

The Hackensack branch crosses by means of trestle bridges, the tracks of the West Shore R. R. and also those of the Northern R. R. The former consists of a steel trestle 500 ft. in length, and

MAP OF HUDSON RIVER LINE.

the boat. Half-hourly trips are usually made, but on Sundays and holidays a 15 minute schedule is maintained.

The cars on leaving the ferry house immediately begin the ascent and pass near the power station and car houses which stand just above the ferry house. A bend is made to the right, then to the left, crossing a small stream, which is alive only in the winter time, and continuing on a 5½ per cent grade along a road-bed cut in the face of the Palisades to a point about half way to the top. Then the track turns on a still wider foundation and continues upwards in the opposite direction to near the top, when it turns west, and reaches the highest point by gradual ascent, the highest point being 260 ft. above the Hudson. The two inclines were, until recently, connected by a switchback arrangement of tracks, but during the present season the rocky face of the bluff at this point has been blasted away and a retaining wall with massive buttresses built, making a shelf about 130 ft. wide or sufficient for a double track loop of 45 ft. inside radius, and leaving a perpendicular rock face of over 50 ft. On the trip up or down the bluff, one gets an extended view of the Hudson and of the New York shore, including the tomb of General Grant, the buildings of Columbia College, the Teachers' College, St. Luke's Hospital and the high arches of the new Cathedral. The view on a clear day extends across and beyond the city, so that boats in the

FERRY HOUSE, EDGEWATER, N. J.

a 70 ft. plate girder span immediately above the tracks of the steam line. The second trestle is also constructed of steel and is 1,150 ft. in length, with a 70-ft. plate girder bridge over the tracks as in

the other case. The foundations of the latter trestle rest on piles with concrete caps, as the structure is through a marsh. The road also crosses the Overpeck Creek on a drawbridge. The feed wires over this draw are supported by poles 55 ft. above the water. This in order to avoid a cable crossing.

The Hackensack River is crossed on what is said to be the largest

are provided at a distance of 50 ft. from each bridge portal and one indicating lamp on the bridge. The signal circuits are closed by the bridge tender just before opening the draw.

The construction of the Hackensack branch included many interesting features, and on a portion of the route it was necessary to cut through a stretch of swamp with a dense growth of timber and

POWER HOUSE, EDGEWATER.

PARK SITE LOOP.

drawbridge designed purely for a street railway line that is to be found in the country. The draw is 160 ft. long, and it is of the riveted truss type. The foundation of the center pier consists of piling on which is a grillage above which is heavy masonry. From the illustration it will be noted that the cross section is spaced for two tracks, the track centers being 11 ft. 1½ in., to provide for the passage of wide cars. The bridge is kept in line by four end rests which are adjustable from above, and the alignment of the track is maintained by means of four shoes at each end, under the end of the rails, and the bridge is locked by the usual spring latches. The draw is so designed that it can be operated by hand or electric power, there being a G. E. 800 motor with a train of gearing, by means of which the draw can be opened and closed in 1½ minutes. Current for operating the motor is taken from a submarine cable which connects the regular feeders with the center pier. The bridge is capable of carrying a 30-ton car on each track. Trestle approaches to the draw are provided on each

underbrush, and over a portion of the way the roadbed was built upon logs and timber work to prevent it sinking into the soft ground. In digging holes for the side poles it was necessary to curb the excavation, and when the pole was in place the curb was filled with concrete, giving a mass sufficiently large and heavy to hold the poles in position. Improvement now being made, and proposed improvements include the double tracking of the line along the bluff, between the ferry and the new park. A large addition is being made to the car houses. An addition will be made to the ferry house on the New Jersey shore, sufficient for a second slip, and a new, commodious, double-slip ferry house is to be built on the New York side.

The new park, which will extend to the very edge of the Palisades, is shaded by a thick growth of trees. It has been graded and laid out in drives and walks, a casino is to be erected, and all the attractions and conveniences to be found in first-class street railway parks will be installed. It is the intention of the manage-

SWITCHBACK WALL.

WEST SIDE R. R. TRESTLE.

side; that on the west side is 915 ft. and the eastern trestle 285 ft. long. The trolley wires are supported by steel latticed work thoroughly braced as shown. By this means and the substantial supports at the shore ends the trolley wires can be kept taut. Safety devices are provided which are located 800 ft. from each end of the bridge, and consist of a cluster of five green lamps furnished with a reflector with a suitable housing. In addition four red lights

ment to make this as good as if not better than any street railway park in the country, so that it may be attractive to the best class of people from New York and the neighboring Jersey villages. A real estate company has recently purchased a large tract of land on the line of the railway on the top of the Palisades and is making improvements with a view of bringing the region into the market as a new settlement. In addition to this, real estate com-

panies are developing additions in the neighborhood of Hackensack, all of which will give added patronage to the line.

Entirely new rolling stock has been purchased for the system during the past year, and among the new cars are 10 double-truck open cars, having a seating capacity for 84 people; these are 41 ft. 6 in. long, and are mounted on Peckham trucks, type 14-B-3, and equipped with G. E. No. 67 motors, and the new type K 6 controllers. The closed cars are five in number of about the same length as the open cars, and will be mounted on the same trucks. These cars are finished in quartered oak, and, as well as the open cars, were built by the American Car Co., of St. Louis. In addition to the ordinary brake equipment, the cars have the Price friction momentum brake, which is said to be giving excellent satisfaction, as the equipments that have been run during the entire summer do not show any wear, and it has not been found necessary to readjust the disks. The cars have Hale & Kilburn seats, are headlights, Van Dorn drawbars, Sterling fenders made by the Sterling-Meaker Co., DeWitt sand boxes, and Wilson trolley catchers which were furnished by the Frank Ridlon Co., of Boston.

The power equipment has also been increased during the past season, two 500-h. p. Heine safety-boilers and a cross compound Hamilton-Corliss engine of 750 h. p. having been added. This engine has been running temporarily belted to a 500-k.w. generator. A direct connected generator, however, is to be put in. The temporary generator is mounted in a novel manner, with the base at an angle of about 45 degrees. As it is located directly over a storage battery which occupies the basement, it was necessary to provide a timber foundation and mount it above the floor to

which gives a panoramic view of Riverside Drive from the top of the Palisades, and also contains a colored map made from the United States Geological Survey, which shows New York City, the Hudson River, the rivers, steam railroads and wagon roads within a radius of 18 miles from the center of population of Manhattan and the Bronx, which from the census of 1900 is said to be

PREPARING THE WAY.

at the intersection of 5th Ave. and 53d St. A reproduction of the Hudson River view mentioned was published in our issue for September, page 535.

The officers of the company are: President, A. M. Taylor; vice-presidents, W. H. Clark and F. R. Ford; secretary and treasurer, W. N. Barrows; ferry superintendent, E. W. Lawson; railway superintendent, F. W. Bacon. The line was built by the engineering firm of Ford, Bacon & Davis, of New York.

HORSE ROADS INCREASING IN VALUE.

Our English contemporary, *Lightning*, in commenting on the tramway situation, says that since it has been demonstrated that to get hold of a horse tramway and convert it to electric working is very near a certainty in the way of profitable business, horse tramways are becoming more difficult to acquire. In addition to the stockholders of the old horse roads, promoters also have to contend with the local authorities, who either decline to grant any concession or drive a hard bargain in the matter of compensation.

ROAD BETWEEN BEAVER FALLS AND NEW CASTLE, PA.

November 26th a charter was granted to the New Castle (Pa.) & Beaver Falls Street Railway Co., which is to build between the towns named in the title, a distance of 16½ miles. The capital is \$100,000, and the directors are: William S. Foltz, George Greer, J. Norman Martin, New Castle; Theodore P. Simpson, John C. Whitla, Beaver Falls.

The same parties are interested in a proposed line from New Castle to Sharon.

ALLEGED INJURY FROM ELECTROLYSIS.

An action brought by the Manufacturers' Natural Gas Co., of Indianapolis, against the Indianapolis Street Railway Co. to recover \$50,000 damages for deterioration to gas pipes caused by electrolysis is pending in the Superior Court at Indianapolis. The gas company complains that disintegration of the pipes has been caused by the inability of the street railway company's conduits to carry the return current of electricity back to the power house, as a consequence of which employes of the gas company have received shocks and burns when the gas has been ignited by the electricity. It was argued for the defense that the street railway company's rights to the use of the streets were prior to those of the gas company, and that the latter was not entitled to recover because it made no pretense that its property rights had been damaged.

HACKENSACK DRAW BRIDGE.

make room for the belt. The storage battery consists of 258 cells, with a capacity of 300 amperes, and was made by the Electric Storage Battery Co. This battery was installed two years ago, and is quite essential to the operation of this system, in order to take care of the fluctuations in the load, as the power varies from zero to 1,200 h. p. at times. The original equipment of the station consisted of two single E. P. Allis engines, of about 300 h. p. belted to M. P. General Electric 200-kw. generators.

The system includes about 12 miles of track, but the longest distance to which the current is transmitted is eight miles. At the turn-outs block signals are provided, and at each turn-out is a telephone housed in an iron case. At some of the turn-outs and at points along the line board signs are provided which read "Bicycle Station." At these points wheels are taken on and are carried by means of hooks attached to the dashboards at both ends of the cars.

The line enjoys a large shopping patronage from people from Englewood, Hackensack and neighboring towns who patronize the large store, in which is known as the "Harlem District" of New York, the principal stores being located on 125th St. Besides this, the line caters to a large pleasure traffic during the summer, as the wild region on the top of the Palisades has a great attraction for city people. The ferry fare is 5 cents, and two fares are charged to and from Englewood and Hackensack. In connection with the operating department a time table folder is published

HOME-MADE FUNERAL CAR AT BALTIMORE.

The latest street railway to provide funeral facilities is the United Railways & Electric Co., of Baltimore, and this company has probably gone into the business on a more elaborate scale than has before been attempted.

Baltimore has a number of fine suburban cemeteries, all of which are reached by some division of the street railway lines, and the company found that by putting in a few crossovers, it could take a car from any part of the city to any one of the burying grounds

The interior arrangement is shown in Fig. 3. The car is divided into two compartments, the smaller one of which has running its full length another compartment or vault, in which the casket is carried. This receptacle for the coffin is 26½ in. high, 26¼ in. wide and 7 ft. 9 in. long. It is made of cherry paneling lined with zinc so as to be absolutely odor proof, and in addition has a vent pipe running up to the roof of the car to ensure a frequent change of air.

Access is gained to the vault from the outside by means of a heavy plate glass door, running its entire length and hinged to

FIG. 1—FUNERAL CAR OF THE UNITED RAILWAYS & ELECTRIC CO., BALTIMORE

without serious inconvenience. It was therefore decided to try the experiment of offering cars for the transportation of funeral parties, the idea as at first proposed being to use regular cars for this service. The innovation, after a little educational work on the part of the company, soon met with extended popular endorsement, and it was not long before the management became convinced it

swing downward. The vault floor is in reality a sliding shelf, the construction of which will be more readily understood from Fig. 4.

When a casket is to be placed in the car, the shelf is drawn out, the casket lifted upon it, and the shelf is then pushed back into place, carrying the coffin with it. The shelf runs upon rollers and will support 1,200 lb. when drawn out. The casket is anchored firmly in position by means of rubber protected metal pins at the sides and ends, these pins fitting into holes or sockets arranged as shown in Fig. 4, and spaced 3 in. apart. Burial caskets are made in standard sizes as regards inside measurements, but vary greatly in outside dimensions, outlines and weight. It is believed, however, that holes arranged and spaced in this manner will accommodate practically every variety made.

The larger compartment into which the car is divided has 12 cross seats, with center aisle, giving a seating capacity of 24. The

FIG. 2—INTERIOR OF CAR.

could afford to go into the business on a broader scale and make the carrying of funerals a regular operating department.

One of the results of this decision was the special funeral car shown herewith, which was designed under the direction of the mechanical department and built at the company's shops from an ordinary 22-ft. double truck car, mounted on Brill No. 30 trucks.

FIG. 3—PLAN OF CAR

smaller one, in addition to the receptacle for the casket, has four seats, as shown in the plan. By means of heavy black curtains the two pairs of seats may be shut in, making practically two private compartments. These are for the pall-bearers or immediate family of the deceased. The top of the casket vault comes about level with the window sills and upon it the floral contributions are piled, in which position they are visible to the occupants of the car and also through the windows, from the street.

The car is finished inside and out in black enamel with all trimmings, lamp fixtures, etc., of nickel. Seats are upholstered in black imitation leather and heavy black curtains are placed in the windows and at the doors.

A suitable light truck shown in the cross-section in Fig. 1, having pneumatic tire wheels and folding sides, is carried in a box underneath the car for the conveyance of the basket from the car to

FIG. 4 SLIDING SHELF.

and through the cemetery, or from the residence to the nearest street railway line, if it is desired.

The charges for the use of the car are as follows: From city points to any cemetery in Baltimore, \$20; to Pikesville, Towson or Catonsville, \$22; to Ellicott City or Reisterstown, \$25. The car has been named "Dolores," meaning sorrow.

REPORT OF MANHATTAN ELEVATED.

The annual meeting of the stockholders of the Manhattan (Elevated) Railway Co., New York, was held November 14th. No changes were made in the directory, and the officers were re-elected. The report of President Gould for the year ending Sept. 30, 1900, shows substantial gains in traffic as compared with recent years, the total number carried being 183,788,851, against 177,204,558 in 1899. The number carried last year was in excess of the traffic in any year since 1895. The figure however, is still far below the record year, 1893, when 210,621,000 passengers were carried, or 35,832,000 more than in 1900.

As compared with 1899, gross earnings increased \$625,624; operating expenses, however, were \$90,870 less, so that net earnings were \$716,494 higher for the year. Bond interest was about \$73,000 less, but this was offset in part by an increase of \$45,000 in taxes, so that total net income available for dividends was \$745,139 more than a year ago. Last year's dividends accrued on the full volume of stock now outstanding, \$48,000,000, while in 1899 half of the 4 per cent dividend disbursement was payable on \$30,000,000 of stock. This last accounts for an increase of \$360,000 in dividend payments last year, but, nevertheless, the company is able to report a surplus over all charges and dividends of \$146,779 for 1900, as against a deficit of \$238,360 in 1899.

TRI-CITY COMPANY'S IMPROVEMENTS.

The Tri-City Railway Co., operating between Davenport, Ia., and Rock Island and Moline, Ill., with headquarters at Davenport, in November finished a year's work for the improvement of its system. The company has spent \$200,000 in the reconstruction of eight miles of track and the building of a new four-mile line, and in the reconstruction of about 10 miles of overhead work. In addition to this all switches, curves and crossovers have been renovated or replaced. A 400-ft. steel bridge on the route of the extension to the arsenal shops has been completed.

The Keokuk (Ia.) Electric Street Railway & Power Co. has completed a short extension of its line.

WEIGHT OF STEEL IN BRIDGES FOR ELECTRIC RAILWAYS.

BY H. G. TYRRELL, C. E., NEWTON, MASS.

The accompanying curves give the total weight of steel in single track bridges for electric railways for spans up to 200 ft., according to the new specifications recently adopted by the Board of Railroad Commissioners of Massachusetts. The weight of steel in bridges to carry two tracks of railroad will be about 90 per cent greater than that given for one track. These bridges are designed for railroad traffic only, no floor being provided for carriages and pedestrians. The weight of ordinary street bridges with provisions for car tracks has already been published by the writer in London Engineering, June 8, 1900.

The electric railway bridges described in this article have steel stringers. Weights are given corresponding to live loads of from 1,000 lb. to 2,000 lb. per lineal foot of track. These weights are conveniently expressed by the following formulas where L is the length of span from center to center of bearings. Weights are given in pounds of steel per lineal foot of bridge.

Beam bridges, $50 + 5 L$

Truss bridges for 2,000 lb. live load per ft., $250 + 1.5 L$

Truss bridges for 1,000 lb. live load per ft., $200 + .8 L$

Extracts from the specifications are as follows:

For bridge floors either a 20-ton 4-wheel car with 7-ft. wheel base, or a 30-ton 8-wheel car with 17-ft. total wheel base and 4-ft. truck wheel base. The fibre stresses to be used in the floor are as follows, the material being medium steel, namely: for I-beams 12,000 lb. per sq. in., properly reduced according to the ratio of width

WEIGHTS OF ELECTRIC RAILWAY BRIDGES.

of flange to total length when this ratio exceeds 20. For plates and shapes 12,000 lb. per sq. in., in tension, and 12,000 lb. per sq. in. reduced by the usual formula according to the distance unsupported. Rivets in shearing 10,000 lb. per sq. in. and in bearing 16,000 per sq. in. for shop driven rivets; field driven rivets to be reduced 25 per cent below these figures. No rivets less than 3/4-in. to be used.

For trusses, uniform loads shall be assumed, varying according to the length which is to be covered by live load to produce maximum stresses, from 1,500 lb. per running ft. per track for a loaded length of 100 ft. down to 1,000 lb. per running ft. of track for a loaded length of 300 ft. and proportionately for other lengths. Due account must be taken in the case of pieces which receive concentrated loading from the floor loads.

The factor for trusses may be larger than that for the floor.

The following may be the stresses per sq. in.: for tension 15,000 lb. per sq. in.; for compression 12,000 lb. reduced by the Rankine formula; for rivets, however, the same stresses should be used for the floor.

The question whether street cars should be permitted to operate on Sunday has been hotly contested recently, in West Superior, Wis. A decision in favor of Sunday traffic was finally rendered, the authorities having conceded that street cars were a necessity each day of the week.

Electric Railway for Georgetown, Demerara.

BY S. SWAN AND NORMAN S. RANKIN.

The city of Georgetown, Demerara, British Guiana can now boast of having a most modern electric tramway, and one that for careful and solid construction, and quality of materials used is probably unsurpassed today. A city of over 60,000 people, beside suburban villages, Georgetown occupies an important position amongst the commercial ports along the northern coast of South America, and though perhaps but little heard of by the public generally, is nevertheless slowly and steadily making vast strides in commerce, population and trade. The capital of the colony, the finest town in the West Indies (for although Georgetown is a South American port, it is so nearly identified with the West Indies in every way, as to be classed with them rather than with the former), the point of call for at least five great steamship companies, connecting the colony with England, France, Germany, the United States and Canada, Georgetown may certainly be said to be a go-ahead city.

Up to within a year ago its citizens had been content to jog along tranquilly with their primitive mule cars, but following the example set by Jamaica, and doubtless also owing to its increasing prosperity and importance, the people finally clamored for a more rapid mode of transit, and clamored with such purpose that at length their desire has become a reality. A little more than a year ago Mr. W. B. Chapman of Montreal, who it may be remembered was the promoter of the Kingston, Jamaica, electric system, and who is as much at home amongst the West Indian Islands as he is in Canada, went down and secured the franchise which was at once financed by a Canadian company with Sir William Van Horne at its head. This company immediately took matters in hand, sending down engineers to lay out the proposed lines, and lawyers to arrange business matters. The Georgetown Tramway Co., whose motive power was mules, was bought out as well as the British Guiana Electric & Power Co., and these two united under the style of the Demerara Electric Co., Ltd. Amongst its officers are Sir William Van Horne, B. F. Pearson, of Halifax, W. B. Chapman, Abner Kingman, James Hutchinson and Ernest Alexander, of Montreal. This last named gentleman is the secretary of the company.

No time was lost in beginning construction and in March last Mr. Frank P. Brothers went down to begin operations, and pushed the work with such energy that the close of the month of August saw the construction books practically closed. Mr. Brothers, who is well known throughout Canada in railway circles, and who was manager of construction of the Kingston electric system, was the right man in the right place, his previous tropical experiences serving him in good stead. It was said in Demerara, that never before in the history of the country had the natives been seen to work—nor was it believed they could work—as they did on the construction of this road.

The difficulties of construction in such a country as British Guiana can hardly be estimated, nor can it be thoroughly understood except by those who have had experience of similar works in tropical lands. The intense heat and glare of the sun, so particularly depressing and enervating to a northerner, the difficulty in receiving and landing the heavy material, the slow and uncertain arrival of goods, the heavy tropical rains and storms, the clay formation and frequent visitations of fever and sickness may be mentioned as chief amongst the many difficulties to be contended with.

Georgetown, though, as has been already said, "the finest city in the West Indies," is built upon a thin coating of alluvial clay, directly over a mud-swamp and under the sun, being but six or seven degrees from the equator, so that during the period of the day when the sun is at its highest it may properly be called a "veritable furnace." At full tide it lies in from four to six feet below the level of the ocean which is held in check by a granite wall of massive construction stretching for nearly two miles along the sea shore of the city front. The city and country is drained by a system of canals and dykes which intersect the land in all directions, and flow into one large main canal whose gates are opened at ebb-tide to permit the outflow of drainage and excess water.

In times of extraordinary rains these are helped along by pumping stations of which there are several at different points, but in spite of this the canals are often taxed to their utmost capacity and

overflow their banks inundating the country all about. The extreme difficulty of construction under such circumstances is quite apparent and on days when such extraordinary rains fell, work had to be entirely suspended. At one time during the construction there was not one period of 24 hours passed in 92 days that some time rain did not fall, and so at dryest the country is but a mud-flat its condition may well be imagined. Before resuming work after a cessation of rain, it was necessary to bail the water out of the trenches which had already been cut and prepared for receiving the rails. This occupied no little time.

The streets are very fine and well laid out and are always kept in splendid condition, indeed from the fact Georgetown might well be called a "bicyclist's paradise" and there are probably more wheels in Georgetown for its size than any city in Canada; this, however, I think is but the usual craze that struck our northern cities some years ago when wheeling first came into public favor, and the bicycle will doubtless become less popular as the novelty wears off. Some of the residential streets or avenues are most ornamental, and are beautifully laid out being over a hundred feet in width with central running down the center, and lines of tall foliage shade trees stretching down the drive on either side. Many of these avenues at certain seasons of the year covered with the beautiful Victoria Regia water lily, and present a singularly handsome appearance.

The sanitary condition of the town is almost perfect for which thanks are due to the capable town superintendent, Mr. Luke M. Hill. Mr. Hill who is also the city engineer, has much to occupy his attention having to look after the water works, roads, fire department, sanitary affairs and police. On account of the scarcity and cost of stone which cannot be got within a radius of 75 or 100 miles inland and is brought down the rivers in punts at a cost of \$150 per ton broken, most of the highways are made up of a mixture of burnt clay and sea shell. The former is most largely used, and well beaten in by traffic and rains gives an almost perfect road of a deep red brown color, smooth, hard, and pleasant to the eye. This clay is burnt in kilns about the city and its cost varies, but may be said to be generally in the vicinity of \$160 per cu. yd. Schooners run continually between Georgetown and Barbados, and do a fair trade in supplying the city with shell and other road material. It is estimated that the cost of public road material per mile amounts annually to about \$675.

Owing to the clayey formation of necessity the buildings are of light construction, wood or plaster, and it is believed that in the whole town there is not one house of stone. In the first place the cost of stone is too great, and again should the building be of heavy construction it would have to be so enormously spread out to prevent its settling that it would be impracticable. Although of light construction some of the buildings present a very fine appearance, there being much ornamentation. The finest are the Government Buildings, the Market, the Roman Cathedral, the Law Courts and the Banks.

Nearly everything for construction purposes had to be imported into the colony, and the failure of contractors to ship materials on specified dates greatly hampered the progress of construction. Materials not sent forward on stated occasions had to be over on the wharves until the following ship was ready to sail, and there was on more than one occasion a period of two or three weeks between arrival of a vessel and its departure had to be held back. Steamers not having settlements largely for Demerara were swived off of the return trip, but visiting Georgetown at all.

The climate being extremely hot and trying to a northerner is peculiar and the weather is such. From January to December the thermometer varies but little ranging from 80 to 88 degrees with but little change at night save the absence of the intense glare of the sun. On the coast there is always a strong breeze which renders the houses cool and pleasant even during the hottest part of the day. We are told that the year is divided into two wet and two dry seasons, but the experience of many is that this is very greatly.

In spite of our trials there is rarely a day without sunshine, the sky clearing almost immediately after the showers, and as the

roads are so hard and well-crowned the rain soon runs off them into the trenches, and save in places where the ground is open for repairing or construction purposes, dries up almost at once. On account of the dampness of the atmosphere, the commonest diseases are malaria and low fever, while yellow fever is practically unknown.

The city may well be called a cosmopolitan one, and in a promenade along Water St.—the principal business thoroughfare—on a busy market day one rubs shoulders with all sorts and conditions of men. The Portuguese, who migrated in large numbers from the Island of Maderia and settled in the colony head the list, then come the negroes, the East Indians or coolies, the Europeans (whites), the aboriginal Indians and the Chinese, while quite a

under cultivation have improved their methods of manufacture, enlarged their fields, and reduced the cost of their product. It is therefore evident that while the plantations are now less in number than they were fifty or sixty years ago, their output has increased considerably.

During the season the shipping trade is most brisk. Every vessel that comes either from the United States, Canada, or Europe, after discharging her cargo of flour, meal and groceries, loads up with sugar, rum, molasses, lumber or fish. The bulk of the sugar goes to America.

The gold industry is apparently going ahead, but on account of the difficulty of getting at the precious metal, only those with experience and capital can operate. It is not a case of just bring-

SCENES IN GEORGETOWN, DEMERARA.

few Arabs and Syrians may be seen, and we are told that the only race that is not represented is the Polynesian. Of them all the most interesting to a stranger are the East Indians, or coolies as they are commonly called. About 5,000 of them are annually brought out from India by the British Government at considerable expense, and are bound under a five years contract to industrial labor in the colony.

Demerara sugar is too well known to require much comment. There is a large out-put annually, but the heavy cost of drainage, dams and dykes, prevent any but capitalists from carrying on this industry successfully. The result is that during the last half-century, the number of estates has greatly diminished, while those

ing along your spade and washing pan and digging wherever you fancy gold may be found as is done in other places. An expedition must be fitted out with men, boats and tools, while an ample supply of provisions for at least six months or a year is absolutely necessary. Nothing can be bought in the bush save from an occasional passer-by whose supply of stores is sufficiently large to enable him to dispose of some of them. The hardships experienced on the journey up-country are very great and two or three weeks are generally taken to arrive at the destination. The total export of gold from January 1st to about the middle of the month of August amounted to 69,265 ounces, yielding a royalty of \$48,486, which is slightly under the amount taken out the same date last

year. During this period 844 claim licenses were issued. The yield of course varies. The largest nugget ever known to have been found in the colony was discovered in 1891 by the Luckie syndicate on their placer on Conamarook Creek; it weighed 599 ounces containing 274 ounces of gold and 4 ounces of silver and was worth £1,067 7s. 7d. During 1891, 20,000 laborers were registered at the different districts. These served on an average of three months each, so that there were always from 4,000 or 5,000 laborers in the bush. Since then, of course the number has increased considerably. A duty of 90 cents per ounce was formerly imposed by the Government on all gold taken from the mines, but we understand that in July last this was lowered to 70 cents. The rules and regulations governing the gold export are very strict, and the penalty imposed on any one falsifying the return of yield is most severe. Matters are so arranged that all gold passes through the hands of the Government, and is subject to this duty. The latest and most important find in the way of minerals is that of diamonds, and during the last three or four months prospecting parties have brought down over 1,500 stones of rare quality and value. While there has been no actual diamond mining going on, the gems have simply been found in the clay while washing for gold, and doubtless more will be heard of this again.

To return to the tramway; 10.2 miles of track were laid in all. A 62-lb steel T rail was used with girder rails at curves and switches. Both straight track and special work were supplied from the United States. The lines branch out from the Post Office which is in the heart of the city, and bring the outskirts and suburbs within easy reach of the business portions. On account of the town being so small and compact, much special work is used. There are two belt lines, one of 3½ miles, the other of about 5½ miles, another line runs from one point at the Sea Wall through the heart of the city, returning again to the Sea Wall at a different point and along a different route, making a distance of about 4½ miles; another short line runs from the railway station to La Penitence covering about 1¾ miles. The rails are set on concrete stringers 22 in. wide by 10 in. deep, with steel ties 10 ft. apart.

The Sea Wall route is the most important one from a pleasure riding point of view. This wall is broad and flat on the top forming a wide promenade provided with benches and rain shelters. At certain times of the day, and on moonlight nights this promenade is thronged with visitors, and on Saturday afternoon a band concert is held. Here, after five o'clock in the afternoon society gathers to chat and gossip, and meet one another. Here the "Four Hundred" come in their carriages to take the air and hear the music, while a little further down on another part of the promenade the masses congregate. What Central Park is to New York, Hyde Park to London, the Bois to Paris, the Sea Wall is to Georgetown.

The overhead construction is single No. 0 copper with Hecla bronze insulation as supplied by the Albert & J. M. Anderson Co. Iron tubular poles set in concrete support the feeder and trolley wires, and as the company controls both the private and public lighting of the city these wires are also being transferred to the iron poles, and the old wooden ones removed. Both bracket and span wire is used in different portions of the city. Mr. J. W. Morris, of St. John N. S., who has had a large experience in Canadian and American cities, as well as in the tropics, has entire control of this branch of the work.

The company will commence to operate with 14 open cars made by the St. Louis Car Co. These are 8-bench cars with reversible seats, monitor top and bonnets, end bulkheads with glazed sash and double thick glass, revolving signs, etc. They are handsomely painted and decorated, and are fitted with Providence fenders. The electrical equipment consists of a Westinghouse No. 12A, 30-h. p., 500-volt, slow-speed single motor with G. E. controller R-17. As there is hardly a grade in the whole city, cars should be operated at a very small cost.

The existing car sheds, with alterations and additions, have been transformed into first-rate car barns. In accordance with the style of building most in vogue in the tropics, they are open, and have a capacity of 16 cars. Four tracks run into this shed, which has also pits and machine shop. There is additional space for three other tracks when required. A part of this building is devoted to storerooms.

Outside are three tracks on which cars can be run on emergency, or stored there at will.

The power station which has been built for some years and was originally the property of the British Guiana Electric Light & Power Co., has been thoroughly overhauled and reconstructed by the present company, which has also put in two additional engines and generators for railway work, and the supplying of power. The franchise of the company gives it the exclusive right to make and supply electricity for the term of 30 years, with renewals features which make it practically perpetual. The original station comprised a duplicate plant for lighting purposes, consisting of two vertical and three horizontal engines giving a power supply of about 800 h. p. These have batteries of Babcock & Wilcox and Stirling boilers, which are also in duplicate, and suffice to supply steam for the two new engines installed.

These new engines were supplied by the Robb Engine Co., of Amherst, N. S., and comprise one 200-h. p. direct-connected, tandem-compound engine and one 200-h. p. belt connected, tandem-compound engine. The two latter engines and generators suffice also to form a duplicate plant for railway purposes. It is the intention of the company later on to extend the lines into the suburban districts, which are thickly populated and give promise of good traffic.

NEW OHIO-PENNSYLVANIA COMPANY.

The stockholders of the Youngstown & Sharon Railway Co., which will build a road between Youngstown, O., and Sharon, Pa., have arranged for a consolidation of the electric light properties of those two places and the Sharon railways. The companies included are: Youngstown Electric & Gas Co.; Merchants' Heat, Light & Power Co., Youngstown; Valley Electric Railway Co., Sharon; Sharpsville (Pa.) Electric Light Co.; Sharon & Wheatland Electric Railway Co.; Sharon Gas & Water Co.; Sharon Electric Light Co.; Youngstown & Sharon Electric Railway Co.

The Youngstown-Sharon road will be 19 miles long, with steel bridges and standard steam railroad roadbed. Some 4½ miles of the old road will be rebuilt and larger units installed in the power station. Sanderson & Porter, No. 31 Nassau St., New York, will specify all material. Park & Hamilton, Youngstown, O., are the contractors.

It is rumored that the promoters of the consolidation contemplate getting control of the Mahoning Valley line and the Park & Falls Electric Ry., of Youngstown, and also the newly organized New Castle & Beaver Falls road.

CHECKING BOOK TICKETS.

The Galesburg (Ill.) Railway & Power Co. sells individual book tickets containing 25 coupons for one dollar. To determine the exact number outstanding at any time, and particularly to guard against counterfeiting, Mr. Seacord uses a specially ruled book

95100	1	2	3	4	5	6	7	8	9		96	97	98	99
95200	✓		✓	✓		✓		✓			✓	✓	✓	✓
95300	✓	✓	✓			✓	✓	✓			✓	✓	✓	✓
95400	✓	✓	✓	✓			✓		✓		✓	✓	✓	✓

which has 100 spaces to each horizontal line. Each coupon is numbered consecutively, and checked off in its proper space when turned in. The checking requires only one hour daily. The illustration shows the method of ruling and checking.

A NEW INTERURBAN LINE FOR NEW ENGLAND.

The Haverhill, Salem & Hudson Street Ry., running between Nashua, N. H., and Haverhill, Mass., a distance of 22 miles, is nearly completed. Passenger, baggage, mail and express cars will soon be put in operation through a section of the country heretofore without railway service of any kind, affording a more rapid service than any other electric line in New England. This new interurban will shorten the time required to travel from Nashua to the ocean beaches at Salisbury and Hampton by two hours. Express cars on a level grade will be operated at the rate of 40 miles an hour.

CONTACT RAILS ON MANHATTAN ELEVATED.

By courtesy of Mr. W. E. Baker, general superintendent of the electrical construction department of the Manhattan Railway Co., New York, we have received drawings illustrating the contact rails which the company is installing in preparation for electrical opera-

FIG. 2.—JOINT.

tion. The rails are of a T-section, 6 in. high, and weighing 100 lb. per yd.; they were rolled by the Lackawanna Steel Co., and have the following composition, aside from the iron: Carbon, 0.073; manganese, 0.340; sulphur, 0.073; phosphorus, 0.069 per cent. The rails are each 60 ft. long and are erected in sections of 300 ft.; the middle rail of each section is fastened by four anchor clips, spaced 4 ft. 6 in., to prevent longitudinal motion, but elsewhere the rails

The expansion on either side of the anchored rail is taken up at the joints at the ends of the 300-ft. sections; one of these joints is shown in Fig. 3. The distances to be allowed between rail ends

FIG. 3.—EXPANSION JOINT.

at expansion joints when laying the rail are given in the table:

Temperature of rail.	Distance.	Temperature of rail.	Distance.
0°	3 in.	70°	1 1/4 in.
10°	2 3/4 in.	80°	1 in.
20°	2 1/2 in.	90°	3/4 in.
30°	2 1/4 in.	100°	1/2 in.
40°	2 in.	110°	1/4 in.
50°	1 1/4 in.	120°	0 in.
60°	1 1/2 in.		

At these joints four stranded copper bonds 18 in. long between terminals are used. The strands are rope laid and not larger than

FIG. 4.—ANCHOR CLIP.

are free to slide in the clips on the insulator block. The insulator blocks are placed every 9 ft.; they are made of artificial granite.

The joint that is used between the five 60-ft. rails constituting a section of the contact rail is shown in Fig. 2. For these joints the rails are drilled with five 7/8-in. holes, three through the web and one in each of the lower flanges. Four solid copper bonds are used, two being under the splice bars. The cross section of each bond is .344 sq. in., equivalent to 437.675 c. m. The bonds are riveted in place with hydraulic riveters.

FIG. 5.—INSULATOR.

No. 14 B. & S.; the sectional area of each bond is .353 sq. in. or 450,000 c. m. These bonds are all riveted to the lower rail flanges. The splice bar for expansion joints has a slot at one end, as will be remarked from Fig. 3. Figs. 4 and 5 show the insulator block and the anchor clips.

A petition has been presented Mayor Cabell of Dallas, Tex., signed by 8,000 citizens, demanding a number of street railway reforms in that city.

MANHATTAN RY., NEW YORK.

DEMERBE TRACK CONSTRUCTION.

In September last Mr. William Dawson, deputy engineer of the Bradford (England) Corporation, read a paper before the British Association for the Advancement of Science describing the Demerbe system of street railway track construction. A short section of this was laid in Bradford in 1804 as an experiment, being placed end to end with a similar length of girder construction. Mr. Dawson says of it:

"Both portions have been subjected to a five minutes' service of steam locomotive cars since that time. About three weeks ago (after six years) a Demerbe rail was removed, in the presence of the Tramway Committee, to ascertain its condition. The rail, joint, and gage were found to be in every way perfect, and it was only after repeated blows with heavy hammers that the rail could be detached from the concrete foundation, and when raised it dragged up with it part of the foundation. No money whatever has been spent in repairing this portion of Demerbe tramway, but the adjoining portion of girder rail has been several times repaired during the six years it has been laid down. The setts used alongside the Demerbe rail are splayed to fit the sides of the rail, and laid directly against it, the rail thus serving as a support for the paving; and there is no tendency either for the setts to rise or fall as is the case with the girder rail. There are in Bradford 40½ miles of tramways, of which 36½ miles are laid on the girder system, with rails weighing 105 lb. per yd., and fishplates weighing 80 lb. per pair. There are four miles of Demerbe tramway, constructed of rails weighing 70½ lb. per yd., and fishplates weighing 51½ lb. each, and the corporation has further in course

FIG. 1—SECTION THROUGH JOINT.

of construction an additional 10½ miles of tramway, which it is putting down on the Demerbe system."

A cross section through a joint is shown in Fig. 1. The rail, A, is a hollow trough and the fishplate, B, exactly fits its interior contour. When this system was first introduced the fishplate was pressed into the rail by means of bolts, but it was soon found that this was not satisfactory, and cotters, E, were used. As the holes in the fishplates and rails are cut at different depths, when the cotters are driven in the fishplate is forced close up to the underside of the rail. The ends of the cotters are then clinched against the side of the rail, and are thus fixed and prevented by any possibility from working loose. The rail when laid in position in the carriageway is completely filled, by means of specially designed tools, with concrete, composed of four parts of ½ in. unscreened

granite shingle to one part of portland cement. The rails are 33 ft. long and the fishplate about 33 in. long with six pairs of cotters, three in each rail. Crown rail bonds are used.

At intervals of 3 ft. 6 in. there are tie bars of flat bar iron arranged as shown in Fig. 2. To avoid the use of bolts and nut two oblique grooves are cut at each end of the bar, the outer

FIG. 2—TIE BAR.

groove fits onto the rail flange and the other groove is wider and receives a wedge.

In England, as a rule, a concrete foundation is laid the whole width of the carriageway to receive the paving, and when the Demerbe rail is filled with concrete in the manner above described it becomes attached to the concrete foundation, and is practically part and parcel of the carriageway.

The detailed cost per yard of single track on the two systems, based on the price of materials delivered at Bradford, is as follows:

Demerbe System.		s.	d.
Rails	100 yds. of 70½ lb. per yd.	10	7 9
Fishplates	100 yds. of 51½ lb. each	0	9 4
Tiebars	100 yds. of 3 in. x ½ in.	1	0 8
Wedges	100 yds. of 1 in. x 1 in.	0	1 4
Cotters	100 yds. of 1 in. x 1 in.	0	7 1
Track labor, including curving		2	6 0
Rails, etc., carting		0	1 1
Packing rails (labor)		0	11 1
Half-inch unscreened granite shingle		1	0 0
Cement		0	11 5
Team labor		0	3 2
		19	5 4
Girder System.		s.	d.
Rails	100 yds. of 105 lb. per yd.	15	11 2
Fishplates	100 yds. of 80 lb. per pair	1	8 8
Marshall's patent joints	100 yds. of 105 lb. per yd.	0	9 0
Bolts and nuts	100 yds. of 105 lb. per yd.	0	5 4
Soleplates	100 yds. of 105 lb. per yd.	1	0 3
Tiebars	100 yds. of 3 in. x ½ in.	0	2 8
Unscreened granite shingle		0	4 0
Cement		0	5 1
Labor (packing rails)		0	3 0
Road scrapings (or plastering rails)		0	0 6
Track labor		1	3 0
Team labor		0	1 0
Soleplates punching		0	1 0
Blacksmiths' work		0	1 3
Repairs to punches		0	1 9
		£	13 1 4

The totals reduced to dollars are. For Demerbe system, \$4.71 per yard; \$8,200 per mile. For girder system, \$5.60 per yard; \$9,850 per mile. The principal saving, it will be remarked, is in the lighter rail that can be used with the Demerbe system.

The Alamo Heights Street Ry., of San Antonio, Tex., was sold by order of the court, November 9th. The purchaser was Otto Kochler, who will remodel and extend the line.

OIL ON HIGHWAYS.

Results of California Experiments in Sprinkling Common Roads with Crude Petroleum—Data on Cost—Application to Roadbeds of Steam Railroads—Possible Advantages of Using Oil on Street Railways.

Dust is a very serious annoyance to many suburban and inter-urban electric railways laid in highways, for sprinkling which no provision is made, and we feel confident that the question of oiling such highways will be given earnest consideration in the near future. A car filled with flying dust, and with a thick layer of it on all the seats and window sills is not pleasant to ride in, and the road where these conditions obtain can expect only the patronage of those who ride because they must; pleasure riding is unknown on such roads.

In May last the writer rode over a newly opened road laid along one side of the highway, and at the end of the journey emerged from the car with his hair, eyes, lungs and clothing full of dust. The manager remarked that the dust was one of his worst worries, and that he was going to look up the matter of sprinkling the road with oil. Another shorter road with which the writer is well acquainted extends for half a mile along one side of a much used highway which is never sprinkled, and unless there has recently been a rain or there is snow on the ground the dust makes riding on the rear platform a most disagreeable experience.

In 1897 crude petroleum was first applied to the roadbeds of steam railroads (by the Albany & Hudson and the Long Island) to lay the dust and prevent the growth of vegetation in the ballast, and the results have been considered very satisfactory. The cost of this treatment was reported at about \$150 per mile per annum.

About 18 months ago it was announced that the experiment of treating common roads with petroleum was to be tried near Des Moines, Ia., under the direction of the United States Department of Agriculture, but we have seen no report of the results obtained. The first account of oiled highways of which we know is that given by Mr. O. W. Longden, of San Gabriel, Cal., in a paper before the Good Roads Association of Southern California. The following is an extract giving the results obtained:

"The first application of oil to the highways of Los Angeles county, for the purpose of laying the dust, was made in the summer of 1898, six miles being oiled. In 1899 the same roads were again oiled and seven miles of new road treated. This year 50 miles of road have been oiled, most of it receiving two applications, and we are much pleased with the results.

"While we have much to learn regarding the best manner of applying oil, the best manner of repairing oiled roads, the most economical quantity of oil to use, and the kind of soil and condition of road surface best suited to its use, yet on these points we are fast forming an opinion, and on one point we are agreed, and that is, that well oiled roads are dustless, and dustless roads are a boon to any country, and particularly so to California, with its climatic conditions. When people have become accustomed to traveling on dustless roads, whether water-sprinkled or oiled, the dustless condition must be maintained. The demand for good roads free from dust is growing daily.

"There is no doubt as to the efficacy of oil on roads. It is superior to water in that, when properly applied, it is lasting, costs less, makes a desirable road and can be used in districts where water cannot be had. It coats the road with a wearing surface that needs but slight attention to keep in good repair. It builds up the weak places and makes an even surface, while water finds and increases the number of chuck-holes. Oil soaks in and remains a part of the road, while mud sticks to the wheels and water evaporates. Oiled roads, properly made, are free from dust in summer and free from mud in winter.

"The first requisite for a good oiled road is the proper preparation of the roadbed by grading and crowning the road so that it will shed water—rolling the road thoroughly after a thorough wetting, if possible, filling all uneven places that develop. The better the foundation the more satisfactory and lasting the oiled surface. We apply the oil hot, by means of the De Camp machine. The hotter the oil the quicker it unites with the dust, and the more readily it is absorbed by the road surface. Cold oil rolls up in balls

and will not take kindly to the dust, nor spread evenly over the road. Hot dust and hot oil, thoroughly mixed, is the motto of our oil men, and the result is a dustless road, approaching asphaltum in texture and appearance.

"The heavy oils, carrying from 25 to 50 per cent of asphaltum, have given the best results, the light gravity oils being not much better than water on account of their tendency to evaporate.

"A loose, dusty surface is as necessary for the successful application of oil as a good foundation is necessary to make it lasting; therefore, when our road is prepared, as stated above, we do one of three things before applying the oil: First, use the road until the ordinary travel and summer drouth have made the road surface loose and dusty; or, second, cover the road surface with a coating of dust and loose earth from the roadside by means of the grader; or, third, loosen the surface of the road itself with a harrow, and then apply the oil. All three of these methods have given satisfactory results, and each has its place in our varying soils.

"It is claimed by the California Dustless Roads Co., which controls the patent for the use of oil on roads, that oil will lay the dust and improve the surface of a road on any kind of soil, it being a question of 'oil, not soil.' While this may be, and doubtless is, true, yet the question of economy confronts the supervisors, who have ten dollars' worth of work demanded for every dollar of road money in the treasury, and our experience has been that results do not warrant the outlay for oil on light sand, alkali, or coarse gravel roads, the best results being obtained on our mesa roads, sandy and gravelly loams, decomposed granite and clay soils. On coarse gravel roads the rocks in the gravel soon cut through the oil and dust cushion, the rocks become loose and chuck-holes are formed. On alkali roads the oil lays the dust for a short time, but it is not practicable, for the alkali soon destroys the oil and the desired effect is lost.

"We have also observed that old roads that have been sprinkled for years, with very poor results, have been put in good condition with one or two applications of oil. On most of our roads the oiled surface is 12 ft. wide. On a few of our heaviest traveled roads we have oiled 18 ft. wide. The first year two, and frequently three, applications of oil are necessary, the second year two applications, and the third year one application. This is not an absolute rule, however, as quality of oil, quantity applied, kind of soil and amount of travel on the road will vary requirements in different places. On the first application we have averaged about 60 barrels to the mile, 12 ft. wide; the second application, where made, has varied from a slight touching-up of weak places to a 40-barrel covering. The oil costs up from \$1.10 to \$1.25 per barrel in Los Angeles, and 25 cents additional delivered on the road, making the average cost under \$150 per mile per annum.

"Our best samples of oiled roads are those that have been oiled for three successive years, these roads requiring this year only one application of from 40 to 50 barrels per mile. Our experience has suggested the following points as among the essentials for making and maintaining good oiled roads, namely:

"A well-graded road, packed by the winter rains or by thorough rolling. Oil as soon as there is sufficient dust on the roads in the late spring or early summer. Oil often enough and with sufficient quantity of oil to make them pack. Apply the oil when the weather is hot. Loosen the surface of hard roads. Re-oil dry places to prevent chucks. Oil and dust of the street are good materials with which to repair chucks on oiled roads or dry roads. Rolling a few days after oil is applied is beneficial. Occasional going over the road with a plank-drag helps it, where the traffic is inclined to wear the roads in ruts. Have the road foreman keep a few barrels of oil on hand, with which to repair chuck-holes and weak places. A little oil and a hand-rake will work wonders on the imperfections of an oiled road.

"There are some people who object to oiled roads. When the oil is first applied the oiled road is not a place for fast driving, as particles of oil not thoroughly incorporated with the dust are liable to be taken up by the wheels and be thrown on the vehicle and its occupants. This objection disappears in a few days, however, for as soon as the oil is absorbed by the dust and roadbed it has no affinity for buggy wheels, and sticks fast to the roadbed, where it belongs.

"There are people who object to the odor of crude oil, but as this odor lasts only a week or two while the volatile oil is evaporating, this objection is not permanent. Some teamsters claim

that a load pulls harder on an oiled road than on a sprinkled or dry road; others claim the reverse. It will take a scientific test to prove which is right. Some people claim that an oiled road is hotter than a dry dirt road, and others hold the contrary to be true. Some wheelmen detest, and others are loud in their praises of oiled roads. You can take your choice of opinions. The fact remains, however, that while the first oiled roads caused much criticism and many scoldings for the supervisors, yet the last 50 miles oiled have won the approval of the public very largely. For every word of adverse criticism now we have hundreds in praise of oiled roads. The oiled road has come to stay."

THE TROLLEY IN THE PHILIPPINES.

(From Our Own Special Correspondent.)

The Philippine Islands appear to offer an excellent field for the promoters of electric railways. In Manila all interested parties were quite confident that trolley lines connecting that city with the surrounding cities, towns and barrios would be well patronized. At Hoilo, on Panay, those in charge of the railroads have prepared plans for an extensive system of electric lines to connect the capital with the chief interior points. On Negros I was told that there was plenty of money available for such enterprises and that the wealthy natives—that is, the sugar mill operators and the rice and tobacco and fruit planters—would gladly take stock in railway companies if provision were made for handling freight, as well as passengers.

I visited the island of Mindinao with a party of miners and saw the essential need of better means for handling ore traffic. There are gold, silver, lead, copper and coal mines already operated on Mindinao and the work is greatly hampered by poor transportation facilities between the mines and the coast. Some of the richest mining concerns have been making estimates on the cost of the building of narrow-gage freight roads for their special use, but those with whom I talked stated that if a trolley line were put in and platform cars provided for carrying ores, they would certainly patronize the new road. As there are great sections of rich mining lands idle in the interior merely because of the great difficulty experienced in getting the output to the coast, it is safe to assume that the success of a trolley line would be assured at the start.

Even on the little island of Gimeras the people want a line for the purpose of carrying passenger traffic and dye woods. This island is rich in dye woods, but the roads are so bad that the woods cannot be taken to shipping points and therefore the owners of the great forests are obliged to check the cutting and send

NATIVE RAILROAD LABORERS.

to market only what little wood they are able to move by means of native animals and drag sleds. The same conditions prevail on Cebu, where there are great forests of hardwoods, including mahogany, black walnut, rosewood and other valuable woods, which for years have been permitted to go to decay through want of means to move the prepared timber to a marketable point.

But, of course, the central point of interest for all enterprise is the great commercial district in the vicinity of New and Old Manila. Hoilo ranks next in importance. In both of these places important steps have been taken towards the establishment of trolley lines and there is no doubt that before the close of another year several lines will be in operation at these points.

In Manila they now have the Manila & Dagupan R. R. in operation as far as Tarlac. The line beyond Tarlac is being put into order as fast as possible and will be running in a few months. The native started the line, together with the Spanish, and it has, up to the present, been one of the worst railroads in the country, so far as equipment and accommodations are concerned. They say that in order to get a ride on the car a year ago one had to remain over night at a station so as to be the first to mount. I always had to ride by hanging to a hand rail, for all seats and standing space on the little cars are taken promptly by the crowd that want to ride at any price. Although the road is run by steam engines, the cars are very like trolley cars for freight. They are small, always breaking down and running off the crooked and worn out track, and look like cattle cars fixed up with seats. Like almost everything else of the kind on the Archipelago, the rolling stock of the road has seen service and was worn out in Spain or some other country before it was sent here. In riding from Tarlac to Dagupan I noticed at the station called Bautista that the roadbed was in bad shape and the train rocked dangerously.

The road would promptly lose its custom if an up-to-date American trolley line were put in to compete with it. There is more than business enough for two roads running through the same places, while the extent of country which could be covered for miles on either side is unlimited. Lines of trolleys running through the cocoanut region on Luzon during the harvesting season would make fortunes carrying natives and their products from the groves to the central markets. At present this traffic is all conducted by pack animals or the caribou and drag sled, both of which modes are very slow and costly.

The Manila & Dagupan company is planning to build a new line to Hocus. This should properly be a trolley road, as the character of the business in this section calls for trolley lines with passenger cars to which are attached one or more platform cars for carrying freight. All along the road at present one may see natives carrying loads of farm products and merchandise from their homes to Manila or other central point. These persons necessarily occupy a day and experience considerable tedious work in covering eight to ten miles, while if there were a trolley line in operation they could be carried for 5 or 10 cents, with their packages on the platform car. Those who have been enterprising enough to start stage lines, charging high rates per mile to carry merchants and their loads, are making much money, although they do not assist the merchant very much.

To establish trolley lines in the city of Manila itself would involve some serious problems for the reason that the streets are exceedingly narrow. The cars now in use through the streets of the city are all very short and small, drawn by two native horses, and they are pulled around the short turns readily; an ordinary American car could not be taken around the curves. Therefore, it is proposed by engineers to overcome the trouble by tunnelling, and already some important steps have been taken in the proper direction. The city authorities are concerned in the matter, for they are aware that by tunnelling for the cars and removing the tracks from the streets that the serious congestion in Manila will be relieved. This congested condition has now existed for over a year and has been notably increasing. I was there a year ago and noticed then the crowded state of the streets, and several months later found that the conditions were worse. At present it is simply impossible to move about with freedom and the cars, carts and foot traffic are constantly mixed.

There are many canals in and about Manila and it has been proposed to build lines of bridges along the wharves for the street railways, for in most cases the main car lines are on streets parallel with the wharfage. But to erect wharves would mean the blocking of the channels to shipping and serious trouble would result. A main trouble in putting in tunnels, on the other hand, would rest in the uncertainty of the ground. The earth about Manila is unreliable and I recollect seeing engineers at work with a pile driver, where the piles would often drop through the slimy strata of their own weight without finding any foundation strong enough for a support. I have seen piles put down with a few strokes of the driver and two or three others caused to follow on top of each, without striking solid ground. The condition of the ground, therefore, would be one of the problems to struggle with in Manila, while out in the country, so far as is known by

the engineer the ground is not so good. If tunnelling is resorted to, it is evident that the Pasig River bed will be cut through from Intramuros to the Capitol House, making a short cut to Binondo.

While capitalists are thinking about how to relieve the situation in and about Manila, some of the smaller capital cities of the southern islands are going quietly to work and building roads. In Cebu the Cebu Street Railway Co. has been organized with a capital of \$200,000, for the purpose of putting in an electric system for the operation of trolley cars from the city of Cebu, the capital of the island of the same name, to the surrounding cities, towns and barrios, of which there are a large number, all thickly populated. Owing to the delay in getting an electric plant in operation, the directors at one of the recent meetings voted to begin operations just as soon as possible by using horse power, but at the same time to begin at once the erection of a power plant. I ascertained that the cost of getting the proposed lines in operation with horses would amount to about \$25,000 gold and that this money and much more was available. The people of Cebu have always been industrious and many of them control sections of the country that bring them large financial returns. I am personally acquainted with some of the native owners of the pearl industries that make large profits. Then there are the sugar and tobacco plantations, all of which pay handsomely. When it was proposed to get together thirty or forty rich Filipinos and Spaniards for the purpose of putting in a trolley line, it was only necessary to announce it through the Filipino and Spanish papers that circulate there and the moneyed men were promptly on hand. The road is to run through De Mabola, the Escolta, Calle Infanta, over the bridge at Taboada and to the interior points where the commercial interests are such as to warrant the undertaking of establishing trolley lines. The Tagalons and some bodies of Visayans are still operating lawlessly in Cebu, and this, of course, tends to hamper the working of the proposed new road, for the projectors fear that the insurgents may tear up the tracks and do other damage. But if this road is established, American soldiers will protect it, for the reason that there is no better or quicker way to end the rebellion than to introduce modern methods of business and works on which the idle population may secure employment, thus diverting their minds from things warlike. The busy engineer, motorman, conductor or track man would have no time to fight and he would become an industrious and peaceful citizen. No company need hesitate about erecting trolley lines in any portion of the Philippines for fear of interference on the part of ladrones, bandits and rebels, as the Americans will protect their interests.

In promoting railways in this territory, however, there are several points that should be observed. In the first place, the pro-

HAULING SUPPLIES.

motor should go over the territory thoroughly and become familiar with the character of the land. I know of several instances in which promoters of railroad schemes operated from Spain, and sold considerable stock in projected roads to natives, and then finally failed to carry out the plans, offering as excuse that the nature of the country prevented it. Some of these schemes were evidently instituted with a view to fraud. The earnest parties who calculate to operate trolley lines here will go over the ground thoroughly and establish their headquarters in one of the leading cities to be traversed by the road. From this point they can handle the af-

fairs of the new company to advantage. The rails, cars, steam power, plant and all desired machinery and supplies can be ordered just as soon as the location of the road is settled upon and proposed capital available. Then while the material is on its way from America, the country can be gone over for the purpose of examining and putting in the roadbed.

There are many rivers in the Philippines and the interior points can be reached readily by means of boats manned by natives, who follow the river to the beach and there get a boat load of gravel and take it to the desired point. This gravel makes a very excellent ballast and as it can be mixed liberally with earth, one boat load of the gravel goes a great ways. Two natives to a boat are sufficient and these two natives work for 15 cents per day each and furnish the boat themselves, and also care for themselves. The company can keep a fleet of boats engaged at this rate at low cost and secure excellent ballast. At some points immense quantities of sandstone are located in the interior, and this stone breaks easily into a crumbly condition suitable for purposes of grading. Large gangs of native labor can be hired along the road for 10, 15 and 20 cents per man per day. The natives have only the crudest sort of tools to work with and means should be taken to provide the proper tools.

There are numerous rivers to cross, and a year ago I observed that about one-half of the rivers were without bridges, these having been burned by the rebels or permitted to decay. Crossings were effected by fording or on rafts. But the United States military officials have compelled the people to rebuild the bridges, so that at present practically all of the rivers are provided with strong bridges, in some cases heavy enough for a trolley line, but as a rule the railroad people should expect to put in iron bridges at the various river crossings or at least good, strong wooden bridges. This will be quite an item of expense, but the way it is done in this country, if a sugar mill owner wants to bridge a river so as to accommodate his sugar teams, he posts a toll collector at one end who collects toll for every passenger and team. Those who do not want to pay ford the stream. The railroad would be permitted to charge toll for the use of its bridges except for United States troops, horses and wagons. The same conditions apply to the rafts and ferries at the wide rivers. The expense of getting rolling stock here and the purchase of tools and supplies are disadvantages, but these are more than balanced by the difference in cost of labor in the islands.

Horses, caribou and oxen, with sleds for moving supplies, can be secured for 10 cents per day each. When the road is complete conductors, motormen, and, in fact, the entire force of the road, can be engaged at wages which seem simply ridiculous. But the people of the islands have been accustomed to working for 15 and 20 cents per day all their lives and they know how to live on these wages. Foremen of sections, engineers, head clerks, office men in general, and others concerned in the management of the road would of course be paid as high salaries, if not higher, than in America. Possibly the chief engineer of the works would have to be engaged from America at five, six or seven dollars gold per day, while the superintendent would be worth eight or ten dollars per day.

The government has not been able to secure effective means for distributing mail in the Philippines and often bags of mail are held at central points for weeks before some army train goes out to the destination of the bags. If trolley lines were in operation, the companies could derive considerable revenue handling the mails for the government.

INSPECT NEW YORK AND BOSTON STREET CAR TRACKS.

A party comprising President E. S. Goodrich and General Manager N. McD. Crawford of the Hartford (Conn.) Street Railway Co. and a number of city officers of Hartford left that city November 12th on a tour of inspection of the grooved rail street car tracks in Boston and New York, with a view to deciding which sort of rail used in these cities would be most suitable for the proposed street railway construction in Hartford. The committee was entertained in both Boston and New York by officials of the cities and the street railway companies, and returned to Hartford November 14th after a profitable trip.

**CLUB HOUSE OF SUBURBAN EMPLOYEES,
ST. LOUIS.**

The St. Louis & Suburban Railway Co., of St. Louis, has placed one of the buildings owned by it at the disposal of its employes to be used as a club house. The building was formerly the depot of the old steam dummy line, which was merged with the Suburban, and is a one-story building centrally located so that it can be reached from the terminus of any line within 20 minutes.

The company has installed baths and toilet conveniences and furnished a gymnasium and billiard and card rooms. Three bath rooms are provided, one being a shower. The billiard room has two combination pool and billiard tables; tables for cards and similar games are provided, and the principal daily and technical papers are kept on file. The gymnasium apparatus includes rings, ladders, horses, rowing machines, punching bags and boxing gloves.

The club house is conducted entirely by the employes themselves, who are nearly all members of the Suburban Mutual Aid Association, though all expenses are borne by the Suburban company. The house is open from 7 a. m. to 11 p. m.; a janitor is in attendance to act as caretaker. The management is vested in a house committee of five members.

The Suburban Mutual Aid Association makes its headquarters at the club house. This association pays sick benefits of \$7 per

**MINUTES OF A DIVISION MEETING ON THE
BOSTON ELEVATED.**

In our issue for May, 1900, in describing the system of the Boston Elevated Railway Co., mention was made of the semi-monthly meetings of the division superintendents with the general superintendent, and the similar meetings of the inspectors and starters with the several division superintendents. At that time we published the minutes of one of these meetings, and now we give the report of another meeting, that held by the inspectors and starters of Division 9, on Feb. 8, 1900. The record is as follows:

Meeting of inspectors and starters, held at my office today. All present except Starter Doloff, excused.

Chief Inspector Stearns reported that some of the new conductors, in looking over the general order book, had found a general order stating that snow plow wings must be ridden. Recommended that said order be declared void, since levers are now provided for the work.

Inspector Kingsbury had noticed conductors on duty with pants tucked into rubber boots. This was thought to be a good point and inspectors and starters were notified to report conductors thus offending. Did not think conductors should be allowed to have uniform covered up in this manner, any more than they should by wearing cardigan jackets over vests. Now that nearly all switches have a switchman, did not think conductor was obliged

EMPLOYEES CLUB HOUSE, ST. LOUIS AND SUBURBAN RAILWAY CO.

week, the dues being 50 cents per month. The officers of the association are: President, Thomas F. Whalen; recording secretary, R. C. McGilway; financial secretary, Edward M. Spates; treasurer, James Gibbons.

We are indebted to Mr. T. M. Jenkins, general manager of the St. Louis & Suburban Ry., for the photographs from which our illustrations were made.

ACCOUNTANT'S OFFICIAL REPORT.

In less than 30 days after the Accountants adjourned their annual convention at Kansas City, Secretary Brockway had issued in book form his official report of the meeting. It is unusually complete, attractive and a handsome piece of printing.

DAYTON (O.) & TROY ELECTRIC RY.

Work on the Dayton & Troy Electric Ry. is being pushed rapidly. Contracts have been closed with the Westinghouse company for two 400-kw. generators, the Carnegie Steel Co. for 2,500 tons of 70-lb., 64-ft. rails, and the New Castle (Ind.) Bridge Co. for the bridges. The power house, car barns and repair shops will be at Tippecanoe City.

to leave the car enough to warrant him wearing boots. Inspector Kingsbury also stated that he thought some cars had brakes set too tightly, i. e., shoes too close to wheels, so that when there was a little snow on the rail wheels would skid. He was instructed to turn in a report of all such cases which came under his observation, that action might be taken to remedy difficulty.

Inspector Carl, in speaking of some of the cars, thought that if a wider iron strap or support was placed in the car floor over the trucks to support traps, same as the Laconia cars had, much cold air could be kept out of the car.

Inspector Russell had nothing of importance to offer at this time.

Inspector Miller had been asked by conductors what they should do if a man persisted in spitting on floor after he had been given a spit notice. Had instructed them to get person's name and address if possible, also to get good witnesses and turn in a report to superintendent's office.

Starter Abbott had noticed that a good many headlight glasses were broken by jolting of cars in running over special work and switches. Thought that a good preventive would be a felt rubber washer to be placed between glass and iron frame, also that the washer would aid in keeping out dust, thereby keeping glass and lamp cleaner.

Starter Day brought up the subject of cold cars, particularly on 12 o'clock midnight trip. This to be remedied by substituting car with six heaters for one with four now in use. Car with four heaters had been used on account of a certain car being required on Adams Sq. trips.

Starter Wright wished to mention that of late conductors had not been as particular as they should in making out accident reports, and had neglected to state whether the time given was meant to be a. m. or p. m. Also sometimes omitted car numbers. He was instructed to make a report of all such cases that he noticed, that suitable discipline might be given offenders.

Starter Walsh, transferman at Coolidge's Corner, complained that it was almost impossible to see to punch transfers after dark at Coolidge's Corner, owing to lack of light. Wished to have a light or cluster put on a pole at this corner. (To be taken up later.)

Starter Buxton wanted conductor's attention again called to necessity of keeping car doors closed.

No further remarks being forthcoming, a portion of the minutes of the last superintendent's meeting was read for the men's information. Particular emphasis laid on necessity of cars being properly spaced on street. No excuse for motorman of rear car to say that he is on time and man ahead late. If motormen are noticed chasing other cars too closely inspectors must board car and warn motorman that he must discontinue such practice. No necessity for men to hurry and crowd other cars, so as to get back exactly on the schedule time. What is known as allowed time, i. e., lay off at end of route between trips, if less than 30 minutes, is paid for and men might just as well spend some of it on the street as sitting down in the car at end of route.

Memoranda in regard to carrying articles on platform of cars, also in regard to delays by "Funeral Procession," and what action conductors should take in case of recurrence of this in this Division, also concerning delay caused by Father Morris' funeral read from minutes.

Inspectors were instructed to look out for flat wheels and report all cases noted. The attention of inspectors also called to excessive crowding of passengers. Heavy riding trips should be reported, that steps may be taken to relieve such crowding by adding or inserting trips where needed.

Meeting of about one and one-half hours.

MASSACHUSETTS ELECTRICAL COMPANIES.

Under date of Nov. 7, 1900, President Gordon Abbott, of the Massachusetts Electrical Companies presented his report for the first fiscal year ending Sept. 30, 1900. The properties controlled by this company are managed by trustees who on June 30, 1899, held a majority of the whole of the stock of 30 street railways, 2 lighting companies and a park company, operating in Massachusetts, Rhode Island and New Hampshire. Since that time the trustees have purchased the stock of the New Bedford, Middleboro & Brockton company, 12,000 shares of the Lowell & Suburban Street Ry. and 6,574 shares of the South Shore & Boston Street Ry.

In order to facilitate operation and improve the service which was greatly hampered by various contracts and agreements between the companies a number of consolidations and mergers were effected, thereby reducing the total number of companies from 36 to 14. These companies own 776 miles of street railway track in 23 cities and 62 towns and are: Beverly & Danvers; Brockton; Globe; Gloucester & Rockport; Hyde Park Electric Light Co.; Lowell, Lawrence & Haverhill; Lowell & Suburban; Lynn & Boston; Nashua; Newport Illuminating Co.; Newport & Fall River; North Woburn; South Shore & Boston; West Roxbury & Roslindale.

The gain in economy of operation and the betterment of the service are reported to be most gratifying. During the year \$1,055,245 was spent in improvements and extensions which included 19.3 miles of new track mostly 90-lb. girder and 70-lb. T rails, 15 miles of track reconstruction, 61 miles of additional feeder lines, 16 box cars, 31 open cars, 34 snow plows, 156 new motors with controllers, a new brick car house at Brockton, and addition of machinery at the power stations. The company has 19 power stations and 2 electric light stations; it is the policy to combine stations where conducive to economy and it is expected the present number will be further reduced.

The balance sheet for the 14 consolidated companies shows assets of \$30,427,189, of which \$28,631,989 is in the property account.

For the year ending Sept. 30, 1900, earnings were \$5,518,838; expenses, \$3,659,337; charges, \$994,294; net divisible income, \$865,206; dividends paid \$645,545; charges to renewal funds, \$89,000; charges to depreciation and sundry accounts, \$93,229; surplus for the year, \$37,432.

The only income of the Massachusetts Electrical Companies is from the dividends on the stocks owned and interest on loans made. Its income was \$904,758, of which \$807,311 was from dividends. Its disbursements were: Salaries, legal and miscellaneous, \$18,900; interest and other charges, \$44,024; dividends, \$480,000; leaving a balance of \$361,834. This balance, some 26 per cent of the income available for dividends is held to provide reconstruction reserves.

The report says: "An important fact concerning the net divisible income for the present year should be noted. Almost all of the companies were not insured against accident at the time when you became interested in them, and it was felt that conservative management demanded that insurance should be provided. A mutual insurance company charter granted in 1895 was therefore acquired, a company formed called the "Massachusetts Street Railway Accident Association," and in that company each one of the street railway companies in which you are interested is now insured.

"The institution of this system of insurance, while advantageous from every point of view, has caused practically a double expense for accidents during the past year, as the companies have paid out considerable amounts in settlements of claims due to accidents which happened before the beginning of their insurance, and have also paid the premiums for the present year, all of which has been charged to operating expense. Had the companies continued without insurance, paying claims as they were settled, in accordance with the custom which obtained down to your acquisition of their shares, the amount of net divisible income for the past fiscal year would obviously have been increased by the amount remaining in the treasury of the insurance company on September 30th, last; this balance amounted to \$103,000. It is probable that the last of the claims which antedate the beginning of insurance will not be settled until the latter part of the present year, but when that time comes the income of the companies will quickly feel the full benefit of the new system."

During the year Mr. Amos F. Breed, the first president of the companies, died.

The present officers are: President, Gordon Abbott; vice-president, Charles E. Catting; general manager, P. F. Sullivan; secretary, Everett W. Burdett; treasurer, Joseph H. Goodspeed; general auditor, D. Dana Bartlett.

STREET CAR AS A HOUSEBOAT.

The retirement of the time-honored horse cars all over the country has diverted many of them from the tracks into all sorts of odd uses and purposes. In one case three of them end to end

are being used as a little chapel; in Providence several serve as lunch rooms, and in St. Louis as a photograph gallery. In each instance the wheels have been removed and the box set up on short posts.

In Chicago one of the old City Railway cars has been mounted on a scow and transformed into a very respectable houseboat.

The Massachusetts Railroad Commissioners are now investigating the desirability of placing vestibules on Boston electric cars. A number of witnesses, among them several motormen, testified that the vestibuled cars were equally as safe as the others to operate.

WHAT WOULD THE IDEAL FRANCHISE CONTAIN.

The following letters were received in reply to an inquiry sent out by the "Review" asking what an ideal franchise—one that would be desirable from the standpoint of the company and at the same time, just and fair to the city—should, and should not contain, as regards paving, sprinkling and repairing streets, taxes and percentage payments to the city, rates of fare, etc.

Mr. Samuel M. Jones, mayor of Toledo, writes: "In my opinion no private franchise or privilege for operating a public utility for the purpose of making private profit out of the necessities of the people can be, in the best sense of the word, 'ideal.' Ideality is, in my mind, so closely allied with the idea of unity, of oneness, of equality, of brotherhood in short, that I cannot associate the word ideal with any relation in life that admits of one man using his fellow man as a mere instrument out of which to make profit. The streets of the city are the common property of the common (all) people. Clearly the people are entitled to the free and untrammelled use of the streets, or ought to be, without paying tribute of any sort to any private profit getter. Under the specialized conditions of today, a street car is as necessary a part of the street as the paving, and there would be as much justification in scientific fact for granting a franchise to private contractors to pave and repair the streets and collect toll from the people who use them as there is for granting private franchises to street railway companies. But we have not yet reached this state of idealism, and it is probable that we shall not for many years to come, although it is as surely ahead of us in the future as was the electric car ahead of us 25 years ago. More marvelous developments are to be witnessed in social and political relations during the next quarter of a century than the wonderful things we have seen in the material world during the past half century. The world is rapidly learning that things should be made for use rather than for profit, and once the people fairly grasp this truth the day of the private profit-getter, and the idle shareholder, and those who exist on dividends which are the result of the toil of other people will be at an end.

"Meanwhile private franchises will probably be the rule of the day. As to their terms while this immature state exists, I would be inclined to be exceedingly liberal with the franchise owner, depending for 'protection' to the city's interest upon the growth of the morality and public sentiment of the people themselves. I think I would favor stipulating the portion of the street that the car company should care for, which will in every case be a subject of dicker, bargain and sale, or trade between professional traders—the lawyers who represent the railway company and the representatives of the people. Then I would endeavor to fix the rate of fares as low as could possibly be secured, leaving entirely out of consideration the question of paying any percentage of gross earnings into the city treasury. The percentage should go directly to the people who pay the fares; they and not the tax payers and heavy property owners who ride in automobiles and fine carriages are the ones who should receive the benefit. Next I would limit the franchise to the shortest time practicable so as to prepare the way for making the transition from private to public ownership as easy as possible. I am an advocate of public ownership of everything in sight. I believe in all of the people and in the morality and integrity at the heart of the nation.

"Because even the conditions of our developing commercialism are better today than in the past, because the sum total of human happiness is greater today than at any other period of the world's history, because in short the present is better than the past, I believe that the future is to be better than the present; and I think the people are learning this lesson, that they cannot lift themselves by their boot-straps, that is, they cannot, without violating a fundamental principle of justice, make something out of nothing. By and by the ethical point will be revealed that no government, municipal, state or national, has a right to deliver its people over to be used for purposes of profit; that it is not only the privilege but it is the duty and business of government to operate every public utility for the benefit of the people at actual cost without profit to any.

"In the developmental stage that we are now in I would especially avoid complexity in franchises. I would make simplicity the main point, and, as I have already said, secure as good a bargain as can possibly be had by dealing with the fundamental points that

I have mentioned. I think the representatives of the cities should stand for these points above all others: low fares, short term franchises, definiteness with respect to the corporation's share of the paving, repairs of bridges, etc. While the franchise system continues the city is, of necessity, in copartnership with every owner of a franchise. Ethically I believe it to be an immoral relation for the reasons that I have stated. The franchise owners—that is a few of the people—have no moral right to make profit out of the necessity of the rest of the people. But taking things as they are, there is a certain mutuality of interest between the owners of a private franchise and the city, and for this reason the city may be better served in that class of utilities known as natural monopolies, such as street railways, by one corporation than by inviting a competing corporation into the city and thus authorizing the investment of double and triple the capital required to carry on the business. In consequence of this wasteful and strifeful competitive method through which we have passed, the street railway lines of this city are today capitalized for several times what it would cost to replace the entire system, and the people must pay the penalty of the warfare that has gone on in years past between private corporations striving for private advantages. There is probably no room for reasonable doubt but that were it not for this phase of our civilization the people of Toledo could have 3 cent fares, and the earnings would provide amply for all the necessary expense of carrying on the work, and leave a handsome margin in the bargain.

"I have endeavored to present this question fairly, as it appears to me. It is well known that I am unalterably committed to the policy of public ownership. I believe in it as a fundamental principle of right relation between men in the affairs of government. I know that it is the order of the future, and I believe that the early years of the 20th century are to witness marvelous and rapid changes in social and political relation along these lines that shall put the municipalities of the United States as far ahead of the cities of the old world, ethically and politically, as they are today in material and economic development."

Mr. Albion E. Lang, president of the Toledo Traction Co., writes: "Conditions of course vary in different cities. Generally speaking, however, I believe a street railway franchise should be perpetual in order to enable the company to borrow money at the lowest rates of interest as do steam railroads, and also in a sense a monopoly which would secure to the company the right to extend lines from time to time as the city develops. On the other hand the franchise should require the company to build extensions under just regulations. In all cases it should carry with it a requirement to transfer passengers from one line to the other, so that one fare will carry persons to any part of the city.

"Such franchises should also require the company to assume obligations to either pave and repair portions of the streets occupied by it or pay a given percentage of its earnings to the city—either or both, as local conditions may be deemed just. I sometimes think that the city should do all of the paving and repairs of streets, making such charge against the company as may be fair, thus silencing the citizen, who is constantly complaining that the company avoids its obligations in this respect.

"I believe that street railway companies at a proper time in their existence can well afford to pay to the community all earnings in excess of the true expenses of operation, plus taxes, interest on fixed debt, an allowance for depreciation and a reasonable dividend to its stockholders, or in lieu thereof, such percentage of its gross earnings as may be deemed the equivalent.

"Under a franchise constructed along these lines the rate of fare should be 5 cents."

Mr. H. A. Everett, president of the Cleveland Electric Railway Co. writes: "I think that franchises ought not to have any clauses which may cause litigation. I suppose the theory of the company paving its tracks in the old horse car days is so established that it would be impossible to secure franchises without that clause. The sprinkling of the tracks is certainly of mutual advantage to the city and the company. I think that the railway ought to pay taxes on a fair and equitable property basis, similar to other properties, and if a percentage of the gross receipts is paid to the city, the same should be nominal. As to the rate of fare, I think 5 cents cash, or 6 tickets for 25 cents, with unlimited transfer privileges for continuous rides, is the correct rate, but think the company should have some protection against trafficking in transfers."

Mr. W. F. Kelly, general manager of the Oakland (Cal.) Transit Co., writes: "The tendency of the rapacious politician who controls municipal affairs is to burden the street railway interests with numerous petty restrictions which increase the cost of operation and hinder the development of street railway systems. The newspaper press is unceasing in its attacks upon corporate investments of this character and creates a hostile sentiment in the minds of the unthinking public so that they are incapable of judging or dealing fairly with street railways. My own idea is that the matter of franchise should be as simple and clear as possible. From a public standpoint a street railway system should be so constructed and operated as to afford ample, speedy and safe accommodations to the traveling public. Construction should be first class, equipment up to date and kept in good order and cars run with sufficient frequency to meet the needs of the traveling public. Transfers should be issued to and from all lines. Under such conditions the public is well served and it would seem that nothing more could be reasonably asked or required in the matter of service.

"Now what should the company pay for the privilege of doing this? To my mind the simplest solution is a percentage of the gross earnings paid into the city treasury. What is a reasonable percentage depends much upon the local conditions and earning capacity of the system. In the smaller towns and cities the municipality could well afford to pay a bonus for the construction and operation of a street railway as no other enterprise would enhance property values so much. It is scarcely possible that any of the citizens of such a community would be far-sighted enough to do this, but under the conditions named they could at least grant a franchise without requiring any percentage of the gross earnings or imposing burdensome conditions as to street paving, car license, etc.

"Again in large cities where the profits arising from the business are large it is but right and reasonable that a percentage of the gross earnings should be paid into the city treasury for the public benefit. The difficulty in determining what is a reasonable percentage grows out of the fact that the average city official has an exaggerated idea of the profits of the company, and the management of the company from a selfish standpoint is loath to surrender any portion of its earnings for the city's use. A graduated percentage ranging from 1 to 5 per cent would under existing conditions be a fair compensation for the franchise. So far as the whole public is concerned a better arrangement to my mind would be no charge for franchise, street paving, car license, etc., but a condition that every 10 years the council should have the right to fix the rate of fare, but in no case should the rate of fare be fixed lower than the operating cost plus 6 per cent of the capital actually invested in the enterprise. A lower rate of fare is always to the advantage of the millions who use the street railways while a large franchise tax, and other burdens such as paving, sprinkling, car license, etc., render the lower rate of fare impossible and only contribute to reduction of taxes for city uses which in turn benefits the large property owners and tax payers and not the large number who pay but a limited amount of taxes.

"Another difficulty in the way of percentage on gross earnings is in the matter of extensions to existing lines. With the growth of the city, the lines are reaching farther and farther into the outer limits. They are not new and distinct lines in many instances and are not operated as separate lines, and the earnings arising from such extensions cannot be kept separate from the older portion of the system. To include in the franchise for such an extension a requirement that a certain percentage of the gross earnings of such extension should be paid to the city is an absurdity as there can be no means of ascertaining what the gross earnings are.

Under existing conditions as many street railways have franchises in perpetuity and others for long terms of years none of the street railway companies nor the city government would be willing that the present conditions should be changed and new franchises granted on a radically different basis, no matter how great a benefit such new franchise might be to the general public. It seems therefore impossible that there will be any decided change in this matter until public sentiment is educated to the point of believing that a first class railway system is a great benefit to the community and that the tendency of all legislation regarding street railways should be towards better service and lower fares."

Mr. D. B. Dyer, president of the Augusta (Ga.) Railway &

Electric Co., writes: "I would briefly state that in my opinion the function of a street railway is to convey the population to and from their homes to places of business and for business purposes, as well as for recreation. In other words, it is recognized as a necessity, and my idea is that franchises should be granted without any restrictions as to paving or keeping up of the streets in any way, except where the street railway disturbs a street in relaying or repairing its track. I believe that the paving of streets would never have been required of street railways, had it not been for the fact that the original service lines were mule and horse lines and that the animals tore up the streets to such an extent that the citizens concluded that the company should keep the portion of the street between its rails in repair. This was an equitable assessment but since the roads are propelled by electricity or steam the same obligation is not due from the railroad companies. I think that in exchange for franchise privileges the cities should assess the railway companies a certain percentage of their gross receipts."

Mr. A. C. Frost, vice-president of the Chicago & Milwaukee Electric Railway Co., writes: "Personally, I have always held that the best compensation a transportation company can give to a municipality is good, efficient and frequent service at a low or at least a reasonable rate, and that municipalities in their greed to get large compensation overlook the most important points, namely, service and rates. Where a street railway company operates in a city of several hundred thousand people, it may be reasonable to ask for compensation but where it operates in a community having a population of fifty thousand or less, or in new territory, I consider that it is unreasonable to ask compensation or any other concessions except, perhaps, to pave between the tracks in improved streets."

Mr. Charles T. Yerkes, of Chicago, speaking before the American Street Railway Association last year, upon the subject of street railway franchises made the following remarks:

"The most important matter in regard to the security of street railway securities is the length of charter under which they are operating. This question is of as much importance to the people as it is to the street railways themselves. The longer time that is given to a charter to run, the greater improvements and the more expensive plant can be operated by the companies. That is to say, it can be made more permanent than if the charter was of short duration, and naturally it would be. If a company had a charter with but a few years to run, the improvements will be of a cheap character, commensurate with the length of that charter, and the better the improvements, the better it is for the people. Not only for those who own property, but for those who ride and have no property. We see this exemplified daily. Let us ask the question, how many bridges of iron or stone would the steam roads have if their charters ran for only a few years? There would certainly be none, and the speed of trains would be greatly reduced. Years ago 30 miles an hour was considered rapid traveling, with 20 as an average. Now the rate has been run up to more than 80, with 45 as an average on fast trains. This latter condition would never have existed if the steam roads had not had charters long to run. Why should not the charters of street railways be equal to those of steam railways? In fact, considering them all in all, they should be longer. The cost of a steam railroad today is not nearly equal to the cost per mile of a street railway, even counting all the appurtenances that go with each."

RENO INCLINED ELEVATOR AT MANHATTAN STATION.

The Manhattan Elevated Ry., of New York, has recently installed a Reno inclined elevator at its 59th St. and 3d Ave. station. The moving platform is 17 in. wide and beside it is a flight of steps 2 ft. 6 in. wide for use in descending; the angle is 42¼°. The surface speed of the platform is 90 ft. per minute and at this station the time required to carry a passenger from the street to the platform is 30 seconds. To walk would require about 22 seconds. By walking on the moving platform the time can be easily reduced to 14 seconds. The capacity of this elevator is stated to be 3,000 persons per hour.

MANCHESTER (ENG.) CAR SHED.

By courtesy of Councillor Boyle, chairman of the tramways committee of Manchester, England, we are enabled to show the accompanying plan and exterior view of the tramway car shed recently completed by the municipality. This building is known as

ation to Yorkville, the southern terminus, by early in December. The construction of the most modern and substantial character, 60 lb T rails, oak tie, gravel ballast and standard appliances being used. The overhead line is No. 00 trolley, supported on brackets where the road is built at the side of the highway, and by span construction elsewhere. Three miles of private right of way

EXTERIOR OF QUEEN'S ROAD CAR SHED, MANCHESTER (ENG.) TRAMWAYS.

the Queen's Road car shed, the main front being on that street. It will be at once remarked that this building is of more imposing appearance than most American car houses; another peculiarity is that of putting the special work all within the building. The longest side of the building is about 670 ft. and the width at the nar-

was acquired to shorten distance and avoid grades. The company has no power station or car house, but the line is operated by the Aurora Street Railway Co., which, under contract, supplies power, maintains the equipment and line, and furnishes car men and other help required. The company owns four double truck Brill cars of the interurban type and proposes to furnish an hourly service with a maximum fare of 20 cents.

The district served lies south of Aurora along the beautiful Fox river, the country is rich and thickly settled and has formerly depended upon the meager accommodations furnished by the Fox River branch of the Chicago, Burlington & Quincy R. R. Yorkville is the county seat of Kendall County, and has a population of 2,500, while Oswego, lying midway between Aurora and Yorkville has a population of 1,000. At Oswego the line crosses Fox River on a new bridge built jointly by the railway and the township authorities, and enters the town over a trestle 600 ft long and 30 ft high, which permits it to avoid a dangerous grade crossing and a steep hill. The country for 2½ miles north of Yorkville, where the line runs through private right of way, is picturesque and beautiful. Heavy woods, deep ravines, and the river always in sight, makes the ride a particularly delightful one and insures the popularity of the line for summer business.

rowest part, 240 ft. There are 42 storage tracks 16 ft. long, 33 of which have pits 147 ft. long. The total capacity is 250 cars. In the rear of the car shed is a yard with sheds for storing track supplies.

The company purchased 50 acres of land lying along the bank of the river three miles south of Aurora, and converted it into a park, the railway passing directly through the center. This park has been equipped with pavilions and all the buildings usually found at resorts of this kind, and it proved to be very popular during the past summer. The entire line was constructed by Mr. D. A. Belden, general manager of the Aurora Street Railway Co., and of the Aurora & Geneva Railway Co.

A NEW ILLINOIS INTERURBAN.

One of the recently completed electric interurban lines in northern Illinois is that of the Aurora, Yorkville & Morris Railway Co., operation over the whole line having commenced early in the present month. This company was incorporated in 1897 with the object of building a railway from Aurora to Morris, via Montgomery, Oswego and Yorkville, a total distance of nearly 30 miles.

During the recent Fall Festival in Cincinnati the Cincinnati Street Ry. carried more passengers than during the great G. A. R. encampment of 1898.

Nothing was done beyond securing a right of way, until August, 1899, when the project was taken up by Col. H. H. Evans, of Aurora, V. A. Watkins and S. H. Case, of Chicago. The company was organized with Mr. Watkins as president, Mr. Case, secretary, and Mr. Evans, treasurer and general manager. Three miles of line were then built, connecting Aurora with Montgomery, a village of 500 inhabitants, and this line was operated during the winter of 1899 and 1900 with cars belonging to the Aurora Street Railway Co.

The Washington (D. C.) Traction & Electric Co. has been requested by the commissioners either to use or to remove the street car tracks in various parts of the city that are not in regular use.

In the spring, it was decided to extend the line to Oswego and Yorkville, making a total of 12 miles, and to abandon the plan of building to Morris. The line was completed as far as Oswego on July 1st, and has been in operation since that time. The rest of the line was built during the summer and fall and was in oper-

The Omaha (Neb.) Street Railway Co. will improve its service, establishing a five minute schedule on local lines. The capacity of the power plant is to be nearly doubled.

The Michigan Traction Co., operating the new interurban line between Kalamazoo and Battle Creek, Mich., will carry the mails between the two cities and the villages of Augusta, Galesburg and Comstock.

INTERNATIONAL TRAMWAY CONGRESS.

The International Tramway Congress was held at Paris, September 10-13, 1900, under the auspices of the Union Internationale Permanente de Tramways. We give below short abstracts of the 11 reports presented to the congress. M. Nonnenberg, secretary of the Union, has already issued a printed summary of the proceedings, and the verbatim report is promised within a few weeks.

TRAMWAY FARES.

Mr. Geron, of the Cologne Tramways, presented a report upon rates of fare and the effect of modifications made within five years. The replies received indicated that wherever fares had been reduced there had been an increase in traffic and in most instances an increase in net profits. Mr. Geron's deduction was that the bases for the formation of a tariff are essentially different according to circumstances, and that only general conclusions can be arrived at. These are (1) that the tariff of urban tramways should be simple and cheap, and established to meet the requirements of the particular localities; (2) for large cities it is advisable in general to provide an interior zone with a tariff at a single price, and in which should not be comprised any suburban lines; (3) that the system of transfers is to be recommended, but it will be advisable to examine in each particular case if there should be a charge for the transfer, and what should be its amount.

The discussion was principally on the third conclusion. Mr. Dubs, Marseilles, preferred to lower the fare rather than give transfers. Mr. Pieck, Berlin, was opposed to free transfers, and thought they should be graded as to cost. The congress concurred in the first two conclusions of Mr. Geron and a committee was appointed to further consider the third conclusion and report on it at the next congress.

EFFECT OF ELECTRIC TRACTION.

Mr. Pirch, of the Barmen-Elberfeld Tramways, discussed the results of electric traction from the points of view of traffic expenses and profits, but all the data he had been able to secure related solely to the overhead trolley system. His conclusion, adopted by the congress, was:

Overhead electric traction recommends itself in place of animal traction and also in place of traction by locomotives, when the system demands small trains succeeding each other at short intervals, on long lines, and with heavy traffic, on the conditions that the duration of the concession is sufficiently long and that the other conditions are favorable to the equilibrium of the undertaking.

NARROW GAGE ROADS.

Mr. Gunderloch reported on the relative advantages and disadvantages of a narrow gage (1 m. or 39 $\frac{3}{8}$ in.) as compared with standard gage. From the replies of 11 companies he drew the following conclusions:

1. The narrow gage permits an easy rounding of sharp curves. With the present types of motor cars, with a wheel base of from 1.6 m. to 2 m., this advantage is not a very important one. It has been found that of 61 electric roads having curves of 20 m. radius or less, 33 employ the standard gage, and only 28 the meter gage. This shows that the occurrence of a few sharp curves should not be sufficient cause to induce railway companies to adopt the narrow gage.

2. There is less expense connected with the construction and maintenance of a narrow gage than standard gage. This, of course, only becomes of importance where the company builds its own roadbed, and where the same is of considerable length. The narrow gage requires a smaller expenditure for roadways, the transportation of earth and general construction.

3. As the electric roads are feeling more and more the competition with steam roads, especially in the transportation of freight, it is to their advantage to use the standard gage, as it enables the electric freight cars to traverse the tracks of the steam road, thus saving the cost of unloading, and vice versa. To permit this the following conditions, however, must be observed in the building of the street car line:

- (a) There must be no curves of a radius less than 150 m.
- (b) The rails must be so supported that they can resist at any point a moving load of 6,000 kg. at a speed of 30 km. per hour.
- (c) There must be a clear space above the track of 760 mm.
- (d) The track centers must be 4 m. apart.
- (e) There must be no grades which would overload the motors for too long a time.
- (f) Such brakes must be installed and such a speed must be chosen on public highways that the train can be brought to a stop within the distance required by law.

It is worthy of note that a number of original narrow-gage roads, in order to become more serviceable, have changed over entirely to the standard gage, or have laid a third rail.

4. As the motors are mounted between the wheels of the motor car, it is evident that larger motors can be installed on standard-gage cars than on those built for narrow gage.

5. The use of large motors on narrow-gage cars takes up all the room between the wheels. Thus the accessibility to the various parts is made more difficult, which is a great disadvantage. The motors are further exposed to a greater extent to the water thrown up from the track during travel, as the space beneath the motors is too small to allow for the provision of proper guards.

6. The small space also forbids the mounting of air pumps for the use of air brakes alongside of the motors, and in any case the arrangement of the brake mechanism is less convenient on narrow gage than on standard gage cars, on account of the crowded condition between the wheels.

7. The standard gage cars are also more stable than narrow gage cars. In the latter cars with longitudinal seats the wheel boxes become very objectionable.

8. In conclusion, a few remarks should be addressed on this subject to the owners and maintainers of highways who are in the habit of advising the railway companies to build narrow-gage roads because they take up less room than those of standard gage. This is an erroneous idea, however, as experience has shown that other vehicles will not use the narrow gage tracks, but travel alongside, and thus take up a great deal of valuable space on the roadway. As the narrow gage cars have the same width as the standard gage ones, the space taken up by them is the same. There will, furthermore, be fewer collisions between vehicles and cars on broad-gage roads, as the former are kept further away from the gage line.

From the above it will be seen that for electric street railway service the standard gage possesses many advantages, and is more commonly employed. A change to the narrow gage, which would exclude the possibility of running street cars over steam railroad tracks, should not be recommended.

Mr. de Burlet, director-general of the National Local Railway Co. of Belgium, objected to the conclusions as applied to country roads for freight traffic. He said there were 100 local lines in Belgium, aggregating over 1,500 miles, and that 1,200 miles more were under construction. Of these 100 lines only three had normal gage. The cost of narrow gage lines, including rolling stock, was 48,000 francs, while for the normal gage it was 100,000 francs. In 1890 the Tramway Congress had approved of the narrow gage.

Other members believed that conditions had changed since 1890, and that the conclusion of the report was correct. Decision on the conclusions was postponed till a later congress.

POWER STATIONS.

Mr. Thonet, of Liege, and d'Hoop, of Brussels, presented elaborate reports giving detailed information concerning the equipment of street railway power stations, and concluded that: In large installations it is necessary to adopt compound steam engines, direct connected and condensing. In installations of medium size there is generally room in or near the works for a battery of accumulators. In small installations, if fuel is dear, the employment of gas engines, even with poor gas, gives very advantageous results.

An amendment was made to the first conclusion as follows: In large installations it is necessary to adopt steam engines, either compound or triple expansion, connected direct and condensing, seeing that triple expansion engines secure a notable economy, and

permit very great facilities in coupling alternators in parallel. The conclusions were then adopted.

CURRENT DISTRIBUTION.

Mr. Van Vloten, Brussels, reported upon the question of the best method of distributing current to a large system of tramways with suburban lines capable of long extensions.

The deductions were:

(1) When the line is not longer than 8 to 10 km. from the works, and with a not too heavy service, the preference should be accorded in general to ordinary distribution by continuous currents with or without secondary batteries; (2) when the line extends under the same conditions to 15 or 16 km. from the works the distribution of continuous current from the central station with transformers and secondary batteries presents advantages; (3) in certain altogether special cases the preference should be given to traction by means of accumulators when the line is not more than 15 to 20 km. in length; (4) the distribution of continuous current, in series, can be applied to still longer lines, above all when it is possible to utilize the power of a distant waterfall, but that distribution from the traction point of view has the inherent defect of systems in series (risks of powerful perturbations affecting the surroundings of the installation), so that it is not advised when the intensity of the service is variable; (5) for these reasons the distribution of polyphase currents with converting stations to continuous current feeding the working lines is a distribution which presents the same advantages from the point of view of the utilization of waterfalls, and is more convenient, principally when the service is intense and variable, the trains heavy, and the line long—say from 20 to 30 km.; (6) the direct distribution by polyphase currents with revolving field motors on the vehicles does not seem to adapt itself to the same conditions of traffic, length of line, etc., so well as to the ordinary railways, independent of the working of urban tramways, and constructed on a special platform.

FALK JOINTS.

Mr. Fisher-Dick, Berlin, submitted a report upon the Falk cast-welded rail joint and its application to many railways in Europe and America. Mr. Thonet stated that railroads had at first been used with Falk joints in France, but had been found unnecessary and were not used in later installations.

ACCUMULATOR TRACTION.

Messrs. Broca and Johannet, Paris, had the report on Accumulator Traction, which included lengthy communications from the Hanover Tramway Co., describing its system, and from Mr. E. E. R. Tratman of the Engineering News, describing the Chicago Electric Traction Co.'s road. Mr. Tratman's answers were doubtless prepared some time ago, as no mention was made of the fact that the Chicago Electric Traction Co. has abandoned the storage battery in favor of the overhead trolley.

After an animated discussion the congress adopted the following resolution:

Ignoring the greater cost of accumulator traction, and speaking only from the point of view of the service the public deserves to receive, traction by accumulators does not ensure in a sufficient degree the necessary regularity, elasticity and capacity; that up to the present no important advances have been made in accumulator traction for tramways; that the accumulator system is much less sure and much more onerous than the overhead trolley system, and can be recognized as applicable only in certain very exceptional and very special cases.

CAR HEATING.

Mr. de Burel, Brussels, presented a report on car heating. It appears that the heating of cars on urban tramway lines is not the common practice in Europe. In Aix-la-Chappelle briquettes are used; in Stettin, stoves; in Vienna and Hanover, electric heaters; the Swiss General Tramway Co. uses hot water heaters.

The Hanover company has no room for heaters under the car seats, the space being taken by the accumulators, and a form of

heater to be attached to the vertical surface of the seat and extending the whole length of the car was devised. This is shown in section in the illustration. The length and diameter of the wire are so chosen that it may be heated to redness by 3.5 ampere at 500 volts. These heaters will raise the temperature in a car 10 degrees (C or R not stated) in ten minutes. The cost of metal

SECTION OF HEATER, HANOVER.

is \$10 per car, and the current consumption is 1.75 kw. h. per hour, costing 2½ cents. This method of heating is sufficient for suburban runs, but has been discontinued provisionally in the center of the town because of the doors being opened so frequently.

The congress adopted the following resolution: It is desirable that the question of heating urban cars and the cars of local lines of railway should remain an order of the day of the Union of Tramways, and that the inquiry which has been commenced should be followed up for succeeding meetings. The affiliated societies are therefore invited to collect information on the question, and to make known their experiences.

OPERATION OF LIGHT RAILWAYS.

Mr. Ziffer, Vienna, presented a brief report on the question of operating local (or light) railways, whether they should be operated by the owners, or by the great railways to which they are feeders. But two replies were received, one from Belgium and one from the French General Tramway. In Belgium the system of the National Local Railway Co. leases some of its lines to the main railway companies, some to companies working several lines and some to companies working one line only. Mr. Ziffer concludes that it is difficult to make any general recommendations, and that each case must be considered on its own merits.

RATING OF ELECTRICAL MACHINERY.

Mr. Macloskie, Paris, submitted a report based upon the questions: Is it desirable to adopt a standard rating for generators and motors? On what should it be based? Can the same rating be applied to other electrical apparatus used on street railways?

The replies received from member companies were mostly in the affirmative. Mr. Macloskie's conclusion was that it was possible to fix a single method for rating all electrical apparatus used

on cars. While the maximum current capacity is the determining factor for controllers, circuit breakers, etc., such apparatus is always used with motors and could be given the same rating as the motor.

For a motor rating the combination of three things is suggested, the data to be written in the form C-A B, where

A is the current in multi-amperes to produce a tractive effort of 1 kilogram with a wheel 800 millimeters in diameter (31½ in.); A varies somewhat with the speed, increasing as the speed increases.

B is the current in amperes required to compensate for mechanical and electrical losses in the motor. For modern motors $B = A P \div 5,000$, where P is the weight in kilograms; this is only approximate for large motors.

C is the kilowatt input under which the motor will work for one hour with a temperature rise not exceeding 75 degrees C.

The question was remitted to the next congress.

BRAKES.

Mr. Monmerque reported upon new developments in brakes for street cars. Only four companies sent data, three were using air brakes and one hand brakes and electric brakes. There were no innovations to report, and it was recommended that this topic be kept open as one of the questions of the day, because of the great importance of efficient braking with mechanical traction.

SUBURBAN CAR SERVICE BETWEEN ATAMI AND YOSHIHOMA, JAPAN.

Mr. Monmerque added some information concerning the brakes required by the regulations in effect in Paris. The specification is that each car shall be equipped with brakes sufficiently powerful to make stop from 20 km. per hour in 20 m., the rail being dry. The General Omnibus Co. placed five brakes on each of its electric vehicles, of which three could be worked by the driver and the others by the conductor in the rear of the vehicle. The driver worked, first, a compressed air brake; second, a reversing brake, and third, a hand brake. The conductor at the back had an automatic compressed air brake and a hand brake. All these brakes were inspected for each vehicle, and the company invited the government engineers to assist them in its efforts. The brakes were tested every morning by the drivers who had to use them.

In the discussion reference was made to brake tests made at Hamburg for the German Tramway Union. These had been conducted under three different conditions—with sanded rails, with dry rails, and with wet rails—on automatic vehicles with two axles, with one motor and with two motors, as well as on vehicles with four axles and two motors. The vehicles running at 22 km. per hour stopped themselves at a distance of 9.5 m. to 10.80 m. in the first case, and 9.90 m. to 10.90 m. in the second case, and at 14 m.

to 20 m. in the third case. (1) The short circuit brakes gave the best results as emergency brakes, but they presented serious imperfections when constantly or partially used as regular service brakes. (2) The electro magnetic brakes gave good results, and can be recommended, especially in systems where heavy cars are used, or where the topographical conditions are very varied. (3) Compressed air brakes generally gave good results, but they should be further experimented with. (4) Other brakes have given results which are insufficient to warrant a pronouncement respecting them. Mr. Roehl, of the Hamburg Tramways, stated that the Hamburg tests had not been conclusive and the authorities had not been able to base requirements on them.

AN ODD JAPANESE CAR.

A tourist has discovered an interurban railway in Japan which is operated by man power. The line is seven miles long and connects the two coast towns of Atami and Yoshihoma in the province of Izie. The train crew comprises two men and a boy. The men, muscular coolies, push the car on the up-grades and jump on the rear platform for a ride when the car is coasting on a level or down-grade. The boy rides on the front platform and it is his duty to blow a horn as a warning at hills and curves, and to manip-

ulate the brakes. The fare, including tips for the crew, on this road is the equivalent of 21 cents per round trip.

A FRANCHISE BRINGS \$1.00.

On November 9th the commission of public works sold at public auction a franchise asked for by the Syracuse & Oneida Electric Railroad Co. The cost for advertising alone was \$504 and there were other expenses connected with the sale. A certified check for \$5,000 to guarantee that the purchaser would comply with the condition of the sale was required, and the terms were one-half cash down and one-half within 30 days. The attorney for the street railway company was the only bidder and the franchise was knocked down to him for \$1. He did not ask for the 30 days' time, but paid the purchase price all at once.

The Des Moines (Ia.) Street Railway Co. desires a franchise to enable it to haul freight between the brick yards and the railroad stations. A popular vote on the proposition is necessary but it was not submitted at the election.

THE WORK OF THE LIGHT RAILWAY COMMISSION.

A paper read at the Light Railway and Tramway Conference, London, by R. H. Scotter, C. E., M. I. Mech. E.

(The meaning of the terms used in this paper will be better understood by American readers after a reference to the article on "British Methods of Tramway Promotion" published in the "Review" for February, 1900, page 95.—Ed.)

When the history of the light railway movement in this country comes to be written, two points will come out very prominently, both illustrating the deeply seated need which existed and which called forth legislation on the matter. 1. The non-political, or, rather, dual political character of the agitation, both in and out of Parliament. 2. The rapidity with which the facilities offered by the Act were seized and taken advantage of all over the country.

Both these are very encouraging factors in the work we, both individually and as an association, have undertaken to perform. The progress of the movement has been especially encouraging to those who have tried for so many years to convince the people of this country that cheap and ready transit from producer to consumer is an absolute necessity if we are to maintain our position in the world's commerce. The fact that both political parties are convinced of this assures us a steady run in the future, unhampered by general elections, or a chance vote snatched at a moment of political or municipal excitement. It is with these facts before me that I venture to call the attention of the members of the Tramways and Light Railways Association to the work which the Light Railway Commission has accomplished, and to attempt to call attention to some of the good points and some of the weak points of the Light Railways Act, 1896. I consider this a most opportune moment to bring the matter forward, because the act itself expires next year, and I feel that this Association can hardly render a better service to the public and the tramways and light railway industry generally than by discussing freely the working of the act, and before Parliament undertakes its revision, by submitting to the proper quarters some practical suggestions for its improvement. With the formation of the Light Railway Commission, the distinct advance in procedure introduced by the Commissioners, and the popularity which has attended its work and results, we are all more or less familiar. The bold attempt at decentralization introduced by the act, by which duties hitherto performed by the House of Commons were delegated to the Board of Trade and Light Railway Commission, caused many old parliamentary heads to shake with ominous distrust. But after watching the movement very carefully, I, for one, must unhesitatingly state my opinion that the step which has been made in this direction is an unqualified success. At the local enquiry, much more real information is forthcoming than in the House of Commons committee room; and this, together with the unvarying kindly patience and courtesy extended to all by the Commissioners, has done much to interest public bodies and the public generally in light railways and tramways. This in its turn has influenced the large development in the movement, as it is useless for engineers to spend time and thought and money in framing schemes to meet local needs if the public are not also interested. The success of the movement is evidenced by the large number of applications made, and the length of mileage asked for by promoters under the Act of 1896. When it is stated that between December, 1896, and May 31, 1900, 3½ years, proposals, plans, and estimates, have been received by the Commission for a mileage of 2,800 miles, a length greater than the total mileage of Irish railways equal to the London & Northwestern and the London & Southwestern combined, and greater than our longest railway, the Great Western, and more than double the total mileage constructed in 30 years under the Tramways Act, the magnitude of the need becomes apparent. Nor is the need confined to one part of the country or to one class of district. Places as far distant and as dissimilar as Penzance, Wick, and Inverness, Colwyn Bay, Bedgelert, and Southend-on-Sea, have benefited by the Act, as well as the most thickly populated manufacturing centres in the North and Midlands of England, and in the metropolitan area.

During the years 1897-98-99, 1900, the commissioners have held 208 local enquiries into the merits of 247 schemes, the general result being that 55 per cent were granted; 24 per cent rejected; 14 per cent withdrawn; 7 per cent to be dealt with. At the present

time the account stands thus: 258 applications received for permission to construct 2,657¼ miles, and capital estimated at £17,889,000. Add to this 24 applications lodged May 31st for about 240 miles, and the total capital may be placed between 18 and 19 millions sterling. How have these orders been dealt with? Of the 258 received to end 1899—138 have been granted; 65 rejected; 36 withdrawn; 19 not dealt with or deferred. So that the commissioners start next month with an arrear of only about 7 per cent to pull up, and then they have 34 schemes presented last month to take in hand. So far for the local enquiry. When the Light Railway Commissioners have satisfied themselves that a scheme is a good one, we should think the Board of Trade, the commissioners, promoters, solicitors, and all concerned, would hurry matters forward, so that the line might come into existence as soon as possible. But such is not recent experience. Of the 138 fortunate schemes approved to date by the Light Railway Commissioners, 108, representing 112 schemes, have been sent to the Board of Trade for confirmation. Of this number, 77 have been confirmed, leaving 61 approved schemes at the present time awaiting confirmation. It will therefore be seen that very often considerable time elapses between the verdict given by the commissioners in favor of the scheme and the actual issue of the order. The average time between the deposit of the plans and the issue of the order is 16 months, or nearly double the time required for the obtaining of similar power per act of Parliament or provisional order. Of this period not more than six months elapses between deposit and local enquiry; hence on an average, ten months are occupied in the process of "settling the order." Here, then, appears to be one weak spot in the constitution of the Light Railway Commission. More help is required, in order that the order, when once approved, may be rapidly settled. This point has been brought out very forcibly by the commissioners in their reports. They say that "the time lost in traveling from place to place is very considerable, and the ever increasing number of applications will make it impossible to deal with them in the proper time unless some fresh arrangements are made." I would suggest that the attention of Parliament might be directed by this association to this point. That an increase of the number of commissioners might be suggested with a view of curtailing the time allowed between approval and confirmation, and also to granting some additional powers by which the commissioners might "spur on" both promoters, objectors and their solicitors to prompt action within a given time. At present valuable concessions are often hung about by frivolous objectors, who take advantage of this flaw in the act, and impose upon the courtesy of the commissioners, in order to obtain some real or fancied advantage. While they are thus hanging matters over public interest flags, the scheme is somewhat discredited, and the chances of local financial support minimized by the dog-in-the-manger policy adopted by objectors. If a "time limit" were imposed, no injustice would be done to either side, and many frivolous objectors would be brought to their senses. At present, Parliamentary procedure is "limited" by the length of the session; a bill must be passed or thrown out during that period. Under light railway procedure, much of the money saved by simplification is lost, either directly or indirectly, by the scheme "hanging fire" after it has been approved by the commissioners.

Two other facts have been noticed with the development of the light railway movement in this country, and I venture to think we who are so closely connected with the industry cannot afford to overlook them. In the early days of the movement, the existing railway companies gave no encouragement to the light railway movement. Wherever they could they opposed, taking refuge in that bogie "competition." We contend that a light railway, properly designed, cannot compete with an existing line, because the true function of a light railway is to continue into hitherto unremunerative districts the facilities offered by the railway. The light line can live where the "heavy" one would starve, because it has a smaller carcass to keep up. Railway companies, however, held aloof from the movement, no doubt because their managers very little understood that light railways would bring grist to their mill at little or no expense to themselves. When, however, it dawned upon them that the movement was one come to stay, they very cutely stood aside, nodding approval while other people found the money, and now their attitude is wholly different. Scarcely a railway in the country, I believe, maintains its former attitude. Several are promoting light railways themselves, and others are on the

watch to get their hands on the purchase clause. Herein a word of caution is necessary. We must not give away our birthright for a mess of pottage; 25, 30, or 42 years is short enough time for repayment of capital in an enterprise which is absolutely new, and which depends for its existence on crumbs which have been cast from the rich man's table. In other words, light railways and tramways tap districts hitherto untapped by railway companies because they would not "pay." They will rely largely upon creating new traffic. When it has been created and nursed, it will not be fair that our quasi-benevolent neighbors, the railway companies, should then swoop down and take all the profit. It is a point which must be taken into account and kept in mind when railway managers smile approval upon the promoters of a light railway. Mention of the purchase clause, too, reminds me of the altered attitude of local authorities, and the county councils in particular. I believe in many parts of the country, the local authorities, having their hand on the pulse of the people, are more keenly alive than any other class of the community to the importance of light railways and tramways. Their support has been loyally and heartily given to many good schemes. But here, again, a word of caution is necessary, so that too much may not be given away by promoters. Some county councils—I do not refer to the London County Council—are making efforts to obtain a clause in each light railway order promoted within their area, that at the expiration of 25 or 30 or 35 years, they shall have the power to purchase the undertaking if the local authorities fail to do so. Now this introduces a new element. We all know that the chances are very much against the whole of the local authorities agreeing to purchase. But when the county council comes along, with its respectability, its weight of influence, its massed debt, and its ability to borrow money, the chances of the light railway company having short notice to quit are enormously increased. I am quite aware this card has two faces, but that it must be considered as a new element in the game I think all will concede, and it must receive most careful attention when the act comes on for revision in 1901. Cannot this new bill be made to settle once for all the supposed difference between a light railway and a tramway? Cannot we insist upon the Tramway Act of 1870, being revised at the same time? I believe it will be possible to effect such a change, if we show ourselves desperately in earnest about the matter.

It will be noted that the Light Railway Commissioners themselves divided all applications into two classes: a. Light railways resembling ordinary railways; b. Lines which may be shortly described as road or street railways. By approving over 250 miles of the latter class, they have set their approval on the use of the ordinary roads of the country for the carriage of both passengers and goods traffic. I believe this practice to be a good one, and that it opens up an enormous field for electric traction, as steam locomotion is by no means suitable for this purpose. In many cases the roads have to be widened before the lines can be laid. I think this a wise and fair regulation, but I consider that provision should be made in the revised act to prevent promoters of light railways being mulcted when carrying out what is undoubtedly a public improvement. Wider roads are for the benefit of all the users of those roads. Hence when a railway or tramway company finds it cannot buy land for that purpose except at an abnormal rate, legislation should step in. Undoubtedly one great improvement which the act will allow to be carried out will be a solution of the housing problem. It can only be solved by allowing the worker to live away from congested town centres. To do this local authorities have tried and failed. If light railways and tramways accomplish this end, they should certainly feel that the local authorities will help them over the purchase question. In revising the Tramways Act our policy must be to get rid of Clause 43. Parliament has gone half way by allowing promoters of light railways a longer time than 21 years in which to recoup themselves. Here, again, tramways and light railways should be put on the same footing. But let us have Clause 43 abolished from the statute book forever. No clause has been so detrimental to the progress of electric traction. I presume, however, its funeral will be attended by our legal friends in full force. But no one else will be there! On the question of financing light railway and tramway undertakings, I will content myself with mentioning the fact that although Parliament some four years ago sanctioned the spending of £1,000,000 by way of loans at 3½ per cent for the purpose of helping the development of light railways, the concession is so hedged in by "provided thats" that so

far only half a dozen grants have been promised. I think that the future of the movement depends very largely upon the support private enterprise can give it, and in this direction I would point out that although investors have not given great attention to light railways, they will certainly become paying concerns in the future. The Board of Trade and the Light Railway Commissioners exercise such a rigid control over the financial side of the matter that over-capitalization is practically impossible. This should go far to induce local capital to be invested in an enterprise which depends for its success upon local opinion and local support, and is specially concerned with the development of the country through which it passes. In conclusion I trust the association will strengthen the hands of the Parliamentary committee by sending in full and practical information upon the working of the Light Railways Act, and endeavor, by discussion, by meetings, by agitation, to formulate and transmit to the proper authorities such practical amendments of both acts that we may obtain a light railways and tramways act which may enable us to make up for lost time, and bring electric and other systems of traction in this country up to their proper level.

I feel the Association, by pursuing this policy, will confer a benefit not only on the industry, but upon the whole community.

DEVICE FOR TAMPING TIES.

Mr. Frank P. Sheppard, of Boody, Ill., has devised a simple apparatus for tamping ties which he states has been tested to satisfaction with finely crushed rock, burned gumbo, and gravel ballast. From the illustration, for which we are indebted to the Railway and Engineering Review, it is seen that the device consists of

THE SHEPPARD TAMPER.

two hooks, similar to ice-hooks, for gripping the tie, and two tamping heads with sockets into which wooden handles are thrust for operating. It is presumed that three men are required, one at each handle and one to shovel the ballast in front of the tamping heads.

CINCINNATI, NEWPORT AND COVINGTON.

The condensed statement sent us by Mr. J. C. Ernst, president of the Cincinnati, Newport & Covington Railway Co., shows for the month of October the company had gross receipts of \$66,640; operating expenses, \$27,167; tolls, taxes, damages, etc., \$12,479; net profit, \$26,994. For the 10 months of the current year the net profit is \$266,158 as against \$229,830 for the corresponding period in 1899.

EXTRA TRAINS ON CHICAGO METROPOLITAN.

CAR SANITATION.

We have at various times commented on the increase of traffic that came to the Chicago elevated roads after the opening of the Union Loop in 1897, which gave these roads good terminal facilities in the business district. During the rush hours in the evening the trains are crowded by the time they leave the loop and thus passengers at intermediate stations often find it necessary to wait for several trains before one comes that can accommodate them.

The Metropolitan Elevated found that a large number of passengers delivered at its Canal St. station (this is not shown on the map, but it lies just west of the river) between 6:30 and 8:30 a. m. wished to start home between 5:30 and 6:15 p. m., thus greatly increasing the density of traffic in the evening. A count showed that only two-thirds as many persons were carried from this station as were delivered there and it was decided to try and regain the lost traffic by putting on additional "shuttle" trains.

The main line has four tracks and extends from the loop to Marshfield; one of the two platforms at Canal St. was extended and a stub track laid between the regular tracks, with switches to each of them. Ten extra trains of three cars each have been put in service during rush hours and two of these make two trips, giving 12 extra trains. They are run on the Humboldt Park and Logan Square branches with no stops on the main line between Marshfield Ave. and Halsted St., and are put in between the regular trains.

The method is to switch one of the shuttle trains onto the stub track at Canal St. where it is loaded and then let it follow one of the regular trains out. These 12 trains arrive at Canal St. between the hours of 6:25 and 8:15 a. m. and leave this station between 5:15 and 6:20 p. m. Since the additional service was put in the evening traffic has increased to the normal.

Many of the persons working in the manufacturing districts near the Canal St. and the Halsted St. stations live near the northwestern terminals of the Metropolitan and the shuttle trains also relieve the regular trains of the large transfer at Marshfield Ave. from the south to the north branches.

The Metropolitan has recently issued a 16-page pamphlet descriptive of the line and pointing out the advantages of the West Side as a residence district. The company is making every effort to accommodate patrons, as the following paragraph will show:

"All stations on the system have free wheel racks for passengers who like to ride to and from trains on bicycles; and the terminal stations have special rooms for storing wheels. If a woman starts down town with a baby she may check the baby carriage at the station to await her return. The stations contain toilet rooms, cigar and news stands and waiting rooms, the approach of trains being indicated by bell signals, so that in stormy weather passengers need not wait for trains on open platforms."

The statement of the Consolidated Traction Co., Pittsburg, for the month of September, 1900, shows: Gross earnings from operation, \$247,810; net earnings from operation, \$142,871; total net earnings, \$170,955; surplus after deducting fixed charges and dividends on preferred stock, \$20,406.

Dr. J. N. Hurty, secretary of the State Board of Health of Indiana, presented a paper on "Passenger Coach Sanitation" at the thirteenth annual meeting of the International Association of Railway Surgeons, in which he discussed the subject with particular reference to the coaches of steam railroads. Those portions concerning cleanliness and disinfecting are of interest to street railways also, and we make the following extracts:

The interior of coaches should be as plain as possible. Panels, angles, carvings, bead and channel work are costly, are not necessary for ornament, make cleaning difficult and are great catchers of dirt and filth. Window frames and sills should be rounding, the car sides perfectly smooth, the seat frames should be perfectly plain, the seat arms never upholstered, but on the contrary made of hard polished wood or enameled iron, and round, simple and plain. The seat supports next the aisle should be simple, round, enameled iron posts. Curved, fluted and elaborate supports should not be thought of, and it would be well to do away with foot-rests, for they are not really necessary, favor dirt accumulation, and are a hindrance to cleaning. The floors should be hardwood, well filled, and kept so.

There is no reason why duplicate cane seats and backs could not be provided for the hot months. Slats or blinds should never be used at the windows. Only smooth, impervious material on automatic rollers should be tolerated. The plain, uncarved interior need not be without ornament, for painted panels, stenciling and frescoing would take their place to relieve the eye.

Being sanitarily constructed as described, a coach on arrival at a cleaning station should have the bottoms and backs of seats taken out and immediately placed in a steam sterilizer of sufficient capacity where they would be thoroughly sterilized and afterward dusted by means of the air blast. Or, ordinarily, they might be dusted first and then sterilized. If the seats and backs were kept in duplicate, clean sterilized seats could always be at hand. As soon as this first cleaning step has been taken, the floor of the car should be lightly sprinkled with water containing a very small amount of some efficient disinfectant (formaldehyde preferred) and then swept. Scrubbing with soap and water should then follow, the arms of the seats and all surfaces which need it should be washed and wiped and all dust taken up with damp cloths.

If a car thus cleaned be closed and allowed to stand a while in the sun, upon opening offensive animal odors are in strong evidence, hence the necessity of disinfection. For car disinfection Mr. W. Garstang, superintendent of motive power of the Big Four, has invented a giant spray. This is a strong copper can with a capacity of one gallon, provided with an atomizing tube of proper size. It is attached to the air hose, and after filling with formaldehyde the workman enters the car and proceeds to the opposite end, dragging the hose after him. He now quickly backs out, spraying the chemical onto the floor, side walls, window sills, into corners, and onto bottoms and backs of seats. The air pressure is so strong and the atomizing tube so well adjusted, that the formaldehyde is driven forth more as a nebula than a spray. By means of this nebulizing the formaldehyde gas is set free and penetrates every part of the car, effecting complete disinfection. A car thus treated does not manifest animal odors upon standing closed in the hot sun.

TAXING TEXAS CORPORATIONS.

The District Court of Dallas County, Texas, has upheld the legality of a tax on franchises. The assessors in several counties have placed the assessments of corporations at high figures on the theory that the franchise enhances the value of the corporation's tangible property and is therefore taxable as part of the whole property. There is no state law directing the assessment of franchises and the assessor's action is said to have been suggested by speculators who have contracts with the counties for collecting the tax. In Dallas county alone the franchise assessments of all corporations amounts to \$20,000,000.

It is said that the city of Lake Charles, La., offers exceptional inducements to the promoters of street railways. A road is desired to carry freight from the rice fields to the shipping station in Lake Charles.

AUTOMOBILE EMERGENCY WAGONS.

The rapid strides made during the last two years in the developing of the automobile warrants the assumption that the self-propelled vehicle has come to stay, and the builders of these vehicles, encouraged by the success that has thus far attended their efforts, are already looking for new fields to conquer. One of the latest uses to which the automobile is being put in as a substitute for the horse drawn emergency wagon for street railway repair work. Experiments have been carried on along this line during the past few months on the Consolidated Traction Co.'s system at Pittsburgh, on the Columbus (O.) Ry., at Washington, D. C., and at other places, but with the exception of the work at Washington, these experiments have not resulted in anything tangible as yet.

The possibilities in this direction however are worthy of close attention on the part of managers. The same arguments that applied to the substitution of electric traction for horses on street railway lines will apply in this case. Horse power is always expensive at the best and any mechanical substitute is, as a general proposition, desirable. The electric vehicle is readily controlled, can be backed, turned or stopped at will, and is capable of fast speeds, especially in crowded streets. Furthermore the current for

at a speed of 12 miles per hour, and is guaranteed to climb a 15 per cent grade. As the vehicle is equipped with a rheostat for charging anywhere on the line, the mileage radius is practically unlimited, and the repair crew can answer any number of calls in rapid succession. Two powerful band brakes, sufficient to stop the vehicle within its length when going at full speed are furnished, and to prevent any possibility of the wheels slipping upon sudden application of the brakes in smooth, slippery places, two sand boxes are installed in the body of the wagon, and sand can be caused to flow to the tread of the driving wheels by pressing a button in the foot board.

The wagon is equipped with a sledge hammer, axe, pike, machine hammer, Stilson wrench, two monkey wrenches, and an A ladder, 9 ft. 6 in. in height, the top of which, when in place, stands 13 ft. 6 in. from the ground. The crew consists of three men. Complete, the wagon weighs 7,000 lb. and has a normal carrying capacity of 4,500 lb.

The body is painted a Paris green, the side rises and running gear a Brewster green, the moldings and battery compartment in black. Striping consists of two ¼-in. lines of gold. On the side panel the company's name appears in plain gold letters.

A hand rail runs the full length of the body, from seat to the

AUTOMOBILE EMERGENCY WAGON, WASHINGTON, D. C.

the batteries can be taken from the line at any point without any appreciable effect on the power station load.

The principal difficulties encountered in designing an electric emergency wagon are of course the scarcity of good storage batteries combining efficiency with light weight, and the severity of the service on the gears. But these obstacles are not unsurmountable and we look for a more extended use of the electromobile repair wagon in the not distant future.

Through the courtesy of Mr. H. L. Hart, until recently general superintendent of the Washington (D. C.) Traction & Electric Co., we are able to publish the accompanying illustration and description of an automobile repair wagon built by the Riker Motor Vehicle Co., of Elizabethport, N. J., for the Metropolitan R. R., of Washington. The vehicle has been in service several months and Mr. Hart states its operation has been highly satisfactory to the management.

The running gear is of the Riker flexible type and the wagon is equipped with two 4-h. p. motors, guaranteed to stand without injury 100 per cent overload for one hour.

The battery equipment consists of 44 cells of 13 plates each, having a total capacity of 200 ampere hours. This electrical equipment will propel the vehicle 30 miles over level asphalt or macadam.

steps. Hand lamps and electric side lamps are hung on either side of the seat. All metal trimmings are of brass.

One feature that is of special convenience to the workmen, and greatly facilitates their work, is the combination volt and ammeter, placed in a convenient position on the foot board. This tells at all times the pressure across the cells, the rate of discharge and the rate of charge when batteries are being renewed.

In regard to signaling and dispatching Mr. Hart states that the hurry-up wagon is called out so seldom, the company does not think it necessary to have any special signal system of its own. When the wagon is wanted an employe calls the station where it is located by the city telephone.

ELECTRIC RAILWAY STATISTICS.

The statistician of the Department of Agriculture has undertaken to collect data concerning electric and other street railways of the United States, with special reference to their extension into the rural districts and the results of such extension. Information concerning the freight and express business is sought, including amount of traffic, rates and effect on traffic of steam roads.

RECENT STREET RAILWAY DECISIONS.

EDITED BY J. L. ROSENBERGER, ATTORNEY AT LAW, CHICAGO.

ADMISSIONS MADE BY CONDUCTOR TO THIRD PARTIES AFTER ACCIDENT.

Kay v. Metropolitan Street Railway Co. (N. Y.), 57 N. E. Rep. 751. June 19, 1900.

A conductor cannot bind or affect the company, the court of appeals of New York holds, by any admissions or declarations, after an accident, made to third parties. They are admissible in evidence only to contradict or impeach him as a witness for the company in case he testifies to anything inconsistent with them.

STREET RAILROAD IS TAXABLE AS REAL ESTATE.

State (Newark & Hackensack Traction Co., Prosecutor), v. Mayor and Council of the Borough of North Arlington (N. J.), 46 Atl. Rep. 568. June 11, 1900.

An electric street railroad, the supreme court of New Jersey holds, is real estate, within the tax laws. But a mistake of an assessor in listing as personal property described in terms showing it to be real estate, it holds, may be corrected, even after the duplicate has been delivered to the collector.

RIGHT TO PLEAD SETTLEMENT BY PLAINTIFF.

Zaitz v. Metropolitan Street Railway Co. (N. Y.), 65 N. Y. Supp. 395. June 22, 1900.

Where the plaintiff in an action brought to recover damages for personal injuries settles, unbeknown to his attorney, with the defendant, after issue is joined, and executes a general release, the appellate division, first department, of the supreme court of New York holds, should be allowed, on application, to set up in a supplemental answer the settlement of the action and the release by the defendant, notwithstanding that the plaintiff's attorney may have given notice of a lien upon the cause of action, and the plaintiff may not be pecuniarily responsible.

REQUIRES NOTICE OF LITIGATION TO BE FILED TO CONSTRUCTIVELY BIND PURCHASERS.

Detroit Citizens' Street Railway Co. v. City of Detroit (Mich.), 83 N. W. Rep. 104. June 5, 1900.

The right to maintain and operate a street railway upon a street, the supreme court of Michigan holds, is an interest in land, to which section 441 of the Compiled Laws of Michigan is applicable, which requires the filing for record of a notice of the pendency of suit to render the filing of a bill constructive notice of the proceedings to any purchaser of real estate, in consequence of which it does not consider a company acquiring such right by purchase pending litigation thereover bound by a decree entered in the suit, no such notice having been filed for record, and actual notice at the time of purchase not having been proved.

DAMAGES ALLOWED FOR LOCATION OF TURNPIKE IN FRONT OF PROPERTY.

Louisville Railway Co. v. Foster (Ky.), 57 S. W. Rep. 480. June 15, 1900.

One of the provisions of the constitution of the state of Kentucky is that, "municipal and other corporations and individuals invested with the privilege of taking private property for public use shall make just compensation for property taken, injured or destroyed by them." In view of this, while the owner of city property fronting on a street must submit to all those noises, smells and disturbances that are usual in city life, including the use of the highway by a street railway, in so far as they are reasonably incidental to the operation of a street railway in a city, and borne by the public generally, nevertheless such owner, the court of appeals of Kentucky holds, can recover for any substantial injury to his property arising from the location or operation of a turntable or cars that is caused by such noises, smells, and disturb-

ances as are not fairly incidental to the usual operation of such a street railway, and borne by the property owners generally along the line.

WHEN EXPRESS WAGON NECESSARILY OVERLAPS TRACK WHILE BEING UNLOADED

Holzman v. Metropolitan Street Railway Co. (N. Y.), 64 N. Y. Supp. 1120. May 28, 1900.

At a place where the space between the curb and the track was very narrow, an expressman was on his wagon, unloading it, which he could not do unless it overlapped a part of the public highway occupied by the track, when a car ran against the wagon, throwing him to the ground and seriously injuring him. In affirming a judgment in his favor for damages, the city court of New York, general term, says that if, as stated, the wagon was partially over and upon its tracks, the street railway company's driver being aware of that fact, it was his duty to notify the expressman of his wish to pass. Then the expressman had the legal right to unload his wagon, taking only a reasonable time to do so; and, until the lapse of such a period, the company's driver should not have attempted to pass. The company, it says, had the right to run its cars, but the expressman had also the right to pursue his business as an expressman. Each one was bound to exercise his respective rights in an ordinarily careful and prudent manner. To this the court adds that the company's driver evidently thought he could pass, in safety, the expressman's wagon. In so thinking he erred, and the consequences of such error must be borne by the company.

CARE REQUIRED IN EJECTING TRESPASSING BOY FROM CAR.

Nussbaum v. Louisville Railway Co. (Ky.) 57 S. W. Rep. 248. May 30, 1900.

The evidence was conflicting, and the issue was whether the boy, nine years of age, to recover for whose death this action was brought, lost his life by reason of the negligence or wrongful act of the motorman. The boy had jumped onto the car to ride to the turntable, and, in affirming a judgment in favor of the company, the court of appeals of Kentucky holds that it was proper for the trial judge to tell the jury that the motorman had the right to eject the boy from the car if he used proper care in doing so. The instruction given the jury was that, if the motorman pushed the boy from the platform of the car into the street, and under or immediately in front of a passing wagon, whereby he was unavoidably run over, they should find for the plaintiff; also, that it was the duty of the motorman to make him get off the car by warning him to do so, or, if necessary, by using such force as was reasonably necessary to make him get off, but that in using force to eject the boy, if he did eject him by force, it was the duty of the motorman to exercise ordinary care to prevent injuring him or causing him to be injured by such ejection; and, if he failed to use such care, and by reason of this the boy was injured, the jury should find for the plaintiff. This, the court of appeals pronounces a fair statement of the law of the case.

SEPARATION OF COLORED FROM WHITE PASSENGERS ON ONE LINE ONLY IS REASONABLE.

Bowie v. Birmingham Railway & Electric Co. (Ala.), 27 So. Rep. 1016. Apr. 12, 1900.

A rule or regulation of a street railway company requiring white passengers to occupy seats in one portion of the cars operated by it on a certain line of its road, and negroes to occupy seats in the other portion, the supreme court of Alabama holds reasonable. The principle upon which it sustains the reasonableness of the rule it says, is that the carrier's right of property in the means of the conveyance and the public interest is best subserved by a separation of negro and white passengers; that their separation tends to secure order, promote comfort, preserve the peace and maintain

the rights of both carrier and passengers. Nor does it consider it of any consequence in this connection that the company operates other lines, and no such regulation is enforced by it upon them. The fact that it does not exercise the right to establish and enforce such a regulation upon its other lines, the court says, affords no reason for saying that the regulation established and enforced on the line where it is, is unreasonable, or that the company has no right to establish such a rule. As to whether the reasonableness of such a rule is a mixed question of law and fact, or purely a question of law for the court, the supreme court takes the latter view, saying that when the rule is established by the evidence, and its violation shown by a passenger, undisputably, it is a question of law for the court.

CONSENT NEEDED TO CHANGE LOCATION OF TRACK BUT NOT TO TAKE IT UP.

Borough of Shamokin v. Shamokin & Mt. Carmel Electric Railway Co. (Pa.), 46 Atl. Rep. 382. May 23, 1900.

This was a suit to enjoin a proposed change in the tracks of the railway company, which change, it appeared, would greatly improve the street and benefit the property owners, their tenants, and all persons having occasion to drive on it. The contemplated change was the taking up of the south track and the moving of the north one to the center of the street. The ordinance granting the right of way, which was the contract between the parties, had a provision reading that, the "railway track, switches, turnouts and sidings are in all cases to be located under the supervision of the committee on streets and highways." And, under this contract, the supreme court of Pennsylvania holds that the company could not change the location of the north track to the center of the street, without the consent of the committee on streets and highways; and that it was properly enjoined from doing so. But it does not consider that anything in the contract bound the company to keep the south track in place, but that could be taken up and removed from the street. Nor does it consider that this was changed by language in the ordinance to the effect that the track should be laid to grade; should strictly conform to existing grades, unless consent be given to their change or alteration, in which event it should conform to altered grades; that the company should take up and change so as to conform to such grades as might be fixed by the authorities, etc.

VALIDITY OF CONSENTS PROCURED IN ADVANCE BY PROMOTERS.

Geneva & Waterloo Railway Co. v. New York Central & Hudson River Railroad Co. (N. Y.), 57 N. E. Rep. 498. June 5, 1900.

It is common practice, and perchance common prudence, the court of appeals of New York says, for the projectors of a railroad to employ parties in advance to procure rights of way, consents, or like privileges to be used after the incorporation. And the court holds that the fact that the railroad acquires such rights through an intermediary by assignment, instead of directly from the property owners themselves, does not affect their validity. What the constitution and the statute require in such cases, it declares, is simply the consent of the property owner that the highway through his property may be burdened with another easement in the form of a railroad, and when such consent is fairly and in good faith given to one interested in the railroad, and by him transferred to the corporation, the court declares that it is unable to see why it should not be treated and considered as valid as if it ran in terms to the railroad itself. Especially does it hold that it is not open to another railroad, for the purpose of defeating an application of a street railroad to cross its tracks, to impeach such consents as invalid. If there is any reason whatever to question the validity of such consents, that right, it maintains, should be limited to the state itself or to the property owners affected. On the other hand, when it appears that consents were neither given nor received in good faith for the purpose of facilitating the construction of a railroad, but for some other purpose, not contemplated by the statute, the court suggests that it might be timely to raise the point that it would be contrary to public policy and to the spirit of the law to allow individuals to procure consents to themselves, and then, as they might, sell them to the highest bidder.

MAY ADOPT REASONABLE REGULATIONS AS TO PAS- SENGERS CARRYING LIVE ANIMALS.

Daniel v. North Jersey Street Railway Co. (N. J.), 46 Atl. Rep. 625. June 18, 1900.

In an action for damages against a corporation operating a street railway for the refusal of one of its conductors to accept a passenger carrying in his arms a live goat, it is error, the court of errors and appeals of New Jersey holds, to submit to the jury the reasonableness of a regulation of the company forbidding the carrying of live animals in the cars. The reasonableness of such a regulation, it holds, is for the trial court. But whether, as a class, questions as to the reasonableness of corporate regulations are for the jury, to be taken from it only when deemed to be free from doubt, or whether they are primarily court questions, to be left to juries only when some other standard than that of reasonableness enters into the test of corporate duty, is a point upon which the majority of the court were not agreed. Moreover, the court avoids passing, in this case, upon the question of whether, if the regulation in question was a reasonable one, the company before enforcing it, must call the attention of the passenger to it. A majority of the court, however, it is stated, were of the opinion that the company might lawfully adopt some regulation with respect to the carrying of animals on its cars, and, as above announced, that the reasonableness of such a rule would be a question for the trial court, and not for the jury.

NEWSBOY NOT A PASSENGER.

Raming v. Metropolitan Street Railway Co. (Mo.), 57 S. W. Rep. 268. June 4, 1900.

It was alleged that the plaintiff, at the time a boy nine years of age, boarded one of the defendant's cars "for the purpose of selling papers to passengers, and with the intention of becoming a passenger thereon." But the words, "and with the intention of becoming a passenger thereon," the supreme court of Missouri holds, were by no means equivalent to an averment that the plaintiff did become a passenger on the car. With mere intention, unconnected with overt act or outward manifestation, the law, it declares, has no concern. Hence, there was no foundation laid in affirmative allegation that plaintiff was a passenger.

But, granting that the plaintiff was a passenger so far as mere allegation was concerned, still, the court says, there was no evidence to support it. He was simply a newsboy plying his vocation. He evidently did not intend nor expect to pay fare. According to his own story, he jumped on the car when in full motion, to sell papers, intending to jump off again, and to pay fare "if the conductor asked him." The conductor did not see him, and (according to the boy's story) the gripman tried at once to push him off. There was nothing to show that the gripman had any authority to grant the plaintiff permission to ride, or to refuse him permission, and therefore, the court holds, no contractual relation, either express or implied, was entered into by the plaintiff when he stepped upon and ran along the footboard of the car, attempting to sell his papers.

The court then quotes the following from what it states Judge Valliant, speaking for division No. 1, in the still unreported case of Padgett v. Moll, forcibly said concerning newsboys who sell newspapers on street cars. "But a newsboy jumping on and off a moving street car to sell his newspapers, not hailing to stop the car to receive him, nor signaling to stop to allow him to alight, not asking nor receiving permission, either express or tacit, not asking or waiting for leave or license, but jumping on and off under circumstances that clearly indicate no purpose to pay fare, and no aim to be transported, but only to avail himself of the presence of persons on the car likely to buy his papers, is in no sense a passenger, and the carrier is not under obligation to observe towards him the same degree of care that the law requires to be observed towards a person in the hands of the carrier to be transported."

Indeed, the supreme court goes on to say, in this, the Raming case, after making this quotation (and here it is the full bench speaking), that it might go further than the language just used in the quotation; for it is a matter of common knowledge, and therefore the court can take judicial notice of it, that a newsboy who hops on a car while at full speed, tries to sell papers, and then

hops off again while the car is in rapid motion, is in no sense, either in fact or intention or law, a passenger. If a newsboy is a passenger, then he has a right to hail a car in the middle of a block for the purpose of selling papers therein; stop it in full motion; get on; sell his papers; pay no fare; and then signal again, stop the car and get off. If this were the law, it is easy, it thinks, to see that street cars would be at the mercy of newsboys, and could not be practically operated.

Then, if the plaintiff was not a passenger, the defendant company the court holds, could only become liable by reason of the fact that the alleged acts of the gripman were within the scope of his duties. But there was no such allegation in the petition, and no evidence on the point, and, this being the case, no recovery, the court holds, could be had on such ground, absent such allegation and absent such evidence.

But no recovery could be had on that ground in this action, the court adds, because it was bottomed in theory on the fact of the plaintiff being a passenger, and on that theory it was submitted to the jury.

POWER OF CITY TO ORDER SUBSTITUTION OF GROOVED FOR OTHER RAILS.

Washington, Alexandria & Mt. Vernon Railway Co. v. City Council of Alexandria (Va.), 36 S. E. Rep. 385. June 14, 1900.

Six years after the construction, with the consent of the city council, of this railway over certain streets, using rails of an improved pattern, known as the "tram girder rail," such as were then commonly in use, and as are still used by many street railways, the city council ordered that a portion of one of the principal thoroughfares of the city should, for the distance of one square, be repaved with vitrified brick, on a six-inch concrete base. On the same date, it by another ordinance directed the company to put down, on the said square, rails to be approved by the committee on streets, and to grade and pave on the space between the railway tracks, and two feet on each side thereof, in a similar manner. Two months later, by another ordinance, it directed the company to take up its rails on that square, and to lay in their stead a grooved rail, with a groove not exceeding $1\frac{1}{8}$ inches in depth, and with a tram not lower than $1\frac{1}{4}$ inches below the head, and with the groove of the outline shown by the full lines of the drawing attached to said ordinance.

The company failing to obey, the city council presented its petition for a writ of mandamus to compel a compliance with the requirements of said ordinance, alleging, among other things, that a grooved rail was a necessary incident to the needed improvement of the street. The jury called to determine certain questions in the case, however, found that the rails in use would not obstruct the ordinary use of the street when the proposed improvement was made as set out in the first ordinance mentioned. It also found that the rails in use were of approved pattern; that is, of such merit and excellence, and adaptation for the purposes for which they were used, as should, in the opinion of the jury, be approved by the city authorities. It also found that the substitution of the grooved rail as proposed by the city was not a necessary incident to the paving and improving of the street with vitrified brick. Nevertheless, when the cause came on to be heard after the jury had rendered its verdict on the issues submitted to it, the circuit court rendered a judgment for the city council, and awarded the writ of mandamus.

This judgment the supreme court of appeals of Virginia affirms. It says that it might very well be that the jury was justified in all of its findings on the evidence submitted to it, and that the court might also have been of the same opinion upon the evidence. But the real issue to be considered was this: Was the ordinance of the city a reasonable one, regard being had to all the circumstances of the case, or did the city council, in passing the ordinance, act capriciously and arbitrarily? Its charter and the general law conferring upon it ample power to control and regulate the laying out, repair and use of its streets. On the question of reasonableness, it contents itself with stating that the evidence clearly showed that there was no fraud in the passage of the ordinance; that the city did not act capriciously, but in accordance with what it deemed best to promote the interests confided to it; that the action was urged upon it by many of its citizens; and that the rail adopted was that in use by the city of Washington, as required by an act of

Congress. Besides, it takes into account that representatives of the company were invited to attend a meeting of the committee on streets and the city engineer, where the whole subject was carefully considered, and as a result of their deliberations the engineer and committee recommended the proposed rail to the city council, and the latter thereupon passed the ordinance requiring its adoption. In view of these facts, it is manifest, it says, that the company did not overcome the presumption in favor of the reasonableness of the ordinance which it was ordered to obey; that it had not shown that it was passed arbitrarily or capriciously; and that the judgment of the circuit court must be affirmed.

NARROW STREETS AND BRIDGE AND OTHER TRACKS NEAR RENDER ORDER FOR EXTENSION UNREASONABLE.

Woonsocket Street Railway Co. v. City of Woonsocket (R. I.), 46 Atl. Rep. 272. Apr. 25, 1900.

Chapter 77, of the General Laws of Rhode Island, is entitled "Of Franchises in Highways." Section 5 thereof provides that "the use and enjoyment of all rights and franchises granted under the provisions of this chapter shall be subject to such reasonable rules and regulations and orders, controlling the extent and quality of construction and service to be maintained by the corporation to which such rights are granted, and prescribing the location and arrangement of its tracks, poles, wires, or conduits, and their appurtenances, as are, or may be from time to time, enacted by the town or city councils," etc. This section, the supreme court of Rhode Island says, is evidently intended to give a large discretion to town and city councils, with which the court would not be disposed to interfere upon slight grounds. But in this case, owing to the narrowness of some of the streets through which the city of Woonsocket ordered the complainant to extend its road, the narrow bridge on one of said streets, and also the narrowness of a portion of the proposed layout to existing tracks, the court is of the opinion, and holds, that the order in question of the city was unreasonable.

THINKS ESTABLISHED CUSTOM OF TURNING OUT FOR CARS SHOULD HAVE FORCE OF LAW.

Helber v. Spokane Street Railway Co. (Wash.), 61 Pac. Rep. 40. Apr. 4, 1900.

The supreme court of Washington here says that, while it is true, as it and many other courts have frequently said, that street cars have not an absolute right of way through the streets, and that pedestrians and others have an equal right to travel on or across any street, yet this latter right must be exercised reasonably, and is qualified by the fact that cars run on fixed tracks, and, in the nature of things, cannot accommodate themselves as readily to emergencies, and cannot even stop with the same promptness or facility, as can pedestrians or drivers of free vehicles, who can instantly stop, or turn to right or left, and avoid a collision with an advancing car. The universal knowledge of this fact, it goes on to declare, has established a custom which ought in justice to have the force of law, making it the duty of the party who can most easily and readily adjust himself to the exigencies of the case to do so, and to stop or turn to avoid a collision; and the motorman has the right to presume that such duty will be performed. Of course, it adds, if he (the motorman) discovers, or ought, as a prudent person, to discover, that it will not be performed, his duty is to stop in any event; otherwise, he will subject himself and his company to the charge of willful negligence. Furthermore, the court says, with reference to the other party's duty, that, while extraordinary mental alertness is not commanded by the law, common prudence is.

LIABILITY FOR INJURY TO BICYCLISTS OR OTHERS CAUSED BY DEFECTS IN ROADBED.

Laredo Electric & Railway Co. v. Hamilton (Tex.), 56 S. W. Rep. 968. Apr. 18, 1900. Rehearing denied May 16, 1900.

The court of civil appeals of Texas holds the following to be correct propositions of law: (1) The duty of a street railway company to repair the streets which it occupies, or, more definitely, that portion of the street upon which its tracks are laid, is a general one, requiring no legislative act or direct agreement to sup-

port it, and such a company is bound to use reasonable care and diligence to keep the space which it actually occupies in a safe condition for ordinary travel, failing in which, it must answer for the consequences. (2) A street railway company is bound to keep its entire roadbed, to the end of its ties and its crossings, in repair, so as not to obstruct travel across its road, or longitudinally upon it; and this duty is a continuing one, irrespective of whether the charter expressly requires it or not. (3) The fact that the city may have authorized the company to erect poles, stretch wires, and lay rails, ties, etc., on the streets and plazas of the city, without imposing terms and conditions by ordinance or by contract, does not discharge the company from the duties it owes to the public; nor does the fact that the party injured thereby may have a cause of action against the city relieve the company from responsibility for the condition of its line.

Municipal corporations are bound to use reasonable skill and diligence in making the streets and sidewalks safe and convenient for travel. And where the roadbed of a street railway company is constructed in the streets of the city, the railway company, the court holds, must use the same skill and diligence as to the part of the street occupied by its road.

In legal contemplation, the bicycle, the court goes on to state, is to be regarded as a vehicle, in relation to its use on the highway, and it is entitled to the same privileges and is subject to the same burdens as other vehicles. And it holds that if a bicyclist, while riding his wheel on a street where such vehicles are commonly used, is injured by being thrown from his bicycle on account of a defect in the street, and such defect was caused by the failure of the city or street railway company upon which the obligation rests to use reasonable care and diligence in keeping that portion of the street safe and convenient for ordinary travel, the city or company upon which such duty rests is responsible in damages to such bicyclist for any injury sustained by him.

In short, it being the duty of a street railway company to use reasonable care and diligence to keep that part of the street upon which its road is constructed in a safe condition for ordinary travel, the court holds that, if it fails to discharge this duty, and on account of this failure a person is injured while riding along the street on a vehicle such as is ordinarily used for travel thereon, the company will be liable for his injuries, if he is not guilty of contributory negligence, whether such vehicle is a wagon, carriage, bicycle, or other in ordinary use.

POWER OF CITY WHERE IT HAS RESERVED RIGHT OF CONDEMNATION FOR NEW COMPANIES.

Mercantile Trust & Deposit Co. v. Collins Park & Belt Railroad Co. (U. S. C. C.), 101 Fed. Rep. 347. Apr. 30, 1900.

The right to take the track of one company for the use of another, the United States circuit court, northern district of Georgia holds, must be reserved in the grant, or exist otherwise by contract, or such taking must be by the exercise of the state's power of eminent domain through the legislature of the state. Concededly, a city has no power of eminent domain in the matter where it has no grant from the legislature to condemn the track of one street railway company for the use of another.

The right to consent to the use of the streets for street railway purposes, as for example under the constitution of the state of Georgia, which provides that "the general assembly shall not authorize the construction of any street passenger railway within the limits of an incorporated town or city without the consent of the corporate authorities," the court holds, embraces necessarily the right to consent conditionally,—to consent with limitations, restrictions, and reservations. Of course, the city can in such a case, withhold its consent entirely. Wherefore, there can be no doubt of its right, the court declares, to withhold partially or to limit the grant. For instance, the city may, the court holds, reserve the right to condemn such portions of the lines, not exceeding five blocks, as may be necessary for the allowing of other street car companies to enter the central portion of the city, upon payment of just compensation to the company.

Then, in construing such a reservation as that just mentioned, the court holds that the city reserved the right to condemn the number of blocks referred to within what might be fairly considered the central portion of the city, adding that these blocks were to be used for the purpose of allowing any new company to enter

the central portion of the city, and not to approach it, or to run in such a way that it might ultimately reach it.

Again, the court holds that, the necessity for such condemnation being necessary to be determined, under such a reservation, before the right reserved could be exercised, the necessity could be determined by the city, notwithstanding that it made the reservation, and was to that extent a party to the contract of which the reservation was a part. But it says that a wholly unreasonable exercise of the reserved power would, in a proper case, be enjoined.

Nor does the court consider that a right to condemn so reserved by a city could only be exercised by it, but holds that it could be transferred, and that a just and proper method of carrying it into effect would be by adopting the procedure of the general law of the state governing condemnation proceedings.

It was hardly contested, the court says, that the city could, even in the exercise of its general powers over the streets, require the old company in question to move its track to one side of the street at a point within the central portion of the city, and allow the new company to build another track. And, if this be true, it says that it seems entirely reasonable that the city should, under a fair and just construction of such a reservation as that above mentioned, require the cars to be so operated by both companies that at such a congested point the cars on one side of the street should all move in one direction, and on the other side in the opposite direction. In other words, assuming the right to condemn the use of the tracks of the old company at such a point, under this reservation, the court says that it seems an inevitable conclusion that such a change and readjustment of the tracks as might be fairly and reasonably necessary to make the reservation effective and to accomplish its purpose could be ordered and enforced by the city.

CITY NOT EMPOWERED TO REQUIRE VESTIBULES

City of Yonkers v. Yonkers Railroad Co. (N. Y.), 64 N. Y. Supp. 955. May 29, 1900.

A city ordinance which prohibits the running of any street cars in the city during the winter months "unless said car shall have a vestibule upon each end thereof sufficient to afford protection from the weather to motormen, conductors and others standing upon the platforms of said car," the appellate division, second department, of the supreme court of New York holds, is not authorized by section 98 of the New York railroad law, as amended by chapter 676 of the Laws of 1892, which authorizes the common council of the any city in the state to "make such reasonable regulations and ordinances as to the rate of speed, mode of use of tracks, and removal of ice and snow, as the interests or convenience of the public may require." It does not consider that the ordinance has any relation whatever to the mode of the use of the railroad tracks, and it says that the act relates to the preservation of the interests and convenience of the public in the use of the streets and tracks as such, and the regulations, to be lawful, must be directed to matters connected with the construction and operation of the cars, which in some manner involves and affects the streets and tracks and their use. This, it declares, the vestibules would not do, directly or indirectly.

Nor does the court think the suggestion deserving of serious consideration that the authority to pass such an ordinance is contained in the provision of a city charter which confers power on the common council "to secure and promote the public health and safety; to determine public nuisances, and to prevent, restrain, remove and abate the same." So far as any evidence appeared in the case, it says that it preponderated in the direction that the vestibules would be more of a menace than a protection to health and safety. Besides, it says that the ordinance in question was not passed in the exercise of the power conferred by such provision, nor does its subject-matter relate even remotely to the abuses aimed at.

Neither can such an ordinance, the court holds, be upheld as a valid exercise of the police power.

Wherefore, the court holds here that, however reasonable the ordinance of this character here in question might be in itself, it was to be condemned as an exercise of a power not inherent to municipal existence, an interference with the affairs of the defendant railroad company, which the legislature had failed to authorize, and the assertion of a right on the part of the city which it did not, so far as appeared, reserve to itself, as a condition of the consent to the use of its streets by the defendant company.

EXPRESS SERVICE BETWEEN PASADENA AND LOS ANGELES.

The express business of the Los Angeles (Cal.) & Pasadena Electric Ry. is handled by a separate company known as the Electric Express & Storage Co., which has a 10 year contract for operating express cars over the Los Angeles-Pasadena electric line, at a stipulated sum per month, the schedule as at present agreed upon calling for four round trips for each week day and one trip on Sunday. The rate per month increases a certain amount at the end of each third year of the contract. The express cars and their motormen are furnished by the railway company, but the

To expedite the service and for the convenience of customers in ordering, the company leases a private telephone line between the two cities, for the use of which no charge is made to regular patrons. The company also owns 15 wagons, which call for and deliver goods shipped over the electric road, no extra charge being made for delivery within a radius of one mile from company's offices in Los Angeles or Pasadena. In connection with the regular carrying business, for a nominal sum the company will take C. O. D. packages, collect for them and return the money to the consignor.

Mr. W. H. Smith, manager of the Los Angeles & Pasadena Electric Ry., to whom we are indebted for the data and accom-

FIG. 1—EXPRESS CARS—LOS ANGELES & PASADENA RY.

motormen are required to assist the express company's servants in loading and unloading goods.

Express packages are also carried on regular passenger cars between the runs of the express cars, the railway company receiving for each article so carried a stipulated amount in addition to the regular monthly rental.

When this express business was started, there were in operation between the cities of Pasadena and Los Angeles some six or eight wagons, upon which charges were very high and service poor. There are now, however, but two wagons in operation, with the prospect that they will soon have to give up, as the car service is becoming more popular every day. During the summer season, when California is very dull, the express cars are used extensively for shipping fruit, such as prunes, apricots, peaches and grapes, from the ranches on the line of the road to the canneries and wineries.

panying illustrations, writes that in 1898 one car and two wagons were all that were required to carry on the express business, but now two cars of 20,000 lb. capacity each, 30 horses, 15 wagons and 30 men are employed. The weight of shipments at the present time average 50 tons per day. Mr. H. H. Hut is manager of the Electric Express & Storage Co.

In Fig. 1 are shown the two special express cars. No. 4 is equipped with two 50-h.p. Westinghouse motors, and No. 1 with two 40-h.p. motors of the same make.

Figs. 2 to 7 are reproductions of blanks used in carrying on the business. Fig. 2 is the form made up by clerks at the initial office, showing abstract of each car load of express matter. From this blank the bookkeeper makes proper distribution of charges. The original is 13 3/4 x 8 1/2 in. Fig. 3 is a form made up by clerks at the sending office, checked by the express messenger, and by him turned over to the checking clerk at the destination office.

can in this way fill mail and telephone orders as quickly and as safely as they could with their own wagons. When the express company collects a bill for a package delivered, it retains the money and remits the amount to the sender by its own check, taking a receipt therefor. The bill accompanying articles which are to be paid for on delivery is placed in a heavy manila envelope, 3x5 1/2 in., on the outside of which are blank spaces for filling in amount of bill and charges for returning money, names of consignor and consignee, and way bill number.

SPECIAL TAX IN GEORGIA.

The city of Savannah, Ga., levied an occupation tax of \$100 per mile on the Savannah, Thunderbolt & Isle of Hope Railway Co., and collection being resisted the case was carried to the Supreme Court which on November 25th affirmed the judgment in favor of the city.

The justices all concurred in the following opinion: "The municipal authorities of the city of Savannah had power, under the charter of the city and the second proviso of section 2180 of the civil code, to levy and collect an occupation or business tax from street railroad companies for the use and occupation of the city streets by their tracks and cars, when such companies' principal business was the transportation of passengers from points within the city limit to other like points."

CANADIAN NOTES.

The Montreal Park & Island Railway Co. is contesting the judgment recently granted the town of St. Louis whereby the town was released from the original contract granting the railway company rights in the municipality.

Application has been made to the British Columbia Provincial Government for permission to build about ten miles of electric railway in the Chemains district. The applicant is the London & Vancouver Development Co., of London, Eng.

A proposition is on foot in Yarmouth, N. S., to extend the existing Yarmouth Street Ry. to Digby, passing through several towns en route. Owing to the prosperous condition of the country thereabouts it is confidently expected that the proposition will take definite shape.

There has been a marked improvement in the receipts of the street railway in Hamilton, Ont., since the Cataract Power Co. has taken hold of the system, and the city officials are congratulating themselves upon the increase in the percentage of earnings collected from the company.

The proposed Hamilton, Guelph & Galt Electric Railway Co. is encountering considerable difficulty in obtaining an entrance into the city of Hamilton, the city council having refused to accept the plan for the original route, and the city engineer has been instructed to make plans for an alternative route which are to be submitted later.

An action has been entered against the Montreal Street Railway Co. by a passenger who was refused transportation to the terminus of an existing line. The car upon which he had paid his fare was apparently behind time and turned back before reaching the terminus, in spite of the passenger's protestations, and he now sues the company for failing to fulfill its contract with him.

The Woodstock, Thames Valley & Ingersoll Electric Ry., formally opened the finished portion of its line, from Woodstock to Beachville, on November 8th. The builders are making every effort to complete the portion from Beachville to Ingersoll before the winter prevents the further work. It is the general impression that the road will be continued as far as Embro next year.

The Toronto Railway Co. has offered to supply the Toronto Baseball Club with suitable grounds, free of rental, on condition that other athletic associations will be permitted to use it, otherwise it would not be a paying investment. This is a new departure on the part of street railways in Canada, and is framed after the methods adopted by a number of the large American companies.

The prospects for the construction of the proposed Brockville & Ottawa Electrical Ry. are exceedingly bright, and promises are given that the work will be started early next spring. Mr. Kidd, the company's solicitor, is at present in New York, interesting capitalists of that place in the scheme. The company proposes placing a line of steamers between Brockville, Kingston, and the Thousand Islands, to be run in connection with the railway.

The Cataract Power Co., operating the street railway in the city of Hamilton, Ont., has been granted the right of way for the completion of its projected electric railway line through Barton Township to Bartonsville. The line to Barton to be completed within two years, and the Barton street railway within three years. The by-laws also contain the stipulation that a 5-cent fare shall be the maximum anywhere within the precincts of the township of Barton.

The charter applied for by the Queenston, Niagara & Port Dalhousie Electric Railway Co., which has for some time been opposed by the Niagara, St. Catherines & Toronto Railway Co., will be issued forthwith, the latter company having withdrawn its opposition upon being assured that its line would not be paralleled by the new company. The Queenston company will now be promoted to operate an electric street railway in the town of

Niagara and the village of Queenston, along the lake shore to Port Dalhousie, and from the latter point to the city of St. Catharines. The first half of the railway is to be completed by June, and the entire road to be in operation by August next at the latest.

November 22d, President MacKenzie, of the Toronto Railway Co., and other gentlemen interested in the road, made a final trip of inspection over the Metropolitan Ry., and it is now definitely stated that they have decided to acquire the road and use it as a main artery for several branch lines which are to thoroughly cover the country for 10 miles on either side as far north as Stouffville, Ont., connecting with the existing Toronto Railway Co.'s system, thus giving access to the city. This deal has been under contemplation for some time.

The contract entered into recently by the Chambly Co., whereby it agreed to furnish the Montreal Street Railway Co. with motive power, has been rudely abrogated by the failure of the Chambly Co.'s dam. Owing to faulty construction the pressure of water carried away about 60 ft. of the retaining wall containing the sluice ways, thus completely stopping the generators, and it will be some weeks before the break can be even temporarily repaired. The street railway company, fortunately, has been able to meet the requirements of the service with its steam plant.

It is rumored that capitalists are endeavoring to combine the Montreal Street Ry. with all the existing electric light and gas companies in that city, and it is stated that the first step towards this has been taken by the sale of the Royal Electric Co.'s manufacturing plant to the Canadian General Electric Co., of Toronto. This will leave the Royal company free to devote itself entirely to the supply of light and power, and as this company has a controlling interest in the Chambly company, which furnishes power to the street railway, this deal gives credence to the rumor.

The Government statistics show some interesting figures regarding electric railways in Canada. During the year ending Dec. 31, 1899, with a total of 612 miles of track, the car mileage was 20,646,847. The total number of passengers carried was 104,033,659, which is equal to carrying every man, woman and child in the Dominion, 20 times. The number of passengers carried per car-mile was 5.04, transfers not being included in these figures. As compared with the previous year the number of passengers carried increased nearly 9,500,000, and the number of miles run by over 1,000,000. The amount of paid up capital invested in Canadian electric roads on this date was \$21,700,000. It is confidently expected that when the statistics for the current year are compiled an enormous increase over these figures will be shown, both in the mileage and the number of passengers carried.

Application has been made for the incorporation of the Toronto & Central Ontario Railway Co., with power to construct and operate a system of electric railways, consisting of six or more main lines and their branches, running from the city of Toronto to the east, north and west, with a mileage of not less than 500 miles, all within a radius of 100 miles of the city. The project, it is estimated, will involve the expenditure of several millions of dollars, the capital stock is to be \$5,000,000 in \$100 shares with bonds and debentures limited to \$20,000 per mile. The company's main offices will be located at Toronto. It is proposed to give both passenger and freight service. It was the original intention of the corporation of the city of Toronto to build this road itself, but it has now decided to invite private capital to assist in the undertaking, and it is the intention that advertisements shall be placed before American investors, requesting them to assist in the formation of the company.

Mr. Duncan McDonald, at present superintendent of the Montreal Street Railway Co., has been appointed general manager of the Compagnie Generale de Traction, of Paris, France. Mr. McDonald has just returned from Paris, where he has been looking over the ground, and states that electricity as a motive power is but in its infancy in that city; a number of lines have already been constructed, but so far very few of them have been operated; they use what is known as the Diatto contact system. The company of which Mr. McDonald will be manager is capitalized at \$25,-

000,000, and controls many minor companies in Paris and elsewhere, and he will act in an advisory capacity toward these different boards of management. Mr. McDonald enters upon his new duties the first of the new year, and expects to Americanize the system forthwith. He will have associated with him in his new

DUNCAN McDONALD.

field, Mr. Nelson Grayburn, formerly electrical engineer of the Montreal Street Ry., at present occupying the position of superintendent of rolling stock with the Corporation Tramways of Glasgow, Scotland. Both these men are thoroughly up to date in every way, and will no doubt render effectual service to the public of the French capital by rapidly improving their very inferior and antiquated street railway system. Mr. McDonald, who has been connected with the Montreal road for over 20 years, is well known to the street railway fraternity, having been a member of the association and a regular attendant at the annual conventions for many years past, and his many friends will no doubt learn with pleasure of his advancement. Before leaving Montreal he will be tendered a dinner by the officials of the company, and presented with an illuminated address and a purse by the men employed in his department.

NEW YORK FRANCHISE TAX.

A great deal of litigation has resulted from the enforcement of the New York franchise tax law and the upper courts have had to pass upon a number of petitions for writs of certiorari looking to a review of the action of the assessors. A writ of certiorari issued at the instance of a Buffalo gas company required the tax commissioners to return the manner of making the assessment and the method pursued in fixing the value, but the Appellate Division of the Supreme Court directs this requirement to be stricken from the writ as the same points are covered by the statute.

The New York & Queens County Railway Co. failed to comply with the law and file its report before Oct. 1, 1899, and the tax commissioners opposed the issue of a writ of certiorari on the ground that by its failure to make a report at the proper time the company forfeited its right to ask for a review. The writ being refused an appeal was taken, which was on November 14th decided in favor of the company by the Appellate Division of the Supreme Court.

SHUCKERT SURFACE-CONTACT SYSTEM.

Since 1896 Messrs. Shuckert & Co., of Nuremburg, have been experimenting with their surface contact electric railway system and in the summer of 1899 put down a line in Munich embodying such improvements as had been found desirable; this line it is stated has worked quite satisfactorily. Illustrated descriptions of the system have been issued by the British Shuckert Electric Co., and copious extracts are to be found in our English contemporaries of November. The Shuckert system is a single-row contact-stud system with grouped automatic switching apparatus, of which each, while separately switched into circuit, switches out the previous apparatus in the route traveled.

YERKES' LONDON ROAD.

The contracts for the construction of the Charing Cross, Euston & Hampstead underground railway, Mr. Yerkes' London road, were signed on November 28th. The parties were C. T. Yerkes, H. C. Davis, A. A. Housman, of New York, J. J. Mitchell, of Chicago, on the one part and Price & Reeves, Westminster, England, general contractors, on the other part. The contract provides for the excavation and equipment, the total cost of the seven miles being placed at \$20,000,000.

IN THE POWER HOUSE

This department is devoted to the construction and operation of electric railway power houses. Correspondence from practical men is specially invited. Both the users and makers of power house appliances are expected to give their views and experiences on subjects within the range of the department.

STORAGE BATTERIES IN RAILWAY POWER STATIONS.

Read before the New York State Street Railway Association, by H. H. Norris, Cornell University.

Within the past few years more attention has been given to the refinements of station operation than was possible at the time of the rapid change from horse and cable to electric traction. By the use of many engineering devices now popular the coal consumption in stations supplying power to electric railway systems has been reduced to a very respectable figure, not greatly exceeding 4 lb. of coal per h. p. hour in first-class plants. This accomplishment is remarkable when the nature of a railway load is taken into account. This load fluctuates greatly in two ways: First, from instant to instant, especially on small roads, and also on account of the variable nature of the business during certain hours of the day. These fluctuations tend to prevent economical operation of engines, boilers and generators, while the "peaks" and the extremely light loads reduce the load factor of the station. Careful selection of sizes of machinery tends greatly to economy, but there has long been felt a need for an automatic regulator of the load which should be economical and convenient. For this purpose the storage battery has always been considered a theoretically ideal device, but patent litigation and other difficulties interfered with its commercial development until quite recently. At the present time the use of the storage battery in railway plants is rapidly becoming general.

The financial features connected with the application of the storage battery to railway work form the determining factors in their adoption. These features have to do with the depreciation and cost as well as with the saving produced. There is no doubt, from an engineering standpoint, that batteries are successful in effecting a saving. They had not been in use in this country in railway work for a long enough period to determine absolutely their deterioration, but apparently this does not amount to much more than that of moving machinery. The experience of a number of large users of the storage battery shows that during the short periods in which the batteries have been in use, practically no money has been spent in repairs. The oldest battery for which data are at hand, has been in use five years, but most of the batteries have been installed within two years. The annual depreciation which one of the largest manufacturers figures upon is from 2 per cent in the best managed stations to 8 per cent in small plants considerably overworked. They consider 6 per cent per annum to be a conservative figure under reasonable conditions.

The first cost of a battery is considerable, being in average-sized plants not far from \$100 per kw. output when discharged in one hour. The same battery will have a much larger capacity when discharged more slowly. In order to obtain a general idea of the proportion of size of battery to capacity of station, data were obtained from a number of well known plants. Out of a station capacity of 43,560 kw. the batteries installed had a total capacity of 28,560 amperes for one hour, or an average capacity of two-thirds of an ampere-hour per kw. output, at the discharge rate mentioned.

By way of illustration assume a capacity of station of 1,000 kw. At the ratio given, a battery of 666 amperes output for one hour would be chosen. The exact battery capacity to be used will vary from this figure with a difference in the nature of the work demanded of it. For "peak" work a larger battery would be needed than for regulation only. If a battery of 270 cells were used, assuming an average pressure of two volts per cell, the cost of such a battery would be roughly \$35,960. At 6 per cent depreciation and 5 per cent interest, the annual cost of this battery would be about \$3,956, exclusive of booster, attendance and building. The booster is neces-

sary if a close regulation of voltage is desired and the cost of such a booster is between \$50 and \$150 per kw. If the booster produces a pressure of 50 volts, its capacity is about 9.25 per cent of that of the battery, so that its price in the assumed case would be somewhere between \$1,663 and \$4,983. Assuming depreciation on the booster at 8 per cent and interest as before, the annual cost of the booster would be between \$216 and \$649, the exact amount depending on local conditions. Attendance often involves no extra expense, as the regular employes of a station are usually able to give the necessary amount of time without seriously interfering with their other regular duties. Cost of extra building is a purely local matter and amounts to very little except in the case of large stations, as some spare room is to be found about most railway plants.

To offset the extra expenditure due to the use of the battery, there should be a considerable reduction of expenses in operating the boilers, engines and generators. This saving should result from the increased efficiency of the apparatus due to more effective loading; to reduced depreciation on machinery from the same cause; to the saving of wages through shutting down of plant during light loads; to the saving of copper in the lines when the batteries are installed in sub-stations, and other reasons following from these. The almost universal testimony is that the saving more than counterbalances the increased expense, and that therefore, the battery is an economical adjunct to a railway power station.

ENGINEERING FEATURES.

Viewed from the engineering standpoint a storage battery serves a number of very useful purposes in a railway station or sub-station. First, by reducing the fluctuations of the load and thus allowing the machinery to be operated under more advantageous conditions; Second, by acting as an energy reservoir for the supply of excessive demands of power, and thus permitting the installation of a smaller number of units than would be otherwise necessary; Third, by placing the batteries in sub-stations the pressure over the systems can be made more uniform, for the battery will be charged when the demand for power is small, and discharged when this becomes excessive; Fourth, by drawing upon the battery at times of very light load the machinery can be often shut down and the load operated from the battery alone. This feature is especially applicable to small stations, when the night load is very light and where accidents to machinery often cause annoying shut-downs.

The use of an energy storage reservoir is common in many applications of mechanical laws. For example, in the steam engine the fly-wheel absorbs the energy supplied very irregularly from the piston. If the load on the engine be steady, the fly-wheel regularly absorbs energy when the piston pushes more strongly than is necessary and gives out enough to supplement the effort of the piston when this falls below the amount required to overcome the resistance of the load. The pressure on the piston may vary from a positive value of 90 pounds per square inch at the beginning of the stroke down to a negative value of 60 pounds per square inch due to the back pressure. Through the medium of the fly-wheel, this effect is averaged and may deliver a steady effort equivalent to a uniform pressure of 40 lb. per sq. in. on the piston. If it were not for the inertia of the moving parts, the engine would stop before the load reached the average value of the piston effort. Still more so is this true when the load also is irregular. In this case the fly-wheel acts as a buffer between the variations on both sides. It is exactly in this way that a storage battery neutralizes the fluctuations in the current of a circuit when connected in parallel with it, for it absorbs energy and stores it in chemical form when the load is light, and restores energy to the circuit when the load is heavy.

Aside from this "fly-wheel" action of the battery, the latter also demonstrates its utility in taking care of "peaks" or unusual demands upon the generators. Peak work requires that the battery

shall be able to stand heavy loads for short times and this a good battery can do, although the efficiency of the process is somewhat reduced by the severe treatment.

As evidence of the fact that an actual saving is produced by the adoption of storage batteries, the following authorities are cited: Mr. W. E. Harrington, general manager of the Camden & Suburban Railway Co., of Camden, N. J., states that a reduced coal consumption of 23 per cent; an increased capacity of station of 300 amperes on account of a more economical load upon the engines; and a material reduction in expense for repairs upon machinery, are some of the results of the installation of a battery in his plant. The capacity of the station is 1,615 kw. and the battery has a capacity of 300 amperes when discharged in one hour, which is somewhat below the average stated earlier. Mr. John Murphy, general superintendent of United Traction Co., of Pittsburg, Pa., reports curtailed operating expenses equivalent to 24 per cent of cost of battery.

The use of batteries in sub-stations, particularly where the distribution of power is accomplished by the use of alternating currents at high pressure with rotary convertors, results in very high economy. The rotary convertor is loaded uniformly, so that its highest efficiency can be maintained, and thus an efficient supply of power is at hand directly where it can be used to the best advantage. Rotaries are used with great satisfaction by the Buffalo Railway Co., of Buffalo, N. Y., the Rhode Island Suburban Railway Co., of Riverview, R. I., and many others. In the immense system of the Metropolitan Street Railway Co., of New York City, twenty-one 1,000 kw. rotaries will be used. Mr. W. A. Pearson, electrical engineer of this company, states as the benefits due to the use of the battery in this connection, that it "decreases the load variations at the different stations, gives us reserve to fall back upon at times of heaviest loads and allows us to shut down sub-stations for work on high tension wires and on steam plants at hours of lightest loads."

The ability to shut down a station for even a few hours a day not only effects a saving in running expenses, but it allows time for repairs and inspection of machinery. It is better for the men, as it shortens the hours of labor, and it is better for the station.

In addition to the matters already mentioned, the battery is of great assistance in enabling the generating units to be kept fully loaded, as the load increases and decreases. In fact, in very large stations, this is one of the principal uses of the battery. It is the custom to install several generating sets and to start and stop them as the load demands. Without the battery, the load on the different units would be fluctuating, but with the battery the latter furnishes part of the power until it is found economical to shut down a unit and then it gives out power until the load has fallen to a point at which the unit next to be shut down is about one-half fully loaded. The reverse of this is true with an increasing load. This point will be brought out more fully in the discussion of the Buffalo railway plant.

A most important feature of storage battery installation is its use in "line work." It is a well known fact that the average power carried by a line is very small in comparison with the occasional heavy demands upon it. Thus, if a line be designed for a given drop with the average current, the drop with unusual demands for current will be excessive, which naturally occur when the pressure should be highest. To put enough copper into a line, especially when the latter is long, is impossible from a financial standpoint, so that a compromise has to be effected between excessive drop and financial economy. It is the emergency drop that has to be looked out for. Just here the storage battery is very effective. By locating it at some distance from the station the battery is charged rather uniformly from the line. When a heavy demand for current occurs, instead of an excessive drop in the line, the battery furnishes most of the current, and thus the drop is practically only the natural fall of pressure in the battery between charge and discharge. In one case the installation of a \$10,000 battery was stated by the engineer to have saved \$30,000 worth of copper. Although the depreciation in copper is less than that of the battery, it is not enough less to offset this saving.

Still other uses of the battery might be mentioned, but most of these follow as a consequence of the advantages described.

BATTERY OPERATION.

The beneficial effects of a storage battery are largely dependent upon the treatment which it receives. The battery has two pur-

poses; first, regulation, and second, preparation for emergency. In the first case the battery can be handled for economy much more easily than in the second. In anticipation of an emergency, such as a heavy peak in the load curve, or the possibility of a shut down, the engineer will naturally overcharge his battery in order to be sure that it contains the maximum possible quantity of energy. Overcharging necessarily involves a waste of energy, so that the battery will appear less efficient.

In regulating work the battery is most economical when it is about three-quarters fully charged. This is true for the following reasons: In charging and discharging there are two main sources of energy loss. First, the loss in amperes-hours due to overcharging, and local chemical action, and second, the loss in pressure both in charging and discharging, caused by the resistance of the battery and connections. Both of these losses are very much greater when the battery is fully charged, hence the desirability of keeping the charge below this amount. Three-quarters "full" is found to be about the best value. These losses can be made a minimum by careful handling, as will be brought out in the illustration from the Buffalo plant.

THE BUFFALO RAILWAY CO'S. NIAGARA STREET PLANT.

In order to illustrate the principles described in the first part of this paper, a well known and representative plant will be discussed in some detail, with a brief description of elaborate tests made upon it by students of Sibley College, Cornell University, during the past spring. The station of the Buffalo Railway Co. has been fully described in engineering literature, in which additional details can be found. The tests were made at the Niagara St. station, where power is obtained from a steam plant and from Niagara Falls. This station is now partly shut down and undergoing extensive alterations in order to utilize still more completely the Niagara Falls power, the experience with rotaries having been so eminently satisfactory.

The boiler equipment consisted of four 250-h. p. Babcock & Wilcox water-tube boilers, twelve 300-h. p. of the same make and two 300-h. p. marine boilers. The supply of fuel was as nearly automatic as possible, as an electrically operated elevator took coal from the dump near the railroad to a coal pocket of 2,500 tons capacity immediately behind the station. A second conveyor, electrically operated, raised the coal to the top of the boiler room, where a horizontal conveyor carried it to a 5-ton hopper. A second movable hopper of 1 ton capacity, distributed the coal to the Roney over-fed, automatic mechanical stokers. This portable hopper enables a very complete record of coal consumption to be kept by simply recording the number of times which it is emptied. Removal of ashes was accomplished by running a hand car in a tunnel below the hopper-shaped ash-pits, and emptying the ash-pits about twice each day.

Feed water was supplied either from the Niagara River, which is the normal arrangement, or from the city supply in emergencies. The water for the boilers was drawn from storage tanks of about 3,400 gallons capacity each, through feed-water heaters. These tanks were supplied from a hot well of about 310 cu. ft. capacity. The water in the storage reservoirs was kept at about 50 lb. pressure per sq. in.

The engine equipment consisted of 11 engines, all two-cylinder, cross compounds, as follows: Two horizontal Ball engines of 250 h. p. each; 9 vertical, marine, Lake Erie engines, three of 1,000 h. p. each and six of 500 h. p. each. To each of the three 1,000-h. p. engines a 10-pole, 800-kw. General Electric generator was directly coupled. To one of the Ball engines a 200-kw. Edison bipolar machine was belted, and two generators of the same type were belted to three of the Lake Erie engines and four pole General Electric generators, of 200 kw. capacity each, were belted to each of the three other engines.

A notable feature of the engine room was the rotary equipment. Four 6-pole, 500-kw. rotary convertors took alternating current from the secondaries of transformers at 350 volts pressure, three-phase. The primaries of these transformers are fed at 11,000 volts pressure from the Niagara Falls power plant. The rotaries convert the alternating current at 350 volts into a direct current at a pressure of about 550 volts.

The storage battery equipment of this station was a very large and complete one, having a capacity of 3,000 amperes for one hour and consisting of 270 cells of the "Chloride" type. As auxiliary to the battery a 70-volt booster, capable of passing 3,000

COST OF POWER FOR ELECTRIC RAILWAYS.

amperes or more, was connected between the positive side of the circuit and the ground. The purpose of the booster was to force the battery to discharge when the load was heavy and to force it to accept current when the load was light. This was accomplished by raising the battery voltage in the former case and lowering it in the latter.

The station was supplied with all necessary modern auxiliaries which go to increase the economy of operation of such plants.

RECORDS AND TESTS AT THE BUFFALO RAILWAY CO'S. PLANT.

In the station just described very careful daily records of station performance have been kept for some years. These included readings of voltage, total current output and generator current output at 10-minute intervals. Also the daily coal consumption, number of boilers in use, wattmeter readings and weather conditions are recorded.

The conditions under which the plant operated were peculiar. A certain amount of power was purchased from the Niagara Falls Power Co. to be used continuously. Also the large number of cars constantly in operation made the load on the station remarkably uniform. These facts should be kept in mind in analyzing the results.

The charts plotted for the electrical readings, for the month of March, 1900, have been carefully studied for the purposes of this paper. On these charts a red line shows the total station output and a dark line the generator output. The difference in the position of these lines is due to the presence of the storage battery, which causes the red line to be above the black at times and at other times below it. When the red is higher the battery is discharging and vice versa. The area enclosed between the lines shows the amount of battery action, either charge or discharge, the enclosed areas being exactly proportional to the energy transferred from electrical to chemical form and vice versa.

The charts show the following points very clearly:

1. The effect of the battery in straightening the generator load line is evident from a casual glance, the peaks being practically entirely carried by the battery.

2. The storage of energy during light loads for emergency use is shown by the large "charging areas" at these times. At night, when the engines were all shut down and the load did not equal the capacity of the rotaries, the battery took up the surplus power. Similarly for the morning hours between the early peak and the noon hour.

3. The great assistance of the battery in adjusting the engines and generators to the changing load is brought out in a very interesting manner. As the load decreased the battery accepted more and more current from the generators, as was clearly shown by the battery ammeter. When the current had reached a value which had been fixed by previous experience, a generator was cut out. This reduced the generator capacity in operation, for the time, below that required for the load. The battery then discharged until the load had fallen below the capacity of the generators. This

continued until all of the generators had been cut out and yet none had been run at inefficient loads.

By integration of the charge and discharge areas on the chart, by means of a planimeter, the input and output of the battery, in ampere-hours, was obtained. From these measurements it was determined that during 31 days the battery received 189,369 ampere-hours and gave out 164,036 ampere-hours, or a proportion of discharge to charge of 86.6 per cent. This is independent of some slight minor fluctuations, too small to be noticed on the chart, but which affect the battery efficiency slightly. Assuming that the difference in pressure at the battery terminals varies by about 12 per cent between average charge and discharge, the efficiency of the battery for the work demanded of it in this case is about 76 per cent. This is lower than would be obtained for regulating work only, as the peak or emergency work requires overcharging with consequent loss of efficiency. In a case where the battery was used largely for regulating purposes with very small variation in voltage over 90 per cent watt efficiency has been obtained.

4. From the coal records the fact is deduced that less than four pounds of coal are required for each horse-power-hour of electrical energy given to the line.

This record system is admirable and gives data from which not only the performance of the station can be ascertained, but by studying which desirable improvements in equipment and methods of operation can be decided upon.

SIBLEY COLLEGE TESTS

Additional data for studying the operation of the plant under consideration can be obtained from a set of elaborate tests made during several days of March of this year.

The purposes of the tests were as follows:

1. To ascertain the station economy as a whole.
2. To discover the effectiveness of the storage battery.
3. To determine the relative economy of the power from the engines and from the rotaries.

Incidentally the efficiencies of the various parts of the equipment were necessarily determined. The standard methods were used throughout and no loss of any moment was allowed to go unmeasured. All instruments were carefully calibrated and all readings were made continuously for 24 hours at very short intervals. The error in the electrical measurements, as far as the instruments were concerned, was not more than one-half of one per cent, probably less. Particular interest in connection with the subject under discussion attaches to the battery measurements. A large Weston ammeter with "plus and minus scale" was used for the battery current readings. These were made at intervals of 20 seconds for 72 consecutive hours.

The data resulting from the tests comprise the following:

Complete sets of data relating to all individual parts of the station under three conditions:

1. Normal, that is with generators, rotaries and batteries operating as usual.
2. Without rotaries, that is without Niagara power.

3. Without battery.

The information obtained under these conditions comprises complete boiler tests, including every detail, and computation of boiler and grate efficiency; engine indicator diagrams and other measurements for determining engine output and efficiency; generator readings of current and pressure; battery readings of current and pressure at 20-second intervals.

The tests involved the employment of over 80 observers, and the computations required the labor of a number of men for several months. The results of the tests are given in the following tables, taken from the Sibley College thesis of Messrs. Burt and Macomber and already printed in the Sibley Journal of Engineering for June, 1900, in connection with a paper by Professors R. C. Carpenter and H. J. Ryan.

Partial Summary of Results of Tests.			
	Run 2.	Run 3.	Run 3.
Pounds of steam per i. h. p. per hour, auxiliaries included.....	24.88	24.38	25.79

Rotary output h. p. h.....	37,500	31,100
Total output e. h. p. h. without rotaries	59,900	88,000	46,000

DISCUSSION OF RESULTS OF TESTS.

The data resulting from the tests show that more steam and more coal are consumed per indicated engine horse power when the battery is not in operation than when it is. This is due to the increased efficiencies of the moving machinery. The summary shows that the efficiency is slightly less under normal conditions than when operating without the battery, but this is the average efficiency for the whole plant, some parts of which operated for a comparatively small number of hours per day.

The apparent battery efficiency is very low, due to a prolonged overcharging. It has been previously shown that the efficiency of the battery is not far from 75 per cent under normal conditions, and overcharged only to an amount necessary to secure a reserve for emergencies. Unfortunately the cells had been heavily overcharged just previous to the test, on account of some cells which had been short-circuited. Also, at the time of the tests a very heavy snowfall drew so heavily upon the resources of the station that the engineer evidently heavily overcharged in order to be ready for any possible emergency. This accounts for the low efficiency of the battery. The accompanying table shows a history of this overcharging during the days of the tests.

The storage battery is not yet perfect, for there are disadvantages connected with its use. There is considerable variation in voltage; its first cost is high; some power must be wasted in the battery. To offset these facts, there is a decided advantage in steadying the load on generators, in keeping up the voltage when the battery is installed away from the station, in enabling the generators to be economically adjusted to the load line, in reduced wear and tear, at the generator commutators on account of the steady load, and most important of all, in the preparation for emergencies, such as peaks in the load line and possible temporary shut-downs. The remarkably rapid installation of storage batteries in railway stations, which has occurred within the last two or three years, shows that the advantages enumerated are generally believed to more than compensate for the disadvantages.

THE STEAM TURBINE.

Dr. R. H. Thurston presented a paper on this subject at the regular meeting of the American Society of Mechanical Engineers held in New York, December 4th to 7th and gave an interesting history of steam turbines from the time of Hero to the present, a discussion of the theory of this type of heat engine, and analyses of practical tests made with modern turbines. The conclusions drawn from the data presented are:

- (1) The steam-turbine thermodynamically approximates in its real form more closely to the ideal than does any other type of heat-motor. Its cycle lacks only the introduction of the Carnot compression.
- (2) It is entirely free from that waste, which in the real steam engine of common type constitutes usually, if not invariably, the most important of its extra thermodynamic losses.
- (3) It is peculiarly well fitted for use with those very high steam pressures as we now regard them, which must ultimately probably be resorted to by the engineer designing heat engines in his endeavor to further improve the efficiency of that class of motors.
- (4) It is only limited in speed of rotation by the strength of its materials of construction.
- (5) It is especially suitable for use with superheated steam, it having no rubbing parts on which lubrication may be difficult, in presence of superheated steam, and the limit to the superheat, so far as the motor is concerned, being only found at that point at which increased temperature of metal produces reduction of tenacity in objectionable amount. That limit, not as in earlier days of lubrication with animal oils, and still with other engines, is fixed with this machine at the boiler.
- (6) As to its operation, it is obvious that friction is peculiarly active for evil in this motor, and that small diameters of journal, freedom from contact of part with part, except as absolutely required by the construction, and minimizing fluid friction by superheating steam, and by securing as complete removal of the atmosphere, air, or vapor from about the revolving wheel as practicable, must be carefully sought in order that the mechanical efficiency of the machine shall be made a maximum.
- (7) The wastes of the steam-turbine are all extra thermodynamic; the loss due, the absence of adiabatic recompression excepted. They consist of (1) journal-friction, which is made a

minimum by the use of a flooded bearing and a light ugent; (2) fluid friction between disk and leakage, steam, or suspended moisture in the jet, which may be made a minimum by super-heating, and between the disk and its enclosing atmosphere of vapor, which may be minimized by the employment of a good condenser; (3) loss of heat and of steam by leakage, which may be reduced to a minimum by durable material, fine workmanship, and close fits; (4) waste by incomplete expansion, which may be reduced to a limit determined by the finance of the case, by the resultant increase of friction and of cost due the necessary enlargement of the turbine; and, finally (5), thermo-

QUICK WORK ON HOLLOW SHAFT.

The Bethlehem Steel Co. recently received from the Anaconda Copper Mining Co., of Anaconda, Mont., an order for a hollow-forged fluid compressed steel shaft 17 ft. 10 in. long and 15 1/4 in. to 20 in. in diameter, with a 7-in. axial hole, to replace a shaft which broke in the hoisting engine of the mine, necessitating a shut down until the new one could be received. The new shaft was taken in hand under emergency conditions and finish-machined complete within 14 days from receipt of the order, which was two days in advance of the contract agreement. The shaft weighed about 12,000 lb., but on account of the urgent nature of the case was shipped to Anaconda by express in a special car.

BOOTHMAN FEED-WATER FILTER.

The accompanying illustrations show plan and sectional views of the Boothman patent feed-water filter which is made by a Glasgow company. Each element consists of a solid-drawn brass casing, perforated, over which is drawn a stocking of Turkish toweling known as "brown terry" cloth which constitutes the filtering medium. The filtering tubes are enclosed in iron castings held in their seats by large set screws. The water is introduced so as to surround the filtering tubes and passes through the cloth to the interior, thence downward as shown by the arrows and to the boiler. Either single or double filtration may be provided for in the design.

The under side of valve C, exposed to the boiler pressure, is greater in area than the upper surface of valve A, exposed to the feed pump pressure. The surfaces are so proportioned that when the feed pressure becomes more than 25 lb. per sq. in. greater than the boiler pressure, due to the fouling of the filter, the valves will move down and open a by-pass direct from the pump to the boiler.

The filter is cleaned by admitting steam to the interior of the filter tubes and thus forcing the dirt out of the cloth. The makers state that a 3,000 h. p. filter can be cleaned in five minutes.

The contract to build the power house of the Toledo (O.). Fostoria & Findlay Electric Ry. as Fostoria has been awarded to J. B. Wells.

The Milwaukee Electric Railway & Light Co. contemplates rebuilding the power house at Racine, Wis. The station will be 110 x 75 ft. and one story high.

Current for the electrical operation of the Manhattan Elevated, New York, will be supplied temporarily from the station of the Metropolitan Street Railway Co.

The Winnipeg (Manitoba) Street Railway Co. has adopted a regulation requiring persons taking dogs with them on the street cars to pay 5 cents for the dog.

The New England Construction Co. has secured an old charter and will build an electric line in St. Albans, Vt., and to St. Albans bay on Lake Champlain, three miles distant, and to Swanton, eight miles distant.

Receiver Baer, of the Galveston City (Tex.) Railroad Co. has been ordered by the court to pay \$25,246.53 to Adone & Lobit.

BOOTHMAN FEED-WATER FILTER.

dynamic waste by failure to secure that complete adiabatic recompression of the fluid which is necessary to convert the Rankine-Clausius' cycle into that of Carnot. The latter is a peculiarly difficult matter with the steam-turbine, since it probably necessarily involves the employment of a separate vapor-compression pump of special character, and an amount of added work and cost which may introduce losses more than compensating its gains.

The fly-wheel of a 400-h. p. engine in the power house of the Jackson (Mich.) Light & Power Co. burst on November 18th, and the street railway and lighting service had to be suspended till repairs could be made.

ELECTRIC SEA SERPENT FOR PLEASURE RESORTS.

The illustrations herewith show Mr. Walter Stenning's idea of the sea serpent which sundry and divers travelers have reported having seen at different times since 1555. It was built in Paris and during the past summer has been one of the attractions of the Jar-

ELECTRIC "SEA SERPENT" AT PARIS.

din d'Acclimatation. Our French contemporary, *La Nature*, says concerning the sea serpent: "The visitors to the Jardin d' Acclimatation arrest themselves stupefied when they perceive circulating

SECTION OF HEAD.

softly in the alleys, through the foliage, this rolling monster." And we do not blame them.

The serpent is about 100 ft. long and 6½ ft. in diameter; it consists of an electric locomotive drawing a train of cars carrying the necessary storage batteries to furnish current. Each car is covered with a ring of the animal's body.

MUNICIPAL OWNERSHIP.

At a banquet of the Merchants Club held in Chicago last month two papers discussing municipal ownership of public utilities were read. Prof. E. J. James, of the University of Chicago, gave his reasons for his opposition to municipal ownership and operation:

"First, private management is, on the whole, more efficient and operates under favorable conditions at a lower cost of production, and leaves, therefore, possibly a larger margin of profit for the community. This, in spite of the fact that individual instances may be found of very capable public management; in spite of the fact that municipalities may be able to borrow money at lower rates of interest than private corporations; in spite of the alleged fact that public employes have a keener sense of loyalty to the community than private employes to the company; in spite of the fact that with every passing year the efficiency of the municipality as a business agent is increasing. How far it is yet behind a well-organized pri-

vate business may be seen in comparing the manner in which the police service of this city is at present conducted and that, say, of suburban train service on the Illinois Central or the delivery of goods by Marshall Field.

"Another reason in my mind for rejecting municipal ownership as a general and satisfactory solution at present is that such a solution would end in increasing enormously the functionary class in our society—the class which, instead of depending upon its own right arm and good cause for getting on in the world, depends on getting a place at the public crib, where, protected by the conservatism of public employment, it may lead a life, if not of ease, at least of inertia, lack of initiative, and lack of strenuous effort. This objection holds especially against a permanent civil service—the absolutely essential condition of reasonable efficiency in public, as in private, employment."

Col. E. R. Bliss followed Professor James and said in part: "Municipal ownership, under existing conditions in this country, does not mean the wiping out of monopoly; it means the destruction of private property, for the purpose of enabling a municipal corporation to enlarge its functions and render an industrial service previously rendered by a private corporation."

CONSOLIDATION IN PENNSYLVANIA.

It was announced November 19th that the Lehigh Valley Traction Co., of Allentown, Pa., had arranged for the lease of the electric railways of the Easton Consolidated Electric Co., which will give the former company 150 miles of electric railways. The lessee guarantees 10 per cent on Easton Consolidated stock. Mr. A. L. Johnson is president of the Lehigh Valley and Mr. Charles E. Flynn, general manager of the Easton company, will be general manager of the consolidated lines. The Johnson roads in Pennsylvania include those in Allentown, the Bethlehems, Nazareth, Palmer, Slatington, Phillipsburg and Easton, the Slate Belt road, and the Kutztown & Hellertown.

The Inland Traction Co. is about to begin building an electric line between North Wales and Chestnut Hill Park, and this, together with an extension of the line from Richlandtown and Hellertown, now under way, will enable a passenger to go from Wilmington, Del., to Mauch Chunk, Pa., by trolley. As soon as these extensions are completed it is expected that through cars to Philadelphia will be put on.

There are a number of important connections serving as feeders. First beyond Philadelphia are the Willow Grove and Doylestown lines, now in operation from Germantown.

The second is the Chestnut Hill, Roxborough & Norristown Road, passing through Norristown and via the Schuylkill Traction Road to Colgevville and Pottstown, with a connection (about to be built) through Bridgeport to Valley Forge, to Phoenixville, thence over the Montgomery and Chester lines to Royersford, where another connection in course of construction will lead from Pottstown, through Boyerstown to Reading, from whence a road now runs to Lebanon.

The third will be the new Willow Grove and Glenside lines from near Ambler. The fourth will be the projected line from Perkasio to Doylestown, thence to New Hope, opposite Lambertville, N. J., a branch diverting to Easton.

The fifth is the newly built Bethlehem-Freemansburg lines to Easton. The sixth is the Allentown-Kutztown line now in operation to Griesemersville.

MAYOR OF CHICAGO ON FRANCHISES.

In a recent letter to the River Improvement Association of Chicago Mayor Harrison lays down five cardinal points to be considered in connection with any renewal of grant to the street railroad companies. These points are:

1. Compensation, based upon a percentage of the gross receipts.
2. Reduction of fare during the crowded hours of the day.
3. Betterment of accommodations for the public.
4. A provision for municipal acquirement of the lines at the expiration of the grant.
5. A requirement that before any franchise shall become operative it must first be submitted to a direct vote of the people for popular indorsement.

MECHANICAL DEPARTMENT

PAINTING CARS.

Practice in Philadelphia and Washington—Lettering—Painting
Roofs and Floors—Keeping Paint Shop Records.

The routine of repainting a car at the shops of the Union Traction Co. of Philadelphia is as follows:

First day, burn off all old paint, sandpaper and apply one coat of lead primer. Second day, putty thoroughly. Third day, sandpaper and apply second coat of lead. Fourth day, rub down, after which operation the car should stand 24 hours. Fifth day, sandpaper and apply third coat of lead, after which car should again stand for 24 hours. Sixth day, one coat rough stuff is put on in morning and another in afternoon. Seventh day, repeat as on sixth day. Eighth day, rub down and apply one coat of color. Ninth day, apply two coats of color. Tenth day, stripe, letter and decorate on the color coat and apply one coat rubbing varnish. Eleventh day, rub with hair and apply one coat rubbing and finishing varnish, mixed half and half. Twelfth day, apply one coat finishing varnish.

This routine cannot be followed strictly at all times, and when necessary one or two days are saved by rushing the work.

The cost of labor for thoroughly repainting as described a closed car, with 18-ft. to 20-ft. body, averages \$35, divided about as follows:

Burning, sandpapering and all colors.....	\$15.00
Painting roof	1.00
Varnishing sash	1.50
Varnishing inside or oiling.....	1.50
Varnishing outside, three coats.....	4.00
Lettering and striping.....	5.00
Painting floor and platforms.....	.75
Trucks	1.00
Washing car	2.50
Blackening off.....	.75

Total\$33.00

The total cost of material for doing this work averages from \$20 to \$25.

The cost for painting an open car is virtually 10 per cent less than the figures for the closed cars.

The Union Traction Co.'s standard color for exteriors was formerly red, but it is now using a light yellow, it having been found the yellows are cheaper, are more easily touched up and therefore wear longer, and do not shade down as quickly as the reds. For mixing body colors the foreman painter uses one-half pint of raw linseed oil to 10 lb. of color ground in Japan.

All lettering is done with plain block letters in aluminum and edged with black. Aluminum, taking into account its durability, is considered as economical as color paints for this work.

Ready-mixed paints are used for the trucks and roof. The dashes are treated in practically the same way as the bodies, but not so much oil is put in the priming coat.

All cars on the system are passed through the paint shop once a year for a thorough overhauling. They are washed and scrubbed inside and out, seats given one coat of varnish, all paint touched up where needed, trucks repainted and the body revarnished, this work requiring on the average three days for each car.

The washing is done in a special room fitted with hose, sinks along the walls, and a cement floor built on a slight grade for drainage. When a car comes in to be cleaned, several men take it in hand, and beginning at the top wash it down with hose, brooms and scrubbing brushes, using clean water and Babbitt laundry soap. Cars are also washed as thoroughly as possible each night at the different car barns.

The paint storeroom in connection with these shops is excep-

tionally well arranged, Mr. D. G. McGee, the foreman painter, believing the best results can be obtained by insisting upon neatness and system in every detail of the work.

The room is practically fireproof, with cement floor. Along the right hand side is shelving for the various colors. Ready-mixed paints that are used every day are kept in $\frac{3}{4}$ wooden tanks placed down the center of the room, where their contents can be drawn off conveniently. On the left hand side are the varnishes, turpentine and oils in 60-gallon metal tanks, each one marked with the grade and name. At the rear of the room is a lye tank and a rinsing tank with hot and cold water. The lye tank, which is used for cleaning pots and cups, has a steam pipe entering at the bottom for blowing steam up through the lye after it has been standing for any length of time.

Brushes are hung on nails along the sides of a box divided into compartments for the different standard colors, color brushes being kept in turpentine, bristle brushes in water and varnish brushes in varnish.

A chain hoist depending from a small trolley traveling on a runway supported from the ceiling enables barrels and tanks to be moved around the room easily and deposited in their proper places.

The Capital Traction Co., of Washington, D. C. finds the following routine for repainting cars gives as good results as any other it has tried:

On open cars the old paint is first burned off. The side panels are then smoothed off, sandpapered and given a coat of lead primer composed of oil, Japan and turpentine. This surface is scraped in with soft putty, sandpapered and reputted, Mr. W. E. Graham, the foreman painter, holding the opinion that a little more time spent in preparing the surface before painting will show 10 better advantage in the finished work, than time spent in rubbing varnish laid on a poor surface. In accordance with this policy the panels are next given three coats of lead tinted, when they are ready for the two coats of color. On the second color coat is laid the ornamentation, and lettering in nickel with nickel stripe border line, surrounded by a fine line of tinted white. The work is finished with but one coat of rubbing varnish and one of finishing varnish. Open cars are running on the road, with panels treated in this way, that have not had a brush touched to them since 1892, and the surface is still in good condition.

Closed cars are treated in the same manner, with the exception that a filler of rough stuff is laid under the color and the work is given an extra coat of rubbing varnish, as the larger expanse of panel surface on the closed cars makes a higher finish desirable from an esthetic standpoint.

On closed cars the main convex side panel designates the route the car is to take, and the concave panel bears near each end the car number, and in the center the name of the company. The car number is also placed on each dash.

On open cars the name of the line is painted on the top side-panel; the first and last seat panels bear the car number and the others a fancy design. The bottom sill bears the company's name. The car numbers are also painted on the dashes. This system of painting the route in large letters on the sides of the cars is appreciated by the public, but of course presents a serious inconvenience to the operating department when it is desirable to temporarily transfer a car to another line.

For rubbing varnish to a dead finish on doors and on interior work, curled hair is always used in preference to pumice or sandpaper. The hair is regular upholstery hair taken from old seat cushions, and the foreman states that it is better than anything else he has tried, as there is less liability of rubbing through or scratching the varnish and the finish obtained is more pleasing to the eye.

All cars are passed through the paint shop once a year for overhauling. At these times they are cleaned inside and out with soap

pumice stone and water. If the seats are in a fair condition they are given a coat of varnish, but if in bad condition they are scraped and receive three coats of varnish. Panels and dashes are touched up if they need it, and the trucks and roof are given one coat of prepared paint.

It is the practice to paint all iron work, including draw bar, bumpers, etc., with Prince's mineral brown.

Mr. Graham has a way of painting car floors that will commend itself to the practical man. He does not attempt to regrind paint skins and scrapings, but throws all skins, leavings and waste paint of whatever kind into a tub partly filled with oil and turpentine mixed, where they remain until a floor paint is wanted. This slush mixture is then well stirred and strained through a fine colander, the resulting paint being saved and the residue in the colander thrown away. The paint is of course a nondescript color, but has good body and wears exceedingly well on floors. When painting floors an extra coat of the paint is laid on where the most wear comes, as in front of all cross seats and on running boards of open cars, and on steps and platforms of closed cars.

When painting new canvas roofs no paste or sizing of any kind is used. A layer of linseed oil, tinted, is first laid on, and then three coats of white lead, tinted. All roofs are white and the tint is added to the coatings so the painter doing the work will not lose his place and leave some portion of the roof untouched.

Color brushes are kept in water and varnish brushes in varnish cut with a dash of turpentine.

Mr. Graham has a convenient way of keeping for ready reference, records of the work done by the paint shop upon all cars of the system.

Upon a sheet of paper mounted on a board he rules longitudinal columns, one for each division, and places in each column the numbers of all cars that run on that division. When a car comes to the shop he places a pencil mark after the car number. When the car has been overhauled and goes out he changes the first mark to a cross. The cars that were overhauled the previous season are designated on the record by a cross mark in front of the car number. By glancing at the sheet the foreman painter can tell what cars are in the shop, what ones have recently been through the shops, and what ones have not been recently overhauled, this information guiding him in his report to the manager as to how many cars he can accommodate in the paint shop each day, and what cars should be sent. This record is for quick reference only, a complete record showing in detail just what has been done to each car being kept in a blank book for reference when more accurate information is wanted.

HANDLING SCRAP.

Mr. J. A. Carney, of the Chicago, Burlington & Quincy R. R., recently read a paper before the St. Louis Railway Club, in which he described a method of handling machine shop scrap. The scrap divides itself into three classes: (1) borings and turnings; (2) punchings and shearings and odds and ends weighing not more than five or six pounds, and (3) large pieces. Borings and turnings should be collected in wooden trays set under the machine, thus catching nearly all the scrap; the small quantity which falls outside the trays can be collected by the sweeper, who wheels the scrap to a bin where it can be conveniently loaded into cars. At one shop this bin is arranged something on the coal chute order. The bins are filled from a platform on one side, and are so arranged that they can be emptied into a car on the other side by means of a suitable chute or apron. By this method no shoveling whatever is done. The only sorting that this kind of scrap can be given in most shops is to keep cast iron separate from steel and wrought iron.

Punchings, shearings, odds and ends, should be put into boxes of about 200 lb. capacity at the machine where they are made. These boxes, when full, are carried to the scrap shed, where they are piled up ready for shipment to the scrap dealer, or to a central point, where the scrap is sorted. If the scrap is sold, the boxes are dumped into cars. If, however, it is going to some central point for sorting, the boxes filled with scrap are carried into the cars and piled up securely. At the central point the scrap is unloaded in the boxes, sorted and thrown into the scrap bins, the boxes being returned to the point from which they started. The advantages of

handling scrap in boxes are (1) reduced cost of labor for handling and (2) sorting by a natural selection.

The old method of piling scrap up on the ground, then when the pile got in the way to move it to some other place, handling it with a shovel or picking each piece up by hand, was expensive. Practice has developed that a 200-lb. unit is an easy and convenient one to handle. The cost of handling small scrap by the old method amounted to about 20 cents per ton for each handling; by the box method it can be handled for about 6 cents per ton.

Where work on machines is fairly uniform the scrap made must necessarily be of about the same quality. This scrap, when collected and stored in boxes, requires little if any sorting. In this way machine shop scrap, blacksmith shop scrap and boiler shop scrap, especially that covered with scale and known as "lime" scrap, are kept separate, and can be sorted in 200-lb. units much quicker and easier than if each piece, weighing a few ounces, is handled separately.

The boxes used are made of 1-in. unfinished pine, and are 24x 14x5 in. deep, inside dimensions. The sides are extended to make handles for carrying, and the ends are bound with hoop iron.

Pieces of scrap too large to go into boxes are economical units in themselves, and are handled a piece at a time.

WOOD STAINS AND COLORS.

Wood stains differ from paint in that they are nearly transparent and bring out the natural beauty and richness of the wood itself, and while they impart a new color or tint, they do not spoil or obliterate the markings of the grain. Paint is a coat of colored pigments laid over the surface but stains act directly on the substance of the wood by chemical process. Both stains and paints must be finished with varnish if a hard glossy surface is desired.

To stain any wood yellow the timber should be coated with a hot concentrated solution of picric acid which will also give a fairly good polish. To procure a gray tint, apply a solution of one part nitrate of silver to 50 parts distilled water; over this apply a solution of ferric acetate until the requisite shade is produced. These stains are poisonous and should not be allowed to touch the hands.

A rich purple may be obtained by boiling 1 oz. of madder and ½ oz. of fustic in 2 gallons of water. The solution should be applied while boiling hot by brushing over the wood until the desired shade is obtained. Next apply a weak solution of nitric acid and finish with a mixture made as follows: Put 9 oz. of dragon's blood and 2 oz. of soda, both well bruised, into 6 pints of spirits of wine. Let the compound stand in a warm place, shake frequently, and apply with a soft brush, repeating the coats until the proper color is reached. Afterwards polish with linseed oil or finish with varnish.

A good mahogany stain can be made by dissolving 2 oz. of dragon's blood in 1 quart of turpentine. To obtain a walnut stain dissolve some dry burnt umber in vinegar or mix 1 lb. of dry Venetian red with 1 pint of asphalt and 1 quart of turpentine. A fine red-brown can be imparted to maple, or a good yellow-brown to oak and fir by the application of a solution composed of 50 parts of commercial alizarine in 1,000 parts of water, to which ammonia is gradually added till its presence can be perceived by the sense of smell. When over this coat is brushed a 1 per cent solution of chloride of barium, the maple takes a dark brown tint, and the oak and fir a lighter brown. If a 2 per cent solution of sulphate of magnesia be substituted for the barium, a dark violet-brown will be obtained on the maple, and a dark brown on the oak and fir. Alum and sulphate of magnesia will make maple a vivid red and oak or fir a blood-red. Chrome and alum give to maple and fir a reddish brown, and to oak a fine Havana brown.

CONCERNING CAR JOURNALS AND BEARINGS.

A review of the subject of hot journals by Mr. Josef Grossman, inspector of the Northwestern Railroad, of Austria, has recently appeared in the *Zeitschrift des Oesterreich*, and was translated for the *American Engineer*. Mr. Grossman considers that experience as well as the elaborate tests discussed in the proceedings of the Institution of Mechanical Engineers (England) in 1883 show that a car journal cannot be oiled from the top. The lubricant must therefore be supplied from below, the journal running in a bath

or in contact with a swab or packing. If the bearing extends too far around the journal it will cramp and transfer the points of greatest pressure from the top to the sides, and the oil applied to the lower part of the journal will be scraped off.

To avoid cramping and because of the unsatisfactory behavior of oil leaders, Mr. Grossman recommends a narrow bearing without oil grooves or leaders, but there are small holes through the top of the bearing and the pressure of the oil layers between the working surfaces is utilized to force small quantities of oil to the back of the bearing, whence it runs through grooves to the unloaded portion of the bearing, thus providing for a circulation of the oil. This bearing is shown in the illustration; it is stated that these bearings have been used in Austria for three years with good results.

In our issue of August last, page 428, mention was made of the journal bearings used by the Indiana Railway Co., of South Bend, Ind. These are much narrower than the bearings generally used, the brasses for journals $3\frac{3}{4} \times 8$ in., having a projected width of only $1\frac{1}{2}$ in. and those for journals $4 \times 8\frac{1}{2}$ in. a projected width of only $2\frac{1}{4}$ in. The M. C. B. standard journal brass for $3\frac{3}{4}$ -in. journals is $3\frac{3}{8}$ in. wide, and that for $4\frac{1}{4}$ -in. journals is $3\frac{5}{8}$ in. wide. The superintendent of the Indiana Ry., Mr. Mark Cummins, stated that the narrow bearings had been used by him because they wore longer and gave less trouble from hot journals.

UNUSUAL CAUSE OF BREAKAGE OF INCANDESCENT CAR LAMPS.

An interesting story of a "trouble" recently came to our knowledge, and the statement of the case may be of assistance to others. The facts are as follows: The auditor of a large railway company found that the number of incandescent lamps for the cars, required at one of the terminals, was very much larger than he thought it ought to be, and called the superintendent's attention to the matter. The superintendent made an investigation and after a considerable time discovered that the fault lay with the men who dusted the interior of the cars. The feather dusters used, by friction on the varnished surfaces of the car, became charged with static electricity, and when brought near the lamps attracted the filament so that the latter was broken.

Such trouble from static electricity is not unusual in shops where there are belts running at high speed and much dust flying, the hot filament of the lamp being attracted to the glass and cracking it.

TEST OF WOODEN PULLEY.

Recently the Dodge Manufacturing Co., of Mishawaka, Ind., received an order for an iron center, wood-rim pulley $46\frac{1}{2}$ in. in diameter and 16 in. face, which was to be tested to a rim speed of 9,000 ft. per minute. When this order was filled a duplicate pulley was also made with the object of testing it to destruction. The maximum speed attained in the test was 2,400 r. p. m., corresponding to a velocity of 28,889 ft. per minute for the rim. Further tests are to be made with the idea of determining the maximum speed the pulley will stand.

There is a difference of opinion between the heads of the city departments of Water Supply and of Sewers and the Rapid Transit Commission as to the utility of building side galleries for pipes in the New York underground tunnel. The galleries contemplated in the tunnel plans extended only for a distance of 5,000 ft.

BALL-BEARING TROLLEY BASE.

The accompanying illustration shows a patent trolley base, now being used by the Montreal Street Railway Co., of Canada. The

IMPROVED TROLLEY BASE

pole socket revolves upon a shaft in the usual way, but it is also fitted with ball bearings which permit of every oscillation in conformity with the changes of position in the overhead line. The base is made in malleable iron, and is cheap and durable. It has

PARTS OF BASE.

been in use on the Montreal Street Ry. for some three years and has given the best of satisfaction. It is the invention of an official of one of the local roads.

ASSESSMENTS OF CHICAGO ROADS.

As modified by the state board of equalization the assessments of the street railway companies of Chicago are:

Chicago City Railway.....	\$700,000
Chicago Union Traction	400,000
Chicago Consolidated Traction.....	100,000
Chicago Electric Traction.....	10,000
Chicago General Railway	20,000
South Chicago City Railway.....	50,000
General Electric Railway.....	5,000

PROVIDENCE FENDER MOVES TO NEW YORK.

The Consolidated Car Fender Co., which has had its general office and factory at Providence, R. I., has moved its headquarters to New York City, and opened offices at 39 and 41 Cortlandt St. This has been found necessary on account of the rapidly increasing business of the company. The American factory will remain at Providence as heretofore.

General Manager Woodworth also advises us he has completed arrangements for the manufacture of his fenders in Canada, and will make them in Ottawa at the works of the Ottawa Car Co. Hereafter all the Providence fenders used in Canada will be made in Ottawa.

THE LINK-BELT STAIR-LIFT.

We illustrate, this month, in the Link-Belt stair-lift, the latest development in that line of passenger elevators known generically as moving stairways. The field of the moving stairway seems already well marked out. Where the problem is to handle a large

passage around the sprocket wheels or rollers, and perfect rigidity in the other direction, providing a perfectly secure and solid footing. This belt carries shafts with self-oiling rollers at intervals. The framing provides two tracks, an upper one and a lower one. A stationary frog at the foot of the stairway switches alternate shafts into the upper and lower tracks in turn, thus deflecting the

LONGITUDINAL SECTION OF STAIR-LIFT.

number of people expeditiously from floor to floor, the standard passenger elevator must take a rear rank position, both as to capacity and convenience. The fact that a moving stairway keeps everlastingly at it, and is doing efficient work all the time, gives it its tremendous advantage over any elevator, however large for handling great numbers of people for one story. It never has to go back after another load. Two general types have been evolved hitherto in the effort to meet the demand for an efficient machine. The first is simply a moving belt inclined upward. The second consists in detaching the steps of an ordinary stairway from each other and attaching them to an endless chain, and thus forming an elevator. The objections to this scheme are the necessity for extending the stairway into a moving platform at both top and bottom, its great weight and the space occupied. The objection to the first type is obviously the fact that the passenger does not stand on a level step.

The stair-lift seems to meet the conditions for a practical machine belt into alternate treads and risers. The cut of the foot housing shown herewith with the floor cut away gives a view of the flat belt as it comes around the foot idlers, and of the belt after it has formed into the treads and risers. The passenger simply steps on and is carried smoothly, rapidly and comfortably to the top, there

The stair-lift seems to meet the conditions for a practical machine

DETAILS AT LANDING.

very fully. It is strong, efficient mechanically, and light. It partakes of the good features of both of the earlier conceptions and of none of their faults. The belt construction gives compactness and lightness, and the fact that the passenger stands on a level tread attains to the one advantage which the second type mentioned above has to offset its cost.

The stair-lift is composed of an endless belt made up of steel links, so arranged as to give flexibility in one direction, permitting

GENERAL VIEW.

to be delivered safely, surely and easily, whether he remembers to step off or not. This is where the advantage of a flexible belt comes in. It makes it possible to run the entire belt around a very small sprocket roller at the head in close proximity to the dull edge of the landing plate placed slightly below the highest level reached by the tread in its ascent. The form of construction at this point is well shown in the engraving.

The stair-lift is the invention of Mr. James Mapes Dodge, president of the Link-Belt Engineering Co. and of the Dodge Coal Storage Co., a gentleman whose large experience in elevating machinery would seem to give some weight to his productions in the line of a continuous elevator for people.

The applicability of such a machine to the street railway world is obvious and immediate. For elevated railroads, for surface roads connecting with elevated roads, for roads running in a subway, it is destined to provide means for overcoming cheaply and completely the objection of the average human being to climbing stairs.

The stair-lift is actuated by an electric motor, placed beneath the floor. Traveling at the rate of 90 ft. per minute, with a passenger on each step, 3,000 people per hour can be elevated without crowding or delay. From rail to rail, the stair-lift is 3 ft. in width. The belt is only 21 in. wide, tests having proved that a greater width does not give any increase in actual carrying capacity. It may be noted in this connection that large passenger elevators in one of the biggest railroad stations in the country show a maximum of seven people a minute in rush hours, whereas this apparatus at the speed mentioned, 90 ft. per minute, will handle more than fifty. Unlike the vertical elevator, the stair-lift requires no attendant, and as but 5 h. p. electric current is required for a machine adapted to a vertical distance of 16 ft. under maximum load, its economy of operation is apparent.

NOTES ON TRACK.

The following notes are abstracted from reports submitted at the annual meeting of the Roadmasters' Association of America, held in Los Angeles, Cal., November 13th to 15th.

Mr. Gurdon W. Merrell presented a report favoring the adoption of a resolution recommending the reversal of alternating bolts at the joints where the rails used are high enough to permit the nuts placed on the inside to clear the wheel flanges. His reasons for this are several. The shoulders on bolts in slots in the angle bar cause an undue proportion of the stress due to expansion and contraction of the rails to come on one angle bar, frequently breaking the bolts and crowding the joint out of line. The staggering of the slots for spikes makes it impossible not to have some spikes so placed that they can not be driven or pulled without removing the bolt; by reversing alternate bolts the heads may be placed over such spike slots and this interference avoided. In case of a derailment of a single pair of wheels they will shear the bolts when striking the nuts while they will not damage them if striking the heads.

Messrs. T. Hickey, G. M. Brown, T. S. Cafferty, J. W. Meredith, H. Ferguson and P. W. McKeon made the following recommendations concerning the plugging of ties. 1. Since every spike hole left unplugged fills with water after the first rain, which remains there to soften and rot the tie, where a spike is withdrawn for any purpose the hole should be plugged and spike redriven in the same place, when practical to do so without weakening the tie by putting in a new place and cutting off more of the fiber of the tie. 2. A spike driven in the tie plug, more particularly in soft wood ties, holds with more than double the adhesive force with which it held when first driven; the advantage of driving the spike into the tie plug results from the fact that when a spike is driven into a tie it must displace and carry down with it a sufficient quantity of fiber to allow the body of the spike to be partly unsupported, whereas when driven into the plug it enters lengthwise of the grain of the plug and simply compresses the fiber of the plug against the walls of the spike hole. 3. Experience has demonstrated that the best kind of timber from which tie plugs should be made is second growth elm, white oak, and ash, in the order in which they are mentioned; cedar and pine are totally unfit for tie plugs, the timber being too weak and brittle to stand the impact of the blows necessary to drive them home, so that they will break off when only

partly driven. This is a very serious defect, because while it may plug the hole against water, if the spike should be driven into it, it will go partly down with it, and thus leave the spike unbraced either at its neck or at its point. The tie plug, therefore, should be of sound, hard, tough timber to secure the best results. Elm has the preference over oak, because when pressure and friction are applied to elm it develops a rough surface, whereas where the same forces are applied to oak it develops a smooth, slippery surface. Oak is also heavier and more costly. Ash is but very little different from oak as far as its qualities are concerned.

Mr. J. M. Meade, resident engineer of the Santa Fe, Topeka, Kan., presented a paper on the "Chemical Treatment of Cross Ties," and gave data on the cost of the zinc-tannin or Wellhouse method at the Las Vegas tie treating plant of the company. The figures for 1898 were: chemicals, 10.97 cents; labor, 2.50; fuel and supplies, .31, a total of 13.78 cents per tie. For 1899, the cost was: chemicals, 12.11 cents; labor, 2.26; fuel and supplies, .33, a total of 14.70 cents per tie. The average for the two years is practically 14¼ cents per tie. The Santa Fe has three tie-treating plants with a total aggregate capacity of over 11,000 ties per day.

SPECIAL CARS IN CALIFORNIA.

The Los Angeles (Cal.) & Pasadena Electric Railway Co. owns a number of interesting cars, several of which we are able to show herewith through the courtesy of Mr. W. H. Smith, manager.

FIG. 1 OBSERVATION CAR.

Figs. 1 and 2 are exterior and interior views of a parlor car rebuilt from a standard coach. It has wide observation platforms, a feature that adds greatly to its value as a pleasure car. The

FIG. 2 INTERIOR VIEW.

interior furnishings include complete buffet, with china closet, ice-box and running water, electric stove and heater, and portab'e dining and card tables. The car is lighted with two 1,000-c. p. direct

current arc lights inside and one outside, which are operated in series with the arc headlight, the resistance of the lamps being used to heat the cars at night, which is necessary the year round in California. The arc lights are the invention of the chief electrician, Mr. S. H. Anderson, and any number up to eight can be operated in series, consuming but 2½ amperes. The company is now equipping all of its cars, inside and out with this style of light, and finds them to be as economical as the small incandescent lamps and

FIG. 3—STANDARD CAR.

far more satisfactory to the traveling public, as they will give a perfect light, even though the voltage drops 150 volts, whereas incandescent lamps would give hardly a glow. The car is equipped with two 50-h.p. Westinghouse motors and axle-driven air brakes.

Fig. 3 is the company's standard coach, 35 ft. long over all. It is equipped with two 50-h. p. motors and axle-driven air com-

FIG. 4.

pressors for the brakes. The seating capacity is 42, but upon one occasion the car has carried in one load 174 passengers from Los Angeles to Pasadena, and none were on the roof.

Fig. 4 is one of three cars which were originally constructed by the old company to be used as trailers. They were found to be too heavy for that purpose, however, and were therefore equipped with

FIG. 5—COMBINATION MAIL COACH.

two 50-h.p. Westinghouse motors and air brakes, and are now used to pull a light but substantial trailer, the seating capacity of the two cars being 72 persons. On the occasion of a big Republican rally in Los Angeles during the recent political campaign, the two cars hauled 153 passengers on one trip.

Fig. 5 shows a combination mail coach recently put in service under contract with the Government. It is 42 ft. 5 in. long, with 16-ft. mail compartment, and is equipped with two 50-h.p. Westing-

FIG. 6—STANDARD SHORT CAR.

house motors, air brakes, interior arc lights, and arc headlight. Its seating capacity is 32 persons. The car makes three round trips daily between Los Angeles and Altadena.

Fig. 6 is a standard "dinkey" used in local service in Pasadena. It is equipped with two 25-h.p. Westinghouse motors and arc headlights.

Fig. 7 illustrates the company's wrecking car, which is equipped with two 40-h.p. Westinghouse motors, and will pull a 15-ton car up a 7 per cent grade. So easily does it handle the heaviest cars

FIG. 7—WRECKING CAR.

on the road, the wrecking crew have hung up a sign in one end reading "All cars look alike to me." The wrecker is provided with several appliances for the quick handling of wrecks of all kinds, one of these being a four-wheel "dolly" truck used in cases of broken

FIG. 8—STANDARD TRUCK.

axles and wheels. The "dolly" is run under the car in trouble, the truck is chained to the body, and the car hauled to the barn by the wrecker, with "dolly" acting as one truck.

Fig. 8 is the company's standard truck, which it builds at its own shops.

In Fig. 9 are shown different views of the Mt. Lowe division from Altadena to Alpine Tavern.

Mr. Smith adds the following information regarding the practice of cleaning cars:

"All of our cars except the three used for hauling trailers are upholstered in plush and are cleaned throughout once a week with compressed air. Owing to the fact that our cars lie over half an hour after each round trip at the Pasadena terminal, we are enabled to keep them swept and the windows very clean at a slight cost. We never use water on the windows or car bodies, but use for window cleaning 'Bon-ami' soap, and one man can clean the windows of one car perfectly in 20 minutes. For car bodies we use a liquid car cleaner, which we find has increased the life of the varnish six months and keeps the surface of the body always looking bright.

Granite Gate, "Ye Alpine Tavern," and View between Echo and Alpine.

FIG. 9—SCENES ON THE MT. LOWE DIVISION.

The aisles of all cars are carpeted, we having found after a great deal of experimenting that carpet wears the longest and is quite an attraction to passengers, and has the moral effect of assisting us to keep the cars cleaner, as we find that passengers of all classes will invariably scrape their feet before entering the car, and it is very seldom that cars are littered up with peanut shells, etc. We are also very strict regarding the rules posted in both ends of cars prohibiting the spitting on the floor, and the carpet has its effect in preventing that disgusting practice."

The Toledo (O.) Fremont & Norwalk Electric Ry. sells 1,000-mile ticket books that are transferable.

OPENING OF ALBANY & HUDSON RAILWAY.

The formal opening of the line occurred on November 22d last. On that day a party of 100 invited guests, including a number of gentlemen prominent in engineering and manufacturing circles, left the Grand Central Station, New York, at 9 a. m., by special train, and were taken to Hudson. Here two of the new electric cars were in waiting, and the run was made to Rensselaer at an average speed of 35 miles an hour, and a maximum of 50 miles on several stretches. On the return trip the party inspected the transmission line, power house, the North Chatham sub-station, etc., and it was evidently the verdict of the party that the promoters and engineers were to be heartily congratulated upon the manner in which they had faced and solved the intricate problems involved.

During the trip from Hudson to New York an elaborate luncheon was served under the direction of Delmonico.

FINANCIAL REPORT OF SOUTHERN OHIO COMPANY.

The Southern Ohio Traction Co., of Hamilton, O., held its quarterly meeting in the Garfield building, Cleveland, November 13th, President Will Christy, of Akron, presiding. The financial report showed that the gross receipts of the company for the period from May 1st to November 1st were \$171,040.62, the net earnings \$88,076.60, and the surplus \$42,406.95. A dividend of three-fourths of 1 per cent, payable December 1st, was declared. M. J. Mandelbaum, chairman of the executive committee, reported the negotiations for the extension of the company's line to Cincinnati as progressing satisfactorily.

STREET RAILWAY MAIL SERVICE IN GERMANY.

The city of Frankfort on the Main, Germany, which operates the street railways and has recently converted them for electric traction has made a contract with the imperial postal bureau for transporting the mails between the central post office and the railway station, which is a union station. Tracks have been laid in the court of the post office building and before the station, and special cars have been put on for the service.

These cars are 25 ft. over the buffers; 5.8 ft. wide, and 11.15 ft. high above the rail. The body is 15.74 ft. long and divided into two compartments one of which is three times as large as the other. The smaller compartment is used for letters and registered packages and the larger one for ordinary packages. It is expected that by using these larger vehicles the number of trips between the stations will be reduced to 20,000 per annum instead of 50,000 as formerly.

VESTIBULES IN MASSACHUSETTS.

The Massachusetts Railroad Commissioners will soon render their decision on the question of whether vestibules shall be placed on Boston street cars. The Lynn & Boston, the West Roxbury & Roshindale, and the Boston Elevated petitioned to be exempted from the law which makes vestibules compulsory outside of Boston and leaves their use within the city to the discretion of the Railroad Commissioners. A hearing was given the petitioners in November and the case continued until December 17th.

BICYCLES IN TACOMA.

It is the practice of the Tacoma (Wash.) Railway & Power Co. to transport bicycles on its cars, the wheels being carried on the car fender. Owing to the inconvenience caused by the delays of loading and unloading the bicycles, the company has been obliged to refuse to carry bicycles between 4:45 and 7:15 p. m., the period of greatest traffic.

An employe of the Cleveland City Ry., having been detected in taking tickets from the company's safe, has confessed that he has stolen \$1,500 worth of tickets which he sold to conductors at half their face value.

LAYING TRAMWAYS IN GERMANY.

A number of attempts have been made in Germany to devise means for lessening the cost of maintenance of tracks laid in trees with asphalt pavements. United States Consul Hughes, of Coburg, writing to the State Department, states that just now much is being said in praise of a system which is being tried in Berlin. Contrary to the ordinary practice of laying the rails immediately upon a foundation of concrete and in direct contact with the superimposed asphalt, the new method consists in placing the rails upon a bed of coarse gravel and running a line of hardwood blocks along each side of the rail.

BUFFALO SNOW PLOW.

The accompanying illustration shows one of seven double shear snow plows built in its own shops by the International Traction Co., of Buffalo, after designs of Mr. Robert Dunning, master mechanic. The framing in the body is of oak, very heavy; the side sills are 6 x 12 in. and on each side one of them projects forward to support the front end of the shear. The shear is set at an angle of about 45 degrees with the center line of the car and is made in two pieces so that when it is desired to have the shear higher above the track it is only necessary to lift the lower half. The bracing of the shear is of old flat and T-rails and at the back it is supported by vertical T-rails which slide in grooves made to receive the rail heads. The side frames of the truck are made of two steel channels enclosing an oak timber; these side bars are also extended to support the lower corner of the shear.

BUFFALO SNOW PLOW.

A flue or leveler at the side is operated by chains which are wound around shafts driven by worm gearing. On the side where the fluke is used the lower half of the opening in the cab is closed with a door and a heavy curtain pulled down to meet it; on the opposite side the car may be entirely closed by a door making the cab very comfortable for the men.

Each plow is fitted with two G. E. 57 motors and, fully equipped, weighs about 13 tons.

Three men are required to operate the plow, one at the controller, one to adjust the shear and fluke, and one for the trolley pole.

It is announced that work will be commenced in the early spring on the Grand Rapids (Mich.) & Ionia Ry. The route will include Lowell and Saranac.

THE HAMMOND SANDING DEVICE.

The track sanding machine shown in the accompanying engraving is the invention of O. S. Hammond, of 102 Pearson Ave., Toronto, Ont. It consists of the following essential parts: A hopper for the sand, carried underneath and running the full width of the car, immediately in front of the forward pair of wheels; a

HAMMOND SANDER.

spindle inside and near the bottom of the hopper, having upon its surface, right and left hand threads or helically arranged projections, which when the spindle is rotated carry the sand from the center of the hopper each way toward the ends; spouts at the ends of the spindle to guide the sand to each rail at a point just in front of the wheels; a system of levers whereby a pawl is made

to engage a ratchet wheel at one end of the spindle, and thereby rotate the spindle a portion of a revolution at a time, causing the sand to be fed upon the rails. The levers are operated by means of a foot piece projecting up through the front platform.

Among the claims made for the machine are that it is positive and economical in action and it will work with wet or lumpy sand.

LOW WIRE COSTS \$4,000.

Arbitrators, to whom the decision of the case was left, last month awarded Mrs. Ada L. Little \$4,000 for the death of her husband, who was thrown from a freight car by reason of striking a trolley wire of the Chester (Pa.) Traction Co. The plaintiff had sued for \$50,000.

HALF FARES.

The first car was run over the Auburn (N. Y.) and Skaneateles electric line early in November.

The street railway system of Guadalazara, Mexico, has been purchased by a Pittsburg (Pa.) syndicate.

Work will be commenced on the Toledo, Fostoria & Findlay Electric Ry., early in the summer of 1901.

The proposed electric interurban between Greenfield and Kokomo, Ind., will not be built until next year.

November 13th, 2,400 ft. of trolley wire was stolen from the poles of the Calumet Electric Street Railway Co., of Chicago.

An ordinance requiring street cars to be run 17 hours per day failed to pass the Bay City (Mich.) council over the mayor's veto.

Fare boxes will be put in the cars of the Terre Haute-Brazil (Ind.) line, thus relieving motormen of the duty of collecting fares.

The Buffalo (N. Y.) Hamburg & Aurora Ry., which was opened October 5th, has established an hourly service between these cities.

There are said to be four separate companies contending for the rights of way for an electric line between Toledo and Adrian, Mich.

The Dallas (Tex.) Consolidated Electric Ry. has acceded to the requirements of the city and will use a 74-lb. grooved Johnson rail.

Pres. John M. Roach, of the Chicago Union Traction Co., proposes to erect two clubhouses for the use of employes and their families.

The Tuscarawas Railroad Co. has inaugurated a street railway mail service on its lines running between Uhrichsville, O., and New Philadelphia.

The Duluth-Superior Traction Co. properties for the first nine months of 1900 had gross earnings of \$324,830 and operating expenses of \$197,278.

A new street railway mail car has been put on the lines between Los Angeles and Garvanza, Cal., affording a service of seven mails each way per diem.

The new circuit line between McKeesport and Wilmerding, Pa., built by the United Traction Co., of Pittsburg, was put in operation November 22d.

William A. Boland was granted a franchise in Jackson, Mich., November 19th, by which the franchise of the Jackson Street Railway Co. is repealed.

The Stamford (Conn.) Street Railroad Co. has completed its extension to Glenbrook, and a regular service between the two cities has been inaugurated.

Gross earnings of the Cleveland Electric Ry. for October, 1900, were \$185,000, which was \$32,200 better than for October, 1898, and \$45,000 better than for October, 1899.

The Indianapolis (Ind.) Street Railway Co. will remove its system of feed wires in the down town district so as not to conflict with the work of the fire department.

Mr. Ira A. McCormick, general manager of the Cleveland Electric Ry., has made a number of improvements which have procured for him the hearty approbation of the local press.

The Millcreek Valley Street Railway Co., Cincinnati, O., has applied for permission to lay double tracks over the entire route between Glendale and Hartwell, in Hamilton County.

The first spike in the new electric railway being built by the Toledo (O.) & Western Railway Co. from Toledo to Sylvania, was driven by President Luther Allen, of Cleveland, November 9th.

Montana will have the longest electric railway in the world when the proposed line from Billings to Great Falls is completed. An important branch of this road's business will be the hauling of coal and ore.

The Twin City Rapid Transit Co., of Minneapolis, in its report for October shows gross earnings of \$240,793, an increase of \$11,584; net, \$131,291, an increase of \$7,095, and surplus, \$93,035, an increase of \$10,689.

The Tacoma-Seattle Ry. is making preparations for the rapid construction of its line. A saw mill with a capacity of 20,000 to 30,000 feet per day has been erected on the Puyallup reservation to get out ties and timber.

The Columbus, Lima & Northwestern Railway Co., recently incorporated, has secured control of the Detroit & Lima Northern, a steam road, which will soon be equipped for electric traction and extended through the Scioto valley.

A new trolley line, one mile long, has been completed at League Island Navy Yard, Philadelphia, for the purpose of saving the men a mile walk across the prairie, in winter. It is understood that no fare will be charged on the new line.

The completion of the Toledo, Fremont & Norwalk Street Railway Co.'s interurban line was celebrated by a sumptuous banquet at Toledo, November 10th. Officers of the line and their friends participated, and covers were laid for 35.

November 27th an ordinance was presented to the Chicago council asking permission for the Citizens Electric Street Railway Co. to build an electric line in Foster and Lincoln Aves. Nothing is known as to the interests asking this franchise.

The Twin City Rapid Transit Co., of Minneapolis, Minn., will make a special effort to keep both its interurban lines in regular operation during the winter. For this purpose several additional 25-ton snow plows have been purchased.

The Buffalo & Niagara Falls Electric Railway Co. proposes to remove its car barns from Gratwick to the Military Road, near Hertel Ave., Buffalo. A new brick and steel structure for the purpose will be completed by January 1, 1901.

The Chattanooga (Tenn.) Rapid Transit Co. has acceded to the property of the Chattanooga & Northside Street Railway Co. Bonds to the amount of \$110,000 have been issued on the purchase, and taken by C. P. King, of Philadelphia.

The construction of the proposed electric line between Mechanicsburg (Pa.) and Carlisle was commenced November 8th, and celebrated at Mechanicsburg with imposing ceremonies. The first spike was driven by Miss Janet Hufford, of Reading.

An agreement has been effected by the street cleaning commissioners of New York City and the street railway companies operating there, by which the latter will remove the snow from the principal streets covered by their tracks, during the winter.

William A. Boland, who has applied for a franchise for his interurban railway, in Ann Arbor, Mich., proposes as the rate of fare 1½ cents per mile. The franchise, if granted, will provide for the forfeiture of a bond of \$10,000 if work be not commenced within three months.

The Portland (Ore.) Railway Co. recently established a new wage rate by which first year employes will receive 17 cents per hour, second year employes 18½ cents, and third year employes 20 cents. This increase will affect 90 men, and is received by them with great satisfaction.

November 14th, the Rapid Railway Co., Port Huron, Mich., entertained the city officials of Port Huron, St. Clair, Marine City and Algonac. The party was taken over the line in a special car and then back to Port Huron where an elaborate dinner was served at the Hotel Harrington.

The Houghton County (Mich.) Street Railway Co. made a record by the rapidity with which its line from Houghton to Hancock was constructed. The first shovelful of dirt was excavated July 31st and the current was turned on for the operation of the completed road October 25th.

December 1st, Maj. R. B. Baer, receiver for the Galveston (Tex.) Street Railway Co., filed his report for the month of October with the clerk of the United States Court. The report is as follows: Operating expenses, \$16,102; maintenance of property, \$2,501; gross earnings, \$4,059; deficit, \$14,543; balance on hand, September \$123,022.08; surplus, \$108,479.

The Toledo, Fremont & Norwalk Electric Railway Co. has awarded the Massillon (O.) Bridge Co. the contract for a new 200-ft. bridge to span the Huron River at Monroeville, O. The bridge will be completed and operation over this portion of the company's line commenced early in January.

The Asheville (N. C.) Electric Co. has made a number of improvements at Riverside Park in anticipation of increasing traffic on the street railway lines next summer. A quarter-mile race track, baseball and football fields, a dancing pavilion, and vaudeville stage have been added to the attractions of the resort.

Regular service on the new line of the Mahoning Valley Railway Co. between Youngstown (O.) and Lowellyville was commenced November 13th. The formal opening was on the preceding day, when the general manager, Mr. A. A. Anderson entertained a party, taking the guests over the new line in his special car.

Mr. J. R. Wharton, manager of the Butte (Mont.) Electric Railway Co., advises us that on last Labor Day his company had over 12,000 people at its park, known as Columbia Gardens, and during the season 262,659 people were carried to the resort. The park was described in the "Review" for last August, page 437.

The Wisconsin Midland Railway Co. has been organized by the promoters of the Berlin-New London line, among whom are included Charles C. Pierce, of Chicago, and W. C. Lawrence and A. L. Hutchinson, of Weyauwega, for the purpose of building an electric line from Berlin (Wis.) to Weyauwega and New London.

The Ohio River Electric Ry. has been opened between Middleport and Racine, a distance of 14 miles. The route is a line of almost continuous towns and villages. Steamboat service has been their principal dependence in traveling heretofore, and for this reason the newly opened electric railway is of incalculable benefit.

As announced in our last issue the interurban line of the Ohio River Electric Railway & Power Co., connecting the towns of Pomeroy, Middleport and Racine was formally opened on November 14th. Mr. John Blair MacAfee issued special invitations for the occasion and the guests were entertained at a dinner served at the power house.

Contrary to American practice, where electric motors smaller than 5-h. p. are seldom used for driving machine tools, experience in Germany has shown that small motors for this purpose may be the more advantageous despite their low efficiency. Success has been obtained with alternate-current motors of 2 h. p.; with these no regulating resistance is used.

The State Association of County Auditors held its regular session in Columbus, O., recently, and declared in favor of raising all taxes for state purposes, except the school levy, by means of levies on franchises and corporations, thus making county taxation a strictly local matter. The position was also taken that machinery, power houses, etc., were taxable as real estate, and that street

railways should be taxed as chattels and returned by the annual board of equalization, rather than as realty and fixed by the decennial board.

Some months ago, on the statement of physicians that the long hours of standing were injurious to its motormen, the Pensacola (Fla.) Electric Terminal Railway Co. permitted its motormen to use stools. November 8th this rule was rescinded and the motormen at once struck. After two days a compromise was effected whereby the men won their point.

A report for two years of operation of the Grove City & Green Lawn Electric Ry., Columbus, O., recently compiled by the manager, A. G. Grant, shows half a million passengers to have been carried in the two years. There have been no accidents of any kind except the killing of one horse and one cow. The gain in receipts of the second year over the first was 14 per cent.

Sir William C. Van Horne, chairman of the board of directors of the Canadian Pacific R. R., and his son, R. B. Van Horne, of Montreal, sailed from Philadelphia for Santiago, Cuba, November 8th, where they propose to secure options on all the horse and electric railways on the island in the interest of the Cuba Co., which has been organized in Philadelphia with a capital of \$20,000,000.

The entire street railway system of the Key West Electric Co. was tied up in November by a strike of conductors and motormen for higher wages and other advantages which the company refused to grant. The strikers were aided financially and otherwise by the cigar makers of Key West and remained out for about ten days, when the matter was settled by arbitration. The company reinstated all but four of the men.

November 14th Messrs. C. W. Wetmore and George R. Sheldon, directors of the Milwaukee Electric Railway & Light Co., arrived in Milwaukee and spent several days in inspecting the system. There had been no inspection of the property for over 18 months, and the non-resident directors expressed themselves as highly gratified at the extensive improvements that General Manager Beggs has carried out in that time.

Mr. H. G. Foltz of New York City, who recently applied for rights of way for an electric line between Lisbon and Salem, O., has abandoned his original project of extending the proposed line to East Liverpool, since it was announced that the Baltimore & Ohio R. R. will build a branch from Pittsburg to East Liverpool. Mr. Foltz is preparing to build between Lisbon and Salem at an early date.

Recent storms throughout Ohio have rendered the management of local street railways difficult, traffic on the Toledo, Fremont & Norwalk Electric Ry. being impeded for several days by broken wires, and trees blown across the tracks. The storm blew down the smokestack of the Akron & Cuyahoga Falls Rapid Transit Co., at Cuyahoga Falls, which crashed through the roof of the power house and damaged the machinery to a considerable extent.

The Chattanooga Rapid Transit Co. is threatened with competition in its Lookout Mountain service. The Rapid Transit company controls the inclines up the mountain and proposes to charge passengers coming to the incline on the Chattanooga Electric Ry. the same fare as is charged for the entire trip from any part of the city over the Rapid Transit lines. The Electric Railway company states that it may build a third inclined road up the mountain.

The North Jersey Street Railway Co. is being sued by Mrs. Rebecca Jenny, of Newark, N. J., for financial loss incurred by the death of her husband, Isaac Jenny, who was killed October 20th in a collision between a truck and a car on the company's line. In her complaint Mrs. Jenny alleges that her husband was doing a business of \$150,000 a year, out of which he made large profits, and she demands as redress for the loss of her share in this income the sum of \$75,000.

THE STREET RAILWAY SYSTEM OF WICHITA, KAN.

Wichita had an electric railway as early as 1887. This was purely an experimental line, however, built under patents issued to Dr. A. W. Adams, of St. Louis, Mo., and was never a success financially. In Dr. Adams' system, a hollow copper tube took the place of the trolley wire, it being put up in 18 ft. lengths, with an overhead switch at the end of each length, to cut the sections into circuit

successor to the Wichita Electric Railway & Power Co., found itself with miles of absolutely worthless lines. The rolling stock and power station were in wretched condition, and the owners being in financial straits could do nothing toward putting the property upon a better footing. The condition finally became so bad that the city of Wichita brought proceedings in the District Court to have the road declared a common nuisance and the company enjoined from operating the property. It was asserted by the newspapers that during the course of this trial, the judge had

LOOP AT RIVERSIDE PARK.

as the car ran through them, and to cut them out when the car had passed.

In 1887, Mr. J. O. Davidson, president of the Riverside & Suburban Railway Co., who was backing the Adams experiments, purchased the Wichita & Suburban Ry., then being equipped electrically. He also bought the Valley Center Ry., operated by steam power, and consolidated the three companies under the name of the Wichita Electric Railway & Power Co.

Just previous to this period, Wichita, for some reason unexplained, attracted the attention of Eastern capitalists who purchased large real estate holdings and started a boom of gigantic proportions. City streets were extended out into the wilderness, the surrounding prairies were staked off into building lots in the

250-KW. WESTINGHOUSE GENERATOR.

to arrest proceedings every time cars passed on an adjacent street as the noise they made prevented ordinary conversation in the court room. The court granted the injunction but ordered it held non-operative for a reasonable time in order to give the company another opportunity to make repairs.

A solution of the difficulty was finally reached by the sale of the franchises and property to a new company, known as the Wichita Railroad & Light Co.

Under the new management a complete renovation has been made. Non-paying lines have been taken up; complete new rolling stock purchased and the power station remodeled and enlarged.

It is interesting to note what effect this action has had on the community. The building of the new line seems to have inspired

BRIDGE OVER ARKANSAS RIVER.

regulation "boom" fashion, and enough street railway mileage was built to fill the needs of a city with five times the population. Every promoter who laid out an addition in a cornfield, immediately proceeded to have a street railway built to his property. It is said the only income that some of these roads enjoyed was derived from enthusiastic wealth seekers who were willing to pay fare out and back in order to see the new addition.

The boom ended as suddenly as it had commenced and when the fever had died away, the Wichita Electric Railway & Light Co.,

BOILER ROOM STIRLING BOILERS.

the people with a new energy. Improvement is the word on every hand and real estate values are undergoing a steady but healthy advance. The people for the first time realize the advantage of a first class street railway. Moreover the new company is confident it has made a profitable investment. When the present owners took charge of the property, the road was carrying less than 1,000 passengers per day. The average daily traffic is now over 3,000 passengers, and there is every indication the business will continue to grow.

The total amount of 18 miles of track, laid with 70, 50 and 35-lb. T rails on new 5 x 8 in. x 7 ft. white oak and long leaf yellow pine ties spaced 2 ft. c. to c. All special work including railroad crossings was furnished by the Paige Iron Works, of Chicago, and the Indianapolis Switch & Frog Co., of Springfield, O. Overhead work consists of No. 00 trolley wire, with Ohio Brass overhead material. In constructing the line it was necessary to rebuild two

TANDEM COMPOUND ENGINE.

old bridges across the Little Arkansas River, and to build two new ones. One of these is shown in an accompanying engraving.

The rolling stock includes 22 new cars, of which 10 are open and 12 closed, mounted on Peckham 7-B trucks, equipped with G. E. 800 and G. E. 52 motors.

In the engine room is one Russell tandem compound condensing engine, with cylinders 16 and 27 x 24 in., direct connected to a 250-kw. Westinghouse direct current railway generators, and also driving a 120-kw. alternating machine, which supplies current to 181 enclosed street arc lights. In addition the plant has as a reserve unit, one Hamilton-Corliss condensing engine, with cylinder 24 x 48 in., belted to three D-62 generators, and driving one 120-kw. alternator from a 5-in. line shaft. Steam is supplied from one 300-h. p., and two 250-h. p. Stirling water tube boilers with forced draft, the fan being supplied by the American Blower Co., of De-

RESERVE POWER HOUSE EQUIPMENT.

troit. The station also contains one Cochran 700 h. p. open heater, and one Wheeler condenser. The Russell engine, the heater, and the condenser were furnished through the Arbuckle Ryan Co., of Toledo, O.

The officers of the Wichita Railroad & Light Co., are: President, Geo. F. Duncan; vice-president, John E. Burnham; secretary and treasurer, Edward Woodman; general manager, S. L. Nelson; superintendent and electrician, L. O. Williams; track superintend-

ent, W. R. Morrison. All the reconstruction work was carried on under the general supervision of Mr. Nelson, who was formerly superintendent of the Springfield (O.) R. R. Mr. Williams, also formerly of Springfield, had charge of power station work, and Mr. Morrison, late manager of the Bay Cities Consolidated R. R., directed the track construction and building of bridges.

NEW CARS FOR CAPE TOWN TRAMWAYS.

The accompanying illustration shows one of a lot of cars which have recently been shipped to the Cape Town tramways by the J. G. Brill Co. The details of construction embody the latest improvements in cars of this type. The bodies are 17 ft. long, with 5-ft. platforms, making the car 27 ft. over the dashers. The width of the sills is 6 ft. 10 in., and at the posts a trifle over 7 ft. 4 in. Stairways leading to the upper deck are of Brill pattern, which in connection with the hood protect the motorman, while they discharge the passengers on the lower deck directly at the entrance. There are 12 garden seats on the upper deck and the same number of spring cane seats and backs in the body. The lower seats are reversible excepting those in the corners, which have stationary backs.

The canopy is braced in all directions, thus giving a much greater stiffness and durability to this part of the car, which is always subjected to severe strains. The truck is the Brill No. 21 E, with the usual double journal springs and half elliptic on the extreme ends. The trim inside is of white ash with three-ply veneer

BRILL CAR FOR CAPE TOWN.

head linings. The Brill practice of using a very high railing is followed in this case, thus insuring the safety of the passenger when alighting, even though the car be in motion. The height of the car inside is 6 ft. 8 in., ample for men of rather more than the average height. There are two oil headlights, radial draw bars, angle iron buffers, a pair of Brill sand boxes and two "Dedenda" gongs. The upper deck is defended by heavy curtains at both sides and ends.

In connection with this order two cars 22 ft. in the body, of the same general type, were also purchased. The principal difference is that they are mounted upon a pair of "Eureka" maximum traction trucks, fitted with one G. E. 1,000 h. p. motor each. The larger cars are capable of making a much higher rate of speed, and will be valuable in the city and suburban service.

JOINT USE OF TRACKS IN RICHMOND, VA.

The franchise ordinance of the Richmond (Va.) Passenger & Power Co. provided that the council might grant permission for other companies to make use of the tracks. The council on November 27th granted permission for the Richmond Traction Co. to use the tracks of the Passenger & Power Co. on Main St., from 1st to 18th. In opposing the ordinance the attorney for the Passenger & Power Co. said: "If you put these two companies on Main street, it won't be a year or 18 months before one company or the other will feel the loss, and consolidation will be inevitable. There will be no competition to hold the companies down, and no 3-cent fare."

FOREIGN FACTS.

The Hyde (Eng.) Corporation is to construct and operate an electric tramway system.

A concession for building tramways in Scarborough, Eng., is asked for by the Scarborough Electric Tramway Co.

At a recent meeting the Chester (Eng.) Town Council voted to reconstruct the horse lines and equip them with electricity.

A street railway strike is in progress in the city of Lyons, France, and cars are run only under the supervision of the police.

The Lyndhurst (Eng.) Electric Lighting and Traction Co. has applied for powers to construct light electric railways in Lyndhurst and district.

Notice has been given by the Central London Railway Co. of its intention to extend its underground electric line from the Bank station to Liverpool St.

Electric traction in Dublin has proven so popular that application has been made by the United Tramways Co. for permission to build several extensions.

Two companies have been formed to build electric railways at Guadalajara, Mexico. One is composed of Pittsburg capitalists and one of Mexican investors.

A Local Government Board hearing is shortly to be given to decide upon the application of Radcliffe Corporation for powers to spend £80,000 on a street railway and lighting plant.

At Leeds, Eng., the Leeds postal authorities pay the tramway managers £500 per annum in order that postmen when on duty shall enjoy the privilege of riding free on the tram cars.

The General Electric Co., of Ireland, is applying for power to build and work light electric railways in the townships of Pembroke, Rathmines and Rathgar in the county of Dublin.

The Devonport (Eng.) Tramways Committee has instructed Mr. C. Chadwell, the borough engineer to prepare plans for the construction of electric tramways and to advertise for bids.

The Mono-rail suspension railway between Barmen and Elberfeld, Germany, was officially opened last month. This interesting installation was described in the "Review" for April 15, 1900, page 216.

The Cologne Street Railway Co. has gone out of existence. Just before dissolving the corporation the directors voted \$20,000 to be given to old employes that had been with the road for 10 years or more.

Mr. J. Clifton Robinson, an English engineer of prominence, depreciates the conduit system with an open slot, as being practically an open sewer, and advocates the overhead trolley under all circumstances.

Cable dispatches state that Mr. Frank W. Hawley, of New York, an electrical promoter, is now in London, and has offered to spend \$4,000,000 in the construction of electric surface lines in London, if franchises can be secured.

According to the London News Agency there is a strong possibility that an electric underground railway will be constructed between Victoria and Putney, Eng. The line will be called the King's Road Electric Ry.

From a report on electrical industries in Spain, published by the Spanish Government, it appears there are 443 electric power stations of all kinds in that country. The report adds that electricity is making steady progress throughout Spain, and that a large num-

ber of electric railways are now either under construction or contemplated.

The city authorities of Juarez, Mexico, have determined to secure electric traction in their city and have agreed to exempt the local horse-railway company from paying tax for five years if it will equip its lines with electricity.

At Grimsby, Eng., the telephone company is opposing the building of electric trams, because it is feared the tramway circuits will render the overhead telephone wires practically useless. It is to be hoped the Grimsby councilmen know better.

According to Mr. Monaghan, U. S. Consul at Chemnitz, Germany, Parisian capitalists are planning to build a tunnel under the Strait of Gibraltar, connecting Europe and Africa. An electric railway through the tunnel is part of the project.

The Bradford (Eng.) Tramways has proposed to new lines and extensions, which are all to be worked by electricity. The committee also asks power to convert existing routes now leased to different companies to the overhead electric system.

The city of Edinburgh, Scotland, has taken a step backward and let contracts for the erection of a cable power house to cost over £20,000. Upon the final vote in the Town Council the advocates of electric traction were defeated by a majority of four to one.

Tramway securities in Cape Town, South Africa, are evidently good investments. The Cape Electric Tramway, Ltd., has just paid its shareholders a dividend of 9 per cent., and an additional bonus of 3 per cent. The total surplus for the year ending June 30, 1900, was £56,204.

Shipments of mining and electrical machinery to South Africa that could not be delivered because of the South African war, are now going forward, and new orders from the Transvaal are coming in rapidly. The English press continues to regret that so many of these orders are coming to America.

The York (Eng.) City Council will meet this month to pass formal resolutions for taking over the local tramways, which are 3.5 miles long. The Council is to give the tramway company £12,000 for the tracks, lands and buildings, and the valuation of the rolling stock is to be settled by arbitration.

On November 15th the Town Council of Pontefract, Eng., adopted the proposal of the United Kingdom Tramway, Light Railway & Electrical Syndicate, Ltd., to establish a system of electrical trams connecting Normanton, Whitwood, Castleford, Glass Houghton, Pontefract, Purston and Featherstone.

R. F. Patterson, U. S. Consul at Calcutta, India, reports that the Calcutta Tramway Co. is preparing to change its lines from horse power to electricity. He adds that electricity is beginning to be extensively used in India, and there is an opening in that country for electrical machinery and goods that American dealers should take advantage of.

Most of the equipment for the new central power station of the Glasgow Tramways was ordered from the United States. Reports from Glasgow say practically all the material has been delivered before the contract time and the officers of the tramway company are loud in their praise of the way in which American contractors have carried out the work.

Since the Central London Ry. has been in operation, about six months, current traffic has been diverted from the old lines to a considerable extent, the Metropolitan company losing nearly £800 and the District company £1,000 per week. The effect on the stock of the old companies has been a decline in Metropolitan ordinary from 128 to 87; District 4 per cent guaranteed has declined from 135 to 90, the 4 per cent debentures from 137 to 110½, and the ordinary stock from 42¾ to 25. The Central London Ry. has inaugurated a uniform fare of 2d, and has the pleasantest and most convenient route.

PERSONAL.

MR. HENRY EVERETT, of Cleveland, sailed for Europe early in December.

MR. JOHN F. CONWAY has resigned as assistant general manager of the Brockton (Mass.) Street Railway Co.

MR. L. B. STILLWELL has been appointed electrical director of the Rapid Transit Subway Construction Co., New York City.

MR. IRVING P. LORD, president and general counsel of the Waupaca (Wis.) Electric Light & Railway Co. was a recent "Review" caller.

MR. F. HYLAND GRACE, formerly of Baltimore, Md., has been appointed assistant superintendent of the Norfolk (Va.) Street Railroad Co.

MR. THOMAS S. BELLAM, for many years treasurer of the Wilmington (Del.) City Railway Co., has retired from that office to devote his time to various private interests.

MR. W. D. RAY succeeds Mr. Bert Harter as electrical engineer of the Detroit, Rochester, Romeo & Orion Ry., a new inter-urban which will have 20 miles in operation in January.

MR. E. W. ASH who has been acting as Eastern representative of the Atlas Railway Supply Co., of Chicago, has been obliged to give up his position on account of ill health. Mr. Ash is now at Rohrsburg, Pa.

MR. NELSON GRABURNE, formerly connected with the Montreal (Que.) Street Ry., who has resided in Glasgow, Scotland, for the past year, has been appointed to an important position in an electrical company in Paris.

MR. N. W. GOODWIN, who, some years ago, was manager of the Detroit, Ft. Wayne & Belle Isle Ry., has been elected general manager of Detroit & Northwestern Railway Co. Mr. Goodwin's many friends will be glad to learn of his return to street railway work.

MR. SAMUEL LITTLE has resigned as president of the West End Street Railway Co., of Boston, and will retire from active connection with the company. Mr. Little became an influential factor in the old Highland company in 1872, and in 1893 succeeded Mr. Henry M. Whitney as president of the West End road.

MR. CHARLES E. YERKES has been elected president of the Lake Street Elevated Railroad Co. succeeding Mr. Howard Abel. Mr. Yerkes has not heretofore been connected with the railways of Chicago as an officer, though he has served as director and officer of some of the other companies in which his father has been interested.

MR. W. C. WEAVER, formerly general manager of the Ogden (Utah) Electric Ry. is taking a trip through the East on business. Mr. Weaver at one time was superintendent of the Northeast Electric Ry., of Kansas City, Mo., but a few years ago went to Ogden to take charge of the Ogden Street Ry. He was later made receiver of the road which office he held until the property was sold.

MR. D. H. LOUDERBACK has resigned as manager of Mr. Yerkes' London road and will return to America. London dispatches state that Mr. Louderback has been offered the management of the Metropolitan & District underground road which is to be equipped for electricity; this offer was declined because the illness of his wife prevented Mr. Louderback remaining in England, but the directors are said to have given him the indefinite refusal of the position.

MR. H. F. J. PORTER, of the headquarters staff of the Bethlehem Steel Co., delivered two lectures last month before classes of the Brooklyn Institute of Arts and Sciences. November 20th the subject was "The Development of the Forging Industry," and on

November 27th it was "Modern Methods of Making Steel Forgings." November 24th the first named lecture was repeated before the German Technical Society of Philadelphia. On December 8th Mr. Porter exhibited samples of turnings made by tools treated by the Taylor White process at the winter conversazione of the Franklin Institute.

MR. SAMUEL MCCLINTOCK HAMILL, president of the Siemens-Halske Electric Co., and a prominent officer of the General Electric Co., was married on November 27th, to Miss Maria Woodward Baldwin, of Baltimore. After the ceremony, which was performed at Grace Church, Baltimore, Mr. and Mrs. Hamill held a reception at the home of the bride's parents and immediately started North on the wedding tour. They will make their home in Schenectady, N. Y.

MR. HOWARD ABEL has resigned as president of the Lake Street Elevated R. R. and secretary and treasurer of the Northwestern Elevated R. R. and the Union Elevated R. R. and will go to London to take up the work on Mr. Yerkes' underground road in which Mr. D. H. Louderback has been engaged, he having been compelled to go to New York on account of Mrs. Louderback's health. Mr. Abel leaves Chicago on December 15th and will sail on the "Majestic" on the 19th.

MR. ASA M. MATTICE has been appointed chief engineer of the Westinghouse Electric & Manufacturing Co., and will enter upon his duties in December. Mr. Mattice was for 10 years up to a year ago principal assistant to E. D. Levitt of Cambridgeport, Mass., and has been actively connected with the design of all the large machinery coming from Mr. Levitt's office during that time. He was assistant to Admiral Melville at the beginning of the new navy, and had an important part in designing the machinery of the Maine, San Francisco, and other important war vessels.

MR. B. J. ARNOLD, the prominent electrical engineer and contractor of Chicago, recently had a narrow escape from serious injury while traveling from Chicago to Kenosha. He was a passenger on the Northwestern train which was wrecked by an explosion at the Northwestern station on December 3d, and had just left his seat to go to the smoking car when a heavy piece of the boiler crashed through the train just at the place he had occupied. Mr. Arnold is an officer of the Kenosha Street Railway Co., and was accompanied by a number of his brother officials. After the excitement attending the explosion had died away one of these gentlemen remarked, "That accident came pretty near making the little road at Kenosha an orphan."

MR. W. E. HARRINGTON, general manager of the Camden (N. J.) & Suburban Railway Co., has resigned his position and will take a well earned vacation before again resuming active work. Mr. Harrington was born in Wilkesbarre, Pa., June 3, 1866, and received a technical education at the University of Pennsylvania. From 1888 to 1896 he superintended the construction of electric lines at Atlantic City, N. J., Wheeling, W. Va., Camden and other cities, spending a portion of this time in the employ of the General Electric Co. and the Cutter Electric & Manufacturing Co. of Philadelphia. While with the Cutter Co. Mr. Harrington invented and perfected the full line of I-T-E circuit breakers which are extensively used in this country and Europe. In 1896 he was made general manager of the Camden roads and during the next few years he entirely rebuilt these properties and placed them upon a paying basis. Mr. Harrington is the author of several papers and treatises dealing with electrical subjects and street railway operation.

THE JERSEY CITY, HOBOKEN & PATERSON (N. J.) STREET RAILWAY CO. at its annual meeting elected the following directors: David Young, of Newark; John F. Shanley, of Newark; Dennis McLaughlin, of Jersey City; E. F. C. Young, of Jersey City; William B. Gourley, of Paterson; Randal Morgan, of Philadelphia; Gen. William C. Heppenheimer, of Jersey City; Chandler W. Riker, of Newark; Charles A. Sterling, of Orange; John R. Lee, of Paterson; Gen. Bird W. Spencer, of Passaic; William C. Shanley, of Newark; Edward L. Young, of Jersey City; A. P. Hexamer, of Hoboken; and J. E. Hulshizer, of Jersey City. All but six of these are new men. This company was

organized a year ago and is a consolidation of the North Hudson Street Ry., Paterson Street Ry., Paterson Central Electric Ry., Saddle River Traction Co., Palisades Railroad Co., White Line Traction Co., Paterson, Passaic & Rutherford Electric Ry., Jersey City, Hoboken & Rutherford Electric Ry., and Paterson Horse Ry.

OBITUARY.

MR. W. H. LAWRENCE, president of the National Carbon Co., of Cleveland, died at his home at Dover Bay, O., on November 23d. Mr. Lawrence was also president of the Brush Electric Co., and the Sperry Electric Railway Co.

MR. GEORGE L. CARRINGTON, of Albert Lea, Minn., has recently died. Mr. Carrington was engaged in promoting an electric railway for Albert Lea and Austin, and was identified with many projects for the improvement of these cities.

MR. MARCUS DALY, the "Montana Copper King," and owner of the street railway at Anaconda, Mont., died November 12th, at Hotel Netherland, New York. He was born in Ireland, was 60 years of age at the time of his death, and had made the major part of his vast fortune during the past 20 years.

MR. JOSEPH O'NEILL, the first superintendent of the Youngstown (O.) Street Railway Co., a position which he held for 15 years, died at his home in Youngstown, November 26th, after a protracted illness. Mr. O'Neill was born at Lockport, N. Y., 49 years ago, and went to Youngstown when 17 years old.

MR. JAMES AFFLECK, secretary and treasurer of the Eighth Avenue Railroad Co., of New York, and vice-president of the Ninth Avenue Railroad Co., died at New York on November 24th. Both of these roads are leased to the Metropolitan Street Railway Co. Mr. Affleck became associated with New York street railroads in 1874, under Mr. George Law, New York's pioneer street railway capitalist.

NEW PUBLICATIONS.

AN EXPERIMENTAL STUDY OF THE CORROSION OF IRON UNDER DIFFERENT CONDITIONS. By Carl Hamblechen.—This is a thesis submitted for the degree of Bachelor of Science in Electrical Engineering, University of Wisconsin, June, 1899, and published as No. 8, Vol. 2, of the Bulletin of the University of Wisconsin. Price, 30 cents.

MUNICIPAL PUBLIC WORKS. By Ernest McCullough. Published by the author, Lewiston, Idaho. Paper, 154 pages; price, 50 cents.—This work is intended as an elementary manual of municipal engineering, and appears to be admirably suited for the purpose. It treats of streets, sewage, water supply, street lighting and fire departments, plans and surveys, municipal ownership, and the city engineer. The author has had a wide experience in consulting work and appreciates the needs of smaller cities and towns.

THE "MECHANICAL WORLD" POCKET DIARY AND YEAR BOOK FOR 1901. Published by Emmott & Co., Ltd., Manchester, Eng.; 4 x 6 in., 330 pages; price 6 pence. This is the 14th annual edition of the "Mechanical World" pocket book for engineers, and the editor's preface states that much new matter has been incorporated in this issue. Considerable space has been given to the subject of Electrical Power Transmission. The usual tables to which an engineer has occasion to refer are included and also the results of much experimental work.

SPECIFICATIONS FOR STEEL BRIDGES. By J. A. L. Waddell, C. E. Mem. Am. Soc. C. E., etc. Published by John Wiley & Sons, New York; 16 mo., 178 pages, cloth; price \$1.00.—This book comprises six chapters of the author's pocket book for bridge engineers, "De Pontibus," prepared with the view of meeting the demand by draftsmen and computers for the specifications of "De Pontibus," that work being too expensive to use for speci-

fication only. Some slight modifications have been made to bring the publication up to date. The chapters included are: General Specifications for Steel Railroad Bridges, Viaducts and Elevated Structures; Specifications for Railroad Draw Spans; General Specifications for Highway Bridges; Specification for Highway Draw Spans; General Specifications for Manufacturers; Shipment and Erection of Steel Bridges, Viaduct, etc.; Compromise Standard Systems of Live Loads and Their Equivalents. Tables, diagrams and a comprehensive index complete the book.

GRADE CROSSINGS IN OHIO.

The railroad commissioner of Ohio has recently directed that the Sandusky & Interurban Electric Railway Co. put in derailing switches at its crossing with the Baltimore & Ohio R. R., the latter being required to erect crossing gates. It is believed that this is the beginning of a policy looking to better protection of such crossings.

MORE WIRE THIEVES.

Six boys have been prosecuted for stealing bonds from the tracks of the Milwaukee (Wis.) Electric Railway & Light Co. December 4th they all pleaded guilty, sentence was suspended.

A negro found with copper bonds identified as having been taken from the tracks of the Chattanooga Rapid Transit Co., is in jail at Chattanooga.

FLEXIBLE MICANITE PLATE.

The Mica Insulator Co., of New York and Chicago, after months of experimenting has brought out a new flexible sheet insulation which it calls "Flexible Micanite Plate," style "C." The company believes that for insulating transformers, armature and field magnet cores, armature slots and commutator shells, this is a most important improvement.

From tests carried out by Prof. Samuel Sheldon, Polytechnic Institute, Brooklyn, N. Y., it was demonstrated that the material would withstand 1,500 volts alternating current per mil of thickness before breaking down. Its resistivity per cu. in. in millions of megohms, at 30° C. was about 1,110; at 100° C. about 123.

MILWAUKEE IMPROVEMENTS.

At the meeting of the directors of the Milwaukee Electric Railway & Light Co., held recently in New York, it was decided to increase the common stock of the company from \$3,500,000 to \$15,000,000, the amount of preferred stock remaining unchanged at \$4,500,000, this additional capital being required to carry out the plans of Mr. John I. Beggs for the improvement and extension of the system. It is contemplated that the company will spend about \$2,000,000 annually for the next five years, the newly authorized common stock being issued as required to meet the expenditures. The improvements include additions to the power house, the erection of car houses, and extensions to the lines.

For the 12 months ending Dec. 1, 1900, the gross cash receipts of the Milwaukee Electric Railway & Light Co. from railway and lighting business were \$2,191,300, a gain of \$214,167 over 1899 and of \$429,860 over 1898. For the same period the gross receipts of the Milwaukee Light, Heat & Traction Co., which operates most of the suburban lines of the Milwaukee system, were \$291,819, a gain of \$59,310 over 1899, and \$191,214 over 1898.

These two companies own and operate 219.29 miles of track and their taxes for the year, 4 per cent on the receipts of the Railway & Light company and 2 per cent on the Light, Heat & Traction company, amount to \$93,401.

The action of the directors in adopting the recommendations of Mr. Beggs is a very gratifying recognition of his ability in managing the properties.

The Galveston (Tex.) City R. R. has been granted an extension of its franchise for the term of 50 years and \$200,000 will be expended for new equipment.

AUTOMATIC ENCLOSED ARC HEADLIGHT.

The W. R. Garton Co., of Chicago, is just putting on the market a new enclosed arc headlight for street cars for which most desirable features are claimed. The headlight has a dimming device so that the arc may be turned down when the car enters business streets. There are also adjustable buffers which permit the angle of the shaft of light to be changed. The lamp connects directly across the street railway circuit, using a minimum current of 1 ampere, with a voltage across the arc of about 280 volts. The arc, although 1 $\frac{1}{4}$ in. long, is remarkably steady and gives a splendid light. The "Multiplex" reflectors are used with these headlights. The

LEA ELECTRIC ARC HEADLIGHT.

lamp is entirely self-contained. The small amount of resistance required is placed in an apartment at the back of the lamp, instead of being placed on the platform of the car, and is easily accessible. The lamp is entirely automatic in action, it requiring no hand feed, as in some headlights. A door in the upper portion of the lamp allows ready access to the working parts. The trimming is easily performed by removing the inner globe and taking out the carbons through the bottom of the lamp. One set of carbons will burn 100 hours. These lamps are made by the Lea Electric Manufacturing Co., of Elwood, Ind., for which the W. R. Garton Co. is agent.

CELEBRATE OPENING OF NEW STREET RAILWAY.

The opening of the Collinsville, Caseyville & East St. Louis Electric R. R., November 24th, was celebrated by a banquet given by the citizens of Collinsville to the promoters of the road and other guests. The banquet was held in the Commercial Hotel, Collinsville, and 40 guests were present, those representing the street railway company being Messrs. D. M. Browning, Thomas L. Fekete, and George D. and W. G. Burroughs. The program of toasts included responses by W. G. Burroughs, Hon. H. S. Foreman, Dr. J. L. R. Wadsworth, Judge D. M. Browning, J. A. Yates and J. J. Fagin. Rapid transit between Collinsville and East St. Louis was inaugurated under the happiest auspices.

DENVER TAX CASE.

The Denver (Col.) City Tramway Co. in 1896 took the position that it was a railroad company and as such not liable to have its property assessed by the county. The state tax board's assessments were uniformly somewhat smaller than those of the county board, and the company has since 1896 paid on the state valuation. The city sued for the difference and on November 26th the lower court decided in its favor, ruling that the Tramway company was operating a street railway and not a railroad, and that it must pay the taxes as assessed by the county. The Tramway company has appealed the case.

The Skowhegan (Me.) & Norridgewock Railway & Power Co. will ask the Legislature to permit it to abandon its railway.

CURTAIN FIXTURES.

The Curtain Supply Co. desires to call the attention of the trade to the fact that it has purchased from the Adams & Westlake Co., the E. T. Burrowes Co., the Forsyth Brothers Co., and the Davis Car Shade Co., the foundation patents on curtain fixtures covering, among other styles, all the different forms of roller-tip fixtures, including both the rigid and movable heads, and that it is therefore able to supply its customers with any style or type of fixture desired, at reasonable figures, free from any claim or fear of litigation for infringement.

INTERURBAN WILL ENTER CINCINNATI.

The Southern Ohio Traction Co. will secure a direct entrance into Cincinnati, running cars to Fountain Square over the tracks of the Cincinnati Street Railway Co. before January 1, 1901. Although it has been arranged with President Kilgour of the latter company that the Southern Ohio's cars shall run over the tracks of the consolidated company into Fountain Square, the route has not as yet been determined. The Southern Ohio has already the right of way through College Hill.

PROJECTS IN MICHIGAN.

A score of companies are seeking franchises in Michigan for proposed interurban lines, which, if but half of them be constructed, will become formidable competitors of the steam roads. William A. Tateum, of Grand Rapids, has recently visited Allegan, Otsego, Plainwell and Kalamazoo in the interests of a company projecting an electric line to connect Grand Rapids and Kalamazoo; surveys have been started in Benton Harbor to the proposed line to run from St. Joseph and Benton Harbor to South Haven, to connect with the line to be built by Charles H. Chapin, of Chicago, between Benton Harbor, Mich., and South Bend and Goshen, Ind. A second interurban between Benton Harbor, St. Joseph and South Haven is projected by a company of German capitalists of Chicago.

A COMPLETE CATALOG.

The Mayer & Englund Co., of Philadelphia, announces that in compiling its new railway supply catalog, which is just coming from the press, no effort or expense has been withheld that would make the work the most complete and valuable hand book of electric and steam railway supplies ever issued; and the binding and artistic make-up are in keeping with the contents. The book contains 528 pages.

It is the desire of the Mayer & Englund Co. that every manager, superintendent and purchasing agent in the world who is interested in getting the best materials shall have a copy of the book. It will be sent upon application.

The Consolidated Railway Co., of Bay City, Mich., will erect a new car barn 100 x 206 ft. Bids were received December 6th.

The Columbia (S. C.) Electric Street Railway, Light & Power Co. has ordered four new double truck cars for its suburban lines.

December 4th, work was begun on the Hartford City-Muncie (Ind.) electric interurban. F. G. Bonnell, of Muncie, is the principal promoter.

The Brooklyn Rapid Transit Co. was assessed for \$43,000,000 capital for 1899, which it seeks to have reduced, the capital at the beginning of that year having been only \$20,000,000. The additional stock was issued at various times during the year.

It is announced that the litigation between the Atlanta (Ga.) Railway & Power Co. and the Atlanta Rapid Transit Co. and the city has been compromised. Various differences concerning the joint use of tracks by the two companies have been reconciled, and the Transit company and the Georgia Electric Light Co. will not oppose the granting of a franchise for power and lighting to the Railway & Power Co.

SERVICE STRIPES IN PITTSBURG.

It is announced by General Manager Schoepf, of the Consolidated Traction Co., Pittsburg, that beginning January 1, 1901, the employes will wear service stripes on their uniforms. A blue strip indicates one year's and a gold stripe five years' service.

INCREASED FARES ON OHIO INTERURBANS.

The Dayton (O.) & Xenia Traction Co. and the Rapid Transit Co. of Ohio, have by agreement raised the fare on both lines operating between Dayton and Xenia to 45 cents for the round trip. A rumor was recently in circulation to the effect that the Dayton & Xenia and the Rapid Transit companies would be consolidated January 1, 1901, but the report at present lacks the confirmation of either company.

STEEL TIES FROM OLD RAILS.

An experiment is being carried on by the Lake Shore & Michigan Southern Ry. that will be watched with interest by street railway engineers. The idea is to form steel ties by rerolling old steel T rails, flattening out the head and making practically an

FIG. 1.

I-beam shape, 3 in. deep, with a top flange 5 in. wide and a bottom flange 8 in. wide. Fig. 1 shows the cross section of a worn 80-lb. rail in comparison with the cross section of a steel tie it is proposed to roll from it.

The statement is made that upon a short stretch of track near Sandusky, O., built with the new ties, the results have been so

FIG. 2—FASTENINGS FOR REROLLED STEEL TIES.

satisfactory as to warrant further tests upon an extensive scale. Roadbed so constructed is reported to hold the surface, line and gage of the track fully as well or better than with oak ties, the cost of labor per mile for laying track is no greater and the cost of maintenance is less. Scrap rails are utilized and it is believed

by converting old rails into ties their usefulness can be prolonged 25 or 30 years, at the end of which time the ties will still be worth as much in the form of scrap as were the rails from which they were rolled.

The fastening device for holding the rail to the new tie consists

FIG. 3—TRACK LAID WITH STEEL TIES.

of clips of ordinary form held by bolts passed through the upper flange from below, as shown in Fig. 2. To prevent longitudinal motion projections are left on the lower face of the lower flange of each tie, under each rail seat, as will be seen from Fig. 2. For the accompanying half-tone cuts we are indebted to the Railway Age.

CANADIAN DECISION ON STOKERS.

In the Supreme Court of Canada, on December 8th, an important decision was rendered, of which The (Jones) Under Feed Stoker Co., Chicago, advises us as follows:

The action has been pending in the Canadian courts for some two years. The American Stoker Co. of New York, sold an equipment of under-feed mechanical stokers to the Dominion Cotton Mills Co., of Montreal, and the General Engineering Co., of Toronto, which is the owner of the Jones patents, charged the American company with infringement of patent on these machines, and sued it in the Exchequer Court. The Toronto company won, but a later judgment, bearing on Section 8 of the Patent Act, went against it. The section was construed to mean that when a foreign patent lapses the Canadian one also becomes void. This point was carried to the Supreme Court, and the decision is that the section should not be construed in that manner.

This judgment in favor of the Toronto company disposes of the question of the ownership of the Jones patents and puts an end to litigation between the two companies. Both companies had engaged eminent counsel, and were determined to make it a test case. A similar action is pending in the United States courts, and the decision will have an important bearing on the result.

A bill introduced in the Georgia Legislature requires street railway companies to provide separate coaches for white people and negroes.

Since the article on page 707 was printed the promoters of the Youngstown-Sharon consolidation have organized the Youngstown & Sharon Street Railway & Light Co., under the laws of New Jersey, with \$5,000,000 capital. An order for 1,350 tons of steel was given to the National Steel Co., and 40 cars have been ordered of Jackson & Sharp.

A collision between an electric car on the Southern Ohio company's lines at Dayton and an engine on the Cincinnati, Hamilton & Dayton R. R., occurred at 9:30 p. m., November 30th, resulting in injuries to the motorman of the traction car and the engineer of the locomotive, both of whom will recover. Either a slippery rail or a defective brake is believed to have rendered the electric car unmanageable and caused the accident.

ECHOES FROM THE TRADE

THE HARRISBURG FOUNDRY & MACHINE WORKS have recently installed a Cross oil filter made by the Burt Manufacturing Co., of Akron, O.

JOHN BLAIR MACAFEE, Philadelphia, has recently completed the construction of the Ohio River Electric Railway & Power Co.'s road and plant.

THE KNELL AIR BRAKE CO., of Battle Creek, Mich., has received orders for several sets of brakes from New Orleans, La., Council Bluffs, Ia., and Omaha, Neb.

THE ELECTRIC STORAGE BATTERY CO., Philadelphia, has the contract to install a storage battery for the Baltimore & Ohio R. R. at the power house of the tunnel electric line.

SOUTH AFRICA offers a desirable field for the activities of our exporting manufacturers and many of them have filled important orders there within the last few years. Locomotives, cars, rails and other railroad supplies have been furnished to the Cape Government Railways.

A SUIT against the Toronto Railway Co. by the Canadian General Electric Co. for infringement of patents on series controllers has been decided for the latter company. The Toronto Ry. is restrained from making any more of the controllers and damages for infringement will be assessed later.

THE SUIT of the Thompson-Houston Electric Co. against the Brooklyn Heights R. R. for infringement of the series-parallel controller patents of the former company has been decided and the Brooklyn Heights road directed to remove the 48 infringing controllers made by the Sprague Electric Co. which are now in use.

THE CURTAIN SUPPLY CO., of Chicago, has published its catalog "C," which describes and illustrates latest novelties in curtain fixtures, as well as all kinds and patterns of curtain fabrics. The company reports that its foreign business has kept pace with its trade in this country, and recent shipments have been made to Australia, France, Belgium, England, South America and Mexico.

THE WESTINGHOUSE AIR BRAKE CO., of Pittsburg, has issued a 22-page pamphlet describing the new Westinghouse motor-driven air compressor, which the company announces has been put on the market to supply the growing demand for small electrically-operated air compressors adapted to supply compressed air for street car brakes and train signals as well as for various other industrial uses.

A NUMBER of the technical schools have recently placed orders with the B. F. Sturtevant Co., of Boston, for the installation of mechanical draft apparatus at their boiler plants, and in several cases the fans have been so arranged as to permit experiments comparing the chimney with the fan. This may be taken as an indication that the advantages of mechanical draft are being recognized by experts.

ROSSITER, MACGOVERN & CO., of New York, are carrying on a tremendous business in second-hand electrical machinery. The concern in addition to the home trade is shipping goods to all parts of the world, particularly to Cuba for which island Mr. C. E. Dustin, president of the company sailed last month. Mr. Frank MacGovern recently returned from an extensive trip abroad in the interests of the firm.

THE AMERICAN BLOWER CO., of Detroit, in addition to its standard line of fans and blowers, makes a full line of vertical and horizontal high speed engines which have been developed with

the requirements of blower service particularly in view. The company is therefore able to supply complete the engines and all apparatus required for ventilating, heating or cooling work. The engines are described in the company's new catalog, No. 116.

PRESIDENT C. F. QUINCY, of the Q. & C. Co., says of the Paris exhibit of his company: "The principal reason for our exhibiting at Paris was for the benefit of our foreign trade and to largely increase our own agents abroad as well as the trade in general. We feel that our exhibit at Paris has been a considerable success. We know of many direct sales that have come from same, and it has encouraged our agents and resulted in much better work by them."

THE SPEER CARBON CO., of St. Marys, Pa., reports that the demand for its self-lubricating motor brushes has grown to such an extent that it is compelled to increase the capacity of the plant. It is putting in new machinery, etc., and is going into the manufacture of electric light carbons for open arc lamps, and carbon specialties. The goods are giving excellent satisfaction wherever used and the Speer company intends to keep up the quality in the future as in the past.

W. T. VAN DORN has recently issued a new illustrated pamphlet showing the latest designs of couplers for street and elevated railway cars. Copies will be sent to those interested on application. At to the maintenance charges with the couplers, James S. Doyle, master mechanic of the Metropolitan Street Ry., New York, and formerly with the Metropolitan Elevated, Chicago, states that in five years' service on the latter road the pins were renewed once and the bars shortened twice.

THE PAIGE IRON WORKS, of Chicago, announces that in order to obtain increased facilities for handling its business the plant on Ontario St. burned on October 27th will not be rebuilt but new shops will be erected at Harvey, Ill. The new buildings, which are to be completed by January 1st, will be in direct connection with the Illinois Central, Chicago Terminal Transfer, Grand Trunk and Big Four railroads. New and improved machinery and increased storage room will give much better facilities for the manufacture of switches, frogs, crossings and other special work. The Chicago office is at 917 Monadnock Block.

THE POWER PUBLISHING CO., World Building, New York, has published a "Gas Engine Edition" of the Power Quarterly in response to a demand for recent copies of Power containing matter on this subject. The Quarterly contains a complete synopsis of the gas engines in foreign countries, as shown at the Paris Exposition, including a description of a gas engine operated by blast furnace gas, a description of the leading American gas engines, editorials on the efficiency of the gas engine and its commercial advantages, and other matter relative to the industry. Copies can be had for 25 cents, upon application to the publishers.

W. T. VAN DORN, Monadnock Block, Chicago, maker of the Van Dorn car coupler, has invented a system for cleaning hot air furnace pipes in residences and flats with compressed air. The air is furnished by a portable air compressor having hose connection. When the hot air pipes in a house are to be cleaned, an air tight connection is placed over the open register in each room and a supply of air at high pressure is forced through the pipes, carrying all dust and refuse that may have lodged therein down into the basement where it is caught in a suitable receptacle.

THE FILER & STOWELL CO., Milwaukee, Wis., reports business very brisk. It has just shipped the Republican Iron & Steel Co., Youngstown, Pa., one horizontal cross-compound engine, extra heavy frame, with cylinders 44 and 82 in. in diameter

and 60 in. stroke and a maximum capacity of 6,500 h. p. There is now on the floor ready to ship one engine of 6,000 h. p., for the National Steel Co., Youngstown; this is a cross-compound, about the same size as the one first mentioned. The company is also shipping one cross compound to Chicopee Falls, Mass.; this engine has 26 and 52-in. cylinders and is rated at 2,000 h. p.

THE LABORATORIES of Geo. W. Lord, maker of Lord's boiler compounds, have been running double time for the last few months. Export business in these chemicals has increased enormously during the past year, a recent order filled being one for 300 barrels of 500 lb. each from a general mill supply dealer in Australia.

THE LARGE ADDITION to the machine shop and the new building provided for the brass foundry, boxing and brass polishing departments of the Bullock Electric Manufacturing Co., of Cincinnati, are nearing completion. When occupied they will so increase the floor space, and improve the facilities, that the capacity of the works will be nearly doubled. Many large contracts have been recently received from both home and abroad, and the company states that the present outlook for business during 1901 is even better than during the past four years. It has recently issued bulletin No. 37, which gives a list of the purchasers of Bullock apparatus, shows numerous views in the works and the various types of machines manufactured.

THE UNDERFEED STOKER COMPANY OF AMERICA, 218 La Salle St., Chicago, has one of the most effective advertising folders of the season, one of its chief merits being the terseness of the reading matter. One side of the folder is blank and upon the other appears 12 half-tone reproductions from photographs showing the plant of the Northwestern Straw Works, of Milwaukee, Wis., which is equipped with the Jones underfeed mechanical stokers, made by the Underfeed Stoker Co. The photographs were taken on October 18th, at intervals of 10 minutes, from 1:05 p. m., to 2:55 p. m., and although four return tubular boilers were in full operation there is no trace of black smoke, the only sign of activity being a faint cloud at the top of the short chimney.

W. C. STERLING & SON, of Monroe, Mich., are making daily shipments of cedar poles, ties and posts by the car load. The firm reports that this year's demand for poles and ties promises to exceed that of any previous year, for more miles of new electric railways, steam railroads and telephone lines are being built than ever before. Oak ties are becoming scarce and cedar ties are fast taking the lead as a substitute. Cedar is also superseding chestnut and other woods for trolley and telephone poles. The wide trade that W. C. Sterling & Son supply is shown by the statement that last month they made deliveries to 36 telephone companies, 18 electric light plants, 27 electric railways, two telegraph companies, and six gas pipe lines. Among recent customers are the Dover Construction Co., which is building an electric railway between Findlay and Fostoria, O.; Chase Construction Co., of Detroit, building between Dayton, O., and Greenville; Jackson (Mich.) & Suburban Traction Co.; American Railway Co., building from Joliet to Chicago; Smithurst & Allen, of Philadelphia, building between North East and Erie, Pa.

Deegan & Co., of Philadelphia, have been awarded the contract for the construction of the Elkton (Md.) & Chesapeake City Electric Ry. The line is to cost \$126,400, and will be completed by Jan. 1, 1902.

A street railway freight service between the cities of Gadsden, Ala., Alabama City and Attalla will be inaugurated. The freight car has been completed by the Southern Car Co., of Gadsden, and dynamos and other machinery necessary for its operation will be purchased by Marcus Foster, jr., of Gadsden.

A car despatcher by the name of Stringer, in the employ of the Portsmouth (Va.) Street Railway Co., was wounded in a fight with R. A. Woods, a motorman, December 1st. A dispute arose at the company's barns, and Woods attempted to cut his adversary's throat. Stringer will recover, and Woods is under arrest.

TRACK MATERIAL QUOTATIONS.

The demand for steel rail continues strong with no recent changes in prices. It is estimated that the mills have now on their books for 1901 delivery between 300,000 and 600,000 tons. Heavy standard sections are quoted at New York and Chicago at \$26; light sections, \$25.50 to \$28. At the Eastern mills girder rails are quoted \$38 to \$38.50.

G. S. Baxter & Co., of New York, are selling yellow pine ties as follows: 7 x 9 in. x 8½ ft., 61 cents; 6 x 9 in. x 8 ft., 56 cents; 6 x 8 in. x 8 ft., 50 cents. Lindley Bros. & Co., Menominee, Mich., quote standard cedar ties at 26 cents; hemlock at 20 cents.

TIME IN DETROIT.

The city council of Detroit prefers local time and though the number of factories and other concerns that have adopted standard time is growing, the Detroit street railways announce that they will continue to use local time until the council otherwise directs. The corporation council has rendered an opinion that unless otherwise specified in the ordinance the mention of an hour in a city ordinance means that hour standard time, standard time being the legal time of the state. The question of what time is meant arises in limiting transfers and workmen's cheap tickets.

The Duluth (Minn.) Street Railway Co. has purchased 12 new double truck cars to be operated between Duluth and West Superior, Wis. The cars are equipped with the Baker steam heater and all modern improvements. The company has completed the work of relaying a large part of its tracks with heavier rails.

NEWS NOTES.

RIGHTS OBTAINED.

PALMER, MASS.—The Palmer & Monson Street Railway Co. proposes to construct a double track extension from Forest Lake Park to a point on the Thorndike road. A private right of way has been secured. D. F. Burritt, general manager.

PHILLIPSTON, MASS.—The Phillipston Street Railway Co. has secured most of the rights of way for its proposed line, surveys have been completed, and a number of the contracts let. M. K. Kendall & Co., 6 Oliver St., Boston, have been awarded the contract for the overhead work, and the contract for the construction of track, including culverts, retaining walls, and grading has been awarded to Arthur Hodges, 8 Exchange Place, Boston. This line will be 1½ miles long and will include Phillipston, Templeton and Athol on the route. The president of the company is Patrick H. Hirsch, of East Templeton.

NEW HAVEN, CONN.—The Fair Haven & Westville R. R. Co. has been granted a franchise by the council of New Haven for its proposed extension to the Yale field, and has also secured permission to double track its Congress Ave. line. Walter A. Graham, superintendent.

ROME, N. Y.—The Rome City Street Railway Co. has secured a franchise to extend its line over several streets in that city. J. W. Brown, general manager.

CHILlicothe, O.—The county commissioners of Pickaway county, O., have granted a franchise through that county to the Chillicothe, Mt. Sterling & Columbus Electric Railway Co. The building of this road has been a matter of some doubt heretofore, but affairs are shaping themselves in such a manner now that it is believed its construction in the near future is a certainty.

COLUMBUS, O.—The Columbus-Portsmouth Electric Ry. will run from Columbus through Shadeville, Lockbourne, South Bloomfield, Ashtabula and Chillicothe to Portsmouth. Floyd McCormick, of Columbus, is the principal promoter, and is rapidly securing the necessary rights of way.

GENEVA, O.—P. W. Tuttle and C. W. Goodrich have secured all the rights of way for their proposed electric line from Geneva through Jefferson and Andover to Meadville, Pa. All preparations have been made for the construction of the road, which will be commenced at once. The company's headquarters will be located in Geneva.

CLEVELAND, O.—Captain E. J. Kennedy, of Cleveland, is securing rights of way for the proposed extension of the Cleveland, Elvria & Western Electric Ry., from Berea to Medina, and has obtained options on private rights of way for over half the distance.

RICHMOND, VA.—Judge J. L. Haner, of Cleveland, O., is interested in a project to build an electric line between Richmond and Petersburg, and has, it is announced, secured options on the franchises and property of the old Richmond & Petersburg Electric Railway Co., which was chartered by the Virginia Legislature several years ago. This company surveyed the route and built a short piece of track. It has until March 3, 1901 to complete the line and operate cars between Richmond and Petersburg. Judge Haner proposes to complete the line before that date.

GRAND RAPIDS, MICH.—Press reports state that Lon's C. Howard, of Grand Rapids, has secured franchises for the proposed electric railway to connect Grand Rapids, Lowell, Saranac and Tonia and that the Grand Rapids & Eastern Traction Co. is being organized to build and operate the line. A power house will be located at Lowell and a substation at Cascade.

THE P & B

DENOTES THE WORLD'S STANDARD

P & B ELECTRICAL COMPOUNDS

The Standard for General Insulation. Quick Dryer, Penetrating, Elastic, Tenacious.

P & B ARMATURE AND FIELD COIL VARNISH

Made of Highest Ingredients. Elastic, Moisture Proof, Unaffected by Oil or Great Heat.

P & B INSULATING TAPE

No Rubber—Will not Vulcanize with Heat, or become Defective with Exposure and Use.

ALL THE ABOVE ARE ACID AND ALKALI PROOF.

Write us about them.

BLUFFTON, IND. J. M. Gore, who is promoting the Indiana-Ohio Electric Ry., has announced that eastern capitalists have furnished the necessary funds for the construction of that line, and work will be commenced at once. Franchises have been secured for a proposed extension from Defiance to Hicksville, O. A proposition is under consideration for a branch of the Indiana & Ohio line to connect Defiance, Bowling Green and Fremont.

URBANA, O. The Urbana, Mechanicsburg & Columbus Electric Railway Co. has obtained a franchise in Columbus for a line to be built on Dublin Ave., Spring, Water and Gay Sts. This company holds franchises through Franklin County, and its proposed extensive system is to be in operation by October 1, 1901. H. A. Axline, president, and Calvin McDonald, secretary, Columbus.

NEWPORT NEWS, VA. The Hampton Roads Railway Co., which proposes an electric line to run from Newport News to Phoebus and Old Point Comfort, as was published in the "Review" bulletin October 25th, has secured a franchise from the council of Phoebus, which has not, however, as yet been accepted. If the objectionable provisions in the franchise shall be set aside the company will build without delay between Newport News and Phoebus. W. J. Nelms should be addressed.

KANSAS CITY, MO. J. P. Gibson, of Philadelphia, and George Gibson and C. W. McGahan, of Kansas City, are promoting a 100-mile electric line to connect Kansas City and St. Joseph. The road, as proposed, will pass through Platt City, Parkville, Dearborn, Faucett and Camden Point. All rights of way have been secured with the exception of about three miles near Camden Point, and the survey, preliminary to the incision of the line, has been commenced this week. It is proposed by the company to run trains every two hours night and day, between St. Joseph and Kansas City, and to reduce the fare now charged on steam roads between these points by over one-half. The line will be entirely in Missouri and will have no connection with the Kansas City Leavenworth line. The company proposes to establish several parks and places of amusement along the route. J. P. Gibson, it is reported, represents an eastern company and will furnish the financial backing for the enterprise.

ST. CHARLES, MO. The city council of St. Charles has granted a franchise to the St. Louis, St. Charles & Western Railway Co. The promoters, who operate a line between Wellston and Pattonville, propose to build a highway bridge to connect the two lines.

MARSHALL, TEXAS. A. R. Wheeler & Co., of St. Louis, Mo., have been granted a 50-year franchise for the construction and operation of an electric street railway system, in Marshall.

NEW BEDFORD, MASS. The New Bedford & Onset Street Railway Co. has secured franchises through Mattapoisett and Wareham and will survey the proposed route at once, preparatory to the construction of the line. H. H. Crapo, New Bedford, may be addressed.

BIDDEFORD, ME. The Atlantic Shore Street Railway Co. has been granted permission by the railroad commissioners to build an electric line

from Biddeford to York Beach, where connections will be made with the Portsmouth, Kittery & York Street Railway Co. C. A. Bodwell, of Sanford, general manager, may be addressed.

GLENS FALLS, N. Y. The Warren County R. R., of which J. A. Powers, of Lansingburg, is one of the principal promoters, has obtained a franchise from the board of county commissioners to build and operate a street railway through Glens Falls.

GENEVA, ILL. The Aurora & Geneva Electric Railway Co. has secured an entrance into Geneva and has now rights of way as far as the county court house. The line will be completed and in operation in the early spring.

CIRCLEVILLE, O. Adam G. Grant, of Grove City, O., has received a franchise in Circleville for an electric railway to run from the Franklin County line to Morgan Station. The road will be an extension of the Columbus & Grove City Ry.

J. M. Wilson, representing the Columbus & Southern Electric Railway Co., received a franchise in Circleville for the proposed line to Washington Court House.

WARRENSBURG, N. Y. A syndicate headed by Joseph Powers, of Troy, and Addison B. Colvin, of Glens Falls, is preparing to build connecting links in a chain of electric railways whereby a continuous trolley trip from Albany and Troy to Warrensburg, 65 miles north, will be possible. Rights of way through Glens Falls have been obtained and the proposed line will run from there to Lake George and thence north. Thirty or 40 miles of single track, overhead trolley line will be built to connect the existing lines between Albany and Warrensburg, and later, a long extension to Schroon Lake is projected. The electric power dam being built across the Hudson eight miles above Glens Falls at a cost of \$1,000,000 will probably supply power for the operation of the Powers-Colvin line. Lines between Troy and Greenwich have already been acquired by the promoters.

WALTHAM, MASS. The Waltham Street Railway Co. has secured rights for the extension of its line from Prospect St. to the Watertown line and has petitioned for locations through Linden, Beaver and Quince Sts. Fred C. Hinds, 58 State St., Boston, may be addressed.

INDIANAPOLIS, IND. Two franchises have been granted by the commissioners of Marion County. The first, to Nathaniel N. Morris and G. C. Webster is for an electric railway on the National road from Indianapolis to the county line, to be in operation by March 1, 1902. The second, secured by representatives of the Union Traction Co., of Anderson, is for an electric line from Danville along the Rockville road to the county line. Charles L. Henry, Anderson, may be addressed.

BANGOR, PA. It is announced that contracts will be awarded within 60 days for the construction of the Bangor, East Bangor & Portland Street Railway Co.'s proposed line. This company was mentioned in the "Review" bulletin November 22d as having been incorporated to build a nine-mile line through Northumberland County. All rights have been secured and the company is now receiving bids for the construction of the road and the power house. E. P. Buzzard, of Bangor, may be addressed.
