During the year we had a few more trade demonstrations than usual, and some, I think, were successful evenings. We had the following:—"Kachin;" the Kromaz System of Colour Photography; The "Tella" Camera; Vicol; Wellington Film; Sandell Films; "Gravura" Paper.

Amongst other papers, we have had the following:—"Wholesale and Rapid Development," Messrs. Human, Walford, and Crawford; "An Easy Method of Stripping Films," Mr. F. Kellow; "Elementary Composition and Perspective," Mr. W. R. Stretton; "Photogravure," Mr. E. Hunt; "The Art of the Developer," Mr. E. Human; "A Few Notes on Photographic Optics," Mr. J. W. Hodges; "The Amateur from Behind the Dealer's Counter," Mr. T. Wright; "Photographic Notes of a Naturalist," Mr. T. E. Freshwater; "The Projection of Colour," Mr. T. E. Freshwater.

If any one subject can be set down as prominent in this year's discussions, I think we can safely apportion that honour to development questions, a sound or two of theory and a few tons of the practical.

The annual supper took place on February 15, when forty members and friends spent an enjoyable social evening, with Mr. Thomas Bedding presiding, Mr. H. Vivian Hyde in charge of the musical arrangements.

Turning now to the financial position of the Association, that is also very satisfactory. We have a larger balance in hand than last year. Our reserve fund has gone down slightly owing to the cost of new lantern lens and alterations to the front being defrayed from it. But with the cash in hand and at the bank we have a total of 30*l.* 4*s.* 4*d.* to our credit.

I think we owe a good deal to the photographic papers for various kindnesses, and especially to THE BRITISH JOURNAL OF PHOTOGRAPHY for their excellent reports of our meetings.

Finally, on my own behalf I have to thank many members for the kind support and sympathy so necessary to the welfare of this Association, and so helpful to your Honorary Secretary.

A motion for the acceptance of the report and balance-sheet was carried unanimously.

The election of officers, &c., then took place. The result was announced as follows, Messrs. Featherstone and Wright acting as scrutineers of the ballot:—*Trustees*: Messrs. A. Haddon and J. B. B. Wellington.—*Committee*: Messrs. R. Beckett, R. P. Drage, T. E. Freshwater, J. E. Hodd, J. W. Hodges, A. Mackie, H. C. Rapson, J. S. Teape.—*Curator and Lanternist*: Mr. Heskins.—*Recorder*: Mr. Featherstone.—*Librarian*: Mr. E. T. Wright.—*Hon. Secretary and Treasurer*: Mr. Walter D. Welford.

Votes of thanks to the retiring officers and committeemen, the auditors, scrutineers, and the press were carried, with the usual speeches and replies.

Mr. R. P. Drage, after the formal business, commenting on a film negative shown by Mr. Human as what could be done on an old film, said that a celluloid film, in his opinion, gradually gave up its light impression from the moment after exposure. In other words, its retentive power was inferior to that of a plate, although in other respects it may be all right.

#### PHOTOGRAPHIC CLUB.

JUNE 27.—Mr. Hans Müller in the chair.

Mr. WASHINGTON TEASDALE, of Leeds, showed several eclipse photographs taken in India. He also passed round an original contact print of negative of the sun, half of which was hidden by a church steeple. The effect was very strange, the complete circle and a kind of halo being visible. A half-tone reproduction in the *Photogram* was also shown, and the two compared, the reproduction being very good. Other half-tone reproductions on paper and card were shown, as also some small collotype reproductions of very good character. A general discussion ensued, and some interesting points were brought forward.

**Hackney Photographic Society.**—At the meeting on the 26th ult., Dr. BURTON gave a most interesting lecture on

#### SKIAGRAPHY,

and showed the great value of the X rays in surgery and the diagnosis of disease. As a discovery for the alleviation of pain, he considered it next in importance to the introduction of anaesthetics and antiseptics.

**North Middlesex Photographic Society.**—June 25,—Mr. J. MacIntosh in the chair. In the unavoidable absence of the lecturer for the evening, a general discussion on technical matters took place. Several questions were asked as to details in carbon printing. One relating to getting prints on to rough paper by the double transfer process resulted in a suggestion by the Chairman to try thin waxed paper as a temporary support, from which no difficulty need be anticipated during the development, and its flexibility would enable perfect contact to be secured with the rough paper support. Mr. H. W. Bennett had previously secured good results by sizing the rough paper with a fairly thick coating of gelatine and chrome alum, which swelled up in warm water and gave perfect contact.

#### FORTHCOMING EXHIBITIONS.

1900.

July 9-14 ..... Photographic Convention of the United Kingdom (Newcastle-on-Tyne Meeting). Hon. Secretary and Treasurer, F. A. Bridge, East Lodge, Dalston-lane, London, N.E.

July 12 ..... Beverley. Hon. Secretary, T. J. Morley, Toll Gavel, Beverley.  
 August 21..... Royal Cornwall Polytechnic Society. W. Brooks, Laurel Villa, Wray Park, Reigate.  
 Sept. 21-Nov. 3 ..... Photographic Salon, Dudley Gallery, Piccadilly. Hon. Secretary, R. W. Craigie, Camera Club, Charing Cross-road, W.C.  
 October 1-Nov. 3 ... Royal Photographic Society, New Gallery, Regent-street. The Hon. Secretary, 66, Russell-square, W.C.  
 November 12-17 ..... Ashton-under-Lyne.  
 " 21-23 ..... Hackney Photographic Society.  
 1901.  
 January 14-19 ..... Blairgowrie and District Photographic Association. The Hon. Secretaries, Blairgowrie, N.B.

Those who desire to send photographs to the above Exhibitions should write for prospectuses to the Hon. Secretaries, whose addresses are given in the second column above. The dates mentioned are those at which the Exhibitions open.

## Answers to Correspondents.

\* \* All matters intended for the text portion of this JOURNAL, including queries, must be addressed to "THE EDITORS, THE BRITISH JOURNAL OF PHOTOGRAPHY," 24 Wellington-street Strand, London, W.C. Inattention to this ensures delay.

\* \* Correspondents are informed that we cannot undertake to answer communications through the post. Questions are not answered unless the names and addresses of the writers are given.

\* \* Communications relating to Advertisements and general business affairs should be addressed to Messrs. HENRY GREENWOOD & Co., 24, Wellington-street, Strand, London, W.C.

#### PHOTOGRAPHS AND PAINTING REGISTERED:—

T. N. Langton, 539, Attercliffe-road, Sheffield.—Two photographs of Miss Lillian.

Catherine Edmonds, 118, Westbourne-grove, W.—Photograph of Mrs. Flora Annie Steel.

Miss A. M. M. Swiney, Hartington House, Herne Bay.—Oil painting entitled, "The Sacred Heart."

The Worthing Portrait Company, 4, Railway-approach, Worthing.—Photograph entitled, "For Queen and Country." Photograph entitled, "When will you come back, daddy?"

GRASSINGTON (Bacup).—A very good negative, though the light is somewhat flat.

THE RHONDDA ART CO.—Send us the address of the firm, and we may be able to help you. We cannot do so without.

J. K. S.—The photographs are good, clever, and interesting. You should be able to dispose of the copyrights for Christmas almanac purposes.

SIGMA.—1. The formula is for plates fogged or light-struck before exposure. 2. We do not give such recommendations. Better examine the instruments yourself and make your own choice. You must not expect too much for that amount.

FAULTY LENS.—R. J. C. If the R.R. lens you have purchased, supposing its focus is ten and a half inches, will not yield a sharp image on a quarter-plate with its full opening, it must be a very bad one indeed. We cannot say how you can improve it without knowing more about it.

HOWARD BARRETT.—1. For the kind of negative it appears to be, we do not think you could do better than use a surface paper. 2. We do not think the print good enough for any but the most elementary competition. Our publishers have written you in regard to the registration.

DOYEN'S CAMERA.—R. MATHEWS writes: "Will you kindly inform me where Doyen's camera to focus by double reflection may be bought in London? I saw the notice of it in the ALMANAC for 1889, on p. 854."—In reply: To the best of our knowledge, the camera referred to is not on the English market.

ADDRESS WANTED.—W. S. MALKIN writes: "Would you kindly supply me with the address of M. Denayrouze, inventor of the new incandescent lamp without gas? I got the name from the *English Mechanic* of January 12, 1900, as taken from your JOURNAL."—In reply: Some Parisian reader might be able to supply the address asked for.

MACHINERY FOR MANUFACTURING P.O.P.—P.O.P. writes: "Would you kindly oblige me with the name and address of agents or manufacturers from whom I may obtain the requisite plant for the manufacture of printing-out paper?"—Flimsch & Co., Offenbach-on-Main, Germany, are manufacturers of emulsion-coating machines. We do not think they have an agent in this country.

BLOOD ALBUMEN.—S. WRIGHT asks: "Where can I get half a pound or so of blood albumen, and what is its price?"—We do not know where it is to be obtained in small quantities. It is usually dealt with in large bulks. It may possibly, however, be obtained at some of the drysalers' and those who supply dyers' materials. Messrs. Skilbeck, Upper Thames-street, we believe, supply it, but we do not know if they sell it in retail quantities.

**PROCESS BLOCKS.**—COUNTRYMAN says: "The church magazine of our village has ordered from me six process blocks from my negatives of the exterior and interior of the church for the Christmas number. How can I make them, or would it pay me better to get them made? The blocks will be about  $5 \times 4$ ?"—Better get them made by one or other of the many process block-makers, as you do not know anything of the process, and have not proper appliances.

**PAINTING A STUDIO.**—J. C. writes for advice as to the painting (outside) of a photographic studio. He adds: "I find the usual way of puttying and painting lasts only a little while, and then lets the rain in."—Nothing is better than the ordinary puttying and painting, if the work be properly done; but, unless the sash bars are perfectly rigid, under a strong wind nothing will make the roof water-tight for any length of time. Perhaps that is the cause of the trouble in your case.

**THE HOFFMAN SYSTEM OF TRICHROMATIC PHOTOGRAPHY.**—F. H. writes: "In your issue of June 22 you give a short account of Hoffman's trichromatic photography, and say that the apparatus is being placed on the market. Can you tell me where this can be obtained in England, or, if not, the address abroad?"—In reply: The apparatus is not obtainable in England, and probably will not be introduced here. We suggest that you address the author, care of his publisher, whose address is given in the first paragraph.

**FLASHLIGHT FORMULA WANTED.**—M. PAUL writes: "Could you give me the formula of a good and safe flashlight powder, such as are so extensively used on the Continent for studio work? Aluminium, I believe, enters largely in their composition."—We know of no formula for a really safe flash light. They are all more or less dangerous at times, and those times, unfortunately, are when danger is least suspected. We should recommend you to use one or other of the flash lamps, with either magnesium or aluminium powder by itself.

**ADDRESS WANTED; COST OF A PATENT.**—J. SPEIGHT asks for (1) the address of a manufacturer of glass funnels for chemical purposes; (2) the cost of a patent.—1. All photographic-apparatus warehouses supply glass funnels, so do all who supply chemical apparatus. We cannot give the names of manufacturers. Most of the glass funnels, we believe, are made abroad. 2. Four pounds for four years, if you take the patent out yourself. If you employ a patent agent to do the work, his fees will, of course, be in addition to that sum.

**FORMULÆ WANTED.**—A. H. TYLER writes; "1. From whom can I obtain a paper suitable for coating with emulsion (gelatine)? 2. Can you give me, or refer to, a formula to make a slow developing-out paper?"—1. From Messrs. Otto König & Co., 27, Cross-street, Finsbury, E.C. 2. The makers of the developing-out papers do not publish their formulæ; they treat them rather as secrets. We expect you will have to work one out for yourself. Formulæ for bromide emulsions will be found on pp. 976-976 of the ALMANAC. These may help you somewhat.

**CLEANING AN ENGRAVING.**—THANKFUL says: "I shall be very thankful if you can tell me how I can clean an engraving. The most objectionable marks are, like water markings, a little yellow. The margin is the principal part to be cleaned."—If the dirt is slight, it may possibly be cleaned off with the crumb of a loaf; if not, the print must be "cleaned," *i.e.*, bleached by the action of chlorine. If you have had no experience in this kind of work, we should advise you to put the print into the hands of a print-restorer, that is, if it is of any value. An engraving may be easily ruined in the hands of a novice.

**ASSIGNMENT OF COPYRIGHT.**—J. W. OAKLEY writes: "On November 12 last you registered a photograph of Eastleigh Town Hall for me. I think I shall want to assign the copyright. I shall esteem it a favour if you would kindly answer the following questions: If I assign, must I get a form from Somerset House, or will a stamped agreement form answer the purpose? If I must get a form from Somerset House, will you kindly tell me what I must send for it?"—No special form is necessary, but the assignment must be in writing, and signed by the owner of the copyright or his agent. See page 630 of the ALMANAC.

**PUBLIC PHOTOGRAPHY.**—J. G. W. writes: "My brother was walking with a lady on a public promenade (the Hove Lawns) on a recent Sunday, and his portrait, with that of the lady, was included in a cinematograph series of pictures being taken by a local photographer. As the two people did not notice the camera, they walked almost up to it, and appear very prominently. The pictures are exhibited at a local music-hall, and appear to be a source of annoyance to the parties concerned. Can the exhibition of these photographs be legally restrained?"—In reply: No. In our opinion no English Court would sustain you in your objection.

**LENS QUERIES, &C.**—BADEN POWELL writes: "1. I have two uncorrected lenses, 6 inches focus. What is the right distance the stops should be in front of the lenses? they are  $1\frac{1}{2}$  diameter; also whether should the flat or curved side look to the view? They are for stereoscopic views. 2. What is the right distance the dry plate should be nearer the lens than the focussing screen. Will they take as good views as corrected lenses? 3. How is it that some views look as well in the stereoscope, although you put the right-hand view to the left side? 4. What is the right number of grains of magnesium powder and the number of grains of chlorate of potash to expose an Imperial special rapid plate,  $f=18$ , seven feet from sitter?"—1. The flat side should be next the views. Fix the stops about one-and-an-eighth of an inch from the lenses. 2. About the thirtieth of its focus. 3. We should recommend you to read the article in the ALMANAC on the stereoscope. That will enlighten you on stereoscopic photography generally. 4. We cannot say, as we have not made any experiments in that direction. We should, however, advise you to be very careful in dealing with the mixture, for fear of an accident.

**COPYRIGHT QUERIES.**—PAINTER writes: "I should be much obliged if you would kindly inform me—1. How one can tell if a photograph is a copyright? Are all such marked plainly that they are so? 2. Has a painter the right to copy any celebrity from a photograph when there is no sign that the photograph is a copyright or not? 3. What is the good gained by copyright?"—In reply: 1. By searching the register at Stationers' Hall. A photograph marked "copyright" is not necessarily registered. 2. No; he runs the risk of being sued for infringement of copyright. 3. The good? Judge for yourself. The Act of 1862 was passed for the purpose of enabling the author of a photograph to protect his own interest in it.

**FOGGED NEGATIVE.**—WALTER MACFARLANE writes: "I have a negative of a three-quarter figure beautifully exposed, lighted, &c., all in white against a dark ground, but one end of negative, fortunately away from figure, is slightly fogged. It was the first of a box, and used immediately, so I think I am free from fault myself; but, as the fog does not obliterate the detail of the picture, can I in any way reduce that part to equal density with the rest? I have an idea I read of using alcohol absolute for reducing halation, &c., which would answer the same purpose in my case, in your paper some while back."—We doubt if the treatment proposed will remove the fog, or that any other will effectually, but it may be tried. We should say that the best thing would be to vignette the picture in printing, and have it as a vignetted portrait.

**STAINED NEGATIVES; COPYING A DRAWING.**—MONMOUTHSHIRE writes: "Some time ago I took six splendid negatives of groups, and in my hurry I mixed up developer with washing soda and pyro, instead of sulphite of soda and pyro, and developed all six negatives before I noticed what I had done. Now all my negatives are a bright red. I have tried alum, and it will not touch the stains. Will you kindly tell me how to remove the stains? It takes a fortnight to get off a print. 2. I have a drawing (pencil) to photograph. Will you kindly tell me how to keep the lines black and paper white? I have copied two negatives, and they come out all one colour."—1. The only thing we can suggest is that you try one of the clearing solutions given on pp. 969-967 of the ALMANAC. 2. Use a slow plate that gives great density, such as those supplied for photo-mechanical work. Do not over-expose, and develop so as to get good density.

**VALUE OF AN OLD ENGRAVING; STUDIO BLINDS.**—S. PORTER writes: "1. A friend of mine has shown me a picture which he has not long since picked up at a sale. It is either an old steel engraving or an old print, and he thinks there is value in it. I enclose you a little description of what he thinks is of the original painting, which he has given me. I have also made a copy of it for you to see. Will you be good enough to give me your opinion on it? 2. I have recently had my studio painted out. The light is north-east, with sun only on the top light. What colour blinds are most suitable? I am thinking of having light green for the top, which run on rollers, and a medium blue for the sides. Can you say what the material would be called in asking for it at a shop? Would any white blinds be required as well?"—1. We can give no idea of the value of the engraving, though we should say it is not much. Better submit the engraving to a picture dealer. 2. The proposed blinds will do very well. Window holland is, we think, the name of the material. White blinds will not be necessary with that aspect.

**USING A TENT FOR PHOTOGRAPHY, &C.**—J. C. LANE writes: "Will you please tell me if I can utilise this tent (photograph enclosed) for photographic purposes? Stands on top of hill, with large expanse of country in front of it, fifty miles or more. Sun on it all day. Light could be let in at top by oiling where a piece has been tried. White calico could be put thereon with sloping tops. Front side might be screwed on. No other place for it. The ground is a little uneven, but tripod leg slipped, when slide came out, and made it worse. Is there any better method of taking doubles than shifting piece of wood at back of camera, taking half at a time? Taylor's duplicator does not answer for use of a shutter, and this is all-important to have both sides with equal exposure."—We should say that the tent could be used if the open side were fitted with, say, blue curtains at the open sides, and the camera placed within the tent. By this means it would practically be converted into a studio. The arrangement mentioned is the simplest in the market. Of course, the two pictures must be taken separately, and there is no difficulty in giving equal exposures to each.

**STUDIO REPAIRING.**—A. T. writes: "Noticing in your issue of June 22 a reply to correspondent *re* studio repairs, does a repairing lease mean repairs of whatever nature must be done by tenant? The terms of my lease are that the landlord binds himself to keep premises wind and water-tight, but all internal repairs to be done by tenant. Strange to say, the day before I noticed your answer to correspondent *re* same, I had sent word to my landlord to see to glass roof of studio, as it was leaking through some panes of glass being broken, also leakage from back through loose slates. Landlord sends slater, but also sends word that I must see to the glass myself. Now, it distinctly says in my case (it is a lady), 'Mrs. — or Law also binds and obliges herself and her aforesaid to keep the said house wind and water-tight during the whole currency of this lease.' What steps can I take in the event of her not making roof good? I have been her tenant for five years, and she has always done repairs in glass roof before. The only way that I can account for her taking up this attitude (which I scarcely think is by her sanction) is, that I learn she is in bad health and not able to attend to business, so that it is through some other party that this reply has been sent me. However, I have nothing to do with that."—Yours does not appear to be a repairing lease, so far as the outside of the building is concerned. But how far the landlord is responsible for broken glass we cannot say. We doubt if it is his place to repair a broken window, and the roof of the studio is simply a window.

### EX CATHEDRA.

By one of our weekly batch of patent specifications we perceive that an old fallacy with regard to obtaining stereoscopic effects from monocular photographs has been revived. The Rev. A. C. Pearson, M.A., has devised means for viewing photographs and pictures "whereby any single photograph or picture is seen through one lens or prism in similar relief to that attained by the use of the double photographs and two lenses in a stereoscope. He constructs a boxlike frame of such a shape as to fit close to the face, and so form a dark chamber, shielding the eyes, and provided with suitable lenses. He also provides a means whereby one or other of them may be shut off at will, so that the picture is visible to one eye only, and stands out in bold relief. The means employed for shutting off the lens may consist of a simple flap formed from sheet metal or other material, pivoted or hinged so as to have a swinging movement, permitting it to cover either the right or left-hand lens, as may be desired." The invention, in fact, simply consists of an American form of stereoscope with a

movable flap to obscure either of the oculars at pleasure. But looking at a single photograph through a stereoscope does not, and cannot, give true binocular effect. In nature the eyes see two distinct images, and two distinct, separate photographs must be presented to them when it is sought to represent nature in miniature relief by the aid of stereography. The employment of one eye, as suggested in the invention, for looking at single photographs is an idea at least as old as Sir David Brewster, whose theory was that the elimination of reflected light gave monocular relief—a very different thing to the stereoscopic effects claimed by Mr. Pearson.

\* \* \*

ELECTRIC head-light photography forms the subject of an interesting illustrated article in a recent number of the *Scientific American*. The writer points out that in many portions of the Southern and Western States the railroad tracks are not separated from the adjoining fields and grazing lands by fences, and it is a common practice for the farmers to allow their live stock to run at large. As a result, the railroad companies are compelled to pay large sums annually for cattle and hogs which have been killed by passenger and freight trains, and a number of serious accidents have occurred, due to derailment. The Central of Georgia Railway traverses a very large area of low-level country, and until the adoption of the electric head light the engineers were obliged to use the greatest caution in running at night, and on some occasions it has been necessary to stop the trains and send men ahead to drive live stock from the track. Engineers were under orders to run trains slowly through the grazing districts, as on a dark night they could see but a few hundred feet of the track ahead, the oil head light being of very limited range.

\* \* \*

By using the electric head light the length of vision had been greatly increased, remarks the writer, objects being plainly perceptible at a distance as over half a mile under favourable conditions of the atmosphere. In the reproduced photographs, such small objects as bridge warnings, posts, &c., along the right of way were distinctly visible at a distance of several hundred yards, so intense is the illumination, while a

broken rail or a displaced switch would be visible in time to mitigate, if not entirely avert, disaster. The photographs reproduced were taken by the light of the electric head light along the line of the Peoria, Decatur, and Evansville Railway. The negatives were exposed for about forty minutes. The light furnished is of the arc type, requiring carbon burners. The electricity is generated by an ordinary dynamo, operated by a Pyle compound steam turbine of  $1\frac{1}{2}$ -horse power. The light with a good reflector equals about 8000 candle power. The dynamo and turbine are attached to the top of the boiler between the head light and the smokestack. Steam is introduced into the turbine from the main boiler at the will of the engineer, the mechanism, of course, being operated from the cab. A carbon can be used continuously for about eight hours, so that it is unnecessary to feed the lamp for that length of time. In connexion with the burner, an ordinary locomotive reflector is used.

\* \* \*

It is only those operators whose experience has brought them face to face with numerous subjects where street traffic has to be encountered, when undertaking some special commission, who can really understand the difficulties that have to be faced and overcome in work of this description. A typical case is that of some public structure situated right in the heart of a busy thoroughfare, and which is as often as not surrounded by high buildings that necessitate the camera being placed in close proximity to the edifice being photographed. In subjects of this kind even the services of an adjacent window are frequently without avail, and there is no alternative but to work from the street level at the furthest possible point. Churches and edifices containing spires or towers are by no means uncommon either, and these especially are very difficult to cope with; in fact, in most large cities there are usually several of the public buildings so situated as to make it impossible to get the entire structure included on a plate satisfactorily.

\* \* \*

The chief difficulty in dealing with subjects of this class lies in the necessity of shutter exposures having to be resorted to on account of the moving objects in the foreground, in conjunction with a strained condition of every other possible means, such as taking full advantage of the rising front of the camera, as well as tilting it to a considerable extent; and, when these alternatives have to be resorted to, it is extremely difficult to cause any lens to work deep enough in focus, at such close quarters as will yield even a fair degree of sharpness and definition, when employed with an aperture sufficiently great to yield a fully exposed negative by means of a shutter exposure. Apart from the strain imposed upon the lens in such cases, there is likewise the added difficulty of having to cope with the curiosity of the bystanders, for these never fail to cause an operator much annoyance when working in an open thoroughfare.

\* \* \*

In providing for work of this description it is best to employ a large plate and use the best covering lens obtainable for a plate of smaller dimensions. Thus a lens of what may be termed a mid angle type of about nine inches focus will cover a fairly wide field with an aperture of about  $f/11.3$  and with a rapid plate and the best conditions of lighting quick exposures are possible. Circumstances, no doubt, will

arise where, under more favourable conditions of lighting and absence of traffic, a very rapid plate may be used in conjunction with a wide-angle lens working at an aperture of about  $f/16$ ; but, in confined situations, it will be found that the former stop will be required if anything like good definition is to be obtained. In very busy thoroughfares, such as are met with in large towns, it at times becomes impossible to work from the street level, and then the only alternative is to employ some kind of vehicle wherein the camera can be placed. A class of vehicle specially suitable for work of this description is that employed by such firms as librarians, &c., in which the entrance is from the rear, the van being entirely closed in, and having doors back and front both of which are cut in half. These enable the camera to be placed on a flat box or pedestal in the rear of the van, and permit all the operations being performed in peace and comfort, quite apart from the gaze or knowledge of passers-by. Such vans can be drawn up at any point and never attract the attention that working from the top of a lorry or other open cart always does.

\* \* \*

It is well known that in nearly all cities and large towns there are buildings which it is almost impossible to photograph satisfactorily, and in some instances years have elapsed before it has been possible to deal with them by means of the camera, and then only by reason of some alterations to other structures being in progress in close proximity. It is at junctures such as these that much may be done by carefully watching for an opportunity to take many views which otherwise could never be secured, for not only can advantage be taken of space so opened up, but it will frequently happen that many desirable views of streets can be obtained from the platforms and behind the hoardings which surround the erections of new buildings. Several of the more important thoroughfares in large towns have only been secured by these means, and professionals especially should be alive to their interests whenever they see any alterations going on, for they seldom fail to offer special opportunities for obtaining photographs which otherwise would not be possible of attainment. This class of work is very far removed from snap-shot or hand-camera exposures, such as are possible at times from the top of cars, &c., which is merely child's play compared with the working of a  $15 \times 12$  or  $12 \times 10$  camera. It is when manipulating these large sizes that an operator begins to feel the anxiety of working under adverse conditions. A good roomy van is then the best means of securing the work being done well and with comfort.

#### MICRO-PHOTOGRAPHS.

TWENTY or thirty years ago the term micro-photograph was used by many eminent scientific men to describe photographs taken on a large scale from microscopically small objects. That meaning appears to have entirely lapsed, and such photographs are termed photo-micrographs, and the process of executing them photo-micrography, one of the most cacophonous words in the language; but, as it seems generally accepted as correct, we are bound to put up with it. The photographs we are now dealing with are microscopically small ones, taken from a much larger object. Originally they were merely a superior kind of scientific toy. A large number of microscope-owners some forty years ago thought their collection was not complete unless they had the Lord's Prayer, the Creed, &c.,

included in a space not as large as a pinhole, and requiring a microscope to see them. Daucer, of Manchester, made them largely, and at one time they were marvellously popular, so much so that the same optician sold a special camera for their production. Nowadays one hardly ever sees a micro-photograph in any one's collection.

A special interest attaches to these tiny photographs by reason of the recent death of the most famous maker of them in the world, M. Dagron. Long before some of our present readers were born M. Dagron was manufacturing these toy photographs, but a time came when his skill was made use of in a special way, and the manufacturer of toys became a public benefactor. This was at the siege of Paris by the Germans about thirty years ago. The death a few days ago, at the ripe age of eighty-one, of this once famous man, brings to mind the work he did in utilising photography and popularising its results in a way never equalled before or after. A brief description of what he did, and how he did it, will be interesting to every one whose memory does not carry him back to the time we name.

Early in the siege of Paris, communication with the outside world was difficult, and before long the investment was so close that it was virtually impossible to get a letter to Paris. Then it was that Dagron came to the rescue by establishing the most marvellous post that ever was. When he brought his plan before the Government, they were wise enough and free enough from red tape to at once recognise its value and adopt it, by furnishing him with means to leave the city with his apparatus. Two balloons—named, with singular fitness, *Daguerre* and *Nièpce*—were provided, and eventually, after a most adventurous voyage and the capture of one balloon by the enemy, Dagron, with his apparatus, established himself in Tours, and forthwith started making his toy photographs, but toys no longer, for each one was a budget of news, a bundle of letters from the outside world to the sorely beleaguered Parisians, and was carried thither by pigeons. He carried out his guarantee to the Government that he would deliver every day two hundred miniature photographs, each one consisting of a thousand words. The messages were first made as brief as possible, after the fashion of writing a telegram, then printed on thin paper, which was used as a negative to get copies on glass, which were cut in pieces, and then reproduced as "micro-photographs" on collodion, duplicated many times over by means of a camera with twenty microscope object-glasses as lenses. This duplication was done so that a number of similar dispatches might be sent, so as to ensure at least one reaching Paris. These collodion transparencies were stripped from the plate, rolled up in a small quill, and attached to pigeons' tails, the bird, upon being set free, setting off for the capital. Probably a million messages in the aggregate were dispatched, and of these fifty thousand reached their destination. When the birds arrived and were caught, the messages were removed from their tails, and the photographs re-enlarged to legible dimensions, cut into pieces, and given into the hands of a hundred clerks to copy out and dispatch to the indicated destinations.

For this kind of work a "structureless" collodion is necessary, that is to say, one which would give a film that may be magnified many times without showing grain or apparent structure. A pyro film, made at a rather high temperature with acids of maximum dilution, will be found best for the purpose.

Most people are familiar with the little ornamental stationery requisites of immense variety of shape, but each containing a small view, mounted upon one end of a little Stanhope lens, and inserted in these various articles. If they are taken to pieces, it will be found that the photograph is attached to the plane end of a Stanhope lens, and is protected by a glass coating, the photographic film lying between the two. The way of producing these pictures is by taking them with the multiple-lens camera upon a glass plate. These minute pictures are then cut up into little squares, attached to the lens by Canada balsam, and then the whole mass of glass and lens is put in a lathe and turned almost truly circularly cylindrical. These little cylinders are then ready for placing into the special place provided for them. Without the modern conveniences of gelatino-bromide films on celluloid sheets, and without bromide paper, Dagron yet contrived to get through his work with marvellous dispatch, a message being usually ready for the pigeon post within five hours after its receipt. But it may be safely said that his record would be easy nowadays to beat with such up-to-date facilities to hand. But all honour is due to him for the originality and dispatch with which he carried out his micro-photographic post.

---

**South Kensington Teaching.**—To adopt an archaic speech, we might say *Delenda est* South Kensington teaching, for the Secondary Education Bill recently introduced into the House of Lords foreshadows such a change in the educational plans of the Government that the various science and art classes that have done so much in the past in educating many hundreds and thousands of students will, at any rate in name, exist no longer. The Duke of Devonshire said, 'We propose to abolish the name Science and Art Department: the Science and Art Department will be merged in the Secondary Education branch of the office.' The main portion of the staff is to be transferred to Whitehall. The most interesting point to the readers of this JOURNAL will be the retention of the well-known name of Sir William Abney, who will occupy the important position of Principal Assistant Secretary for secondary education.

---

**Kew Observatory** is another institution which, in the march of progress, is to be known as such no longer. Beginning on the first day of the present year, it was incorporated into the National Physical Laboratory, and for the future the well-known Kew certificate, whether for lenses, thermometers, or other scientific instruments, will bear the impress of the new institution. It appears from the last reports of the Kew Observatory Committee—that for 1899—the instruments sent for verification were less numerous by over ten per cent., the number sent being over 22,000, the previous year's work having included nearly 2400 more than that number. It is somewhat remarkable that there are so few photographic lenses met with possessing Kew certificates, a fact which may, perhaps, be accounted for by the utterly unscientific way in which lenses and their performances have been described both in photographic publications and in the advertisements of the makers. When we read in the lists of makers of repute that such-and-such lenses possess good "depth of focus," it is futile to expect any one to take an interest in an exact description of the powers and limitations of such remarkable optical achievements as modern photographic lenses. To any one who can believe that depth of definition or focus is a function or some special property of a particular make of lens, such data would be as much use as a treatise on quantities to a Hottentot native.

---

**The Great Telescope of the Paris Exposition.**—The newspapers have made this instrument their own, and published paragraphs about it calculated to interest that overdone entity, the man in the street, but, in most cases, utterly devoid of a semblance of truth. Every one remembers how the instrument, before it was

built—for that is the only expression to be used regarding such a monster production—was to bring the moon to within half a mile of the observer. One of the latest pieces of information is that it will throw an image of the planet Mars on to the screen, and of a magnitude of ten feet in diameter. Now, a very simple calculation, familiar to photographers, can easily be made. The object-glass of the telescope is fifty inches in diameter. Supposing the glass to absorb no light whatever, it is evident that the light received from Mars by the glass will be spread out to cover an area about eight times as large as that glass, and, consequently, with only one-eighth of the brightness that a sheet of paper would possess if illuminated by the light of Mars alone. In other words, it would be invisible. It is within the bounds of possibility that, if a sensitive photographic surface were exposed to such an image for a few months, an impression might be obtained; but even this is something very different from the statement made. One more reference will suffice to show the utter absurdity of the statement. The moon's image is to be forty-eight feet in diameter, with the same telescope and screen, that is, about five times that of Mars; but it does not need pointing out that one to five is by no means the proportion that exists between the diameter of the two luminaries.

**Steinpapier.**—In Eder's *Jahrbuch* Herr Fritz, the Vice-Director of the State Printing Works at Vienna, writes in glowing terms of a new lithographic paper which has been introduced under the above name. It is a fairly stout card coated on one side with a matt white film, which does not soften nor dissolve in cold water. It can be obtained glossy, matt, or more or less strongly grained, or with lines impressed on it. It takes any printing or fatty ink, and gives absolutely sharp, clean lines, and it is possible to obtain from it any number of transfers, without harm to the matrix itself, of type, blocks, woodcuts, engravings, lithographs, or collotypes, on to stone, zinc, or aluminium. It promises to be extremely valuable, particularly in lithography, and a great saver of stones, as an impression may be made on or from it, the run finished, the litho-stone cleaned and reground, and the steinpapier proof kept, and, if the design is wanted again, it can be transferred to stone, and results quite as good as ever obtained.

**Devils.**—Professor A Albert points out, in Eder's *Jahrbuch*, that some kinds of gelatine are extremely prone to give spots of a peculiar nature, which are due to minute bubbles of gas which, whilst the solution of gelatine is fluid, will rise to the surface and there break; but, as the gelatine sets, it cannot fill up the little pit thus made, and one has small pits with thickened edges. Albert says that by many this is said to be due to fatty substances which adhere to the surface of the gelatine, but that he has tried cutting off the edges of gelatine, cleaning both sides by various means, repeated meltings and coolings, and repeated skimming of the jelly, and from two to four filtrations through paper to obviate this defect, and without success. The cause lies in the gelatine itself, and it is interesting to note that the ordinary cooking gelatines are specially prone to this. It is quite possible that the "devils" so well known in photogravure are due to this trouble.

**A New Negative Varnish.**—Valenta suggests the use of the following as an extremely useful negative varnish, which can be used either hot or cold, and which will take retouching easily without any medium:—

- Manila copal ..... 20 grammes.
- Epichlorhydrine ..... 70 "
- Digest in a water bath till dissolved then add
- Absolute alcohol ..... 100 c. c.
- This may be further diluted with a mixture of
- Epichlorhydrine ..... 1 part.
- Absolute alcohol ..... 5 "
- It makes a very hard, clear, colourless film, which quickly dries.

**Panchromatic Plates.**—Dr. Eberhard, of Potsdam, states, in Eder's *Jahrbuch*, that ordinary plates, especially chloro-bromide

plates, can be made practically sensitive to the whole of the spectrum by bathing in the following solution and quickly drying:—

- Erythrosine (1 : 500) ..... 2-3 c. c.
- Silver nitrate (1 : 10) ..... some drops.
- Ammonia ..... 0.5 c. c.
- Chinoline red (1 : 500) ..... 1.5 "
- Cyanine (1 : 500) ..... 0.3-0.5 c. c.
- Alcohol ..... 50 c. c.
- Distilled water ..... 50 "

The plates are made much more sensitive, but they will only keep for one or two days.

The following also give similar results, but the plates are not so sensitive, but keep better:—

I.

- Acridine yellow (sat. alc. sol.) ..... 6 c. c.
- Cyanine (1 : 500) ..... 2 "
- Tetra-bromo-eosine (1 : 500) ..... 2 "
- Alcohol ..... 50 "
- Distilled water ..... 50 "

II.

- Acridine yellow (sat. alc. sol.) ..... 5-6 c. c.
- Chinoline red (1 : 500) ..... 1 "
- Cyanine (1 : 500) ..... 0.5-1 c. c.
- Alcohol ..... 50 "
- Distilled water ..... 50 "

**Substratum for Plates.**—Dr. E. Vogel suggests that for collodio-bromide emulsion, when stripping negatives are required for collotype or other photo-mechanical process, one of the best substrata is a 0.1 per cent. solution of pure indiarubber in benzine. When, however, the film is not to be stripped, either of the following may be used:—

- Gelatine ..... 1 gramme.
- Water ..... 300 c. c.
- Chrome alum (two per cent. solution) . . . 6 "

The plate should be well washed, and whilst still wet flowed two or three times with this solution, or the plate may be coated with a solution of

- Gelatine ..... 3 grammes,
- Water ..... 1000 c. c.,

to which, when dissolved, should be added with constant stirring

- Formalin ..... 10 c. c.

PHOTOGRAPHIC CONVENTION OF THE UNITED KINGDOM.

[Presidential Address to the Fifteenth Annual Meeting, held at Newcastle-on-Tyne, July 9-14, 1900.]

WHAT NEWCASTLE HAS DONE FOR PHOTOGRAPHY.

The great city in which this gathering of photographers from all parts of the United Kingdom has met has borne an important share in the furtherance and development of photography, and I have therefore thought it right that the opening passages of this address should recognise the indebtedness. True to its reputation for practicability of ideas, Newcastle-on-Tyne's contributions to photographic knowledge have concerned themselves less with matters of speculation and theory than with those things which are of direct daily benefit to us. In this respect one name above all others stands out clearly and sharply. I allude, of course, to that of the distinguished master of electrical science, Mr. Joseph Wilson Swan. Nearly forty years ago the plan of printing in pigmented gelatine, termed the carbon process, was brought to practical perfection by Mr. Swan, who devised the transfer method, which is the working process of to-day.

Undoubtedly, carbon printing, though perhaps not the system in the greatest use, has attracted the least adverse criticism of any photographic process. The beauty of its images satisfies all tastes, and it escapes those accusations of impermanence which are occasionally levelled at other systems of printing. Consider, then, how appropriate it is that the name of Newcastle-on-Tyne should be associated with a charming printing process in which the image is formed of a chemical relation of the staple product of this part of Great Britain—carbon, of course, being only purified coal. Rest assured of this, that when the New Zealander, spoken of by Macaulay, has finished his antiquarian studies of decayed London, and comes and places himself on the High Level Bridge to sketch or photograph the ruins of the once mighty city on the Tyne, of the few things that will have escaped the destructive influences of time one in all probability will be a photographic print by the carbon process.

In the very early days of gelatine dry plates, a quarter of a century ago, high sensitiveness of the silver salt was credited to Swan's plates; and, of the old school of wet-plate workers, how few could have been ignorant of the virtues of Mawson's collodion—a vehicle still largely in use? Photographic portraiture, too, traces some of its most gifted producers to Tyneside, and to this day the refined studies of female beauty by Mr. Mendelssohn, and the well-known work of Messrs. Downey, are of their kind unexcelled. The pictorial landscapes of the respected veteran, James Pattison Gibson, the flawless studies and lantern transparencies of Mr. Edgar Lee, and the engineering photography of Mr. Goold and Mr. Parry are widely recognised as having an executive care and finish which touch the limits of present photographic possibilities. After the lapse of six or seven years I can recall Mr. Goold's wonderful photographs of torpedoes leaving a ship's side—then, as now, some of the most striking examples of instantaneous photography conceivable.

The names of other prominent Tyneside workers in photography will occur to you, but your patience is perhaps not equal to a too-extended eulogy. The position of Newcastle-on-Tyne in the first rank of modern photography has been pointed out before—is, indeed, so obvious as not to necessitate reaffirmation; nevertheless, it is fitting that it should be brought once more to the minds of those, themselves photographers, who this week are the guests of a city which, in every photographic aspect, occupies a place of the highest esteem.

#### WHAT THE FUTURE MAY HAVE IN STORE.

From this tribute to the achievements of the present there is a natural transition, in this year of all years, to a brief meditation on what photography may be reserving for us in the future. Six months hence we close an old century and open a new one. The time has not yet come when the voice to which you are listening and the illuminated scene of which you all form a part are simultaneously transmitted to the ears and eyes of people a great distance away who may be interested; but who will be so venturesome as to doubt the close probability of such an achievement? A glance at contemporary science must convince the student of natural phenomena that finality of accurate knowledge in chemistry and physics has by no means been reached. Remember that it is upon chemistry and physics that practical photography relies. The progressive study of the elements has recently revealed the fact that the table of sixty-five irreducible bodies of which, in our school days, matter was said to consist, must be largely added to. It seems only the other day that the text-books described the atmosphere as a mixture of two gases—nitrogen and oxygen, and yet the presence in the air we breathe of at least two other gaseous bodies has recently been conclusively demonstrated. But perhaps the wonders of physical discovery transcend those of the sister science. Not seven years ago it would have been considered impossible to affect a sensitive plate through an opaque substance by electrical radiations. Röntgen, however, demonstrated that this was a possibility of excited vacuum tubes, and the marvels of X-ray work are now known to us all, and are daily accepted as a matter of course.

It is the fascinating mystery which surrounds the origin and properties of some of nature's forces that supplies the chief source of speculation as to what photography may reveal to us in the new

century. I spoke just now of the possibility of simultaneously transmitting waves of light and sound to a distance. In the case of the latter the telephone has already proved that one half the problem is solved, and, lest any of my hearers may be unduly sceptical as to the possibility of controlling light in a similar manner, they may be reminded that photography has proved the important fact of waves of sound being controlled by the same influence as waves of light. In other words, you can photograph sound as well as light; and, if you can transmit the one, why not the other?

We all know that the interposition of natural darkness is no obstacle to the transmission of stellar or solar light. Some of the rays which nightly or daily fall upon the human retina or the sensitive plate have been travelling for very lengthy periods through space. Much work that has been done in experimenting with the electrical transmission of photographs gives encouragement to the idea that direct photography in the new century will annihilate time and space. Can you not imagine a reflected or lenticular image of a South African battle being transmitted to Newcastle or London, received on a sensitive surface, developed and printed, and the picture publicly shown whilst the battle itself is actually in progress? If it is difficult for you to imagine this, hark back to what I said as to the similarity of the phenomena and properties of light and sound, and the mind may not then rebel at the idea.

To exhaust this suggestion that the limits of photographic action have not yet been reached is clearly impossible in a brief address. My one object in introducing it is to ask those who take photographs without finding the necessity of considering these things to be assured that "sun painting," as it is still sometimes narrowly termed—for, of course, light and its manifestations do not entirely rely upon solar origin—is an art still in its childhood. At any moment, such are the mysteries and complexities which still shroud those natural forces—light, sound, heat, magnetism, and electricity—upon all of which photography more or less relies, and which have such close common relationship—discoveries quite as important and as far-reaching as Röntgen's are probable. Foremost of these, of course, the popular idea will place the photographic philosopher's stone, photography in natural colours. But, if for convenience sake we regard the colours of nature and art simply as decomposed light, then the pictures you will see on the screen this evening must be said to satisfy the theoretical requirements of natural colour photography, for they are spectrum colours more or less pure. Still, these interesting specimens are not what the general public and the writers in the newspapers vainly sigh for. What is scientifically termed pigmentary colour photography—the only process which could gratify a lady's wish to have the colours of her hair, complexion, and dress reproduced by paper photography as they visually appear—gives no clue to us whatever that it is likely to make its appearance yet a while. In the whole vast range of chemical and physical science there is no known theory which points to the likelihood of pigmentary colour photography—the photography in natural colours of the popular idea—being in process of practical evolution. From what study I have been able to give to the matter I will end this reference to it with the remark that, if my hearers are spared a headache until pigmentary photography in natural colours is discovered, they will be free from that distressing complaint for a good many years to come.

#### PHOTOGRAPHY AT THE PARIS EXHIBITION.

And now let me lead you down from the heights of speculation up which you have been so good as to follow me to the level plain of common interest. The end of the century is unhappily being rounded off by the remorseless God of War; but the gentle lady, Peace, is not wholly thrust out of sight, for she smiles upon us in her sweetest manner from across the Elysian Fields at Paris. It was my good fortune recently to pass some days studying the Universal Exhibition which our neighbours the French have organized. The participation of Great Britain in this wondrous festival of art, science, and industry is not so whole-hearted as that of other countries, and the English visitor may feel some little annoyance or surprise at this fact. But there is one respect in which I sincerely think Great Britain far outshines all her competitors. You are

of course, aware that many people have urged that the Great London Exhibition of 1851 harmed British industry by teaching our foreign competitors our methods of production. Insistence upon this point may be responsible for the abstention of most of our leading manufacturers from Paris this year, but photography comes in to redress the balance. I am happy to say that British photography at Paris is seen at its very best. The pictorial and technical exhibits organized by Mr. R. W. Craigie and General Waterhouse make a show of the greatest beauty and interest. Amateur efforts from Paris and Vienna touch a very high level of pictorial quality indeed; but the British school of work clearly stands above it in right of imaginative and executive beauty. As a case in point, the well-studied gracefulness and refinement of the portrait work sent to Paris by my accomplished predecessor, Mr. Crooke, by Mr. Craig Annan, and Mr. Craigie is not approached by any other exhibits. This I say after carefully studying the photographic work from Italy, Switzerland, Hungary, Denmark, Spain, Germany, and other countries. The same thing may be said of British landscape, figure, and architectural work; the Parisian and Viennese amateurs alone approach it in respect of pictorial excellence. Photographic manufacturers are few at Paris, but they are well represented by Messrs. Dallmeyer, Messrs. Ross, Messrs. Watson, and Messrs. Newman & Guardia, whose well-finished productions worthily represent the manual and mechanical skill of this country. This perhaps is a suitable place for me to mention that, in the sister city of Glasgow, next year, a great International Exhibition is to take place, and I have been assured that British photography in all its branches will manifest itself to the full of its splendid possibilities. I am sure we must all be glad to feel that the first great International Exhibition of the new century is to take place on British soil.

#### PHOTOGRAPHIC COPYRIGHT, &C.

A word as to a point of material interest. Tennyson's *Northern Farmer*, with his devotion to "property! property!" voiced a sentiment for which no apology is ever called for. Photographers of all degrees and kinds enjoy protection for their work under an Act specially passed in their interests thirty-eight years ago. Recently a secret band of painters and publishers combined for the purpose of inducing Parliament to diminish the value of photographic copyright to the vanishing point. That attempt was abandoned, and a new Bill has been presented to the House of Lords less unfavourable to photography than its predecessor. This Bill is now enjoying the attention of a Select Committee. In the present state of the world's politics domestic legislation of a minor kind has little hope of engaging the attention of the British Houses of Parliament, and the Copyright Bill has no chance of passing this session. No useful purpose would be served by discussing the provisions of a measure which, upon its reintroduction next session, may bear an aspect different from that of its predecessors. But these are the three points which I would earnestly ask all photographers, professional and amateur, to bear in mind for self-guidance when the subject of copyright again comes before Parliament: 1. The existing Act of 1862 is ample protection for all interested. 2. The illustrated press, the publishers, and the painters have combined for the purpose of making photography the defenceless object of plunder and brigandage. 3. Powerful influences are at work to induce Parliament to substitute for the equitable Act of 1862 some measure which will fatally belittle photography in all its aspects. There are representative institutions charged with the duty of defending photographic copyright against these attacks, to which I bespeak the support of all photographers. There is a familiar saying that the tenderest part at which you can strike a man is his pocket. The whole photographic community will be financially affected in an adverse sense if the opponents of photographic copyright get their way in Parliament. Let this fact be realised, and, when the time of struggle comes, photographers throughout the country should be sufficiently numerous and aggressive to influence their representatives in the right manner.

A few brief sentences for that large class with whom year by year I have the pleasure of being brought into intimate contact—I mean professional photographers. To me, as a student of the subject for twenty years, it appears that the greatest hope for the future of the photographic profession rests on two great truths:—1. Only a limited

few of its members have yet risen to an adequate realisation of the pictorial beauties of photography, especially applied to human portraiture. 2. Of the best work that is produced millions upon millions of the general public remain in ignorance. The future is thus with professional photography, and not against it.

Finally, there may be some who are listening to me who have not taken to photography as a recreative pursuit. If such there be, I ask them to accept of my pity and compassion. A practical study of photography reveals the globe and the life that is lived on it in their best and truest aspects. It is one of those intellectual pleasures which help you to assure the cynic that, after all, life is worth the living, and that is best partaken of at the annual gatherings of the Photographic Convention of the United Kingdom, to whose members, after thanking you, ladies and gentlemen, for the patience with which you have listened to me, I conclude by wishing a pleasant stay in hospitable Newcastle-on-Tyne and its charming neighbourhood this week.

THOMAS BEDDING.

#### PARIS EXHIBITION NOTES.

##### II.

OF the many lessons which the photographic visitor to the Paris Exposition has the chance of learning, that of comparing the professional portraiture exhibited by different countries should be not the least instructive. Taking the French section first, work by such men as Hanriau, of Paris; Belingard, of Lyons; Nadar, E. Piron, Paul Boyer, and H. Provost, all of Paris, supplies what may be taken as a group of representative efforts. The theatrical and the political celebrity is made much of by Parisian photographers, and in this Exhibition the feature is very prominent. Reutlinger, Pierre Petit, and other well-known Paris photographers do not show, but these abstentions can scarcely be set down as a weakening omission. The fact is, portrait photography of the highest class does not seem to have made any converts amongst French professionals. The examples shown at the Exhibition are of that kind which is referred to in this country as good commercial. Artificiality of the theatrical order is seldom absent, and the retouching is always unstinted. The photographs, as a rule, are striking in virtue of the strictest adherence to conventional lines. You search in vain for any attempt to introduce the least subtlety of lighting, or a suggestion that glass-house traditions have been set at naught. It is all plain, straightforward matter-of-fact photography, such as the Royal Photographic Society is seeking next autumn to attract to the New Gallery in a specially provided section. Surfaced prints, carbon and bromide enlargements, to which no possible objection could be taken on the ground of technique, greet you on every side, and you are not left unconscious of the fact that a certain gaudiness characterises the framing. But where is the delicate and restful little "at home" study in sepia platinum, free from harshness of lighting, awkwardness of pose, and vulgarity of surroundings to which so many clever workers in this country nowadays accustom us? Not visible in the French Section at Paris. We must confess that this absence of the pictorial element in French photographic portraiture somewhat astonished us. There would surely be a demand for it if it were properly introduced.

But in Paris, according to all accounts, French professionals hold themselves far too cheaply, a respect in which they are not superior to many of their English brethren. Price-cutting is rampant, allied with the fatal disinclination to take advantage of new ideas which so often attacks photographers of most European nationalities. The irony of the thing lies in the circumstance that the Photo-Club de Paris, a body of amateurs, produces portrait studies resembling in style and treatment the best professional work of this country, but the Paris photographers either shut their eyes to its existence or are ignorant of it. In this country, exhibition-goers have for years had opportunities of studying the work of Messrs. Demachy, Puyo, Darnis, Le Begue, and other prominent members of the Photo-Club, and, among the three or four hundred photographs which comprises the Club's exhibit, we saw a great deal of work which was hardly inferior to that of those well-known exhibitors.

The Société d'Excursions des Amateurs de Photographie also make

display. The probability of any recommendation we might offer French professionals being followed is doubtful, and, while hesitating to record the suggestion that an hour or two passed in studying the productions shown in the British Pictorial Section could be a good investment, we have no scruples whatever in saying that the portrait work of the native amateurs would yield a very good substitute as a source of inspiration.

Sunny Spain disappointed us. The work that represents Toledo and Madrid is so poor as not to deserve a second glance. Larsson, of Stockholm, sends portraiture of a highly retouched kind, but not otherwise noticeable; and the views contributed by Klemming, of Stockholm, are of the cartographical order, which has long since disappeared from first-rate English exhibitions. Hungary is numerically well represented, Mertens & Co., of Budapest; Mai & Co., of Budapest; Strelisky, of the same city; Emil Klegovich, of Szeged; Cossak Jozsef, of Temésvar, and others, sending collections of work. What struck us about the Hungarian portraiture was the magnificent quality of the prints, platinotypes having rich blacks and pure whites; but, in common with most Continental work, Hungarian portraiture appears to suffer from bad vignetting and unsuitability of backgrounds. The pervading idea seems to be to obtain rigid pose, to exhaust the skill of the retoucher, and to make bright, striking, and vigorous points. The sitter, in fine, is treated as a map, upon which the best defining powers of the lens and the most strenuous care of those manipulators who handle the picture in its various stages of preparation are concentrated.

Much the same sort of thing has to be said with regard to the professional work from Berlin and Vienna. The saving clause in regard to the latter city is on all fours with that of Paris, the amateurs save the situation. The Vienna Camera Club sends, perhaps, the smallest collection of work to the Exhibition, but it includes examples of portraiture by Von Schoeller, and landscapes, &c., by Dr. Henneberg and Herr Watzell, who are at their very best. In fact, these three men in the half-dozen examples that they send stand perhaps at the highest mark for the marvellous bits of broadly treated work they have executed. We believe Schoeller's portrait was seen in London last year, but the work of Henneberg and Watzell is new to us.

Three other countries come out very well indeed out of the severe ordeal of exhibiting at Paris. Italy is well served by Broji, of Florence, whose portraits are above the average of quality. There is taste and refinement in the treatment of these, and his reproduction work is also noticeable for the care and apparent fidelity to the original by which it has been executed. Considering the great support extended to the Exhibition in most other directions, it is to be wondered at that so few American photographers make a representation. The burden for sustaining the United States' reputation for high-class work is mainly borne by Messrs. Taber, of San Francisco; Lawrence, of Chicago; Schumacher, of Los Angeles; and W. N. Brenner. Looked at as a whole, this work lacks, perhaps, the tenderness of touch, if we may so express ourselves, which you feel invests the best portraits here—those in the British Section, for example; but it is clever and striking, for all that. American photographers appear to be exceedingly good printers—they do the most thorough justice to negative and positive process. Mr. Schumacher's work gives one the impression of having been produced in a pure atmosphere—it is full of brilliancy and sparkle. As a whole, the American work is characterised by freedom of treatment and an absence of vulgarity. It is not over-retouched, but there is a certain affectation in the fixing which robs it of its highest merit. The fame of Mr. Byron, of New York, as a flashlight photographer, had preceded him. The specimens of his skill that he sends are clever, but not striking.

The Swiss photographic pavilion is well patronised, and, as a collective exhibit, is very high indeed in quality. The Zürich colour-printing houses cover a great deal of wall space with specimens of work which is so universally known nowadays that it does not call for more pointed reference. The leading Swiss portrait photographers send a great deal of large direct work, noticeable for the fact that the images are very often in the brightest colours, carbon printing being presumably the process used. M. F. Boissonnas, of Geneva, has a

distinctive exhibit in the shape of several binocular portraits. If we rightly follow the photographer's *modus operandi*, he takes his portrait stereoscopically, but in the printing gives only one picture, formed by superposing one print on another. Thus you get an effect of diffusion. The theory at stake in this matter is, we presume, the by no means new one, that, as the eyes see two distinct images, it is only necessary to nearly superpose two stereoscopic images to get binocularity of effect, or, at any rate, some sort of relief. We fear M. Boissonnas is flogging a dead horse. At least, thrice within our recollection has this idea been patented in Britain, and we ourselves had it more than once submitted to us as a novelty. M. Boissonnas, no doubt acting in perfect good faith, thinks he obtains stereoscopic effect in single portraits this way, but we doubt if his clients will be able to realise the phenomenon. The idea will die the death it has died before, we are convinced.

It is to be regretted that portrait photography is so scattered at Paris, but we have endeavoured within the limits of this short article to give our readers an idea of its characteristic features. The Swiss and American professionals and the Austrian and French amateurs show admirable work, watered down by so much from other countries that is lamentably poor.

#### NOXIOUS GASES.

In a room next to a dark room for several days experiments with acetylene apparatus were carried out; the operators who were working in the dark room were unable to obtain prints on developing paper with pure whites. As the first assumption, that the emulsion of the paper used was wrong, proved to be false, the blame was shifted on to the acetylene gas, which had penetrated into the dark room, and this was proved by a series of experiments.

A sheet of paper was, in the dark room, dipped into water through which acetylene had been allowed to bubble. After a few minutes it became yellowed and showed brown stains. A dry plate behaved in precisely the same way, the gelatino-bromide film assumed an intense brown colour. Coarse-grained silver bromide behaved exactly the same as the fine grain.

A light-sensitive film, exposed to an atmosphere of acetylene, was quickly coloured by a mixture of hydroquinone or metol with sulphite without the addition of any alkali. A preliminary exposure produced no stronger colouration.

Prints on a very sensitive bromide paper also became brown in the high lights in a room wherein acetylene had penetrated. The use of very dilute sulphuric acid after fixing removed the brown colour from the prints.

As an explanation of this action, we may assume that acetylene has a reducing action on the silver haloids. In further experiments it was proved that neither hydrogen nor coal gas appeared to have the same action. The second possibility was the activity of impurities in the acetylene. This appeared to be considerably more probable, for the colouration formed on the sensitive films by the action of acetylene appeared to be due to a substance more allied to silver sulphide than pure metallic silver. With dry plates the colouration was not pure black, but brown, and with paper the characteristic metallic iridescence of silver sulphide appeared.

In order to decide these points, water, in which acetylene had been developed, was strongly acidulated with citric acid. We may assume that a pure reduction of the silver haloid would be stopped by this. The action of a phosphorous or sulphur compound actually took place much stronger than before, and the liquid smelt more strongly, exactly like burnt indiarubber. This acidulated solution actually produced an intense brown colouration of a dry plate immersed in it. This action must therefore be ascribed to impurities in the acetylene.

It is most highly probable that the actually active impurity of the gaseous acetylene is not the sulphuretted hydrogen, which is always present, but phosphoretted hydrogen, or gaseous organic compounds of phosphorus.

Phosphoretted hydrogen is, in any case, extraordinarily active with silver compounds, and the best proof of this is the charac-

teristic reaction of this gas with nitrate of silver paper. The smallest quantity, as in Eckelt's tester, colours the paper black by the formation of a silver phosphide; with an excess of silver nitrate this is converted into metallic silver, and becomes grey.

Acetylene will thus have a greater prejudicial action the more it is contaminated with phosphoretted hydrogen, and this depends primarily upon the composition of the calcium carbide. With the better sorts of calcium carbide care is taken that these impurities are as small as possible, but there is still always enough in order to exhibit the described action. On the other hand, it should be noted that the same carbide may develop different qualities of phosphoretted hydrogen, according to the way it is treated. Caro pointed out (*Zeitschrift für Beleuchtungswesen*, 1898, p. 34) that in the first moment of evolution of the acetylene 0.5 per cent. of phosphoretted hydrogen was given off, and later less; further, that a carbide which gave as an average 0.038 per cent. of phosphoretted hydrogen gave off 0.8 per cent. when the apparatus, through insufficient water, became hot.

In exactly the same way phosphorus matches can act if such lie side by side in the same parcel with celloidine, aristotype, or other printing-out paper; the latter may be very soon spoilt by insufficient packing. This can be very easily proved by placing such a match on a piece of these papers. Even after a quarter of an hour a strong colouration with metallic lustre will appear under it, and this discolouration extends more and more sideways.

These reactions are not only of interest for practical work, but possibly through this strong action of a gas may be explained the so-called Russell's effect, that is to say, the action at a distance of printed matter and other bodies on photographic films, and perhaps also later the Becquerel radiations.

R. ED. LIESEGANG.

#### FOREIGN NEWS AND NOTES.

**Three-colour Printing.**—The *Photographische Chronik* publishes a very instructive table, given by Hofmann in his recent work, *Praxis der Farben Photographie*. This table gives the colour produced by printing from the three primary negatives, made in five degrees of density. The thinnest negative for each of the primary colours is represented by 0, and the densest by 5. The *Chronik* remarks that, although the table may not be unexceptionable, it is extremely interesting.

Red Plate.	Blue Plate.	Yellow Plate.	Resultant.
Degrees.	Degrees.	Degrees.	Colour.
0	5	5	Red.
1	4	5	Red-violet.
2	3	5	Reddish-violet.
3	4	5	Bluish-violet.
4	1	5	Blue-violet.
5	0	5	White-blue.
1	5	4	Red-orange.
2	5	3	Reddish-orange.
3	5	2	Yellow-orange.
4	5	1	Yellowish-orange.
5	5	0	White-yellow.
4	5	5	Reddish-white.
3	5	5	Red-white.
2	5	5	White-red.
1	5	5	Whitish-red.
0	0	0	Black.
0	1	1	Dark brown-red.
0	2	2	Brown-red.
0	3	3	Red-brown.
0	4	4	Brownish-red.
5	5	5	White.
4	4	4	Pale grey.
3	3	3	Grey.
2	2	2	Medium-grey.
1	1	1	Dark-grey.

**The Combined Toning Bath.**—According to a short note in the *Photographische Mittheilungen*, the condition of the combined

toning and fixing bath prepared with sulpho cyanide of ammonium, without lead, may be considerably improved and approximated to an old bath, by first washing the prints in a small quantity of water, to be added to the toning bath. Dr. E. Hegg, who recommends this, states that the first prints toned in such a bath, instead of being of disagreeable yellowish-brown tone, as is usually the case with a freshly prepared bath, are of a warm brown or violet colour, according to the length of immersion. It is, of course, necessary to avoid diluting the bath, by making it of sufficient strength in the first instance, so that the quantity of water in which the prints are washed shall not reduce it below the normal. To obtain good results with certainty, Dr. Hegg recommends that there should be twenty c.c. of solution to each print 13 x 18 cm., and that the water in which one quarter to one third of the prints have been washed be added to the bath.

**Röntgen Rays and Rheumatism.**—At the conclusion of an article by M. Barlet in the *Photographisches Wochenblatt*, the writer mentions that, having read of the alleviating effect of the Röntgen rays in cases of rheumatism, he made a personal trial of the remedy. In the autumn of last year he was suffering considerably from rheumatic pains in the upper arm, which affected its use. He exposed the part to the rays for seven minutes, the tube being placed at a distance of one centimetre, under the influence of a current of 1750 volts strength. The clothes were not removed from the arm. In seven minutes the pain was entirely relieved, and after a lapse of eight months had not reappeared. Another instance is also cited. In this case the patient was unable to move his arm. The part was exposed for two periods of five minutes each, with a short interval. After three minutes' exposure the pain was much reduced, and the arm could be moved slightly. After the second exposure, movement was restored, and only a little difficulty remained in raising and deflecting the limb. A few days after there was a fresh attack of pain, and the patient was compelled to remain in bed and bandage the arm. The doctor ascribed the attack to neuralgia, but recovery was rapid, and there has not been any recurrence of pain. It should be borne in mind that considerable care must be observed in working with an electric current of the strength named. A shock from such a coil might prove fatal.

**The Influence of Temperature in Drying Prints.**—The influence of heat upon the tone of a print is a well-known fact. Dr. R. A. Reiss, of Lausanne, has endeavoured to ascertain the cause, and gives the result of some experiments in the *Photographische Chronik*. Strips of P.O.P., 6 cm. broad and 10 cm. long, were exposed for various lengths of time to light, toned and fixed in the same combined bath, washed and mounted upon card, and cut in half. One set was dried at the ordinary temperature of a sitting-room, and the other set near a gas oven. The latter were dry in one and a half to two minutes. Those dried by heat had a more glossy surface, and differed from the other set in tone. The difference varied with the thickness of the film, being greater with the more thickly coated papers. Kurz's collodio-chloride paper, which has a very thin film, showed only a slight difference, whilst the Parisian paper "le Collodion" (Trumpet brand), with a thicker film, exhibited a more marked deviation. Lumière's gelatino-chloride paper, which also has a very thick film, showed a very decided difference in tone, the prints dried by heat being much redder and very glossy. In the first trial with Lumière's paper the prints were toned to a brown-red, and in the second to a blue-violet, but the latter, under exposure to heat, also dried to a deep red, whilst the halves allowed to dry spontaneously retained their blue-violet tone. Other makes of paper also exhibited variations in tone according to the method of drying. The writer thinks the change is due to the presence of air and water in the film after washing. When the print is exposed to heat, the surface of the film melts and dries. The air and water below the surface cannot escape readily, and the film consequently swells. On the other hand, when the film dries spontaneously, the air and water are allowed to escape gradually through the surface of the print, and the film is finally thinner than when the print is dried by heat. The writer is continuing his experiments, and purposes verifying the results by measurement of the sections under the microscope.

**Mounting Enamelled Prints.**—The *Photographische Wochenblatt* states that a highly glazed surface may be preserved if the prints, after fixing and washing, are immersed in a dilute bath of formalin (1 to 4). Before squeegeeing them upon glass or ferrotype plates they should be washed in two or three changes of

water. The prints may then be mounted with paste upon card in the ordinary way, and they will not lose their gloss. When they have been treated in this manner, the prints may even be immersed in water before mounting without much detriment to the glaze. If they are dried off with blotting-paper and fibres remain upon the film, they may be rubbed off when the print is dry, as the formalin destroys the adhesiveness of the gelatine.

**Cheap Transparencies.**—In the *Archiv für Ophthalmologie* Dr. O. v. Eversbusch mentions that he has found the following method of preparing illustrations for clinical lectures very convenient and inexpensive. Professor v. Labs had engravings printed upon fine tissue paper, treated them with Canada balsam, and mounted them in the ordinary way as transparencies between sheets of glass. Dr. Eversbusch, as an improvement, has had the engravings printed upon celluloid, and has found them a great success. Chromo-lithographs upon celluloid could even be used for coloured subjects.

**Aluminium Dishes.**—Readers of the *Photographische Mittheilungen* were recommended, in a recently published article, not to use aluminium dishes for development, as the metal was unsuitable when alkaline solutions were used. H. Schumacher writes that, although it is quite true that aluminium is attacked by strong alkaline solutions, the small quantity of alkali used in the development of a plate has no effect upon the metal. He states that he has used aluminium dishes for development for the last seven years, and can recommend them for that purpose, but they should not be used for solutions containing platinum, gold, or mercury, and the metal is also unsuitable for tanks for stand development. It is, of course, necessary to wash out the dishes after use.

**Phosphorography.**—Dr. R. E. Li-segang finds that phosphorus is very prejudicial to P.O.P. A sheet of gelatino-chloride paper was covered with a sheet of perforated tinfoil, placed in a box, and a couple of ordinary non-safety matches suspended within about two centimetres of the surface. The box was closed for two hours, and it was then found that the unprotected portions of the paper had been strongly affected by the fumes of the phosphorus. Some sensitive bromide paper and some dry plates were also affected under similar conditions, and were amenable to development. Acetylene is always contaminated with a certain amount of phosphuretted hydrogen, and is likewise very injurious to plates and printing papers.

#### THE AMATEUR PHOTOGRAPHIC ASSOCIATION.

FOUNDED so long ago as 1861, the Amateur Photographic Association of which H.R.H. the Prince of Wales is President, has recently undergone reorganization. The offices have been transferred to the premises of the London Stereoscopic Company at 106, Regent-street, W., and the duties of Hon. Secretaries have been undertaken by Mr. J. Lillie Mitchell and Mr. Butler Humphreys. The Vice-Presidents of the Association are H.R.H. the Duke of Cambridge, K.G., the Archbishop of York, the Duke of Newcastle, the Earl of Rosse, F.R.S., the Earl of Warwick, Lord de Ros, and Mr. James Glaisher, F.R.S. The Council consists of Viscount Maitland, Major-General G. F. Kaye, and Messrs. Charles Stevens, Walter Wood, F.R.G.S., Robert O. Milne, Edward Kennard, M. J. Paterson, and R. W. Kennard. In the explanatory booklet that has just been issued with the idea of presenting the Association in an aspect best calculated to awaken renewed interest in its existence it is pointed out that it has for its object the spread and encouragement of photography by means of an exhibition and the interchange of the work of amateur photographer, and by the opportunity afforded to members of exhibiting at the Annual Exhibition, and participating in the competition for the valuable prizes offered, together with the use of a developing room in the West-end, and, by special appointment, the use of a fully-equipped portrait studio, on payment of a moderate fee, and of having prints executed from their negatives promptly, artistically, and at reasonable rates.

A brief study of the book of rules which has just been issued shows how it is proposed to carry these objects into effect. The Association is open to lady and gentleman amateurs, election being by the Council upon nomination and seconding. The subscription is one guinea a year, but, after December 31 next, an entrance fee of one guinea is to be imposed. We reproduce the essential parts of the rules which relate to

the Annual Competitive Exhibition, as it is hoped to make this feature of the Association's proceedings as important as it formerly was: There will be an Annual Competitive Exhibition (open to all members), held during the London summer season, due notice of which will be given. The Exhibition will be held in the Grand Salon of the London Stereoscopic Company, and will remain open to members and their friends for a period not exceeding one month. The prizes (the selection of which shall be in the hands of a Sub-Committee) shall be awarded by a Committee of three or more Judges, who are not competing, and the Hon. Secretaries, and any other non-competing Members of the Council willing to give their services.

The Association's Challenge Bowl will be competed for annually, and gold, silver, and bronze medals and other articles will be given as prizes. The custody of the challenge bowl is awarded annually to the exhibitor of the most artistic photograph of the year, the name of the winner being engraved thereon. Every member, whether exhibiting or not, shall be presented with a replica of the most artistic photograph of the year, the owner of which has won the custody of the Association's challenge bowl and first prize in Class B. This picture will be supplied at the Association's expense, the size and process being decided by the Council. No photograph may be entered for competition which has already gained a prize in any other exhibition, but it may be exhibited as non-competitive. All Secretarial and Treasurer's duties will be conducted by representatives of the London Stereoscopic Company without charge, the Association however, paying all out-of-pocket expenses. The Judges reserve to themselves the right to limit the number of, or to withhold, the prizes, if in their opinion the exhibits are not worthy of such awards, or if the number of exhibitors in any particular class is deemed insufficient. Prize-winners are to furnish the Association with an unmounted copy of their prize pictures in exact duplicate, if possible, and in the same process as exhibited, with the view to its being placed in the album presented to the Association for this purpose, and which will always be on view at the offices.

The work of reorganizing the Association has only recently been taken in hand, but exceptionally good progress has been made under the direction of the Hon. Secretaries—business men of first-rate administrative ability. Last week the Annual Exhibition was held. It was divided off into about a dozen classes, about 150 photographs being sent in. The Judges were the Hon. Secretaries, Major-General Kaye, and the Editor of THE BRITISH JOURNAL OF PHOTOGRAPHY. Amongst the competitors were such well-known workers as Mr. W. Smedley Aston, Mr. R. O. Milne, Mrs. S. Francis Clarke, and others whose names will be found in the published list of awards. Some surprisingly good work was shown, and there appears, from what we can gather, to be so much interest taken in the Association in its new path of usefulness that we shall be prepared to see future exhibitions showing very marked excellence and variety. At any rate, here is the nucleus of an association which should meet the needs of a large class of amateur photographers at the West-end of London and elsewhere who desire to take advantage of the exceptional opportunities offered them for indulging in competitive photography at a summer exhibition. The old Association has entered upon a second youth, and the experience gained in the work of reorganization has been most valuable. Copies of the rules and prospectus may be obtained of the Hon. Secretaries, 106, Regent-street, London, W.

#### THE SENSITIVENESS OF SILVER AND OF SOME OTHER METALS TO LIGHT.

[A Paper read before the Royal Society, May 31, 1900, and reprinted from the *Chemical News*.]

DURING some recent investigations on the Daguerreotype process, the question presented itself as to which of the elements forming the sensitive surface of the plate—the silver or the halogens—the sensitiveness was due? Now, although the fact that nearly all compounds of silver, especially the haloids, are more or less sensitive to, and decomposed by, the action of light, has long been known, the sensitiveness of metallic silver itself to light, though observed in 1842 by Moser, has never been generally recognised either by chemists or by photographers.

*Moser's Experiment.*—Before describing my own experiments, it may be as well to give a description of Moser's experiment taken from the original paper in *Poggendorff's Annalen*, 1842, vol. lvi. p. 210.

"A perfectly new silver plate was thoroughly cleaned and polished. A black tablet with various excised characters was fixed above it, without touching it, and the whole placed in the sun for two hours or more, and directed towards it. After the plate, which naturally did not show the

east change, was cooled, it was held over mercury, heated, as usual, to about 60° R. (167° F.). To my great delight, a distinct image of the screen was produced, in which those parts where the sunlight (which, during the course of the experiments, was always weak and changeable) had acted had attracted a quantity of mercury. This interesting experiment was repeated several times with the same result. Sometimes the plates after having been placed in the mercurial vapours were exposed to those of iodine and then placed in the sun, by which the images usually improved."

"If we compare this remarkable fact of the action of light upon surfaces of silver with the above-mentioned phenomena produced by contact, we can no longer doubt that light acts on *all* bodies, modifying them so that they behave differently in condensing the vapours of mercury. A similar experiment was made with copper during unfavourable weather. The copper was not well polished, and, consequently, the image produced by the mercurial vapour was faint, although clearly visible. By exposing the plate to the vapour of iodine the image became stronger, and this method was found useful in experiments with copper. A plate of clean mirror glass was exposed in the same way to light, and the action was as plain as on the silver if the glass was afterwards breathed upon, the image remaining visible for a long time afterwards. We may therefore assume that *light acts on all bodies, and its influence may be tested by all vapours that adhere to the substance or act chemically upon it.*"

*Robert Hunt's Views.*—Although Robert Hunt recorded these experiments in his *Researches on Light*, he does not seem to have repeated them as regards the direct action of light upon metallic silver, but to have paid more attention to Moser's experiments on the images produced by contact or proximity of dissimilar substances, and his theory of invisible light, as well as the effects of heat. Hunt's own experiments were chiefly carried out on copper plates, and led him to attribute Moser's results to calorific or thermic radiations rather than to light. Knorr, Karsten, Grove and others seem also to have investigated Moser's theories, but again without taking any notice of the fact of images, either directly visible or developable, being produced on metallic silver by the direct action of light.

I have not been able to find a record of a visible action of light upon ordinary silver plate, though its occurrence should be well known to silversmiths.

*Carey Lea's Observations.*—Carey Lea found that the three forms of allotropic silver he obtained were all sensitive to light: A, the red soluble, and B, the dark brown or blue insoluble variety, becoming brown after some hours' exposure, while C, the golden-coloured, became lighter by exposure (*Phil. Mag.*, 1891, Ser. 5, vol. xxxii. p. 337).

*Electrolytically Deposited Silver.*—In a series of electrolytic experiments made in Calcutta in 1892, I found that a golden-yellow or light olive-coloured deposit of silver on the cathode plate (silver or platinum) of a decomposition cell formed with two pure silver plates, as anode and cathode, or with a silver anode and platinum cathode in distilled water, through which a weak current was passed, was slightly sensitive to light, and became lighter in colour by exposure. This seems to confirm Carey Lea's observation, if my golden-yellow silver deposit was analogous to his C product. My deposit being made by electrolysis of pure silver in fairly pure distilled water must have been nearly pure silver, with no traces of foreign substances beyond those contained in the silver or the water, unless there was a small amount of occluded hydrogen, which other experiments of the same series, but with a stronger current, showed might not be impossible.

*Photo-electrical Observations in Calcutta.*—In another series of observations on the electrical action of light upon silver made in Calcutta about the same time, and published in the *Journal of the Asiatic Society of Bengal*, Part II., No. 1, for 1893, I found that the action of bright sunlight on a plate of almost pure silver, as indicated by a very sensitive Rosenthal galvanometer, was to make the exposed half positive to the unexposed, or as zinc to copper, which would seem to point to some slight oxidising action. The observation, however, was a difficult one, not readily repeated with certainty, and no very definite result was obtained. The currents observed did not appear to be due to unequal heating of the two halves of the plate, because the direct application of heat to the exposed side produced at once a clearly marked current in the opposite direction. This effect was always the same, and could be readily repeated.

In further observations of the same series, in which pairs of pure silver plates were partly immersed in distilled water or good tap water, one plate being exposed to light while the other was covered, as in Becquerel's electric actinometer, the current in nearly all cases, though small, was as above, the exposed plate being positive to the unexposed,

as it generally was when the silver plates were placed in dilute sulphuric, nitric, phosphoric, or hydrochloric acids.

*Confirmation of Moser's Observation.*—Recent observations of the action of light upon silver, made in connexion with the working of the Daguerreotype process, have fully confirmed Moser's observation quoted above, and shown that silver, when exposed under ordinary conditions, shows distinct sensitiveness to light, and that not only can an invisible developable image be obtained, as was done by Moser, but, by prolonging the exposure, printed-out impressions are produced which are clearly visible after exposure. The difficulty is to make sure of obtaining a surface of pure silver, free from the presence of condensed gases or other foreign matter which might affect the plate and give it a sensitive surface. The silvered glass plates used have generally been cleaned and polished with well-washed tripoli, and the metal plates in the same way, sometimes after being well cleaned with fine emery paper, and, in some cases, after making the metal red-hot.

*Various Silver Surfaces Sensitive to Light.*—Repeated observations with silver surfaces of different kinds, pure silver plates and foil, silver leaf on varnished glass, Daguerreotype plates and silvered glass, have shown that by an exposure in bright sunshine of about half an hour to one or two hours, under an ordinary black-and-white negative or a cut-out design, photographic images can be obtained, which are sometimes clearly visible after exposure, especially if it is at all prolonged.

*Development of Images on Plain Silver Plates.*—Whether visible or invisible, these images can be developed by the vapour of mercury, or by ordinary physical development with acid solutions of ferrous sulphate or pyrogallol acid, to which a little silver nitrate is added, as in the old wet-collodion process. The images were also produced when the negatives or cut-out masks were separated from the silver surfaces by sheets of thin mica, which, as Dr. W. J. Russell, F.R.S., has shown, stops the action of vapours upon a sensitive gelatine dry plate, and, no doubt, would do so upon a silver plate. As a rule, the mica itself makes no difference in the action of light, and is quite transparent to it, though, in some cases, it may exercise a slight retarding action. It was found, however, that when the silver surfaces were exposed to light in hydrocarbons, such as fluid paraffin, benzole, turpentine, &c., no action took place under the parts screened by mica, though the fluids were perfectly clear and colourless. Under ordinary conditions of exposure in a printing frame, the mica appeared to exercise no special influence upon the plates, except at the cut edges, as will be noticed further on.

*Effects of Pressure.*—That the images were not produced by differences of pressure was proved by leaving the mica screen, with the cut-out black-paper design at its back, in contact with a polished silvered glass plate in darkness for twenty-four hours. There was no visible image; but, on development with mercury vapour, the mercury was deposited fairly evenly all over the plate, except just where the outside edges of the mica and the edges of some initials cut in it had been in contact with the silver. Here there was very little deposit, and the edges appeared as dark lines on a white ground. There was no sign of the black-paper design. The fact that the images were readily obtained from ordinary black-and-white photographic negatives is further evidence against the results being due to pressure.

*First Experiment with Silver Leaf.*—My first experiment was made on August 14 last with a piece of silver leaf laid down on a plate of glass coated with varnish, and exposed in the sun for a short time under a plain cut-out cardboard screen. On developing with mercury vapour, a faint image was visible, the mercury having deposited on the part exposed to light.

Next day the experiment was repeated. A similar plate was exposed under a black-and-white gelatine negative of some lace for half an hour in bright sunshine. On developing with mercury, a very distinct, though faint, image of the lace pattern was produced, the mercury again depositing on the parts exposed to light, as in Moser's experiment.

*Effect on Polished Silvered Glass.*—Thinking that these results might be partly due to some action of light upon the varnish underlying the silver leaf, a piece of polished silvered glass was exposed under the same negative for about an hour. Again a distinct image was developed with the mercury, but partly positive and partly negative. A somewhat similar result was obtained on another plate developed with the ordinary acid iron and silver developer already noticed.

*Effect on Pure Silver Plate.*—The next experiment was with a piece of nearly pure silver plate, carefully cleaned with "Globe" polish, and washed with benzine to remove all greasiness. After half an hour's exposure in dull sunlight and development with mercury, an image was produced similar to the two first on silver leaf, *i.e.*, the mercury had deposited upon the exposed parts.

These experiments with three different forms of silver surfaces and two methods of development, all giving results similar to those obtained by Moser, seemed at any rate to prove the correctness of his observation, and the sensitiveness of ordinary forms of silver to light.

With the exception of the first, the foregoing trials were all made with a black-and-white negative on glass. Others were then made with cut-out black-paper screens and with like results.

*Observation of Printed-Out Visible Image.*—The first observation of an image visible on the silver surface after exposure and without any development was on a plate of nearly pure silver, cleaned with tripoli and ammonia, polished off with dry tripoli, and exposed on August 21 for about half an hour in sunshine under a black-paper cut-out screen. The parts exposed to light appeared lighter than the unexposed, but, on development, the mercury was deposited upon the unexposed parts. In this case the surface may have been affected by the ammonia used in cleaning, but it is also likely that the black paper used for the mask exercised some effect, as was afterwards found to be the case.

Another silver plate exposed for the same time under the same cut-out mask, but separated from it by a sheet of mica, did not show the visible image after exposure, though an image was readily developed with mercury vapour.

A day or two later, on August 24, the same experiment was repeated upon a plate of silvered glass exposed in the sun for half an hour under the cut-out mask, with a mica screen between it and the silvered surface. The image of the black-paper design could be faintly, but distinctly, discerned in a suitable light, again appearing dark upon a lighter ground. Development with acid iron and silver brought out clearly the images of the paper mask, and of some letters cut out of the mica screen, as well as the edges of the mica screen itself.

A piece of silvered glass was then exposed for forty-five minutes under the same black-and-white negative as used in the first experiments, the silvered surface being protected from contact with the negative by a mica screen. In this case also a faint image was visible after exposure.

Several other prints, both from the lace negative and the paper masks, were made on silvered glass with longer exposures, so as to obtain a distinctly visible image, and it was then found that there was a tendency to reversal of the image when developed with mercury vapour, *i.e.*, the mercury deposited upon the unexposed parts instead of upon the exposed. In one plate the image thus produced from the negative of lace, exposed for two hours in the bright August sunshine, has quite the appearance of an ordinary Daguerreotype picture on an iodised silver plate, though no halogen or other sensitizer was used.

Further trials of prolonged exposures of pure silver foil or plates, carefully cleaned with dry tripoli powder, have given very distinct printed-out images on the metal, so that there is no doubt about the fact that visible images can be produced on clean plain silver surfaces by light.

*Blue Rays found to be Active.*—In order to ascertain, if possible, what rays were active in producing these visible images upon the silver, and as it was hopeless to expect to obtain satisfactory results from observations with the solar spectrum, a slip of silvered glass was exposed under a small artificial spectrum of seven coloured glasses. After forty-five minutes' exposure in sunshine very faint images of the violet and cobalt blue glasses were distinguishable, but showed more distinctly when breathed upon. A similar result was obtained upon a pure silver plate, and, on developing with acid iron and silver the space exposed under the cobalt-blue glasses, developed out quite clearly, with traces of the violet and blue-green glasses. This result quite agrees with an observation made by Moser that only the blue and violet rays have any influence on pure silver, for he obtained very clear images by means of glasses of these colours, while only traces could be rendered visible when red glasses were employed, although they transmit more light and heat.

On another silvered glass plate, exposed under a similar colour screen or artificial spectrum, consisting of fifteen coloured glasses, for three hours in bright sunshine, the image has apparently reversed by over-exposure, the mercury being deposited on the spaces exposed under the red, orange, yellow, and yellow-green glasses, but not on those which were under the blue-green, blue, and violet glasses.

As we have seen, Robert Hunt was inclined to attribute Moser's results to the effect of heat or differences of relative temperature rather than to light or solar radiations, but his experiments were mostly carried out on copper, which is, as I have found myself, much more sensitive to rays of low refrangibility and to heat than silver is.

*Developable Images Produced on Silver by Heat.*—Towards the end of September, when the weather was much cooler than it had been at the commencement of my experiments in August, I found that there was a distinct falling off in the sensitiveness of the silver surfaces, and it

seemed that Hunt's view might, at any rate to some extent, be correct. I therefore tried an experiment to see if the same developable images could be obtained by heat as by light. A silvered glass plate was polished and put into a printing frame with the cut-out paper mask and mica screen, in which were the cut-out initials, just as if it were going to be exposed in the sun, but it was gently warmed for about five minutes over a spirit lamp, and then developed with mercury. The cut-out initials and edges of the mica came out distinctly in dark lines, just as they did in the pressure experiment, but there was also a clear image of the black-paper mask, which developed lighter than the ground, by the deposition of mercury, or the opposite of the ordinary action of light.

This is a very interesting observation, but recent repetitions of it with silvered glass plates and clean silver foil have quite failed to give such a distinct image of the black paper, though traces of it have been visible, and the edges of the mica and of the cut-out initials were always clearly impressed. In one case, when the silver foil was well heated to redness on both sides before being placed in the printing frame and the subsequent heating, no image of the initials was obtained, and only part of one edge of the mica screen with a faint trace of one corner of the paper mask where there was extra pressure. From this it would seem that heat does not play any active part in the production of the images, though the higher temperature of the summer sunshine, as well as its greater actinic power, may accelerate their formation by light. This is, to a certain extent, proved by the fact that the most perfect printed-out image obtained on a pure silver plate was exposed for three days at the end of September, when the thermometer exposed in the sun at the same time did not rise above 64° F., so that there could have been no question of heat producing the effect, as there might have been under the hot, clear sunshine of August.

*Protection from Air.*—In most of the experiments the plates were protected by glass during exposure, so that the outer air had no direct access to them. When plates were exposed under mica screens and without the protecting glass, the outside unprotected surface became distinctly yellow and tarnished with long exposures.

*Under Surface of Silvered Glass Plate not Sensitive.*—In order, however, to ascertain the effect of cutting off all atmospheric action on the exposed side, a silvered glass plate was exposed from the back or glass side under a cut-out mask made of thin aluminium sheet, and exposed for four days in October, two days being sunny and two cloudy. There was no visible image on either side of the plate after exposure, but breathing showed an image on both sides. The plate was then developed with acid iron and silver, and showed the image not very distinctly; but, as development was prolonged, traces of it appeared at the back of the silver film quite clear of deposit, so that apparently the developer had worked through the protected parts of the film, while the exposed part had taken the deposit of silver. When the plate was dry, there was, curiously enough, no trace of the image on either side of the plate.

This experiment was repeated in January, two silvered glass plates being exposed face to face for fifteen days, of which five or six were sunny and the rest fairly bright, with the object of also seeing whether an impression could be made through the upper plate on to the silvered surface of the under one. On developing with mercury, a fairly clear image of the cut-out design was obtained on the inner surface of the exposed plate, dark on a lighter ground, but neither on the outer exposed silver surface of the upper plate, nor on the silvered surface of the lower plate, was there any trace of an image. The experiment was repeated with a similar result. The only other case in which images have been obtained through the silvered film was on a plate partly fumed with hydrogen peroxide and developed with mercury, but much overdone. As far as they go, the experiments show that the visible image is not produced on the silver except more or less in contact with the air. Further trials in bright, sunshiny weather are required to prove this.

#### SCIENTIFIC TRANSLATION.

GLANCING over the list of scientific books which are published each year in ever-increasing numbers, one finds that not a few of them are translations of German and French works, which have been deemed of sufficient importance and value to warrant a reissue in England or the United States. The introduction to English-speaking scientists of works whose writers are respected as authorities is, says the *Scientific American*, undeniably praiseworthy; but the ragged English in which the thoughts of these foreign authors have been clothed must give us pause and cause us to reflect whether engineers and chemists would not do well to brush

up their German and French, mildewed by long disuse, and to read in their undefined native language those works which are now presented in uncouth dress.

The translation of a scientific treatise is both more difficult and more readily accomplished than the translation of a novel or essay; more difficult because it requires, in addition to a mastery of two languages, a reasonably thorough knowledge of the subject under discussion; more readily accomplished because elegance of expression must give place to accuracy of translation. Indeed exactness is the prime requisite of a rendering of a foreign scientific work.

But sometimes it happens that a scientific writer is not only a man of thought, but also a man of considerable literary ability, who clothes his thought in phrases and sentences artistically formed and grouped. The translation of the writings of such a man ceases to be merely an intellectual task, it becomes an undertaking in which the feeling and good taste of the translator are called into requisition to reproduce as faithfully as possible the style as well as the intellectual traits of the original. A Frenchman who would construe into his mother-tongue the lectures of Huxley and Tyndall would seek to convey in his version something more than the mere thought of his original. He would endeavour to reflect the style as well—not that he would ever fully succeed, for the idiomatic grace of one language can never find an exact counterpart in another; but he would deem it necessary to convey to his readers something of the colour, the music, and suggestiveness of the English work. In short, he would attempt to reproduce the man, even to his mannerisms, as well as the thought of the man.

That most scientific translators fail to catch the style of the foreign author is too often due to a deficient knowledge of their own language. A well-known and most successful translator of novels, a woman who has presented to Americans many of the most popular works of German fiction, once remarked: "Anybody can find out the meaning of a French and German text; that is simply a matter of using a grammar and a dictionary. The secret of making an acceptable translation lies in the ability to express that meaning in good English."

But, granting that the dictionary is a matter of secondary importance to the translator of novels, it cannot be denied that it is well-nigh indispensable to the man who is rendering into English the works of a foreign scientist. As the late Master of Balliol was wont to say, no one is infallible—not even the youngest of us. No translator can be expected to know the English equivalent of every foreign technical term, he must of necessity have recourse to a good lexicon in which he is sure to find reasonably accurate translations of technical phrases. But unfortunately the dictionaries at present in use are most dangerous things; that they are for the most part old is pardonable, but that their definitions should often be inadequate and sometimes inaccurate is inexcusable.

Few works become so quickly antiquated as scientific dictionaries. An invention frequently requires the coining of an entire terminology to define the new contrivance and its functions. The introduction of the phonograph and telephone, the invention of the steam-engine and dynamo-electric machine, the discovery of the Röntgen rays, have each been the means of enriching our scientific vocabulary with words that have been immediately seized and absorbed in the technical speech of the day. Although of new mintage, these terms are as commonly used as any in ordinary mechanical parlance. Obviously the dictionary in which they are not contained is incomplete; and yet most of the purely technical dictionaries are so lamentably deficient in this respect, that, for example, many of the terms used in electrical engineering for the last fifteen years find no place in their pages.

For this reason the task of the scientific translator is rendered doubly difficult. In order faithfully to render a scientific treatise into English he must, in a measure, be independent of the lexicon; he must be sufficiently conversant with the topic under discussion to supply, when his dictionary fails him, a correct translation of a term, and to select from a number of meanings that which adequately fills his needs. We shall not readily forget a translation of an article on a German air ship, published in a prominent American newspaper, in which the German word for "car" (Gondel) was literally translated by "gondola," an example either of a too slavish adherence to the original or a lack of judgment on the part of the translator.

The habit of consulting a good technical dictionary is one of the means of cultivating a nice appreciation of distinctions in scientific synonyms. One acquires, moreover, an excellent understanding of the possibilities of one's mother tongue as well as a knowledge of its defects and of its advantages over other languages. The English translator will tell you that, of all languages, French is the most idiomatic, German the least;

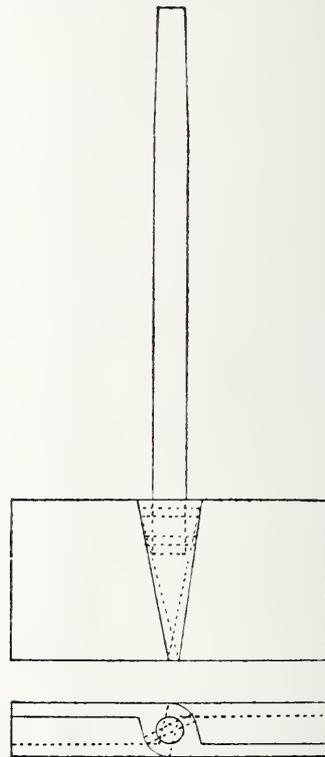

and, although he has not the blessed German privilege of compounding words *ad libitum* to meet his special requirements, he rejoices in that wealth of synonyms which enables him to render a foreign sentence into good Anglo-Saxon with much of its original vigour and idiomatic connotation, and to give to his translation all the marks of an English work, with no trace whatever of the foreign idiom.

## GELATINO-CHLORIDE EMULSION.

### II.

THE method of mixing is a point upon which the authors of various formulæ agree to differ, some saying that the silver must be added to the gelatine solution first, while others are equally as sure that it must be added last; the best way for any one to convince themselves, is to try both methods, and then the writer is quite sure that they will advocate adding the silver solution last, for, on adding it first, the gelatine will be found to discolour, especially if it stands in the light, as silver combines with gelatine, and this seems to be accentuated by the action of light, and a reddish-brown tinge is imparted to the gelatine which cannot afterwards be eradicated; so the writer unhesitatingly pronounces for adding the silver last, in any case it is not advisable to add free silver to gelatine, a much better result being obtained by forming citrate of silver first.

It will be found rather hard and tedious work to mix any quantity of emulsion by hand, besides which it occupies a good deal of time, and the grain obtained is not so fine as might be wished. The writer has found the following little contrivance succeed admirably, as the chloride is formed right through the emulsion; it may be driven by a treadle with the foot,

Mixer.

or, better still, by a small motor, either water, electro, or air; as very little power is required, it should be driven at about 150 revolutions per minute, and the writer is confident that a beautifully fine grain will be obtained, very much better than can be procured with the generally recommended shaking and stirring, at infinitely less time and trouble. The details will be seen from the following sketch.

This mixer should be made entirely of mahogany, both blade and stem. The latter should fit tightly into a hole drilled in the former, and be fastened in by wooden pins, also made of mahogany. No metal pins, nails, or glue, must be used for this, otherwise the emulsion may be spoilt. The writer has tried aluminium for the blade, and, although it does not hurt the emulsion, the alkalis forming the emulsion attack the aluminium, turning it black and making it difficult to clean. Before using the mixer, the blade and bottom part of the stem should be well soaked in methylated alcohol, to decolourise the wood as much as possible, after which no trouble need be feared with it. The only attention required is a wash in warm water after using. The top end of the stem should be tapered off, and may then be fitted into a socket, driven by a motor. It can be forced into the socket by hand, and is then easily

withdrawn when required. This will be found quite tight enough to drive, as very little power is required unless the quantity of emulsion is very large. The effect will be found very good, as it forms quite a vortex, and the chloride can be seen forming right through the emulsion from top to bottom, thus ensuring a very fine grain, more especially if the solutions are placed in a glass funnel having a small piece of glass tubing drawn out to a fine point, and attached to the stem of the funnel with indiarubber tube, with a small pinch-cock on this. The solutions are obtained in a very fine stream, which can be regulated at will, the funnel being supported upon a retort stand, thus leaving the hands at liberty. The emulsification proceeds with the greatest regularity, and, as it requires no attention, except to see that the funnel is kept filled, other preparations may be made during the operation. A small plugget of cotton-wool should be placed in the neck of the funnel to arrest any impurities which otherwise would stop up the fine tube.

When the gelatine is thoroughly dissolved, No. 2 should be heated to 100° F. and added. This may be poured in fairly quickly, stirring all the while, or mixed with funnel and mixer if desired. Up to the present the operations may be conducted in daylight, but the emulsification must be effected in a darkened room, an orange-yellow light being sufficient. Artificial light, such as candles, oil lamps, incandescent electric, or ordinary gas may be used, but not acetylene, incandescent gas, or electric arc. No. 1 should be heated to 100° F., and either poured in very slowly, stirring vigorously while doing so, or the mixer described above, and the aforementioned funnel should be used, when a splendidly fine-grained emulsion should result. A glass rod should be dipped into the emulsion, and if the emulsion has been properly prepared, on looking at gas or other light through the bead of emulsion which collects on the end of the rod, a rich orange colour should be noticed.

The writer thinks that no gelatine obtainable commercially is sufficiently hard for gelatino-chloride emulsions, so he advocates the addition of a hardening agent. No very great quantity is required or the gelatine will be turned into an insoluble lump. The usual hardening agents for gelatino-chloride emulsions are chrome alum and formalin. The former is a very good hardening agent, despite the fact that it contains sulphur, but, unfortunately, it gives the emulsion a peculiar greenish hue, so the writer prefers to add to the above quantity of emulsion one drachm of a four per cent. solution of formalin, this will be about the right quantity for either Winterthur's or Fischer & Schmitt's gelatines; but, if other gelatines are used, it will be necessary to experiment with them before adding, the aim being to get as tough a film as possible, without precipitating the gelatine, or detriment to the working of the film, so that any hardening agent should be used with discretion. If chrome alum is preferred, 6 grains should be dissolved in 2 drachms of water, and added to above before filtering. Formalin should be added after filtering. Concentrated solution of alum or formalin should not be added to gelatine. The emulsion should be raised to *not more than* 120° F., and filtered.

The mixer and filter should be kept in a dark room as much as possible after being used, for otherwise they discolour.

In making gelatino-chloride emulsions, a good result is obtained by adding a *small* quantity of alcohol, to make the emulsion flow more easily; no great quantity should be added, or the gelatine would be precipitated. The writer believes with Captain Abney that the best quantity of alcohol for the above amount of emulsion is 3 drachms. Methylated alcohol answers perfectly well, providing it is methylated with wood naphtha, and not mineral naphtha, as the latter is of an oily nature, and is sure to cause trouble in the coating. A simple way to test for the presence of mineral naphtha is to pour a small quantity of water into the alcohol, when, if mineral naphtha is present, the alcohol will immediately become cloudy, while, if wood naphtha is the methylating agent, no change in the brightness will take place. The alcohol, not necessary, should be added after filtering, and the emulsion should then be allowed to cool to about 90° F., which will be found the most convenient temperature for coating.

The following is a very good formula containing alum :-

FORMULA II.

No. 1.

Recrystallised silver nitrate .....	150 grains.
Citric acid .....	40 "
Distilled water .....	1½ fluid ounces.

No. 2.

Tartaric acid .....	20 grains.
Sodium bicarbonate .....	10 "
Alum (potash) .....	15 "
Water .....	1½ fluid ounces.

No. 3.

Hard gelatine .....	480-500 grains.
Sodium chloride .....	20 "
Rochelle salts .....	20 "
Water .....	7½ fluid ounces.
Alcohol .....	3 drachms.
Formalin four per cent. solution ...	50 minims.

In this formula the method given in Formula I should be followed. The effervescence in No. 2 should be allowed to subside before the alum is added, and left to dissolve before adding to the gelatine solution. This forms what is known in the dye trade as basic alum. Besides exercising a hardening influence upon the film, both the alums and formalin act as antiseptics to gelatine. It may be thought that, as formalin is obtained in a forty per cent. solution, it is a waste of time to dilute it to four per cent., and that five minims of the concentrated solution might be added; but the concentrated solution would precipitate the gelatine in lumps, without exercising the proper effect upon the film. The same remark applies with equal force to the alums, which should be well diluted before using. Some of the published formulæ advise adding such a large quantity of alum, that a moderately hard gelatine is turned into an insoluble lump, so that, when trying a new hard gelatine, it is advisable to add the necessary proportion of alum or formalin to a small quantity of the gelatine, and see whether the effect is right, before wasting further time and chemicals.

Glass jars should not be used for making gelatino-chloride emulsions, as the heat is liable to crack them. The writer has seen large quantities of finished emulsion wasted, through the bottom of the glass jar cracking, and falling out, and, as any one who has worked with salts of silver knows, the stains upon the person, clothes, and floor are very difficult to eradicate. When possible, white or very light cane-coloured earthenware jars should be used for gelatine-emulsion making, as they show up any dirt or old emulsion left in the jar, which would spoil the colour of the emulsion. The safest plan is to wash the jar out with warm water before placing the gelatine in it.

Glycerine is sometimes advised to be added to gelatino-chloride emulsions, but the writer disagrees with this view, as there seems no advantage in using it with a gelatine film, which can always be softened by immersing in water, while a great disadvantage is that it keeps the film in a moist state, and thus affects its keeping properties.

The writer strongly advises that only the sulphocyanide bath should be used for toning the above, as very much better and more satisfactory results are obtained with this bath than with any other, at a less expenditure of gold. The following will be found quite strong enough :-

Ammonium sulphocyanide .....	15 grains.
Gold chloride .....	1¼ "
Distilled water .....	8 fluid ounces.

If a stronger bath is desired, the gold may be raised to 2 grains and the sulphocyanide to 25 grains, but it must be borne in mind that double toning is more likely to take place with this bath than with the former, although the stronger bath will give dark tones better than the weak one. A point to be remembered is that considerable reduction of the print always takes place on first immersing in a sulphocyanide toning bath, the prints assuming a peculiar yellowish colour; but the density is soon recovered, and toning should then proceed with the greatest ease and regularity if the bath is in proper working order.

As the question of coating and the kind of paper to be used will make this article rather too long, the writer proposes to deal with them subsequently.

C. T. SUTTON.

IMPROVEMENTS IN DEVELOPING AND FIXING.

[Thornton & Rothwell's Patent No. 17,292 of 1899.]

THE invention consists in preparing each sensitive plate or film with a developer or combined developer and fixer, applied thereto in suitable dry form, and protected by an air-tight covering, so that, by immersion in the necessary quantity of water, an active solution is formed at the time of development, separately for each plate, sufficient for developing and fixing the negative.

The patentees incorporate the developer and the fixing medium, so that, when dissolved in water, a solution is prepared which effects the double functions of developing and fixing the image. Although they prefer the developing and fixing medium mixed or incorporated, and then applied to the plate, the developing medium only may be so applied.

Any suitable developing or developing and fixing mediums may be employed, which can be put up and packed with the plates in dry form. The following may be taken as examples of suitable preparations, the proportions being enough for each plate of quarter-plate size :-

DEVELOPER.

Pyro .....	2 grains,
or—	
Hydroquinone .....	3 "
or—	
Metol .....	2 "
and—	
Hydroquinone .....	2 "
Carbonate of soda anhydrous .....	10 "
Sulphite of soda anhydrous .....	10 "
Potassium bromide .....	½ grain.

## COMBINED DEVELOPER AND FIXER.

Anhydrous sulphite soda .....	15	grains.
Powdered caustic soda .....	9	"
Anhydrous hyposulphite soda .....	20	"
Grind together, and add—		
Kachin or pyrocatechin .....	9	"

The developing and fixing medium is made up in the form of a strong solution with sugar or dextrine, and then applied in one of the following ways:—

(a) The plate is coated on the back with the solution, and, after the latter is dry, over this is placed a sheet of air-tight material, such as paper, soluble gelatine, or other material, which will prevent the action of the air upon the developing medium, and will prevent it coming into contact with adjacent plates, and which will readily separate or dissolve on immersion in water.

(b) The prepared solution may be coated upon a paper backing sheath or envelope, which covers or protects the plate, and which, at the same time, serves as an air-tight protection for the developing and fixing medium as applied to rolls; the covering material may be attached to the back of the sensitive film, or a loose paper backing may be wound up with the film, and removed or discarded when the film is cut up into plates.

The effect of the combination of the developing and fixing medium is a great improvement upon what has hitherto been done, because it not only dispenses entirely with all chemical solutions in bottles (a great advantage to travellers), but it also renders a dark room entirely unnecessary, as the plate can pass from the camera, after exposure, direct into a trough or tank, in which it is both developed and fixed. By making this tank of red, yellow, or other non-actinic glass or transparent celluloid, the progress of development and fixing can be easily seen, and the plate removed when desired. It is, however, not essential to watch the progress, as, by combining the fixing with the developing operation, no serious result will happen to the picture should the plate be left in the tank rather too long.

By the invention it becomes possible to remove the plate from the tank in daylight as soon as developed, whereas this was not possible hitherto, because, if the plate was removed from the developing tank to a separate fixing tank in daylight, the image became fogged by the light during transference from one tank to the other, and all devices hitherto proposed in which the two tanks were enclosed from daylight by some box or covering chamber other than a dark room were unsatisfactory, as accidental mixing of the solutions frequently occurred and spoiled the image.

After the plates have been developed and fixed outdoors or away from home, we prefer to leave the necessary operations of washing to free the plate from all traces of chemicals until the operator returns home. In order to facilitate this, and prevent any injury to the plates in the mean time, a grooved box or equivalent device may be employed, into which the wet plates can be placed without touching each other. The box is closed by a lid or door, and may afterwards be used as a washing tank without removing the plates therefrom.

To develop, the covered plate may be immersed complete in the water, which dissolves the developer and softens the covering, permitting the latter to be removed or thrown away.

## IMPROVEMENTS IN THE DEVELOPMENT OF PRINTING PAPERS.

[Thornton & Rothwell's Patent No. 17,738 of 1899.]

The invention consists essentially in coating the back of the printing paper with a concentrated solution of the necessary chemicals to produce, when dissolved in water, a developing and fixing solution.

The patentees prepare a concentrated solution of the developing and fixing medium with a soluble cement or adhesive such as gum, starch, dextrine, sugar, or the like, which can be easily applied to the surface of the paper, will dry or set hard thereon, and be readily dissolved again when immersed in water.

The following may be taken as examples of suitable preparations:—

## DEVELOPER ONLY.

Metol .....	2	grains.
Hydroquinone .....	2	"
Carbonate of soda (anhydrous) .....	10	"
Sulphite of soda (anhydrous) .....	10	"
Potassium bromide .....	$\frac{1}{2}$	grain.

## DEVELOPER AND FIXER COMBINED.

Sulphite of soda (anhydrous) .....	15	grains.
Powdered caustic soda .....	9	"
Hyposulphite of soda (anhydrous) .....	20	"
Kachin or pyrocatechin .....	9	"

## FIXER ONLY.

## Hyposulphite of soda.

These materials are made into a strong solution with sugar or dextrine and applied to the paper, the concentration of the solution being regulated according to the amount required on the paper.

The back of the printing paper is rendered more or less waterproof by a coating of an impervious material before the solution of the chemical medium is applied, in order to prevent any penetration through the paper of the chemical medium which would damage the sensitive coating on the face. Celluloid or other waterproof varnish, or other suitable material, may be employed for this purpose, but we prefer the product obtained by treating or dissolving the zinc or aluminium salts of the fatty or resin acids, or a mixture of these salts, with a suitable volatile solvent, such as benzole, coal tar naphtha, benzoline, or other similar light hydrocarbon, and drying or solidifying the same in the presence of heated air.

Upon the paper is first spread the waterproofing material, then it is coated with the chemical medium and finally dried. The layer of chemical medium may be protected by a sealing sheet or coating of air-tight material solubly attached thereto, such as paper, soluble gelatine, or other suitable material, thus enclosing the chemical medium between the paper and the air-tight covering, which will prevent the action of the air upon the developing medium, and will prevent it coming into contact with and damaging the adjacent sheet of printing paper.

For development papers, such as gelatino-bromide of silver, gelatino-chloride of silver, and the like, we may use a developer only, but we prefer to use a combined developer and fixer.

For print-out papers, such as gelatino-chloride, collodio-chloride, and the like, we may use a combined toner and fixer, or, if the toning chemical is incorporated with the sensitised coating (as is possible and sometimes done), we simply apply the fixing chemical to the back of the paper.

In use, after the prepared sensitive paper has been printed in the ordinary way, it is immersed in water, and kept in motion therein until the chemical medium attached to the back completely dissolves. The solution thus produced develops, fixes, and completes the print, the paper being allowed to remain in the solution any desired length of time. It is subsequently well washed in running water to remove all trace of the chemical medium, and dried in the usual way.

## Studio Gossip.

**MOUNTING.**—A mixture of gelatine and arrowroot makes a good mountant, which does not injure the glazed surface of P.O.P. so much as does simple starch paste, points out *Photographic Scraps*. Take of gelatine 100 grains, which should be by preference the thin colourless gelatine usually sold in sheets. Cut this up into very fine shreds and, after soaking it in 3 ounces of water for about five minutes, add to it 200 grains of arrowroot; mix well while cold and apply heat until the gelatine is dissolved and the arrowroot broken up, stirring well all the time. While still warm add 2 drachms of methylated spirit a little at a time, mixing thoroughly after each addition, and about 3 drops of oil of cloves. When cold, a firm jelly will be produced, which, with a stiff brush, may easily be worked upon the dry print. In mounting dry bromides considerable difficulty is usually experienced in making the print adhere to the mount round the edges, as a most persistent curl is generally present. To overcome this, when the print has been placed in position and squeegeed down, take a moist piece of chamois leather and gently press the edges of the print all round. This damps the gelatine surface, causing it to curl the other way, thus effecting perfect contact. When using the commercial mountants, care must be taken that none of the preparations strays to the front of the print, especially in very glossy ones, or the mark will be difficult to remove successfully.

**A POSTER ACADEMY.**—A writer in the June number of the *Poster* (an excellent publication) remarks that "the idea of a Poster Academy—the outcome of the article, 'Why not a Poster Academy?' in the last number of the *Poster*—is one which should secure the active support of both artist and advertiser. The artist, instead of hiding his talent in his studio, will be enabled to display such where it can be appreciated from both artistic and commercial standpoints. Further, the artist, aware of such an opening for the exhibition of his skill, will be encouraged to do his very best work. On the other hand, the wide-awake advertiser would be afforded an opportunity of inspecting a representative selection from the works of the leading poster artists. The busier and more important advertiser cannot waste so much time as would be involved in the visiting of even two or three artists' separate studios. Besides, he is deterred from adopting this, to him, extreme measure by fear of not finding something suitable, or through fear of being expected to purchase what he may not fancy. Looking at the matter, first from the artist's standpoint and then from that of the advertiser, I must say I feel that a Poster Academy is just the very thing needed to bring the artist's work and advertiser together. There is no better *locale* for the headquarters of such an Academy than the Crystal Palace, more particularly as the 'Great Glass House' is now so popular a centre for trade exhibitions. Since writing the last paragraph I see that the Poster Academy idea is taking practical shape. The initiative was taken by several well-known artists, including Messrs. John Hassall, Cecil Aldin, Robert Sauber, Tom Browne, W. S. Rogers. Mr. Austin Fryers has been selected as hon. scribe. I wish them every success."

## News and Notes.

**ROYALTY AND ANIMATED PHOTOGRAPHY.**—The *Daily Telegraph* states that Mr. R. W. Paul, whose services at their river fête were invaluable, succeeded in obtaining a very good animated picture of the Prince and Princess of Wales at Chelsea. It is a unique animated photo of their Royal Highnesses, as they approach the camera (passing down the lines of soldiers' wives) in such manner as to give most effective portraits. The Princess has asked for a copy, and the picture is to be exhibited at the Alhambra.

**MR. J. E. AUSTIN.**—Of this once well-known exhibitor of photographs the *Camera Club Journal* tells us that, "playing in the Croquet Championship Meeting at Wimbledon last month, he beat all comers, and is now the Champion Croquet Player. The *Illustrated Sporting and Dramatic News*, of June 1900, contains a portrait of our member playing in his own particular style and with his own particular mallet, which mallet is his own particular invention, and to which he gives his own particular name. Mr. Austin is an old Rugby boy, and a member of Oxford University. At the Camera Club he is known as a consummate story-teller. He is a man who excels in everything that he takes up. Some years ago it was photography, now it is croquet. We understand that Mr. Austin only took up croquet-playing seriously about four years ago. The rapid way in which he has risen to the top is characteristic of the man."

**THE ABSENT-MINDED BEGGAR "TIT-BIT" FUND.**—Mr. William Tylar sends us a copy of a letter just received from Dr. Hall-Edwards, acknowledging receipt of photographic sundries, the result of the Tit-Bit Camera Fund, to which we gave publicity a few months ago:—"Imperial Yeomanry Hospital, Deelfontein, South Africa, June 11, 1900. DEAR MR. TYLAR.—The box containing the apparatus kindly sent by you as the outcome of the Tit-Bit Camera Competition, reached me yesterday, and I can hardly tell you how delighted I was with the contents. I am distributing the stereoscopes and slides to the various wards, and am sure the patients will derive much pleasure from them. I have given the field glasses away so generously sent by Mr. Kent, optician, Staines, and you may be pleased to hear that each of our five Birmingham policemen have had one. I took several photos with the stereoscopic camera this morning, and they all turned out well. I have done a very large amount of photographic work, over 300 whole-plates and 250 quarters. I gave the views on the Thames to our commandant (Colonel Sloggett), he has decorated his house with them and they have been much admired. Please convey my most grateful thanks to the subscribers to the Fund and accept same yourself.—In great haste, yours very truly, J. HALL-EDWARDS, L.R.C.P., &c., Surgeon-Radiographer to I.Y.H."

## Commercial Intelligence.

**MESSRS. WYNDHAM & Co.**, of Mill Hill Park, Acton, London, W., write that they have purchased the business carried on since 1896 by Messrs. Walford & Co., Limited, together with the premises, machinery, negatives, and their process for the production of photographs in nature's colours.

**PHOTOGRAPHS OF CORSICA.**—The series of views in and around Ajaccio, recently taken by Mr. A. L. Henderson, are now being published, and prints, enlargements, and lantern slides from the original negatives (which include all the principal views, churches, hotels, characteristic studies, street scenes, and objects of Napoleonic interest) can be obtained of the Brighton Photographic Company, Clarence-square, Brighton.

**THE CLIMAX ALBUMENISED PAPERS.**—Messrs. John J. Griffin & Sons, Limited, of 20-26, Sardinia-street, Lincoln's Inn-fields, W.C., inform us that they have taken over the sensitised-paper business carried on by Mr. J. D. Mucklow, at 2, Turtle-road, N., and have been able, by comparing methods of manufacture, to produce a paper practically free from defect, and combining the qualities most desirable in sensitised paper—softness and depth, with entire absence of meanness.

**KNOWLEDGE.**—*Process Work* for June gives the following piece of sound advice on the subject of knowledge in business: "It is a fallacy to suppose that money can make up for lack of knowledge of a business, because you can afford to hire the knowledge at so much per hour, per day, or per week. You must have knowledge yourself before you can employ profitably the knowledge of others. The hugely successful businesses of to-day are nearly all run by men who have been 'through the mill' and have an intimate knowledge of the working of every department. The heads of some of the great businesses may not seem to exert much influence, and may have almost retired from the concern; but, if we inquire into its past history, we invariably find that the man who runs it took an active part until he perfected his organization to such an extent that he was able to draw himself away from his drudgery. Instead of doing the work himself he trained up young men, or got in specialists and was able to tell them what he wanted, thus gradually making a head for every department. The employer's duty thus became simply the control of so many heads of departments, and, as the business grew larger, even this could be lightened by placing 'heads' over 'heads' like the successive officers of a ship or an army. Thus the demand is keen in all businesses for men with knowledge, that is to say, a knowledge above the common rack of things. The constant cry of employers is for men with their 'heads screwed on the right way.' Everybody knows what that means, and every one who has anything to do with running a business knows how difficult it is to get them. Nature does not seem liberal in the production of such men or our social or educational system is at fault. Boys are turned out of school thoroughly unfitted for the battle of life, because they have not been taught to think and act quickly. What is the remedy? We fear there is none. We must abide by the law of the 'survival of the fittest,' and trust to the incentive of ambition for advancement to produce more and more of the right sort of men. As foreign competition makes the demand keener for good

men, we may take it that the incentives will become greater, and the standard of intelligence will rise higher and higher; but it will be a slow process, and meanwhile foreign nations, with their soberer, steadier, more industrious, and highly educated workmen will be forging ahead and ousting us from the commercial marts of the world. Well, it will be our own fault if we lose ground in the commercial race of nations. No nation has had greater advantages and opportunities offered than ours, and no nation has so slowly grasped them. We can only lament the fact and give a word of advice to those who will take it. All who would succeed in life must learn the value of perception and observation, and the importance of observing and thinking for themselves, opposing strenuously blind belief in authorities of any kind. They must rely on their own labour and research, yet not be ashamed to ask concerning that which they do not know. Those who possess knowledge find it a pleasure to impart it to those who are really willing to learn. We must all utilise more the knowledge we possess. Men should think more, read more, and question more; but, as regards reading, we must remember that it is valueless unless we pause and reflect on what we read. Acquaintance without real knowledge is too common a characteristic of to-day. There are plenty of men whose knowledge is a versatile as a volume of *Tit-Bits*, but what is wanted in the serious battle of business life is the man whose knowledge is thorough on some one subject. There is no harm in knowing a bit of everything, but we must know one thing well, and that must be the business we depend on for our bread and butter. To sum up we would say: Learn your business in its entirety, understand thoroughly all the details, watch its operations, improve where you can, never resting content to do the same as others, always striving to do better."

## Patent News.

The following applications for Patents were made between June 25 and June 30, 1900:—

**ANIMATED PHOTOGRAPHY.**—No. 11,575. "Improvements in Mechanism for Taking a Series of Photographs upon a Sensitised Band of Film and for Projecting the Same." W. HOCKLEY.

**ROCKER.**—No. 11,723. "The Automatic Rocker and Washer for Washing and Rocking in Photographic and similar Processes." H. HUGGINS.

**ANIMATED PHOTOGRAPHY.**—No. 11,745. "Improvements in the Fixing and Guiding of Pictures in Kinetoscopes." Complete specification. P. WOLFF.

**"PHOTOGRAPHY."**—No. 11,746. "Improvements in Photography." F. BOISSONNAS.

**SHUTTERS.**—No. 11,786. "Improvements in Everset Photographic Disc Shutters." J. E. THORNTON.

**STAND.**—No. 11,867. "New and Portable Stand for Photographic Cameras." S. E. PARKER.

**RELIEF PHOTOGRAPHY.**—No. 11,873. "A Process and Apparatus for the Production and Representation of Objects in Relief or Intaglio by the Aid of Photography." Communicated by K. Kutzbach and H. Burkert. A. J. BOULT.

## Meetings of Societies.

### MEETINGS OF SOCIETIES FOR NEXT WEEK.

July.	Name of Society.	Subject.
15.....	South London .....	{ Irish Excursion to Co. Fermagh and Sligo. Leader, H. Esler.
16.....	South London .....	{ <i>Beginners' Difficulties</i> F. Goddard.
17.....	Gospel Oak .....	{ Short Papers by Beginners: Prize awarded for best.
17.....	Hackney .....	{ <i>Thornton Film</i> . W. D. Welford.
20.....	Birmingham Photo. Society ...	{ Excursion: Tewkesbury, Gloucester, and the River Severn. Leader, C. S. Baynton.
21.....	Ashton-under-Lyne.....	{ Excursion: Bolton Abbey and Woods. Leader, Charles Lord.
21.....	Croydon Camera Club .....	{ Excursion: Limsfield to Edenbridge.
21.....	South London .....	{ Excursion: Ashtead, Surrey. Leader, H. E. Beckett.
21.....	West London.....	{ Excursion: Burnham Beeches.

### LONDON AND PROVINCIAL PHOTOGRAPHIC ASSOCIATION.

JULY 5.—Mr. S. Herbert Fry in the chair. Mr. PHILIP EVERITT said a question was put to him at a recent meeting as to the new Unar lens, which two of the members, if he recollected rightly, contended had a close resemblance in construction to the Cooke lens, of which they considered it to be as close a copy as was permissible under patent law. Mr. Everitt took exception to this opinion at the time. He had now bought one of the Unar lenses for examination, thinking that those interested in photography professionally would like to see it and gain an idea of its capabilities. The lens shown was one of eight-and-a-quarter-inches focus, listed to cover, at its full aperture of  $f/5$ , a plate measuring  $6\frac{1}{2} \times 4\frac{3}{4}$ . Two photographs were shown, taken at full aperture; but, as they were on  $7\frac{1}{2} \times 5$  plates, a corresponding allowance would have to be made. The qualities claimed for the lens were flatness of field, great rapidity, and extensive covering power. The lens was of the same rank as the Petzval portrait lens for rapidity, but with a much larger angle and more even illumination throughout the field. He had only just received the lens, so that his practical experiments were limited to the two negatives shown. One of these was to indicate the possibilities of the lens for portraiture at full aperture. The quality of the definition he considered very fine. The second plate was of a drawing-room

window, showing blinds, curtains, &c., all of which was faithfully rendered to the edges. Mr. Everitt thought a lens with the qualities claimed for this was especially valuable to the professional man. It was a portrait lens, a group lens, and a lens for practically every purpose. Each half was composed of two lenses with an air space, yet no disturbing reflections arose—a great achievement in an instrument of this kind. At present there was nothing published about the constructional details of the lens. A cursory examination showed that the back half of the lens was about seven inches focus, and was uncorrected chromatically. The burden of correction for colour was thus thrown on the entire combination, and the two halves could not be separately used. The back lens, however, was corrected for astigmatism. It would be seen that the lens was of a very different type from the description given to it at the previous meeting to which reference had been made. In the Cooke lens the burden of correction was thrown upon the central lens, which was nearly equal in focus to the combined focus. The lens was shown upon a camera erected in the meeting-room. In response to a remark by the Chairman, Mr. Everitt repeated that the chief claim made for the Unar was "rapidity." As to the suggestion that, granted greater rapidity, its other powers were not superior to those of Zeiss or Goerz lenses at  $f-7$  or thereabouts, he did not think that any other factor need be considered. It might not be superior in defining power to the other Zeiss lenses, and, as a matter of fact, it covered a less wide angle than some of them. The advantage it had was its rapidity. Again, in some of the modern lenses one found reflections, but not so with the Unar. A lens was always a compromise. Certain types have special advantages over others. For specially rapid work he should choose the Unar rather than the stigmatic. If he wanted a lens that could be divided up and used for a number of purposes, and extreme rapidity was less important, then he would prefer the stigmatic. In reality the Unar was perfection at a large aperture.

Some discussion ensued on this matter and that of celluloid films.

### FORTHCOMING EXHIBITIONS.

1900.

- July 13, 14 ..... Photographic Convention of the United Kingdom (Newcastle-on-Tyne Meeting). Hon. Secretary and Treasurer, F. A. Bridge, East Lodge, Dalston-lane, London, N.E.
- August 21..... Royal Cornwall Polytechnic Society. W. Brooks, Laurel Villa, Wray Park, Reigate.
- Sept. 21–Nov. 3 ..... Photographic Salon, Dudley Gallery, Piccadilly. Hon. Secretary, R. W. Craigie, Camera Club, Charing Cross-road, W.C.
- October 1–Nov. 3 ... Royal Photographic Society, New Gallery, Regent-street. The Hon. Secretary, 66, Russell-square, W.C.
- November 12–17 ..... Ashton-under-Lyne.
- „ 21–23 ..... Hackney Photographic Society.
- 1901.
- January 14–19..... Blairgowrie and District Photographic Association. The Hon. Secretaries, Blairgowrie, N.B.

Those who desire to send photographs to the above Exhibitions should write for prospectuses to the Hon. Secretaries, whose addresses are given in the second column above. The dates mentioned are those at which the Exhibitions open.

## Correspondence.

- \*\*\* Correspondents should never write on both sides of the paper. No notice is taken of communications unless the names and addresses of the writers are given.
- \*\*\* We do not undertake responsibility for the opinions expressed by our correspondents.

### COATING MACHINERY FOR P.O.P.

To the EDITORS.

GENTLEMEN,—I notice in the last issue of the JOURNAL an inquiry by "P.O.P." re "Coating Machinery for P.O.P.," and your reply referred him to Flimsch & Co., of Offenbach a/M. I beg to point out that there is no necessity for going about for machinery of that kind, as Messrs. Masson, Scott, & Co., Limited, engineers, of York-place, Wandsworth, S.W., are makers of all kinds of paper-coating, printing, printing-ink, and paper-making machinery, and have, to the best of my knowledge, made and supplied paper-coating machines to the Britannia Company, Limited, Ilford; Messrs. Berger & Co., Hampstead; Cadett & Neall, Ashted, and other firms in this country.—I am, yours, &c.,

E. FENSKÉ.

## Answers to Correspondents.

### PHOTOGRAPHS REGISTERED:—

- H. Barrett, Spondon, Derby.—Photograph entitled "The Village Blacksmith."
- J. Norval, 123, New-road, Dunfermline.—Two photographs of survivors of the "Thin Red Line."

\*\*\* All matters intended for the text portion of this JOURNAL, including queries, must be addressed to "THE EDITORS, THE BRITISH JOURNAL OF PHOTOGRAPHY," 24 Wellington-street Strand, London, W.C. Inattention to this ensures delay.

\*\*\* Communications relating to Advertisements and general business affairs should be addressed to Messrs. HENRY GREENWOOD & Co., 24, Wellington-street, Strand, London, W.C.

SMOKE IN FLASHLIGHT PHOTOGRAPHY.—FLASHLIGHT asks: "Could you kindly suggest the best way to avoid smoke in making flashlight photographs?"—The only way is to either conduct the smoke into the open air, as in Salmon's and similar apparatus, or to trap it, as in Weiss's or contrivances of a similar type. There is no way of avoiding the flashlight yielding smoke.

BOOK ON PHOTOGRAPHY.—A. CARROLL says: "I want to know if there is a good book on all-round photography, one that would give professional work to suit one in the trade. If so, would you kindly let me know where to get it, and the price?"—There are several books published for the assistance of amateurs and beginners, but we know of none for professional photographers. They are supposed to know their work before they commence business, therefore such a work would be useless to them.

NAME OF BOOK; PLATINOTYPE PRINTING.—PLATINO asks: "(1) The name of a book on the business of photography, giving details of the keeping of books, negatives, &c.? (2) what platinotype paper and developer to use to get pure velvety-black colour?"—1. Write to Messrs. Dawbarn & Ward, Farringdon-avenue, E.C. 2. Ordinary commercial platinotype paper. Use the formulæ supplied with the paper, and you need have no difficulty in getting rich blacks. Of course, some little practice and skill are required to get uniformly the best results. These are not always obtained in the first attempts.

RECOVERING GOLD RESIDUES.—W. THOMPSON writes: "I wish to recover the gold from old toning baths, and should esteem it a favour if you would let me know if I am on the right track to do so. I have put a little sulphate of iron into a bottle, and have put in the solution when I have finished toning. I leave it in the bottle for about two days, then pour off and fill up again. If this will not deposit the gold, what would you recommend, and how to use it?"—The best way is to put the old toning baths into a bottle, and, when it is nearly full, add a solution of sulphate of iron, acidified with sulphuric acid, and then well shake the bottle. The gold will then be precipitated.

IDENTITY OF A PICTURE.—F. YATES writes: "I should be much obliged if you could give me some information about a picture I have hanging up here. The subject is the Madonna of Raffaele in the Dresden Gallery. In left-hand corner is 'Kerblarum Art' (or Herblarum); in right-hand corner is 'F. Muller Sculp.' I believe it is a photograph, though it might almost be taken for an engraving. I shall be grateful for any light you can throw on the matter."—Without seeing the picture we can offer no opinion. It may be an engraving or a photographic reproduction from one. The Dresden Madonna has been reproduced in so many ways and by so many methods that it is impossible for us to say whether the one in question is an original engraving or photographic copy.

PHOTOGRAPHING PLASTER CASTS.—AJAX asks: "1. When photographing a white plaster cast that has figures in slight relief, and using side light, is it necessary to cut off top light? I find that using side light only I do not get the whole surface equally lighted. The part of the cast furthest from the light does not develop as dense as that part nearer the light. I put the cast at the back of a deep box, painted black inside, from which one side and most of the front had been removed. 2. I noticed in your Answers column, a few weeks ago, that some one else had taken the pseudonym of 'Ajax.' I do not know that this can be prevented, but it seems likely to cause confusion."—1. It is clear that the cast was not evenly illuminated, hence it would necessarily not have even density all over. No set rules can be laid down as to how different subjects are to be lighted, it is simply a matter of judgment on the part of the operator. Why put the cast in a box at all to copy it? 2. Correspondents who do not wish their answers to appear under their own name can, of course, adopt any pseudonym they choose, the same as our correspondent has done.

COPYRIGHT QUERIES.—SIMILE asks: "1. Has an employé need to concern himself about the question of copyright when he is told to make a copy of a work of art, either by photographing it or by painting or drawing it? and does it matter whether he is paid wages or for the job? 2. If such a work of art turned out to be copyright, would the blame fall upon him, or his master, or both? 3. In the case where two or three took a part in the work of copying, would they all be responsible? 4. Supposing the job consisted in a sort of composition or compilation of several pictures, as, for instance, a head from one, a figure from another, an accessory from a third, with perhaps a background and colouring from imagination, so that the result as a whole would appear to be something new, yet, if the proprietors of copyrights discovered bits of their own in it, could they all come down on the artist, still supposing that he is working under his employer's direction?"—These queries seem framed with a view to evading the Copyright Act. 1. If the employé was aware that the work was copyright, he would know that he was infringing the law. 2. Probably both. 3. This would look very much like a conspiracy to evade the law. 4. Probably the owners of the copyrights could proceed against all that were concerned in the transaction, but we decline to give a definite opinion.

\*\*\* Our notes on the Newcastle Convention will appear in the JOURNAL of next week.

### EX CATHEDRÁ.

As a supplement to this number of the JOURNAL we give a phototypic reproduction of the group of members of the Photographic Convention of the United Kingdom, taken at Jesmond Dene on Wednesday afternoon, July 11, 1900. The negative was made by Mr. W. Parry, the well-known photographer of South Shields. This is the fifteenth Convention group that has been taken, and it is the general opinion that it compares very favourably indeed with the best of those produced at former meetings of the Convention. A beautiful natural background assisted Mr. Parry to secure an effective piece of grouping. The original photograph is 15 × 12 inches, and, the negative being of very good quality, rich prints on surface paper are the result. Copies of the picture may be obtained of Mr. Parry at the address above mentioned. There are 112 figures in the group, and next week we shall give a key of names.

\* \* \*

A FREQUENT contributor to our columns, Mr. J. A. Reid, of Cutliffe-grove, Bedford, is issuing a shilling book, entitled,

*The Environs of Bedford.* It illustrates points of interest in the county, and supplies a map. The guide is arranged in sections suitable for "day tours" in all directions, taking the tourist along the best roads, prettiest scenery, through quaint and typical English villages and places of special interest, and past the famous residences of Bedfordshire notabilities. The author tells us that he has undertaken every one of the tours personally, and he hopes that his production will prove of utility and interest to the always increasing number of cyclists desirous of enjoying a pleasant day's spin in the country. The routes will be found suitable and convenient for drives, rides, or walks, and they can be curtailed or extended at the will of the tourist. Photographers as well as cyclists will find Mr. Reid's book worth adding to their collection of local guides. Bedfordshire, photographically speaking, has been somewhat neglected by those who tour with the camera, but it has many quiet and beautiful spots where, though comparatively near London, the photographer can follow his hobby far enough from the madding crowd to secure immunity from interruption.

\* \* \*

THIS week the marvellously fertile publishing house of George Newnes, Limited, adds a new periodical to its long and successful list of publications. It is called the *Traveller*, and, at the price of sixpence, is issued weekly. Photo-typically illustrated articles, interesting alike to travellers and "stay-at-homes," fill its pages; and it is superfluous to add that in style and get-up the new-comer is faultless. The prospectus tells us that the business of modern travel has assumed such enormous proportions that it is remarkable no high-class weekly journal has yet been published to reflect and represent this important phase of life. The *Traveller* is designed to be such an organ—a high-class weekly journal, abundantly illustrated, and devoted to the great business of holiday travel and tours, both at home and abroad, for health, sport, and pleasure. The journal will be so arranged as to appeal to all classes at all seasons. The plan of campaign has been very widely laid down, and it includes a page for the amateur and his camera. Mr. A. Kemp, an old photographic friend, is associated with the management of the *Traveller*, to which we wish the utmost success.

WHO does not know the name of Charles Reid, of Wishaw in connexion with the photography of birds and animals? For many years past he has had a very great reputation for these by no means easy kinds of work. His latest catalogue lies before us. It contains some exquisitely dainty reproductions of negatives of blue tits, sheep, Shetland ponies, cattle, dogs, poultry, swans, sporting dogs at work, &c., all showing mastery of selection, and skill in photographing a subject happily and characteristically. Of his very large collection Mr. Reid tells us that it numbers several thousand subjects, to which additions are constantly being made. The portraits of typical animals of the different breeds form but a very small portion of this collection; and, while care and judgment have been exercised in endeavouring to show individual animals to advantage, by far the greater part of the photographs have been taken with a view to the obtaining of pictures rather than of portraits. Lovers of the bird and animal kingdoms should possess this catalogue. It will serve to briefly introduce them to one of the largest and most varied collections of photographs from nature that exists in the United Kingdom.

\* \* \*

THE prolific novelist, Mr. S. R. Crockett, has written a little book published by Messrs. Newman & Guardia, of Shaftesbury-avenue, W.C., in which he tells us why, in the compilation of sketches and memoranda for his novels, he was led to substitute the camera for the pen and the pencil. He yearned for some method more complete, certain, and permanent of recording and filing his impressions. "So, in a moment of inspiration, it chanced that I strolled into a railway terminus. I stood a moment undecided at the bookstall, and then demanded a copy of *Nature*. The brisk young gentleman behind the counter offered me a choice between *Tit-Bits* and THE BRITISH JOURNAL OF PHOTOGRAPHY. Being at the moment frivolously inclined, I chose the latter, and, lo! on the second page I saw for the first time the mystic letters 'N. & G.' It was a modest advertisement, drawn up with the lack of enthusiasm of a builder's specification." Our author has many agreeable things to say of the fine "N. & G." cameras which are perfectly well deserved, and his book is written all through in an amusing style. We hope his frivolous mood has not passed off, and that he remains a constant reader of the JOURNAL, to which he owes his introduction to the camera of which he thinks so highly. When frivolity next attacks us, we will buy one of Mr. Crockett's novels, and trust a perusal of it will profit us as much as a glance at our pages appears to have done the celebrated writer of *The Raiders*, *The Lilac Sun Bonnet*, and other charming books.

#### LEAKY ROOFS—THEIR REPAIR AND PRESERVATION.

A CORRESPONDENT was replied to in the Answers column last week on a subject that has always been a source of trouble to professional portraitists, namely, the making and keeping of the studio in a water-tight condition. The querist said, "I find the usual way of puttying and painting lasts only a little while, and then lets the rain in." Now, nothing conduces so much to an unsightly appearance in the interior of a studio as a leaky roof and its concomitants, stained and discoloured blinds and curtains. Much time and money are frequently expended in remedying the evil, but it is often found that, after a very brief period, the state of affairs becomes very much as

before, and this seems to be the substance of the complaint of the correspondent who wrote us.

This subject has more than once been dealt with in these pages, and the reason why we again refer to it is because now, or will be shortly, is the best season of the year to deal with the trouble, as the necessary work can be the better done when the woodwork is dry and shrunken with the hot weather than when it is in a moist and expanded state, as it will be after the wet season has set in.

One of the most fertile sources of leaky studio roofs is the lack of stability in the sash bars themselves, so that they give under the pressure of a heavy wind, thus causing the putty, after it has become hard and lost its elasticity, to crack and separate from the glass, or from the wood or iron, as the case may be. Wood, iron, and even glass will yield, but *hard and dry* putty will not—that breaks. Too often, particularly in the case of the more ancient studios, which were built with the view of admitting the greatest possible amount of light, the sash bars—both roof and sides—were unnecessarily slight; so indeed they are in some modern ones. Where that is the case, it may happen that repairing will, instead of mending matters, make them, after a time, worse rather than better, because the weight of the painter on the roof may cause the bars to bend sufficiently to separate the hardened putty from the glass on the under side. This will not be manifest to the eye, and the applied paint on the outside will not remedy the injury caused, hence the water will eventually find its way through.

The first thing to be done in rendering a roof sound and lasting is to make the sash bars absolutely rigid and unyielding. This is best done by affixing, laterally, on the inside, two or more, according to the length of the sash bars, bars of tee (T) iron. As this form of bar has great strength and rigidity, it need be but small, hence it will stop off but little light. That being done, all the old putty that has become hard and cracked, or loose, should be "hacked" out and thoroughly cleared away. Next a coat of thin paint should be given. The paint should be so thin that it will run, or penetrate, between the glass and putty on the under side if that has separated from the glass. Then a second coat should be applied after that has dried. After this has become dry, the new putty, which should be made of the best linseed oil, whiting, and a little white lead, must be put on with good pressure, so that it is forced well between the glass and the bars. Finally, after the work has stood for a few days for the putty to harden somewhat on the surface, a couple of coats of tolerably thick paint, made with the best white lead and linseed oil, with a minimum of dryers, should be given. A comparatively slow-drying paint is better than a quick-drying one for this purpose. In this way a sound roof will be obtained. We may here give a practical hint: it is that it is not always advisable to have the work done by "contract," as then the requisite time, and quality of material, is not always expended upon it so as to ensure a durable result.

A sound roof having been obtained, the next consideration is the best means of preserving it in that state. The best way to do that is to, every six months or so—say spring and autumn—lay on a fresh coat of good paint, even if the work does not seem to require it for the time being. If this were periodically done, we should hear less of leaky roofs than we do. A photographer we knew, always towards the end of the summer, made it a practice to have a coat of thin tar, to which a little tallow had been added, applied warm, or while

the sun was upon it, to the outside of the sash bars of the studio as a means of keeping the roof water-tight, and this it did effectually.

Some weeks ago we reproduced, from the *Camera Obscura*, a formula for a cement to take the place of putty for studio roofs that looks well in theory. It stands thus: Tear ordinary newspaper into small pieces, place in an enamelled vessel, and cover it with caustic potash lees; boil it, and add, with constant stirring, one-third the quantity of turpentine; thoroughly mix, and keep the solution hot; then add the following ingredients, which must also be dissolved in boiling turpentine: ordinary pitch, 10 parts; resin, 3 parts; gutta percha, 10 parts; wood tar,  $2\frac{1}{2}$  parts. The solution should be well stirred, and boiled until it becomes a thick paste, and then it should be used while still warm. It is scarcely necessary to tell our readers that this composition is highly inflammable, and therefore its preparation should be conducted out of doors. The claim made for this composition is that, being somewhat elastic, it gives with the unequal expansion and contraction of the glass and the sash bars.

We have said that this formula reads very good in theory, but we cannot say how it would answer in practice. We should ourselves rather adhere to the old and well-tried putty system, with an occasional coat of paint, taking, of course, the precaution that the sash bars are made sufficiently rigid, in the first instance, to withstand the pressure of the strongest gales without their yielding. Without that condition we consider that nothing will render a studio lastingly water-tight.

**A Copyright Case.**—A decision was given in the Chancery Court one day last week that is of considerable interest to photographers, although photography was not directly concerned in the case. Briefly, the case was this: The plaintiffs issued a catalogue containing a dozen illustrations, with price-lists attached. Another firm were desirous of using the same blocks for their catalogue, and the plaintiffs declined to lend them, but agreed to sell electros of them, which they did. These electros were handed to a firm of printers, who agreed to do the printing at a special price, on the understanding that they could use the electros for other catalogues, a permission that the purchasers of the blocks, as they had bought them, thought they had the right to give. The plaintiffs contended that, as they had sold the electros for a specific purpose—to be used for the purchaser's catalogue—they should be used for no other, and therefore sought an injunction to restrain. In this they were successful, Mr. Justice Byrne, in a reserved judgment, ruling that, as the electros were sold for a specified catalogue, they could not be used for any other, and he therefore granted an injunction, with costs of both the action and the interlocutory motion. This case is specially interesting to photographers, as showing that when they sell the right to use their copyright photographs, say to an illustrated paper, the purchasers have no right to use the blocks for any other, and they can be restrained by law from doing so. In the forms supplied by the Photographic Copyright Union, copies of which are printed in the ALMANAC, there is an express stipulation that the permission is given "for one issue only, and the subject may not be reproduced or sold as an independent illustration separate from the above publication and its accompanying letterpress. If any other use is desired, a fresh permission and payment is required." Our readers, when they sell the right to reproduce their pictures, would do well to formally make this stipulation, notwithstanding the decision in the case above referred to. Litigation is costly, and it should always be avoided when possible.

**Phosphoric Fumes.**—In our Foreign News and Notes, last week, were given the results of experiments by Dr. R. E. Liesegang

with the fumes of phosphorous on photographic silver papers, and plates. The Doctor finds that P.O.P. exposed to the fumes given off from non-safety phosphorus matches reduces the silver on the surface in a couple of hours, and produces a strong colouration with a metallic lustre. The knowledge of the reduction of silver from its salts to the metallic state by the fumes of phosphorus is by no means novel; indeed, it was one of the old methods of obtaining a conducting surface, in electrotyping, on objects that were too delicate to stand black-leading. The method was this: The article was brushed over with a solution of nitrate of silver, and then exposed to the fumes of phosphorus, obtained from the evaporation of either an alcoholic or ethereal solution, where a deposit of finely divided metal took place, forming a good conducting surface. A salt of gold or platinum may also be used in place of the silver salt, though that was the one usually employed. The method of obtaining a conducting surface by the reduction of silver by the vapours of phosphorus is given in the third edition of Smee's *Elements of Electro-metallurgy*, published in 1851. Hence it will be seen that this property of phosphoric fumes in reducing silver to the metallic state is not altogether a new discovery.

**Objectionable Photography.**—Photography, we are sorry to say, is often followed in an objectionable manner. We read that Governor Roosevelt, candidate for the Vice-Presidency of America, has been greatly annoyed by the action of a couple of photographers who took "snap-shots of him while he was bathing in Oyster Bay." The thought that he must go on record, possibly in public print, as he appears shorn of rough-rider hat or glasses, in an ordinary bathing suit, has, it is said, raised his anger to white heat; and no wonder. The publication of such photographs would be very annoying to any one, even were he not a candidate for the Vice-Presidency of America. Why we allude to this here is that we have recently heard, as we frequently have before, of the offensive behaviour of some amateur photographers with hand cameras at seaside places in hovering about the ladies' bathing places to "snap-shot" them as they leave, or return to, their bathing machine. Such conduct is highly reprehensible, and tends to bring photography into contempt, because ladies, of course, have a very strong objection to being photographed, surreptitiously, when they are in a state of *deshabille*, as they necessarily are when enjoying the morning dip, and with the possibility that the photograph may eventually be shown on the screen to the amusement of scores of people. Some ladies, just returned from the seaside, remarked, in our presence, that the pleasure of bathing was much marred by two or three "snobs" besetting the ladies' bathing place with their hand cameras every morning. Such conduct is not only discreditable, it is really disgraceful; but, unfortunately, there is, at present, no law to prevent it.

**Value of Engravings.**—During last week Messrs. Sotheby conducted several sales of engravings that, on the whole, brought good prices. For example, a portrait of Miss Palmer, after Reynolds, engraved by J. R. Smith, realised 90*l.* *Rural Amusement*, after G. Morland, engraved by Smith, printed in colours, fetched 61*l.* A damaged engraving, after Raffaele, *The Massacre of the Innocents*, which had been skilfully repaired, went for ten guineas. Many others realised from twenty to forty pounds a piece. Although these high prices are sometimes realised at auction sales, it should be borne in mind that they are only given for exceptionally fine proof impressions, of which there are only a very limited few taken from each plate. Therefore these prices may be looked upon as fancy ones, and must not be taken as a criterion as to what ordinary prints from the same plates may be worth. It may sometimes happen that a fine proof impression will realise as many pounds as some prints from the same plate, after it has been well worn, are worth pence.

**War Portraits.**—The number of portraits of generals and prominent officers now serving at the front, to be worn as buttons or badges on the dresses of their admirers, must be reckoned by millions. Almost everybody one met a little time ago was wearing one or several as a mark of loyalty. The majority of these portraits

were photographs, and, of course, very little time or care was bestowed on their production, and, as a matter of course, they are not proving very stable. During the past few weeks we have noticed many being worn that have become, by the continued exposure to light, in a very woe-begone state. A few days ago we were travelling in a train, and a lady opposite us had two portraits of generals on her dress, but the images were almost obliterated by the deep yellow colour caused by imperfect fixation. What more could be expected for the price at which these pictures are produced, considering that they carry two or three, sometimes more, profits before they are sold complete, retail, from a penny to twopence each? Yet, unfortunately, they tend still more to confirm the general idea of the majority of the public that "all photographs fade."

## NEWCASTLE CONVENTION NOTES.

### I.

LIKE many of its predecessors, the Fifteenth Convention at Newcastle-on-Tyne opened in tears and closed in smiles and sunshine. Two hours before the Mayor, Sir Riley Lord, with a humorous apology for the absence of his chain of office, took the chair at the opening ceremony, and made one of those direct, cordial little speeches of welcome which the Convention was to hear repeated by so many of its Northumbrian hosts during the week—two hours before the Mayor reflected the first ray of official sunshine upon the proceedings, Newcastle was indeed a city of dreadful night to the newly arrived Conventioneer. A dank mist hung over the river, rain fell heavily, and a moist November day seemed to have stolen out of the calendar and surlily intruded itself upon the strawberry-laden kingdom of the month of July—a chimneysweep had darted into the rose-scented boudoir of a dainty lady. Despair shone in many a face. A wet week in Northumberland was a refinement of torture and disappointment which would hit the fine-weather-loving Conventioneer hardest of all.

### II.

But the cheery phrases in which the Mayor extended Newcastle's welcome to the Convention helped to raise their spirits. Sir Riley Lord spoke enthusiastically of the historic interest and natural beauties of Northumbria, and, as members listened to him, their hopes of a bright morrow also rose; and when Tuesday came the sun had replaced the mist and the rain, and the rural Tyne gleamed between its delicately greened banks as the large party were leisurely conveyed by the North-Eastern Railway Company to Hexham. June had lent one of her choicest days to her sister month! The Hexham excursion was a great personal triumph for Mr. Pattison Gibson, whose hard work on that occasion will never be forgotten by those who profited by it. In the early part of the day he led the party over the old abbey, the principal features of which he painstakingly and minutely described. The light was very good, and a considerable amount of interior work was attempted by the members. In the afternoon a drive of some miles took the Convention to the Roman Camp at Walwick Chesters, the Great Wall again giving Mr. Gibson the opportunity of convincing his hearers that he has the history and legend of this deeply interesting part of Northumberland at his finger tips.

But there was a third delight in store for a large party of the Conventioneers, who were chosen by lot to drive to Haughton Castle, the border home of Mr. W. D. Cruddas, M.P. for Newcastle. The kindly host paid the Convention the exceptionally high and much-appreciated compliment of travelling specially down from London in order to be present at the reception. Mr. Cruddas and the ladies of his family entertained the visitors at afternoon tea, and every opportunity was given for taking exterior photographs of the Castle. Hexham was again reached by brake as the sun was setting, and the party arrived at Newcastle at a quarter to ten, charmed with an excursion which had afforded them exceptionally fine opportunities for photographing buildings and remains of historical interest and world-renowned picturesqueness. The indefatigability of Mr. Pattison Gibson, and the kindness of Mr. Cruddas in throwing open his "border home," added a touch of gratefulness to one of the most successful Convention Tuesdays yet experienced.

### III.

The sun still shone on Wednesday, the day on which the principal business of a Convention has to be transacted. The General Meeting

elected the House list of members of Council for 1900-1901, as printed in these pages on June 22nd last, and the Local Committee were thanked for their labours, the name of Mr. Edgar G. Lee (Local Hon. Secretary) being warmly coupled with the vote. Expression was also given to a sincere regret that illness had prevented Mr. W. Thompson (the joint Hon. Sec.), who had been working hard for the Convention for months past, from participating in the fruits of his labours. A vote of thanks of an especially hearty character was passed to Mr. F. A. Bridge (the General Hon. Secretary and Treasurer), and, with the selection of Oxford as the meeting place of the Convention for the year 1901, general business was brought to a close. At the Council meeting which followed Sir William Herschel was unanimously chosen as President of the Convention for 1901-1902. The morning business was over very shortly after eleven, and members hastened away to take advantage of the sun shine. There was a dread—an apprehension—that it might go at any moment, but it stayed with them all the week.

In the afternoon Mr. Bainbridge, the President of the Newcastle and Northern Counties Photographic Association, "took the field," if the expression may be allowed. He held a reception of members of the Convention at Jesmond Dene, a paradise for stereoscopic photographers. Here, amid the trees and the undulating walks by the rocky stream, members strolled and photographed for an hour, and then came the solemn ceremony of the group. Later in the afternoon the Banqueting Hall was the scene of Mr. Bainbridge's hospitality, and yet again one was reminded that the Photographic Convention usually fixes its meeting at a time when strawberries are at their very best. The afternoon passed away to the perfect satisfaction of every member of the Convention.

### IV.

The sweet and plaintive Northumbrian pipes, with the haunting little melody, "Take a peep at Peggy's foot," were a feature of the dinner, which was a pleasant and successful function. In responding to the toast of the Newcastle and Northern Counties' Photographic Association, Mr. Bainbridge, the President, spoke of the pleasure it had given them to welcome the Convention to the North, and said that, when it was Newcastle's turn to be again visited, an even better programme would be better prepared for their entertainment.

The following was the list of toasts: "The Queen and Royal Family;" "The Photographic Convention of the United Kingdom," proposed by the President and responded to by Mr. Bridge; "The Newcastle and Northern Counties' Photographic Association," proposed by Mr. Bridge and responded to by Mr. Bainbridge; "The President," proposed by Mr. C. H. Bothamley; "The Ladies."

Telegrams and letters of regret from the following members, who were prevented by illness and other causes from being present at Newcastle, were read: Messrs. H. P. Robinson (Past President), Ralph Robinson, Harold Baker, Fred W. Hindley, Thomas R. Dallmeyer (President of the Royal Photographic Society), Colonel J. D. Lysaght (who cabled specially from Capetown), Messrs. C. G. Emery; H. Vivian Hyde, Hedley M. Smith, Dr. P. H. Emerson; Mr. James Gribble (Paarl, South Africa), &c., while many verbal messages of a similar tenour were conveyed to principal officers.

### V.

The lantern arrangements in the hands of the Rev. J. W. Ogden and Mr. Milburn, of Sunderland (colour), were exceptionally well carried out, and the show of pictures on the screen on the Monday, Thursday, and Friday included some of the best slides recently produced. Amongst the contributors were the following:—

Graystone Bird, Bath,	Ernest Marriage, South Woodford,
H. C. Leat, Bristol,	Mrs. Annie E. Blake, Bedford,
Harry Wade, Manchester,	Mrs. Welford, London,
John Gunston, London,	A. Brooker, Hastings,
R. R. Rawkins, London,	A. T. Crane, London,
A. R. Bull, London,	A. E. Smith, Kingston,
Ex. Henderson, London,	H. G. Frost, Deal,
Wm. A. Fraser, New York,	Alfred Rogers, Stretford.

This collection was arranged for by Mr. W. D. Welford.

Amongst local workers, Messrs. Bainbridge (President), J. Pattison Gibson, W. S. Corder, Edgar G. Lee, and W. Parry were especially prominent in delighting those present at the meetings, which were exceptionally well attended, considering the fact that the Grand Hotel Assembly Rooms are situated a considerable distance from the centre of the town. On the Friday evening Mr. Watson showed an amusing cinematographic view of the members of the Gloucester Convention,

which had been specially brought for the purpose by Mr. W. Crooke, the President on that occasion. Mr. E. J. Wall superintended the display of slides by the Joly, Ives, and Sanger Shepherd superposition process, the latter being very much admired. Every one connected with the optical arrangements at Newcastle deserves to be congratulated. We have seldom seen better slides better shown.

## VI.

Sunshine again on Thursday, when Major White and Mr. Robert Maxwell led the Conventioneers over Durham Cathedral and Castle. Within the space of a few lines "we are not equal" to describing the beauties of those grand old piles; let us, then, take refuge in the remark that a perfect wealth of possibilities in architectural photography was placed at the disposal of Conventioneers. The classic view across the river (it must be nearly twenty years since we saw McLeish's *Misty Morning on the Wear* on the walls at Pall Mall—what, we wonder, has become of its producer?) attracted the attention of many a lens, and in the afternoon Finchale Priory drew a small party away from the oppressive heat of the old city.

But who of those present will forget the charm of taking lunch in the Great Hall of the Castle (or University), one of the finest of the kind in the kingdom? The portraits of dead and gone Masters of the University looked down from the walls, it seemed, in dignified approval when the thanks of the Convention were conveyed to Dr. Plummer, the present Master, for the great privileges he had placed at the disposal of members. Major White (the President of the Durham Camera Club) and Mr. Gray (the Deputy Mayor) also acknowledged the thanks that were tendered to them. After the pleasant meal in this historic and academic hall, away to more camera work in the Cathedral and the Castle. Then, at the close of the afternoon, home to Newcastle to the serious business of papers and lantern slides.

The papers that were read at the Convention will be found at the end of these notes. Sir Benjamin Stone, M.P., was detained in London by his political duties, and Mr. Scamell (Hon. Secretary of the National Photographic Record Association) kindly deputised for him. The Hon. Secretary read the papers by Mr. E. Howard Farmer and Dr. Emerson, and Mr. Webber supplemented his brief paper by a practical demonstration of blow-pipe work with some of the precious metals. All four gentlemen who contributed papers were cordially thanked by the Convention.

## VII.

"All aboard! All aboard!" cried the leader of Friday's excursion, when the brakes had conveyed Conventioneers a few miles through the magnificent natural park at Alnwick. The ungrazed wilderness of this splendid domain, combined with the crisp fresh breeze that tempered the heat of the sun, supplied a vigorous feast of nature that came well at the end of a splendidly varied week. The party had left the brakes at a lofty memorial tower erected by a former Duke of Northumberland, when "All aboard! All aboard!" cried the leader, the Rev. Mr. Perry. Rebellious looks were cast at him. Nobody likes to be hurried on a Convention excursion, especially in such a place as Alnwick Park. But the genial guide would not be denied. He knew better than the Conventioneers what was in store for them. So "All aboard" they got, to be driven more miles through this matchless expanse of unspoiled grandeur, to be given the opportunity of photographing at the ruins of a Carmelite abbey on a hill top; to be pointed out a column-crowned eminence resembling the real Mount Carmel, and then to be taken for still more miles through the park into the old border town of Alnwick itself, and to be "All aboard" at lunch almost to the minute of time, thanks to Mr. Perry's prompt generalship. Mr. Bainbridge, who had provided alone carriages for the party, had induced the North-Eastern officials to switch the Convention train on to a convenient "Scotchman," and had secured an extension of time for the party in Alnwick, was again cordially thanked for his kindness, and especially enthusiastic were the thanks given to the Rev. Mr. Perry who had proved himself such a successful leader in a splendid country. The remainder of the afternoon was chiefly passed in exploring and photographing Alnwick Castle, and when the day had ended, and the party once more sought the train, a feeling of intense satisfaction with a grand day's outing was expressed by all. At the departure from Alnwick the Rev. Mr. Perry was again heartily thanked, and when the President of the Newcastle Association, Mr. Bainbridge, detrained at Morpeth, the cheers that followed him were not only the expression of the members' thanks for his week-long activity and kindnesses, but were also an indication of their delight at their days' presence in the land of the Percies.

## VIII.

"One of the best Conventions yet held!" "Second only to Dublin!" "Successful all through!" were some of the criticisms passed on the Newcastle Convention. Not a discordant note was heard during the week. Perfect weather favoured the excursions, and the chances for serious photography which Hexham, Durham, and Alnwick offered were taken advantage of to the utmost by those members who were anxious to put in some good work with the camera. The local organization worked with machinelike precision, and Messrs. Bainbridge, Pattison Gibson, Edgar Lee, and their co-workers in Newcastle and the three excursion centres named, may be assured that what they did on behalf of the Convention was crowned with absolute success and caused the liveliest satisfaction to the visitors.

An exhibition of photographs was held in the meeting room, where there were also exhibits by members of the local association, the Sandell Film Company, Mr. Godfrey Hastings, the Thornton Film Company, and others. The Platinotype Company had a large series of platinotype portraits and reproductions of paintings on view, and the presence of their electrically controlled oxymagnesium light in a specially erected studio supplied them with the opportunity of demonstrating its great utility by taking the portraits of most of the prominent members of the Convention present in Newcastle. In this manner some six dozen 12x10 plates were used. The evening meetings were remarkably well attended, and much real interest in the papers and demonstration was manifested. On each occasion the meeting room was well filled. The local press reported the Convention proceedings with the greatest possible fulness. In fact, from whatever aspect it is regarded, the Newcastle Convention bears the marks of splendid success. A glance at the names of those associated with it will show that it was attended by prominent representatives of all phases of modern British photography, and, if the total attendance fell slightly below that of previous meetings, the exceptional circumstances of an exceptional year provide a sufficient explanation. The meeting was, photographically, pleasant and profitable throughout, and the kindness of every individual member of the Local Executive, we are sure, will never fade from the memories of the visitors from near and far.

In writing these few Notes of the Convention, we have had, of course, to keep in mind the fact that the pen is being directed by one who had the honour of acting as the official head of the Newcastle meeting. This circumstance obviously precludes the insertion of a report which gives any degree of prominence to the name of a President who is also Editor of this JOURNAL. It is hoped that the notes, written in a mood of the utmost self-detachment, will meet the needs of readers. But the President cannot let slip the opportunity of heartily thanking the troops of friends who came to his support during the Newcastle meeting. Their splendid loyalty and comradeship will gladden him all his days.

## DIARY OF A CONVENTION PRESIDENT.

**SUNDAY.** Take much physical exercise. Golf in the morning; walk in the afternoon; rowing in the evening; walk after supper. Feel very fit.

**Monday.**—To escape crowd journey alone to meeting place. Arrive an hour before opening. Learn that Hon. Sec. and local committee have been searching for me all day. Sorry. Mayor arrives. Am installed. Wonder if I have lost presidential address. Last recollect seeing it on dressing table 300 miles away. Search in pockets. Find it at last mixed up with cloak-room ticket, bunch of keys, Mr. Watkins' table of plate speeds, and other railway literature. Much handshaking after the meeting. Asked by sixteen people whose plates I consider best. Reply that I always use films.

**Tuesday.**—All-day excursion. Aggrieved photographers discuss copy right with me on outward journey. Am induced to lecture on astigmatism to crowd in Abbey. Get in the way of twenty people all photographing at once. Am liberally reviled. Smile. Lunch off cold roast lamb, salad, and the orthochromatism of ordinary plates. Resume journey in brake. Discussion: lantern slides by contact or reduction. Arrive at Castle. Am asked whose films I use. Say I have brought plates. Speech. Am photographed by twenty Conventioneers. Return journey occupied in considering the hardening effects of formalin. Arrive home at 10. Delightful day. Wonder what the scenery was like. To bed at 12. Knocked up at 2.30 a.m. by Conventioneer, changing plates in own bedroom, wanting to borrow sheet of ruby paper. Endeavour to be polite.

**Wednesday.**—Speech-making from 10 to 11.45. Short drive in town. Discussion *en route*, collodio-chloride versus gelatino-chloride. Reception in Park after lunch. Temperature in shade 92°. Silk hat and frock coat delightful wear. Asked whose lenses I consider best? Suggest the

Kew Test. By request explain it. Group taken. Nearly precipitated in water. Smile. Afternoon tea diversified by the examination of several double-toned prints, over-exposed negatives, and the changing mechanism of fourteen hand cameras. Much photographed again. Annual dinner 7 to 10.30, followed at 11.55 by examination of negatives showing dichroic fog. Discussion adjourned at one o'clock. Woke at three by Conventioneer who had been making midnight exposures from the High-level Bridge and had mistaken his room. Blessed him.

*Thursday.*—Excursion. Discussion *en route*, the cure of distortion given by single lenses. Irreverent small boys in town call Presidential badge Victoria Cross. Resolve not to get in anybody's way in Cathedral. So go on river. Photographic discussions barred for one hour only. Lunch in University Hall. Speeches. Deputy-Mayor self-declared to be the discoverer of method of exposing plates through the backing! Announcement received with deafening applause. After lunch am asked to explain (1) U.S. system of marking stops; (2) meaning of phrase, "Gauss Points;" (3) wave-length theory of light. Friendly hands rescue me and bear me off to the quietude of a ruined priory. Home at 7.30. Papers and lantern slides from 8 to 10. Informal discussion, "Is photography an art?" from 11 to 12.30. Adjourned. Woke at two by member anxious to know if I had key that would fit his bag. Hadn't.

*Friday.*—Excursion. Attempt to "do" the third largest county in England in eight hours. Discussions *en route*: colour photography, stereography, and benzole derivatives. Am asked to give formula for best developer. Reply:  $H_2O = \text{hydroxyl-mono-hydride, } q. s., \text{ qualified according to taste and circumstances.}$  Photograph Norman archway with crowd looking on. Shutter sticks. Crowd sniggers. Told camera wasn't level; that it had moved; that I had over-exposed, under-exposed, and not exposed at all. Smile benignly. Lunch. More speeches. Tell a story—for the first time not about parrot and dog. Everybody delighted and shakes hands with me. Castle of Five Acres! Not big enough. Still chided for getting in the way of Conventioneers giving ten minutes' exposures on one-second subjects. Homeward journey devoted to taking photographs of President. Novel experience! Start dinner at 7.45. Finish at 7.59. Papers and slides 8–10.30. Discussion on things in general, 10.35. 12.30, to bed. Woke up at 2.30 by Conventioneer anxious to tell me the latest good story. Saved him the trouble as politely as I could. Made an enemy of him.

*Saturday.*—Alive!

*Sunday.*—A liver!!

### NATIONAL PHOTOGRAPHIC RECORDS.

[Paper read before the Photographic Convention of the United Kingdom.]

THE value of obtaining a systematic collection of permanent photographs that may prove of value to the future historian or scientific man is now so well established that it is unnecessary to dwell at any length on that point. The only questions now are: What to take, how to take it, and how and where such a collection should be stored.

With regard to the first—what to take. If in any doubt, let us consider the value a print of a similar scene or incident of the past would be to us at the present day. Our only sources of information now of the dresses and customs of the past are to be found scattered through the old manuscripts, or in such work as the Bayeux tapestry, in which we have a splendid record of the dresses, arms, armour, shipping, &c., of that age; or if we come to later date we have to refer to Hogarth, Rowlandson, or some of the old sporting prints, but in every instance we only get a record of the event as represented by the artists of the period, and have to make allowances for their peculiarities and idiosyncrasies, whereas with the camera we ought to obtain a true and unbiassed representation, and one that our successors may rely on.

As far as possible records should be obtained of the manners, customs, ceremonies, and sports of the people which, especially in the villages, are in a transition state, thanks to County Councils and School Boards, and this class should include types of people, groups of school children, &c., as these may prove of the highest value to ethnological students; also portraits of local celebrities, geological subjects, especially when fresh excavations are being made for railway cuttings and similar purposes; coast scenery, which is ever changing by the action of the sea; our shipping and means of transport, which is being revolutionised, thanks to the introduction of electricity and motor cars; and, of course, architectural subjects, which, owing to the restorer, are always changing.

For obtaining such prints a special effort should be made to induce amateurs and others to look through their stock of old negatives, as there is any amount of work invaluable from a record point of view, now valueless because unknown; and, even if the owners cannot be induced to make prints, they might be persuaded to forward lists of such

negatives to headquarters or local secretaries, so that prints could be obtained if particularly required. As an illustration of this, the National Photographic Record Association have been favoured with the loan of some old quarter-plate negatives of bits of London which have now disappeared or have been altered, from which enlargements have been made. The views include such subjects as Old Hungerford Bridge, Somerset House before the Embankment was built, Cremorne Gardens, &c.

With regard to the method of working, the object of all record societies should be to arrange and carry out the work in a systematic way. To begin with, the committee of management should be composed of members representing the archaeological, antiquarian, and photographic societies, so that one branch could select and direct the work which another branch could carry out. Membership may consist of two classes, the one qualifying by an annual contribution of not less than six prints, and the other class by an annual subscription, which need not be heavy (the National Record Photographic Society is fixed at 10s. per annum for the Warwickshire, 2s. 6d.), as the expenses should not be great, the principal item being for mounts. At the same time, if funds are plentiful, part might be available for the purchase of prints of anything of special interest from the professional photographer.

The first county to take up the work seriously was Warwickshire, and it is due to Mr. W. J. Harrison, who, in December 1889, read a paper on the subject before the Birmingham Photographic Society. The principles of their system of working are as follows: In the first instance they adopted the old county divisions of "hundreds" as their large boundaries, and the Ordnance 6-inch map as subdivisions. Each square of this map as published represents about six square miles, and forms the distinct field of work for one or two members; by so doing it prevents all overlapping and duplication. The list of objects in each district is carefully prepared by the committee and published for the use of photographers.

The Guildford Society have adopted another method, that is, to divide the Ordnance map into distinct blocks with natural boundaries, and to furnish the members to whom a block is allotted with a corresponding plan cut from the one-inch Ordnance map mounted on card.

The question of issuing tickets to members requires very careful consideration, but it has been found best to grant tickets or cards of membership annually, and that they should not be reissued to any one not doing satisfactory work or abusing their privileges. One of the Warwickshire by-laws states each member may, upon application obtain a printed permit authorising him to photograph within the limit of his allotted square.

It requires a certain amount of unselfishness on the part of the photographer, as the first thing he must bear in mind is the object for which he is working—viz., to secure a record—and must study the subject from that point of view, and not from the artistic or picture-making side, and must be content to work steadily on, and not just skim through the district, and pick out the choice bits and leave the less interesting though, perhaps, from a record point of view the most valuable, to his successor.

The standard size of the picture generally adopted is the whole-plate at the same time smaller ones should not be refused, as much architectural detail can be well shown on half or even quarter-plate prints.

The style of mount adopted is as shown, consisting of a light bulb mount with a cut-out portion of grey board over. The colour suits the prints, and do not fade, and, being cut out, the prints can be stacked with out fear of rubbing or being damaged. The one shown is 14 ins.  $\times$  11 ins. outside measure, the cut-out  $9\frac{3}{4}$  ins.  $\times$   $7\frac{1}{2}$  ins. This size allows of one whole-plate print, two half-plate, or four quarter-plate.

On the back of the mount are printed headings to be filled in, viz. :—

Subject.

Date.

Name of Contributor.

Address.

Remarks.

The remarks should mention the orientation of the building or direction from which the view is taken, focus of lens, and a brief and accurate (particular care being taken upon this point) description, and the title should be as comprehensive as possible. The cost of these mounts is 2s. 6d. per dozen.

Only prints should be accepted that are produced by some permanent process, such as platinum, carbon, photogravures; no silver prints should, under the circumstances, be received; and all prints should be sent in unmounted, so that they can be mounted at headquarters in a uniform manner.

In every instance, where possible, a scale should be introduced, to give an idea of the size of the object photographed. For this, the Society of Antiquaries, Burlington House, have published a very useful one, giving

English and French measures, price 6d. Failing this, the introduction of a figure will give an approximate idea of the size of the subject.

Then comes the question of storing and indexing. The best place, no doubt, is the British Museum; but, if possible, two copies of each print should be obtained, one for the local museum and one for the British; and the subject of cataloguing requires to be well considered, as no collection is of any real value unless it is readily available for reference. The Warwickshire Society have adopted the system of classifying all pictures of a certain locality or parish together; the Birmingham Reference Library prefer the alphabetical method at present; the British Museum have adopted the county method; but, in any case, a copious index and a complete catalogue should be kept at the headquarters of each survey society wherever the prints are kept.

In order as far as possible to encourage and arrange the work through Great Britain, Sir J. Benjamin Stone, in July, 1897, called a meeting of representatives of twenty of the Royal and scientific societies to discuss the matter, and the National Photographic Record Association was formed, a council and hon. secretary appointed, and a scheme of work and model by-laws were drawn up, and Sir E. Maunde Thompson, on behalf of the British Museum, undertook to receive all prints. Since then some 1400 prints have been received, mounted and forwarded to the Museum, including portraits of the leading Members of the House of Parliament and views of the House, a series of views of Windsor Castle by Sir J. Benjamin Stone; a series of studies of London slum life by Mr. Malby and Edgar Scamell; of Irish antiquities by Mr. Welch, of Belfast; of antiquities of North Britain by Mr. Diveri, of Huntley, N.B., and many others. From this district we have received thirteen from Mr. H. R. Leighton, Co. Durham, and various societies have been started in different parts of England.

In conclusion, on behalf of the Association, I ask all present to assist in the work, and if they will forward us some prints they may be assured they will be well cared for, and, if not prints, I shall be very much obliged if they will let me have a list of any negatives in their possession, of which a register will be kept, so that, if required, we may know where to apply.

I now propose to show some slides as specimens of the work required, and must ask you to consider them from the record point of view, and not as specimens of slide-making.

The slides shown will comprise views of the House of Commons, Westminster Abbey, portraits by Sir J. Benjamin Stone, Irish antiquities by Mr. Welch, antiquities round Elgin by Mr. Diveri, slum life by Edgar Scamell, Stratford-on-Avon by Mr. and Mrs. Snowden Ward, some old houses from my own negatives, and sundry others.

GEORGE SCAMELL.

## BUBBLES.

[Paper read before the Photographic Convention of the United Kingdom.]

SOME of you may remember *A Study in Gum*, by an American, published in *Photograms* for 1899. It was a rather awkwardly posed girl showing a "sticky back;" and I hope some can remember a much more perfect girl's back by Mr. Fellows Wilson in last year's Royal Exhibition. The two portraits will serve well as a comparison of the bad and the good.

It is now almost universally acknowledged by artists that the one distinctive and precious quality of a good photograph is its delicate gradation (hardly to be equalled by any other black-and-white medium), and its power, for certain subjects, of rendering texture.

The study in gum referred to gives us a back that looks as though it suffered from a bad attack of eczema, and yet we are told this is what we are to line up to, that this is an advance, that this is Art.

Now, before we accept these mentors we want a reason (artistic) for changing our opinions. These gumists may shrug their shoulders and squeak and gibber for "perfect freedom," and shrilly ejaculate, "Art!" but we will not accept such shifty arguments. It is useless crying liberty when there is no liberty. We are hard bound by the mechanical conditions of our craft, and if these workers require that "perfect freedom" which they are always crying for, let them become artists and adopt media where there is perfect freedom, and leave us poor photographers alone.

Again, some of you may remember the photograph of a quite commonplace *River Scene at Hampton Court*, frame and all. The sail is altogether wrong in value, the water is woolly, and the photograph is as bad a bit of river scenery as it has ever been my lot to behold. Compare with this the neat little seascape, *Landing Cattle at Morocco*, exhibited at the

Royal. In this latter we have true values, delicate gradations, unobtrusive forms, fine texture, and no frame.

These examples will serve well to illustrate what a section of the photographic world are giving up for a mere smudge, false in every pictorial essential.

I may be told these are not fair examples, but others could easily be produced. In all the best gum work I have seen these essential and fundamental errors abound.

Now, in looking at the examples of fine carpentry or cabinet-making, shall we say, in which these precious daubs are enclosed and afterwards photographed, one is constrained to think that the ideal these amateurs set before themselves is to produce something like a *photograph of a painting*, and they imagine this is progress, this is art.

All of us, even the youngest, are liable to err, so I was careful to place a number of these gum-caricatures before one of our best painters. Shall I ever forget the jeering guffaws with which he picked up the prints; and, having been in France a good deal, he said, with a wicked smile, "Ce sont des articles de Paris," for the names of some well-known French daubers were beneath them. Now, it seems to me this "gum" printing is one of the greatest bubbles floated upon the limpid stream of pure photography, or pictorial photography, or whatever name you may be pleased to call it.

Those who would have us sell our birthright for a mess of gum will, I feel confident, never succeed in their object; and, when they talk to us of art, I, for one, will burst into mocking laughter at their solemn pretentiousness; and I regret to see amongst their number some who used to glibly talk of "subtle tonality," "values," &c.—evidently gum-paint cant on their part, and I should like to know what the young woman with the sticky, diseased-looking back thinks of the outrage. I'll warrant her back is far more lovely than such a sickly representation of it.

France has given us much in true art to be thankful for; but these *bourgeois* French photographers make us begin to wonder if the seeds of Philistinism are there, as the seeds of political and social decay are there, and strongly sprouting. As I have said elsewhere, at the last Paris Exhibition I could only discover that Scandinavia had struck any new note in art; and perhaps, after all, art itself in Paris is merely imitating a splendid tradition, and so becoming as sterile as its population. Such things have repeatedly happened in the history of Art; but I, for one, hope fervently that those ridiculous photographic travesties are perpetrated by the uneducated Philistines of that country, and a French Philistine is hard to beat. One of these scribbles a deal and causes us much amusement, and thus adds to the gaiety of nations, and gives such artists as Mr. J. Pennell a fine subject for satire.

To sum up this point: the gum process destroys tone, texture, and with it values and atmosphere; it makes the result coarse and false, and to look like the photograph of a painting—a *pis aller*, which is merely a rough index of the painting, and which no real artist is satisfied with or cares a toss about, except merely as a rough and crude memorandum to keep when he has sold his picture; and some prefer a simple pen-and-ink sketch for this purpose. And, lastly, it is hand work, and not photography. Another bubble of less pretentious size and less objection is the "dodged printing fake," for sometimes that might come true, but it rarely does. I have been greatly amused to read, in a shilling guide to pictorial photography that the greatest care must be taken in selection of the view, and in exposure, &c., so that the values may be true; and straightway he gives a ponderous apparatus for "faked printing," and advises the use of clouds taken with a small aperture, an error I long ago warned the operator against. His advice continues in the same vein, that is, to "sun down" the print, and in his work he does not hesitate, by scraping the film or some other dodge, to make garish high lights. In short, his chapter on printing is a pocket encyclopædia of how to ruin values, and often textures, and all this after telling us to work in the initial stages most carefully in order to secure true values!

Dr. Hurter and Mr. Driffield show us how to do that scientifically, so far as exposure and development go, and I have endeavoured to do it with regard to other matters, and what is the result? The same issue of *Photograms* contains a print produced by this "sun downer," and I ask you frankly, "Is it art?" It is certainly false in many respects, has a meretriciously deceptive appearance to the unwary, and deceives the amateur. But what has the landscape painter to say to it? I showed some of these prints to a great landscape painter, and he simply asked, "why the fellow did them; what was he after?"

I ask the same question: If pure photography is not good enough or "high" enough for such as he, by all means let him become an artist, and leave us alone and not try and foist "fake" upon us.

I suppose these fakers appear in all arts—"il faut être dans le mouvement," dear boy; "must conspire with 'notions,'" like the cheap-jack; "when one stock of rubbishy goods fails, must bring out another, old friend," I suppose is the explanation. It's commerce, but is it art? It isn't photography. We all remember a painter who tried the faked photo-dodge, using photography as a basis; we all, doubtless, remember what his fellow artists said; and yet he is the prince of photo-fakers, if he care to assume the title; and the poor "sun-downers" are far, far behind him at the game.

I do not suppose you, I, or any sane man cares one brass farthing or the proverbial "two penn'orth of gin" what our fakers do in the faking line if they only don't pretend to us it is something new, something we are to follow—"Art, dear boy!" The British public will have the fake of retouching, and the photographer must live; but we should think him an ass did he begin to shout and yahoo that he had found the recipe—the new recipe, mind you!—the solution of the pictorial photograph—in faking.

The appreciator of the gum plaster and photo-faking is, doubtless, the type of scribbler who is responsible for foisting the sickly monstrosities of Aubrey Beardsley upon the unwary public, and for driving Mr. Whistler abroad, and for causing dishonest dealers to cover old and worthless pictures with white of egg, and let this dry in cracks to cheat the ignorant, another form of gum-work, in fact.

Returning now to the two principal Exhibitions of last year and to *Photograms* of 1899, one meets with the gum landscape of an American. Now, if this conveys anything to any one, I ask to be instructed. A meaningless smear is said to represent *Mountains in North Carolina*. Now, it is said Americans do things on a big scale; but, to judge by that plaster, the mountains of North Carolina look very much like a photograph of a scrubby English hedge that has been "treated" by a good brawny British road-scraper who has set about clearing the countryside up. So much for the great rushlight of the American school. Mr. Steiglitz and Mr. Day are the best exponents of American photography, and I rejoice I've seen no gum-plasters or fakes by either, and I hope I never shall. Then we have the French "school" and its infants. In *A Spring Snow* we find the composition is childish; in *A Lark Shooting*, which might have been good had it been pure photography, though it only proves the Frenchman as ridiculous at *le sport* as M. Tartarin, of Tarascon; the coarse daubs of white, and lack of tone value in what might have been a beautiful and delicate distance, ruin it, and prove the 'prentice hand. Next we find another worker's theatrical and ill-posed women. They recall the sweepings of the worst type of Paris atelier. The chief interest is that this amateur has an island where he retires with his models, an idyllic picture that makes one long Mrs. Grundy were dead and her soul gone to Paris. This series finishes with two commonplaces, most penny-plain peasants, *Returning from the Fields*, and *A Study*, a young woman performing athletic feats with lilies; and all along with this jumble of inanities we have the most solemn, inane, and pretentious letterpress by the great and original gum-splodger himself. It is, indeed, a relief to turn to the manly and healthy works of our Colonial brethren in New Zealand.

But to continue. Of what avail is such a picture as that hung in last year's Royal, *In June?*—woolly trees, degraded lights, impossible grass—and all to represent June, the glorious month of light and leaf. The photo looks like a miserable December evening, with the leaves as though suffering greatly from cell congestion. Another equally bad Salon companion picture was a *Gleam of Sunshine*. "Subtle tonality," again, I presume—only gone wrong. As dismal a sun as one could expect in Hades.

I appeal to you, is this photography? I am sure it will not last—cannot last; and we will welcome the new parlour biographs, if only as a sure and certain kill-all for these pretentious bubbles.

A painter and I sat down one night to select, from the publication referred to, what we considered the two best photos in it pictorially, and what think you they were? Mr. Tingley's *Light Beyond* and Mr. Campbell's *Messengers of Death*, and, lo! we found the latter was included in the *Technical Section*. On the other hand, the very worst in the book—to which we adjudged, too, the wooden spoon—was *A Pond at Weston Green*, which seemed to us to possess every ill that photography is heir to; and this to me was all the more regrettable since the producer of that abominable daub has done some beautiful things in pure photography and platinotype, and may he renounce false gods and return to the style of his saner days.

There was a time when the great bubble of sharpness enveloped the photographic world, but that has burst, and the explosion thereof seemed to have upset the sanity of some, who have been carried away in the ex-

plosion and lost all reason and sense, all tone and texture, those vital and great qualities of photography.

Another bubble that seems to get into the eyes of some of our chemical friends, and which they are constantly playing shuttlecock and battledore with, is the "control in development" question. By all sorts of high-sounding devices they are constantly telling us how they can modify results, and therefore, say they, P is A, or Photography is Art. Now, our good chemical friends are the most respectable of men—the fathers of families, eke churchwardens—but they have never even yet told us how by stirring up something we can make one specific tone lighter as against another. They give us varied results which have no real bearing on the issue at all; but, until they can tell us how a certain wall (say) is to be made lighter or darker as against a certain other wall, and the rest of the picture to remain *in statu quo*, they cannot legitimately deduce P is A, or else they are but logically arguing after the manner of cause and effect of Tenterden Steeple and the Goodwin Sands.

This is a small matter to them, perhaps, but it is of fundamental importance concerning the point at issue, and Dr. Hurter and Mr. Driffield told me it could not be done; and, until one of our friends does it, I shall continue to say P is not A, and add Q.E.D. after the manner of dear old Euclid.

I claim no originality in further destroying these bubbles. I have let them grow and grow, unopposed by me for years, to see if they could give us a new and valuable hint of any kind; but are they doing us any good as a body? We have been held up to ridicule by an able artist, Mr. J. Pennell, in one of the leading reviews; by an artist who was a photographer, and I trust the home truths in the perhaps unpalatable article to many have not been forgotten, though the writer went too far to prove his case, but he said many truths that should not be allowed to drop, for it must not be thought he had any ulterior motive. That I don't believe for a moment; the pretensions in framing and daubing would naturally arouse the ire and sarcasm of any good artist, and many artists I know have said similar and worse things than Mr. Pennell enunciated. To many of us his remarks in no way referred; and if any of us wish to gain the esteem of artists, and, in the long run, of photographers as well, I feel sure the abjuration of all these illegitimate and resuscitated "fakes" is the only royal road. And it delights me to find the responsible press of the photographic world has sternly set its face against such humbug.

DR. P. H. EMERSON.

## RESIDUES, AND WHAT TO DO WITH THEM.

[Paper read at the Photographic Convention of the United Kingdom.]

It can hardly be expected at the end of such a busy week that the subject of residues can be fully dealt with, for an amateur to address an audience chiefly of professionals seems a little out of place. Further, I have little to add to what the press has so fully written for years past.

Briefly, I may tell you that I found the residues of the gold toning bath so much resembling the residues I had to do with in my business of a goldsmith, that I determined to find what the value of the old toning baths really were. To that end I dissolved 2 ounces of sulphate of iron in a quart of hot water. This I put into a two-gallon jar, and as the baths were used up they were poured into the jar after two years. The precipitate was filtered, dried, and burned in an iron ladle; it was then a heavy brown powder. To this I added twice its weight of pearl-ash, after much mixing in a mortar, put into a crucible and submitted to a strong heat for an hour, and this gold was in the bottom of the crucible and weighs  $\frac{1}{4}$  ounce troy.

I had it flattened out to what you see, just in the state in which gold-beaters use in the manufacture of gold leaf. The amount of gold recovered I estimate to be seventy per cent. of the twenty-four 15-grain tubes bought. I expected to have found some silver from the albumenised paper toned, but I did not. The gold by assay is  $23\frac{5}{8}$  carats of fine, or 996 in 1000.

This is another button similar to the first, only heavier. Of silver residues I have only saved the first washings and trimmings of albumenised paper. Common salt was used as a precipitate, and treated generally the same as the gold; it weighed over 11 ounces when it was put into the crucible, now it weighs nearly 5 ounces.

These products prove most conclusively the value of residues.

Having introduced the residues, it is now my duty to demonstrate to you the uses to which they can be put, or at least one use.

I was asked by the Committee of the Council to repeat a demonstration which I had given shortly before at the Camera Club, London, and I have prepared material, and am ready to proceed to make a ring, if you, sir

MEMBERS OF THE FIFTEENTH ANNUAL PHOTOGRAPHIC CONVENTION OF THE UNITED KINGDOM.

Held at Newcastle-on-Tyne, July 9th-14th, 1900.

Henry Greenwood & Co., Printers and Publishers, 24 Wellington Street, Strand, London.

Negative by W. Parry, Photographer, South Shields.

Mr. President, give the word and necessary time. I propose to make a gentleman's hoop ring, weighing about  $\frac{1}{2}$  ounce, by alloying 9 dwts. of fine gold with 2 dwts. of F silver and 1 dwt. of F copper, producing 12 dwts. of 18 carats gold.

To melt these with a common blow pipe, and a gas flame, upon charcoal, to cast same into an ingot of gold, to forge, shape, and prepare for soldering the ends, thus completing the circle.

The finishing the ring must be left for another time, it is getting late, and I will not weary you any longer. S. B. WEBBER.

## DESICCATED DRY PLATES.

### A PRELIMINARY NOTE.

[Paper read before the Photographic Convention of the United Kingdom.]

It is well known that dry plates, as ordinarily used, retain a considerable percentage of water, mainly in molecular combination with the gelatine. I find that the presence of this water in the film at the time of exposure has a large influence on the image, all the chief characteristics, i.e., definition, detail, density, speed, time of development, &c., being affected. Moreover, very small differences in the quantity of this moisture materially affect the result, so that negatives vary with the atmospheric conditions, as to temperature and humidity, at the time of working.

The drier the film, the better the definition and the greater the power of rendering fine detail; in lesser degree, the greater the speed and facility of developing density.

This property of the film can be utilised by desiccating plates for work where definition, detail, brilliancy, or maximum speed are desired, and in exposing plates wet where softness of image or the destruction of small textures and details are sought for. Extra-rapid plates or orthochromatic plates, in which the former of these qualities are usually found lacking, gain them when thoroughly desiccated to an extent hitherto only found in wet collodion or other specially prepared films.

A perfectly flat-topped kettle containing boiling water is a convenient appliance for desiccating plates. They are simply laid on the flat top of the kettle with a piece of bibulous paper between to equalise the heating, and kept there a few minutes at a temperature of 200° before being placed in the slides, or a thick copper slab with an asbestos cover can be used. Too great or too prolonged heating will crack the film or induce fog.

Desiccated plates have been (with increasing satisfaction) in daily use here at the Polytechnic for several months past, and are already widely adopted in the trade and for scientific work. E. HOWARD FARMER.

## THE SENSITIVENESS OF SILVER AND OF SOME OTHER METALS TO LIGHT.\*

[A Paper read before the Royal Society, May 31, 1900, and reprinted from the *Chemical News*.]

*Images Formed on Both Sides of Exposed Glass Plate.*—In connexion with this action through glass, a curious result obtained on a plain glass plate may be mentioned. A piece of clean glass plate was exposed for a day and a half in October under the same aluminium screen, with another glass plate over it, so as to protect the surface from the air. It showed a clear breath image, but mercury vapour did not produce any image. Iron development, however, brought out part of the design very clearly, the silver depositing upon the unexposed parts, and giving an image darker and clearer than the ground. The image of the design appeared by breathing on both sides of the exposed glass plate, so that the action of light went through both plates.

*Effect Produced on Varnished Silver Glass.*—With the same object of ascertaining whether the images could be produced when the silver surface was protected from the air by varnish, a silvered glass plate was coated over one half with photographic negative varnish, and then exposed in the usual way, under the cut-out paper mask and mica screen, in October. After exposure for two days, the image of the black-paper mask, the cut-out initials, and edges of the mica screen were not reproduced so clearly as usual, though they appeared readily enough on the unvarnished half when breathed upon. The distinct heightening of the effect under the varnished part is apparently due to some chemical combination, probably oxidation, or the formation of an organic silver compound sensitive to light. When the varnish is removed the strong image remains, and there is a distinct change of colour in the exposed part of the silver surface, which takes a

\*Concluded from p. 442.

sort of yellowish olive-grey tint. Recent repetitions of the experiment with silvered glass, and with a plate of nearly pure silver, gave exactly the same results. It may be noted that with iodised silver plates the same varnish has been found to exercise a decidedly retarding effect on printed-out images.

*Probable Cause of the Effects Described.*—As regards the cause of the peculiar effects described, and the nature of the visible and invisible but developable images produced by the action of light upon plain silver surfaces, it is very difficult to give any definite opinion. It would seem that in this, as in most photographic processes, the first action of light is principally [molecular, but, if the exposure be prolonged and takes place in the air under ordinary conditions, there is a certain chemical decomposition of the surface of the plate, and the impressed image becomes distinctly visible.

*Moser.*—Moser was of opinion that the action of light does not necessarily consist in the separation of two chemically combined bodies, even in the Daguerreotype, in which process he maintained there is no separation of iodine from silver under the action of light. (We now know that the iodine evolved is absorbed by the underlying silver.) He brought forward his experiments on pure surfaces of silver, where, he says, there can be no possibility of a chemical action to show that the effects of the Daguerreotype could be produced in quite a different way.

*Waidele.*—Waidele (*Pogg. Ann.*, 1843, vol. lix.), although he does not refer to Moser's observation of the direct action of light upon silver, and concerns himself more with the contact actions attributed to invisible light, concludes that Moser's effects are not produced by any action of invisible light, but must be rather explained by the action of atmospheric bodies and the absorption of gases. He points out that polishing powders, such as tripoli, charcoal, &c., ordinarily contain moisture and absorbed gases, for which they have a strong attraction, and, if used in this state, they give up these vapours to the surface polished. If, however, they are heated to a red heat to drive off all moisture and gases, they then act as absorbents, drawing out the moisture and gaseous impurities from the surface of the metal, and producing a far purer and more perfect polish. He also notes the effect of carbonic acid, hydrogen, and other vapours on iodised silver Daguerreotype plates.

So far as my experiments go, I do not think that the nature of the polishing materials has had much influence on the results obtained, though it is an interesting point, which might be looked into.

*Roscoe.*—Roscoe (*Watts's Dict. of Chem.*, 1872, ii. p. 805) also attributes the Moser effects to absorbed gases, and says: "Almost all of the singular phenomena first investigated by Moser, and ascribed by him to the action of latent light, may be more rationally explained by the authenticated facts of the absorption of gases by solid bodies." He also refers more particularly to the contact or "breath" images produced by laying coins, &c., upon polished plates of metal.

*Action of Gases.*—It is evident that, if there be any chemical action on the silver under the influence of light, it must be produced by the agency of gases or vapours contained—

(i.) In the silver itself.

(ii.) In the layer of air or condensed gases in immediate contact with the plate.

(iii.) In the surrounding atmosphere.

(iv.) In the masks or coverings under which the exposures are made.

What the exact nature of the decomposition may be, and to which of these agencies it is attributable, is not easy to ascertain, nor does the appearance of the visible image give much clue to it. From the dull-grey colour of the exposed parts it seems, however, probable that oxygen plays an important part in the action; but whether the oxygen is drawn from the air or is disengaged from the metal itself, or whether both actions take place with interactions of other gases occluded in the metal itself or present in the atmosphere in contact with its surface, there is nothing so far to definitely show. It seems also probable that, as in many other photographic processes, the presence of watery vapour is necessary to bring about the decomposition. These points require further investigation at a time of the year when the light is bright, and the effects can be observed under the most favourable conditions. From the fact that in most of my experiments the external air has been excluded by the outer glasses of the printing frames, we may, I think, conclude that the effects are due more to the gases or vapours occluded in or attached to the silver surface or to the screens rather than to any outside atmospheric influences.

*Oxygen Found in Silver by Graham.*—With regard to the presence of oxygen in silver, Graham found that silver heated and allowed to cool in oxygen could occlude 0.745 volume of oxygen, which was permanently fixed in the metal at all temperatures below an incipient red heat. I.

did not tarnish the bright metallic surface of the silver, or produce any appearance suggestive of the oxidation of a metal. He further showed that silver in the form of sponge can occlude eight volumes of oxygen without any visible tarnish. Silver appears to have a relation to oxygen similar to that exhibited by platinum, palladium, and iron to hydrogen. Silver can also occlude variable quantities of hydrogen, nitrogen, and carbonic acid (*Phil. Trans.*, 1866, p. 434).

*Dumas' Observations.*—According to Dumas (*Comptes Rendus*, 1878, vol. lxxxvi, p. 69), 1 kilo. of pure silver, prepared by fusion with borax and nitre, was heated in a vacuum to a temperature not exceeding a dull red, about 500° or 600° C. The evolution of gas continued for about six hours, and it was received over mercury. The gas given off was pure oxygen, amounting to 47 c. c. at 0°, and 760 mm. of pressure for 1 kilo. of other silver, and weighing 82 milligrammes. In two experiments in which silver was fused in a more oxygenated atmosphere, as much as 158 c. c. of oxygen, weighing 226 milligrammes, and 174 c. c., weighing 249 milligrammes, were obtained from 1 kilo. of pure silver in each case. He found also that silver which contains oxygen does not lose it all in a cold vacuum.

*Mallet's Observations.*—Professor J. W. Mallet, in some investigations on the atomic weight of aluminium, notes these results obtained by Dumas, and states that, in his own observations of the same kind, but using a lime support for the silver heated in a hard glass tube to a moderate redness, he obtained only 34.63 c. c. of oxygen from 1 kilo. of silver (*Phil. Trans.*, 1880, p. 1020).

These different observations show that silver, apparently pure, may contain a very considerable quantity of oxygen, and I believe it is a well-known fact, especially in the mints, that oxygen is nearly always present in silver, with or without hydrogen, carbonic acid, and other gaseous impurities in much smaller quantities.

Whether occluded oxygen is the cause of the photographic effects produced on surfaces of apparently pure silver might readily be proved by extracting all the oxygen from a silver plate by the above methods, and then exposing the resulting purified silver to light, a similar plate from which the oxygen had not been extracted being exposed at the same time. I have not the appliances at my disposal for making this experiment.

*Effects of Heating Silver Plates to Redness.*—With regard, however, to the effect of simply heating the silver plates to redness, the following experiments may be of interest, and seems to show that the heating whether accompanied by subsequent "blanching" or "pickling" in dilute sulphuric acid or not, causes a distinct loss of sensitiveness, and in some cases may destroy it entirely.

A piece of thin, pure silver plate was first of all heated to a red heat over a spirit lamp, then plunged into dilute sulphuric acid, and, after being washed with distilled water and dried, was exposed for about two days and a half, partly in sunshine, at the end of September last, under a screen of mica carrying a cut-out design in tinfoil, which had also been passed through the flame of a lamp. No visible image was produced, nor did one appear by breathing on the plate. Development with acid ferrous sulphate and silver nitrate brought out traces of the opaque tinfoil mask, and of parts cut out of the mica. The free ends of the plate, which were exposed to the air all the time, did not show any distinct attraction for the developer.

Another plate of pure silver, well cleaned with "meteoric" polish (No. 2), and exposed as usual under a mica screen with black-paper mask only one day longer than the last plate, gave a very strong visible image requiring no development. There must, therefore, have been a considerable difference in the conditions of the surfaces of the two plates.

In the plate which was heated and then treated with dilute sulphuric acid, it may be assumed that any surface layer of condensed gases must have been destroyed, and a surface of pure metal exposed, which, as one would expect, was not visibly sensitive to light. In the other case, in which the plate was probably oxidised (it had been lying by for several years), and was simply well cleaned with a dry polishing powder, the surface of the metal was left so sensitive to light as to give a strong visible image. This difference of action in two plates, which were exposed to the same conditions of light, seems to show that the effect produced by light on surfaces of metallic silver are chemical rather than merely molecular in their nature.

A repetition of this observation gave similar results. Further, a plate of thin silver foil, well heated over the spirit lamp and exposed under a mica screen, which was also heated, for two days, including some hours of sunshine, showed no image, even on development with mercury, although distinctly visible images had been obtained on the same piece of foil when cleaned in the ordinary way and exposed under the same or similar screens. Further experiment on this point is still necessary.

*Effect on Silver Surfaces Fumed with Acid and other Vapours.*—A

good many experiments have been made with silvered glass plates or silver foil, fumed with various vapours, which might possibly be present in small quantities during the exposure to light, among them hydrogen peroxide, nitric acid, ammonia, also sulphurous acid; these plates have all shown visible and developable images of a somewhat similar character to those formed on the plain metal.

*Nitric Acid.*—By fuming silvered glass plates with ordinary pure nitric acid (1.420), or, better, with the same acid diluted with an equal volume of water, very clear positive printed-out images have been obtained, even with the comparatively short exposure of one hour in the February sun. With a longer exposure the image was clearer, the exposed parts appearing lighter than the protected parts, as is also the case with the plain silver surfaces.

*Dilute Ammonia.*—Dilute ammonia, containing one part of the solution at 0.880 in thirty of water, gave a similar image, but the film was not so sensitive as with the nitric acid. Further experiments have, however, to be made.

*Dilute Sulphurous Acid.*—Dilute sulphurous acid, formed by acidifying a solution of sodium sulphite with sulphuric acid, gave a weak image of much the same character.

*Hydrogen Peroxide Solution.*—Silvered glass plates, fumed with various strengths of hydrogen peroxide solution, have given fairly sensitive films, sometimes a little white in appearance, but as a rule the printed-out images produced on exposure to light are just the reverse of those produced on plain plates and those fumed, as noted above, *i.e.*, the parts exposed appear darker than the unexposed parts, and do not attract mercury vapour, so that a positive picture is produced from an ordinary black and white negative. By long exposure this effect is sometimes reversed. The visible images produced on silvered glass plates fumed with the peroxide quickly fade away, though the details may still remain visible on breathing. The same effect of fading out has also been observed on plain silver plates.

*Rain or Boiled Distilled Water.*—Silver plates exposed under fresh, clean rain water, or boiled distilled water, gave distinct images on development with mercury, but not very readily, and further observations are necessary.

*Exposures in Fluid Hydrocarbons.*—In order to ascertain whether the images would be produced on silver surfaces exposed in fluid hydrocarbons containing no oxygen, silvered glass and pure silver foil were exposed in fluid paraffin, benzole, xylol, and toluol.

*Paraffin.*—In clear, colourless, fluid paraffin very strong dark olive-yellow images were produced by light on silvered glass and silver foil on the parts exposed freely in the fluid or under the parts cut out of a black cardboard mask, but under a mica screen, which covered part of the black mask and of the plate itself, there was no darkening action whatever. The darkening appears to be due to sulphuration, but why it should not occur under the mica is not clear, unless the latter cuts off the rays which are active in producing it.

*Benzole.*—Silver foil well cleaned and exposed in ordinary rectified benzole under a cut-out black-paper mask, and also half covered with mica, showed very clear, yellow images of the cut-out design on the part uncovered by the mica, apparently by decomposition of the thiophene or other sulphur compound present in the benzole. This darkening required strong sunshine to produce it, and on prolonging the exposure in the sun the metal became quite bronzed in the uncovered exposed part, while the part protected by the mica also took a light tint. It may be noted that, as a rule, the backs of these clips of foil (which were exposed in test tubes) were not protected by any covering, but showed no perceptible change of colour; the darkening of the exposed foil was therefore solely an effect of light.

*Effect of Heating the Foil.*—A piece of the same foil was exposed in the same way in the same benzole after being heated to redness. This did not show such a strong image, even by long exposure in the sun.

A piece of pure foil (assay foil) was exposed in a purer sample of benzole, and also gave a distinct yellow image as soon as the sun acted upon it after some days' exposure, the light being dull till near the end of the period. Another piece of the same foil, heated to redness and exposed at the same time, only showed a very pale yellowing.

*Xylol.*—A similar very faint, but browner, change of colour was noticed on a piece of the same foil, not heated, exposed for several days in commercial pure xylol.

With toluol similar results were obtained after long exposure.

*Effects of Light upon other Metals.*—A few observations have been made as to the action of light upon other metals; but, with the exception of lead, none of them have proved very sensitive, and further work is necessary in good weather.

**Gold.**—Images developable with mercury have been obtained on gold leaf by prolonged exposures, but scarcely any trace of a developable image could be obtained on some highly polished well-gilt buttons exposed for several days in good sunshine in October.

**Lead Foil.**—On pure lead foil I have obtained a very distinct darkened image visible after exposure. Very distinct darkening was also produced on lead foil exposed in pure benzole.

**Copper.**—On copper, distinct visible images have been obtainable sometimes, but the metal is not so sensitive as silver to light, though I have readily obtained heat images on it, developable by mercury. Pure copper foil exposed in sunshine in pure benzole showed a distinct darkening, but, exposed in xylol, it did not change colour.

**Nickel, Platinum, Aluminium, Palladium.**—Nickel, aluminium, and platinum appear to be quite insensitive to light, but with a small button of palladium, kindly lent to me by Mr. T. Bolas, which was exposed for some days under a black-paper mask, there appeared a slight but fairly distinct trace of deposit of mercury on the exposed parts. The spot was too small to make sure of.

**Trial with Röntgen Rays.**—With the kind assistance of Mr. F. H. Glew I was able to make a few experiments with the Röntgen rays upon silvered glass and pure silver plates, exposed for several hours to the rays, but without any visible or developable effect.

The above is a summary of my observations in this direction so far as they have gone. I hoped to have made them more complete, but the dull winter weather has been very much against such work. I hope, however, to go on with it during the summer, but think it advisable to publish the results already obtained now, in order that others may be able to extend them at the same time. They show, I think, that most of the phenomena that occur by the exposure of ordinary photographic plates containing haloid compounds of silver can be observed upon a plain silver plate exposed to light in the air under ordinary conditions. It seems not impossible, therefore, that the key to the hitherto unsolved problem of the production and constitution of the so-called "latent photographic image" may be found within these limits.

MAJOR-GENERAL J. WATERHOUSE, I.S.C.

THE AMATEUR PHOTOGRAPHIC ASSOCIATION EXHIBITION.

SUPPLEMENTING our last week's notes on the Exhibition of the Amateur Photographic Association, of which the Judges were the Editor of THE BRITISH JOURNAL OF PHOTOGRAPHY, Major-General G. F. Kaye, Mr. J. Lillie Mitchell, and Mr. Butler Humphreys, we append a list of the exhibitors, with the number of the photographs entered for competition in each class:—

- Class A.—Robert O. Milne, 9; W. Smedley Aston, 3.
- Class B.—S. Bourne, 4.
- Class C.—Robert O. Milne, 2; Albert S. Hicks, 4; S. Bourne, 4; Hugh V. Smith, 18; E. Cecil Hertslet, 4; W. Smedley Aston, 4; Rev. Edward Jervis, 4; Hesketh Pembroke, 4.
- Class D.—Robert O. Milne, 3; Hugh V. Smith, 4.
- Class E.—Hugh V. Smith, 5; Robert O. Milne, 2; Mrs. S. F. Clarke, 8; Albert S. Hicks, 4; W. Smedley Aston, 4.
- Class F.—Mrs. S. F. Clarke, 4.
- Class G.—None.
- Class H.—Edward Kennard, 1; Robert O. Milne, 4; F. S. Schwabe, 3; H. Gething, 1; Flag-Lieutenant M. A. Kennard, 1.
- Class I.—None.
- Class J.—Robert O. Milne, 2; Hesketh Pembroke, 1; E. Cecil Hertslet, 1; Captain L. E. Kennard, 1.
- Class K.—S. Bourne, 4; A. S. Hicks, 4; J. W. Budd, 6; R. W. Kennard, 1.

Not for Competition.—Captain L. E. Kennard, 3; Flag-Lieutenant M. A. Kennard, 2; Edward Kennard, 2.

- Class L.—None.
- Class M.—None.

Exhibits consisted of a frame or frames containing one or more photographs.

The following awards were made by the Judges:—

Class A (Champion).—No award. The Judges did not consider that the number of entries warranted them in awarding the prize.

Class B.—The custody of the Challenge Bowl is awarded to Albert Slee Hicks, Stoneleigh, Bromley, Kent (for Exhibit No. 25); the prize of 5l. 5s. was withheld, as there was not a sufficient number of artistic pictures in competition.

Class C.—First prize, Albert Slee Hicks, Bromley; second, W. Smedley Aston, 7, Newhall-street, Birmingham; third, E. Cecil Hertslet, H.B.M.S. Consul, Havre.

Class D.—First prize, Robert O. Milne, Leamington; second and third withheld.

Class E.—First prize, W. Smedley Aston; second and third withheld.

Class F.—First prize withheld; second, Mrs. S. F. Clarke, Louth, Lincolnshire.

Class G.—No entries.

Class H.—First prize, Edward Kennard, The Barn, Market Harboro'; second, Robert O. Milne, Leamington; third, Flag-Lieutenant M. A. Kennard.

Class I.—No exhibits.

Class J.—First prize, Robert O. Milne; second, Captain L. E. Kennard, Meerut, India.

Class K.—First prize, S. Bourne, Brightlands, The Park, Nottingham; second, J. W. Budd, 24, Austin Friars, E.C.

Classes L and M.—No entries.

Class N (consolation prize).—No award.

We are asked to state that Mr. Butler Humphreys, one of the Hon. Secretaries, whose address is 106 and 108, Regent-street, W., will be pleased to give any information additional to that contained in the book of rules from which we quoted last week.

PHOTOGRAPHIC SOPHISTICATION.

[A Paper read at the May Meeting of the Photographic Society of Philadelphia.]

THERE was a time when the veracity of the evidence afforded by the camera was accepted with unqualified acquiescence, but a time followed quickly when confidence in its results, as an unfailing index of facts, began to suffer by probation; and those who had implicitly believed in its infallibility learned that, like the witches which Macbeth met upon the blasted heath, photography could "lie like truth."

The *Deus ex machinâ* often made it become a "lying spirit to deceive," so that on occasions it could prevaricate with the aid of certain angle lenses, or by elevation or depression of tripod legs. It is not our object at present to discuss the ethics of photography, but to show how a qualified deception is legitimate, nay, even expedient, from an artistic standpoint of judgment, since the deception, like the cheat of vision in legerdemain, is admitted for the compensation which the deluded sense receives in the pleasure experienced. Hitherto monochrome photography has held whatever art status it possesses, in *fee simple*, by its faithful representation of nature in whatever phase she is presented to us, by methods peculiar to photography, and not by artistic dodges or devices.

Painting has its peculiar, legitimate methods which hitherto have not been considered peculiar or legitimate to photography. Painting, justly, because of necessity, has recourse to all sorts of tricks to cheat the imagination, to convey to the mental vision the impression which a superbly coloured landscape gives to the mind through the physical eye. The "faking" or "dodging" which painting must make use of is resorted to not because the painter despises to give us an actual transcript of the harmonious colouring, but by reason of the limitation of his means to do so. Painting suggests nature, and is consistent in the treatment, but in suggesting is often compelled to give us a colour or a form which is not an actual embodiment of the thing (a form, we say, because colour often deforms objects to human vision, though not to the eye of the camera).

My opinion is perhaps not of much weight with the shining lights of the new photography—I have not yet found out how to get ecstatic over symphonies in yellow or nocturnes in blue—but it seems to me that photography is running on crutches when it forsakes its own legitimate method of monochrome, and endeavours to imitate the results of the painter in colour. Such photographs look only like poor copies of paintings, and, despite the ability displayed in the composition, one grows weary of them. Photography has won "golden opinions," which should be "worn in newest guise, not cast aside so soon." The photographer's "style" is simply his way of setting forth his ideas, and though the rules of art, in its application to photography, are somewhat restrictive, yet they are sufficiently general to allow scope for individual action. Indeed, there is a tendency to too great laxity in photographic style, and photographers are sometimes rather rash in their attempts at originality of conception, presuming that the correctness or falsity of the idea is dependent upon the power to please some one, believing that art, like poetry, is addressed to the world at large, not to a special jury of professional masters, and that the technical qualities are only means to the public end.

To a great extent this is true, and the question after all is, How far do pictures, by brush or camera, tend to the object of all the fine arts—enduring pleasure?

The public cares little for method—it is the effect produced which excites in people pleasures, and perhaps here, too, the public is right.

The poet is not restricted to measure of a certain kind in giving expression to his thoughts, and we are told that one painter lays on the paint so smoothly that not a brush mark is perceptible, while another uses a palette knife, a trowel, or, it may be, a shovel. Photography, like painting, has a tendency to drift away from nature's simplicity, and the photographer tries to persuade himself that he is dressing up nature to advantage by studio tricks, by sensationalism, or by bizarre posing.

These tricks, with the gloss of novelty upon them, pass current a while for the gold of art. The ruling fad sanctions them, and false taste and prejudiced Salon Judges demand pictures made by such facile artifices, until, by familiarity with what is false, one gets so perverted in taste that it becomes impossible to distinguish or appreciate the beautiful and the true. When some one, who, braving the *turn-downs* of the jury, has courage to offer a natural picture, lovely in management of light and shade, but modest in conception, we view it through the defracting medium of a set standard of fashion, and adjudge it altogether too commonplace or ordinary in treatment and illumination.

Sensationalism is a step downward, since it tempts the photographer, by its very demands, to dash and coarseness, to carelessness of manipulation and disregard of technical qualities, and the assumption of the various other forms of mere effect. Then, in turn, it leads the photographer to subjects either vulgar or profane—profane in the sense of disregard of the true aim and province of photographic art.

When photography undertakes to present on the walls of our photographic rooms the agony of Golgotha, and has a yellow baize exhibition, space all to itself and a set of counsellors, skilled in art-puffery, to glorify its merits in our photographic magazines, photographic art has reached a dangerous pinnacle of sensationalism. It is by this adjulation, as well as by the ability displayed by the photographer in the production of such pictures as the *Dead Christ*, the *Crown of Thorns*, or the *Crucifixion*, that the dangerous effect upon photographic art is heightened.

As Charles Lamb says: "Instead of realising an exalted idea, we have only materialised and brought down a lovely vision or a sublime and intense feeling to the low standard of the flesh."

But I am afraid I am like Josh Billings, who announced a lecture on "Milk," yet made no other allusion to the lacteal fluid than in the announcement (but this is my infirmity). My topic is "Photographic Sophistications;" and, as sophistication may be defined as that which gives the impression of truth and reality by falsity and unrealness, I shall endeavour to show by a few illustrations that such a method might be accounted as legitimate, in accordance with the *dictum* of the modern school, for inciting effect in the beholder.

In other words, I have made the camera a "lying spirit to deceive," and have sought to cheat the sense of vision by presentation of natural scenes, in which the natural objects of landscape have no lot or portion.

If faking of negative and print is admissible to produce pleasurable effect, why not faking of the original scene itself?

I have collected a few twigs, pieces of stone, moss, coal, sand, ashes, a bar of soap, old corks of bottles, rags, cinders, &c., and have endeavoured to build up with them the simulation of a landscape picture.

The endeavour was begun in a mere spirit of mischief, but I builded better than I knew, and the result demonstrated to me that the method of pictorial effect in the hands of some one possessed of more artistic perception might result in something far more rare and strange.

The amount of personal enjoyment derived from the exercise of the faculty would more than compensate for the pains bestowed in the creation. I hope the pictures I show will not be too severely judged artistically, since I have revealed the *modus operandi* of their evolution.

JOHN BARTLETT.

#### GAUT AND ROUSE'S IMPROVEMENTS IN CAMERAS.

[Patent No. 7474 of 1900.]

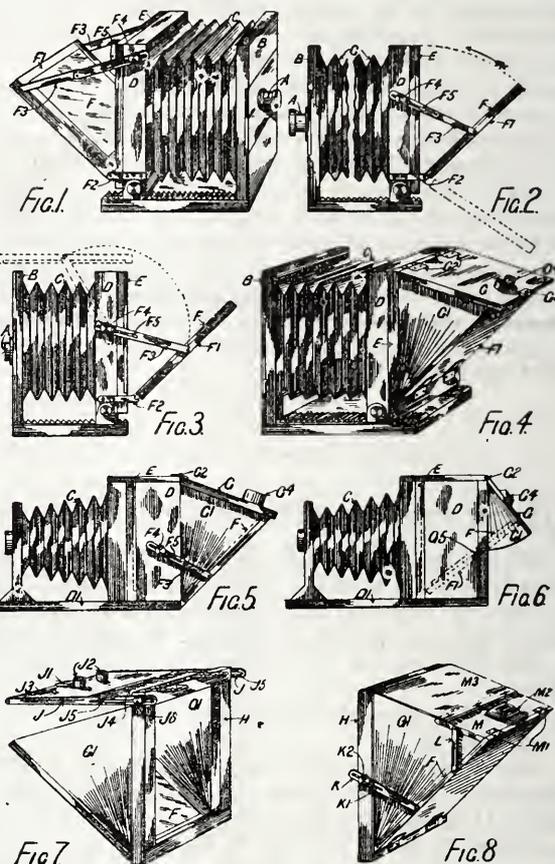

THE invention has been specially devised in order that the operator at the camera will be able to observe a reflected image of the object to be photographed as it appears on the focussing screen with said image in an uprightly uninverted position, that is to say, not reversed vertically as such reflected images have heretofore been seen. The reverse image cast by the lens on to the focussing screen direct or transferred from the lens on to said focussing screen by a reflector will be reflected uprightly uninverted to the operator's vision.

The improvements consist primarily in the combination and arrangement with the focussing screen of the camera of a mirror or reflector set

angularly upwardly and outwardly from the lower edge, or from near the lower edge, and to the rear or outwardly of said focussing screen.

Fig. 1 is perspective view of a bellows camera with these improvements attached, the angularly set mirror or reflector at the rear of the focussing screen being of a very simple construction. A is the lens, B the front frame of the camera, C the bellows, D the back frame of the camera, which may include a "swing back," E the frame of the focussing screen attached to the back frame, D. The angularly set mirror or reflector, F, is held in a frame, F<sup>1</sup>, jointed at the lower part of frame, E, by means of tag-pieces, F<sup>2</sup>, screwed on to the back frame, D, or the swing back forming part thereof which form a hinge upon which the lower part of the reflector frame, F<sup>1</sup>, has movement. The upper end of said frame, F<sup>1</sup>, is supported by side bars, F<sup>3</sup> (jointed in the centre so as to facilitate folding), adjustably affixed to the frame, D, by set screws, F<sup>4</sup>, through slots, F<sup>5</sup>. It is easily to be seen that the inclination or angularity of the mirror or reflector, F, may be adjusted by the movement of the slot, F<sup>5</sup>, backwardly and forwardly of screw, F<sup>4</sup>.

This camera is used with the ordinary focussing cloth, and the image cast by the lens on to the ground-glass focussing screen in the frame, E, is reflected upon the said mirror or reflector, F, and it appears there in an uprightly uninverted position, that is to say, unreversed vertically. As well understood, when the image is properly focussed, the ground

glass in the frame, E, is replaced by the dark slide and the sensitive plate exposed. For carriage, the frame, F<sup>1</sup>, is folded inwardly on to the frame, E, the medial joint in the side bars, F<sup>3</sup>, allowing of such, or, if preferred, the frame, F<sup>1</sup>, may be sprung from the tag pieces, F<sup>2</sup>, and the side bars, F<sup>3</sup>, removed from set screw, F<sup>4</sup>.

Fig. 2 is a side elevation of a similar camera to that shown in fig. 1, with the angular mirror or reflector angularly set in a similar manner to that shown in fig. 1, and in this figure similar letters of reference denote similar parts to those described with reference to the latter. In this case the side bars, F<sup>3</sup>, are set lower down on the frame, F<sup>1</sup>, and the set screw, F<sup>4</sup>, is set lower down on the frame, D. In all other respects the parts are similar. The position to which the frame, F<sup>1</sup>, with the mirror, F, may be swung, if it is not desired to use the same, is shown by dotted lines.

Fig. 3 is a side elevation of a similar camera, to which an angular mirror or reflector is attached, in substantially the same way as in figs. 1 and 2. In this case, however, the tag pieces, F<sup>2</sup>, have jaws in which to receive pintles upon the frame, F<sup>1</sup>, and the side bars, F<sup>3</sup>, are joined to it at about midway of the frame, F<sup>1</sup>, so that, as shown by dotted lines, when it is not desired to use the reflector or mirror, it may be swung upwardly out of the way.

Fig. 4 is a perspective view of a similar camera, to which a hood or covering for the angular mirrors or reflector is affixed so that the focusing cloth is dispensed with. In this case the parts of the camera are of similar construction to those described, and are as follows: the front frame, B; the bellows, C; the back frame, D; the focussing

screen frame, E; and the angular mirror or reflector, F, with its frame, F<sup>1</sup>. This frame is hinged to the frame, D or E, as shown, and between it and the frame, E, is stretched the bellows-shaped side piece, G<sup>1</sup>. The top of the cavity thus made is closed in by rigid lid or cover, G, hinged at G<sup>2</sup>, to the frame, D, or to the frame, E, and fastened to mirror or reflector, F, by spring clasp, G<sup>3</sup>. In this cover, G, are spy holes or eyepieces, G<sup>4</sup>.

In use, the operator directing his vision on to the mirror or reflector, F, through the spy holes, G<sup>4</sup>, will perceive thereon a picture in an uprightly uninverted position. For carriage, the clasp, G<sup>3</sup>, being unloosened, the mirror or reflector, F, is closed in on its hinges, compressing the bellows sides, G<sup>1</sup>, and the top, G, being then closed down over them both. The spring clasp, G<sup>3</sup>, can be utilised to keep the whole in place.

Figs. 5 and 6 show these improvements attached to those classes of photographic cameras which have a cavity at the back of the focussing screen frame for the purpose of carriage of dark slides and the like. In fig. 5 the reflector, F, is hinged to the end of the hollow frame, D, which forms the cavity, or it is hinged to the baseboard, D<sup>1</sup>. It has side bars, F<sup>2</sup>, and set screw, F<sup>4</sup>, on the side frame, D. It has bellows sides, G<sup>1</sup>, between itself and the back end of the frame, D, and it has a rigid top or cover, G, hinged at G<sup>2</sup> to the top of the frame, D. It also has a spy hole, F<sup>3</sup>, and a spring clasp not shown. In this case the operation is the same as that described with reference to fig. 4, and the mirror or reflector, F, is, if so desired, made to close at, and form the back of, the cavity formed in the frame, D.

In fig. 6 the angular mirror or reflector, F, is hinged inside the frame, D, at the lower part of the frame of the ground-glass screen, E, or upon the baseboard, D<sup>1</sup>, and it has friction catches, or springs, or rollers, G<sup>5</sup>, on its edges, which press against the sides of the recess, D, to hold the mirror at the required angle, and prevent easy movement. The upper back of the frame, D, is hinged, as shown at G<sup>2</sup>, and this upper part moves upwardly, having bellows or folding side connexions, G<sup>1</sup>, and a spy hole G<sup>4</sup>. In this case, for carriage, the angular reflector is folded up against the frame, E, and is held there by the springs, G<sup>5</sup>, the back part, G, closing down into place.

So far as has been described, the improvements form part of, or are incorporated into, the construction of the camera itself, but they are equally as well applicable to, and may be manufactured into, a structure integral in itself, adapted to be temporarily attached to the back of a camera. Figs. 7 and 8 show in perspective two such constructions, it being understood that these may be attached to the back frame of the camera or to the frame of the focussing screen in any well-known manner by hinges, or screws, or set screws, or by grooves and buttons, and that the frame, H, of such attachment may, if desired, hold the focussing screen, and said frame take the place of such focussing screen frame.

In fig. 7, H is the front frame for attachment to the camera, and this frame may, if desired, hold the focussing screen in the usual manner on its back or on its front, and this frame may be attached to the camera in a similar manner to that in which the focussing screen frame is now ordinarily fastened. F is the angular mirror or reflector hinged at the bottom to the frame, H, and having bellows or flexible sides, G<sup>1</sup>, between it and the frame, H. J are the side arms or frames for the top or lid of the cavity just formed. This top has a spring clasp, J<sup>1</sup>, to affix it to the top of the reflector, F, and it has spy or eyeholes, J<sup>2</sup>, on the rigid part, J<sup>3</sup>, of said top, the other part, J<sup>4</sup>, of said top being of flexible or textile material, so that the side frames, J, moving with their slots, J<sup>5</sup>, on set screws, J<sup>6</sup>, will allow the angularity or set of the reflector, F, to be adjusted. For carriage, it will be seen that the reflector, F, and the top may close one upon the other.

Fig. 8 is a similar construction to that of fig. 7, differing in that the mirror, F, is supported by side bars, K, having slots, K<sup>1</sup>, through which pass set screws, K<sup>2</sup>, to the frame, H. The angular reflector, F, in turn, by means of side bars, L, supports the rigid top piece, M, hinged at M<sup>1</sup> to it, and having collapsible eyepiece, M<sup>2</sup>. The part, M<sup>3</sup>, which reaches from rigid piece, M, to the back of the frame, H, is made of flexible and or elastic material or fabric, so that it will allow for adjustment of the angular set of the reflector, F. Between the reflector, F, and the frame, H, are bellows sides, G<sup>1</sup>.

Where the image, instead of being cast direct from the lens on to the front of the focussing screens is reflected by an intercepting reflector or mirror and cast on the front or inside face of a focussing screen in or on the side of the camera or relatively to the lens parallel with the axis thereof, the angularly set reflector or mirror is attached in a similar manner to those herein described, but in this case it is essential that the plane of the mirror be parallel with the axis of the lens, and the angular set must start from the lower edge of the focussing screen and incline inwardly or outwardly and upwardly.

## Studio Gossip.

A SINGULAR PROSECUTION.—Messrs. Eddison (Limited), photographers, of Newbury, were summoned at the Dewsbury Police Court for an offence under

the Waterworks Clauses Act. Mr. Lee, the Town Clerk, who appeared for the prosecution, said the maximum penalty for allowing water to run to waste was 5*l*. The waste of water in Dewsbury had been a serious matter, and four years ago an Inspector was appointed, whose duty it was to detect such waste. On June 23 last the Inspector saw the water running from the defendant's dark room. The premises were then closed for the week end, and on the morning of the 25th ult. the water was still running, and it had been allowed to run to waste all the week end. Some thousands of gallons must have been wasted. A representative of the firm was present, and pleaded guilty, saying it was through an oversight. The Bench imposed a fine of 5*s*. and costs.

A COPYRIGHT CASE.—In the Queen's Bench Division, before Mr. Justice Channell, a copyright case was decided last month. The plaintiff, Mr. George Bagnall Bradshaw, who carries on business at High Bank Studio, Church-street, Altrincham, under the style of G. B. Bradshaw & Co., photographers, obtained a perpetual injunction restraining the defendant, Mr. James Littler, Stamford-street, Altrincham, hairdresser, his servants, agents, or workmen; from printing or producing by photographic process or otherwise, or selling prints or copies of a certain photograph of the "Amateur Naval Brigade and 4-7 Naval Gun taking part in the procession of 'Patriotic War Fndd,' Altrincham, of which the plaintiff was the registered owner." The facts, which were incorporated in affidavits, showed that the plaintiff, on February 26 last, took on the Devisdale, Bowdon, on the occasion of the patriotic procession, a negative of the Amateur Naval Brigade and 4-7 Naval Gun taking part in the procession, his plate being a 12-inch by 10-inch size. He subsequently developed the negative, and produced photographs, which had a ready sale. The defendant obtained possession of one of the positives, and then proceeded to copy the plaintiff's photograph, reproducing a photograph in a smaller size, 5 inches by 3 inches, signed with his name and address. The plaintiff registered his photograph at Stationers' Hall as copyright, and the defendant subsequently sold a copy to a Miss Bacon, for which she paid 9*d*. The infringement being established, the Court, by consent, made the injunction perpetual, with costs in the plaintiff's favour, with liberty to apply for inquiry as to damages if the matter was not settled between the parties.

## News and Notes.

MR. FRANK T. ADDYMAN, B.Sc. Lond., F.I.C., of St. George's Hospital has in hand for publication this autumn a volume on *Practical X-ray Work*. It will be issued by Messrs. Scott, Greenwood, & Co., 19, Ludgate-hill, E.C. Mr. Addyman will give a course of lectures on X-ray work at St. George's Hospital early next year.

THE DELAYROUZE LIGHT.—Messrs. Crayon (Limited), of 49, Brecknock-road, N., write: "Re Answers to Correspondents' address wanted, the address of the Delayrouze Light Syndicate is 28, Victoria-street, S.W. Perhaps this may help Mr. Malkin. We are using one of the Delayrouze torch burners, with which we are well satisfied."

We have received an advance press copy of the Great Eastern Railway Company's booklet, giving particulars of new Continental tours via the Royal Mail Harwich Hook of Holland route. A sight of the little book makes one long to take advantage of the excellent facilities for reaching European pleasure spots provided by the Great Eastern Company.

THE R.P.S. EXHIBITION.—We are requested to remind our readers that the last day for the receipt of applications for space in the Professional Section and the Apparatus Section of the Royal Photographic Society's Exhibition, at the New Gallery, October 1 to November 3 next, is Saturday, July 21, after which the allotment will immediately be made.

THE Glasgow Camera Club's Annual Exhibition will be held in the rooms at 46, Gordon-street, Glasgow. It will open on Monday, November 12, and remain open until Saturday, November 24, 1900. The Judges are Messrs. J. Craig Annan, F. H. Newberry, and W. Goodwin. The following class is for open competition: Class G (any subject, any size), one silver and one bronze medal.

THE ASHTON PHOTOGRAPHIC SOCIETY'S ANNUAL EXCURSION.—The Annual Excursion, under the leadership of Dr. Hamilton (President), came off on Saturday, July 7. Lincoln was for a second time the place selected. The weather was splendid throughout the day, and the members thoroughly enjoyed their outing. As many as 342 plates were exposed, but in 1894 this was exceeded by fifty-eight.

THE *Woodbury Reproductions of Old and Modern Masters*, just issued, set forth, in a cheap handbook, many interesting particulars concerning reproductions of the chief artistic masterpieces from the world's greatest art galleries. It is illustrated with numerous reproductions of great pictures, and possesses an additional attraction in including excellent examples in carbon, Woodburytype, and collytype, depicting the processes adopted by the Woodbury Permanent Photographic Company, of Great New-street, E.C., the publishers of the work. Its price is 1*s*.

WORKMEN'S COMPENSATION.—At the Clerkenwell County Court, on Friday last, before his Honour Judge Edge, Henry George Brown sued Messrs. Fordham & Co., of 8 and 9, Lonsdon-place, N.E., photographic mount-makers, to recover compensation under the Workmen's Compensation Act. It appeared that the defendants had paid 1*l*. 1*s*. into court, with a denial of liability. The applicant stated that his finger was injured whilst working a machine, and it has since lost its sensitiveness. After evidence had been given on both sides, his Honour said that he had every desire to assist applicant, but he was satisfied that he was not prevented from earning full wages. He had to guard against workmen obtaining compensation from one firm and then going to another firm and earning full wages. He would award the plaintiff 7*s*. per week from February last to June 30 last, or 5*l*. 19*s*. in all.

At the Somerset Quarter Sessions, on Wednesday last, John Stuart, aged forty-two, photographer, was indicted for obtaining, by means of false pretences, from Louisa Cox the sum of 9s. in money, on March 25 last; also, on March 31 and June 18 and 19, various other sums from divers persons. The prisoner pleaded guilty. Mr. Vachell, who appeared for the prosecution, stated that the prisoner was an army pensioner, and lived at Hotwells, Bristol. He had been about the country with a dummy camera, pretending to take photographs of farmhouses, for the London Stereoscopic Company, to be used in railway carriages and for magic-lantern slides. Upon those representations, and upon a promise to send copies of the photographs, when finished, he received the various sums of money mentioned in the indictment. The Chairman said the prisoner had been guilty of a deliberate and carefully laid system of fraud, and he would be sent to gaol for eight months with hard labour.

**MICROSCOPIC PHOTOGRAPHS.**—"These were first originated and produced by Mr. George Shadbolt [a former Editor of this JOURNAL.—EDS. B. J. P.], then President of the Microscopic Society. They were so minute as to appear to the naked eye as a mere ink-spot. I termed them 'dot photographs,'" writes Mr. F. H. Wenham in the *English Mechanic*. "I have specimens in my microscope cabinet of the portraits of several esteemed friends (all since deceased), and also some buildings, the details of which, under the microscope, are quite visible. They were taken by the wet-collodion process, which in itself has a structure apparently coarse under high magnification. With the modern instantaneous process and dry films better results could be obtained. The subject appears to be forgotten; but, on account of its undoubted utility, I should be glad to see it revived, for where secrecy is desirable the camera could be disguised as an ordinary snuff-box. The lens, of course, would be a perfectly corrected micro-objective."

**THE PRESENT POSITION OF RÖNTGEN-RAY WORK.**—At the recent meeting of the Röntgen Society, Mr. Wilson Noble, in the course of his presidential address, said no very striking discovery with regard to the rays had to be recorded, but a steady improvement had taken place in general practice. It was now possible to shorten exposures, and to get far better definition, both in sclagrams and on the screen. In the latter case there was much greater clearness, and, what was of even more importance, an absolutely steady image. It was also possible to localise foreign bodies with certainty, and the importance of stereoscopic radioscopy, seeing objects in relief on the screen, was an accomplished fact. There were many things difficult to see, or, at all events, to distinguish with certainty, when seen as a flat surface, but which came out with wonderful clearness when seen in relief. One had only to look at an ordinary stereoscopic slide—first without and then with a stereoscope, to appreciate this. More particularly was this the case with objects showing but little contrast and ill-defined, such, for instance, as the early patches of tuberculosis in the lung. He could not but think that the diagnosis of this disease would be enormously facilitated when stereoscopic radiography became general. Many minor improvements had been brought before the Society during the past year. One noticeable feature of the present practice was the adoption of the influence machine by many workers. It was too soon to say whether that machine would ever supersede the coil. In South Africa the rays had rendered admirable service. It was a fortunate circumstance that the work for which they were most wanted on the battlefield—i.e., for the localisation of foreign bodies—was the easiest to perform, for the employment of the rays anywhere than at a well-appointed base hospital was accompanied with enormous difficulties. The number of cases constantly coming in, the necessity for hurrying through them, and the constant impossibility of keeping the tube in good working condition, the difficulty of charging the accumulators, and many other serious inconveniences, made it a marvel how any satisfactory work could be done.

**THE BRITISH MUTOSCOPE AND BIOGRAPH COMPANY (LIMITED).**—At the Ordinary General Meeting of the shareholders of this Company, held at the St. James's Restaurant, Regent-street, under the presidency of Mr. Smedley the Chairman, in moving the adoption of the report and accounts, said the had sent out to South Africa, at a very considerable expense, a number of representatives to take views of the war. As a result, they had received some very excellent views, some of which had never been taken before under similar circumstances. The Company's operators were under fire at the battle of Colenso and elsewhere. Notwithstanding the whole of that expense the average price of negative films had gone down about fifteen per cent during the year. Their positive films, those used in running the biograph had gone down fifty-five per cent. per foot, which was less than half that at which they stood at the beginning of the year, and was even less than the cost price of the films. That had been brought about by their doing business with other companies. When they received the films from South Africa, they were developed for this Company, and additional positives of the films were sold to companies in other countries at a very handsome profit. During the year the had purchased the patent rights of the automatic banjo and other machines for 11,649/. The automatic banjo was one of the most successful ventures they had at the present moment, and was earning a handsome dividend on their entire capital. The biograph had a competitor in the cinematograph, but he believed he was right in saying that the cinematograph could not show pictures such as they exhibited, especially as regarded size and steadiness. Their negative was from seven to nine times as large as that of the cinematograph, and was run at a much greater speed. The records of their pictures, which were accumulating, were, of course, of the greatest value. It was astonishing how prominent men in all countries willingly lent themselves to be photographed for the biograph and mutoscope. The German Emperor had been especially good in this respect. He thought the time would come when their war pictures taken in South Africa would be of great value, and the negatives would be, he was going to say, beyond price. They had made arrangements for representatives to go to the seat of war in China, and the pictures obtained there would be of great value. Some people thought the mutoscope a novelty that would go off, but that was not his view. The novelty of the mutoscopes had worn off to some extent, but not the novelty of pictures which would become of greater interest as time went on. No doubt, the novelty of the illustrated newspaper had worn off years ago, but the selling power of illustrated newspapers had not been reduced, but was increasing. The thirst of the public for illustrations was increasing, and the thirst for moving illustrations was also growing. The difficulty was to find some means for the mutoscope to be under the control, and within reach, of the public. If an illustrated newspaper could be produced by which the public, as they turned over page after page, could see a moving picture of events, they would probably buy that journal, and no other. The Company was now introducing the display mutoscope, which formed an excellent means of advertising. The Company had taken a studio, where they were able to take moving pictures at any time of the day or night, and he believed the effect of that would be that within twelve months it would be the rage to be photographed in a moving position. They were also introducing "The Home Mutoscope," for which a small rental would be charged, and a change of reels would be sent to the user every week. They had also secured a new system of photographing on porcelain, which was absolutely different to anything which had hitherto been introduced in that line, and the photographs would be of permanent character. He had the fullest confidence in the future of the Company, and he believed they would maintain a ten per cent. dividend, and improve the business year by year. The motion was seconded and carried unanimously, and the proceedings, after a short discussion, were concluded.

### MEETINGS OF SOCIETIES FOR NEXT WEEK.

July.	Name of Society.	Subject.
23.....	Southampton .....	Retouching. A. Freeman.
24.....	Birmingham Photo. Society ...	The Pictures taken in Competition by Members at the Cannonock Escursion will be on view, and the Judges' Awards made known.
24.....	Hackney .....	Warm Tones on Velox. Donald C. Nightingale.
28.....	Borough Polytechnic .....	Excursion: Carshalton. Leader, F. W. Levett.
28.....	Croydon Camera Club .....	Excursion: Gatton Park and Hall.
28.....	Croydon Microscopical .....	Excursion: Chipstead and Neighbourhood. Leader, G. Moore.

### LONDON AND PROVINCIAL PHOTOGRAPHIC ASSOCIATION.

JULY 12.—Mr. T. E. Freshwater in the chair.  
 Mr. PHILIP EVERITT showed a photographically corrected magnifying pocket glass made by Steinheil, and magnifying twelve diameters. It consisted of three lenses cemented together, and was remarkably flat of field although the field was not very large. It was a vast improvement upon the ordinary pocket magnifying glass.  
 Mr. J. E. HODD showed several photographs of the recent partial eclipse taken at Balham by Mr. G. H. Gill. Plates of several makers were used—the Sandell, the Warwick, and the Chromatic plate, all with yellow screens, and the exposures varied from one-sixtieth at *f*-22 to one-half at *f*-16, most of them being at *f*-16. The time was from 3.20 p.m. to 3.43 p.m. In two of the plates the Chromatic at one-fifth second and the Sandell at one-half second, the sun's image was reversed, the print showing a negative image. There was an additional point of interest in a thin white line which surrounded the reversed

We are informed that Major-General J. Waterhouse has joined the Board of the Britannia Works Company (Limited).

**MESSRS. ARCHER & SON,** of 71-73, Lord-street, Liverpool, have had the word "Optic" registered as their telegraphic address.

**THE AUSTIN-EDWARDS MONTHLY FILM-NEGATIVE COMPETITION.**—The prize camera for the current month has been awarded to the Rev. W. T. Reeder, The Vicarage, Carlton, R.S.O., Yorks.

**MESSRS. B. J. EDWARDS & CO., LIMITED.**—We are pleased to find included in the list of Limited Companies registered during the past week the name of our old friends Messrs. B. J. Edwards & Co., the well-known manufacturers of isochromatic plates, &c., who will in future carry on the business under the title of B. J. Edwards & Co., Limited. We learn, on inquiry, that Mr. B. J. Edwards will still retain his interest in the new firm, and that associated with him in the management will be Mr. Roland Stone, son of Sir Benjamin Stone, M.P., the well-known amateur photographer. The firm will shortly remove their factory to new and commodious premises at Ealing, and, as the new works will be fitted up under the personal supervision of Mr. B. J. Edwards, it is certain that every possible facility will be secured for the manufacture of the highest class of goods. The latest and best appliances will be used throughout, including Mr. B. J. Edwards's patent coating machine, which has already been adopted, not only by the most important firms in Great Britain, but also in Germany, the United States, and elsewhere. In addition to these are other improvements, &c., of more recent introduction, including a machine for cleaning and preparing the glass previous to coating. By this new method the plates are not only rendered chemically clean, but they are also coated with a substratum which effectually prevents all chance of frilling, so that in this respect the new Company starts with an important advantage.

mage in one of the pictures, the cause of which it was desired to ascertain. 'Halation,' and the well-known fact that a high light in juxtaposition with a shadow gave this effect sometimes, were mentioned in explanation, but the point was one not easy to settle. The six prints were examined with considerable interest.

Mr. EVERITT said he had a photograph of the eclipse taken with a four-inch telescope, the image of the lens measuring three inches in diameter; also one taken with part of a R.R. lens of eleven inches focus, the image being about one-tenth of an inch across.

PHOTOGRAPHIC CLUB.

JULY 4.—Mr. J. W. Ziehnsdorf in the chair.

Mr. J. W. MASON, on behalf of Messrs. Newman & Guardia, showed the new Nydia camera, a pocket folding camera, taking eight plates or twelve films in sheaths, and in a changing box which really formed part of the camera. The shutter was seen to work without hitch or jar of the slightest description up to one-hundredth of a second, and the sheaths and changing mechanism were of effective and simple design. The workmanship is characteristic of Newman & Guardia's productions, and the camera was thought to be a very creditable piece of apparatus.

The CHAIRMAN said that, with reference to iron specks in papers, which, of course, were in the highest degree detrimental to photographic pictures, from an examination of some old books dating back to 1800, he thought he had traced the trouble to iron specks from the rollers rather than to the iron present in spring water. The iron had oxidised in the paper, and produced a network of peculiar lines. He could not imagine that the mere trace of iron in spring water used for paper-making could be enough to cause trouble.

Mr. E. W. FOXLEE believed that the same defect in paper might be attributable to the "devil," the instrument used to tear up the rags, &c., from which the paper was prepared. Particles of metal from this got mixed up with the pulp, and the same with any metal buttons on old linen which might get overlooked.

Mr. FOXLEE showed some further tests with old kachin developer kept for some thirteen or fourteen months. In the intervening period he had made several trials of the old used solution, and some of them have been shown. The two negatives taken together in a bi-lens camera, and shown, were developed, one with new solution, and one with the old stock. Apart from the fact that the old solution required for complete development sixteen minutes to four and a half minutes with the freshly made solution, there was no practical difference. Opinion was evenly divided as to which was by the old and which by the new developer, and Mr. Foxlee himself confessed that only by a private mark could he tell.

The rest of the evening was devoted to an attempt to solve a question put by Mr. Müller, viz., given a plate correctly exposed, and requiring to reduce the whole of the light-struck silver bromide, would it matter what developer was used?

Mr. J. W. MASON was convinced that, in the first place, what might be a correctly exposed plate with one developer would not with another.

Mr. FOXLEE believed there were many who held that so-called tinkering with the developer had very little to do with the ultimate result, but he thought it did. Theoretically, perhaps, any of the developers should thoroughly reduce the exposed bromide of silver; but, when one was dealing with a negative from which a print was required, other factors came in, and the matter resolved itself into a different one altogether. He believed that the thinner the film, provided one gave correct exposure, one more nearly approached the condition of things suggested by the original question.

Mr. MÜLLER defined what he considered a correct exposure in the case of a sheet of print as one which allowed the maximum of action by the white parts of the paper without permitting the black points to influence the paper.

FORTHCOMING EXHIBITIONS.

1900.

August 21..... Royal Cornwall Polytechnic Society. W. Brooks, Laurel Villa, Wray Park, Reigate.

Sept. 21—Nov. 3 ..... Photographic Salon, Dudley Gallery, Piccadilly. Hon. Secretary, R. W. Craigie, Camera Club, Charing Cross-road, W.C.

October 1—Nov 3 ... Royal Photographic Society, New Gallery, Regent-street. The Hon. Secretary, 66, Russell-square, W.C.

November 12-17 ..... Ashton-under-Lyne.

„ 21-23 ..... Hackney Photographic Society.

1901.

January 14-19 ..... Blairgowrie and District Photographic Association. The Hon. Secretaries, Blairgowrie, N.B.

Those who desire to send photographs to the above Exhibitions should write for prospectuses to the Hon. Secretaries, whose addresses are given in the second column above. The dates mentioned are those at which the Exhibitions open.

Correspondence.

\* \* Correspondents should never write on both sides of the paper. No notice is taken of communications unless the names and addresses of the writers are given.

\* \* We do not undertake responsibility for the opinions expressed by our correspondents.

THE TANQUEREY PORTRAITS.

To the EDITORS.

GENTLEMEN,—As you will see from the enclosed, which I have received by post from Paris, the enlargement swindle is not confined to England only. Both the first and the second letters are cunningly written, with the aid of English press cuttings to deceive the English public. I thought you might like to warn the public.—I am, yours, &c.,

Graphic Works, Tunbridge Wells, July 9, 1900. CARL NORMAN.

[We have been warning the public for years against the methods of Mr. "Tanquerey," and, indeed, scarcely a week passes without we receive a batch of his literature. The British postal authorities hold the only key which would lock the door on Mr. "Tanquerey," but they refuse to turn it.—EDS.]

STEREOSCOPIC PHOTOGRAPHY.

To the EDITORS.

GENTLEMEN,—Apropos of your remarks under Ex Cathedra in the JOURNAL for June 29 on the introduction of figure models into stereoscopic work, and the pleasing and interesting effects they may be made to produce when artistically posed and arranged, I send you, for inspection, a set of six slides representing the six acts in *La Dame Blanche*. These slides were purchased by me many years ago, some time after the first Paris Exhibition. They are transparent and are coloured at the back, and, when viewed in the stereoscope by transmitted light, the scenes are most lifelike, and the stereoscopic effect perfect. Whether the figures are living models or mere dolls I am unable to determine; it has always been a puzzle to me. If the latter, I can understand them being taken with a single camera and lens, on the Latimer Clarke principle, which was the method in use in those days; but, if the former, that is, taken from life on the stage of a theatre at a matinée or a rehearsal, it is difficult to conceive how the scenes could be so well lighted, and how the living figures, especially in the ballet scene, could maintain their position long enough to enable the operator to take the photographs.

It is possible you may have seen similar slides before, but they are unique in my experience and very interesting. I regret that two of the slides are damaged, but I think they can be put right with a little transparent glue.—I am, yours, &c.,

THO. MITCHELL.  
Ffynonau, Harrow-road, Newport, Mon., July 11, 1900.

[We are much obliged to Colonel Mitchell for sending us the set of Paris theatre slides, which we have returned to him. The figures are life models, which, we should imagine, were posed against scenery placed in the open air.—EDS.]

Answers to Correspondents.

\* \* All matters intended for the text portion of this JOURNAL, including queries, must be addressed to "THE EDITORS, THE BRITISH JOURNAL OF PHOTOGRAPHY," 24 Wellington-street Strand, London, W.C. Inattention to this ensures delay.

\* \* Correspondents are informed that we cannot undertake to answer communications through the post. Questions are not answered unless the names and addresses of the writers are given.

\* \* Communications relating to Advertisements and general business affairs should be addressed to Messrs. HENRY GREENWOOD & CO., 24, Wellington-street, Strand, London, W.C.

PHOTOGRAPHS REGISTERED:—

W. J. Anckorn, 12, West Port, Arbroath, N.B.—Photograph of Rev. G. K. Cuthbert.  
W. Fisher & Sons, Rutland-street, Filey.—Two photographs of the Rev. J. Stalker, D.D.  
E. G. Brewis, 8, New Bridge-street, Newcastle-on-Tyne.—Two photographs of G. W. Waller.

PYRO-ACETONE.—A. M. Z. asks for a formula for a good two-solution pyro-acetone developer for negatives.—You will find the formula, with instructions for use, on p. 1072 of the ALMANAC.

ADDRESS WANTED.—LENS writes: "Could you oblige me with the address of Darlot's, optician, London?"—So far as we are aware, there is no Darlot, optician, London. Darlot's address is 125, Boulevard Voltaire, Paris. Shew & Co., Newman-street, W., are the London agents.

**DIRECTORY OF PHOTOGRAPHERS.**—ACCO asks if there is any book published containing the names and addresses of all the photographers in the United Kingdom.—In reply: Messrs. Percy Lund, Humphries, & Co., of Bradford, publish a directory of photographers, price, we believe, 7s. 6d.

**COLLODION.**—W. MINNS. The plate arrived broken; but, by putting the pieces together, we can see there is no fault with the collodion itself. The streaks are due entirely to the coating. The plate was not properly rocked as the collodion was poured off, so that the film became equalised.

**DESCRIPTION OF PRINT.**—A. VIVIAN writes: "Would you be good enough to tell me by what process or paper the enclosed print is produced? By so doing you will greatly oblige."—It appears to be an ordinary bromide print on glossy paper. What brand we cannot say. Similar results may be got on Velox and suchlike papers.

**RIGHT TO THE NEGATIVE.**—SAWBONES. With all deference to the opinion of your solicitor, the negative does *not* belong to you, but to the photographer. That point has been settled over and over again in Court, and that you will find out if you proceed with the summons. We fancy your solicitor is not well posted up in what has gone before.

**MEALY PRINTS.**—S. BARROW says: "I have been trying the acetate toning bath with albumen paper, and all the prints turn out like the three I have sent you. Can you tell me the reason?"—Evidently the toning bath was used too soon after it was made. This bath should be made up about twenty-four hours before it is used to get the best results.

**GELATINE *versus* COLLODION.**—J. R. SIMES asks: "Will you please tell me how much slower a wet-collodion plate is than a gelatine one?"—This is really a ridiculous question, seeing that some gelatine plates are very many times more sensitive than others, and wet-collodion plates vary in sensitiveness according to the collodion and the condition of the bath.

**VALIDITY OF AGREEMENT.**—S. S. S. According to the wording of the agreement, several knotty points might arise in Court, therefore we should not like to give an opinion. We should advise you to submit it to a solicitor before taking any action in the County Court. In fact, we are not sure if it would be a County Court case at all; we rather suspect it would be a case for a higher Court.

**LENS.**—WARDER says: "I have bought, at a pawnbroker's, a portrait lens bearing the name of M. P. Tench, Fleet-street. It is three and a half inches diameter and about ten inches focus, and it wants some repairs. I cannot find the maker's name in the *Post Office Directory*, and he is not now in Fleet-street. Can you give me his address?"—Mr. Tench has been out of business for some years now.

**DISCOLOURED PAPER.**—T. WICKS writes: "I have bought, as a 'job line,' several gross of P.O.P., cabinet size, but I find it is all a little off colour, like the piece I am sending you. It prints all right. Can you tell me how I can get pure whites in the toning?"—No, we cannot. The paper has become spoilt by long keeping. You say it is a "little off colour;" we should say it is very much so. It is quite useless, except for the residues.

**RAPID FIXATION.**—"HYPO" asks: "Can you tell me of anything that will instantaneously fix a dry plate, acting the same as cyanide of potassium does on a wet-collodion plate?"—There is no such thing as an instantaneous fixer for dry plates. Cyanide of potassium does not fix collodion plates instantaneously, though it fixes them very quickly if the solution is strong; but, if it is used strong, it is very liable to injure the delicate tints of the negative.

**REGISTRATION.**—"COPYRIGHT" asks for "The address of the registration offices, and the terms applying to photographs and printed matter. Is the charge the same for both, or is it a different scale for the latter?"—Stationers' Hall, off Ludgate Hill. In the case of photographs, the registration fee is one shilling. In the case of books, no registration is necessary, but a certain number of copies for the different libraries, British Museum, Bodleian, &c., must be deposited.

**MAGNESIUM RIBBON.**—A. W. asks for "The best system of using magnesium ribbon or powder for taking a large group in a hall or studio. I have used some flashlight lamps, but they do not give the same brilliancy as the ordinary ribbon. I wish to know the best mode of using the ribbon so that a good even light could be got."—If you desire to employ ribbon, the best way will be to use several ribbons slightly twisted together, so as to increase the light. In the case of large halls, several strands might be used in different parts of the hall.

**DEFECTIVE PRINTS.**—W. MURRELL writes: "Will you be kind enough to criticise the two photographs sent? No. 1. Group, light coming from the side, but blocked out with curtains; on the other side, white-washed. The eyes seem to glare; is it the fault of the whitewash being too white? Please find all faults."—The photographs show that the figures were lighted by far too much direct front light. The single figure was similarly lighted, and the negative appears to be badly fogged. Stop off the direct front light, and use a side front light.

**PHOTOGRAPHING FURNITURE.**—J. & H. write: "We expect to have a commission to photograph, for the manufacturer, a number of articles of furniture to illustrate a new catalogue. Will you please give us a hint as to how to combat the high gloss upon it?"—As you are to do the work for the manufacturer, get him to let you take the negatives before the articles are polished, but after they are glass-papered up for the polisher. If you explain to him that you can get better results when the work is at that stage, he will be pleased for you to do it while in that state.

**GASOLINE, &c.**—A. H. K. asks "where gasoline can be obtained, and whether a fifteen-inch or sixteen-inch roll burnisher heated with gasoline heater would be a success. Are there any good roll burnishers successfully heated with spirit, large size?"—We suspect you will have a difficulty in getting gasoline, as, owing to its dangerous nature, there are great restrictions on its carriage. We do not know the address of any makers of it. Probably some of the wholesale dealers in oils would procure it for you. Yes, up to the size you mention, but the large sizes are usually treated by gas.

**BACKGROUND PAINTING.**—BACKGROUND writes: "Can you kindly give directions for background painting in distemper, or refer me to a reliable handbook on the subject?"—We cannot afford space in this column to give such directions as would be materially useful for painting backgrounds. Distemper colour, however, is made by mixing whiting, lampblack, or other colours, with size and water in such proportions as will yield a thin, tremulous jelly when cold. The colour should be applied in this condition. There is no handbook published on the subject that we are aware of.

**STUDIO-BUILDING; LENS FOR HAND CAMERA.**—B. W. C. writes: "1. Can you tell me of a work on studio-building? I am thinking of putting one up, and should like a hint or two. 2. In substituting a double combination lens for a single in a hand camera, how shall I tell what distance to fix it from plate?"—1. Mr. Bolas's work on the subject published by Marion & Co. 2. The lens must be fixed at its focus whatever that may be. Place a piece of ground glass in the place of the prepared plate, and adjust the lens so that the image is perfectly sharp upon it. Then fix it there, supposing it is a fixed-focus camera.

**SPOTS ON PRINTS.**—VANDYKE writes: "I enclose a print, which, you will notice, is covered with spots. They have been a great trouble to me. I have tried various remedies, and have got all my solutions between 60° and 70°, clean dishes, &c., and then they show. It does not matter whether the paper is new or old, they appear just the same. I have used the albumen paper before, but never got into this trouble. For your opinion as to the cause of the trouble I should feel greatly indebted."—The spots appear to be due to air bubbles on the paper while in the fixing solution. Apart from the spots, the print is not nearly fixed. Use a stronger fixing bath and allow a longer time in it keeping the prints in motion all the while. The print forwarded shows great want of care in the manipulations.

**A QUESTION OF COMPENSATION.**—G. F. writes: "Your advice on the following will oblige. I ordered a photographic studio from a well-known firm that manufacture them on June 1 of last month, and the firm stated, in their letter before I ordered the studio, that they could have a photographic studio ready for me in about fourteen days. I forwarded them the order, and enclosed cash, on June 1, and told them to let me have it in the time mentioned, as I require it urgent, and it has not been sent yet. Can I claim compensation for the time lost through starting my business here, now three weeks and a half over time, and cannot commence without studio, and have to turn people away through not having studio ready?"—Under the circumstances, we should say that an action for damages could be sustained; but, before commencing one we should advise you to consult a solicitor.

**VARIOUS QUERIES.**—A. H. BOULTON writes: "1. What is the best tint, and that which is preferred by the printers to work up photographs of machinery, &c., in water-colour for half-tone blocks? 2. What is the best way to make the water-colour 'take' to the paper? Is there any medium to take away the greasiness? 3. How shall I obviate marking on negatives which come during development? I trace them to the alum bath. The alum seems to eat into the gelatine surface, and score and marks it all over, almost spoiling the negative for printing. Is this due to the hot weather, or is it likely that my alum bath is too strong? It is according to the Ilford directions."—1. Usually black is preferred. 2. Wash the surface over with very diluted ox-gall, as sold by artists' colourmen. 3. Probably the trouble arises from the plate not being sufficiently washed before it is put into the fixing bath; if so, the remedy is obvious.

**LOST FILMS: A QUESTION OF LIABILITY.**—LIABILITY writes: "An amateur left thirty Bullet-size films with us to be printed. We sent these to a trade printer, who has failed to return them, and suggests his messenger boy lost them in bringing them to us; but the boy can't remember, or won't, what he did with them. Our customer is furious, and, after threatening to do us all the harm he can, rushes to a solicitor, who writes to us demanding the films in three days, or, in default, the sum of 10*l.*, as the subjects are foreign scenery. We wrote asking for more time, and suggesting non-liability as the custom of the trade. We have printed at the foot of our list, as every other dealer, that we cannot accept any liability, &c. 1. Are we liable? Would the custom of the trade hold good? 2. If liable to the customer, is the trade worker liable to us? 3. The films were fourth-rate; is not the amount absurd? 4. Would it not be as well to have a combine to take up a matter of this sort, as every dealer is liable to having an amateur placing an absurd value on his negative, while the same, as in this case, is of no use whatever, except as a souvenir to the owner?"—1. We are inclined to think that the notice printed at the bottom of the price-list would not apply in such a case as this; it is understood to apply to negative broken or lost in transit through the post to or from the customer, or broken in printing, and not when they are sent to a third party without the customer's sanction. 2. Yes. 3. We should say, as the negative were of foreign scenery, the claim is moderate, it being less than 7*s.* for each negative; and, of course, they could not be retaken for any thing like that sum. Under the circumstances, it is not at all surprising that the customer is "furious." 4. That is a matter for the consideration of dealers; we can offer no opinion on the subject.

### EX CATHEDRÁ.

WE are very pleased to learn that the two new sections of the Royal Photographic Society's Exhibition, which opens on October 1st next, at the New Gallery, Regent-street, W.—those in which general professional work and non-competitive exhibits are admitted—have been exceedingly well supported by those in whose interests these subdivisions were made. Apparatus makers and others have taken up the whole of the space allotted to this kind of photographic production, and in the general professional section many eminent firms of enlargers and others have come forward. The support of the professional photographer—the “bread-and-butter man”—is not so great as there was every reason to hope it would be; but this may be due to the fact of his omission to realise that he should have applied for space by Saturday last. Still, we suppose that if he comes forward by the dozen, or the score, during the next few weeks, he will not be denied the opportunity of showing his photographs under their proper classification. All things considered, the first exhibition in the New Gallery, which the President of the Society, Mr. T. R.

Dallmeyer, will open two months hence, bids fair to be very large and varied. By the way, all our readers will learn with regret that the Past President of the Society, the Earl of Crawford, has lately been ill, and has been obliged to go abroad. It is to be hoped that the noble lord will speedily regain his health.

\* \* \*

THE name of Professor Nipher has recently been tacked on, many times, to the record of some experiments connected with reversed images on gelatino-bromide plates. As it has not been quite clear what the Professor has aimed at or succeeded in doing, we have refrained from noticing the matter. To last week's *Nature*, however, the Professor, writing from St. Louis, sends a letter, in which he says that he “has shown that a plate which, on account of over-exposure, will develop as a zero plate in a dark room, will develop as a positive in a light room. The paper contains a half-tone reproduction of a positive obtained by a camera exposure of one minute, and developed within a few inches of a sixteen-candle incandescent lamp. The plate was an instantaneous Cramer plate. Since that time the same results have been reached by first opening up the plate-holder and exposing the film to the lamp-light until it is all converted into the zero condition. If covered with an opaque punched stencil, no trace of the design will appear on the film when developed in the illuminated bath. The slide is then closed and the plate afterwards exposed in the camera in the usual way. Such a plate cannot be over-exposed in any reasonable time. It may be exposed for a minute or for four hours to a brilliantly lighted landscape, and the most superb results can be obtained. There is no restraining developer needed. The tendency to fog when the exposure is too short is corrected by taking the developing bath nearer to the light. It seems probable that on very short exposures it might sometimes be advantageous to use a developer which will yield a positive with an under-exposed plate. In the two eclipses of long totality which are now [June] approaching this method seems to promise very valuable results, and the attention of those who will have the work in charge is earnestly directed to this matter. The results described have been reached but recently, and there is need of preliminary experimenting by any one who wishes to avail

himself of these methods." We have successfully experimented in the phenomena of reversal by making positives from positives and negatives from negatives, but we have made no observations as to the influence of the developing light. Some amount of incompleteness strikes us as characterising the Professor's experiments; however, those of our readers interested in reversal may like to be placed in possession of his ideas. The last line of his letter is probably exceedingly true.

\* \* \*

THE Pan-American Exposition, to be opened at Buffalo on May 1, 1901, is already receiving notice in our Transatlantic contemporaries. Mr. J. V. Noel, in *The Professional Photographer*, tells us that it "will afford a splendid opportunity for interesting work to those lovers of photography who will be able to attend this great educational event. The artistic arrangement of the entire plan of the buildings, the beautiful gardens with their foliage of both temperate and tropical zones, and the wealth of architectural beauty in the buildings of the Spanish Renaissance style, will all give the intelligent photographer vast scope and innumerable opportunities for the development of the artistic appreciation of his surroundings. In and about the lakes, near the canals, where gaily bedecked boats and gondolas will glide, in the park itself, striking views will be taken by those who see a line of beauty in every ripple and in every twig and leaf." The article from which we quote is illustrated with views of the chief buildings to be erected, and Mr. Noel urges photographers not to miss the opportunity held out to them of using their cameras at the Exhibition. They will be asked to pay a tax of fifty cents a day for the privilege of taking views on the grounds with photographic apparatus carrying plates not larger than 4 x 5 inches, or at the rate of \$1.50 per week. The photographer is advised not to bring his tripod to the grounds, for its usage will not be permitted. Large and convenient dark rooms will be provided by the official photographer, Mr. C. D. Arnold, at the free disposition of all, and for their special convenience, plates and films will be sold at the usual rates. We do not suppose that many of our readers will visit the Pan-American Exposition, but they may be interested in knowing that photographers there are limited to the use of cameras not exceeding 5 x 4 in size, at an approximate charge of 2s. a day, or 6s. a week. It is amusing to note the dread of the tripod in the grounds, especially as 5 x 4 is the maximum size allowed. The official photographer apparently hopes to make money in two ways—by photographing large direct views himself, and selling plates and films to those whom he limits to snapshot work. He seems to be a very shrewd person.

\* \* \*

THIS week the annual meeting of the British Pharmaceutical Conference has been held in London under the presidency of Mr. E. M. Holmes, F.L.S. A glance at the programme shows that pharmacists in their yearly peripatetic gatherings occupy themselves much in the same manner as photographers who attend the Convention. A presidential address, receptions, the reading of papers, excursions, a concert and dance, a garden party, and a photographic group were the principal items in the proceedings of the Pharmaceutical Conference, which is now in its thirty-seventh year. From what we can gather, the Conference, though largely composed of members of the Pharmaceutical Society, has an entirely separate organization. It is twenty-four years since it last met in London.

The meeting occupied four days, and if the programme was carried out in its entirety, a great deal of work and pleasure was got through in the short space of time at the disposal of members. For a society of this kind, which, we suppose, has no permanent home, thirty-seven years is a long life, and it goes to show that, if properly directed, pleasant annual reunions of the kind which so frequently take place in the summer and autumn, may easily retain the uninterrupted favour and support of those on whose behalf they are held. We hope the members of the Pharmaceutical Conference had a pleasant meeting.

\* \* \*

THIS week, too, the twentieth annual Convention of the Photographers' Association of America is being held at Milwaukee. Here is an outline of the proceedings:—Monday, July 23: Art Hall open to exhibitors to permit them to drape or readjust their pictures.—Tuesday, 24: Opening of the Convention. Address of welcome by Hon. D. S. Rose, Mayor of Milwaukee. Reading communications. President's address. Reports of committees. "Progress of Photography," by W. I. Scandlin. Lecture by Professor O. W. Beck. Subject: "What are the Principles of Beauty in Art?" Demonstrations of the MacDonough process in colour photography. Theatre party by special invitation of the Wisconsin State Association.—Wednesday, 25: Reading communications. Treasurer's report for 1899. Secretary's report for 1899. Copyright question of to-day by B. J. Falk. Appointment of Committee on nominations. Routine business. Lecture by Professor A. H. Griffiths. Subject: "Topics of Interest and Value to the Photographic Profession Generally." Reports of committees. Informal discussion. Layton's Art Gallery. Lecture on the art works in the gallery by Professor C. E. Eldridge. Grand summer night concert at the Deutscher Club by special invitation of the Club.—Thursday, 26: Reports of committees. Selection of next place of meeting. Nomination of officers. Election of officers. Lecture by Professor O. W. Beck. Subject: "Does Lighting Insure Art?" Demonstration of the Ives-Kromskop process in colour photography. Excursion to Whitefish Bay.—Friday, 27: Unfinished business. Lecture by Professor A. H. Griffiths. Awarding of prizes. Adjournment. Grand excursion on Lake Michigan on Crosby line steamer.—Between the American Convention, the British Pharmaceutical Conference, and the British Photographic Convention there appears to be a strong resemblance at all points. And the youngest of the three institutions is not the least successful or deficient in strong prospects of a long and useful career.

\* \* \*

THE *Cape Times* of June 19 publishes a detailed description of the Imperial Yeomanry Hospital, which has so nobly ministered to the needs of suffering soldiers at the front, and, in the course of the article, it states that the most valuable special department has been the X rays; this is under the skilled management of Mr. Hall-Edwards, Radiographer to the Birmingham General Hospital. Owing to his skill, many bullets have been not only discovered but also precisely located, and their removal by the surgeons thus facilitated. The exact fracture in doubtful cases has been shown, and, in consequence, any incorrectness of position has been avoided in the setting of them. The sanitation of the camp has been most carefully and satisfactorily worked out under Mr. Barclay Black's guidance; there is a sergeant, a corporal, and thirteen

natives perpetually at work in this department alone. We are pleased to read that Dr. Hall-Edwards's services at the hospital have been so freely recognised. He has steadily devoted himself to radiographic work for the last four years, and we do not doubt that the accumulated experience he has gained at home and abroad renders his services simply invaluable in difficult surgical cases. In the recent discussions that have taken place in Parliament and the Press relative to the alleged hospital mismanagement in South Africa no suggestion has been made that the radiographic service has not been maintained at a point of the highest efficiency. On the contrary, from all sides we hear the most gratifying tributes to the excellent way in which radiography, on its first field of war, has assisted the army surgeons in their humane work.

\* \* \*

ON the occasion of the visit of the Duke and Duchess of York to Bognor on July 9, for the purpose of opening a new Convalescent Home for Women, the address of the Urban Council to their Royal Highnesses was prepared by Mr. W. P. Marsh, the well-known photographer, a member of the Council, and one of our readers for thirty years. Mr. Marsh has kindly sent us a photograph of the address, of which the *Sussex Daily News* gives the following detailed description:—"Mr. Marsh conceived the idea of representing the prawn and lobster fishing industry of Bognor in the many embellishments which surround the text of the address, which bears illustrations by Mr. Marsh. Surrounding the text appear the following enrichments:—On either side, a broad column of matt gold, supported at the base on the right-hand side by an artistically arranged group of lobster and prawn pots, seaweed, lobster and crab, fisherman's jack-boot, boat-hook, oar, sail, and net. At the base of the left-hand column, representations of sea-shells, sea-weed, and prawns. The upper portion of the columns was entwined with the White Rose of York, while the ornamentation at the top of the address consisted of a very beautiful and effectively worked-out design in ears of corn, intermixed with cornflowers and other wild flowers, over which appeared a design of two large sea-gulls with outstretched wings. The embellishments at the foot of the address represented the bottom of the sea, with various coloured sea-weed, shells, &c. Surmounting each of the views was a filagree design, surrounded with an arrangement of sea anemones, starfish, shells, and seaweed. A shield bearing the arms of West Sussex in blue and gold ornamented the top left-hand corner. The text of the address was illuminated in gold and colours, and the whole of the work was hand-painted." If we may judge by the photograph, the address was strikingly elaborate and beautiful. To the best of our knowledge, no photographer has before had the honour of preparing a Royal address. Certainly Mr. Marsh put a remarkable wealth of ideas into the Bognor address, and we heartily congratulate him on his work.

## MUCH-NEEDED IMPROVEMENTS.

### IRIS DIAPHRAGMS.

THERE has been of late years great discussion upon the alleged superiority of American manufactures over British manufactures generally, as well as those specially pertaining to photographic work; but, like discussion on many other questions, it is not capable of a simple conclusion. Of the inventiveness of American mechanicians there is no doubt. Not to go outside

our own province of photography, it cannot be doubted that many important improvements in apparatus have emanated from the United States, and have been adopted here; yet there will be few, if any, to gainsay our assertion that, when we desire to obtain a camera, for example, of the highest quality of workmanship, a British-made one will surpass that of any make in the world. In this very point, we believe, lies the crux of the whole problem. We go on the lines of bringing to perfection any existing patterns; we add minute details of improvements, but are prone to be content with the pattern as a whole, and to go on making it for years, with the assurance that no one can produce it of better construction. Our competitors, however, are less content to rest on their oars. A demand may arise either from within or without, and, if it seems probable that sales may result, some maker will throw his manufacturing plant on one side, and erect fresh for making the newly devised product. The net result here is a general tendency to conservatism as to patterns, though we are ready to admit that some portions of the vast strides in the manufacture of photographic apparatus that have actually taken place are due to the initiative of our own manufacturers. It is not long since we called attention in these columns to a much-needed addition to all cameras—the application, to every camera made, of some form or other of a light, portable, easily adjustable sunshade. So far our words have fallen upon unheeding ears, but we are certain that some day, when the right pattern shall have been devised and then properly brought forward, portable "skyshades" will become a veritable boom.

Turn we now to the iris diaphragm, and its capability of improvement, and we may say, *en passant*, that this particular piece of apparatus forms a conspicuous example of the conservatism we refer to. There is a general impression that iris diaphragms are quite a modern invention, as applied to photographic lenses; but it is an entirely erroneous one, for we ourselves have seen, between thirty and forty years ago, a lens with an iris diaphragm similar in all essentials to those now made. Almost every lens of modern construction is fitted with contracting and expanding diaphragm, yet the knowledge of the existence of so valuable an adaptation virtually lay dormant for nearly a quarter of a century. It is true that there are photographers who prefer the older kind of stop, but the general consensus of opinion is more favourable to the iris, which, to use an expressive Americanism, has come to stay.

The mechanism of the diaphragm has been brought to beautiful perfection, the movements of one in a first-class lens being a marvel of apparent simplicity and smooth working; yet, notwithstanding that it has now been in use for about a dozen years, there is in one direction a crying need for alteration in the instrument. We refer to the mode of placing the figures representing the intensity ratios upon the tube. In ninety-nine cases out of a hundred they are simply engraved upon the tube itself, a position which would naturally suggest itself when the apparatus was first devised. As a matter of fact, however, this is a vicious principle, and it is the purpose of our writing to indicate, in the strongest manner possible, the urgent need for alteration in this direction.

As an example of what we wish to see altered, one instance alone out of many similar ones that occurred at the recent Photographic Convention, will exactly illustrate the point. When in Durham Cathedral, a lady asked us if we could oblige her with a match, as she could not read the numbers of the iris stops. The camera was awkwardly placed and difficult to approach. In actual practice it is frequently similarly placed,

when the diaphragm numbers as now marked cannot be read. If, however, they were placed on a projection or rim, at right angles to the lens tube, and facing the front, the numbers could be read with ease, however awkwardly situated the camera might be, and we fervently hope that before long there will not be a lens made with the tube marked in the old way. It is a very simple matter, and the most singular thing is that there have been a few lenses made for some time with the figures displayed in the manner we indicate. No one but the photographer whose work carries him into all kinds of places, in all kinds of light, has any conception of the impossibility at times of reading the scale numbers. This is no imaginary grievance, but a real and trying difficulty, too frequently accompanied in practice with a regrettable strength of language, and the difficulty is increased by the usual way of fixing the lens, the scale being placed on the part of the lens that is uppermost when the lens is screwed home. The scale, as usually made, should be read from the side, not from the top, which is often absolutely inaccessible. When placed, however, so as to be read from the front, in the manner we indicate, all trouble vanishes. As we have said, there are lenses made with the improvement that we indicate attached, but, so far, we have only observed it in some hand cameras; however, we trust that before long all makers will sufficiently appreciate the advantage of the system we recommend that they will issue all lenses with diaphragm ratios so marked that to read them will be a matter of no difficulty, whatever position the camera may occupy.

**Heat in the Studio.**—The temperature of the studio has always been a source of trouble to professional portraitists. The problem in winter is how to keep it warm, in summer how to keep it cool. These difficulties are not so great with modern studios as they are with those of more ancient build, inasmuch as the former contain much less glass than do the latter. Still, there is the difficulty in each case. Good ventilation ameliorates the oppressiveness, even if it does not always actually cool the atmosphere. Ventilators driven by water-power, or a small electro-motor, are a great aid; so is sprinkling the floor with water, assuming it to be covered with oilcloth or the like; it would be destructive to carpets. One of the best means that we have seen in use of keeping the studio cool in hot weather is having a water-pipe laid along the ridge of the studio with small holes pierced in it, so that a series of fine streams are continually trickling down the roof. This arrangement keeps the studio delightfully cool by the evaporation of the water as it flows down. Anent the leader last week on leaky roofs and cracked putty, many may not be aware that during the hot weather, with the sun on the glass, the sash-bars, especially if of iron, will become so hot that the hand cannot be comfortably borne upon them, while the glass will feel quite cold, at least by comparison. What wonder, then, that the putty cracks, when it becomes dry and hard, owing to the unequal expansion and contraction of the sash-bars and the glass.

**Natural Clouds in Landscapes.**—One is often surprised that photographers, whose aim is to produce the best possible results, do not, when they have exposed a plate on a landscape, expose a second—giving a suitable exposure—on the clouds, supposing, of course, there are clouds present. Then, by double printing, without the trouble of blocking out skies, &c., a cloud negative, with clouds suitable for the picture, would be secured that would only require a little shading of the landscape in the second printing, perfect registration being a very simple matter, as each negative would be in perfect register with the other. If this were done, we should hear far less criticisms than we do at the exhibitions of the pictures being spoilt through the skies not being suitable to the landscape. These criticisms are not to be wondered at when it is considered that the stock sky negatives generally used by amateurs and some "art

photographers" are purchased at so much each, or per dozen, and then employed without discrimination as to whether they are suitable to the subject or not. It may be argued that the man who goes out with half-a-dozen plates does not care to expend half of them on clouds to make the other half complete pictures; also that the hand-camera man, with his dozen plates with which he is anxious to snap-shot anything or everything, does not care to expend that dozen to obtain six pictures. Be that as it may, three or six good pictures—really good pictures—are worth dozens of mediocre ones. In the foregoing remarks we have only mentioned plates, a limited number of which can be carried, but the case is different with films. The man who goes out with, say, forty films can well afford to be liberal with them in the matter of duplicate exposures for clouds, particularly seeing the ease with which such cloud negatives can be afterwards fitted to the landscapes in printing. As a hint to those who do feel inclined to adopt the course we hint at, we should say that the cloud negatives should be made, in development, of approximately the same density as the landscape one, because, if they are made very thin, as is usually the case with sky negatives, the skies will be of a different tone from the other portions of the pictures, particularly if the prints are made on some of the gelatine papers.

**The Great Heat and Photography.**—With the thermometer at 92° to 94° F. in the shade, the studio very much hotter, and a stuffy little dark room with, perhaps, a lamp lighted with gas, the professional's lot has not been a happy one for some little time past; therefore, when he is troubled with restless sitters, or refractory children suffering from the excessive heat, it is not surprising if at times he "thinks things," even if he does not openly express them. Coupled with this trouble is the difficulty of working. Even some of the best-behaved plates are, with this exceptional heat, inclined to frill or otherwise give trouble. Gelatine papers, too, become decidedly tender under this abnormal temperature; therefore, as we have just remarked, the professional's time just now is not altogether a happy one, though, as a rule, he knows how to combat the difficulties. Not so, in all cases with the amateur, particularly if he has not had much experience, as several letters we have received during the past fortnight prove. In most instances the trouble has been put down to the fault of the plates, or the paper, as the case may be, whereas, of course, it is due to the excessive heat, and to that alone. The best advice we can give to the inexperienced amateur, while this great heat lasts, is to keep all the stock solutions in the coolest place available, and in diluting them to use water drawn from the coolest possible source. If a spring is not available, it is well to let the water run for some little time, so as to clear the pipes of the water they contain, as that will generally be found several degrees warmer than that in the cistern. If it can be drawn direct from the main, so much the better, as that will be found cooler still. After the plates are developed they should be put into a dilute solution of formaline, or one of alum, before they are put into the fixing bath. If this latter be used, the plates should be well washed to free them from the alum before they are put into the hypo. The same treatment applies to the manipulation of gelatine papers during abnormally hot weather. It is also advisable to use a freshly mixed solution of hypo, as this salt in dissolving makes the solution very many degrees cooler than it will be after standing an hour or two. Another precaution to take is not to put the fingers into the solutions more than can be avoided, as they, of course, have a tendency to raise the temperature still higher. We have not alluded to the use of ice and its advantages, as they will be obvious to every one, if it can be obtained.

#### A SILVER CHROMATE AND PHOSPHATE COLLODION EMULSION.

In a previous article (*THE BRITISH JOURNAL OF PHOTOGRAPHY*, May 25, 1900, page 325) Dr. Valenta described a method of making a phosphate emulsion which had a very high sensitiveness, and further experiments showed that it possessed such a long range of gradation

at very contrasted negatives were required in order to obtain brilliant prints. The phosphate collodion paper considerably surpassed albumen paper in this respect, and if it is desired to make a printing paper which shall act similarly to albumen it is necessary to make certain additions to the emulsion, which shall shorten the scale of gradation and give a greater differentiation between the individual ones. In this respect the phosphate emulsion behaves exactly like a chlorocitrate emulsion, and it has been proved that by the addition of chromic acid to the phosphate emulsion it is easy to obtain papers which are very similar, as regards gradation, to albumen paper. Chromic acid with this emulsion lowers the sensitiveness, but its action is such that it gives, with suitable quantities of acid, brilliant prints, and a sensitiveness far above that of albumen paper.

The same effect can be obtained in another way without the use of chromic acid or chromates, namely, by mixing a chlorocitrate emulsion with a phosphate emulsion in suitable proportions. For this experiment two emulsions were used of the following composition:—

A.	
Collodion ( four per cent.) .....	150 c. c.
Ether .....	30 "
Phosphoric acid (sp. gr. 1.26).....	2 grammes.
Citric acid .....	5 "
Alcohol .....	10 c. c.
Glycerin alcohol .....	2 "
B.	
Silver nitrate .....	7 grammes.
Water .....	8 c. c.
Alcohol .....	15 "

**B. Chlorocitrate emulsion.**

This was made up in a similar way to the phosphate emulsion, only it contained, in the place of the phosphoric acid, equivalent quantities of strontium and lithium chlorides in the ratio of 2:1.

The sensitiveness and the range of gradation of both emulsions were now tested by means of a scale photometer. The phosphate emulsion proved to be from four to five times more sensitive than the chlorocitrate, and the range of gradation with the former 25°, and that of the latter 13°. Freshly silvered albumenised paper showed rather less sensitiveness than the chlorocitrate emulsion, and a range of gradation of 18° on the same photometer.

The following mixtures of the two emulsions were made:—

1. 10 c. c. of A. ....	90 c. c. of B.
2. 20 " .....	80 "
3. 30 " .....	70 "
4. 50 " .....	50 "

Tests with the papers prepared with these emulsions gave the following results:—

Mixture No.	Sensitiveness over Collodio-chloride Emulsion.	Range of Gradation.
1	2.5	17°
2	3.8	18°
3	4.1	20°
4	4.7	Over 20°

It is obvious from these experiments that it is very easy, by adding a phosphate emulsion to collodio-chloride of silver, to increase the sensitiveness, and at the same time raise the scale of gradation. —*Photo. Corresp.*

**FOREIGN NEWS AND NOTES.**

**Etched Labels.**—Every photographer knows how difficult it is to keep paper labels on the dark-room bottles, or, if they keep on, to keep them clean. The following method of etching labels is simple and cleanly:—

Solution No. 1.	
Sodium fluoride .....	36 parts.
Distilled water .....	500 "

Dissolve and add—  
Potassium sulphate ..... 7 "

**Solution No. 2.**

Zinc chloride ..... 14 parts.  
Distilled water ..... 500 "

Dissolve and add—

Strong hydrochloric acid ..... 65 "

For use, mix in equal parts, and add sufficient Indian ink, in powder or solution, to enable one to see the letters. This mixture rapidly etches glass or porcelain, so that it is advisable to use a small inkstand made out of solid paraffin, and also a quill pen.

**The Effect of Intensification and Reduction.**—In a very valuable monograph upon the sensitometry of photographic plates which has just been published in *Photographische Correspondenz*, and also separately, the author, Dr. J. M. Eder, gives the following table showing the effect of various intensifying agents and the hypo and ferricyanide reducer. It is complementary to that by the same author published by us in a recent issue of the JOURNAL.

Sensitometer numbers, 0.3 meter light distance.	Opacity of the gelatino-bromide plate before and after intensification and reduction.						
	Opacity of the untreated negative.	Slightly intensified with mercuric bromide and sodium sulphite.	1. Fully bleached with mercuric bromide.			Normally reduced with hypo and ferricyanide.	Strongly reduced with hypo and ferricyanide.
			2. Blackened with sodium sulphite.	3. Blackened with Ammonia.	4. Blackened with amidol developer.		
11	—	—	0.16	0.15	0.22	—	—
10	0.15	0.2	0.19	0.22	0.27	—	—
9	0.21	0.24	0.27	0.33	0.35	0.13	—
8	0.27	0.35	0.42	0.52	0.47	0.18	—
7	0.38	0.55	0.59	0.71	0.65	0.29	0.17
6	0.51	0.78	0.72	0.90	0.83	0.36	0.23
5	0.66	0.95	1.02	1.30	1.01	0.53	0.38
4	0.81	1.25	1.31	1.56	1.26	0.70	0.50
3	0.91	1.50	1.61	1.92	1.57	0.85	0.60
2	1.05	1.70	1.38	2.35	1.84	1.00	0.75
1	1.19	1.91	2.25	3.00	2.12	1.15	0.85
a	1.43	2.12	2.70	} quite opaque	2.60	1.30	0.96
b	1.55	2.30	3.00		3.00	1.37	1.06
c	1.65	2.70	opaque	opaque	opaque	1.47	1.20

1. The mercury intensifier was: mercuric chloride, 2 parts; potassium bromide, 2 parts; water 100 parts.
2. A ten per cent. solution of sodium sulphite was used.
3. Ammonia diluted with 10-20 parts water.
4. Amidol, 2 parts; sodium sulphite, 20 parts; water, 500 parts.

**Intensification after Ammonium Persulphate.**—

At a recent meeting of the Photographic Society of Philadelphia Mr. J. Bartlett called attention to the fact that it is generally recommended to refix a negative which has been reduced with ammonium persulphate; but, when it is desired to re-intensify, it will be found that greater strength and brilliancy is secured by omitting both the sulphite of soda and the fixing bath, and intensifying with mercuric chloride, followed by sulphite of soda. The reduced silver forms a good substratum for the deposit of mercury, and by this method excellent printing qualities can be obtained in negatives which would otherwise be useless. It is necessary to carry on the intensification in subdued light, as strong light acts injuriously on the image attacked by the persulphate.

**Restoring Old Daguerreotypes.**—According to Belitzki, in the *Deutsche Photographen Zeitung*, old Daguerreotypes, which show the familiar iridescent markings, prove very stubborn when treated with the usual cyanide solution, and he suggests the following bath as much more effective:—

Potassium cyanide (five per cent. solution) .....	200 c. c.
Iodine .....	1 gramme.
Potassium iodide .....	3 grammes.
Water .....	100 c. c.

It must not be forgotten that the fumes of this are poisonous.

#### A NEW PROCESS FOR THE DETERMINATION OF POTASSIUM IODIDE.

[Reprinted from the *Pharmaceutical Journal*.]

POTASSIUM iodide is liable to be contaminated with the corresponding chloride and bromide, and these react in the same way as iodide with silver nitrate, hence a volumetric test with silver is of little use. It is evident that for the accurate determination of potassium iodide a method must be adopted in which the iodine alone is affected, and if possible liberated. Many processes are in vogue for this purpose, some dependent on the liberation and *distillation* of the iodine of the iodide, and others on its (the iodine's) oxidation to iodic acid.

The author has developed a process which gives exceedingly accurate results. The principle of the process is as follows:—When a mixture of potassium chloride, bromide, and iodide is dissolved in water and treated with a five per cent. solution of potassium bichromate and a ten per cent. solution of sulphuric acid, iodine, and iodine only, is liberated. The iodine is extracted with an immiscible solvent, carbon bisulphide or toluol, which is titrated with decinormal thiosulphate solution, and from the iodine found, the potassium iodide is calculated.

The analytical process requires the following solutions:—

1. Decinormal thiosulphate solution.
2. Iodine solution (decinormal or otherwise), whose strength relative to thio. solution is known exactly.
3. Potassium bichromate in five per cent. aqueous solution.
4. Sulphuric acid in ten per cent. aqueous solution.

Weigh out about 0.5 gm. potassium iodide, dissolve in 20 c. c. water contained in a stoppered separator, add 10 c. c. each of bichromate and acid, allow to stand three or four minutes, then add 60 c. c. toluol and shake vigorously. When the mixture has separated, run off the lower yellow acid stratum, and wash the toluol by agitation with various small quantities of water, adding washings to the first separate. The mixed washings are treated with more toluol in another separator, and if the toluol be coloured violet, it is, after washing, added to the toluol previously separated. The coloured toluol is then shaken out with about 30 c. c. thio. solution; the thio. is run off, the toluol washed to free from adherent thio. solution and washings added to first separate. The separated thio. is now titrated with iodine solution to determine the excess of thiosulphate which is deducted from the volume taken. As 16.473 gm. potassium iodide equal 1000 c. c. N/10 thio. solution, the percentage of iodide in the sample can easily be calculated.

The following extract from the author's laboratory note-book shows the accuracy of the process:—

1.2685 gramme potassium iodide was dissolved in water and made up to 200 c. c.

##### EXPERIMENT I.

49.8 c. c. iodide solution required

37.8 c. c. thio.—18.75 c. c. iodine

(factor 1.026) (factor 1.047)

= 38.7828 c. c. thio.—19.63125 c. c. iodine

= 19.1516 c. c. N/10 thio.

= 99.877 per cent. potassium iodide in sample taken.

##### EXPERIMENT II.

49.8 c. c. iodide solution when mixed with 3 grammes potassium bromide and 1 gramme ammonium chloride required

36.75 c. c. thio.—17.7 c. c. iodine, which, after correction as above

= 37.7055 c. c. thio.—18.530 gramme iodine

= 19.1746 c. c. N/10 thio.

= 99.949 per cent. potassium iodide in original sample.

THOS. S. BARRIE, PH. C.

#### AMMONIUM PERSULPHATE AS A REDUCER.

[Translated from *Das Atelier des Photographen*.]

ABOUT a year and a half ago the discovery was made by Messrs. Lumière Brothers and Seyewetz that persulphate of ammonium was an excellent substance for reducing negatives, and that persulphate had the peculiar property of attacking the more dense portions of the image, whilst the finer tones were almost unaffected. I have since made use of persulphate and found it of great value. But I must acknowledge that I did not fully understand how and why persulphate acted in such a remarkable manner, and I had not the time to investigate its action more closely.

At the same time I could neither agree with the theory of the process as stated by Messrs. Lumière, nor with the opinion expressed by Professor Namias that thiosulphate of silver was formed and deposited upon the particles of silver constituting the image, and protected them from further destruction.

The fact that negatives, after reduction with persulphate, show a marked relief, the hollows of which are most pronounced where the persulphate has acted most, led me to the idea that ammonium persulphate might possibly attack the gelatine as well as the silver and dissolve it in the high lights of the negative, where the film had retained a more attenuated condition in consequence of the presence of the particles of silver.

With regard to the Lumière hypothesis, which may be briefly described as the action of persulphate upon the negative from within—not from without, as in the case of other solutions—this may easily be demonstrated as incorrect. If a plate is exposed through the glass and then immersed in the reducing solution, it will be seen that reduction proceeds in precisely the same manner as though the plate had been exposed in the usual way—that is to say, the persulphate attacks the densest part of the image with most effect. This proves the incorrectness of Lumière's theory that the reduction at the surface is prevented by the immediate deposition of silver from the silver sulphate formed by the excess of persulphate. If the supposition expressed by Namias be true, that the thiosulphate of silver formed is deposited upon the particles of silver, then the process must finally arrest the action of the persulphate, for the experiment with the plate exposed through the glass shows that the deposit, if a fact, must not only take place on the surface, but throughout the entire film, and consequently the denser parts of the negative would be protected; but this is not the case.

Thus the only hypothesis left is that the persulphate of ammonium primarily dissolves the gelatine and the adjacent silver where the former is most attenuated by the latter, and that the gelatine is not attacked where it is of greater consistency, that is to say, where less silver is present and more protection is given to it from the attack of the persulphate.

I have made the following experiments in support of this theory:—

A gelatino-bromide plate was cut in two. One half was fixed without exposure to the action of light, and, after thorough washing, should only have a coating of gelatine. The other half was exposed and developed in order to reduce the whole of the bromide to silver. The plate was then fixed and washed. Both films were stripped from the glass and separately immersed in a ten per cent. solution of persulphate of ammonium. After about fourteen hours the film of the second half, containing silver, was completely dissolved. The other film, consisting of gelatine only, showed no signs of attack at the end of a fortnight. To ascertain what resistance gelatine free from silver would offer to persulphate containing silver in solution, two gelatine films were prepared. One film was merely fixed and the other contained silver, but both were immersed in the same ten per cent. bath of persulphate. After fifteen hours the film containing silver was dissolved. The other film was scarcely affected, but ten hours later this also went into solution.

By the action of metallic silver upon ammonium persulphate a substance was formed which had the power to dissolve gelatine. It would appear, therefore, that the process of reduction with persulphate takes place approximately as follows:—

The solution of persulphate of ammonium permeates the gelatine film, and in the denser portions of the negative, where the gelatine is most attenuated by the particles of silver, it attacks the latter and converts them to sulphate of silver, which partly goes into solution. The ammonium persulphate is reduced to sulphate, and oxygen is liberated. The decomposition of the persulphate in the presence of water causes the formation of sulphuric acid, which attacks the gelatine and dissolves it. This process occurs in the first place where the gelatine contains most silver, as the molecules of the latter form the nucleus of the reaction. As the process continues, the action upon the gelatine becomes more pronounced, and at last the solution of persulphate penetrates to the

more protected particles of silver, and the entire image is destroyed by the prolonged action of the reducer. The reduction of a negative is comparatively quick, and in ten to fifteen minutes the entire image is dissolved. The film, however, remains adherent to the glass, and is apparently unchanged. The only indication of attack upon the gelatine is the formation of the relief. I have not yet had time to ascertain if the gelatine is also completely soluble when exposed to air. The experiments, in which the gelatine was dissolved, were made in stoppered bottles, and the evolution of oxygen was so great that at times the stoppers were forced out. It is, therefore, a question whether this evolution of oxygen plays an important part in the complete destruction of the gelatine film.\* If a negative is completely bleached with persulphate, the image is not entirely removed. The negative retains a faint bluish tone. This tone is probably due to sulphate of silver which has not been converted by the reducer, and the process of washing fails to remove it.†

An experiment with one of these images formed of sulphate of silver showed that the tone was completely removed in the fixing bath, and that physical development with hydroquinone and silver nitrate intensified it slightly.

The results of my experiments led me to infer that, by addition of ammonium persulphate to the developer, the strong high lights might be held back in development. This opinion was verified. The following experiments were made in substantiation of this.

Two plates were exposed upon a window. One was developed in the ordinary way with amidol, and showed that the window was much overexposed and degraded with halation. The other plate was developed with 50 c. c. of amidol solution, ‡ with addition of ten per. cent. of persulphate solution.§ The image appeared slowly, and was harmonious and full of detail. The image could be seen more distinctly from the back of the plate than from the film side. This circumstance seems to indicate that the image is gradually attacked and dissolved by the persulphate during the process of development. These investigations are not yet concluded, but I think persulphate may also be found useful in this direction.

In all the experiments Ilford ordinary plates and an amidol developer were used.

After these experiments were made, I found an article by J. Gaedicke in the *Photographisches Wochenblatt*, 1898, p. 333, which had previously escaped my attention. In this article Gaedicke refers to the same hypothesis which I have here defended. It appeared as supplementary to an article by Dr. R. Ed. Liesegang, in Liesegang's *Archiv*, 1897, p. 161. ||

Liesegang did not, however, treat of ammonium persulphate as a reducer, but as a means of producing gelatine images in relief. The article may be summarised as follows: If a fixed and washed bromide print upon paper be treated with a concentrated solution of ammonium persulphate, the image is bleached in less than a quarter of an hour. If the image be then rinsed, and carefully rubbed with the warm hand, all the dark portions of the picture are dissolved, and a relief image is left. . . .

By comparing this experiment of Liesegang's with my own, it seems proved that the action of ammonium persulphate as a reducer is ascribable to its capacity for dissolving gelatine in conjunction with silver. D. NYELIN.

#### PHOTOGRAPHERS AND THEIR PUBLIC.

NEXT to the quality of the work which he produces, nothing is of more importance to the professional photographer than the manner in which he introduces it to his public with the object of obtaining their patronage. The following notes on some of the ways in which this matter is approached in actual practice have been compiled by the writer from personal observation of most of the leading London and many of the more prominent provincial studios, and are here offered as an incentive to the further personal consideration of the subject by the profession generally.

There has been reported—I forget where at the moment—the saying of a very successful commercial photographer to one no less eminent in the artistic quality of his work, "You take a first-class picture and a second-class order, while I take a second-class picture and a first-class order."

\* In the vessel containing the fixed gelatine film without metallic silver a large evolution of oxygen was not perceptible.

† Dr. E. Vogel draws attention to the residual silver sulphate in the *Photographische Mitteilungen*, 1899, p. 146.

‡ Water, 1000; sulphite of soda, 25; amidol, 8.

§ Water, 100; ammonium persulphate, 4; sulphuric acid, 4 drops.

|| See also *Photographisches Wochenblatt*, 1897, p. 388.

If not apocryphal, this goes to prove that commercial success depends as much, if not more, upon how a man's work is exploited as upon the actual quality of the work itself, and so, in these days of keen competition, the photographer cannot give too much care, pains, and consideration to the manner in which he places his productions before possible clients.

Now, the first and most obvious way of doing this is by the display of specimens in windows and show-cases, and here in practice we find a great variety of methods and results. In some photographers' windows will be seen, year in and year out, just one class and standard of work, with no effort for improvement and no apparent perception of the advent of new styles and fresh processes. The worker has got into a groove and so goes on, day after day, producing in endless monotony, the "usual thing," and if you remark upon it he will generally reply that it has always done very well, and that he has neither time nor money to spend on improvements or efforts to do anything different, especially, as he will explain, now that times are so bad—quite forgetting that they might get better with him if he had some better and more varied styles of work to offer to his customers.

In other places, on the contrary, one finds all the latest processes employed and exhibited, and a considerable variety of work always on view—something, in fact, to appeal to and please everybody; and, although it is, perhaps, at present too much to expect that the general public will always choose that which is artistically and technically the best, yet the fact of its being shown and readily obtainable will in time create a demand for it. In proof of this it is only necessary to note the facts that, in the better and more prosperous class of studios, the demand for warm, soft tints and matt surfaces has increased with the facilities for obtaining them, and that now carbon and platinotype are slowly but surely ousting the shiny surfaces and generally displeasing tints of toned silver prints. There is, perhaps, now only one of the principal establishments in London which makes a special feature of enamelled work, and even there the warmest possible tone is consistently employed, and, of course, all the other processes are obtainable as desired.

Next to variety of work being a desideratum, experience shows that it needs to be well displayed, and here there is great scope for both judgment and artistic taste. In some places, especially where there is plenty of window space, one finds a very large quantity of work exhibited without sufficient attention being paid to its quality or variety, and examination of some of these multitudinous displays, and comparison of them with others of more moderate extent, produces the opinion that it is very easily possible to have too much.

Among a very large number of pictures, some, at least, must necessarily be of more or less inferior quality, and these lower the general average of the whole effect, besides which the eye becomes wearied by looking at so many, and some of the best work may consequently escape attention. In the highest class and most flourishing London and provincial establishments, a moderate show of the best work produced, sufficiently varied, of course, to indicate the scope of the business, seems to be the best and most successful method, and it is usually only in second-rate places that one sees rows upon rows of work all similar in size and style, and at one universal dead level of monotony. The provincial photographer has often the advantage of his London *confrère* in possessing a moderate-sized and well-lighted window in place of the show-case or two, or badly lit entry, with which the latter has often to be content; but, on the other hand, he has to keep his specimens more constantly varied, as he has not the ever-changing flow of passers-by to see them that the metropolis affords. Every one is fond of pictures, and the photographers' windows of small or moderately sized towns are often the objects of regular visits by the inhabitants, and I have repeatedly heard such comments as, "Oh! do come and look; here's a new portrait of Mrs. A.," and "Don't the Misses B. look nice!" and "That's a good picture of Mr. C.," and so on through a whole alphabet of admiration and interest, concluding with, "It's always worth while to come and look at Mr. Uptodate's windows;" and have contrasted them with the "Oh! come along; there's only that old picture of Mr. Mockturtle when he was Mayor the year before last, and old Lady Dowdy and the Misses Asper Usuals—Mr. Dryadust never has anything fresh in his window" as heard before other establishments. The display of photographs of topical interest is always an unending draw, and when we go down Prince Regent-street we always stop in front of the Universcopic Company's window to see the latest portrait of General Lord Bullerts, now at "the front," or that of Miss June in the *Bells of London*, and so on, and some day we go in to be photographed on our own account, so well has what we have so often seen impressed us.

Another desirable point with regard to window displays seems to be that all work above cabinet size should be suitably framed. Comparison of places at which this is done with others at which it is not results in favour of the former as regards finish and completeness of effect, and the method has also the advantage of not only often bringing to the photographer a profitable trade in frames, but also of enabling him to see that his work is suitably and artistically framed before it leaves his hands, instead of afterwards being entrusted to the tender mercies of the average frame maker, whose ideas are too often limited to some spiky "Oxford" abomination, or an ill-designed combination of fussy and

misplaced ornament. Suitable mounting should also receive more careful attention than it very often does at the hands of the photographer himself, who usually keeps but one or two varieties of mounts in stock, and places everything, with but very little discrimination, upon them. This is not the place for an essay upon mounting and framing, but the importance of the proper study of both these means of improving, finishing, and setting off our work cannot be too strongly insisted upon in an article on its exploitation. I know at least one London establishment in which the neglect of proper mounting does much to spoil what would otherwise be a good window display. The work is of generally good quality, and mostly printed in platinum; but the greater part of it being done by electric light—and often, doubtless, with a certain amount of London dust and fog in the atmosphere—some of the prints are not as brilliant as others, but all alike are mounted on white cards with fairly wide margins, which, of course, compete severely with the high lights of the flatter pictures, and so produce a generally unsatisfactory and in-artistic effect, which is still increased by the fact that the shop-front is also of a brilliant white—not a bad colour in itself for the painting of photographic premises, but in the present instance not going well with the white mounts and many white frames of the exhibited pictures.

This brings us to the consideration of the style and colour of shop-fronts, and of windows and their fittings as influencing the impression produced by photographers' works upon their public. The worker, being usually only the tenant of the premises he occupies, has but little control over their architectural features, but when taking a place he will do well to choose something not too elaborate and with not too much polished granite, shining metal, or carving about it, all of which will tend to swamp and depreciate the artistic value of his work. Fairly dark and unpolished natural woods form usually the best setting for photographs, both in frames and shop-fronts, and the very simple yet effective oak doors and windows designed by Mr. George Walton for the Eastman Company's Regent-street Branch may be cited as good examples of the right thing. For painted fronts black and gold is often dignified and unobtrusive, and white of a warm tint in conjunction with a dark Indian red may be sometimes effectively used. For show cases hard woods and simple mouldings are always safe, but elaborate carving and metal work are to be avoided. I know one establishment at which the cases are so carved and ornamented with *repoussé* work that it is almost a puzzle to find the photographs concealed therein. With regard to window fittings, the photographer who desires his display to always look well should have two or three different sets of draperies, &c., so that they can be varied to suit and harmonise with the show of the moment. The draperies (by which I mean any necessary curtains and coverings for stands and not a lot of useless frippery) may be of silk, plush, velvet, or serge, of which all tints are obtainable, and besides these a few pretty easels and stands are all that is really necessary. The man of taste will avoid quantities of palms, ferns, china monsters, pots and tiles, to say nothing of such things as the *stuffed kittens* which I recently saw in a photographer's window! Before leaving this part of the subject, it may be just noted that one at least of our best male and one of our most patronised lady photographers do without outside display of any kind, conducting their businesses in what are apparently private houses, in which they receive their aristocratic clients, a dignified and quite professional method, but one not always possible for lesser lights, or for the more frankly commercial side of photography.

It ought to be hardly necessary to insist that whatever specimens are shown should be the actual work of the establishment showing them, but it apparently is so when one finds even good photographers displaying work obtained from other sources; while, at the lower end of the scale, I have seen the work of well-known men unblushingly placed outside a very fifth-rate establishment in a London thoroughfare, and we all are familiar with the advertisements of and for specimens which frequently appear.

Other methods of approaching possible sitters are to be found in the distribution of advertisements, circulars, and price lists. With regard to the first, it appears to be doubtful if general newspaper advertising is of much benefit to the artist, whose best ad. is the quality of the work sent out bearing his name; but, in the provinces especially, an occasional announcement in the papers under such circumstances as the taking or removal of a business, additions to premises, or of topical reference, or a well-printed and well-worded circular making such things known may be of advantage. Circulars should be sent by post, enclosed in a good envelope, and addressed in a good hand with the full names of the persons they are intended to reach. I regret to say that many of the specimens of this class of literature which I have seen have been not only badly written and ungrammatically expressed, but also very badly and in-artistically printed; and such things, sent in a halfpenny wrapper, and roughly addressed, "— Smith, or occupier," are almost certain to find their way into the W. P. B. (For the meaning of these cabalistic letters apply to the editor. He is used to giving other things besides circulars decent burial therein.) Of the price lists of London and provincial photographers I possess quite a large collection, but very few of them, even those of the best houses, are ideal productions, some being badly printed, some giving too much information, and others not enough. An artistic business should surely have its accessories of an artistic nature, and really good printing is but very little dearer than commonplace, not to

say common, work. It is surprising, too, how very few photographers have taken advantage of the possibilities of colotype and the half-tone process for the illustration of their price lists and circulars, though those who have done so have certainly benefited by so doing. A picture or two on a circular or price list may not only lead to their preservation, but also place specimens of the photographer's skill in posing and lighting directly into the hands of possible sitters; and I can speak personally of the benefit of adopting this plan of doing so. The class of price list above alluded to as giving too much information is that in which the photographer appears to have taken a delight in making everything as complicated as possible, and quotes you different prices for vignettes, half lengths, three-quarters, and full lengths; for groups of two, of three, and of more persons; for silver prints, platinotypes, and carbons (not to mention a few processes with barbarous names of his own invention), with extra positions, resittings, further copies, &c., all jumbled up together, until the whole is a maze of words and figures that may well repel the possible or intending sitter. By all means let all desirable information be given, but let it be properly tabulated and clear at a glance. The price list that does not give enough information is, if anything, worse than the redundant and muddled one, and none is complete that does not clearly state the terms on which business is done, cash or credit, the number of positions taken, and the conditions of resitting. The exact understanding of these things beforehand, and the printed statement of them for reference, would often save much after-friction and trouble.

And here I wish to put before my brother photographers a system by which not only would price lists and business be simplified, but the ever vexed questions of number of positions, proofs, and resittings be solved. It is to do away altogether with the arbitrary "first dozen" price (which has often the effect, even when the photographs are much approved of, of limiting the order to the said dozen as originally paid for), and to abolish the changes for "extra positions" and "resittings;" putting in the place of all these: "First copies, to any number of desired positions, sittings, or costumes, so much each," and "further copies of any of them, so much each." "First copies to be paid for at the time of sitting, and further copies at the time of ordering." Then the fussy or faddy customer could sit and resit, or come in as many costumes, or have as many positions taken, as she (it is usually she) desired or was willing to pay for; while the photographer would be paid in exact proportion to the work done (and why not, messieurs?); and both the profession and the public would be on a better footing. The writer has used this system with very great success when working for the dramatic profession, and has no doubt that any good photographer adopting it for his general work, and taking a dignified stand upon it, would find it answer equally well. The differences of price for groups of two, three, or more figures might also be done away with, for, although they contain more heads to retouch, the size of such heads is smaller in proportion, and there would then be only the matters of size and printing process to complicate business and the price list. With regard to printing processes, all silver prints, whether in albumen, gelatine, or collodion, might very well be classed together, and carbon and platinotype have but one price in common.

Next after the price list the attention of the would-be sitter is taken by the receptionist, on whose possession of good business ability and tact much of the obtaining of good orders depends, and therefore the importance of the photographer being well served in this department cannot be over-rated. In a lengthened experience I have met with receptionists good, bad, and indifferent, and, while the latter appear to predominate, the former are certainly born and not made. I have seen those who had every detail of the business at their fingers' ends; among these being, curiously enough, a smart little maiden still in short frocks, whom I recently encountered in the reception-room of a fashionable photographer, and others who could not answer the simplest question without reference to book or price list, and were completely non-plussed at an inquiry respecting an enlargement or a miniature. How a photographer's relations with his public are thus affected it is easy to see, and happy is he who possesses a wife or a sister to attend, *con amore*, to this part of the business if he is not lucky enough to have one of the born receptionists above referred to. The desirable qualities are, of course, knowledge of photography and its possibilities, plenty of tact and business acumen, good manners, and a lady-like and pleasing appearance, all of which it is not always easy to find combined in a single individual.

Another thing that has often an effect on the possible sitter is the condition and appearance of the shop or reception-room. Here over-elaborate embellishment and decoration is out of place, as tending to dwarf and swamp the effect of the work, and as giving to some sitters the idea that the prices asked are as much to pay for all the show and glitter as for the photographs they will receive; but these interiors should be quietly pleasing and unobtrusively artistic in effect; well lighted for the easy examination of specimens; fitted with comfortable seats and conveniences for waiting sitters and their friends; and, above all, perfectly orderly and spotless in their cleanliness. It should be superfluous to write the last clause, but judging from some places I have recently seen, and those not of the lowest class, it apparently is not so to offer such advice to some practitioners. When the specimens shown become soiled, or in any way *démodé*, they should be at once destroyed, as a faded or damaged print is

doing more good among the residues than on the reception-room walls; and anything like litter or lumber should be scrupulously avoided. If possible, no work of any kind except the book-keeping should be done in the shop. There is an old saying that children and fools should never see things until they are finished, and without insinuating that those of a photographer's clients who have outgrown the first category are to be placed in the second, it is more likely that they will be pleased with work which they first see only in its completed condition, than if they behold it in any of its crude initial stages.

This, I think, also holds good with regard to the sending of proofs, which, if perfectly finished photographs, are far more likely to obtain good orders than the unretouched, untuned, and untrimmed prints which some photographers place before their clients. If the system of charging so much each for "first copies," as above suggested, were carried out, they would, of course, be perfectly completed prints, and the photographer could afford to make them so. If, however, a man shows no more respect for his own work than to submit it in a rough and unfinished condition he can hardly expect his clients to receive it with a greater amount, and so business suffers in the end. It also appears to me that the same effect must be produced by the indiscriminate giving of "free sittings," indulged in by some photographers on the off-chance of obtaining a subsequent order, which is surely an undignified and cheap-jack method of business, and if of momentary benefit to an individual probably injures him in the long run, and certainly lowers the status of the profession as a whole, which is the last thing that should be assisted by those who are proud of the calling they follow, and desire to see it keep its proper place among the useful arts.

DRINKWATER BUTT, F.R.P.S.

#### PHOTOGRAPHY AS AN OCCUPATION FOR WOMEN.

FROM the the census returns of 1891 the total persons engaged in photography in England and Wales numbered 10,571: males, 8102; and females, 2469—in London, 1635 males and 610 females. This shows that the women employed in the trade amounted to a trifle over a quarter of the total. Since 1891 there can scarcely be a doubt that this proportion has been much increased, and probably at the next census we shall find that the women number a half, if not more, of those employed in photography. A marked feature of our time in commercial life is the influx of middle-class women into occupations formerly entirely under the control of men, it being greatest into all professions which are neither laborious nor carried on under exposed, dangerous, or unpleasant circumstances. Photography, being one of this class, falls under the selective action, and is an employment peculiarly inviting to that "monstrous regiment of women" seeking occupation.

Besides this, it must be admitted that the profession is well adapted to feminine capacity. Both as employers and employed, women meet with success, showing considerable enthusiasm and being devoted to the work. The ladies also now at the head of photographic establishments, and doing the operating themselves, give evidence of an ability quite equal to, if not surpassing, that of the best of masculine competitors. For every-day commercial work women, by reason of habit and training, seem much more likely to succeed than men. The chief supporters of the photographer are ladies and children, and in serving these the lady operator has every advantage on her side. She is an expert on all matters of dress, fashion, and questions of feminine etiquette, has a natural sympathy with children, and an intimate knowledge of the character of her sex, which few men possess. She is thus in a position to do and to say the right thing to put her sitters at their ease.

Ladies also give the preference to a female operator, and such a choice being beyond the control of the male photographer is fatal to any attempt to compete with a female rival. The ladies practising commercial photography have likewise given evidence of the possession of the faculty of gauging the public taste—an important aid towards business success. Mrs. Cameron also was able to divine what style of portrait would please her sitters. These ladies, however, are pioneers in the work, and of exceptional ability. It is thus open to question if weaker followers could maintain the same high standard.

Given a free field, it appears that the lady employer holds the advantage, and is the most fitted to survive in the struggle for business. Owing to the manner in which women are investing capital in suitable occupations, photography must in future fall under their control, with the consequent thrusting out of male competitors. The only thing that can stop the invasion is a change in middle-class sentiment which may go against the present movement towards business life for women, and return to the older ideal of seclusion and gentility.

Although, as employers, ladies are yet but a fraction of the profession, and have not ousted men to any alarming extent, the case is quite different in the ranks of the assistants. Here the introduction of the lady assistant has been so rapid that, if it continues at its present rate, in a few years the male assistant will be but a matter of ancient history. That this is no exaggeration the sceptical may satisfy themselves by taking a review of retouching during recent years.

Not more than ten years ago the lady retoucher was scarcely known, and formed but a minority, the main work being done by men. To-day

she has captured the position, the relations are reversed, the women form the majority, and the men are a small and fast-disappearing minority. A similar change is at the present moment occurring in the printing, and the male printer seems likely to vanish from the scene. Already in many houses it is the custom to fill up all secondary posts in the printing department with female hands as sensitizers, "fillers-in," &c., leaving simply the printing and toning to a head male printer. In small establishments, employing a single printer, there is likewise a tendency to engage a lady, and a glance at the advertisement columns of this JOURNAL will prove that the demand is a growing one. Perhaps the change will not be so quick as with retouching, but it seems certain to happen at no distant date, and in those days the photographer will no longer find a convenient scapegoat in the male printer. The lady operator has not yet arrived in any numbers, but it may be remarked her passage will be easy when once the public grow accustomed to the lady principal doing the studio work herself. A more serious obstacle in the line of progress is dark-room work, against which all women have a great aversion, the lady employer generally leaving this department entirely in the hands of male assistants. Apart from this drawback, which may be removed at any moment by the introduction of a method of open-light development, or other system abolishing the dark room, everything seems ready for the advent of lady operators in sufficient numbers to compete seriously with men. Finally, in other branches women have had a monopoly as colourists, receptionists, black-and-white workers, spotters, and mounters.

These facts can scarcely be overlooked, so prominent has been the advance of women both as employers and assistants, and such a change, when completed, must produce a great effect upon photography in general, and professional photography in particular. We know that photography, under masculine guidance, has progressed favourably during the years since its discovery. Looking back over its history, and noting from what it commenced to what it has now attained, it must strike all as one of the most brilliant records of the century, a work of monumental industry, devotion, and intelligence, and it must not be forgotten that professional men have done much towards this result. To equal such a record or to keep up this tradition, the feminine photographers will need to possess in their ranks some of the brightest intellects.

What is there to lead us to expect these great efforts from women, judging by their achievements in other capacities? Is there any evidence to lead one to conclude that photography will profit, start forward, or even continue in its course of triumph under female control? Perhaps a Mrs. Somerville, a Mrs. Cameron, may again arise, or even a series of ladies of greater photographic ability, though it seems quite visionary to expect a female Robert Hunt, Draper, Abney, Rijlander, Adam Solomon, Robinson; yet, unless minds of this calibre are working in the service of photography, it cannot progress. Guided by what they are now doing, we should expect a high level of good work from lady photographers, perhaps the average standard of trade work would be much higher than now, but of really striking, original, or progressive portraiture probably not a trace. Doubtless to the many this would be a decided improvement, although it leaves out of account the growth of photography, which is of more importance than the temporary success of a section. The number of lady employers is relatively so few that it is yet too early to predict with certainty what is likely to happen, and it is therefore useless to pursue the subject further.

Turning to the lady assistants, however, we find that several pronounced changes have already taken place. In retouching the reduction of wages has been very great. The old price for retouching a cabinet head in the leading houses was from 2s. 6d. to 5s., and even 7s. 6d.; present prices by women for similar heads is from 4d. to 1s. Wages in the masculine days were 2l. and 3l. per week; the wages now received by women are from 1l. to 1l. 10s. per week. This is a feature common to women workers without exception; the salary they receive is always less than that paid to men for doing identical labour. For this injustice against women there is no remedy under our present social arrangement, because it arises from the fact that the wage paid to a man is a family wage, that is, it represents roughly the cost of subsistence of himself, wife, and family, whereas the salary paid to a female is merely the cost of subsistence of herself without relation to others, hence it always must be lower compared to a man's wage, whilst he is the actual, or probable, head of the family. It is therefore evident that, when women supplant men, the wages bill in photography will be greatly reduced. The photographer will thus gain the difference as profits, provided (a) the efficiency of female labour equals that of male, (b) that the selling price of portraits does not fall. These conditions, however, are not likely to be realised. In the first place, it is doubtful if women are as efficient as men in doing the same work, at least it has not yet been tested on a sufficiently large scale to justify such an assumption. The fact also that their wages are always so low indicates that in some essentials they are lacking compared with men. In every instance the salary paid to women is a bare subsistence, whilst, if their labour was as efficient as men's, they ought to receive an amount above this lowest rate, though not so high as that paid to the head of a family.

In a highly skilled profession like photography a low rate of pay is alone sufficient to prevent any body of workers, male or female, from

reaching the utmost point of efficiency; hence, assuming women as equal in skill to men, they could not maintain a high standard of work on the lower scale of wages. In retouching, something of this kind has actually taken place, for, since women have practised the art, there has been no marked improvement on the best work done by men, but rather a gradual decline in quality concurrent with the fall in piece-work rates and weekly wages. It is thus rash to conclude that the efficiency of the female retoucher will remain if employers insist on paying her a small wage—that is, below what her position and standard of comfort require.

With respect to selling prices, it is evident that the ordinary photographer of average skill cannot prevent prices from falling with wages, the mobility of capital being now so perfect that competition amongst capitalists soon brings down selling prices in accord with a drop in wages, by reason of a cheapening of cost of production. The fall in wages, following on replacing men by women, does not of necessity mean increased profits, but may lead to a decline in selling prices, which leaves matters rather worse than before. The higher the selling price of photographs the larger the proportion of profits, and any action that tends to raise or keep up prices is the most likely to benefit the photographer.

The conclusion forced upon us is that no gain can accrue to the employer by substituting the lady assistant for the man unless she proves his equal in efficiency and suffers no reduction in pay; for to sacrifice efficiency to secure a fall in wages can be of no permanent value either to employer or employed.

JOHN A. RANDALL.

### CHROMIUM SALTS APPLIED TO PRINTING IN COLOURS.

[From the *Bulletin de la Société Havraise de Photographie*.]

THE process which I here describe permits the production of photographic prints on papers, fabrics, and other supports in all colours, which, at the same time, withstand the action of light and of chemical reagents to a remarkable extent.

I will not fully review the history of the process. There is nothing particularly new about it, but the extremely striking examples of it lately shown by M. A. Villain, who has himself done much to bring the process to perfection, induces me to bring it before my colleagues. The process is one well worth the serious attention of all photographers.

As is well known, a bichromatised gelatine coated paper becomes insoluble on exposure to light. If after removal of the excess of bichromate the paper be immersed in a bath of some colouring matter of the rosaniline family, such as fuchsine, Paris violet, Lyons blue, &c., the paper takes the colour most especially easily where the light has not acted, the insoluble gelatine protecting the fabric from the dye.

It only remains now to remove the subchromate in these insoluble portions by means of slightly acidified solutions. It will at once be seen that this process gives a positive from a positive, a negative from a negative. It gives, however, prints which are far from permanent in light, many of the dyes derived from aniline being extremely fugitive.

In 1859 Person sought to use the greenish oxide of chromium, produced by the action of light on potassium and ammonium chromates mixed together, as a mordant of the dyestuff, and described the following process in *l'Année Scientifique*.

Paper or fabric is placed in a solution of this double salt, dried in the dark, and exposed behind a negative. It is afterwards washed, by which the reduced chromate is removed, and treated in a dye bath. Extracts of such tinctorial woods as log-wood, venetian shumac, brazil wood, orchanet, quer-citron, &c., are suitable for this purpose. After a short immersion the oxide of chromium fixes the colour to the fibre. The treatment is then arrested, and the fabric washed and dried.

A few years ago, M. Villain, taking Kopp's process as his basis, and substituting for the tinctorial substances mentioned above others more permanent in light, obtained very fine prints of great permanency. He used mostly anthracene derived colouring matters.

The artificial alizarines, sold in commerce as alizarin for red, alizarin for violet, &c., give with chrome mordants a certain red colour—that from the former being inclined to violet; that from the second to yellow.

Alizarin blue, alizarin black, gallo-flavin, purpurin, anthracen brown, orange, yellow, alizarin green, gallein, cerulein, have all in M. Villain's hands given images of great permanency towards light, acids, and alkalis. The deposition of these dyes being proportional to the amount of mordant in the fibre, which latter is in turn proportional to the light falling on the fabric, it follows that the process if properly conducted and with pure materials, may be regarded as a reliable photographic method.

In order to avoid any discolouration of the high lights, the paper should be carefully dried and the printing frames filled in non-actinic light, and development likewise conducted in a weak light, the chromate being far more sensitive to light than may be thought. Exposure should preferably be made soon after the paper has been prepared. This must be particularly observed in the case of textile fabrics, which themselves reduce chromic salts, thus giving rise spontaneously to chrome mordant with its attendant result—a general fogging of the print.

For the same reasons too high a temperature in drying should be avoided; in fact, all the precautions usually taken in the preparation of carbon tissue are necessary.

In cases where from some cause or other the prints do not exhibit perfectly pure whites, pass them into a bath of soap and carbonate of soda or into a very weak bath of chloride of lime containing a few drops of hydrochloric acid. After using this, wash in an alkaline bath and afterwards in water.

*Formula*.—Sensitising bath: M. Villain recommends the following, with which I have myself obtained the best results:—

Potass. bichromate .....	50 parts.
Ammonium metavanadate .....	5 "
Water .....	1000 "

Soak the tissue in the above for a few minutes, dry in the dark and the cool. Temperature should not exceed 25° C. (80° F.). Expose under a negative until all details are plainly visible. Rinse in cold water until it is no longer coloured yellow, *i.e.*, till excess of chromate is removed.

The dried print can be kept indefinitely at this stage before being dyed. When this process is to be conducted, soak the print first in water, then place in tinctorial bath; bring latter slowly to the boil and keep thereat for about fifteen or twenty minutes. Remove, wash, and if the high lights are not pure enough, treat as described above before drying.

*Applications*.—This is a process which lends itself to many very decorative purposes, such as the ornamentation of screens, curtains, &c. It is simple, easy, and inexpensive, and, as M. Villain's prints at the Champ-du-Mars demonstrate, capable of giving the most charming results.

A. SORET.

### THE HISTORY OF PHOTOGRAPHY IN NATURAL COLOURS.

At the annual meeting of Swiss Photographic Societies held not long ago in Lucerne, Professor Barbieri read a paper in which he gave a useful review of the history of photographic processes in colour. Dr. Barbieri presides over the photographic school of the Zurich Polytechnic, and he is, as we discovered on a visit we recently had the pleasure of paying to his department, a teacher in the best sense of the word, explicit and infectiously enthusiastic. Our version of his communication is translated from our contemporary *Revue Suisse de Photographie*.

Two processes have been employed up to the present time for obtaining photographs in natural colours. The older of the two is the direct; the other adopts the method of preparing three colour sensation negatives, one for the red, one for the blue, and one for the yellow. The print is thus obtained in every tint by the mixture of these three colours.

Seebeck was the first to obtain direct coloured prints. He found that silver chloride not only deepened in tint but became coloured when exposed under coloured glasses. A more important observation was that of Becquerel who found that a more exact reproduction of the colours was obtained by combining chlorine and silver by electrical means. Becquerel also made the observation that the coloured result was more nearly perfect if the film were submitted to a preliminary exposure to daylight. This fact is an indirect proof that the reproduction of the colours depends more upon the action of light upon the *sub-chloride* than upon the normal chloride.

Poitevin improved on Becquerel's process by adding to the sensitive mixture substances to increase the sensitiveness to colours without, however, producing any action on the sub-salt so essential to the process. The method used by Poitevin was afterwards very considerably improved by the well-known photo-chemists, Krone, Kopp, Veress, Valenta, and others.

Next in the history of the direct process come the experiments of Lippmann who followed out experimentally the process described by Zenker in 1868. This process consisted in employing a film sensitive to all colours and a mirror of liquid mercury. The rays passing through the film fall upon the mirror, by which they are reflected through the film. The reflected rays show the interference produced by the film, *i.e.*, the existence of waves capable of retaining coloured rays in the sensitive film. Lippmann's coloured prints are thus not formed by any pigment. Their colours are visible only when they are viewed by reflected light, but they are none the less permanent. Others have taken up and improved Lippmann's process. I may mention Krone, Valenta, and Lumière. The last especially has produced since 1892 landscapes and portraits by Lippmann's process.

It was Lippmann who conceived the idea of replacing the bromide of silver by bichromated gelatine. But here also the colouration is seen only by reflected light. The theory of Wiener as to the production of coloured images with silver compounds does not hold good in regard to these coloured images in bichromated gelatine because in this latter there are no silver layers, and Wiener's theory is based on the fact that the super-imposed and reflecting layers of silver in the film are the cause of the colours. One must thus conclude that the colours are caused by reflection from fine films of unchanged gelatine.

The basis of the various indirect processes of colour photography is the production of three negatives by means of three different light filters—three plates sensitive to red, yellow, and blue. With these three negatives polychrome prints can be made in various ways.

De Rausonet proposed to make three negatives by means of yellow, blue, and red filters, from these three lithographic stones, and to afterwards print in the appropriate colours by lithography. But this process did not give good results, for, though the negatives were taken through coloured screens, the plates were not specially sensitive to the different colours. Du Hauron's process suffered from the same defect. He printed from his negatives in carbon, and transferred to plates of mica.

When Vogel invented colour-sensitive plates, Drs. Albert and Obernetter were the first to succeed with tricolour reproduction.

But there are still many difficulties to be overcome. The problem of the selection of the proper blue, yellow, and red colours is one; these three colours must be such as shall give every other colour by admixture, a condition which at present cannot be fulfilled. As a matter of fact, the same three colours should be used for both sensitising and printing—a very practical difficulty—for most sensitisers are useless for printing purposes. Hence resource must be had to those colours which lend themselves to the printer's art, and hence, although extremely beautiful reproductions are made, facsimile representations of the originals are, at present, not possible. Still, there is no occasion to despair. Wonderful progress has already been made, thanks to the researches of, amongst others, Dr. Vogel, Baron Hübl, Frisch, Husnik, and Angerer. Before leaving photo-mechanical colour processes, mention must be made of the synchromotopes of Turati, which are obtained by means of a press constructed by Turati himself, and with which only a single impression is required to give all the colours.

Amongst non-photo-mechanical processes, that of Ives led the way in viewing three images at one time. His apparatus simply consists of a lens through which the rays of light fall on one plate directly, and on two others by reflection. Each plate is provided with suitable screen, and the positives printed from the negatives thus obtained are viewed against the glasses corresponding to the taking screens.

Vidal projects the three positives on to a screen. Nacet adopts Ives's arrangements, using stereoscopic apparatus. (Projection and stereoscopic apparatus are included in Mr. Ives's colour apparatus.—*Translator*.) Selle makes three positives on collodion films, which he dyes red, blue, and yellow respectively. They are then super-imposed and projected.

Joly uses the idea of McDonough, taking a single view through a ruled screen of coloured bands, red, green, and blue, repeated across the plate. The result is a negative of very fine lines. A positive is made from this and placed in contact with a screen similar to that used in the camera, line to line.

Stockert's process possesses much of interest. From each of the negatives made, as for the tricolour process, a print is taken in gum-bichromate, the first for the yellow, the second for the red, and the third for blue. The three prints are made on the same paper, one on top of the others, sensitising twice more after the first printing.

Lumière similarly uses carbon. Hofmann has a similar process, in which the preparation of the negatives and registration of the prints is assisted by ingeniously devised apparatus. PROF. D. BARBIERI.

#### THE LATE W. McLEISH.

WE regret to announce the death of Mr. William McLeish, photographer, of Northgate, Darlington, which took place on Sunday at midnight. Mr. McLeish was seventy-five years of age, and unmarried. For the last three or four months his health showed a gradual decline. At first he was simply confined to his house, and then he had to take to his bed, until the end gradually came. He had no relatives in the district; the nearest one is a brother of eighty, but hale and hearty, who resides in Perthshire.

Mr. McLeish was a native of Perthshire, and went to Darlington about forty years ago. Changing his occupation from that of gardener, he became a photographer, occupying for some years a wooden erection in Grange-road, Darlington. The measure of success that he achieved in the years that followed showed that he had found his forte in taking up photography. After a few years at the above place, he removed to Northgate, and there he remained until the end, living in rooms adjoining his establishment. He gradually built up a most lucrative business, and at one time was undoubtedly the leading photographer in the district. In the exercise of his profession, he at one time employed quite a number of assistants, and trained several pupils, who have since given proof of the ability of the master to teach, and the pupils to learn. Mr. A. H. Harrow, photographer of Priestgate, Mr. Morgan, of Durham, and others were privileged to serve in the studio of Mr. McLeish.

A few years ago Mr. McLeish commenced a branch establishment in West Hartlepool, but subsequently gave it up. He had patrons of high degree, and had done work for Lord Barnard, &c. The recent presentation portrait of the Bishop of Hexham and Newcastle was entrusted to him. He never took an active interest in the affairs of his adopted town, but was devoted to his profession, and found it quite sufficient to keep him well employed, especially in the second and advanced department of it, that of painting. He was an artist as well as a photographer, and the combination of the two was in him a complete success. He was of

venerable appearance, with his long, patriarchal beard, and was of a generous disposition, giving liberally to necessitous cases, of which he generally had some on hand. He was well liked and highly respected by all with whom he came into contact.

In his professional labours he was gifted, painstaking, and original, and made a name for himself far beyond the bounds of Teesside. He was one of those who made an endeavour to bring to a state of perfection photography on a life-size scale. Whenever his photographs have been exhibited they have received medals and awards. At the Brussels Exhibition he gained the silver medal. He obtained similar honours in connexion with the Royal Photographic Society's Exhibition, the Bewick Club, Newcastle, and at exhibitions in the leading provincial towns. To the technical skill of the photographer, Mr. McLeish added the eye of the artist, and the numerous examples of carbon studies from life showed how thoroughly the two had become blended. In his own work in oils one is struck with the delicacy and strength with which he has depicted the scenery of Perthshire and the Western Islands. His *Monarch of the Glen* has become household property through the enterprise of the fine art publishers, who have reproduced a quarter of a million copies of it. It was in the early eighties that Mr. McLeish first made his name with the famous photograph, *A Misty Morning on the Wear*. This remarkable picture created a sensation, and was one of the chief exhibits in the Pall Mall Exhibition of the year. This picture is indeed very impressive, and the atmospheric effect of the misty morning, with the sun, is rendered in a way to make the painter envious. Of this photograph between 2000 and 3000 copies have been printed, till the negative has become defective, but copies have gone all over the world. Mr. McLeish was offered 300 guineas for the copyright of *Sympathy*, which will afford some idea as to its value, and his other works are also of great value.

#### ARTIFICIAL BACKGROUNDS.

[Patent No. 15,950 of 1899.]

MR. T. R. WATSON'S invention consists in painting over the original backgrounds in photographs with suitable paint or metallic composition, such as gold, silver, or bronze powder, leaf, or paint.

After the paint has been applied, a roughened or embossed appearance may be given to it, so as to make it resemble hammered or ornamental metal.

In place of painting over the original background, the photograph may be cut out (like a scrap picture) and mounted upon glass, and the paint or composition be applied to the back of the glass.

Gold leaf, aluminium, tin, or lead foil may be used.

#### JACKSON'S IMPROVED DARK-ROOM LANTERN.

[Patent No. 5564 of 1900.]

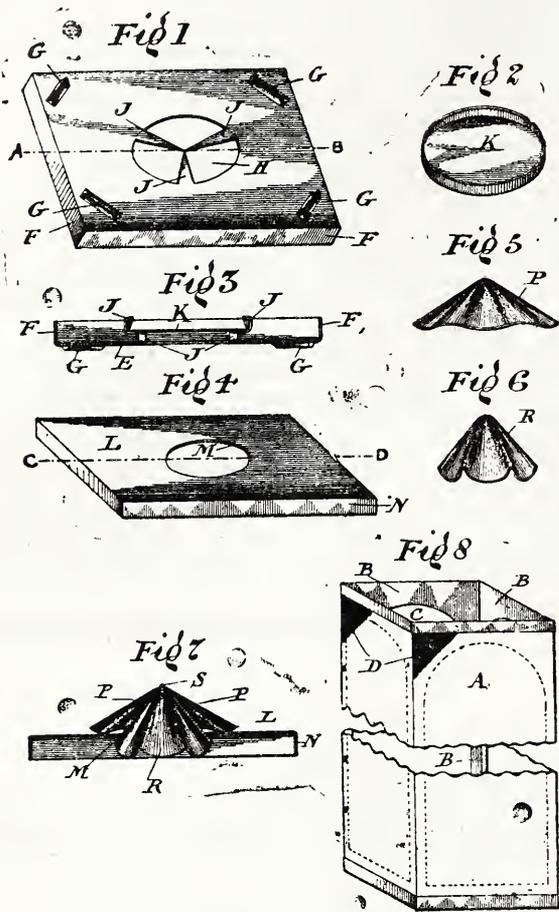

IN his specification Mr. Jackson says: I provide a lantern, A, composed of four metallic frames, such as B, each provided with an opening, C, and all four covered externally by a ruby-coloured fabric, D, adapted to form joints between the frames, and enable them to be folded up into a small compass in the usual way.

For such a lantern body, A, when opened out, as at fig. 8, I provide a bottom (fig. 3) upon which the body may be stood, the bottom being produced from, preferably, sheet metal, and, by the means of suitable dies, presses, and the like, would be formed to provide a bottom portion, E, with turned-up edges, F, so that the lantern body may stand upon E and within F. The bottom, E, has punched-up portions, G, to form feet, as at fig. 3, and punched-out central portion, H, adapted to provide two or more projecting pieces or wings, J, these, when suitably bent about, serving to support and hold a metallic tray, K (fig. 2), in manner shown in fig. 3, so that the candle, night-light, or other illuminant used may stand in the said tray, K, in the usual way, the opening, H, and space between the projections, J, serving to provide the inlet for the necessary air to support combustion.

The second portion of the invention relates to the canopy or cover for the lantern body, which I provide also of sheet metal, and, by the use of suitable dies, presses, and the like, I form this as at fig. 4, which consists of a preferably flat portion, L, having a central opening, M, and turned-up edges, N, so that while L may rest upon and close the upper end of the lantern body (fig. 8), the said turned-up edge, N, may form a rim for retaining the said cover in position thereon.

The opening, M, is to provide the necessary ventilation, and in order that rays of light from the illuminant in K may not exude through M, I produce two circular metallic plates, which, by the means of suitable dies or presses, I provide with radial corrugations or flutings, until they appear as at figs. 5 and 6, the larger of which, P, I mount upon the upper surface of the cover, L, covering and extending considerably beyond the limits of the opening, M, while the smaller corrugated plate, R, I pass

upward through the opening, *m*, until arrested by its outer surface abutting against the edges of the said hole, when I connect *p* and *r* together by the means of a central rivet screw or pin, *s*, which effectually

serves to retain both in position, as shown in fig. 7, the diametrical measurements of *p* and *r* being such as to entirely obviate the possibility of light rays escaping between them, while their respective corrugations provide ample ventilation.

DE REDON'S IMPROVEMENTS IN TRIPODS.

[Patent No. 5161 of 1900.]

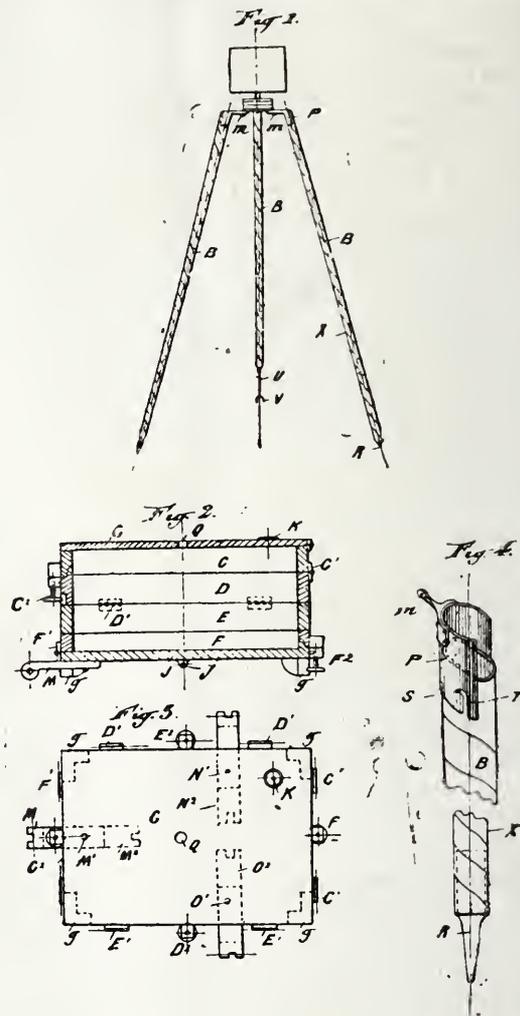

THE invention consists of a tripod with collapsible or reducible and dismountable legs, and an adjustable head or box which receives the apparatus to be supported, and admits of its being levelled or adjusted horizontally.

The adjusting box or head consists of parts or frames, *c*, *d*, *e*, and *f*, superposed on one another and united or connected together by hinges, *c*<sup>1</sup>, *d*<sup>1</sup>, *e*<sup>1</sup>, and *f*<sup>1</sup>, in different directions, and provided with regulating or adjusting screws, *c*<sup>2</sup>, *d*<sup>2</sup>, *e*<sup>2</sup>, and *f*<sup>2</sup>, for levelling or horizontally adjusting the upper face or surface, *g*, of the box or head which receives the stem or coupling of the apparatus in the central hole or aperture, *q*. A circular spirit level, *x*, mounted upon the surface, *g*, admits of the adjustment or levelling of the box or head being effected. The interior surface, *j*, of the box or head is provided with brackets, *g*, and with lugs or pieces, *m*, *n*, and *o*, arranged to turn upon points, *m*<sup>1</sup>, *n*<sup>1</sup>, and *o*<sup>1</sup>, in the position shown in dotted lines at *m*<sup>2</sup>, *n*<sup>2</sup>, and *o*<sup>2</sup>. These lugs or pieces are terminated by a perforated mortice, which can engage and be held in place by a pin an arm or projection, *m*, also perforated and connected to a curved or bent plate, *p*, provided with a curved slot or groove, *t*, which forms a bayonet joint with a pin, *s*, fixed upon the legs, *b*. These latter are formed of an elastic and flexible band or strip, *x*, spirally wound in such a manner as to be capable of allowing the said legs, *b*, to be lengthened or shortened.

In order to impart to these elastic strips or bands, *x*, a sufficient degree of rigidity, their upper portions are firmly gripped or held in the curved or bent plate, *p*, by means of the pin, *s*, and their lower extremities are each fitted with a point, *r*, fixed in a block of hard wood secured to the metal band or strip. A cord or thread, *v*, provided with a forked piece, *v*, and hooked or hung to the lower side, *j*, of my adjusting box or head, *j*, at the point, *j*, serves the purpose of augmenting the stability or fixidity of the apparatus by forcing the said forked piece into the ground.

In order to dismount the tripod, the bayonet joint, *t*, *s*, must be dis-

connected and the flexible bands or strips collapsed or telescoped by bringing their lower ends towards their upper ends. The connection between the lugs or pieces, *m*, and the projections or studs, *m*, are next

undone and the lugs or pieces, *m*, are turned under the adjusting box or head. The bent or curved pieces, or sockets, *p*, and the legs, *x*, are put into the box or head, the whole occupying but little space.

Our Editorial Table.

A CATALOGUE OF PHOTOGRAPHS.

By Messrs. Alfred Ellis & Walery, 51, Baker-street, London, W.

RUNNING to considerably over a hundred pages, this catalogue is a tribute to the energy and skill with which Mr. Ellis has built up the well-known business that bears his name. In the photography of celebrities he has secured a very high and well-deserved reputation. The catalogue bears the sensible recommendation, "Keep for reference." It is simply indispensable to editors of illustrated papers and other persons called upon to make themselves acquainted with the photographic presentments of people who have achieved the transient glories of popularity or notoriety, as the case may be. Thus there are sections devoted to royal personages, the aristocracy, authors, artists, composers, dramatists, editors, clerical, medical, and scientific, music and the drama (the fair sex taking up thirty-six pages of print, while the mere males only occupy fifteen), theatrical managers, plays, M.P.'s, naval and military, and sporting celebrities. Then come lists of London and country views. The catalogue is well printed and illustrated, and the cosmopolitanism of the stock of negatives of which it is the record should secure it a wide field of usefulness.

MR. GEORGE JOBSON, of Adin Villas, Boston-road, Horncastle, England, sends us a little pocket article which appeals alike to the smoker, the photographer, and the cyclist. It is an "electro-plated German silver" match-box, which, besides serving the useful office of storing the means whereby the pipe, the cigar, or the cigarette may be set going, carries on a spring roller a band of fabric upon which is printed a cyclist's lighting-up table for the year and a photographic exposure guide. This little novelty, for which the small sum of 2s. 6d. is charged, may be had of any photographic dealer or from Mr. Jobson at the address above given.

### CATALOGUE OF PHOTOGRAPHS OF SAILING AND STEAM YACHTS; SAILING SHIPS; DEEP SEA AND RIVER STEAMERS.

By J. ADAMSON & SONS, Rothesay, N.B.

PHOTOGRAPHS of some hundreds of vessels are listed in this unique catalogue. Messrs. Adamson state that they hold the largest collection of photographs of yachts, steamers, &c., in the world. They undertake the photographing of every kind of craft under sail, steam, or at rest, in any part of the country. We are glad to see the following emphatic warning printed in the catalogue: "Our Marine negatives are registered copyright, and as our collection has been got together at a very large cost, we warn any one who may reproduce them in any way that they lay themselves open to an action for substantial damages." All those interested in yachts and ships should procure a copy of this catalogue. We have called it unique—to the best of our knowledge no other firm of photographers issues a similar list.

### PHOTOGRAPHS OF THE PARIS EXPOSITION, 1900.

By M. ALBERT LÉVY, 4, Avenue Pinel, Asnières, Paris.

THE photographs taken of the Paris Exposition by M. Lévy make a set of 100 12 x 10 views, which are the outcome of a systematic attempt to reproduce the principal external architectural features of the world of beautiful buildings now open on the banks of the Seine. M. Lévy kept himself rigidly to his self-imposed task of giving his photographs this particular interest, and in many cases views in detail accompany the pictures representing entire buildings or the principal parts of them. The photographs are arranged in consecutive order, commencing with the main entrance and taking the palaces as the visitor might be supposed to pass them during a tour of the Exposition. The set before us is printed by the ferro-prussiate process, and, enclosed in a suitable portfolio, sells for 10s., separate views not being obtainable. As a record of the principal external architectural features of an Exposition the like of which Europe may not look upon again, M. Lévy's photographs are of very great interest indeed. The album may be obtained or ordered of Mr. Batsford, architectural publisher, High Holborn, London. Most of the photographs taken at the Paris Exposition fall in the category of general views, and do not attempt to convey an idea of the structural beauty or grandeur of the principal buildings. This is what M. Lévy has succeeded in doing in the set of views before us. Those who study the Exhibition from this standpoint could not have a better souvenir of it. To readers of this JOURNAL it should, perhaps, not be necessary to mention that M. Lévy's experience in architectural photography extends back a quarter of a century or more. These pages and those of our ALMANAC have often contained hints from his pen on points of photographic practice.

### A RADIOGRAPHIC LIST.

Published by Isenthal & Co., 85, Mortimer-street, Cavendish-square, W.

VERY early in the practical applications of radiography Mr. A. W. Isenthal took a prominent place, and his firm to-day probably stands foremost amongst those houses who make a speciality of the supply of apparatus for this branch of work. The list before us bears the aspect of having been compiled by the light of a thorough knowledge of the subject. What is best and most advisable in coils, interruptors, batteries, tubes, screens, and fluoroscopes, plates and films, and other accessories, is fully set forth and illustrated. The list, in fact, appeals to the specialist in radiography, and it has the merit of being compiled by specialists. Messrs. Isenthal say: "Our Röntgen laboratory is by far the most completely equipped in the United Kingdom. We have both continuous and alternating current at our disposal, and are thus able to demonstrate every instrument contained in the present list to intending purchasers. Both our Röntgen installation and our dark room may be used, by special arrangement, by experienced radiographers who wish to temporarily avail themselves of such powerful apparatus." This is the most useful and carefully compiled radiographic list that we have seen.

### Studio Gossip.

A SOUVENIR of the war in South Africa has been published by the London Stereoscopic Company. It consists of photographs of our generals at the front grouped round a medallion portrait of the Commander-in-Chief. The souvenir is called "Heroes All," and the Directors of the Company wish it to be known that they will send, gratis and post free, as many copies of "Heroes All" as may be applied for by the managers of every hospital, sick ward, convalescent home, or other resort, where our invalided soldiers and sailors returned from South Africa are being treated, in order that these souvenirs may decorate the walls and interest the invalids. Presentation copies have been accepted by Her Majesty the Queen, the Prince of Wales, the Princess of Wales, the Duke of York, the Duchess of York, the Duke of Saxe-Coburg and Gotha, the Duke of Connaught, Princess Christian, Princess Louise (Duchess of Argyll), Princess Henry of Battenberg, and the Duke of Cambridge.

EFFECTS OF COLOURED LIGHTS ON THE NERVES.—French scientists have been making some very interesting experiments in connexion with the effect of certain colours on the nervous system. And people who have been somewhat scoffed at for calling red warm and blue cold and yellow invigorating, may now kindly regard themselves as forerunners of a great discovery. Henri de Parville, of Paris, asserts that the red end of a spectrum excites the nerves, while violet, green, and blue are soothing. Dr. Bonza goes many steps further, and attempts to cure nervous diseases by the use of certain colours. Melancholia he treats with red, violent mania with blue, and nervous prostration with violet. The very grave question arises as to how the woman already nervous will stand the prescription of an unbecoming colour. Dr. Dor, another experimenter, has brought on vertigo in patients by the use of red lights, and relieved the symptoms by changing the ray from red to green.

FIGURE GROUPS.—In the course of an able and interesting paper on figure studies by photography, Mr. T. Lee Syms, in the *Photographic Record*, says: "In lighting a figure group, due regard must be paid to the colour of the costumes, and if special dresses are not used, one must bear in mind that reds and yellows come out darker and blues lighter than they appear to the eye (of course isochromatic plates and screens are out of the question for inside work). If care is not exercised in this particular, we shall probably have the principal figure taking a minor position, and a secondary one coming out to the front. Taking it all round, I find it best to either select a few costumes, with due regard to their photographic qualities, or have them made up specially of varying shades of grey. It is, however, essential that they be well worn and characteristic; as to me, nothing is so bad as obviously dressed and posed models in a picture. Much pure white drapery should be avoided, and a rinse in a weak yellow dye greatly improving such from a photographic point of view. Children should be dressed in plain simple things, clothes that can be romped in without fear of damage and of a dark cream for the lighter one. A special pinafore or two and a bonnet and hat are worth investing in, as sometimes a splendid model, unsuitably dressed, will be found, and if the right things are at hand, a minute or two works quite a transformation. On no account let the models look as if they had just stepped out of a handbox. For older models, a blouse or two of unobtrusive patterned calico and a skirt or so, dyed at home to the shade required, and not too much starched and ironed, will be found useful, and if the pattern is not too pronounced, will not be recognised as old friends in every picture, as they will look quite different in every change of lighting. Always strive to make the clothes look part and parcel of the picture. The same remark applies to the accessories. Many otherwise excellent prints are spoiled by the models being palpably made up and out of all harmony with their surroundings. For this reason, avoid as much as possible fancy pictures in dress of any other period than the present or the immediate preceding one. Not many people nowadays can wear a Court costume with anything like natural grace, excepting, perhaps, actors, and they generally are the worst of models for our purpose, their dramatic poses not being suitable at all for picture making, besides which their make-up always looks artificial in a photograph. On the whole, it is better to be content with every-day subjects, such as are found around us in profusion."

### News and Notes.

AFTER an investigation into the effect upon the eyesight of the incandescent electric and incandescent gas lamp, the University of Heidelberg has decided that neither light, if properly placed, has any bad effect upon the eyes. On the question of lighting, the Committee in charge decided that for the lighting of rooms, especially concert rooms and lecture halls, where many people remain for long periods at a time, the electric light is without doubt to be preferred to all others from a hygienic point of view.

THE G.E.R. "TOURIST GUIDE TO THE CONTINENT."—We have received a copy of the Great Eastern Railway Company's *Tourist Guide to the Continent*, published at the price of 6d. Among its fresh features are particulars of the new Ober-Ammergau tours; express services to Norway, Denmark, and Sweden, via the Royal Mail Harwich-Hook of Holland Route; of new tours in the Luther Country, and Thuringian and Hartz Mountains, a series of Continental maps, and a chapter, "Dull Useful Information," giving particulars as to the cost of Continental travel.

A CORRECTION.—At the conclusion of Mr. S. B. Webber's Convention paper on *Residues and what to do with them*, the following passage occurs in some copies of last week's JOURNAL: "I propose to make a gentleman's hoop ring, weighing about ½ ounce, by alloying 9 cwt. of fine gold with 2 cwt. of F silver and 1 cwt. of F copper, producing 12 cwt. of 18 carats gold." It needs hardly be said that the obvious errors are typographical, and that throughout the passage "dwt." should be read for "cwt." A gentleman's gold ring weighing 24 cwt. would, indeed, be a remarkable production! By the kindness of Mr. Webber, the ring which he made at Newcastle has been adapted for the use of a lady.

THE Rotherham Photographic Society's Eleventh Annual Exhibition will be held in the Drill Hall, Rotherham, on Wednesday, Thursday, Friday, and Saturday, 17, 18, 19, and 20 October, 1900. The following are the open classes:—A. Photographs, any subject (previously medalled). Medals—one silver gilt, one silver, and one bronze. B. Photographs, any subject (not previously medalled). Medals—one silver and one bronze. One certificate. C. Lantern slides (sets of four). Medals—one silver and one bronze. One certificate. Entry forms and further information respecting the Exhibition may be obtained from Mr. H. C. Hemmingway, Hon. Secretary, Tooker-road, Rotherham.

**ROYAL ACADEMY ELECTIONS.**—There were two elections at the Royal Academy last week: one for an A.R.A., caused by the retirement, through ill health, of Mr. P. R. Morris; the other for a Professor of Painting, rendered necessary by the resignation of Mr. Hubert Herkomer, R.A., who succeeded Sir William Richmond, R.A., only last summer. The method of the Royal Academy is peculiar in its elections. The "first round" is termed the "scratching," the second the "black-board" ballot, and then comes the final ballot. In the end, Mr. Joseph Farquharson was elected as the A.R.A., and Mr. Val Prinsep, R.A., as the Professor of Painting. It was generally thought that Mr. G. A. Storey, R.A., who was defeated by Professor Herkomer at the last election, stood the best chance for the Professorship, but Mr. Val Prinsep secured eighteen votes to Mr. Storey's seven. Of course, as usual, there are divided opinions as to whether the best men have secured the coveted honour, but we expect that will always be the case at every R.A. election.

**BALLOON OBSERVATIONS.**—We read that the largest balloon ever constructed is to ascend from Berlin next month to make meteorological and scientific observations. The balloon, it is said, is capable of lifting more than six tons, and will be supplied with provisions for several weeks and two beds. It will be interesting to see whether the balloon will be able to keep afloat for several weeks. Many valuable researches have been made from balloons, but mostly from those of moderate size, capable of remaining in the air for a comparatively short time only. It remains to be seen what will be accomplished with one that will keep afloat for several weeks, if it does so. By the way, speaking of balloons, it seems that the trial of Count Zeppelin's navigable balloon turned out more or less a failure. However, its inventor is still sanguine, and, after some alterations and repairs, intends shortly to make another trial. Although many attempts have been made to construct a navigable balloon, the thing remains to be accomplished. Will Count Zeppelin accomplish it? If so, all honour to him.

## Commercial Intelligence.

**MACHINERY FOR P. O. P. MANUFACTURE.**—In reference to some recent queries in our columns. Messrs. Ferdinand Flinch & Co., of Offenbach-on-Main, Germany, write that they are making complete plants for manufacturing printing-out paper.

On Saturday last the *employées* of Messrs. Wyndham & Co., Limited, collog-type printers and photographic view publishers, Acton, London, held their annual outing. A party consisting of forty persons left the works in the early morning, journeying in brakes through the country lanes to the Black Horse, Fulmer. On the journey a visit was paid to a fruit garden, and lunch was partaken of, and the enjoyment of a five-a-side football competition by the male portion was indulged in. At the subsequent dinner the chair was taken by the Managing Director, who, in the course of a few remarks, referred to the recent opening of additional departments, and to the fact that two more machines were in course of erection, which he expected would be in working order immediately following August Bank Holiday, and concluded a short address by impressing upon all the necessity of turning out all work in the best possible manner. On the return journey a different route was followed, and home was reached after a most pleasant and satisfactory holiday had been spent.

**THE WARWICK COMPETITION.**—The following is the list of awards in the Warwick Competition for July:—10*l.* prize, Miss Maude Craigie Halkett, Percy House, Eltham, "*We'll be late for School*;" 5*l.* prize, F. M. Sutcliffe, Photographer, Whitby, "*A Medical Student*;" 1*l.* prizes, T. Calder, 14, Broomilaw, Glasgow, "*Porta del Popolo, Rome*;" H. Cochrane, jun., Adelaide Park, Belfast, "*An Obstacle Race*;" Mrs. Dumas, Glascoed, Bromley, Kent, "*In Winchester Cathedral*;" W. H. Elwood, jun., Malone Park, Belfast, "*Sir G. White in Belfast*;" Captain F. W. Evatt, Riversdale, Ilfracombe, "*Ilfracombe Harbour*;" Dr. F. Graves, Waverley House, Kenilworth, "*Edge of the Forest*;" J. R. Gunson, The Priory, Whitehaven, "*On the Shore*;" W. C. Hope, Bellevue-road, Cowes, "*By Grassy Field and Babbling Brook*;" T. E. Innes, Photographer, Heaton Chapel, Halifax, "*A Musical Mite*;" W. Ives, 21, Edinboro' Grove, Armley, Leeds, "*An Ugly Customer*;" H. A. Norman, 116, Westminster-bridge-road, S. W., "*A Pond in Epping Forest*;" J. Patterson, 62, Clifton Park-avenue, Belfast, "*Hundred Yards Race*;" H. Price, Dennis Vale, Stourbridge, "*Lilies of the Valley*;" R. R. Rawkins, 5, Alma-road, Canonbury, N., "*A Monarch of the Forest*;" J. T. Rigby, 66, Belmont-street, Southport, "*A Path through the Wood*;" F. C. Smithard, 124, Rose-hill-street, Derby, "*Evening Sunshine*;" F. H. Stevens, 5, King-square-avenue, Bristol, "*The Young Student*;" S. W. Taylor, 31, Market-place, Penzance, "*A Cornish Cottage*;" W. Vick, Photographer, Muswell-hill, London, N., "*The Green Man Hotel*;" C. J. Woodhams, 34, Ship-street, Brighton, "*A Rest by the Way*."

## Patent News.

The following applications for Patents were made between July 2 and July 14, 1900:—

- CAMERAS.**—No. 12,028. "Improvements in and relating to Photographic Cameras." W. J. HOLT.
- SHUTTERS.**—No. 12,036. "Improvements in or relating to Pneumatic Regulating Mechanism for Photographic Shutters." A. L. ADAMS and W. G. ROBERTS.
- STAND.**—No. 12,069. "A New Form of Stand for Photographic Cameras." S. E. PARKER.

**HALF-TONE WORK.**—No. 12,139. "'Backing up machine' for Mechanical Backing up 'Electro' and 'Half-tone Work,' either for B of Periodicals, or Trade Work." Complete specification. J. COLLIS and T. J. KELLY.

**PHOTOGRAPHY ON GLASS.**—No. 12,142. "Improved Decoration of Glass Means of Photography." W. A. BONNELL.

**HAND CAMERAS.**—No. 12,226. "Improvements in Hand Cameras." C. PECSENIK.

**BOOK FORM KINETOSCOPES.**—No. 12,308. "Improvements in Book-form Kinetoscopes." H. W. SHORT and H. E. HUGHES.

**PHOTOGRAPHY.**—No. 12,313. "Improvements in Photography." Communicated by Actien-Gesellschaft für Anilin-Fabrikation, Germany. C. J. ABEL.

**REDUCER.**—No. 12,375. "Improved Manufacture of a Photographic Reducer." Communicated by Actien-Gesellschaft für Anilin-Fabrikation, Germany. C. D. ABEL.

**LENSES.**—No. 12,521. "Improvements in Photographic Lenses." H. I. ALDIS.

**LENSES.**—No. 12,608. "Improvements in Photographic Lenses." H. I. ALDIS.

**SHUTTERS.**—No. 12,722. "An Improved Lens-hole for Camera Shutters." R. MARTIN.

**CAMERAS.**—No. 12,759. "Improvements in Photographic Cameras." Complete specification. T. R. DALLMEYER and H. L. ALDIS.

## Meetings of Societies.

### MEETINGS OF SOCIETIES FOR NEXT WEEK.

July.	Name of Society.	Subject.
31.....	Hackney.....	Chat on Bromide Paper Working.
August.		
4.....	Darwen.....	Excursion: Bolton Woods.

### LONDON AND PROVINCIAL PHOTOGRAPHIC ASSOCIATION.

JULY 19.—Mr. A. Mackie in the chair.

MR. PHILIP EVERITT showed two eclipse photographs, one taken by a beginner with one half of a 5½ inch rectilinear lens, equal to about 11 inch focus; and the second with a telescope of 4 inch aperture. In the first the image of the sun was, of course, extremely small, but the second was of about three inches diameter.

MR. W. T. WILKINSON passed round four prints from two pairs of negative developed with pyro-soda and ortol respectively. There was very little difference to be seen between the two pairs of prints.

The question of the peculiar power of metol to attack the skin of some users was brought up. A member described the progress of the attack as first an irritation or itching of the skin, succeeded by the appearance of spots underneath the skin. After a time the skin became so that one imagined it to be at least a quarter of an inch thick. Finally, the hands peeled, and it seemed that one could never use metol again without giving rise to a reappearance of the trouble. Ortol also was said to affect some skins in a similar way.

MR. W. D. WELFORD said that he had never heard of trouble when metol was used in conjunction with hydroquinone. Pyro-metol was said to cause irritation to some people, and hyposulphite of soda, it was stated, gave rise to blisters in some instances. Allusion was made in a conversational way to the new kachin developer. When first introduced, caustic alkalis were prescribed for it. The new kachin, it is said, has been modified for use with carbonates as the alkali instead of the caustic alkali, but it was pointed out that excellent results had been obtained with the first kachin used with carbonates.

MR. A. HADDON, replying to a suggestion that ozotype, the carbon process now commercially worked, was comparable to the old process of Marion, said that they were as different as wet and dry plate processes. A general discussion ensued on this as well as other topics.

### PHOTOGRAPHIC CLUB.

JULY 18.—Mr. H. Müller in the chair.

MR. E. W. FOXLEE showed a quarter-plate negative taken by an amateur forty-five years ago with a single lens. Notwithstanding the great improvement in lenses that had taken place since that time, he thought everybody would perceive that the lens used was an excellent instrument, the absence of distortion being as complete as with the best lenses of to-day. He believed that the focus of the lens was about six inches.

MR. A. MACKIE remarked that a single lens used properly did not really distort much. He had a whole-plate negative taken with a single lens of about nine-and-a-half inches focal length. Looking directly at the negative or print, a certain straight line in the subject appeared as it should, but held at an angle one could distinctly see the curved line produced by the distorting lens.

MR. FOXLEE said, of course, the plate used was a wet plate. The subject was a street scene. A glass positive made similarly many years ago, was also shown. Some discussion ensued as to the length of focus of the lens used, judging by the width of the street, and the rendering of the view.

MR. MACKIE thought it likely that the lens was the front glass of a ¼-plate portrait lens.

North Middlesex Photographic Society.—July 16.—Mr. A. H. WALL gave a lecture on

CLLOUD NEGATIVES.

The lecturer dealt with the various forms of clouds, and the relative exposures required for the various forms. He touched on the work of Claydon and Birt Acres, saying that their work was scientific, and not intended for pictorial purposes. The use of a Claude Lorraine mirror was explained, and a simple substitute, which the lecturer had found efficacious in his hands, was described. A thin ground-glass focussing screen, half-plate size, was coated with black varnish on the ground side, and mounted on one side of the lens at an angle of 33° to it. The blue of the sky was polarised by reflection from its polished surface as in the mirror, and no double image was obtained.

FORTHCOMING EXHIBITIONS.

1900.

- August 21..... Royal Cornwall Polytechnic Society. W. Brooks, Laurel Villa, Wray Park, Reigate.
- Sept. 21–Nov. 3 ..... Photographic Salon, Dudley Gallery, Piccadilly. Hon. Secretary, R. W. Craigie, Camera Club, Charing Cross-road, W.C.
- October 1–Nov 3 ... Royal Photographic Society, New Gallery, Regent-street. The Hon. Secretary, 66, Russell-square, W.C.
- November 12–17 ..... Ashton-under-Lyne.
- „ 21–23 ..... Hackney Photographic Society.
- 1901.
- January 14–19..... Blairgowrie and District Photographic Association. The Hon. Secretaries, Blairgowrie, N.B.

Those who desire to send photographs to the above Exhibitions should write for prospectuses to the Hon. Secretaries, whose addresses are given in the second column above. The dates mentioned are those at which the Exhibitions open.

Correspondence.

\* \* \* Correspondents should never write on both sides of the paper. No notice is taken of communications unless the names and addresses of the writers are given.  
\* \* \* We do not undertake responsibility for the opinions expressed by our correspondents.

THE CONVENTION GROUP.

To the EDITORS.

GENTLEMEN,—Please allow me to heartily thank you for the supplement to the JOURNAL this week. I purpose mounting and framing such, although I am not a member of the happy party.

May I offer a suggestion, which I think would be much appreciated by the readers of your valuable paper, *i.e.*, a supplementary sheet of the Editor and staff (if he wills) of the JOURNAL that might go side by side with other such publications? I should feel it a great honour to possess.—I am, yours, &c.,  
AUGUSTUS H. TAYLOR.

19, Rolle-street, Exmouth, July 21, 1900.

[We are glad to know that our correspondent appreciates the Convention group, which reflects the greatest credit on Mr. W. Parry, who took the negative. The suggestion shall be borne in mind.—EDS.]

SOUTH LONDON SOCIETY'S EXCURSION TO THE RHINE.

To the EDITORS.

GENTLEMEN,—I have much pleasure to inform your readers that we have permission to photograph interiors in Cologne Cathedral, St. Gereon's Church, Cologne; Munster Church, Bonn; and Remagen Church.

Those wishing to join this excursion should send me 2*l.* 10*s.* towards travelling expenses by Saturday next, July 28.—I am, yours, &c.,  
5, Firs Parade, High-road, Lee, S.E. WILLIAM F. SLATER.

KODAK DEMONSTRATIONS.

To the EDITORS.

GENTLEMEN,—We beg to inform you that we are now arranging for demonstrations in connexion with the following subjects during the ensuing winter:—Development of rollable film; Dekko paper demonstrations; Panoram photography, illustrated by examples.

If you will kindly give publicity to the above in the columns of your esteemed journal, together with an intimation that we shall be pleased

to arrange dates for these demonstrations with the secretaries of photographic societies, we shall be much obliged.—We are, yours, &c.,

Head Offices: 43, Clerkenwell-road,  
London, E.C., July 16, 1900.

KODAK, LIMITED.

SPECIMENS.

To the EDITORS.

GENTLEMEN,—I have subscribed to your very useful publication for a number of years, during which time I have seen frequent complaints made by operators anent loss of specimens and delay in their return.

I have fortunately not been "out" much, but as soon as I have occasion to send specimens in reply to one of your advertisers just so soon do I get such cause for complaint that I swear I will never again send specimens to another advertiser. I have kept this vow for two or three years so far as replying to a number care of JOURNAL, but when a man is out he must try something; therefore I am forced to reply and send specimens, and, I regret to say, absolutely always with the same result, *viz.*, I have to write at least once before I get them returned. I could name firms from whom I never get them back at all, the publication of whose names, I fancy, would rather surprise the trade generally, and, if I do get them back, it is never under two weeks, but oftener three or four. I have heard all the excuses made on behalf of the advertisers, such as that they are often inundated with amateurs' trash, which is certainly annoying and, no doubt, in such cases expensive! but surely an "operator" has not to suffer for that. When I say "operator," I mean a really proved good worker, like myself. I may here mention that I have never worked for less than three guineas for over three years, and successfully too. Why, then, should employers, advertising, have so little regard for any really good man who takes the trouble to submit specimens? In the case of third-rate advertisers—but the wording of whose advertisements would lead one to believe they are Lafayettes or Langfiers of the first water—there might be the suspicion that they wanted to sneak them for their own use; but in the case of really first-class firms such an excuse does not exist, therefore, if anything, their case is even worse than the first, for with them it is purely a case of downright selfishness; they decide on a man, and are themselves satisfied, and are then utterly regardless whether or not the rejected applicants have another set of specimens to send out the next week should the necessity arise. I am so disgusted now that I have decided to start business on my own, so, so far as I am concerned, I need hardly worry. Yet there are no doubt dozens, perhaps hundreds, of brother-workers who are not so luckily situated as regards *£ s d* as I am, and who, if they do not get their specimens returned by the following Friday, may lose perhaps the very situation most suited to them, and therefore go idle for goodness only knows how long.

It is for these men I now make this my first and last appeal. Any advertiser, unless he is a consummate ass, can surely decide in at most one day which are likely and which are useless applications; his duty then is very clear, *viz.*, return the rejected at once. Why keep them up one hour? And then, if within the week he cannot make every necessary inquiry regarding, say, the half-dozen he has considered likely, and make a choice, and return the specimens of the other five, well, then, he ought never to have been in a studio at all; such men should be running a small washing and dressing establishment.

You, as a rule, are very fair and desirous of keeping both advertisers and applicants right, but apparently have not yet devised a cure for this very common and unnecessary complaint. To further my appeal I hereby submit a remedy which I think would be effectual and at which, if due notice was first given by you through the JOURNAL, no decent firm, could object, and—well—the other kind want showing up. Why not publish a black list of all advertisers who keep an applicant's specimens and copy testimonials more than one week—or two if you think—but let it be definite. No doubt, all applicants would be glad to inform you of defaulters.

Lawyers, stockbrokers, and members of many other high-class professions are immediately hauled over the coals if in default, why then should photographers escape the penalty of such petty meanness. There is always some extenuating point in the case of a man—say a stockbroker—who cannot come to the scratch on settling day, but in the case under consideration there is absolutely none.

No doubt you acknowledge receipt of all advertisements, could you not at the same time inform your customers of the black list now in vogue, *i.e.*, if you adopt my proposal. If not, all I can say is, poor operators.

Both defaulters' and complainers' names could be listed, and if it was thoroughly understood that advertisements were only inserted under these conditions there could surely be no liability on your part.

When I am at it I might also suggest that advertisements should be classed 1st, 2nd, and 3rd, for as it is the 3rd, *aye*, and often the 4th grade advertiser asks for a first-class man, when they have not the slightest notion of paying more than 30*s.* per week, what earthly good is it to them then getting specimens from men whose work at once shows them to be far above the advertisers' standard and what is more gallingly to a really first-class man than to have to wait three or four

weeks for the return of his specimens and then receive same in a thin tissue envelope with great vulgar printing all over the face of it, much more suggestive of a vegetable store than anything connected with art; this classifying of advertisements would also often prevent third-rate men applying to really first-class houses.—I am, yours, &c.,  
July 24, 1900.

MAN'S INHUMANITY TO MAN, &c.

## Answers to Correspondents.

\* \* All matters intended for the text portion of this JOURNAL, including queries, must be addressed to "THE EDITORS, THE BRITISH JOURNAL OF PHOTOGRAPHY," 24 Wellington-street Strand, London, W.C. Inattention to this ensures delay.

\* \* Correspondents are informed that we cannot undertake to answer communications through the post. Questions are not answered unless the names and addresses of the writers are given.

\* \* Communications relating to advertisements and general business affairs should be addressed to Messrs. HENRY GREENWOOD & Co., 24, Wellington-street, Strand, London, W.C.

### PHOTOGRAPHS REGISTERED:—

N. Budd, 40, Lichfield-street, Wolverhampton.—Photograph of a memorial brass tablet.

J. Kennerell, 7, York-row, Wisbech.—Photograph of Wisbech fire engines, escapes, and fireman.

G. W. Tottem, 6, The Boulevard, High-road, Balham.—Photograph of Dan Leno and others on cricket field. Photograph in railway station of Oronhyatekko, M.D., and others.

W. B. (Hull).—Many thanks; it is a curious advertisement.

HOT-WEATHER TROUBLES.—W. BLAKE, R. W. C., AMATEUR, and others. See remarks on the subject in another column.

WILLIAMS.—We regret very much that we cannot at present offer a suggestion likely to be of service, but we will keep your letter before us.

BOOK ON ENAMELS.—J. BRANDEBOURG asks for the name and publisher of a book on vitrified enamels.—In reply: Messrs. Dawbarn & Ward, of Farringdon-avenue, E.C., publish such a book.

ETCHING PROCESS.—A. D. BISHOP asks: "Is it possible to prepare a polished silver plate with suitable ground, print thereon a photo, and etch with nitric acid?"—Yes, if you use the bitumen process, but that is only suitable for line work.

STAINS ON PRINTS.—R. M. writes: "Will you kindly inform us what is the cause of the stains on the prints enclosed. We had three or four in the last toning, but this toning about seventy-five per cent. are as enclosed."—This is another case of imperfect fixation. See answer to Helio.

JOHN FLYNN (Johnstone).—The apparatus you describe is the invention of Mr. L. Nievsky, Avenue-road Villas, Shepherd's Bush, to whom you had better write for further particulars. We sat to it some few years ago for our portrait, and the results were expeditiously produced and satisfactory.

PHOTOGRAPHING IN THE NATIONAL GALLERY.—The Secretary. But we may tell you that amateurs are not allowed to photograph in the National Gallery. Permission is given, occasionally, to professional photographers, but they have to specify the purpose for which the work is required before it is accorded.

RED STAINS ON PRINT.—P. CHARLETON asks the cause of red stains on enclosed print before toning; one half the print will be blue, the other red. He has been greatly troubled with it lately and cannot find out the cause.—So far as we can judge from the print the paper appears to be unevenly coated. Expose a sheet to a weak light and see if it darkens evenly all over. If it does not return it to the maker.

SPOTS ON PRINTS.—SPOTS writes: "Please enlighten me in the next issue of your paper, the cause of the spots on the prints which I enclose. The spots only appear when washing and toning. I have never had such an occurrence before the last two packets."—The spots are caused by particles of foreign matter in the washing waters, which have reduced the silver in the paper to the metallic state. They look like particles of iron, and probably are.

FORMULA FOR DEVELOPER.—W. K. writes: "Will you kindly give me what you consider the very best formula for very short exposures, say from 200th to 800th of a second? One containing pyro preferred."—If pyro is preferred use the solution weak with a minimum of bromide, and allow plenty of time. Some consider that metal will bring out more detail than pyro in under-exposed plates. A formula for that is given on p. 1021 of the ALMANAC, but use it diluted somewhat.

THE PENNY PICTURE BUSINESS.—H. W. Post writes: "Can you inform us whether or not what is known in America as the 'Penny Picture business' (a dozen pictures for a shilling or sixpence), has been carried on to any extent in England? Information on this point will oblige us, and your kindness will be greatly appreciated."—Presumably stamp portraits are referred to. These portraits are produced here as low as twenty-five for a shilling at some places, but the demand for them is but limited in this country.

RESTORING ALBUMEN PRINT.—If a gold toned print be immersed in a solution of bichloride of mercury, the yellowness will be removed. That is the method you doubtless have heard of. If the print is not gold toned the image as well as the yellowness will disappear. Such would be the case with a bromide picture for example.

STRENGTHENING METHYLATED SPIRIT.—B. G. writes: "I want some methylated spirit stronger than that sold at the shops, and I know I can make it stronger by distilling it from carbonate of potash, or quicklime but that necessitates the use of a still. Will you please say what the license to use one would cost?"—The license for a still is ten shillings a year, but you will not be allowed to use it for strengthening methylated spirit, for that is illegal. Methylated spirit must not be tampered with if it is a heavy penalty is incurred.

SENSITISING CARBON TISSUE.—CARBONIS writes: "I have just bought a roll of carbon tissue, and I find when I sensitise it that the coating comes off everywhere it is touched by the fingers. Although I have been using the carbon process for some months I have never met with this trouble before, so it must be the fault of the tissue. Should I not return it?"—No; the trouble is due to the hot weather. Keep the sensitising solution below 60° by the aid of ice, and the trouble will disappear.

A QUESTION OF COMPENSATION.—VERNON BIRD, of 3, Cannon-street, Wisbech, writes: "Seeing in your Answers to Correspondents of July 20 that 'G. F.' writes to know 'A Question of Compensation,' would you be so kind as to let me have his address, as I should like to write him to know if it is the same firm as I have been trying to deal with. On February 8 I gave an order for a greenhouse to use as studio to —, and sent cash; during that time they have frequently said same was coming. The last letter I had from them is about six weeks ago. Have written in meantime, and they don't reply. On their price list they say, 'Cash returned if required.' But they won't send either."

BROMIDE ENLARGEMENTS.—B. & Co. write: "Will you please tell us the cause of the cold black and white tones in the enclosed pieces of enlargements? They are made on — bromide paper. We used to send our enlarging to —'s to be done, but the time taken and the cost of carriage has induced us to try and do it ourselves, but we cannot get the same colours that — do."—The pieces of pictures sent show that the exposures were wrong, in most considerable under-exposure. To get the best results with bromide paper the exposure must be accurately timed, or the colours will not be warm and rich. Knowledge of the proper timing can only be gained by experience. That, of course, those to whom you have hitherto sent the work have gained.

A QUESTION OF COMPETENCY.—T. ROBERTS writes: "I advertised in THE BRITISH JOURNAL OF PHOTOGRAPHY for a first-class operator and retoucher. I had one application from Ilfracombe, and one from Ireland. Both men represented themselves as first-class men at operating and retouching. Neither of them could retouch, and their operating was very indifferent. The one I gave a trial for a week, the other one I sent off after four days, giving both every possible chance. Am I bound to pay such men wages?"—We should suppose so, unless they agreed to come on trial without payment. Of course you need not pay them if they came with false references, for of course you did not take them without some reference.

STAINED PRINTS.—HELIO writes: "Can you enlighten me as to the cause of the stains on enclosed prints? Paper is Trapp's best; silver, Marions. Every care and cleanliness; well washed by hand, and rosed. These prints were well hand washed and rosed for one hour, and left standing in water from Saturday night to Monday morning. Same effect, but more prints affected, is caused when prints are left in running water all night. Large print is an extreme case, and cabinet a normal case. My photographic friends cannot explain cause, and I am mystified. Of course I cannot say that my printer is truthful, but he appears to take every care, and is anxious."—The prints are simply not fixed. Either the hyposulphite solution was far too weak, or the prints were left in it for much too short a time. A stronger solution and a longer immersion is the only way of avoiding the trouble in future.

PRECIPITATING SILVER RESIDUES.—UBE writes: "Please pardon my inquiry for information on what has been a simple matter with us for nearly forty years, and which gave us no trouble until quite recently—namely, the precipitation of silver from print washings. Until a few months ago we managed to precipitate effectually with chloride of sodium, and occasionally a few drops of hydrochloric acid, but now we cannot get the silver liquid settled. I am afraid our printer does not clean out the dishes every time the water is run off. Would that be sufficient to account for the difficulty? or may ready-sensitised paper be the cause? and could you kindly suggest a remedy?"—The silver in the washings from ready-sensitised papers does not precipitate so readily as it does for paper of one's own sensitising. Neither is there so much silver in them to precipitate. The best way to get the silver to subside is to precipitate it with hydrochloric acid. After the acid has been added, well stir up the residue, or otherwise agitate it. We do not think the want of cleanliness of the dishes has anything to do with the trouble.

\* \* Great pressure on our space obliges us to hold over our Paris Exposition Notes, several reviews of apparatus, &c., and other matter.

## EX CATHEDRÂ.

WE have this week received the annual report of the Photographic Club for the years 1898–99. It extends to over 140 pages, and covers the records of the Club from November 17, 1897, to November 1, 1899. One of the earliest papers printed in its pages is on the subject of the "Gum-bichromate Process," by Mr. James Packham. Other notable matters that have been treated of before the Club during the past two years are "Electricity and Optics," by Mr. A. W. Isenthal; the "Woodbury Process of Lantern-slide Making," by Mr. J. R. Williams; and "Photogravure," by Mr. A. Ernest Smith. The book is full of useful information on practical photography, and, as we turn over its pages, the echoes of many a pleasant meeting are borne in upon us. The Photographic Club, it may be remarked, was established in 1879, and thus it comes of age in the present year. So far as London is concerned, it ranks as one of the oldest photographic institutions. The attainment of its majority should give the Club the opportunity of celebrating in some fitting manner so interesting and rare an event in the history of photographic societies.

DURING the approaching autumn and winter, lantern slides of the Paris Exhibition will, no doubt, be in considerable demand for optical projection entertainments—that is if the disturbed state of the world's affairs does not, as was undoubtedly the case last winter, entirely dislocate this branch of photographic industry. The veteran photographer, Mr. Frederick York, was very busy with his camera at the Paris Exhibition early in the year, and we understand that his firm has ready for the market a set of lantern slides to the number of about seventy, illustrating the principal features of the great show. Accompanying the slides is a book of reading matter tersely describing introductory views at Dieppe and Rouen, and then plunging the hearer at once into the glories of the Exposition. Messrs. York's address is 87, Lancaster-road, Notting Hill, W., and the reading book we are noticing may be had at the cost of one shilling. Seventy slides with the lecture before us will make an entertainment of not excessive duration. A glance through the list of slides assures us that none of the principal external features of the Exhibition have been omitted, although the photographer, so far as interior views was concerned, was necessarily restricted in his scope of work.

\* \* \*

THIS month one of the American photographic societies makes an ambitious departure in respect of an exhibition. It appears that the Chicago Society of Amateur Photographers proposes to hold a Photographic Trades Exhibit in Chicago, August 27 to September 1 inclusive. The chief object of this Exhibit, we are told, is to call attention to the great improvements which have been made in photographic apparatus and materials, and to show what is latest and best in everything pertaining to it, including cameras, lenses, shutters, plates, papers, films, albums, chemicals, books, periodicals, sensitizers, developers, colour-photo apparatus, steopticons, view-finders, intensifiers, reducers, flash lamps, flash powders, pastes, mounts, colour screens, exposure meters, ruby lamps, lantern slides, tripods, trimmers, &c., as well as the best work of all photographers, professional and amateur, commercial and scientific. The date selected is that upon which the National Encampment of the Grand Army of the Republic will be held in Chicago. At this time a large number of strangers will be

in the city. In Chicago alone there are 60,000 amateur photographers. We quote these details from the *American Journal of Photography*. The Chicago Society has undertaken a plucky thing in running a photographic trades exhibition, and we hope success will result. Promoters of trade exhibitions in England run risks which it is to be trusted do not trouble the Chicago Amateur Society.

\* \* \*

AMONGST our recent visitors we have had the pleasure of including Mr. T. Baker, the managing director of Messrs. Baker & Rouse, Limited, photographic dealers and manufacturers, of Sydney, Melbourne, Adelaide, and Brisbane. After fifteen years' close attention to business, Mr. Baker is taking a holiday in the Old World for a few months, but is not neglecting the opportunity of adding to his photographic experiences. We wish our visitor a pleasant and useful holiday. We learnt from Mr. Baker many interesting details concerning the condition of Australasian photography. In professional circles keen price-cutting prevails. Amongst amateur photographers American-made hand cameras are popular. Climatic conditions render dry-plate making an extremely hazardous undertaking, the contents of a drying room being frequently attacked by fogging influences, due to external atmospheric variations impossible to guard against. Perhaps in Australasia photography has not yet reached its highest developments; at present it is necessarily a limited industry. But, with the new order of things that has recently been inaugurated, we may fairly hope that camera work will share in the general advancement.

\* \* \*

At a recent meeting of the Photographic Society of Philadelphia, we are told in the Society's *Journal*, an interesting series of slides and prints illustrating the methods employed in photographing the solar eclipse were shown. One worker's negatives were made with a twenty-one-inch lens, on Cramer Iso. backed plates, and through a bichromatic cell. The exposures were all the way from one-hundredth of a second at *f*-30 to one-quarter of a second at *f*-7.5. It was partly cloudy sometimes, but, so far as could be seen, the exposure made no difference whatever, except that one showed a perfect sample of reversal. In the course of some remarks Mr. Carbutt said that he had made special plates for several astronomers, including some one-sixteenth of an inch thick "B" emulsion, and others double and triple-coated and backed. He had developed some of the plates, and found that the "A" double-coated produced the best results. The best developer was metol hydroquinone or metol alone, very much diluted. One sentence in Mr. Carbutt's observations is of distinct interest, viz., that in which he refers to the production of sensitive gelatine films one-sixteenth of an inch thick. It is not often that one hears of such extremely thick gelatine bromide films.

\* \* \*

PHOTOGRAPHERS will be interested in the election a few days ago of Mr. Joseph Wilson Swan, F.R.S., to the Presidency of the Society of Chemical Industry for the ensuing year. His predecessor was Professor Charles F. Chandler, of New York, who at the recently held annual dinner of the Society referred to the fact that for the first time in the Society's history the Council had filled the presidential chair with a non-resident from over the sea, who lived at such a distance

that it had been impossible for him to take part in the administration of the Society's affairs. It may be noted that Professor Chandler's name appears on the title-page of our excellent contemporary, *Anthony's Bulletin*, as one of its editors.

## EXHIBITIONS AND EXHIBITORS.

EXHIBITIONS and all connected with them possess a fascinating interest to a substantial part of the body photographic. When there is nothing else to live for, the winning of the elusive medal forms many a camerist's sole *raison-d'être*. As being hung "on the line" at the Academy seems solace to the painter for years of weary, soul-absorbing toil, so an award at, or even a place on the walls at, the Royal is the gilded dream of his brother worker.

Many a line has been written, mostly by those who have not won them, against the giving of medals or awards of any kind. We are told how they inevitably lead to the production of work that is likely to satisfy the fashion of the hour and the whims of the Judges, rather than representative of its creator's best thought and ideal. Perhaps there is some modicum of truth in this. Take any particular exhibition, bear in mind the special points in which the Judges excel, or are known to take an interest, and it will be found that quite a remarkable number of pictures calculated to please them are shown. It is a well-known fact that many exhibitors take pains to ascertain the personality of the Judges before sending in their work, and it is difficult to think out any really forcible reason against such a course, so long as the standard chosen is a good one and mere imitativeness is avoided.

Still, no doubt there is a certain drag placed on freshness and originality by the way things are managed at present. Some thoughtful minds have been wondering whether it would not be much better if the identity of the Judges were concealed till the opening day. A few of these Daniels themselves are rumoured to be privately of the same opinion.

The flattery of imitation does not appeal so strongly to them as might be expected. No doubt, a feeling of weariness grows on them at seeing so many attempted parodies of their own cherished works. Perhaps this explains in some sort why it is so often the unexpected that has happened when the awards are published. The fresh and unhackneyed is bound to appeal to the Judges with greater force than the technically better, but less original, works that the public admire, and so it comes to pass that the latter criticise the awards and speak enviously of certain people's "luck."

Would the discontinuance of awards have a depressing effect on exhibitors, resulting in fewer pictures being shown? It is difficult to say. Possibly it might be deterrent to the more ambitious, and some whose sole object in exhibiting is the capture of medals. But what about the rank and file, who scarcely dream of winning them, but follow pictorial photography from simple love of it? There are no awards at the Royal Academy, yet it can hardly be said to lack pictures for the hanging. Of course, it is well known that the mere presence of one's work there is reward and honour sufficient, so that the comparison is scarcely fair.

The amount of heartburning and jealousy aroused over the distribution of awards at some photographic exhibitions is, unfortunately, only too familiar to those who have been behind the scenes. It is this, as much as anything, that has caused

many a lingering doubt as to whether the abolition of such distinctions would not be better for everybody's peace of mind. Certainly a clever and skilful worker will make his name without the aid of any of these meretricious trappings, and a photographic reputation is not won or lost by their possession or non-possession. Still, what is life without competition? It seems to be the universal law, ending in a sort of artistic "survival of the fittest." Many a name now revered in photographic circles would, perhaps, have remained in contented obscurity had it not been for some incentive to effort gained in friendly rivalry for the prize. *Qui non proficit deficit.* Where emulation fails to stir us to the showing forth of our best ability we fall behind, losing even what we have.

Who would have ventured to anticipate, say five-and-twenty years ago, the great popularising of photography that has taken place, the spreading of the network of societies from town to village, the passing acquaintance which even "the man in the street" now possesses with what was then so esoteric and difficult? Many good traits and qualities have their birthplace and nursery in these meetings together of brother workers, as, for instance, the benevolent and kindly interest that is always taken in the difficulties of the beginner, and the ungrudging way in which the more experienced place their knowledge at his disposal.

There is an amazing amount of recreation offered by these societies in the shape of excursions and trips, nominally for the purpose of photographic work amid the beauties of nature. It is a curious fact, however, that most workers confess they have never turned out anything remarkably brilliant as a direct result of these gregarious rambles; their best efforts, almost invariably, being the product of solitary journeyings. It might be deduced from this, perhaps, that photography is a pursuit favoured by loneliness, and not satisfactorily practised in a crowd. Sociability seems inimical to it, and yet, as a contradictory truth, we find its devotees the most sociable of men.

With the multiplication of societies has come, as a natural consequence, many an addition to the number of our shows and exhibitions, till it would now require an excellent memory to bear them all in mind. What an amount of human interest centers round each one of them! Consider the many troubles and failures that go to the making of a single successful picture: the dozens—nay, hundreds—of spoilt plates and quires of wasted paper, from which emerge, as butterfly from chrysalis, the finished beauties of an exhibition.

The work of judging the pictures is very tedious, calling sometimes for the exercise of considerable patience, especially when the classes are few and exhibits many. The judicial labours are, however, generally lightened by all that courtesy and tact on the part of the authorities concerned can accomplish. Still, mingled with their usual pleasant experiences, the Judges have often unwelcome reminders of the innate imperfection of humanity in the shape of unblushing canvassing by some of the competitors.

It is hoped that this is gradually dying out, and that the state of things which permitted an exhibitor to button-hole a Judge and lead him unresisting round the room, pointing out the while the merits and beauties of his (the exhibitor's) pictures, is becoming an impossibility. Certainly the exhibition atmosphere is cleaner and less open to reproach than, according to the reminiscences of some of us, it used to be.

Is anything gained by the great number of shows we now

have? Would not their purpose be better served, and their sphere of usefulness widened, if they were fewer and farther between? County exhibitions, for instance, to which a numerous group of societies would contribute, and which should be held in some large and central hall in the county town, would probably prove more attractive than the many smaller shows individually. London and other large cities might arrange for frequent imposing displays in such a building as the Crystal Palace, on the excellent lines of that organized some time ago by the Royal Photographic Society. This centralisation would tend, no doubt, to give to photographers a broader range of thought and greater *esprit de corps*. The latter quality is at present, alas! by no means so evident as it might and should be.

It is interesting and amusing to take up some of the old exhibition prospectuses, and notice how curiously different are the regulations and instructions, both in letter and in spirit, from our latter-day directions.

Those were the times when wide-margined mounts, of white or some light colour, were the order of the day, and Oxford and gilt frames were enjoined rather than prohibited; when highly burnished silver prints were the admired ideal, even on the walls of Pall Mall, and pictorial photography, as we now know it, was but a wailing infant.

The little circle of the Salon cannot fairly claim to have had much hand in this change for the better, which must be credited to the general raising of British art standards. The Salon, moreover, has certainly shown marked ability to profit by the many examples of technical perfection which the sister show has afforded. These two groups of diverse intentions and interests have played the part, as it were, of Ministry and Opposition.

And so the world progresses; the changing of the old order, the unperceived and stealthy advance of the new—here before we know it, and going as quickly. "Art is long"—long in pursuit, long in attainment—but all well-directed effort leaves some beneficial impress that defies even fleeting time.

---

**The Uranium Mystery.**—The scientific world has been greatly agitated by the announced discovery of sundry remarkable new elements possessing the power of emitting Becquerel radiations of immense power and for indefinite periods of time. M. and Mde. Curie, with also M. M. G. Belmont, have made most of the investigations referred to, and have undoubtedly been instrumental in preparing chemical substances possessing most marvellous powers of emitting radiations, capable of passing through metal sheets, and then affecting photographic dry plates. Still, they have not so far been able to separate a particular body and exhibit it as a sample of the new element, the polonium or the radium as the case may be. They have shown mixtures containing the assumed new element, and they have proved the existence of a new spectral line emitted by these mixtures. In an article by Béla v. Sengyel, recently translated by the *Chemical News*, from a communication from the chemical laboratory of the Buda-Pest University, the writer says that "it can scarcely be maintained that chemical elements exist which are in no way distinguishable from other well-known ones except in radio-activity." He set to work to discover whether these new elements really do exist or not. Naturally the photographic interest of substances capable of acting through opaque bodies of metal is equally great whether they be elementary or not, but at the same time real progress with them can only be made by setting all these questions at rest. It is not necessary for us to describe in detail the methods adopted by this investigator, and we will merely sum up his results by saying, that he came to the conclusion that

the claim for the position of elements could not be maintained on the grounds that they were actually able to transform ordinary salts of baryta into "a radio-active form which apparently possesses all the properties of the radio-active barium observed by different experimentalists. I have, so far, prepared three compounds, radio-active barium, sulphate, and from this the chloride and carbonate." It will be interesting to await developments.

**Neglected Genius.**—We have all read how the Chinese discovered gunpowder, the Ancient Egyptians the hand magnifier, that Columbus did not discover America, and so on, and, according to the *English Mechanic*, there are reports of another native genius languishing in obscurity, and who has only just been discovered by the Paris Automobile Club. The claim made for him is very comprehensive but rather vague. Besides, having patented and actually worked, in 1860, the first Automobile, he is credited with being the author of many other inventions, including the enamelling process in general use for tinning various utensils, an electric brake, and various chemical applications in galvanising metals, and in photography, all of which have been taken up by the trade, perfected and turned to valuable account. He is stated to have made neither money nor reputation out of his inventions, and as the worthy inventor, Etienne Lenoir by name, is now ninety-eight years of age, it is to be hoped that, if some definite claim for his services in connexion with photography is put forward and proved, photographers also may follow suit with the Automobile Club, who intend that "recognition, though tardy, shall be paid to the aged inventor's talents."

**Acetylene Purification.**—The great importance attached to the use of acetylene is attested to by the large number of investigations upon the best methods of purifying it that have been published in the technological journals. There is one singular point about these articles: no sooner does one process get published than it is at once written down by the upholders of another. We have already given details of the most important as they have appeared in print, the most prominent, perhaps, having been the Ullmann chromic acid process. It may be said that there is plenty of room for improvement, as there are few installations of the gas where its presence is not unmistakably felt by the olfactory organs. The chromic acid process acts by destroying, by oxidation, the offensive gases, and not, as in Franks' process, precipitating them, or rendering them non-volatile. Dr. Wachs has made laboratory experiments, and finds Ullmann's method perfect; he publishes the before and after condition of the gas, accompanied by particulars of the rate of flow and the lighting power after treatment. Dr. Lundstrom reviews a number of these processes, and gives details of what there is in the gas that has to be got rid of. For practical purposes of every-day life, it is evident that interest almost entirely centers upon getting rid of the evil-smelling components, though it is evident that the presence of impurities that might lead to the production of explosive compounds must not be lost sight of. He states that, in a general way, there is about 0.5 per cent. of other gases present in acetylene as ordinarily made, the most objectionable being sulphuretted, phosphoretted, and arseniuretted hydrogen. The users of small generators may take comfort from Dr. Lundstrom's statement that "in actual practice nearly all the impurities are absorbed by lime water, and a simple washing with water will even suffice, unless the gas contains a large quantity of phosphoretted hydrogen, in which case a more complete purification will be necessary."

## ON THE CONSTRUCTION OF PHOTOGRAPHIC OBJECTIVES.

[Reprinted from the *Journal of the Royal Photographic Society.*]

THE first person who attacked the problem of the construction of photographic lenses on scientific principles was Professor Petzval of Vienna University, 1840, who will always be remembered in connexion with the portrait lens which bears his name. My object this evening will be to endeavour to give you some idea of the nature of

the theory as developed by him, and also to show how it may be applied to the construction and simplification of photographic objectives.

In the first place, it is necessary to dismiss from our minds the view that a photographic objective or, in fact, any optical system is composed of lenses. The real fundamental units of any optical system are spherical surfaces separating homogeneous refracting media, and an ordinary single lens is simply a piece of glass bounded by two of these surfaces. Further, we always suppose that an optical system is centered, *i.e.*, the centres of the spherical surfaces of which it is composed are all ranged along a straight line called the axis of the system.

Since, again, all objects are seen or photographed by means of the pencils of light rays emitted from each point of them, our first business must be to investigate the nature of the action that takes place when one of those pencils of light is refracted at a spherical refracting surface.

Petzval shows that this action can be conveniently separated into five parts which we call as follows:—(1) Spherical aberration; (2) Coma; (3) Astigmatism; (4) Curvature of field; (5) Distortion. And the essence of Petzval's theory is that, for an optical system composed of any number of surfaces, the total effect is simply

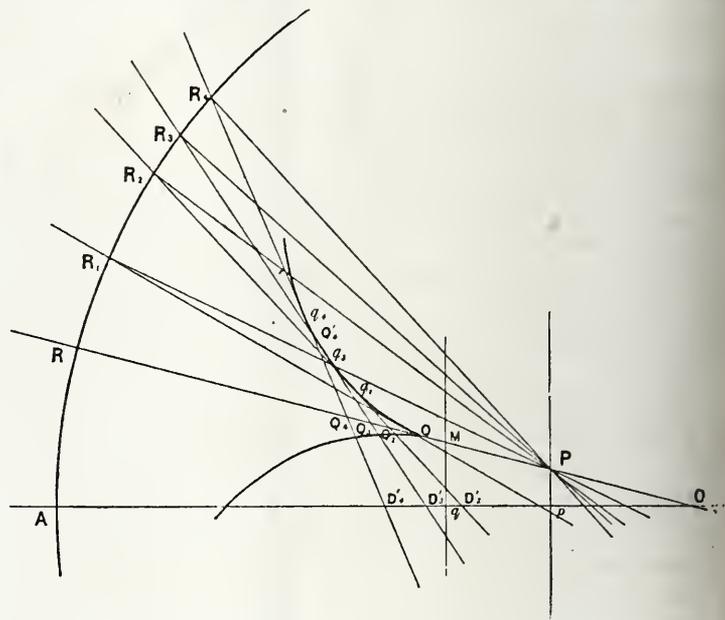

FIG. 1.

additive, *i.e.*, the total spherical aberration is the sum of spherical aberrations due to each surface, and so for the coma, astigmatism, curvature, and distortion.

Considering now a single surface centre O (fig. 1). Let AO be the axis of the system cutting the surface at A, which we call the vertex of the surface. Let P be any point on the image emitting rays of light in all directions. Let OPR be the particular ray which passes through the centre of the surface. This ray, we know, after refraction passes on unchanged in direction, all other rays are refracted or bent from their original direction when they meet the refracting surface.

Consider, first, rays lying in the plane AOP, which we call the primary plane. After refraction these rays will still remain in the primary plane, but these rays after refraction will no longer pass through a point, but will touch a caustic curve  $Q_2 Q_3 Q_4$ , the marginal rays of the pencil such as  $PR_4$  coming to a shorter (or longer, as the case may be), focus  $Q_4 R_4$ , than the central rays of the pencil  $PR_1$ . This well-known effect is described as spherical aberration, and, as a measure of the spherical aberration, we take the rate at which the focus  $Q_4$  recedes from the geometrical focus Q as the angle  $RPR_4$  increases.

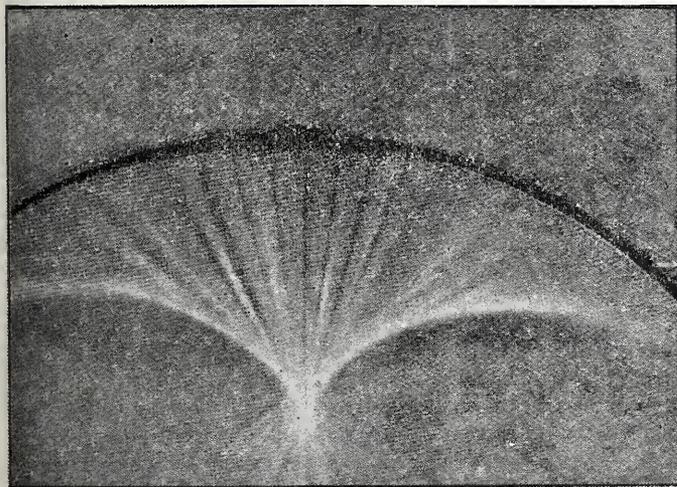

We next come to the consideration of what we call "coma." In the previous figure we supposed that rays of light were proceeding in all directions from the point P, but in practice the rays of pencils

which go to make up the image must be limited by a stop of some sort which is a small round aperture, the centre of which is on the axis of the system. Now, in this figure, the spherical aberration is symmetrical about the line OP passing through the centre of the surface. If, then, we limit the incident pencil by means of a stop whose centre is at O, the spherical aberration after refraction will be the regular pattern symmetrical about the central ray of the pencil. If, however, we limit the pencil by means of a stop at  $D_3$  away from the centre of the surface, the emergent pencil will consist of the bundle of rays between  $q_2R_2$  and  $q_4R_4$  which touch the caustic away from the vertex, and, moreover, the spherical aberration is not symmetrical about the central ray  $R_3q_3$ . This unsymmetrical spherical aberration of an obliquely incident ray is called coma, and the amount of coma evidently depends on the obliquity of angle of incidence of the axis of the pencil of incident rays (the angle  $R_3PR_4$ ). In fact, Petzval shows that a measure of the coma is the quantity

$$L\xi,$$

where L is the measure of the spherical aberration for a centrally incident pencil and  $\xi$  is a quantity depending on the distance of the centre of the stop  $D_3$  from O.

Again, considering the small pencil whose axis is  $D_3PR_3$  the primary focus of this pencil after refraction is the point  $q_3$  where the axis of pencil after refraction touches the caustic of refraction, and the secondary focus is the point  $Q_3$ , where the axis of pencil after

Photograph of a Caustic of Reflection.

refraction cuts the line joining P to the centre of the surface. The small pencil of rays after refraction has therefore acquired some astigmatism, the amount of which depends on the distance  $D_3O$ , and in fact Petzval shows that the measure of the astigmatism is  $L\xi^2L$  and  $\xi$  being the same two quantities that we have already investigated.

We may examine the nature of the pencil after refraction further by examining the properties of the caustic of refraction. The half-tone shows a photograph of a caustic of reflection obtained by laying a bright brass ring on a photographic plate in a dark room and exposing to a small distant illuminant. Fig. 2.  $PQ_3Q_4$  is the axis of pencil passing through the centre of refracting surface. Let  $Q_3Q_3Q_4$  be axis of pencil obliquely incident touching the caustic at  $q_3$ . If this make an angle  $\theta$  with  $PQ$ , then we know that  $QQ_3 \propto \theta$ . Say  $QQ_3 = \frac{1}{2}L\theta^2$ . Let  $Q_4Q_4$  be a ray of this second pencil, making an angle  $\phi$  with  $Q_3Q_4$ .

$$\text{Then } QQ_4 = \frac{1}{2}L(\theta + \phi)^2$$

$$\therefore Q_3Q_4 = \frac{1}{2}L\phi(2\theta + \phi)$$

$$\therefore Q_3Q_4 = Q_3Q_4 \frac{\theta}{\phi} = \frac{1}{2}L\theta(2\theta + \phi).$$

Putting  $\phi = 0$  it follows that  $Q_3q_3 = L\theta^2$ .

$$\text{Hence } q_3Q_4 = \frac{2}{3}L\theta\phi.$$

Hence it appears that the aberration of the obliquely incident pencil ( $q_3Q_4$ ) consists of two parts:—

1.  $\frac{1}{2}L\phi^2$  ordinary spherical aberration as in central pencil.
2. A term  $\frac{2}{3}L\theta\phi$  which represents the coma, and the measure of coma is the quantity  $\frac{1}{2}L\theta$ .

Returning now to our original figure, let  $Mq$  be the conjugate plane to  $Pp$  after refraction at the surface—in other words,  $q$  is the geometric conjugate of  $p$ , and  $PpMq$  are planes parallel to axis of optical system.

If we limit the pencil forming an image to a small pencil with OP as axis, the image of P will be formed at Q, which in general will not lie on the conjugate plane of  $Pp$ , hence in general the image will be curved, and the curvature of the image is measured by the abscissa  $2QM$  (the curvature in fact is  $\frac{2QM}{Mq^2}$ ). There is in this case

no astigmatism in the refracted pencil. We call this curvature—U.

If, however, we limit the pencil forming the image to a small pencil having  $DPR_3$  as its axis, the axis of pencil after refraction is  $D^1Q_3R_3$ , and this refracted pencil is astigmatic, the primary focal line being  $q_3$  where  $DQ_3$  touches the caustic and the secondary focal line at  $Q_3$ .

Hence the curvature of image formed by secondary foci is measured by  $2MQ_3 = -U - L\theta^2$ , and primary curvature is  $2MQ_3 = -U - 3L\theta^2$ .

Also the axis of the refracted pencil cuts the conjugate plane at

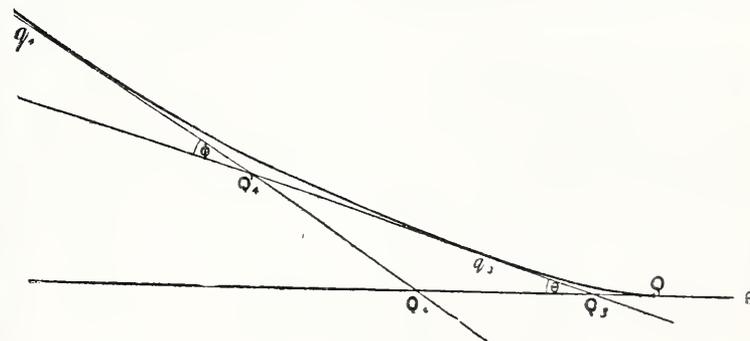

FIG. 2.

N instead of M, hence the image in this case also suffers from distortion, which is measured by  $MN = MQ_3\theta = \frac{1}{2}\theta(U + L\theta^2)$ .

Hence we see that, in the case of oblique refraction at a single spherical surface, the pencil after refraction has

	spherical aberration measured by L.
	coma " " $L\theta$ .
and the image has primary curvature	$-U - 3L\theta^2$ .
" " secondary " "	$-U - L\theta^2$ .
" " distortion " "	$\frac{1}{2}(U + L\theta^2)\theta$ .

Since the primary curvature is  $U + 3L\theta^2$  and secondary "  $U + L\theta^2$

we may take it that U is a measure of the curvature and  $L\theta^2$  of the astigmatism. With respect to the quality U we may remark that, if the object lies in a sphere centre O, the image must also lie in a sphere centre O, and hence in this case  $\frac{1}{OP}, \frac{1}{OQ}$  will be the curvatures of object and image respectively. But by the law of geometrical foci

$$\frac{1}{\mu'OQ} - \frac{1}{\mu OP} = \left(\frac{1}{\mu'} - \frac{1}{\mu}\right) \frac{1}{r}$$

Hence in this case,

$$\frac{\text{curvature of image}}{\mu'} - \frac{\text{curvature of object}}{\mu} = - \frac{\mu' - \mu}{\mu'\mu} \rho.$$

This relation will always hold between the curvature of image and object for pencils through O. Hence, if object be flat—

$$\frac{\text{curvature of image}}{\mu} = - \frac{\mu - \mu}{\mu\mu} \rho = -U \text{ aforesaid.}$$

We have thus seen how these five aberrations arise in the refraction of a pencil at a single spherical surface. Now, as Petzval shows if a pencil of rays from a point on the object be refracted by an optical system consisting of any number of such surfaces, the—

1. Spherical aberration of the emergent pencil is measured by

$$\Sigma L_n$$

2. Coma of emergent pencil is measured by

$$\Sigma L_n \xi_n$$

3. Primary curvature of image is

$$-\Sigma U_n - 3\Sigma L_n \xi_n^2$$

4. Secondary curvature of image is

$$-\Sigma U_n - \Sigma L_n \xi_n^2$$

5. Distortion of image is

$$\Sigma U_n \xi_n + \Sigma L_n \xi_n^3$$

Where  $L_n$  is the spherical aberration of the  $n^{\text{th}}$  surface,  $\xi_n$  is a measure of the obliquity of incidence on that surface of the axis of the pencil and  $U_n = \frac{\mu_n - \mu_{n-1}}{\mu_n \mu_{n-1}} \rho_n$ ,  $\rho_n$  being the curvature of the  $n^{\text{th}}$  surface. Hence, if the emergent pencil is to be perfectly free from spherical aberration, coma, and astigmatism, and if the image is to be plane and non-distorted, we must satisfy the five conditions:

1.  $\Sigma L_n = 0$  (Spherical aberration).
2.  $\Sigma L_n \xi_n = 0$  (Coma).
3.  $\Sigma L_n \xi_n^2 = 0$  (Astigmatism).
4.  $\Sigma U_n = 0$  (Curvature).
5.  $\Sigma \xi_n (U_n + L_n \xi_n^2) = 0$  (Distortion).

The quantity  $\xi_n$ , as we have said, measures the obliquity of inci-

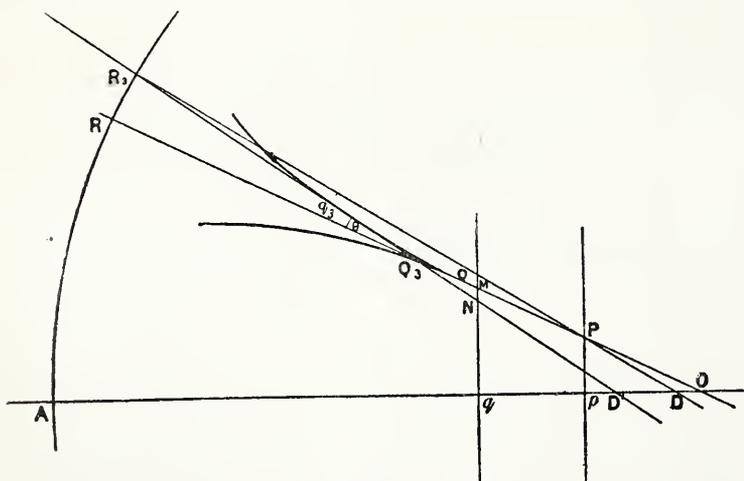

FIG. 3.

dence on the  $n^{\text{th}}$  surface of the axis of the pencil forming the image; in other words, the form of the above equations will depend on the position of the stop which we take to limit the incident pencils. But we shall find on taking the general case that, if we satisfy the equations for any assumed position of a stop, they will also be identically satisfied for any other assumed position. Hence we may evaluate the quantities  $\xi_n$  for any arbitrary position of a stop we please, and it is usual to take this arbitrary position to be at the vertex of the first surface.

The exact values of  $L_n \xi_n$  and  $U_n$  may be put into various forms. One of the simplest is as follows:—

Let the refractive indices of the various media be successively  $\mu_0, \mu_1, \dots, \mu_n$ .

the curvature of the  $n^{\text{th}}$  surface  $\rho_n$ ,

the vertical thickness of the  $n^{\text{th}}$  medium  $\mu_n \tau_n$ ,

and putting  $\kappa_n = (\mu_n - \mu_{n-1}) \rho_n$ ,

let the successive convergents, formed in the usual way of continued fraction,

$$\frac{1}{\kappa_1 + \frac{1}{\tau_1 + \dots + \frac{1}{\tau_{n-1} + \frac{1}{\kappa_n}}}}$$

be successively

$$\frac{a_1}{b_1} \frac{a_2}{\beta_2} \frac{a_3}{b_3} - \frac{a_n}{\beta_n} \frac{a_n}{b_n}$$

and let the distance from the object of the first surface be  $\frac{1}{u_1}$

$$\text{Then } L_n = (a_n \mu_0 u_1 + \beta_n) (A_n \mu_0 u_1 + B_n)^2 A_n \mu_0 u_1 + B_n^3$$

$$\xi_n = \frac{A_n}{(A_n \mu_0 u_1 + B_n)} \quad \text{where } A_n = \frac{\frac{a_n}{1} - \frac{a_{n-1}}{1}}{\frac{\mu_n}{1} - \frac{\mu_{n-1}}{1}}$$

$$U_n = \frac{\kappa_n}{\mu_n \mu_{n-1}} \quad A_n^{-1} = \frac{a_n}{\mu_n^2} - \frac{a_{n-1}}{\mu_{n-1}^2}, \text{ and so for } B_n B_n^{-1}.$$

The value of  $\xi_n$  can also be put into a form which shows the nature of this quantity most plainly, thus:—If a ray normally incident on the  $n^{\text{th}}$  surface be traced backwards through the optical system, when it finally emerges it will cut the axis of the system at a distance  $\frac{\xi_n}{u_1 \xi_n - 1}$  in front of the vertex of the first surface. If the object be distant (as is usually the case) this distance is  $-\xi_n$ , and hence under these circumstances  $+\xi_n$  is the apparent distance of the centre of the  $n^{\text{th}}$  surface behind the vertex of the first surface.

The five Petzval equations involve some interesting points. The two conditions for spherical aberration and coma are

$$\Sigma L_n = 0 \text{ and } \Sigma L_n \xi_n = 0.$$

This is the same as the condition for the equilibrium of a system of parallel forces,  $L_1 - L_n$ , acting at the  $\xi_1 - \xi_n$ , which, as we have said, the apparent positions of the centres of the several refracting surfaces.

Now, a system of two parallel forces cannot be in equilibrium unless (1) the two forces act at the same point, or (2) each force is zero.

Consequently it follows that an optical system composed of two refracting surfaces, *i.e.*, a single lens either thick or thin, cannot be free from spherical aberration and coma unless

1. The two surfaces are concentric.
2. There is no spherical aberration at either surface.

In neither of these ways is it possible to construct a lens having a positive real focal length.

Hence the first two Petzval conditions cannot be satisfied by any optical system having less than three refracting surfaces.

Next consider a system of three parallel forces in equilibrium. In this case we know that the two exterior forces must act in the same direction, and the third opposite force must divide the distance between them in the inverse proportion of the two first forces.

Hence in an optical system of three surfaces (*i.e.*, two lenses cemented together) the apparent centres of the two surfaces giving spherical aberration of the same sign, must lie on either side of the apparent centre of the surface giving the opposite spherical aberration, and the latter centre must divide the distance between the first two centres inversely in the proportion of the first two spherical aberrations.

The object-glass of a telescope is an example of such an optical system. This is almost invariably composed of a nearly equi-convex crown lens cemented to a nearly plano-concave flint lens as in fig. 4.

Here the apparent centre of the first surface is O, the actual centre, since there is no previous refraction to take into account. On account of the refraction at the first surface the apparent centre of the second surface  $O_2$  is rather nearer to the lens than the actual position, and, since the third surface is nearly plane, the apparent position of its centre is at  $O_3$  the focal length of the lens in front of the lens.

In such a lens the first and third surfaces both give positive spherical aberration, as we have indicated is necessary, and then, if coma has been successfully eliminated, the centre  $O_2$  must divide the distance  $O_1 O_3$  in the ratio of  $L_3 : L_1$ .

It will be noticed that this argument is entirely independent of the thickness of the component lenses.

We can now show that such a system cannot possibly be free from astigmatism; for, if we put a small stop at  $O_2$ , the astigmatism of the emergent pencil is

$$L_3 O_2 O_3^2 + L_1 O_2 O_1^2$$

and, since  $L_1 L_3$  necessarily have the same sign, this cannot be made to vanish.

In fact in this case the astigmatism is the same wherever the small stop be placed, e.g., let the stop be placed at a distance  $x (= O_3K)$  in front of  $O_3$ .

Since  $O_2O_3 : O_2O_1$  as  $L_1 : L_3$  we may put  $O_2O_3 = \lambda L_1$ .  $O_2O_1 = \lambda L_3$  Also  $L_2 = - (L_1 + L_3)$  where  $\lambda$  is some constant.

Then the astigmatism of pencil through K after refraction is

$$\begin{aligned} & L_3O_3K^2 - (L_1 + L_2) O_2K^2 + L_1O_1K^2 \\ &= L_3x^2 - (L_1 + L_3) (x + \lambda L_1)^2 + L_1[x + \lambda(L_1 + L_3)]^2 \\ &= \lambda^2 L_1 L_3 (L_1 + L_3) \text{ and is therefore independent of } x. \end{aligned}$$

To be quite accurate, this astigmatism can only vanish if one of the three quantities  $L_1, L_2, L_3$  vanishes and the apparent centres of the other two coincide, and the spherical aberrations of the two latter surfaces are equal and opposite. Such an optical system, however, cannot possibly give a real focus.

We, therefore, conclude that to satisfy the first three Petzval conditions at least four refracting surfaces are necessary. This is a point of some interest. An optical system of four surfaces provides

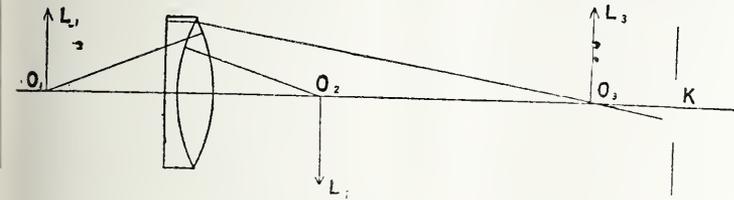

FIG. 4.

us with seven variables, viz., three thicknesses and four curvatures, and yet three of the necessary conditions cannot be satisfied with fewer variables.

In an optical system containing four refracting surfaces free from spherical aberration, coma and astigmatism

$$\begin{aligned} L_1 + L_2 + L_3 + L_4 &= 0 \\ L_1\xi_1 + L_2\xi_2 + L_3\xi_3 + L_4\xi_4 &= 0 \\ L_1\xi_1^2 + L_2\xi_2^2 + L_3\xi_3^2 + L_4\xi_4^2 &= 0 \\ L_1\xi_1^3 + L_2\xi_2^3 + L_3\xi_3^3 + L_4\xi_4^3 &= 0 \end{aligned}$$

Hence

$$\begin{aligned} &= L_1(\xi_1 - \xi_2) (\xi_1 - \xi_3) (\xi_1 - \xi_4) \\ &= L_2(\xi_2 - \xi_1) (\xi_2 - \xi_3) (\xi_2 - \xi_4) \\ &= L_3(\xi_3 - \xi_1) (\xi_3 - \xi_2) (\xi_3 - \xi_4) \\ &= L_4(\xi_4 - \xi_1) (\xi_4 - \xi_2) (\xi_4 - \xi_3) \end{aligned}$$

Hence if  $O_1O_2O_3O_4$  be the apparent positions of the centres of the surfaces in the order in which they occur and  $O_1O_2 = x$   $O_2O_3 = y$   $O_3O_4 = z$  we have

$$\frac{L_1}{yz(y+z)} = \frac{-L_2}{(x+y+z)(x+y)z} = \frac{L_3}{(x+y+z)(y+z)x} = \frac{-L_4}{xy(x+y)}$$

Hence we see that the spherical aberrations of the surfaces corresponding to  $O_1O_2O_3O_4$  must be alternatively positive and negative, and in the ratios given by this equation. In other words, each spherical aberration is proportional to the product of distances between the three other apparent centres.

Considering next the distortion of such a system. This is—

$$\begin{aligned} & L_1\xi_1^3 + L_2\xi_2^3 + L_3\xi_3^3 + L_4\xi_4^3 \\ & + U_1\xi_1 + U_2\xi_2 + U_3\xi_3 + U_4\xi_4 \end{aligned}$$

Since the distortion consists of these two series  $\Sigma L\xi^3$  and  $\Sigma U\xi$ , it follows that the distortion can, theoretically, be eliminated. Thus all the five Petzval conditions can theoretically be satisfied by a system composed of four refracting surfaces.

We can now consider some practical aspects of the question: How far photographic lenses can be improved upon in the future? The chief directions in which it would seem that progress is possible are increased simplicity of construction and greater usefulness.

With regard to simplicity of construction, it would appear that we are still far from the theoretical limits, since it appears that it is possible to construct a perfect lens having only four refracting surfaces, e.g., a system composed of only two thick lenses, while it is quite possible that this limit will never be reached unless in the future glass-makers succeed in producing glasses of altogether abnormal qualities; still, even systems with five refracting surfaces

(e.g., a cemented lens and a single lens) would be a considerable improvement on anything at present produced; and there is no doubt that, if it can be done, it will be done sooner or later.

With respect to the question of increased usefulness, the subject of combination lenses naturally occurs. As we have already shown, if each of the single combinations of a double lens is to be corrected for spherical aberration, coma, and astigmatism, each combination cannot have less than four refracting surfaces, e.g., either three lenses cemented together, or two lenses separated by an air space.

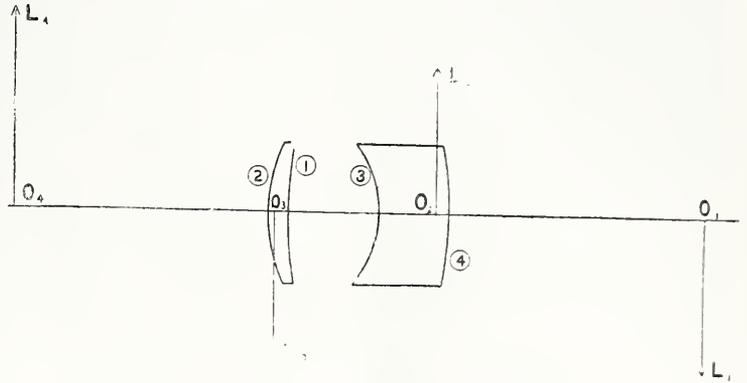

FIG. 5.

Thus the minimum number of refracting surfaces in such a doublet lens is eight, and consequently it cannot possibly be made very simple in construction.

In the only doublet lens of this nature at present manufactured—the Zeiss-Satz Anastigmat—there are altogether five refracting surfaces in each lens, so that it appears that an improvement in the direction of simplicity is still possible in the case of such lenses. In fact, there seems to be no reason why lenses like the Goerz and the Voigtländer Collinear should not be perfected for each single lens, which is not the case as they are at present manufactured.

H. L. ALDIS, B.A. (Cantab.)

AMERICAN PHOTOGRAPHY.

[Reprinted from Wilson's Photographic Magazine for July.]

SOMETIMES patience ceases to be a virtue, and must give place to the whip of plain speaking. It has become the fashion of late, more particularly with a noisy section of the English photographic press and a few ambitious youngsters on this side of the Atlantic, to decry all American photography, save that produced by a certain "school," as something almost beneath contempt. In season and out of season we are confronted with windy critiques, from which we learn that, with the exception mentioned, photography in America is in a truly deplorable condition. According to these amusingly ponderous utterances, which abound with verdant freshness and advice of a very lofty kind, our amateur photography is childish and crude in the extreme; our professional portraiture hopelessly bad and beyond redemption; our photographic journals are blind leaders of the blind, given to "hifalutin," and generally despicable. Difficult, indeed, would it be to say in what the fashionable critic of to-day differs from the Pharisee of old!

At first the output of these self-anointed critics was regarded as adding to the gaiety of nations as so much "light reading," to be smiled over rather than seriously considered. The superior "tone" and mystic subtleties of Hartmann's papers, for instance, tickled the sense of humour in the American reader. The long drawn condescension and soulful earnestness of Hinton's contributions, as another instance, provoked that delightful bewilderment which the American enjoys when puzzling out a genuine British joke as we find it in *Punch*. The sugar-coated pills of pure art, given out quarterly in a certain club organ, so "doped" the subscribers thereof that back numbers of the papers sold at a premium, and the price was doubled that the pills might be made stronger. The reverberations of Keiley's "pom-pom" brought forth a salon even out of Chicago, made *The Photo-American* sbriek in sarcastic comedy, and awoke the gentle Cummings from his peaceful slumbers under the shadow of Plymouth Rock. All of which is duly attested in various precious documents, organs, and what-not published here and abroad. But the fashion has been overdone, and latterly its narrowness

of view, its self-assurance, and fatal lack of common sense have given it a nauseous flavour, and it deserves condemnation as a public nuisance. On another page, therefore, we give place to a well-informed contributor who takes a few of the "godlings" to task for their bumptiousness. His treatment of them, although severe, is well merited by the absurdities they have perpetrated in the fair name of criticism.

As for American photography, it needs neither apology nor justification at our hands. It is appreciated at home by a public quite intelligent as that to which the European photographer appeals. Whenever exhibited abroad, as at London, Paris, Berlin, Vienna, &c., it has secured more than a proportionate share of praise and reward. In common with the photography of England and other countries, it has its weak points as well as its points of excellence. But, if we compare it at its best, or by its average, with the best of average foreign work, the fact is plainly evident that the American photographer, amateur or professional, has no cause to be ashamed. And this may be said, with equal truth, of his achievements in the past as well as of his promise for to-morrow.

[The relevant portions of the exceedingly able article to which our contemporary refers are appended. We congratulate the author, Mr. Ward, on his temperate treatment of some regrettable phases of American and British photography. With regard to his analysis of the second half of his subject, he may be assured that his remarks will find widespread if not universal acceptance in this country.—Eds. B.J.P.]

#### THE CULT OF THE GODLINGS.

MANY interesting discussions have recently taken place concerning the relative merits of what are spoken of as the "old" and the "new" schools of photography. The question has almost, for the moment, overshadowed that somewhat threadbare one, "the professional *versus* the amateur." It may, in turn, yield precedence, for a little while, to the Cult of the Godlings. It certainly will not fail to do so through any neglect of effort on the part of the godlings themselves.

Within the past few years several persons possessed of artistic temperament, and with the technical training of artists, have chosen photography as a means of expression. They have not, usually, depended upon the camera for a livelihood; and they have not graduated through the studio of the professional photographer. Freedom from the conventions of orthodoxy, and from the whims and wishes of "the sitter," has enabled these workers to develop along new lines. The result has been the moulding of a number of useful individualities; and the accession of a number of these workers—including several women—to the professional ranks may exercise a broadening influence on the craft as a whole.

Within the past few years, too, the amateur has increased in the land, and among the many there are many good workers. They wisely keep aloof from portraiture as commonly understood, and work along lines of their own. There are many who do good work, a few who do very good work, and the fact has not been overlooked by the American in general, in whom a generous appreciation is a characteristic trait. Perhaps it is this appreciation, given with a simple wish to please, which has led to the formation of a select "inner circle," a circle which claims, in effect, that it contains within itself all that is commendable in American photography.

As with all cults, these godlings have their advertisers, and these are, curiously enough, led by an Englishman. The godlings who are most closely associated with the publicity department of their cult, and of themselves—mostly of themselves—are, in England, A. Horsley Hinton, and, in America, Joseph T. Keiley, and a person named Hartmann.

There is in New York a body of men styling themselves the Camera Club, and within this body the godlings reign. In a measure, aloof alike from their brethren and the outlander, the godlings have undertaken the regeneration of the country and the exploiting of themselves.

Neither the country nor their fellow club-members are exactly clamorous for regeneration, but this does not check the good work. To assure themselves of a constituency, the godlings have annexed several of the strong workers referred to as having recently entered the ranks of photography. These workers have not been consulted as to their adoption; it is a case of "benevolent assimilation."

The person Hartmann teaches through a series of dissections of the work of the adopted ones, with portrait of the author. To judge from his writings, he has no acquaintance with the practical side of photography, as he certainly has none with either its breadth or its history. He is said to be a very able "art critic," and true it is that at first glance his writings would, if it were possible, deceive the very unselect. With a wide range of adjectives and much disregard to punctuation (points in which he hopelessly outdistances even so careless a journalist as myself), he

fashions sentences which the reader is apt to accept on sight. A more careful reading reveals that his mission is dissection, sometimes critical, sometimes cold-blooded, and that, when he does not dissect, he is commonplace.

I may here point out that the godlings suffer from an inability to discriminate between the temperament of the artist and the eccentricity of the crank. They have, too, an erroneous conception of the requirements of the critic.

The critic must be a man of wide sympathies and wider knowledge; not the narrow mouthpiece of a cult.

It may be urged that I am speaking almost too strongly for journalistic courtesy, but those who have read the somewhat arrogant writings of the cult will recognise that I am but following them a little distance on their road. Hartmann is scarcely worth more serious consideration, and we will turn to Messrs. Horsley Hinton and Joseph T. Keiley. Horsley Hinton is a maker of good pictorial photographs; so good is his work that it is difficult to associate Hinton the photographer with Hinton the godling writer. He has, at times, shown himself to be a worthy successor to H. P. Robinson at his best, which is high praise for a photographer. Keiley has a graceful and facile pen, and, with matured powers and a broader grasp of his subject, he might in part fill the place left vacant by Gleeson White. It is always a delicate task (for any one but a self-constituted critic) to judge work which the author announces as intended for "the few." Keiley might be termed an interesting and clever experimenter, and his work at times suggests a transition stage which should be cultivated in retirement. Hinton and Keiley might together make a team. If the former would abandon his pen for all time, and the latter go slowly with pen and camera until assured of his pictorial standing, the photographic world might be helped.

There is a period in the life of every well-regulated boy when he first experiences the delight of long trousers and anticipations of a moustache. At such a stage of existence sisters are an unfortunate possession, and the old schoolhouse is suddenly discovered to be the resort of undersized and altogether depreciable juveniles. This attitude of youthful superiority is the one taken by the godlings.

A correct estimate of Keiley's writings may be obtained from the pages of *Camera Notes*, and from his contribution, "The American School," to *Photograms of the Year 1899*. In this latter effort we learn the position of the elect.

Since the beginning there have been good workers—respectable practitioners they might be termed—in the ranks of photography. One by one, school by school, they have budded, and blossomed, and faded. Their influence has been *nil*, and their names are forgotten, because they lacked utterance. The result has been stagnation of all things until the godlings arose, and with a great shout sent a thrill of life throughout the land.

Their principal means of publicity is *Camera Notes*, a sumptuous and expensively illustrated quarterly magazine, described by Keiley as "the most unique photographic magazine in the world." Among the many modest achievements of this "most unique" quarterly, it "has raised the standard of photographic excellence in both amateur and professional circles far above any previously established; has educated the public taste to an understanding of what really good work is, and has created an art movement in the photographic world that gives every indication of maturing into a distinctly American school." The magazine "is so much in demand, that almost immediately it appears the copies sell at a most extraordinary premium, and the most advanced of the leaders of the new movement have come to be termed disciples of *Camera Notes*."

These quotations are from the pen of Mr. Keiley, and he announces further an issue of some of the illustrations of *Camera Notes* in separate form: "A portfolio containing eighteen exquisite photogravure reproductions of the masterpieces of some of America's foremost workers. This portfolio is the most perfect thing of its kind ever published."

Of course, all this glorious achievement has not been without cost.

"There is opposition, bitter, aggressive opposition. . . . But slowly, irresistibly, almost imperceptibly, the forces of ignorance, provincialism, and prejudice have been crushed to the dust, and no longer bar the advance of progress."

An examination of the pages of *Camera Notes* shows it to be under the editorial control of Alfred Stieglitz, with Joseph T. Keiley as assistant-in-chief. The inference, therefore, is that the "most advanced workers of the new school" are disciples of Stieglitz and Keiley. This inference is confirmed by the fact that *Camera Notes* is largely used for the personal glorification of these two gentlemen. This glorification is carried to absurd lengths, for, when either of these writers enters into eulogy of

the cult, a note signed by "The Editors" is appended, pointing out that only the modesty of the writer has excluded his own name from share in the adulation. Thus does modesty meet its reward in receiving the greater glory. I did not include Mr. Stieglitz among the godlings. He is saved this distinction by the undoubted excellence of his photographic work. Every one who knows his versatility, his strength, and his sound technique, regrets that so able a worker should have fallen under godling influences; and this regret is greater with those personally acquainted with his real courteous modesty, so much at variance with the phase which he permits to be revealed in print.

Not content with leading the American photographer from darkness to light, the godlings have further endowed him with a new method of faking which will revolutionise all things. This new power, which is commonly spoken of as "the glycerine method," marks an epoch in photography greater than its first discovery, and infinitely greater than the entry of such innovations as the dry plate or platinum paper. The glycerine method is, in its outline, simplicity itself, and of a robust age. A platinotype is printed, and before development it is coated with glycerine. The developer is applied locally, usually by means of a brush, and this method allows of much local control, amounting to entire blocking out if required. The process may be carried a step further, and different parts of the same print developed with different developers. This gives possibilities of various tones, and is used mostly to impart a "flesh tint" in places, a thing that was not possible hitherto except by use of paint (and a wash of water colour on a photograph is altogether illegitimate and not to be mentioned in godling circles).

Perhaps the godlings are wise in endeavouring to lastingly link their names with the perpetual fame of the glycerine method. Cannot they read the lessons of the past? Who first applied the practice of vignetting to photography? No one surely knows, and yet some one was the first to see, with the sure eye of genius, that simple method by which countless thousands of photographs have been rendered "artistic." In future years, when comparative merits can be more accurately gauged, the beginnings of photography may be traced to the closing years of the nineteenth century, and statues raised to those who so thoughtfully placed themselves on record as the true and only godlings.

A. Horsley Hinton has several times contributed godling utterances to American journalism, and he has recently hashed his teachings into a contribution to the catalogue just issued by Andrew J. Lloyd & Co., of Boston. Writing on "The Renaissance of Artistic Photography in America," Hinton is not content to be a godling, but aspires to the position of a little god. Those who are interested cannot do better than obtain this catalogue and read the article. I think that none who do so will consider me unduly discourteous in my somewhat frank consideration of an artist and an editor.

Hinton is, as I will show, somewhat inapt as a writer, but a careful reading of him will reveal what he is endeavouring to say.

We all know, to our sorrow, that we are apt to get too much on our plates. But not one of us, even in his insanest or most artistic moments, ever imagined the thing to be as bad as it is painted by A. Horsley Hinton. Hear the declaration of the godling:—

"Photography's deficiencies or shortcomings, artistically, consist of excesses; that is to say, its promiscuous inclusiveness at once makes it deficient in power of making selection and redundant in execution, or, to put it otherwise, the compulsory excessive inclusion makes necessarily a lack of power to omit."

In *The Pose in Portraiture* John A. Tennant tells us the same thing:—

"The bane of photography as a method of expression is that it tells too much, and gives equal prominence to things important and unimportant."

Mr. Hinton should take a lesson in expression from his "American contemporary."

Hinton considers it an axiom that the applications of photography to the attaining of scientific knowledge or for the giving of æsthetic pleasure "are higher and nobler than the more practical and useful applications to commerce and the useful arts, or even to its cultivation as an independent handicraft." We learn that photography has suffered from inartistic sponsors: "Were not the chemist, the optician, the skilled artisan, so to speak, the godfathers of the infant photography? And these trained up the child as they supposed it should go." This unfortunate fostering led to a striving after fidelity to truth; the photographer erroneously supposed that his artist's mission was "to copy nature," and gauged his success by his closeness to the fact. After learning this through many paragraphs, we reach the "art." And here we come to an understandable explanation:—

"The difference between the photograph and the picture is that the

former indiscriminately records everything, without selection or preference, as a final fact; the latter selects some out of the many, and emphasises one or few out of these, in order to express an idea or sentiment and appeal to the imagination of the beholder."

As a half truth this may be accepted as a truism. Pronounced as an axiom, with its evident inference, it is unworthy of further consideration.

Mr. Hinton refers, more in sorrow than in anger, to the fierce opposition which the godlings have incurred. Unlike those martyrs of old, who went to the stake in defence of their faith or in opposition to the faith of their enemies, the godlings have been forced to a compromise. This is perhaps to be regretted, but certain it is that the word "artistic" has been sacrificed on the altar of expediency, and "pictorial" reigns in its stead. A somewhat complex and unconvincing argument is advanced to defend and define the limits of faking, and we learn that its practice is a temptation to "exceed the limits of good sense and good taste." This is interesting, and we learn further that the means are only justified by the excellence of the result. "The notoriety which awaits on mere eccentricity is the applause which is indulgently given to the fool." Chance effects are, we are told, "the antics of a clown or the jangle or cap and bells, and the praises awarded to each one are of equal value."

From these comforting hints at godling worshippers Mr. Hinton rises to the peroration.

In three paragraphs the career of American photography is painted with much godling content.

"It has been long enough with us to acquire bad habits, like a young child; and, having progressed in the wrong way, the task of correction is proving a difficult one to those who, seeing the evil and being moved with regret at the prospect of lost possibilities, and stimulated by the passion of the reformer, are, by example and precept, seeking to arrest those tendencies which prevent it attaining a nobler state."

"In America, as in England, photography's exceeding adaptability to every-day uses has, perhaps, led to its undue exaltation as an industrial craft; and the craftsmen, made vain by the praise of the indiscriminating, are content with the smug complacency of moderate success in little things. They have not the spirit to see that a position, if only on the steps of the higher throne, is greater glory than a seat amidst the crowd."

"Artistic or pictorial photography in America is but of a very tender age, and in no country are the possibilities of its future greater. None the less, it may very easily become crippled or deformed, led astray, or crushed out of existence, but that its guardians, if few, are sufficiently staunch and loyal to make the last contingency very improbable."

Good little godling!

Mr. Hinton falls foul of the professional worker, of the amateur, and of the journalist. He may himself be classed among the two latter, and as he once, for a brief period, entered the ranks of the former, it might reasonably be inferred that he had some little acquaintance with his subject. Here is his word on the professional:—

"The men by whom photography is practised are chiefly those who pursue it with purely selfish ambition, and are interested in its advancement only in proportion to the increased aggrandisement such advance may lead to. In thousands of cases we find men who have adopted photography as a profession, not from any special aptitude for it, nor from love of it, but because the mere chance of circumstances did not lead them to be shoemakers or to follow some other trade. Succeeding more through the excellence of apparatus and perfection of process than their own skill to produce likenesses of men and things, they, knowing no better, call themselves artists, adopt a sham Bohemianism of carriage, and by careful observation cultivate an unconventional exterior, which is as artificial to them as it is an essential attribute of a genuinely artistic temperament."

Now, should even a godling be allowed to utter such nonsense without protest? Wrapped in his own superiority—smug complacency he terms it—he speaks on a subject of which he knows but little and understands even less. His broad contempt makes legitimate almost any mode of reply. Certain it is that a pestle-and-mortar treatment would prove ineffective, and the choice lies between the bludgeon and the rapier.

To leave the professional, we will turn to the amateur:—

"The debasement of photography, due to its being practised by thousands of people as a mere frivolous pastime, has been brought about by the ingenious commercial enterprise."

Good little godling! We will let the amateur wriggle in company with the ingenious commercial enterprise, and pass on to the journalist:—

"The reproductions of contemporary work, which are spread world-wide by the enterprising publishers of American photographic journals and magazines, are for the most part such as to make one marvel who is

responsible for their publication, and what manner of men they may be.

"My American friends who are ably and devotedly labouring for the advancement of better things in photography must not be surprised if England and Europe are slow to give America credit for as much as, through them, she deserves, when for every single one of their own clever reproductions that ever reaches more than a few favoured ones, ten thousand reproductions of the most paltry rubbish are showered around, accompanied by highfalutin eulogiums from the editorial pen.

"The illustrated photographic publications of America are, with the rarest exceptions, the most serious drag and hindrance to pictorial advance."

Now, Mr. Hinton, what do you deserve?

You are a clever and widely known photographer, and you are a godling. I am neither. But we are both journalists, and on this basis we will talk.

I will commence with a little anecdote. A few years ago, when I was in England, an American lady married a somewhat uncivilised Indian, and we all twitched our noses into promise of a sneer and said "American." Recently an English gentlewoman married an African "king," no remove from savagery. It was the culmination of what had become more or less a scandal. But the American people said "foolish girls." Can you apply the moral?

Mr. Hinton wonders, with true godling insolence, what manner of men publishers of American photographic journals may be. He says, with more than godling impertinence, the American journalists reproduce the most paltry rubbish, accompanied by highfalutin eulogiums.

The present writer has selected many photographs for reproduction, and he has written concerning some of these photographs. He has never selected paltry rubbish, and he has never written highfalutin eulogiums. Hinton is editor of a photographic journal. He has published half-tones which have made courteous American journalists say among themselves that probably the block did not do justice to the original. He writes highfalutin eulogiums, and he writes most paltry rubbish.

Mr. Hinton wonders what manner of men we may be. He will be interested to know that many—probably the greater number—of the "American" editors known to him are British-born or English subjects.

The average American photographic editor (British included) is a hard-working, conscientious journalist. He possesses some knowledge and some sense; he has a brotherly feeling for his co-workers, and he minds his own business. I have said that Mr. Hinton's remarks are not true as regards myself. I will go further. I have the honour of knowing the editors of all the recognised photographic magazines published in New York, including Dr. Wilson, who has been an editor for a third of a century; and Dr. John Nicol, who practised photography before Mr. Hinton was born. Add to these that unregenerate man, F. Dundas Todd, in Chicago, and several others who are doing honest work. Mr. Hinton's remarks are not at present true concerning any one of them.

It has grown to be a custom for some English journalists to sneer at American magazines. They will quote from or refer to "an American contemporary." When they find something which is not in the best of taste, they have not the grace to keep silent. They do not even name the culprit; they name "American photographic magazines."

A. Horsley Hinton is a man who has produced good photographic work. As a photographer he has earned an honourable position among the leaders in the art. Nowhere has this position been more generously accorded than in America. In treating of Hinton the photographer we are treating of a strong worker.

Hinton the writer is a man who produces much specious nonsense. Where he is not ponderously involving his sentences around some trite commonplace, he is moralising with smug godling complacency, or indulging in ignorant tirades. It may be that his defects have never been hinted to him, and that until now there has been no awakening. But I fear the trouble is too deep for treatment even with the knife; and I can only hope, with all who know his work, that he will either learn facts and restraint, or for ever hold his peace.

WILLIAM EDWARD WARD.

#### CONVENTION MEMORIES.

THE Convention is one of those institutions that take firm hold on any one who has participated in one of these functions. The writer has enjoyed these summer outings; he has even, incredible though it may seem to some, learned something thereat; but this year the fates were unpropitious and he was perforce absent.

During the week of the Convention the knights of the camera were much in his mind, and from past memories he enjoyed a—vision, shall we call it?—of the delights of the Conventioneers.

Newcastle is a manufacturing town, consequently the hospitality is kindlier and the welcome warmer than in the abodes of gentility, where industry dwells not. The picture that first rises before the mental gaze is President Bedding—who might almost be taken as the press representative of photography—attended by his satellites, receiving the homage of the great I Ams of Newcastle. His honours sit lightly on the President, but he infuses a sublime dignity into the character that is in magnificent contrast to the humble adoration of the civic chief.

We cannot help thinking of the lovely old-world courtesy of that well-known Conventioneer, Mr. Pattison Gibson. Probably he forgets his act of kindness to the writer when on his first Convention visit, but it's "minded" yet. With what inimitable charm he would act as the guide, philosopher, and friend at the Hexham excursion. In what picturesque language he would describe the various beauties and antiquities, with which he seemed to be on intimate terms of acquaintanceship. One of the beauties of the Convention is the ability of the guides selected by the Local Committee, and fortunate indeed it is that their descriptions are always spiced with a *souffron* of humour, unconscious it may be—probably the unconscious species is the better.

Of course, these various humours—*contretemps*, I believe, is the learned name for these said humours—are to be found in every P.C.U.K. One of these rises visibly before me. Photographing in a cathedral on one of the delightful excursions, there was one special view, a charming picture, although it had been degraded to the position of a stock photograph, that could only be taken at a certain time of the day, looking through a small window in a part of the ruins of the cathedral. As the proper moment approached, a number of us, intent on securing a negative of this famous picture, made our way to the said window. A lady was in possession, but that did not scare us; she would be finished in a minute. She was evidently of a "pernickety" disposition, and time and again she viewed the scene on the ground glass of a quarter-plate camera. The minutes were flying, but still the lady laboured on. Some of us gnashed our teeth with suppressed rage, while others, with less command over their tempers, used language that would certainly not be permitted in Parliament. Her ladyship heeded not. At last she made the necessary exposure, and on leaving said, with a seraphic smile—I am not sure if, looking at the weight of the subject, seraphic is quite the correct word, but I'm sure the lady will approve of it—"I hope I have not kept you waiting." There was a rush for that window, but the sun rendered all efforts of the patient ones futile. Only one Conventioneer has a negative of that view, unless the wishes of some of the disappointed ones were fulfilled; in that case, no negative of that view was secured at the Convention.

After my experiences of the Convention, I have come to the conclusion that the Thornton-Pickard people are practical jokists of the deepest dye. The reason of this finding is their purveying of that "shutter" dark room. In the first place, it cannot be called an advertisement, as no "instantaneous" work has been done in that "shutter"; the work has been all "time," and a very long time at that. Look at the countless "cursory remarks" that have been made by the waiting multitudes while some fastidious photographer laboriously numbered each plate he had exposed, and as laboriously dusted each unexposed plate before placing it in the plate-holder. The time he occupies seems hours to the "exposed" workers outside, while they see many sure medal-winners, pictures that could not fail to please any judges, vanishing beyond their ken. It has been suggested that the new valve exposure be used and set at the longest time marked on the disc; when the time expired, the door would open, and if the plates were not then changed, the man inside would have his trouble for his pains, and the attendant in charge would get as much education from the elocution of the inside man as he does now from the oratory of the outside photographers.

The writer has, as already stated, been, much against his will, absent from the Newcastle Convention, but those memories have kept alive the desire to be present, and he hopes to gratify his longings by being present at the Oxford show.

He hereby expresses his regret to the President and office-bearers for the chagrin his absence must have caused them. ALLAN BLAIR.

#### A METHOD OF RECEIVING TELEGRAPH SIGNALS AS DISPLAYED OR PHOTOGRAPHED BY MAGNETICALLY DEFLECTED CATHODE RAYS.

[Siemens' Patent No. 16,444 of 1899.]

A STRIP of sensitised paper which is intended to receive the transmitted signals is moved by a motor, clockwork or similar appliance at a suitable speed. It is placed with the other necessary parts of the receiver in a dark room. The strip of paper is exposed to cathode rays, which are deflected from their normal position in a manner corresponding to the signals to be given by the received current flowing through a coil of wire (which may contain iron). These deflections can be used in different ways for producing telegraphic signals on the paper strip. When shorter

and longer signals are required, for instance dots and dashes as for the Morse code, current impulses of shorter and longer periods are sent through the deflecting coil, causing the cathode rays to remain deflected for shorter or longer times. These positions of the cathode rays are then fixed on the paper strip in the form of dots and dashes. An arrangement like this is shown in fig. 1 of the drawings accompanying our provisional specification, but with the modification that the cathode rays do not act directly on the sensitised paper, but indirectly through the light which they create on a fluorescent screen.

*a* represents a Wheatstone apparatus for automatic quick sending. The current flowing through this apparatus is sent through the line *l* to the receiver *b*, where it passes through an electro-magnet coil *m*. In front of this electro-magnet the cathode ray tube *c* is placed, which is excited in a

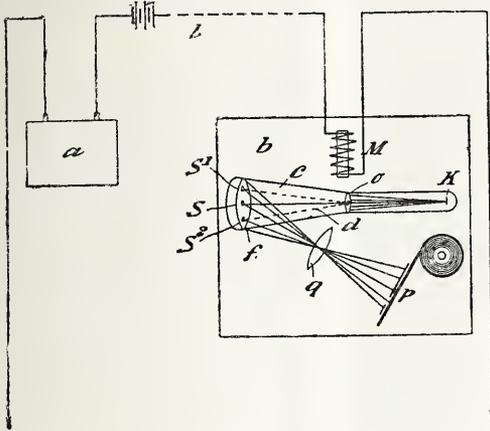

FIG. 1.

suitable manner. A bundle *d* of the rays emitted from the cathode *x* passes through the opening in the metal disc *o* and strikes the fluorescent screen, *f*, where it becomes visible in the form of a spot *s*. The rays *d* are deflected to the position *s*<sup>1</sup> or *s*<sup>2</sup> according to the direction of the current flowing through the electro-magnet *m*. In case the position *s*<sup>1</sup> corresponds with the telegraphic current, a lens *q* is so placed that the light rays, corresponding to this position, are projected against the paper strip *p*, where, according to their duration, they are fixed as dots and dashes; the light rays corresponding to the position *s* and *s*<sup>2</sup> are screened off, and are therefore not photographed. It is to be understood that signals other than the Morse signals can be received in this way.

According to a modified method of using the deflected cathode rays, the deflection according to its magnitude is applied to indicate certain letters or other signs. The current impulses sent into the line by the transmitter have in this case generally the same duration. The different current

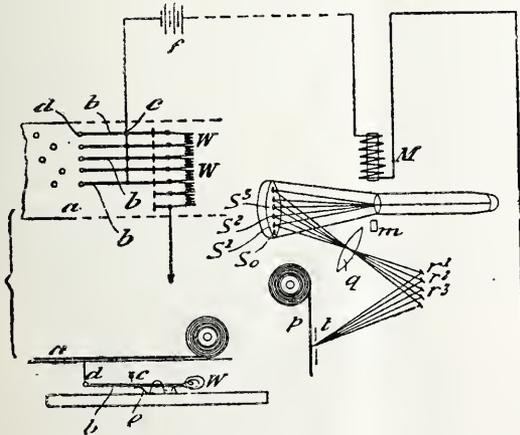

FIG. 2.

intensities which are to correspond to the different signals are either produced by the insertion of resistances into a circuit of a constant potential or by connecting the line during the sending of the current in such a manner that it is acted on by different electro-motive forces. These may be obtained by connecting the telegraph lines, according to the different signals, with different contacts of a row of contact blocks between which there are contacts for different electro-motive forces.

In the first instance the transmitter is of the known Wheatstone type for high-speed telegraphy, which works with a perforated strip of paper and in which each hole in the paper effects the closing of a certain circuit. It is of advantage to use with this an auxiliary contact, which is inserted into the circuit and which is worked by the transmitter itself in such a manner that the absolute closing and opening of the circuit is effected by the auxiliary contact after the contact which corresponds with the hole in the paper has been established, or before it is interrupted. In

this way all the sparking is in the known manner removed to the auxiliary contact, which can easily be exchanged.

An arrangement of this kind is shown diagrammatically in fig. 2 of the drawings accompanying our provisional specification. *a* is the previously perforated paper strip of the transmitter, which is moved over the contact levers *b*, *b*, *b*. Whenever a hole in the paper strip *a* appears over one of the pins *d* the pin is raised by the spring *e* and at *c* a contact is made. All the points *c* are connected with the pole of the battery *f*. Between the contact levers *b*, *b*, *b*, the adjusted resistances *w* are connected. The last of these resistances is connected to earth. Whenever one of these levers makes a contact, the circuit is closed through a definite fraction of the resistance and a current of a definite strength is produced, which causes a definite deflection of the cathode rays. The receiving apparatus shown in fig. 2 differs from that shown in fig. 1 by the following arrangement. The zero position of the cathode rays is, through the influence of the adjusting magnet *m*, situated on the lower part of the fluorescent screen on the place marked *s* *o*, and is deflected by the electro-magnet *m* in steps to *s*<sup>1</sup>, *s*<sup>2</sup>, *s*<sup>3</sup>. Each of these deflections represents a different letter. The illuminated spots *s* are projected by a lens *q* and the mirrors *r*<sup>1</sup>, *r*<sup>2</sup>, *r*<sup>3</sup>, to a hole in the diaphragm *t* behind which the sensitised paper strip *p* is moved. On the face of the mirrors letters of opaque material are fixed, the images of which are then photographically fixed on the paper strip as instantaneous photographs, the time of each current impulse being very short. For projecting the different illuminated spots, *s*<sup>1</sup>, *s*<sup>2</sup>, *s*<sup>3</sup>, on to the same place where the letters &c. are to be photographed, other known means, for instance, prisms of a separate lens for each point may be used. Fluorescent letters may be fixed to the spots *s*<sup>1</sup> which would light up through the influence of the cathode rays and would be projected on the sensitised paper.

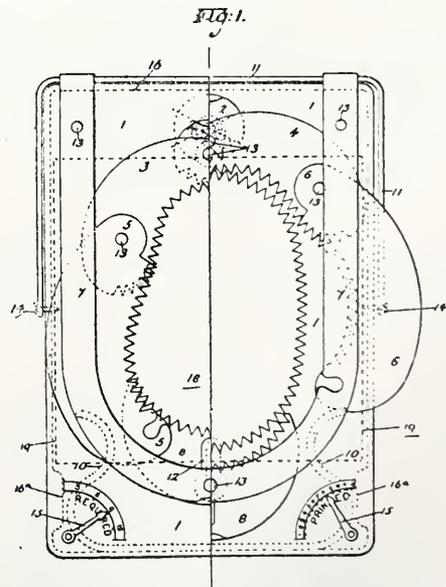

A third method for using the deflection of cathode rays for telegraphic purposes is as follows:—

If the cathode rays, instead of being acted on by a single electro-magnet *m*, are acted on by two or more, which are fixed at an angle relatively to each other and which are influenced by different telegraphic currents, each of which at the transmitting station can be varied as regards strength and direction, combined magnetic fields are created, which produce deflections of the cathode rays in various directions. In this way it is possible to obtain a deflection of the cathode rays all round the zero position, and with each of these deflections (as described above) it is possible to project a certain letter on to the place where the moving sensitised paper strip is exposed.

MAURICE'S IMPROVEMENTS IN PRINTING FRAMES.

[Patent No. 1108 of 1900.]

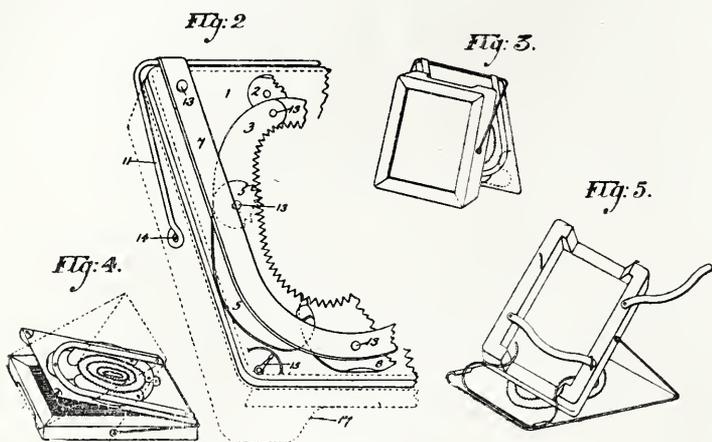

1 is a large plate covering printing frame, with full-size opening cut or stamped out either plain or serrated. The plate 1 may be strengthened and raised from the printing frame in any convenient means by the edges 16 of plate being turned and bent over a piece of wire, the wire

side forming back of vignetter, an extra piece of wire, movable to form strut for skyshade, and retouching desk is attached 10. Plate 2 is a round plate, top part bent to catch hold of and having a slot cut, at the bottom of slot is a hole punched to take the fastener of plates 3 and 4, the slot in plate 2 allows for raising and lowering of plates 3, 4, 5, 6, and throwing them out of centre, so that the vignetter can be centered over any part of negative. Plates 3, 4, 5, 6, are fastened together by three pins, eyelets, rivets or suitable fastener, and are attached to plate 2.

Plate 7 is a piece cut or stamped out U shape and lies over plates 1, 2, 3, 4, 5, 6, 8, and 12, the top end is bent over support 11, and fastened at back of plate 1. Plate 8 is the bottom plate with vertical movement having slot cut in, and bottom edge turned up to catch hold of, 15 printer's indicators cut or stamped on plate 1 bottom corners.

10 is bent wire support for use as skyshade and retouching desk, and when not in use it is sprung into side of plate 1 at part 16<sup>a</sup>. 11 is

support for attaching to printing frame over which plate 1 revolves plate 12 is small strip to cover slot in plate 8.

13 are the fasteners for all movable plates, to plates 1 and 7. 14, screws for fastening support of vignetter to frame. 15, pointers for indicator. 16, turned edge of plate 1 over wire. 16<sup>a</sup>, turned edge of plate to take support 10. 17, printing frame. 18, half drawing showing pear shape opening. 19, piece of tissue or waxed transparent paper for soft vignetting in strong light.

## Our Editorial Table.

### KACHIN.

Prepared and sold by Messrs. J. J. Griffin & Sons (Limited), 26, Sardinia-street, London, W.C.

We have received a sample of a new kind of kachin Messrs. Griffin are putting on the market. Wherein this differs in chemical composition from that which has met with so much favour during the past year or so we are unable to say. Upon trial, we find it possesses all the qualities of the older form, while it possesses other advantages in addition. For example, the carbonates can be used instead of the caustic alkalies, which are objected to by some. Here is the formula as given for plates and films:—

#### Kachin Sodium Carbonate.

	A.		
	British System.		Metric System.
Kachin (avoirdupois).....	160 grains.		9 grammes.
Sodium sulphite (crystallised) .....	2½ ounces,		62.5 „
Water (up to) .....	20 „		500 c. c.

	B.		
	British System.		Metric System.
Sodium carbonate (crystallised) .....	2 ounces.		50 grammes.
Water (up to) .....	20 „		500 c. c.

For use, take equal parts of A and B. More diluted developers give softer results.

With this formula development is complete in about four or five minutes, and the negatives are quite free from stain or tint in the shadows. A corresponding formula to this is given for those who prefer to work with ten per cent. solutions. Another advantage claimed for the new kachin, which we find is fully sustained, is that it can be employed for bromide papers, with which it yields excellent warm blacks. In this case potassium carbonate is used in place of the sodium salt. The new kachin is also used with advantage for Velox papers for colours. When restrained with bromide of potassium, it yields all colours, from a dark sepia to a bright red chalk, according to the exposure and the quantity of restrainer added. The new kachin, like the old, can be employed in the simultaneous developing and fixing

method by those who prefer that system. The formula for that stands thus:—

#### Stock Solution.

	British System.	Metric System.
Sodium sulphite (crystallised).....(avoirdupois)	4 ounces.	30 grammes.
Caustic potash (purified, in sticks) .....	408 grains.	7 „
Kachin.....	408 „	7 „
Water, up to .....	10 ounces.	up to 75 c. c.

For fully exposed plates, take—

Stock solution .....	6 fluid drachms.
Hypo solution (1 ounce hypo to 5 ounces water) .....	10 „
Water.....	15 „

As a restrainer for kachin in the case of over-exposure, the makers recommend a five per cent. solution of ordinary borax, five to ten drops to the ounce of developer in place of the usual bromide. With the sample of kachin Messrs. Griffin & Co. were good enough to send us a box of kachin "cartols." These are glass tubes containing the kachin and accelerator, with a glass septum between them to keep them separate. The contents of each cartol have only to be dissolved in four ounces of water, and the developer is ready for use. Each box also contains a neat little corkscrew to remove the corks. These cartols will be found very convenient to amateurs, and the price is two shillings per box of six. Another great advantage of kachin as a developer is that it does not stain the fingers, and the solution can be used over and over again even after the lapse of a week or two, though, when much used or after long keeping, it requires, of course, a little longer time for its action. We should recommend our readers to write for the pamphlet on *Kachin and How to Use It*.

*Modern Printing Processes* is the title of a little book by Mr. H. G. Abbott, that has been published by Messrs. George K. Hazlett & Co., 373, Dearborn-street, Chicago, U.S.A. It deals with gum bichromate and platinotype, and especially with the glycerine and mercury bichloride modification of the latter process, of which such an absurd amount of fuss has lately been made in the United States by one or two amateur photographers. These gentlemen may be interested in knowing that local development of platinotype prints was first demonstrated in this country several years ago. However, the book before us is a useful little compilation, with several explanatory half-tone illustrations. It sells in paper covers for 25 cents a copy.

### A CONVENTION GROUP.

SURELY not one of the party of sixty or seventy ladies and gentlemen who had the privilege of visiting Haughton Castle on the occasion of the Newcastle Convention will forget the pleasant hour spent one afternoon at that beautiful seat of Mr. W. D. Cruddas, M.P.? In the short space of time at command a considerable amount of photography was attempted, and several groups of the entire party were taken; amongst others, by Mr. R. W. Dugdale, who kindly sends us prints from each of his negatives. Photographers in groups are notoriously difficult to photograph successfully, and we must therefore congratulate Mr. Dugdale on the excellence of his results. They are pleasing mementoes of a pleasant time. Mr. Dugdale, whose address is Harold Villa, Kingsholm, Gloucester, asks us to state that he will be pleased to supply, free of cost, a copy to any one interested in the group, provided a stamped and directed cabinet-size envelope be sent him. For his generosity in this matter Mr. Dugdale is deserving of the greatest thanks.

### THE PHOENIX REFLECTOR HAND CAMERA.

Manufactured and sold by McKellen (Limited), 165, Long Millgate, Manchester.

THE new reflector hand camera of Messrs. McKellen relies upon simplicity of essential movement in making an exposure. As the makers phrase it, "The movement which sets the shutter also removes the exposed placed plate, and brings another into position." Let the reader imagine himself, Phoenix camera in hand and about to take a photograph. By following this brief description, he will be enabled to realise how easily the Phoenix is manipulated: A ground-glass focussing screen, the full size of the plate, is placed in the top of the camera. A mirror is hinged at the angle formed by the planes of the sensitive plate and this ground glass, and, to manipulate it ready for exposing a plate, the cord, with tassel attached, which hangs underneath the camera on the left-hand side, must be drawn down as far as it will go, or until a click is heard. When this movement has been completed, and the aperture in front of the lens is opened, the light, passing through the lens, falls upon the mirror, and is reflected up to the ground-glass focussing screen, where the image can be seen its full size and right-side up. That the image may be seen distinctly, light is shaded from

his focussing screen by a hood, which folds down when not in use as a shade, and protects the ground glass from breakage. The focussing is adjusted by a metal pointer sunk into the right-hand side of the camera near the front. At certain positions in the path moved over by the pointer a focussing there are numbers, each of which represents the distance, in yards, of objects which will be in focus when the pointer is set opposite to any particular number. The exposure is made by pressing a button on the front of the camera on the left-hand side. This releases the mirror, which, revolving on its hinges, rises to the top of the camera, allows the light from the lens to pass to the plate, and then closes the shutter behind the lens, thus completing the exposure. This is the essentially novel feature of the Phoenix hand camera, which was recently placed before us for our inspection and examination, and we congratulate the makers on a very clever modification of the reflector principle. The remaining details of the Phoenix constitute it an exceedingly useful type of magazine hand camera.

**MERCK'S ACID PYRO IN HEAVY CRYSTALS.**

E. Merck, 16 Jewry-street, E.C.

A SAMPLE of this concentrated form of pyro has been sent us. Besides possessing the convenience of diminished bulk, it also has all the good reducing qualities of the older form of the product. Mr. Merck writes: "Although, as a rule, I supply my pyro in the light resublimed form, which has been in use for a great many years, I am prepared to supply these heavy crystals, but customers who wish to receive the latter kind ought to say so specially."

**THE CHALLENGE CAMERAS.**

Manufactured and sold by J. Lizars, 101 & 107 Buchanan-street, Glasgow.

A LARGE selection from the well-known and justly appreciated series of hand and stand cameras bearing the name of Lizars was recently placed before us, and we have much pleasure in making mention of the season's modifications and improvements in those instruments, with which the

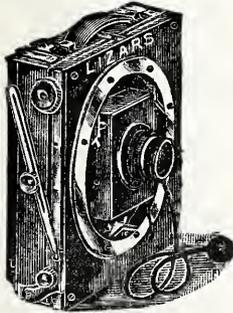

FIG. 1.

photographic world is so familiar that a detailed description of each camera is rendered unnecessary. Taking them in order of reference, the new Challenge stand camera, which forms an item of the seventy-shilling set is now fitted with a time and instantaneous shutter with special indicator (fig. 1). The Challenge combination stand camera (figs. 2 and 3) is well named, for its uses range from very short focus work to copying.

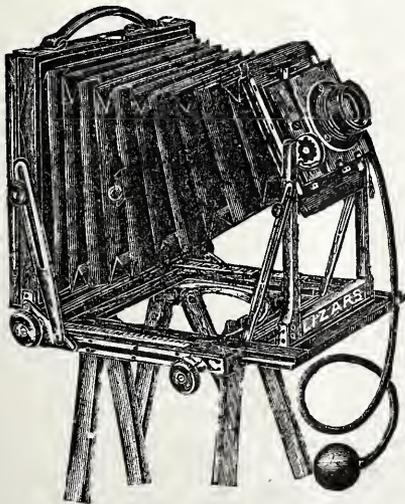

FIG. 2.

The back of the camera moves forward by means of a rack and pinion for the use of wide-angle lenses. The baseboard is also extended by the front rack and pinion, thus allowing of rack focussing for the whole extension. The front may be raised to bring the lens to the top of the plate or angled into any required position, as shown in fig. 2. The extension

of the camera is such as to permit of lenses from 4½ to 16 inches focus being used. The Challenge interchangeable hand camera, model D (fig 4), takes either glass plates or rollable cartridges.

When plates are being used, the back part of the camera folds over the entire dark slide, and thus prevents the possibility of light getting at the

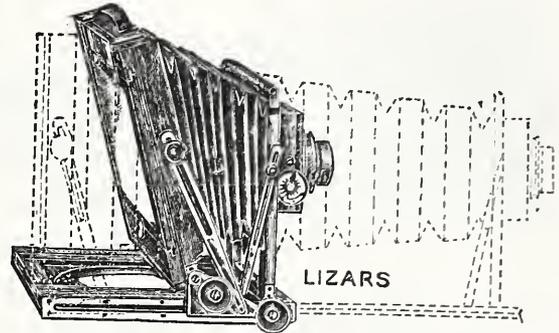

FIG. 3.

sensitive plate when the camera is exposed out of doors. With this protection the shutter of the dark slide can be withdrawn, leaving the camera ready for immediate action. Model E (fig. 5) aims at extreme compactness as may be understood from the illustration; it is fitted with a reversing back and a double extension baseboard, and takes either a

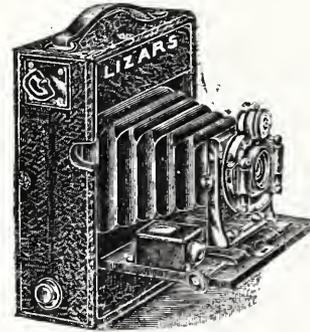

FIG. 4.

roll holder, a changing box, or slides. Model F (figs. 6 and 7) very skilfully embodies the principle of triple extension. By an ingenious arrangement, the second base is used for ordinary work, and the triple base is only employed upon those occasions when the camera is to be racked out to its

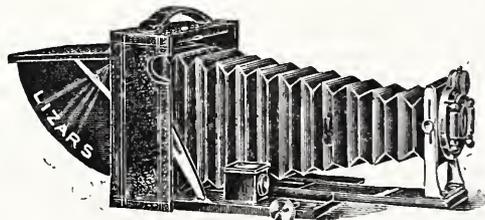

FIG. 5.

full extent. Mr. Lizars points out that the gain in rigidity of this latter system is considerable, as it overcomes at once any objection that might be made to a long extension camera for ordinary work, for which it is in every way as convenient as the short extension models, whilst it is always

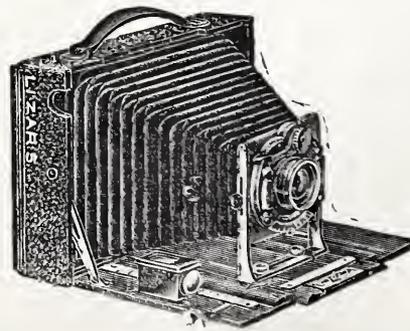

FIG. 6.

available for copying, and for use with long focus and telephoto lenses when required. The rack acts upon both portions of the baseboard, which do not require to be set by hand as in many models.

In this brief review of Mr. Lizars' cameras, the distinctive characteristics

only of these instruments have been mentioned. But we may generally and unreservedly praise their design, construction, and finish. They are well made and practicable tools with which the photographer cannot fail to be satisfied, and withal the prices are moderate. We hear much in these

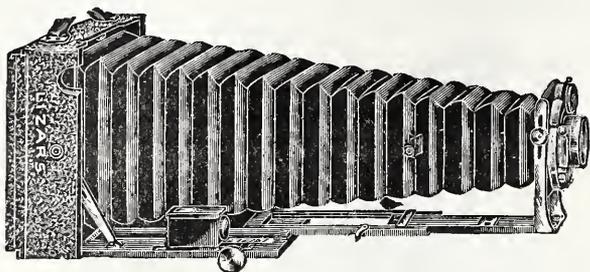

FIG. 7.

times of the supremacy of American made photographic apparatus; but though we have no means of knowing how many cameras Mr. Lizars disposes of at his branches, we should not be surprised to find that he had the largest sale of any British manufacturer.

### Studio Gossip.

**AN INDELIBLE INK.**—An indelible ink, the use of which in writing the public records of the State of Massachusetts is enforced by a law passed four years ago, is made by mixing together 23.4 parts by weight of pure dry tannic acid, 7.7 parts of crystal gallic acid, 30 parts of ferrous sulphate, 10 parts of gum arabic, 25 parts of diluted hydrochloric acid, 1 part of carbolic acid, and 902.9 parts of water. The Secretary of the Commonwealth decided on this ink after samples of the many inks had been tested. Writing done with the acceptable ink had to withstand the action of the sun's rays behind a sheet of glass for three months; but a more severe test than this was adopted afterwards, as, in addition to the foregoing, the writing had to be exposed for six months without protection to the action of the weather. The paper on which the writing had been executed was, before the tests, to be soaked in water, then in alcohol, and, lastly, in a mixture of the two, to determine whether the colour of the ink would fade or the ink itself spread. The ink, whose composition is given above, is said to have come out of these severe tests with every satisfaction.

### News and Notes.

**THE FULHAM CAMERA CLUB.**—A camera club has been founded at Fulham, with Mr. Arthur C. Baldwin as Chairman. The inaugural meeting will be held on September 19 next, when Mr. E. J. Wall, F.R.P.S., will lecture on "Colour Photography."

WE take the following paragraph from the *St. Louis and Canadian Photographer*: "J. P. Sullivan, of Salina, Kan., has a horse in whose right eye there is a photograph of his wife. He is offered \$500 for the animal, but refuses to sell it. The photo is a perfect likeness. Mrs. Sullivan stood in front of the horse during an electrical storm, and veterinary surgeons attribute to this fact the photo coming in the horse's eye. Its sight is not affected."

**THE BRITISH ASSOCIATION.**—The following is the general programme for the Bradford meeting of the British Association, which takes place next month:—Wednesday, September 5.—4 p.m., Meeting of General Committee at the Town Hall; 8.30 p.m., the President's Address in St. George's Hall. Thursday, September 6.—3.30 p.m., Reception at the Technical College (Textile Exhibition); 8.30 p.m., the Mayor's *Conversazione* in St. George's Hall. Friday, September 7.—8.30 p.m., Lecture in St. George's Hall by Professor Gotch, F.R.S., on "Animal Electricity;" 9.30 p.m., Smoking Concert in the Technical College in honour of the President. Saturday, September 8.—Excursions (half-day); 8 p.m., Artisans' Lecture in St. George's Hall by Professor Silvanus Thompson, F.R.S. Sunday, September 9.—10.30 a.m., Sermon by the Bishop of Ripon in the Parish Church. Monday, September 10.—3.30 p.m., Corporation Garden Party in Lister Park; 8.30 p.m., Lecture in St. George's Hall by Professor W. Stroud, D.Sc., on "Range Finders." Tuesday, September 11.—8.30 p.m., Corporation *Soirée* in St. George's Hall. Wednesday, September 12.—3.30 p.m., Private Garden Parties; 8 p.m., Full-dress Concert in St. George's Hall (Festival Choral Society; Permanent Orchestra; conductor, Mr. F. H. Cowen; Miss Ella Russell). Thursday, September 13.—Excursions (whole day).

### Commercial Intelligence.

**LANGFIER, LIMITED.**—The Secretary of Langfier, Limited, 23A, Old Bond-street, writes us: "I have pleasure in informing you that, at a meeting of my Company's shareholders, held a few days since, a dividend at the rate of ten per cent., free of income tax, for the year ending June 3 last, was declared."

**MESSRS. W. N. JENNINGS & FRANK M. SAWYER**, who have been associated with Mr. Ives for the last four years in the developing and perfecting of the kromskop, have opened an establishment at 1213, Filbert-street, Room 613, Heed Building, Philadelphia, thoroughly equipped with all the modern appliances of the art, where they are prepared to carry out anything photographic.

WITH a view of increasing British trade and spreading a better knowledge of articles manufactured in this country, the National Lecture Society are arranging a series of illustrated addresses on British Industries, to be given in all important commercial centres throughout the world. Those who are desirous of availing themselves of this movement are invited to write to the Hon. Secretary, National Lecture Society, Imperial Institute, London, S.W.

**THE DEALER'S TERROR.**—"We've all heard about the patience of Job, of the seeker of a government job at Washington, and other notable instances," writes Mr. Edward W. Newcomb in the *Photo-American*, "but I do not think the poor retail photo stock clerk has a bigger and brighter halo coming to him at his necessarily early demise and entrance within St. Peter's portals than any other man. In a store the other day, a smart-looking business man bought a pound of hypo for five cents, and, when the clerk politely interrogated him as to the further extent of his desires, he said that would be all, except he'd like to ask a question. Now, the store was crowded, people were waiting to be served, and the man knew it, but what does he do but ask the clerk questions enough to fill a little book with the answers. He got something like fifty dollars' worth of information at current rates, riled the clerk and the customers, some of whom left without buying (maybe THEY wanted half a hundred dollars' worth of information with a five-cent purchase, too), and departed with a condescending word or two, as much as to say that his patronage was valuable indeed. The worst of it all was that he remarked to a friend as he left that he didn't think the clerk knew what he was talking about, and that he was not very obliging any way. Ten years ago we made decent profits on photographic materials, and could afford to throw in quite a considerable instruction gratis; but now, when there is no profit on plates at all, but little on supplies in general, and prices are cut to a level where nothing but quick sales will afford a man his living, no advice can be given. The dealer should have an expert at the disposal of patrons, but should charge for his words just as they would for their hypo. I really believe both dealer and patron would be better pleased at this arrangement than with the one in general practice now."

### Patent News.

THE following applications for Patents were made between July 16 and July 21, 1900:—

- PHOTOGRAPH FRAMES.—No. 12,779. "Improvements in Photographic Frames." A. P. SHANN.
- CINEMATOGRAPHY.—No. 12,820. "Improvements in Apparatus for Taking and Viewing or Exhibiting Cinematographic Pictures." G. F. HATTON and A. N. WHITEHEAD.
- HAND CAMERAS.—No. 12,957. "Improvements in Hand Cameras." E. WILSON.
- LIVING PICTURES.—No. 13,076. "Improvements in and relating to Apparatus for the Production of Moving or Living Pictures." W. P. WARRREN.
- X-RAY APPARATUS.—No. 13,199. "Improvements in and relating to Röntgen-ray and like Apparatus." F. L. MUIRHEAD and R. H. EDGAR.

### Meetings of Societies.

#### MEETINGS OF SOCIETIES FOR NEXT WEEK.

August.	Name of Society.	Subject.
6.....	Bootle .....	Excursion: Delamere Forest. Leader, Thomas A. Dodd.
6.....	Croydon Microscopical .....	Excursion: Chilworth and Gomshall. Leader, H. D. Gower.
6.....	Southampton .....	Print Competition: Snap-shots.
9.....	Ashton-under-Lyne.....	Meeting to Examine and Discuss Results of Rambles to Bolton Abbey and Bakewell.
10.....	Croydon Microscopical .....	Conversational Meeting.
11.....	Borough Polytechnic .....	Excursion: Leatherhead. Leader, E. W. Burch.
11.....	Croydon Microscopical .....	Excursion: Netley Heath and Gomshall.

#### LONDON AND PROVINCIAL PHOTOGRAPHIC ASSOCIATION.

July 26.—Mr. F. W. Mundy in the chair. Mr. PHILIP EVERITT passed round a negative taken by quite a beginner which, but for marks caused by the developer being only partially applied to the plate, was a very fair result. But the said beginner was so confident that he had properly covered the plate with developer that he agreed that the London and Provincial should report upon it. Mr. Everitt's decision was entirely confirmed.

Mr. E. T. WRIGHT showed a negative reduced with persulphate of ammonium. Before treatment it was quite free from stain and was a good negative, but during reduction one end of the plate became deeply stained with an opaque brown deposit or mud.

Mr. A. L. HENDERSON was inclined to attribute the trouble to careless handling, and thought it probable that it had been placed wet on a dirty shelf or bench from whence it had picked up the stain.

Mr. E. T. WRIGHT also exhibited a foggy negative terribly marked with pinholes and reticulations. It was developed with pyro in the ordinary way; ten plates were good and two bad.

Mr. W. T. WILKINSON put the trouble down to development in warm solutions.

Mr. R. P. DRAGE thought hasty drying would give the result shown.

Mr. S. H. FRY informed the meeting that the celluloid measures, for which Mr. Henderson had so often expressed a desire, were obtainable according to the list of a firm he passed round. They were of German make, and were marked in English and French systems. It was also said that an English firm made these articles.

Mr. HENDERSON referred to Mr. Howard Farmer's paper on desiccated dry plates before the Convention, which carried him back to experiments of his own performed twenty years ago. There were, he found, distinct advantages in wetting a dry plate before exposure and allowing it to get surface-dry. A negative of a different character to that ordinarily obtainable was the outcome, greater contrast being the result. In reply to a question he added that a wet-collodion negative became more intense as it dried, but not so the gelatine, which grew thinner as it dried. Increased density might be given to the gelatine plate by bathing it in alcohol.

Mr. DRAGE drew attention to the extent to which cheap collotype imitations of silver prints were superseding the genuine article. He rather regretted this tendency in the view business, but it was very true on the Continent.

FORTHCOMING EXHIBITIONS.

1900.

August 21..... Royal Cornwall Polytechnic Society. W. Brooks, Laurel Villa, Wray Park, Reigate.

Sept. 21-Nov. 3 ..... Photographic Salon, Dudley Gallery, Piccadilly. Hon. Secretary, R. W. Craigie, Camera Club, Charing Cross-road, W.C.

October 1-Nov. 3 ... Royal Photographic Society, New Gallery, Regent-street. The Hon. Secretary, 66, Russell-square, W.C.

November 12-17 ..... Ashton-under-Lyne.

„ 21-23 ..... Hackney Photographic Society.

1901.

January 14-19..... Blairgowrie and District Photographic Association. The Hon. Secretaries, Blairgowrie, N.B.

Those who desire to send photographs to the above Exhibitions should write for prospectuses to the Hon. Secretaries, whose addresses are given in the second column above. The dates mentioned are those at which the Exhibitions open.

Correspondence.

\* \* \* Correspondents should never write on both sides of the paper. No notice is taken of communications unless the names and addresses of the writers are given.

\* \* \* We do not undertake responsibility for the opinions expressed by our correspondents.

WAR BUTTONS AND BADGES.

To the EDITORS.

GENTLEMEN,—Your leaderette, entitled "War Portraits," in a recent JOURNAL interests us particularly in the question of the woe-begone state that your correspondent has noticed that some of these badges and buttons present after continued exposure to light. Of the enormous quantity of prints that have been used for this purpose we have sold a number of millions, printed by the bromide contact process, and have not found a single case of fading through imperfect fixation, and we have seen our productions in the retail fancy shops everywhere. We will say, however, that on account of the extraordinary rush there has been for these small photos, several new and inexperienced firms have gone into the button-making business, and much of the yellow colour noticed is nothing else than an oxydisation of the thin iron shell, or support, through the use of an imperfect method of fixing the enamelled surface to the prints. We might say that our managing director—the writer—was the first in this country to make tools to manufacture photographic buttons, and it took him a lot of time to discover the most perfect system of manufacture. We claim to-day that our machines are the most up to date in existence, being our own special designs, and by the samples, which we herewith send, you will note that we can make buttons or medallions in various ways.—We are, yours, &c.,

CRAYON LIMITED: F. A VENNING, Managing Director.

49, Brecknock-road, London, N., July 25, 1900.

[Our correspondents have been kind enough to send us a considerable assortment of their popular war buttons, both in monochrome and colours, together with samples of American and English-made

"fittings" upon which the little pictures are mounted and varnished. The latter are reproduced in a variety of ways—Velox, P.O.P., Bromide, and printer's ink being employed to obtain the impressions. The hand colouring is exceedingly good, and altogether these photo buttons are attractive little ornaments.—Eds.]

THE RÖNTGEN RAYS.

To the EDITORS.

GENTLEMEN,—In your issue of the 22nd ult. you publish some remarks by Mr. Noble, president of the Röntgen Society. He speaks of the benefits which the great invention has bestowed on our wounded soldiers, and says that its usefulness is on the increase. It must be a source of satisfaction to the persons, those who perfected the rays and those who apply them, to think on the amount of suffering which they now render unnecessary. In connection with the widening of their application, might I inquire if a mouth doctor could use them with advantage? A patient may be annoyed by a tooth travelling in the interior of the gums, in which case I venture to think it would be beneficial to have the annoyance located.—Thanking you in anticipation, I am, yours, &c.,

WILLIAM FISHER.

18, Albert-street, Dundee, July 25, 1900.

[Our contemporary, the *Pharmaceutical Journal*, a few weeks ago printed a paper on the subject of the X rays in dentistry, to which we refer our correspondent. The *Journal* is obtainable at 5, Serle-street, Lincoln's Inn, W.C.—Eds.]

ITINERANT PHOTOGRAPHY IN THE ISLE OF MAN.

To the EDITORS.

GENTLEMEN,—I herewith enclose you page from a local paper, thinking it would be of interest to you. Being one of the "pests," I will give you my version. Some ten years ago I came here as operator for a firm, when this business was just taking root—the photographing of the visitors on the steps of the boarding-house—and so popular did the business get that it was no infrequent occasion but that we had orders to go and take from six to eight groups a day. The consequence was that the firm I was with laid themselves out for the work, sending a man out at breakfast-time to make appointments for dinner and tea-time, the sun being on these particular houses first thing in a morning, and the thing became an institution and became very popular. After being with this firm three seasons I started for myself, and a number of others came there, being, at the present time, some dozen to twenty doing the work; and, like myself, the majority submit proofs before asking for orders, so that the visitors see what they are going to have for their money, and there is no compulsion for them to order. The authorities are instructing the police to stop us although there is no by-law. We tell them, if we cause any obstruction, to summon us and give us a chance of defending ourselves, but they will not. It is simply dog in the manger. The natives will not do it themselves, and they object to us, as the majority of us come from across the water, and they say we have no business here as we bear no share of the taxes. I say we do, and pretty heavy for what we get. Well, that's my experience. The plates are whole-plate P.O.P., on plate-sunk mounts, and the price 1s. 6d. per copy. I enclose you a rough print of group I took last night, so that you will be able to judge. The island is maintained by visitors from across, but yet no one from across must come here to do business; and this is a fair sample of the clannish principle of Manxmen.—I am, yours, &c.

PYRO.

The extract referred to is as follows:—

Amongst the pests of the Isle of Man season the itinerant photographer occupies a fairly prominent position. He comes with the visitor, has no shop, pays no rates, requires no licence, and goes from door to door, soliciting work and executing his orders on the steps of the houses then and there. The work is never of a high order, the money has to be paid down, and the visitors are expected to place their simple faith in him along with their shekels. The Town Council might very well consider whether some of these gentry are not within the reach of the by-laws relating to hawkers.—*The Manxman*.

[The print which our correspondent encloses would do credit to any photographer; it is a capital specimen of group work. The remarks quoted from the *Manxman* do not flatter the writer's intelligence. The "execution of photographic orders on the steps of houses then and there" is a feat never performed outside a Manx newspaper office. As to the point at issue: a photographer who calls at houses soliciting orders is surely no more of a pest than other visitors on business bent, and probably causes less obstruction than butchers, bakers, and other tradesmen. In the group before us there are some thirty or forty middle-class visitors who appear rather pleased than otherwise at being photographed. Until visitors to the Isle of Man complain of the "pest" of being photographed at their boarding establishments we imagine that there is no call for the intervention of the local authorities or the local press.—Eds.]

## Answers to Correspondents.

\* \* All matters intended for the text portion of this JOURNAL, including queries, must be addressed to "THE EDITORS, THE BRITISH JOURNAL OF PHOTOGRAPHY," 24 Wellington-street Strand, London, W.C. Inattention to this ensures delay.

\* \* Correspondents are informed that we cannot undertake to answer communications through the post. Questions are not answered unless the names and addresses of the writers are given.

\* \* Communications relating to Advertisements and general business affairs should be addressed to Messrs. HENRY GREENWOOD & Co., 24, Wellington-street, Strand, London, W.C.

### PHOTOGRAPHS REGISTERED:—

W. HARRISON, Holly Bank, Onchan, Isle of Man.—Two photographs of steamer "Lily" on rocks.

G. T. C.—We are much obliged for your letter.

STAINED AND SPOTTY PRINTS.—S. R. W., SPOTS, W. WADE, and SPOTTY.—An article on the subject will appear next week.

W. G. BURRELL (Wandsworth).—We are much obliged to you for your letter and enclosure. The patent specification of the invention was printed in the JOURNAL of July 20.

COPYRIGHT.—MEZZO asks: "If a copyright photograph of a group has been acquired, is it an infringement of that copyright for a stranger to take out of that group a copy of one of the figures in it?"—In reply: Undoubtedly.

PREPARATION OF PLATINUM PAPER.—UNION would be glad to know where he can obtain information by which he could make his own platinum paper.—In reply: You will find some useful information on the subject in Abney & Clark's *Platinotype*, published by Sampson Low & Co., Fetter-lane. In this JOURNAL of June 15 last a lengthy article also treats of it.

STUDIO FURNITURE.—ACCESSORIES writes: "Will you kindly tell me where I can obtain proper studio furniture, such as a chair with several backs or a short settee?"—In reply: Messrs. Marion & Co., Soho-square; Houghton & Sons, High Holborn; Fallowfield, Charing Cross-road; and other firms whose advertisements appear in the JOURNAL supply studio accessories.

AMY CASSELS.—No complaints similar to yours have reached us. From your description of the defects we should not look for the cause in the paper. They frequently appear when a negative has been used in silver printing and through slight damp particles of silver salt have been conveyed to the surface of the platinum paper. This or some other equally simple explanation may account for the failure.

THE PLATE-MAKERS' ASSOCIATION.—D. T. B asks for: "1. The address of the Plate and Paper Manufacturers' Association. 2. Is it necessary to have a licence for the sale of photographic chemicals, &c., and where obtainable, and price?"—In reply: 1. Address The Secretary, London Chamber of Commerce, Botolph House, Eastcheap. 2. No; but the Association has arranged a scale of discounts for *bona-fide* dealers, &c.

SPOTS ON PRINTS.—SPOTS writes: "Would you kindly tell me the cause of spots on the enclosed prints, as I have been much troubled with them of late. At first I thought it was dust, but have taken care to see that there was no dust about, with the same result."—The spots have all the appearance of having been caused by dust. If they are not, they are probably due to metallic particles in washing waters—iron rust, for example.

COPYRIGHT.—ARTHUR writes: "I have a photograph of a stranded vessel under very difficult circumstances, and the negative is turning out very valuable. I have sold a dozen copies or so, and expect a good sale. Having sold those, will it debar me from securing the copyright if I send you the usual *ls. 6d.*, &c.? I took it on 'spec,' not an order. If I can legally copyright, and anyone copying from the prints I have disposed of, I take it that they are liable. Is it so or not?"—In reply: Registration will give you legal protection for the copyright, for any subsequent infringement of which you can recover.

NIIEVSKY'S APPARATUS.—CRUBEN asks: "1. Where automatic cameras can be purchased. I mean those which you simply expose, then allow the plate to drop into developer. Photographs are sold at *2d.* or *3d.* 2. If I was to take one of those cameras to a seaside place, what should I have to do, either to stand on sands or road close by? 3. Is there any special place that you could recommend?"—In reply: 1. Write Mr. Nievsky, Avenue Road Villas, Shepherd's Bush. 2. You would have to comply with the local regulations. 3. We have seen the machines in successful use in large towns—of seaside places we can say little, as we avoid them.

ENLARGING.—R. M. writes: "I enclose an enlargement I took yesterday from a quarter-plate negative. I am a novice at enlarging, and do not understand the cause of the black granular deposit in the sky. May I ask you to be good enough to assist me? The development was by the Wellington formula and amidol; exposure, twenty minutes with *f-16*. May I also ask you to be so kind as to criticise the print for me?"—With the exception of the granularity in the sky, the print is fairly good. So far as we can judge, the granularity seems to be due to the developer not being kept in motion while the print was in it, or, maybe, too little solution was used. Try with a larger quantity of solution, and keep the dish rocking all the while the picture is in it.

DAYLIGHT ENLARGING.—BOB TIMMS writes: "I have an enlarging lantern with a six-inch condenser. Will you please tell me how it should be fitted into a window, north aspect, so that I can use it for enlarging by daylight?"—No condenser is required for daylight enlarging, it would be of no use. Simply fix the negative at the window, with a piece of white cardboard outside at an angle of 45° to reflect the light through it. It is scarcely necessary to say that all light should be blocked out from the window that except coming through the negative.

"ECZEMA THROUGH TONING" (?).—E. CAVE writes: "Could you give me any information as to the cause of my fingers breaking out and keeping raw for the last three months? The toning baths that I use every day are as follows:—Ammonium sulphocyanide, acetate bath, for silver prints; phosphate of soda bath, for the Aristo paper (American). Also, platinum chloride and phosphoric acid, for the same paper as above. Do you think that either of these chemicals would cause the breaking out on my fingers? It's the same as eczema. I have never had it before, or eczema either."—We do not think that either of the three first-named baths would cause the evil. We have, however, heard of the platinum toning bath producing skin troubles. We should advise you to consult a medical man who makes a speciality of skin diseases.

WET-COLLODION POSITIVES.—COLLODION writes: "Would you be so kind as to explain the method for making wet-collodion positives direct? I believe this can be done by treating the negatives with nitric acid, but so far my results have been extremely thin and faint. An ordinary negative backed with black paper will not do, I want the genuine article. Or, if you could refer me to any work on the subject, I should feel obliged."—The formulae for wet-collodion positives are given on pp. 1088 and 1089 of our ALMANAC. But these will not help you much, as you are quite unacquainted with the process, without full working details. These our space is too limited to give in this column. You had better get any of the old works on photography published twenty or more years ago. All of them contain full details of the process.

A COPYRIGHT MATTER.—COPYRIGHT states: "Some time ago I photographed a building for an advertising firm, and sent them finished prints, also to the people living in the house, without charging them, after which I copyrighted the negative, and have since found that some members of the Mercantile Association have made use of the photograph by ordering a London firm to make a block from same for an illustrated book advertising the place. I have accepted an apology from the Association, but shall be glad if you will tell me if I can recover any compensation from the London firm who made the block, or from the party who printed the book and used the block, who also sent the photograph for the block to be made from."—In reply: Strictly speaking, all those concerned in the reproduction of the photograph are liable; but we doubt if in this case you can recover, as you have accepted an apology from the principal offenders. Better have a solicitor's advice on the point.

STUDIO-BUILDING.—"ONE IN TROUBLE" writes: "I have lately had the roof of my studio altered from 35° to 60° degrees, as H. P. Robinson recommends, thinking that I should improve my work by so doing; but I find that now the shadows are very strong and there is a loss of detail all over, and my sitters are complaining that they look old; in fact, there is no roundness. My studio faces east, is 10 feet wide, 13 feet to ridge, and 7 feet 6 inches to eaves. There is a building on my side about 25 feet high, and distant 70 feet. There are also houses on my front—about 25 feet high, and distant 30 feet. I use dark blue blinds as hitherto, but I seem to have no control over the effect of lighting, as immediately I draw a blind it gives flatness. It seems that more light is required in front of the sitter."—If you got good pictures before the alteration, it is clear that the studio is not improved by the alteration. Or maybe you have not adapted yourself to the altered conditions. If you had sent us a print or two, we might have been able to help you. As you complain that the portraits have no roundness, we suspect you are employing too much direct front top light. Try the effect of stopping off more of the light towards the ridge.

VARIOUS.—VALUE writes: "1. I have been troubled, when photographing in damp, foggy weather, by moisture collecting on the lens; could I, to obviate this, when using a R.R. or single landscape lens, whilst focussing and arranging my picture, by placing on the hood of the lens a cap with a piece of plain glass (optically prepared), removing the same just before exposing the plate? You will readily follow the plan I propose to adopt, but I wish to know whether, when this cap of plain glass were removed, I should have to refocus, or would the removal of the plain piece of glass in front in no way affect the focus of the image? 2. I notice that the Thornton-Pickard Company sell a 'new patent time exposure valve,' giving exposures  $\frac{1}{8}$ ,  $\frac{1}{4}$ ,  $\frac{1}{2}$ , 1, 2, 3 seconds; are the results obtained by this valve sufficiently accurate for you to advise any one buying one of their standard time and instantaneous shutters with speed indicator to have it (the valve) attached? 3. For general work, including architecture interiors, do you consider, with the facilities for enlarging, and when exhibition pictures are aimed at, that the user of a half-plate camera has the pull over one using the 5×5 size? I ask this, as many people advocate the half-plate, which, besides being heavier and more costly to work, does not seem to give the shaped view that we see in nature so well as the squarer one afforded by the 5×4 size."—In reply: 1. The simplest and best way to avoid the condensation of moisture on the lens is to make it slightly warmer than the surrounding atmosphere, then no moisture will condense upon it. Place the lens in the sun for a short time or carry it in the pocket, either will warm it sufficiently to avoid the trouble. 2. This is a different arrangement, and is complete in itself. 3. It is much a matter of taste, but we ourselves prefer the half-plate size to the 5×4.

### EX CATHEDRA.

THE Controller-General of Patents has sent us a copy of the first of a new bibliographical series in course of issue by Her Majesty's Patent Office. It is a book of sixty-two pages, giving a subject-list of works on photography which are to be found in the Patent Office Library. At the end of an introductory note Mr. Dalton tells us that the list comprises 557 works (73 serials, 484 text-books) wholly or in part photographic, representing some 1300 volumes. The catalogue entries relating to these works number 708, and are distributed under 68 headings and sub-headings. A study of the catalogue, which includes foreign as well as English works on the subject of photography, shows, of course, that this section of the Patent Office Library is not entirely complete, and that many books are included which are of very little value indeed for purposes of reference. There is no photographic library with which we are acquainted—and we have had occasion to consult and inspect most of those in London—that would not be the better for the elimination of many useless and redundant volumes. The list before us, however, is a serviceable compilation, and it

bears evidence that an attempt has been made to bring the Photographic Section of the Patent Office Library well up to date. Only a very few years ago, when we were constantly making reference to the photographic books in Southampton-buildings, the absence of many standard volumes was the subject of frequent inconvenience. That reproach has been very largely removed, and the list before us should therefore be welcomed by students and others interested in the literature of photography.

\* \* \*

IF any reader of the JOURNAL owns a whole-plate camera that may be employed for studio and outdoor work, and for which he has no further use, we shall be pleased to be the channel of its disposal for a worthy object. There has been brought to our notice the case of a photographer who, at seventy-five years of age, has had to pass through the Bankruptcy Court, but who is anxious to recommence work with the remains of his old outfit. His camera during the time it has been in the hands of trustees, &c., has become dilapidated beyond repair. From personal knowledge, the case is certified to be a deserving one, and we are assured that the camera would provide the unfortunate photographer with the means of earning a living. On several recent occasions we have regretfully had to mention the fact that the Photographers' Benevolent Association has passed out of existence, so that in distressing emergencies of this kind recourse must, for the future, be had to private sources of assistance; and, as we know only too well, distressed and unemployed photographers increase rather than diminish in numbers. There must be many well-to-do photographers having an idle or unused whole-plate camera on hand, and we sincerely hope one of them will come forward with an offer to help a brother fallen by the way.

\* \* \*

FROM a circular that has been addressed to us, we are pleased to learn that Mr. H. C. Shelley, the able photographer and journalist, who spent eight months with the British Army in South Africa as special war correspondent for *The King* and the *Westminster Gazette*, proposes to deliver an illustrated lecture descriptive of the realities of the conflict in that country. Mr. Shelley's war experiences embrace actual knowledge and personal eyesight of all the chief events of the campaign

on the western side, including the battles of Modder River and Magersfontein, the relief of Kimberley, the surrender of Cronje on Majuba Day, the march to and occupation of Bloemfontein, and the advance on and capture of Brandfort and Kroonstad. We further learn that Mr. Shelley was the only correspondent who was allowed to make an ascent in the war balloon, and during the halt at Bloemfontein he was accorded special privileges by Lord Roberts to enable him to secure the only pictures in existence of many historic incidents transpiring in that town. The opponents of photo-faking will be pleased to be told that, as so many frauds have been perpetrated on the public in the shape of posed photographs and fancy sketches by artists who have not seen what they attempt to depict, special attention is called to the fact that Mr. Shelley's battle pictures were secured during actual engagements, and are absolutely devoid of "faking." Applications for dates and terms for Mr. Shelley's lecture should be addressed to The Lecture Agency, Limited, The Outer Temple, Strand, London, W.C.

\* \* \*

THE lecture, which is entitled "War on the Veldt," will be illustrated by upwards of two hundred lantern slides, and the following is the synopsis: With Sir Redvers Buller to the Cape; General French in a Basket; Transports in Cape Town Docks; Through the Karroo to the Front; Orange River Camp; Breaking out of Bounds; Belmont and Graspan; Modder River Battle; The Struggle at Magersfontein; Two Months of Camp Life; Up in the War Balloon; Round the Forts of Modder River; Jack and his Gun; Exploring the Boer Position at Magersfontein; In Kimberley; Cronje surrenders on Majuba Day; Bloemfontein in British hands again; Life at the Presidency; A Dinner with Lord Roberts, Sir Alfred Milner, and Rudyard Kipling; Off to Pretoria; Brandfort; A Fight at the Vet River; How Lord Roberts entered Kroonstad; Some Personalities of the War, including General Hector Macdonald, Padre Robertson, General Pole-Carew, General Sir Henry Colville, General French, Sir Alfred Milner, and Lord Roberts. We possess every number of *The King* containing reproductions of Mr. Shelley's photographs and his vividly written articles. He has evidently accumulated a wealth of splendid material for his lectures, which should be extremely popular.

\* \* \*

IN last week's JOURNAL we briefly announced the formation of a new camera club at Fulham, and we have since been supplied with further particulars relating to it. The *President* is the local member of Parliament, Mr. W. Hayes-Fisher, an energetic politician, and the *Vice-President* is Mr. F. O. Drew, J.P., Chairman of the Fulham Vestry. The other officers are as follows: *Chairman of Committee*, Mr. Arthur C. Baldwin; *Vice-Chairman*, Mr. Franklin T. Barrett; *Hon. Treasurer*, Mr. C. Pretty, North End-road, Fulham; *Committee of Management*, Mr. W. F. Crawford, Mr. D. Barker, Mr. H. R. Parry, Mr. E. Gabrielli, Mr. E. J. White, Mr. S. Toyer, and Mr. Hearn; *Hon. Secretary*, Mr. A. E. Littleboy, 8, Fulham-park Gardens. The headquarters of the club are at 40, Darlan-road, Fulham, and it is proposed to hold meetings on alternate Wednesdays from September to April. The subscription to the club is only five shillings per annum, and an excellent start has been made with a membership of forty. In suburban London there are wide fields of usefulness open to photographic societies, the success of which mainly rests on the administrative abilities of the officers. There is no lack of business acumen and photo-

graphic knowledge on the Committee of the Fulham Camera Club, to which we extend a hearty welcome, coupled with good wishes for a prosperous career.

\* \* \*

FROM time to time the public learns of the many millions of small prints by the bromide process that are prepared for the decoration of cigarette boxes and similar purposes. They are often mistaken for collotypes. This process, however, has not hitherto met with such a degree of support as its convenience, good qualities, and comparative inexpensiveness should have assured for it. However, we learn from the well-known house of Messrs. Morgan & Kidd, of Richmond, that they are experiencing a demand for collotypes specially produced to advertise articles in popular demand. Before us is a set of little pictures, naval and military subjects, which Messrs. Kimball, of Old Gold cigarette prominence, are attaching to their boxes. There is also a half life-size portrait of Field-Marshal Lord Roberts, prepared by the same process for publicity purposes. These collotypes, though turned out in great numbers, lack none of the qualities we look for as a matter of course in photographic prints; indeed, at a first glance, they might easily be taken for albumen prints, so closely is the imitation often carried. Only recently we had the pleasure of inspecting Messrs. Morgan & Kidd's collotype department, wherein all grades of this branch of printing are executed. We hope their work will find its way on to many millions of cigarette boxes, for it is exceedingly good and cheap.

\* \* \*

BRITISH photographers will be interested to know that the Great International Exhibition to be held at Glasgow next year will have a unique display in the Photographic Section. A representative collection of the world's pictorial photography is to form a notable feature of the Exhibition. A large gallery, considerably over a hundred feet long, will be devoted to the photographs, which will be obtained by invitation. Mr. J. Craig Annan, who is the "convener" of the Committee having charge of this special department, has just returned from a month's visit to the Continent, chiefly occupied in arranging for exhibits from the principal Belgian, French, German, and Austrian photographers. It is rather more than a year since Mr. Craig Annan assured us of his determination to make the Glasgow International Exhibition the occasion of the finest display of pictorial photographic work that has yet been organized, and there is every prospect of his complete success. Of course American and British work will also be represented. With such an inducement as this, it should be the duty of every photographer to visit Glasgow next year. The Paris Exhibition, as we have already remarked, signally fails to do justice to the higher branches of photography, but we anticipate that the great city on the Clyde will achieve all that is possible in the matter.

#### IMPERFECT FIXATION ONCE MORE.

TO many of our readers it may seem like a thrice-told tale to again refer to the subject of the fixation, or rather the non-fixation, of silver pictures, so often has the subject been dealt with in these columns. Still, rarely does a week pass that we do not receive one, two, or three queries, for replies in the Answers column, as to the cause of stains or spots on prints. Last week we dealt with two, this we have received three.

Usually, if the stains appear on the prints before they are mounted, the querists seem either to suspect fault in the paper, or that an assistant has not properly washed them. If, on the other hand, the stains are not apparent until some little time after the photographs are mounted, then the mounts are generally suspected of being the cause. In nine cases out of ten the queries could be answered in two simple words—imperfect fixation.

It is a noteworthy fact that the majority of these queries do not come from inexperienced amateurs; if they did, it might not be surprising; but they come from professional photographers employing assistants. One might reasonably surmise that the former would be sufficient masters of their craft to at once recognise the cause of the defects by the character of the stains, or other defects by their appearance; or, if not, they certainly were able to do so by overlooking the work while in progress. Evidently that is not the case; hence the number of queries we are constantly receiving. Usually the queries are tersely put, in something like the following words: "Please tell me the cause of the stains on enclosed prints." Often the following, in effect, is added: "My printer tells me he (or she) takes every care in the washing," &c.

Last week a correspondent, in his query, adds, "Of course, I cannot say that my printer is truthful, but he appears to take every care, and is anxious." The print forwarded by this correspondent was from a fairly good  $12 \times 10$  negative, and the cause of its yellow, iridescent appearance and mottleness, when viewed by transmitted light, could be recognised at a glance by any one who had but a superficial knowledge of his craft. The print had either been put into a very weak solution of hypo, or merely passed through a stronger one without time being allowed for it to do its work. In either case the chloride of silver was but partially converted into the soluble hypo and silver salts, hence the stained and unfixed appearance of the photograph. Yet the employer evidently did not know the reason, therefore his query to us.

Stains are frequently put down to the *carelessness* of printers. This is a charge that, in many instances, we are inclined to enter a protest against on behalf of the *employés*, and would substitute lack of knowledge in place of the term carelessness. Printing is now too frequently intrusted to lads and girls, taken as apprentices, with or without a premium, so as to get the work done as cheaply as possible—in some cases for nothing. Now, how can employers, who themselves are so ignorant of their craft as not to know the cause of stains, spots, &c., such as they so often seek information upon, teach their apprentices the trade? It is very evident that some that write to us on these and similar things do not understand photography and the fundamental principles involved in its practice. These outspoken words, which we use in the interest of photography itself, we hope will give no offence to any one. Our object is simply to uphold the credit of photography, which the numbers of stained and fading pictures to be met with daily is seriously impairing.

If the proper conditions are fulfilled, there is no reason whatever why silver prints should not be permanent, or at least reasonably so, instead of passing into the "sere and yellow leaf" within two or three years—often much less. Silver prints by hundreds—nay, thousands—are in existence that were made thirty and forty years ago that are now, practically, unchanged; and, what is more, they were produced at a time when far less was known on the theory of the subject than

should be the case now; though, in spite of technical schools, it evidently is not by many, either employers or *employés*.

Often the queries relate to yellow spots which make their appearance some time after the prints are finished. These, in the majority of cases, are due to air bubbles adhering to the surface of the papers when they are put into the fixing bath, thus preventing the free and equal action of the solution, and thereby causing imperfect fixation in those places. One would naturally imagine that every employer could at once localise this defect, and so set his *employés* right in the matter, and it is really surprising that so many are unable to do so. Often the stains submitted to us are due to the prints not being kept in motion while they are in the fixing solution or have been allowed to stick together, so that, again, the hypo does not get free action equally all over the prints; or, maybe, as is often the case, too little solution is employed, and then unequal action is unavoidable. Every one knows that, unless prints, in toning, are kept in continual motion and are not permitted to stick together, uneven tones are the result. Here the effect is seen at once. Precisely the same conditions prevail in the fixing of the prints as in the toning of them, but here the effect is not at the time visually apparent; it only becomes manifest some time afterwards—perhaps in a week, month, or maybe years, but the cause is there from the first.

As we have just intimated, we hope that this somewhat strongly worded article, written in the interests of photography, will be read in no unkindly spirit by any of our readers. On a future occasion we may possibly have something more to say on the subject of the fixation of silver pictures.

---

**The Bank Holiday and Photography.**—All who had to travel in the neighbourhood of London a day or two before the Bank Holiday could not well fail to notice the many reminders there were at the different railway stations of photography. Hand cameras and tripod stands seemed to be in evidence everywhere. During the two or three days preceding Monday last we had to make several journeys in and round London, and could not help noticing how photography seemed to be becoming more and more popular, if one could judge by the numbers who were carrying photographic paraphernalia, though we fear that many were much disappointed with the weather experienced. While noticing the number of travellers we met with photographic impedimenta, we could not help thinking the boon it would be to them if they were enabled to travel at reduced fares. At various times there has been agitation in the amateur photographic world to secure that end. While considering that matter, the reflection is suggested to us, if the boon were granted, what a material difference it would make in the railway companies receipts, seeing the large numbers that were *en voyage* with photographic kits.

---

**Collotype Views.**—At a recent meeting of one of the metropolitan photographic societies a member drew attention to the extent to which cheap collotype imitation silver prints were superseding the genuine article. He added that he rather regretted this tendency in the view business, but, he said, it is very true on the Continent, and he might have added that it is very true in England. Some of the very worst collotype views that have come under our notice, we are sorry to say, were produced in this country, and some of the very best on the Continent. Both good and bad are made everywhere. We have in our possession many collotypes which no one but an expert could detect as not being "the genuine article" if the standard of that be a silver print. More than that, the collotypes are unquestionably permanent, while no such claim can be put forward for the so-called "genuine article." Now, the collotype is,

apart from its undoubted permanency, one of the most beautiful processes of photography, for it is capable of yielding results that are unsurpassed by any other. Unfortunately it is also capable of yielding results as bad as any other when unskillfully worked, and that is, we regret, too often the case when it is worked commercially and price is the chief consideration. The best collotypes cannot be produced rapidly, as commercial work is too often done both at home or abroad. At one time in this country machine collotype work was looked upon as necessarily being inferior to hand-press work, but we unhesitatingly say that better results are produced by machine than is possible in the hand press. But—and here is the crux—the machine must be worked with brains, and at a very much slower speed than is usually the case in commercial work. With the hand press, when the impression is taken from the plate, there is an end to the matter. Not so with the power press, for, by the movement of a lever, the print is retained *in situ* on the cylinder while the plate is being inked afresh, and a second print can be taken superimposed on the first one, and even a third or fourth or more can in the same way be taken at will. In this way any amount of vigour in the print can be obtained. It is tolerably well known that collotype plates with the finest grain are the most delicate and difficult to print, owing to their slight ink-holding properties, but, when two or more impressions are superimposed the one on the other, great vigour is obtainable; but it is obvious that two printings require double the time of one printing, and a proportionately increased cost is incurred in executing the work.

**Vanishing London.**—Those who have passed through the Strand lately need not be reminded that at last the Strand improvement has commenced in earnest. The houses backing on Holywell-street are for the most part cleared away, but the old thoroughfare with its overhanging houses is yet practically intact. Those of our readers who yet desire to obtain photographs of this old street should lose no time in securing them, and for two reasons: First, the street is very narrow, and runs nearly due east and west, and the best time to secure pictures of it is when the sun is near the zenith, then the street is the best lighted, and the best results obtained; each day now the sun gets lower, and by the time it next reaches its present altitude Holywell-street will probably, be a thing of the past; second, securing photographs of disappearing London is often delayed until the buildings have passed into the hands of the bill-posters or those of the "housebreaker." Although houses may not be pulled down for some time after their fate is sealed, they are often disfigured by posters or hoardings long before they are, so that photographs of them in that state are worthless for all historical purposes. Many of the houses in the neighbourhood of Clare Market from which Dickens drew so many of his pictures are already thus disfigured, but many are yet intact, though they will not remain so for long. Therefore we again remind those who wish to secure mementoes of "Dickens' Land" to lose no time, now that the light is favourable to getting them.

**Art Training and Photography.**—This is how Sir W. B. Richmond, R.A., proposes to revolutionise art-teaching. We read that he would place in a well-lighted room photographs of the finest pictures of the world, as well as some tables and chairs, and pencils and paper; and he would let the working man go there and absorb the beauties of art until they became part of his nature; furthermore, he would let him smoke his pipe in the mean time if he cares to do so. His idea is that in time the man would begin to copy the beautiful things around him, and would have developed in him the most human part of his sensibilities. This, in effect, is what Sir W. B. Richmond said at the opening of the Loan Exhibition of Pictures at Deptford last week. The idea is certainly excellent in theory, and one would like to see how it would work in practice. The local photographers of Deptford would certainly do well to study the pictures now being exhibited at the Sayes Court Hall, for we must confess that many of the portraits shown in some of the Deptford photographers' show-cases are certainly not of a very high

art order. By the way, speaking of photographs of the best paintings of the world, it may not be generally known that permanent pigment prints, about nine inches by seven, of the best pictures in our National Gallery and Continental National Galleries are to be had retail for 1s. each. These should prove an immense boon to art students of limited means.

## PARIS EXHIBITION NOTES.

### III.

THE historical photographic exhibits at Paris are extremely interesting, although we may be sure from analogous experiences at home that they will not secure much notice from visitors. We have observed over and over again that modern photographers care very little for that kind of photographic history which is illustrated by examples of obsolete processes and specimens of out-of-date photographic appliances. At South Kensington, in the Museum of the Royal Photographic Society, at the Camera Club, and at the Photographic Club, many precious relics are stored, but you seldom hear of instances in which they are disturbed for purposes of inspection or study. And yet a conscientious endeavour to acquaint oneself with the evolution of photographic practice and the chemical, optical, and mechanical influences that have been at work can only be properly satisfied by a careful contemplation of applied photographic history as it is shown in these collections of antiquities. One class in particular—manufacturers—would profit immensely in this manner. Many old ideas would probably present themselves as worth resuscitation to-day, and, on the other hand, disillusionment of an instructive kind might attack some cherished beliefs in the novelty of several modern inventions.

The historical loan collection at Paris owes its existence to the efforts of the Société Française de Photographie, and the large case in the French section contains specimens of apparatus and examples of processes from Daguerrean times down to the present. Two or three modern apparatus makers, who claim the idea as original, should feel comfort at the information that Dr. Monckhoven's cross-wire "finder," originally introduced in 1866, finds a place in this collection. Panoramic photography, which will not improbably regain favour in the immediate future, is illustrated by some Daguerrean panoramagraphs, truly fine examples of accurate exposure and good definition. The chrono-photographic work of M. Marey is shown in all its stages, and there are examples of Du Hauron's tricolour heliochromy, dated 1868-1875, which, so far as we could judge from a necessarily cursory inspection, are exceedingly correct in colour rendering. A magnificent spectrum, nine or ten inches in length, by the Lippmann process, is contributed by Messrs Lumière. We do not know if this beautiful specimen of interferential photography has been shown in England; but, of the many examples of this class of colour work that we have seen, it struck us as the most remarkable. Solar and stellar photography, photogrammetry, and radiography are very largely illustrated in the French scientific section, and M. Henry Becquerel has a collection of prints showing the effects of the uranium and other radiations—the mysterious "radio-activity" which has recently occupied the attention of prominent French and English investigators.

It cannot be denied that in both the French and the English sections the higher scientific applications of photography are very fully illustrated—it would be difficult to name a branch of investigation which nowadays does not select the sensitive plate as its recording agent—and we have already recognised the outstanding excellence of the British pictorial section, organised by Mr. Craigie; but in most other respects photography as it is represented at Paris is a disappointment. The credit of British professional work is sustained by Messrs. Werner, Byrne, Downer, Lafayette, and a few other firms, but it is placed in the scientific section, and these photographers perhaps do not show the best examples of their powers. It suffices to mention in the apparatus section the names of Messrs. Watson, Messrs. Ross, Messrs. Dallmeyer, Messrs. Newman & Guardia, to give the reader an idea of what these firms' exhibits are—a detailed description of them would read like so many pages out of this JOURNAL and its ALMANAC.

But, were it ever so largely represented at Paris, photography, according to the system of classification or grouping adopted, would not make that appeal to the eye and the mind of the visitor which would have the effect of impressing one outside the sacred pale of cameradom with the beauty and variety of the achievements performed by the lens and the dry plate. Even in its most adequate manifestations photography is but a small thing in comparison with other divisions of human industry. It does not, to quote a familiar term, "bulk" so largely to the view as engineering, sculpture, painting, shipbuilding, and so forth. Undoubtedly, the organizers of the Paris Exposition missed a great chance in not availing themselves of this fact in an obvious manner. The work of Niepce and Daguerre is counted among the glories of France, and the invention of photography ranks very highly on the credit side of a century to which Paris is magnificently writing the word "Finis." What would have been more fitting, then, that photography should have had collective representation in a building specially set aside for the purpose at the Exposition? Two years ago, at Sydenham, British photography filled the naves of the Crystal Palace. We do not think we err in saying that, if the whole of the photographic exhibits at Paris were set out in the same space, there would be a very considerable amount of room to spare, so that a separate photographic pavilion on the Champ de Mars need not have been structurally vast. Unquestionably the Universal Exposition has yet to be held which shall at least attempt to do full justice to the world's photography. Elsewhere we make mention of the fact that at Glasgow next year an earnest effort will be put forth to improve upon past performances in this respect, and we trust that the example thus set will not be lost on the organizers of future exhibitions which appeal for universal support.

Reproductive processes at Paris rely almost entirely for illustration upon the well-known house of Braun & Co., which shows in carbon and photogravure copies of some of the world's pictorial masterpieces, including works which are conspicuous in our own National Gallery. There are one or two Italian contributors of photogravures; but, so far as we were able to perceive, no other country, save Great Britain, is represented by this branch of photography, although it is possible that there are examples in the Exposition which escaped our observation. A series of collotypes, of a very inferior commercial description, are placed in the French section; but they are hardly worth mentioning more specifically. Since the last Exhibition was held in Paris, the revolution in book and periodical illustration then impending, thanks to photography, has become an accomplished fact, and the etched block produced from a negative has driven the work of the hand engraver out of the field. But of this wonderful change little or no sign is visible at Paris.

The amount of discussion relative to pictorial photography, its position and prospects, is very considerable; and, perhaps, is somewhat out of proportion to its absolute importance. Other divisions of photography might advantageously receive more notice than is given to them. Take, for example, reproductive photography, as demonstrated by Messrs. Braun. What a vast scope for admitted usefulness lies before it! The art treasures of the world are ready to hand for sympathetic reproduction in platinum, photogravure, and carbon; of this one phrase of photography alone a great collection might be made and shown to the public, which, in the main, is steeped in ignorance of the capabilities of photography in this important respect. If we except Messrs. Braun's work, Paris reveals to us nothing at all comparable, for instance, to the magnificent series of picture reproductions in platinum which our English Platinotype Company only too rarely show in public. These copies are in themselves perfect examples of monochrome work, judged by the standard to be kept in view when the qualities of a photograph are taken into consideration, and as satisfactory renderings of the originals in tone and texture could not be bettered.

It is apparent that comparatively few English people intend visiting the Paris Exposition, and consequently the photographic section of it will come under the notice of only a small number of photographers from this side of the Channel. If there be any who make a visit the opportunity of conscientiously studying the

comparatively little photography that is to be seen there, we should be surprised if the resultant feeling is not one of considerable disappointment. From our particular standpoint the Paris Exhibition is one of lost opportunities. In years to come, some great universal show may possibly be held in which the world's photographic workers will combine for the purpose of setting forth in no half-hearted manner a collective exposition which shall be worthy of photography. So far such a thing does not appear to have been contemplated by exhibition organizers.

ON THE NEW KACHIN DEVELOPER.

It is now more than a year since I made my first acquaintance with kachin. On its first introduction in the market I had the pleasure of contributing an article to the JOURNAL on this, the then latest new developing agent. In that article all I could say was in its favour, and now, after a more extensive experience with it, I can still speak in its praise. Just now Messrs. J. J. Griffin & Sons are introducing a new and improved kind of this developer, and a short time ago they were good enough to send me a sample for trial, and, if permitted, I should like to say a few words on its characteristics.

In appearance the new kachin does not differ much from the older kind, nor does it in solubility. It dissolves at once. With the older form caustic soda was necessary as the accelerator, and that is not a pleasant material to deal with. Again, the caustic soda in the developer produces an unpleasant softening of the skin of the fingers. Furthermore, it has a tendency, during hot weather, to soften the gelatine and so render the negatives tender to handle, and, with some plates, to cause frilling of the film. It is these inconveniences that have, I believe, mainly led the manufacturers to so modify the original kachin that it can be used with the carbonate, instead of the caustic alkali, while still retaining its old qualities. With the carbonate of soda the modified kachin is as energetic a developer as the original one was with the caustic soda. This would seem to show that the new agent is, *per se*, really a more powerful developing agent than the old one. Another advantage in the new material is that it can be used for developing Velox paper for colours, thus avoiding any after-toning, which the old kachin was not well adapted for.

Here is the formula recommended by the makers as a developer for plates and films, and I am pleased to see that Messrs. Griffin have given it under the metric system as well as the antiquated British one. It stands thus:—

KACHIN SODIUM CARBONATE.

	A.	
	British System.	Metric System.
Kachin .. (avoirdupois)	160 grains.	9 grammes.
Sodium sulphite (crystal-		
lised .....	2½ ounces.	62.5 "
Water (up to).... (fluid)	20 "	500 c. c.
	B.	
Sodium carbonate (crys-		
tallised) .....	2 ounces.	50 grammes.
Water (up to) .... (fluid)	20 "	500 c. c.

For use take equal parts of A and B. More diluted developer gives softer results.

With this developer and a plate with normal exposure, I find the image appears in from half a minute to a minute, according to the temperature; in the tropical heat we had a fortnight ago the image came out in about thirty seconds. After the image appears, development proceeds steadily and uniformly until the desired density is obtained. A vigorous negative takes from four to six minutes. If the negative is under-exposed, a little longer time will be required. If the negative should be considerably under-exposed, some more of the accelerator "B" may be added to hasten the operation; but, except in extreme cases, a longer time in the solution will suffice, as, with this developer, density seems, so to speak, to wait for detail. In the case of much over-exposure, a five per cent. solution of ordinary borax is recommended as the restrainer, and I find it answers

admirably. However, the orthodox bromide may be used, and, personally, I am inclined to prefer it, but that perhaps is because I am a little conservative in my ideas—I am sometimes said to be so.

The negatives yielded by the new Kachin are of the same character as those by the old. They are free from staining of the film, and are of a rich, warm, black colour, which is not deceptive in the development, as is the case with some other developers which yield negatives that seem to have sufficient printing density when developed, but prove much too thin after they are fixed.

One most useful quality in Kachin is that its solution can be used over and over again. I have used the new kind after many plates have been developed in it, and then kept it three weeks and it still worked well. Necessarily the more plates that are developed in the same solution the slower it becomes in action through the accumulation of bromide from the films, though there is not very much difference unless a large number of plates have been developed in it. An old solution will be found an advantage in the case of much-over-exposed plates, as no restrainer is then necessary, and it tends to give vigour.

Kachin, whether the old or the new, does not in the least stain the fingers, neither has it any injurious action on the skin, as some developers have. In the little booklet, *How to Develop with Kachin*, issued by Messrs. Griffin, a formula corresponding with the above is given in ten per cent. solutions, which are preferred by some who like to know the proportion of each ingredient in grains per ounce they are working with. It is as under:—

KACHIN SODIUM CARBONATE.

(Using so-called Percentage Solutions.)

Ten per Cent. Kachin A.

Kachin .....(avoirdupois) 1 ounce.  
Sodium sulphite (crystallised) .. 1 „  
Water (boiled or distilled) (up to  
(fluid) 9 ounces. 1 drachm.

Ten per Cent. B.

Sodium carbonate (crystallised).  
(avoirdupois) ..... 1 ounce.  
Water (boiled or distilled) (up to  
(fluid) 9 ounces. 1 drachm.

Ten per Cent. C.

Sodium Carbonate (crystallised)  
(avoirdupois) ..... 1 ounce.  
Water (boiled or distilled) (up to  
(fluid) 9 ounces. 1 drachm.

For a normal developer take—

A ..... 80 minims.  
B .....(fluid) 7 drachms. 20 minims.  
C .....(fluid) 7 „ 20 „

Each fluid ounce of the above contains—

Kachin ..... 4 grains.  
Sodium sulphate ..... 26 „  
Sodium carbonate ..... 22 „

In the booklet a formula is also given for a caustic soda developer; but, as one of the special advantages of the new Kachin is that it can be used with the carbonate, I will not take up space by quoting it. I might here mention that the new Kachin, with the requisite carbonate, &c., is put up in glass tubes (“cartols”), and kept separated by a partition, six in a box for 2s. With these all one has to do is to empty the contents of one of them into 4 ounces of water, when we have a one-solution developer ready for use without further trouble. Or, if preferred, the two can be dissolved separately, each in 2 ounces of water, and we then get a two-solution developer without the trouble of having to weigh out the different ingredients. These “cartols” will, I am sure, be found a great convenience to amateurs, and they will also prove economical for the reason that amateurs often have to waste much of the sulphite of soda through it all going bad before it is all used up, and also that they cannot always replenish their stock when away from home.

One property of Kachin, both the old and the new, is that it can be employed to develop and fix the negative at the same time. The formula for that is as under:—

Stock Solution.

British System. Metric System.

Sodium sulphite (crystal-  
lised) (avoirdupois) .... 4 ounces. 30 grammes.  
Caustic potash (purified in  
sticks) ..... 408 grains. 7 „  
Kachin ..... 408 „ 7 „  
Water (up to) .....(fluid) 10 ounces. 75 c. c.

For fully exposed plates take—

Stock solution .....(fluid) 6 drachms.  
Hypo solution (1 ounce of hypo to 5 ounces  
of water) ..... 10 „  
Water ..... 15 „

With this, and exposures approximately correct, I have got excellent negatives. But, as a professional photographer, I must confess I am no admirer of combining two distinct operations in one. I am no more in favour of combined developing and fixing than I am of combined toning and fixing. Still these systems do find favour with some amateurs—mainly, I surmise, as a matter of convenience.

The new Kachin, with carbonate, I find, is admirably suited for bromide paper. It yields fine warm blacks, and better than I have been able to get with other developers. Also with “platinomatt” paper, in my hands, it gives tones more closely resembling genuine platinotypes than does the formula supplied by the makers of the paper I experimented with. I may as well quote the formula I used.

A.

British System. Metric System.

Kachin ..... 160 grains. 9 grammes.  
Sodium sulphite (cryst.) 2½ ozs. 62.5 „  
Water, up to ..... 20 fl. ozs. up to 500 c. c.

B.

Potassium carbonate .. 1¼ ozs. 31.25 grammes.  
Potassium bromide .. 4 grains. 23 „  
Water, up to ..... 20 fl. ozs. up to 500 c. c.

Take equal parts of A and B.

Kachin does not lend itself to black tones with “Velox” and similar papers. But it is excellent for colours, without the necessity of after-toning. Here is the developer for this purpose:—

British System. Metric System.

Kachin ..... 40 grains. 4.5 grammes.  
Sodium sulphite (cryst.) 250 „ 28.5 „  
„ carbonate .... 350 „ 40.0 „  
Potassium bromide .... 2 „ 23 „  
Water, up to ..... 10 fl. ozs. up to 500 c. c.

With this developer and the “Carbon Velox” any colour from a dark chocolate brown, through the sepias, to a bright red chalk—even a fiery red—can be obtained at will, simply by modifying the exposure and the developer. The longer the exposure and the more the developer is diluted and restrained, the redder will be the colour. Used as given above, with the addition of five or six drops of a ten per cent. solution of bromide of potassium to the ounce, and an exposure to three inches of burning magnesium ribbon, six inches from a negative of average density, a good chocolate brown results. With the developer diluted with half its bulk of water, and fifteen to twenty drops of bromide solution, a warm sepia is obtained with an exposure to four inches of magnesium. With five inches of ribbon, and the developer diluted with an equal bulk of water, and restrained with fifty to sixty drops of bromide to the ounce, a dark red chalk is the result. If the developer is diluted with twice its bulk of water and still further restrained with a hundred or a hundred and twenty drops of the bromide, and six inches of ribbon used, a bright fiery red will be obtained. That is what I have found when employing what I call negatives of average density. “Average,” however, is

by no means a fixed quantity when applied to negatives, for what some would call strong, others would term medium, or even thin.

In my experiments with Velox and Kachin I found that the tints could be considerably modified by the addition of a ten per cent. solution of citrate of soda, in the proportion of about double the quantity of the bromide employed. With this the tints partake more of a purple, and less of a yellow, tinge. Here is a hint I would give in working with Kachin for colours, namely, that in producing the redder tones the development should not be carried too far, as the pictures dry up much darker than they appear whilst wet.

The special purpose of Kachin, however, is not so much for paper as it is for plates and films, and for them I find, on comparison with other developers, that it is one of the best with which I am acquainted. I would therefore recommend my professional friends, who are still wedded to the "good old pyro," to give it a fair trial.

E. W. FOXLEE.

## THE PHOTOGRAPHER'S YEAR.

### AUGUST.

"THERE is no month in the year in which nature wears a more beautiful appearance than in the month of August. Spring has many beauties, and May is a fresh and blooming month, but the charms of this time of the year are enhanced by their contrast with the winter season. August has no such advantage. It comes when we remember nothing but clear skies, green fields, and sweet-smelling flowers—when the recollection of snow and ice and bleak winds has faded from our minds as completely as they have disappeared from the earth; and yet, what a pleasant time it is! Orchards and cornfields ring with the hum of labour; trees bend beneath the thick clusters of rich fruit, which bow their branches to the ground; and the corn, piled in graceful sheaves, or waving in every light breath that sweeps across it as if it wooed the sickle, tinges the landscape with a golden hue. A mellow softness appears to hang over the whole earth; the influence of the season appears to extend itself to the very waggon, whose slow motion across the well-reaped field is perceptible only to the eye, but strikes with no harsh sound upon the ear. As the coach rolls swiftly past the fields and orchards which skirt the road, groups of women and children, piling the fruit in sieves or gathering the scattered ears of corn, pause for an instant from their labour, and, shading the sunburnt face with a still browner hand, gaze upon the passengers with curious eyes. The reaper stops in his work, and stands with folded arms looking at the vehicle as it whirls past. . . . You cast a look behind you as you turn a corner of the road. The women and children have resumed their labour; the reaper once more stoops to his work; the cart-horses have moved on, and all are again in motion."

Such is the description of the month from the master-hand of Dickens. Individual observation in any suitable part of the country will verify it to-day as true and distinctive. Rural England never looks so full and rich as in August. If it be desired to embody such a pleasing feature as ample prosperity in a picture, this is the fitting opportunity. Speaking generally, no one with a fairly active liver will question that an immediately apparent pleasing idea is about the highest qualification that a picture can possess. If the tombstone mood be on, as it occasionally is with the best, let the camera at least be left at home. Instead, let there be as many as possible of Dickens's ingredients in the picture—sunshine, fruit-picking, corn sheaves, and exhilarating motion. The last item, and one which he ever loved to dwell upon, in coaching, has been evolved out of existence. As a point of vantage to observe from, the coach-top is no longer available—a most regrettable loss so far as the summer months are concerned. We are very ready to congratulate ourselves upon the great advances made during the last fifty years, particularly in the matter of newspapers and travelling. Whilst admitting gains, we have had to pay some penalty for the progress. There was more individuality, and harder thinking, when newspapers were fewer. The persistent drip of a halfpenny daily soon wears down solidity of character. Open, leisurely coaching, again, gave far better opportunity for drinking in fair country sights and scenes than railway travelling. The box seat of a coach in August must have been a true throne to one with a sympathetic feeling for nature. With all fitting respect for the padded comfort of a railway carriage, it could never rise to the top of a coach in fine weather. Luckily, something of a minor salvation has been worked out for us in the bicycle. It is the best existing means of coming into touch with the country, a fact proved by the marked increase of books dealing with the country since the bicycle has been brought to the point of being safely

and easily rideable. There is no necessity for entering into its many and various advantages; most readers will have found them out for themselves from experience. Amongst them much has been written of the facility with which it lends itself as an aid to the photographer.

Different views have been advanced as to the best form of camera to use, the best position upon the bicycle or its rider, upon which to carry it, and various little ingenious appliances invented to the doing so with a minimum of jar and dust intrusion. In the abstract it looks very easy and practicable. Why is it that we see so few cameras on bicycles? And why so few good pictures when they have been carried? As a matter of fact, there is a bottom drawback acting independently of mechanical possibility, and even the inclination of the rider. The cycling mood is opposed to the photographic one. The natural tendency of the cyclist is to keep moving. The mind appears to become sympathetically sensitised by the physical motion, and takes to a ruling occupation of measuring things by distances, and the time in which those distances can be covered, comfortably or otherwise. One may determine, before starting on a run, that a part of its programme is to consist of admiring the view from a ridge, or smoking a pipe in the wayside shade. But, once comfortably a wheel, the view is postponed from one gap or ridge-top to the one further on, and yet further on, with the ultimate result that it will not be looked at definitely at all.

Insensibly the important point becomes, How far is it to A? What prospect there is of getting into B in time for dinner or a bed? It is not stated, of course, that the necessary break cannot be managed at all, but the strongest tendencies pointed out. Most cyclists who do carry agreeable impressions of views will be ready to endorse the foregoing by noting, upon looking more closely back upon their pleasant memories, that they were gained not by following a predetermined plan, but during rests from weariness, for the absorption of "long" drinks, or for eating. There is, too, a general expansion of mind felt by the cyclist that is not of a piece with the cramped result given by the camera. The rapid motion, the thorough oxygenation of blood and tissue, and the closer contact with the open face of heaven and earth, account for it.

To do justice to his feelings he wants a camera that can take a panoramic view, a lens working at  $f/1$  to give the necessary atmosphere, a shutter that will go off at the highest curve of an emotion, etherealised emulsions on his plate to record even suggestion of light and shade, and certainly an included something to register colour. But this, alas! is the kind of article given away to good and honest photographers in Elysian realms above: to ones, maybe, who when below did not cut prices for a dozen cabinets, who did no more retouching than they could help, and who possessed no competition medals. Even if it were available here, the necessary favourable condition for gaining full results would be so rare, and probably take its owner as unpreparedly as is the case with the less perfect instrument he has, that it would not be of much use. To cement the cyclo-photographic elements some solution with more clay and less ether in it is necessary. The practicable one must certainly take into chief consideration the ethical condition referred to, induced in the rider when his machine runs easily. It depends a good deal upon the proportions of cyclist and photographer in the worker. But one thing is certain, that the latter element will not have fair play, nor show high result, unless it be subject to something less erratic than passing fancy. The work should be to a plan. A series of photographs of English villages, for instance, would form a valuable possession; and English villages never look better, or more thriving, than they do in August. They would be agreeable mementoes of tours, and invaluable as factors in an intelligent, wide grasp of the face of England. The bicycle, and the bicycle only, can bring them within the reach of a moderately lined purse, and at the same time give the added measure of healthy and pleasant exercise. Once the plan had begun to get filled in, there is little fear that any mere moving impulse would send a man through a village that deserved notice without stopping.

Another plan of a very high order would be, trying to suggest the word-picture of a master, say that already referred to of Dickens, in a picture. Others of our classical writers, Scott, Ruskin, Blackmore, and Stevenson, have drawn pictures of the country, with the broad, simple touch characteristic of genius. The reader knows the spot, or such another, and, tribute to the touch of a master-hand, thinks he could describe it equally well himself. He soon finds out his mistake, if he takes upon himself to try, but with a sympathetic liking, and the faculty for selecting, the camera will help him out in getting a picture of it. In the case of the picture quoted, as a whole it is beyond the camera, but portions of it might be picked out and shown, fruit-gathering, corn-reaping, gleaming, the corn waggon, and so on. Many visits would have to be made—by the ready aid of the bicycle—many exposures made, an

probably many failures recorded before the desired result was got. But these are no peculiarities of photographic success; they are common to all best work in every direction. The great thing is the ultimate success. If even one such could be placed against each month, the worker may count himself lucky. Twelve in the year! Why, there are many workers of the very first order who cannot count as many real successes in as many years! The evolution of many things, from a piece of pottery to man himself, has been shown us with pen and pencil; it would be quite as interesting, as well as encouraging, to a conscientious and high-idealized photographer, inclined to be discouraged at the many difficulties in his path, if the full evolution of a really fine photographic picture, from the germ of the first suggestion to the framed success, were shown in the same way. There would be less of the happy accident about it than we are inclined to think, although possibly the highest praise that can be given to a picture, after all, is that it looks a happy accident.

But, let the plan be what it may, there is fine material of the best available in August, in its rich, mellow, sunshiny fulness. As a continuation month of the holiday one of July it also has its greater leisure, and from the fact of their being themselves more abroad in it, friends and critics will the more readily recognise the particular scenes and objects depicted, and, if good, be in a better position to appreciate and praise them.

#### DEBASED PHOTOGRAPHY.

We have received a copy of the speech on the evils of the streets of London, delivered by Mr. Samuel Smith, M.P., in the House of Commons on Friday, July 13. The Hon. Member made the following references to certain objectionable uses which are charged against photography: "Photography is far more employed than it used to be. It is much easier to produce cheap illustrations; and there are villains who scour the picture galleries of Europe to collect the worst garbage, and reproduce them in cheap forms for English circulation. One of these publishers offers twenty-four of such pictures for sixpence, and this is advertised in the cheap papers sold to boys and girls.

"Related to this trade in obscene pictures is the great abuse of animated pictures. This wonderful discovery can be utilised to give rational and innocent entertainment, and usually is, but it is also used by ruffians to debauch the young. In my constituency, last year, we discovered some 'penny-in-the-slot' machines which exhibited grossly indecent pictures to boys and girls, and I had many letters complaining of this plague from seaside resorts. Now I am told that many parts of London are plagued with it. I quote from a reliable observer:—

"I visited the Exhibition at Earl's Court on Friday, June 29. Many 'animated pictures,' 'mutoscopic views,' or 'moving pictures' are on view there in various parts of the grounds and buildings, all exhibited by means of 'penny-in-the-slot' machines. The first set of machines I visited were advertised to contain 'mutoscopic' views, and a number were labelled with suggestive titles. I put a penny in one machine, and found that it contained a series of pictures of girls in short frocks engaged in kicking at a hat which was held above their heads, there being at each attempt a liberal display of underclothing. In another machine of this set, labelled 'The Spider and the Fly,' views were exhibited showing a woman in tights sitting in the centre of an imitation spider's web, and inviting a young man to come to her. He resists at first, but in the last view rushes forward evidently to embrace her. There were many other views with suggestive titles. One which I saw was called 'Mixed Bathing Allowed,' and represented women in scanty bathing costumes playing on the beach.

"I visited another set of machines not labelled 'mutoscopic.' These pictures were the worst I have seen. One set was entitled 'Behind the Scenes of a Paris Theatre,' and consisted of thirteen pictures, which I saw. All of these pictures were objectionable, and many were indecent. One was a picture of a perfectly nude female; another represented a girl undressing in a bedroom; a third, a girl with nothing on but a thin under garment; and many were pictures of the lowest kind of French dancers in indecent and suggestive attitudes.

"I may add that the attendants at many of these machines are girls.

"Scoundrels take an empty shop in a populous thoroughfare and fit up their machines with such pictures, putting suggestive headings in the windows, and a crowd of children are enticed within, and gradually brutalised by the disgusting sights they witness. In a primitive state of society these men would be lynched, but here they are allowed to do as they like."

There is no doubt that photography, ever since it became a practicable portrait process, has suffered from the improper uses that have been made

of it; and the honourable member from whose speech we are quoting but no means indicates, as every man of the world perfectly well knows, the worst features of this unpleasant traffic. The examples cited in the above speech are, perhaps, less objectionable than they are made to appear in the printed report of an impassioned harangue; but, independently of this aspect of matters, the member for Flintshire may rest assured that the many thousands of right-minded photographers in this country will view with disfavour any attempt to utilise their favourite art inimically to public morals.

#### FOREIGN NEWS AND NOTES.

**Photo-Niello.**—Herr Gaedicke, the editor of the *Photographisches Wochenblatt*, has patented a process of imitation Niello-work, in which photography plays an important part. Niello was practised in the fifteenth century by Italian silversmiths for the decoration of small articles. A design was deeply engraved in line upon a plate of silver, and filled with a mixture of sulphide of silver, copper, and lead, and exposed to heat. The lines and surface are thus covered with a black substance resembling silver in regard to flexibility and capacity for polish, and, by grinding until the silver groundwork of the design is again exposed, some very beautiful decorative effects are obtained. Herr Gaedicke transfers a suitable process print to silver, etches it, and fills it in with Niello. Some small difficulties have to be surmounted in the etching, as silver must be treated differently from zinc or copper; but the real difficulties are connected with the application of the Niello. The dots forming the image are so fine and close together that the old process is useless, the Niello being too coarse. Herr Gaedicke, therefore, makes his Niello by precipitation from a mixed solution of copper, silver, and lead salts, and the powder thus obtained is so fine that, with a little practice, the image can be properly filled in and then fixed in a muffle furnace. The process may have to be repeated two or three times until the entire surface is covered. The plate should then be ground successively on fine sandstone, wood ash, and finest emery, until the image is perfect, and has the appearance of a very fine process print.

**A New Company.**—We learn from the *Deutsche Photographen Zeitung* that a new company has been formed in Germany for the manufacture of photographic apparatus and kindred appliances, with the exception of optical instruments in the more restricted sense, and for the sale of all kinds of photographic requisites. The Company is called the "Actien Gesellschaft Camerawerk Palmas," and has a capital of 150,000 marks. The Company takes over the assets and business of the firms Karl Bernhard Kurt Bentzin, cabinet-maker, and Karl Bentzin, photographic apparatus manufacturer, of Görlitz, by purchase, for the sum of 100,000 marks. The managers are Hugo Oscar Ludwig Bräntigam, merchant, of Görlitz, and Karl Bernhard Kurt Bentzin, cabinet-maker, of Görlitz. The founders of the Company are Dr. Paul Rudolph, mathematician; Karl Gustav Hermann Richard Schüttauf, mathematician; Karl Friedrich Oswald Näther, foreman; Karl Friedrich Hyronimus (alias Fritz Müller), foreman; August Bruno Klemm, foreman, all of Jena, who have subscribed the capital. Emil Mehlhorn, barrister and notary, of Kahla; Gotthilf Heinrich Franz Schmidt, merchant, of Snalfeld; and Karl August Kellner, merchant, of Kahla, have been elected members of the first Board of Directors.

**Reduction and Reversal with Permanganate of Potash.**—It will be remembered that, shortly after the persulphate of ammonium reducer was introduced by Messrs. Lumière, Professor Namias drew attention to the use of permanganate of potash for the same purpose. The *Photographisches Centralblatt* republishes the formula given by Professor Namias, and recommends permanganate instead of persulphate, as it is a salt which may be obtained anywhere of sufficient purity, whereas persulphate varies considerably in quality. Namias gave the following formula in the *Bulletin de la Société Française* for December 15, 1899:—

Permanganate of potash . . . . .	½ gramme.
Strongest sulphuric acid . . . . .	1 c. c.
Water . . . . .	1000 "

Like persulphate, this reducer attacks the densest parts of the negative first, and it is of great value in the treatment of hard negatives. Moreover, the negative does not need prolonged washing for removal of the hypo, as the permanganate oxidises any trace which may remain in the film. The brownish tone, which sometimes remains after treatment with permanganate, may be removed by immersing the plate in a one-half to one per cent. solution of oxalic acid to remove residual traces of manganese peroxide. Permanganate may also be used for making direct positives in the camera. A slow plate should be used, and full exposure given. Develop with hydroquinone, using at least seven grammes of bromide of potash per litre of developer. A very strong image should be aimed for, regardless of fog. After development the plate should be immersed in a permanganate bath of double the strength given above. The image will soon disappear, and, if a brownish stain should remain, treat with oxalic acid as recommended. The positive should then be developed in daylight with—

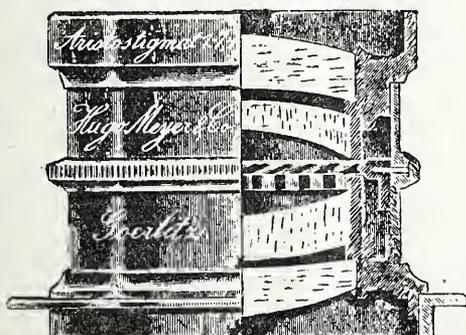

Metol .....	10 grammes.
Anhydrous sulphite of soda.....	20 "
Caustic potash .....	10 "
Water .....	1000 c. c.

An image of fine black tone is obtained. If the gelatine should show too much tendency to frill, add a little formalin to the developer.

THE ARISTOSTIGMAT—A NEW LENS.

ACCORDING to the *Deutsche Photographen Zeitung*, the firm of Hugo Meyer & Co., of Görlitz, have introduced a new lens which is shown in the accompanying figure; and, as will be seen, it consists of two unsymmetrical and uncemented combinations, each consisting of an outer convergent lens and an inner divergent lens. It is somewhat similar in type to the Planar and Unar, of Zeiss. This lens is said to work at an aperture of  $f-7.7$ , and from the tests of Herr Schwier, its effective aperture was  $f-7.85$ . When focussing the same size, the chemical focus was 1.5 mm. within the visual; when the image was  $\frac{1}{2}$  of the original, it was 0.9 to 1.2 mm.; when focussed on infinity, there was no difference. The lens is quite free from focal difference with the diaphragms.

The field of illumination is about  $110^\circ$ , and the greater part of this could be used practically when stopped down, as the lens is so astigmatically corrected, that at an angle of  $39^\circ$  to the axis an almost

complete sharpness is attained in the picture plane. The following variations were found; at  $10^\circ$  from the axis 0.7 mm., at  $15^\circ$  1.6 mm., at  $20^\circ$  2.1 mm., at  $25^\circ$  3.2 mm., then the error quickly sank again, till at  $39^\circ$  it was flat. The curves for the meridional oblique rays are so close to one another, that sufficient sharpness for the two may be simultaneously obtained on one plane, and the flatness of field is such that, with a group of  $2\frac{1}{2}$  m. breadth, the greatest sharpness in the middle is only 20 cm. behind the other sides.

With a lens of 24 cm. (advertised) 24.35 actual, a plate 18 x 24 cm. is covered sharply with full aperture, and 24 x 30 cm. is covered with smaller stop, if, as is generally the case in practice, absolute sharpness is not required in the extreme corners. A plate 13 x 18 cm. is covered absolutely sharp at full aperture.

Distortion was not detected either with the complete lens, or with the back lens alone, which covered a plate 13 x 18 at  $f-30$ . Flare was not detected in spite of the number of reflecting surfaces.

MEASUREMENT OF PHOTOGRAPHIC INTENSITIES.

[Reprinted from *Popular Astronomy*.]

THE object of this investigation is to determine the photographic intensity of various sources of light upon a uniform scale. This scale will be that of the Meridian Photometer, in which  $\alpha$  Ursæ Minoris has the magnitude of 2.15, and one unit corresponds to the ratio of 2.518, whose logarithm is 0.400. Luminous points may be compared directly with stars. In the case of surfaces, the light emitted by a circle having a diameter of one minute of arc is employed. In general, different portions of the same photographic plate are exposed for a given time to the sources of light to be compared, and the darkening measured with a photographic wedge.

Observations of surfaces will include intensity of the sky at different distances from the sun; the sky in the zenith during twilight, on clear and cloudy days, on dark and moonlight nights; comparisons of blue sky with cumulus cloud; intensity of Milky Way, Aurora, and Zodiacal Light. For this purpose pinhole cameras are used with various apertures. For very faint lights, apertures subtending an angle of sixty degrees or more are used. When possible, automatic devices are employed, both to make the exposure and to shift the plate.

For measuring luminous points, the light concentrated by a lens illuminates the plate placed at various distances from the focus. In this manner, bright stars, the planets, and the Moon at different phases and latitudes may be compared with  $\alpha$  Ursæ Minoris or an artificial light placed at a distance. It is also necessary to determine the effect of any slight fogging before, after, or during the principal exposure. The total and local absorption of the lens will also be measured. The same objects are also compared directly by pinhole cameras. In using a pinhole camera to measure points differing greatly in brightness, the duration of the exposure must be varied. This necessitates a study of the darkening of the plate with relation to time. The comparison is made, in all cases, with a light, producing an equal darkening in the same time. Another factor may be introduced by inclining the plate. An angle of sixty degrees is equal to a diminution of one-half, or about three-quarters of a magnitude. The exact amount corresponding to the inclination used must be determined by experiment.

The determination of the light of the sun is a difficult problem. The light may be reduced by a distant lens of short focus, and compared with the standard light similarly reduced, but at less distance. Another way is by a combination of lenses like a telescope, which enlarges or reduces objects as we look through one end or the other. The absorption of the instrument is thus eliminated. Two plates of glass, placed so as to give multiple reflections, will also afford a wide range of exposure, as well as a means of comparing lights of great difference in intensity. Pinhole cameras having the aperture covered with a porcelain plate can be constructed so as to give a range of fifteen to twenty magnitudes, which is sufficient for comparing the sun and the moon. A second pinhole camera placed in front will cut off the light of the sky from the aperture. The absorption and the diffusing power of the porcelain plate must be measured independently. In all the preceding plans the sensitiveness of the plates to different colours affects the results. By combining a slit-spectroscope with the cameras just described, a comparison of the light of the sun and the moon may be made in different parts of the spectrum corresponding to given wave-lengths.

The comparison of the spectrum of the various sources of light possesses many advantages. The work is placed on such a basis that the results are freed from the troublesome questions of absorption, sensitiveness of the plate, &c., and are rendered directly comparable with those that may be obtained at different times, by other observers, under widely differing circumstances. In fact, the results should be the same as those obtained by the eye, the bolometer, or in any other manner that may be devised. All these measures may be made either with a telescope and objective prism, or with a slit spectroscope combined with a pinhole camera or telescope. With the objective prism the spectra are made of the same width, either by interposing a cylindrical lens, by moving the plate at the same equable rate for each exposure, or by throwing the image out of focus. In the latter case a rectangular aperture should be placed over the prism, so as to give width with a minimum loss of definition. With the moving plate a variation of light is obtained by covering one-half of the prism at a time, along a line perpendicular to its edge.

The standard light used is an ordinary Argand gas burner shining through a small hole. The star  $\alpha$  Ursæ Minoris is made the ultimate standard to which all work is referred, since the standard light is compared with it before and after each monthly test of the plates. In addition to the wedges for measuring the density of photographic plates a polarising photometer is used for comparing surfaces with each other.

Early in 1900, while this work was in progress, Mr. W. H. Pickering, in preparing to observe the Solar Eclipse of May 28, desired to select a suitable plate and developer for the work, and accordingly undertook the following investigation, which he describes below:—

A suitable standard of light has long been wanted in photography. Artificial sources usually give even more uncertain results photographically than they do visually, because a slight variation in temperature will affect the blue end of the spectrum even more than the red end. In 1893 it occurred to the writer to employ as a primary standard of actinic intensity the radiation of a star shining directly upon the photographic plate without previously passing through or being reflected from any medium except our atmosphere. Since this standard is too faint for general use, a secondary one to be standardised from it has been devised. The light from the star is condensed through a simple plano-convex lens of 8.2 cm. aperture and short focus, and is focussed on a small circle of ground glass 0.5 cm. in diameter. This is placed 3 cm. in front of the sensitive plate, which is exposed to it through a small square aperture measuring 0.2 cm. on a side, cut in a blackened brass plate. The constant of this instrument was determined, and it was found to give about thirty times the light of the direct radiation of a star upon the photographic plate. With twenty minutes exposure *a Ursæ Minoris* darkened the plate sufficiently to produce the "Sensitive Tint," that is to say the tint where a small variation in the light is most noticeable. The secondary standard, however, is not sufficiently brilliant for ordinary purposes, and a tertiary one has therefore been devised. This consists of a box 30 cm. in length, one end of which contains an aperture 5 cm. in diameter, covered by a piece of ground glass, and the other end carries the sensitive plate and the blackened brass plate described above. Just inside the ground glass may be placed diaphragms ranging from 0.04 to 4.0 cm. in diameter. At a distance of about 200 cm. beyond the ground glass is placed an Argand gas burner. This apparatus gives ample light for all photographic purposes, and the plates exposed in it may always be standardised when necessary by an additional exposure to the secondary standard.

The three pieces of apparatus above described are adapted to various investigations. Thus the photographic brightness of the moon, and of the brighter stars and planets, may be measured with accuracy by employing different apertures in front of the lens of the secondary standard, and measuring the brightness of the various images obtained by means of a photographic wedge, or a series of standard squares of varying density. It is very important to vary the aperture rather than the time of exposure, since the results obtained in the latter case would have to be corrected by the "time correction." The secondary standard also enables us to express the sensitiveness of a plate in terms of universal application throughout all time. Thus the Seed plate No. 27 is capable of being appreciably darkened when exposed for ten minutes to a source equal to 300 times the brightness of *a Ursæ Minoris*. This amount of light is equal to about thirty times the brightness of a star whose photographic magnitude is 0.0. The logarithm of this number, 1.5, may be conveniently used to represent the sensitiveness of the Seed plate. By the use of the secondary and tertiary standard, together with an ordinary photographic telescope, we may make a study of the brightness of nebulae, comets, and other luminous surfaces.

From these various investigations it is hoped that we shall obtain a scale of photographic intensities with which all sources of light may be compared and to which they may be referred.

PROFESSOR EDWARD C. PICKERING.

Harvard College Observatory.

## ANALYTICAL PORTRAITURE

[Reprinted from *Nature*.]

It seems well to put on record the principal results of experiments that I have recently made to isolate the particulars in which one portrait differs from another. They had a measure of success, but not enough to deserve illustration or lengthy description. The objects I had hoped to attain are important; namely, to define photographically the direction and degrees in which any individual differs from the race to which he belongs, the race being represented by a composite picture of many individuals belonging to it. Or, again, to define the particulars in which any variety of a plant or animal differs from its parent species. Or to define family features; or to isolate expressions, recollecting that these consist both of subtractions from, and additions to, the features as seen in repose.

My starting point was that the exact superimposition of a rather faint

positive upon its rather faint negative produces an approximately uniform grey when they are viewed as a single transparency. Thus, I photographed a rotating disc that had been faced with white paper and divided into concentric rings. The innermost disc was left white, the outermost ring was painted black, and the intermediate rings contained successively increasing proportions of black to white. The photographic negative showed rings of graded tints, and from this I took a positive by contact. Subsequently applying the positive to the negative, film to film, and viewing them as a transparency, a nearly uniform grey surface was produced. It was necessary to superimpose them with exactness; otherwise the edges of the rings were conspicuously dark in one part, and light in the opposite part. Another test experiment was to paste together thicknesses of tracing paper—two-fold, three-fold, &c., up to twelve-fold—to cut distinctively shaped snippets of these, and to variously distribute them over the surface of a glass plate, which was then photographed, and a positive taken as well. On treating the positive and negative as above, all the tints between those of the three-fold and the nine-fold inclusive produced a uniform grey.

Let A and B be any two pictures, whose respective negatives and positives will be called *neg. a, pos. a, neg. b, pos. b*. My object was to produce photographically a third picture, X, which should express the difference between A and B, that is, should be equal to A—B, or else a fourth picture, Y, which should represent B—A.

It will, however, be simpler to treat the problem at first as an optical one, based on the following equations:—

$$(I.) \text{ pos. } a + \text{ neg. } a = \text{grey}; \quad (II.) \text{ pos. } a + x = \text{pos. } b$$

(if treated as a photographic problem, (II.) would be replaced by *pos. a + x = neg. b*). From these we obtain

$$(III.) \text{ pos. } a + \{\text{pos. } b + \text{ neg. } a\} = \text{pos. } b + \text{grey},$$

and

$$(IV.) \text{ pos. } b + \{\text{pos. } a + \text{ neg. } b\} = \text{pos. } a + \text{grey}.$$

Calling the terms within brackets by the name of "transformers," the transformer of *b* into *a* is the negative of the transformer of *a* into *b*. The two terms within brackets may be "composited" together on equal terms, then the result may be composited with the first term, allowing two-thirds of the total time of exposure to the transformer, and one-third to the first term; or, what comes to the same thing in the end, all three terms may be composited in equal shares, allowing one-third of the total time of exposure to each. The transformers in (III.) and (IV.) being respectively *x + grey* and *y + grey*, are nearly equivalent for the purposes of the inquiry to *x* and *y*, because the addition of a uniform shade of grey has little or no effect on pictorial resemblance. A portrait does not cease to resemble the original when it has become somewhat browned by exposure to a London atmosphere, or when it is viewed in shade or under a tinted glass. Its distinctiveness depends on the differences (not the ratios) being preserved between the tints of all adjacent elements of its surface. Of course the grey must not be too dark, otherwise the deeper tints of the portrait would appear indistinguishably black.

This method of transformation succeeds fairly well. I changed an F on a white ground into a good G on a grey ground, and I changed, with passable success, one portrait A on white ground into another portrait B on grey ground, but the transformer itself gave little of that information to the eye which I had expected. It must have nearly isolated, but it failed to exhibit in an intelligible form the differences between A and B. Then I photographed two faces, each in two expressions, the one glum and the other smiling broadly. I could turn the glum face into the smiling one, or *vice versa*, by means of the suitable transformer; but the transformers themselves were ghastly to look at, and did not at all give the impression of a detached smile or of a detached glumness.

Part of the ghastliness was due to the different densities of the superimposed positives and negatives, which did not neatly obliterate one another in the unchanged portions of the face, and part was due to their not being superimposed in the best possible way. There can be no doubt of the best fit when engaged in making the transformer of an I into an L; but the eye must determine the best fit and proportions of the two components of the transformer of one portrait into another. I cannot yet make up my mind whether or no the process admits of substantial improvement, but feel sure that the only satisfactory experiments now would be those made by two converging lanterns on a screen, one at least of which admits of easy and delicate adjustment in direction and in the intensity of its illumination. The most suitable portraits for the attempt are apparently such as are popularly, and sometimes reproachfully, termed "artistic," that is to say, with blurred outlines and medium tints; certainly not those which in photographic language are called "plucky." I have no means in my house for experiments of this kind,

out perhaps a trial might be made in some laboratory where they exist. The point is to ascertain whether the images of *neg. a* and *pos. b* can be so combined on the screen so as to give an intelligible and useful idea of the differences between *A* and *B*.

FRANCIS GALTON.

THE THREE-COLOUR PROCESS IN THE REPRODUCTION OF PAINTINGS.

Not for the first time do we find the art critic of the *Daily Chronicle*, whose style of writing betrays his identity, publishing his views on the unsuitability of the three-colour process as a reproductive medium where oil or water colour is concerned. Of a three-colour frontispiece to the *July Studio* he remarks: "The print is signed by Angerer & Goeschl, and for mechanical reproduction of subtle, artistic colour—the mere name brands the process—this firm is as good as, if not better than, any other in the world. But," he proceeds, "the important part of the whole matter is just this: As has been pointed out again and again, pictures cannot be reproduced by the three-colour process or any other superimposed method. This month there are innumerable proofs that the feat may be accomplished—after a fashion. Almost every magazine, certainly almost every American magazine, contains colour prints, and all are vile, simply because the artists, instead of working for colour reproduction, have made pictures without any reference whatever to the reproducer. It is impossible, and it always will be impossible, to reproduce a water colour in printer's ink with any degree of satisfaction. It is absolutely absurd to attempt to reproduce an oil painting in printer's ink by the three primary colours when not a single one of them was used by the artist in doing his work. It is perfectly easy, however, for the artist to make a drawing in colour especially for reproduction, to have this reproduced, and then for the artist alone, not the printer or photo-engraver, to mix up in printers' ink the colours he wishes it to be printed with, and the result will be at once obtained. This, however, would eliminate the three-colour person and the fine-art printer, who are making our magazines and books the despair of artists. Reproductions in colour are always out of place in a well-printed book. Simple decorations may be, at times, used; but the attempt to print mechanically reproduced versions of oil paintings and water colours on shining art papers is an abomination, and in the cheaper publications a supreme expression of vulgarity." The unsatisfactory nature of most three-colour reproductions of water colours being provisionally granted, is not the writer a little rash in pinning his faith to the impossibility of successfully imitating colour by heliochromy? The passage we have italicised appears to indicate that, if he possessed a less elementary acquaintance with the scientific side of his subject, he would not be so sceptical of the feasibility of the correct reproduction of it by means of photography. The provision of suitable inks for three-colour work is a matter that has engaged very considerable attention.

IMPROVEMENTS IN APPARATUS FOR PROJECTING IMAGES OF OPAQUE PICTURES AND OTHER OBJECTS UPON SCREENS.

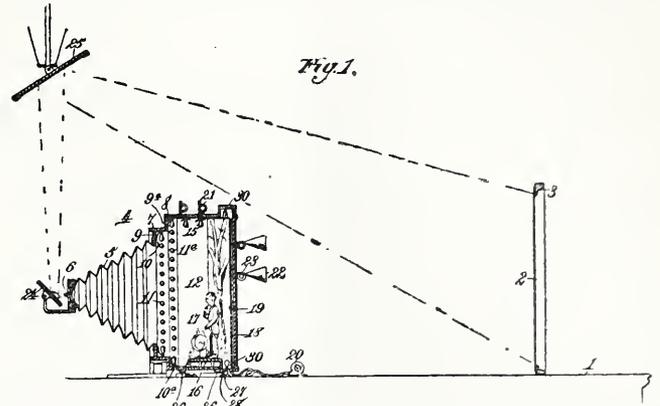

[Fulgora's Patent No. 8891 of 1900.]

The patentee says: "I mount upon the stage 1, preferably near the front thereof, a translucent screen 2 having an ornamental frame 3 surrounding the same. At the rear of the screen 2 the projecting apparatus 4 is located, the same consisting of an opaque tapering bellows 5 having a lens 6 at the apex thereof and an annular frame 7 at the rear thereof. The said frame is provided with a rearwardly extending flange 8 and an inwardly extending flange 9, between which is an offset 9<sup>a</sup>, forming two annular pockets or recesses 10 and 10<sup>a</sup> in which are located two continuous series of incandescent lamps 11 and 11<sup>a</sup>. As these lamps are located respectively behind the flange 9 and the offset 9<sup>a</sup>, the direct rays of light therefrom are prevented from being projected against the lens 6. Behind the bellows 5, but in close contact with the frame 7, is a car or casing 12, having all sides closed, except its front. The top, bottom, and sides are substantially in line with the flange 8 of the frame 7, and are adapted to form a light-tight joint therewith. In the cap or casing 12, rows of incandescent lamps, 15, 15, are located, the said lamps being so disposed that the direct rays thereof will be cut off from the lens 6 by the flange 9. When the car or casing 12 is in operative position, in close contact with and joined to the flange 8 of the frame 7, there is formed by the bellows 5 and the car 12 a closed chamber having opaque walls through which no light can enter or escape. At the bottom of the car or casing 12, I preferably form a platform 16 on which the living figures 17 stand, in the position they are to assume for the representation of the picture to be produced. Back of these figures and against the rear wall

18 of the car 12, suitable scenery is placed. For the purpose of providing for the change of scenery the rear wall 18 is made movable. This, however, is not essential, as the scenery may be placed in position in other ways.

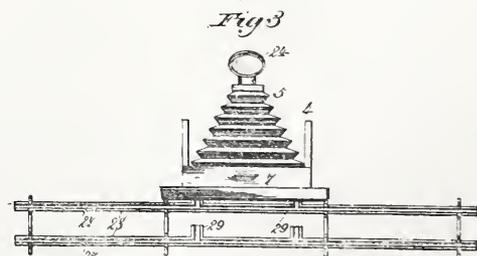

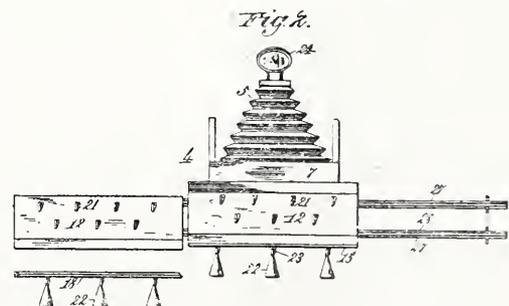

"In order to provide for the ventilation of the box or car 12, which the living objects occupy, I provide a ventilating fan 20 and pipes 21, the latter communicating with the outside of the car or casing and being crooked for the purpose of preventing the escape of light from within, or the entrance of light from without. In the rear wall 18 of the car or casing 12 I also provide megaphones 22, having crooked stems 23 for the transmission of sound from the inside of the car to the outside.

"In front of the lens 6 is an adjustable reflecting mirror 24 and above the mirror 24 is a second adjustable mirror 25, these two mirrors being

designed for the purpose of reflecting the image of the living objects within the car or casing 12 upon the rear side of the translucent screen 2. It will be obvious, however, that both of the mirrors 24 and 25 may be dispensed with and the image transmitted direct upon the rear side of the screen 2. To do this, however, the position of the projecting apparatus 4 would have to be reversed.

"It will be understood from the foregoing that the electric lamps 11 and 15 illuminate the living objects 17 within the car or casing 12, and that the rays of light from said living objects are collected by the lens 6 and transmitted upon the screen 2. All movements of these objects as well as the colours thereof, will also be transmitted, with the result that

the living picture, represented by the objects 17, is accurately transmitted and reproduced within view of the audience in front of the stage 1.

"It will be understood, of course, that a number of cars or casings 12 are employed by means of which the picture to be produced may be readily and quickly changed. These cars are provided on their under side with ball rollers 26, which fit within the grooves 27 of the rails 28, extending across the stage 1 and secured thereto. These rails 28 are provided with lateral extensions or branches 29, 29, just back of the projecting apparatus 4, so that a car may be moved from behind the scenes on the stage along the rails 28 until the branches 29 are reached, and then thrown forwardly until the sides of the car connect with the flange 8 of the frame 7 at the rear of the bellows 5. When it is desired to change from one picture to the other, the lamps 11 and 15 are

extinguished, and while the stage is still in darkness the car 12, containing the figure representing the picture which has just been produced, is drawn rearwardly on the branch rails 29 and moved off the stage, say to the right, along the main track rails 28. At the same time the car containing the figures of the picture which is to be produced next is moved from the left-hand end of the track rails 28 to the branch rails 29, and then brought forwardly until contact or close engagement is had between said car and the frame 7. The lamps 11 and 15 are then turned on and the apparatus acts as before. In addition to the pockets 10 and 10<sup>a</sup> in the annular frame 7 for the reception of incandescent electric lamps 11 and 11<sup>a</sup> I form at the rear of the car or casing 12 a pocket or pockets 30, in which a supplemental row of incandescent electric lamps are placed. The front walls of these pockets cut off the direct rays of light from the lamps from the lens 6."

### THE SOUTH LONDON PHOTOGRAPHIC SOCIETY'S IRISH TOUR.

WE are indebted to the President of the South London Society, Mr. Charles H. Oakden, for the following notes of a recent photographic tour in Ireland carried out by his energetic and ubiquitous society:—

July 20 saw the South Londoners, under the leadership of Mr. Howard Esler, off to Ireland on their annual excursion. They travelled *via* Holyhead and Greenore to Enniskillen, where they put up at the Royal Hotel. The same morning the steamer *Knockninny* was taken for a trip of twenty-two miles to Castle Caldwell. On the way it was noted that the scenery of Loch Erne changed entirely three times during the journey. The first stage of the journey, reedy shores being very characteristic; the next stage the islands being luxuriantly covered with foliage, while in the third stage the scenery was of a more open character, at one point a mountain coming down to the edge of the lake. Castle Caldwell was found to consist practically of a railway station and constabulary barracks, next to which was a fiddler's tombstone. A few yards distant were two or three cottages, and on an opposite side of an arm of the lake the ruins of Castle Caldwell were found.

Next morning row boats were taken, and the ruins of the abbey, old church, St. Molaise's house, the round tower and high cross were photographed, and many pictures of cattle cooling themselves in the waters on the lake shores obtained. Other islands were visited, and on the return journey pictures of Enniskillen from the river were taken. Next morning, by special conveyance, the excursionists travelled *via* Florence Court to the Glen of the Claddagh, at the head of which is the Marble Arch in the side of a limestone hill from which the river emerges. The scenery of the glen partakes of the character of the Dargle and also of the Devil's Glen in Wicklow. Some of the excursionists visited the caves on the other side of the mountain through which the river flowed. This river they had to cross by means of stepping stones. Leaving the Marble Arch, the Black Lion Fair, two miles distant, was found in full swing, and here the hand-camera men took full advantage of their chance. The return was made *via* Bellecoo and the north shore of Loch Macnean, and many fine views were noted. After dinner the train was taken for Sligo, where the headquarters were at the Imperial. After spending some time among the ruins of Sligo Abbey, a special conveyance was taken for a drive of twenty miles round the base of Knocknarea. On the way stoppages were made at Carrmore to visit the Cromlechs, the shore opposite Glen Lodge overlooking Ballysodare Bay, Cullenmore, Strand-hill, Scarden Holy Wells, Gibraltar Point, and Cummeen Strand. On this day the whole of the plates and films taken out were exposed, and the wish for more expressed, the skies throughout the latter part of the day being exceedingly fine.

Next morning row boats were taken down the river Garvogue. At the point where it enters Lock Gill, Tobern'alt, one of the Pilgrim's Holy Wells, was visited. It was found under the shadow of overhanging trees, and close by an altar had been erected upon which the pilgrims left their offerings. The boats parted company, each visiting a different part of the lake, which is often referred to as the "Killarney of the West."

Next morning a drive was taken to Glencar Loch and Fall where many exposures were made. The return journey was made, *via* Drumcliffe-of-the-Crosses where a fine cross and the remains of a round tower were found. Many stoppages were made, both on the outward and return journey. Before breakfast the next morning, some of the excursionists visited Ballysodare, where the cascades, the ruined church, and the village were photographed. After breakfast, steamer was taken to the Rosses, seven miles distant, and on the return a conveyance met the excursionists to take them to Primrose Grange. The Glen of Knocknarea here consists of a fissure in the limestone rocks, varying from twenty to thirty feet in width, and three-quarters of a mile in length. At the entrance, the meadow-sweet grew in great profusion up to six feet in height, scenting the air around. In the Glen itself the ground was literally carpeted with ferns, partially overshadowed by trees. The stereoscopic workers were in clover, and well they appreciated it. Some of the younger members of the party climbed the mountain from Primrose Grange, and they considered themselves amply repaid by the view they obtained from the cairn, the

burial-place of Queen Mab in the first century. The view included the shores of Donegal, Sligo, and part of Connemara, the Ben Bulbin range of mountains, Loch Gill with Sligo mapped out at its end, Ballysodare and the adjoining mountains, while in a south-easterly direction the view extended over the great central plain of Ireland. The next morning the excursionists returned to Enniskillen, where four hours were spent in and about the town, some taking advantage of the time in taking a flying visit to Lisbellaw. After a substantial dinner, the return journey was commenced, the excursionists arriving at Euston at 7 a.m.

## Our Editorial Table.

### CATALOGUE RECEIVED.

George Houghton & Sons, 88 & 89, High Holborn, W.C.

A STRONGLY bound volume of 744 pages forms the latest catalogue of Messrs. Houghton. It exceeds the 1899 issue by more than 100 pages. Special attention is drawn to the fact that over 50 varieties of hand cameras are quoted, illustrated, and described in the book. There are many special bromide and half-tone pictures. We may remind our professional readers that a 32 page section deals with backgrounds and studio accessories, which are here shown and beautifully illustrated in great variety. The catalogue is a valuable guide to every photographer with money to spend on his hobby or business.

### LUMIÈRE'S NEW PORCELAINE PAPER.

MESSRS. L. GAUMONT & Co., of 25, Cecil-court, Charing Cross-road, London, W.C., are issuing a developing bromide paper manufactured by Messrs. Lumière, of Lyons. It is called the new Porcelaine paper. A perfect matt surface, pure whites, rich blacks, and excellence of gradation are amongst the distinctive features claimed for the paper, which is said to yield prints in which the finest details are preserved. The paper is manipulated in the ordinary way, but a few special instructions are given. These we quote: In opening the papers one must be careful not to rub the sheets, as any friction on the surface will show black in the whites of the print. Marks can, however, be easily removed by rubbing them well with a soft leather soaked in alcohol. The exposure should be long enough to enable the print to be developed in thirty to forty seconds in order to ensure pure whites. In the case of prints with white margins, it is well to rub the whites lightly with a piece of wet cotton-wool. This can be done in the last washing. Proofs not intended to be mounted can be immersed for about ten minutes in a water containing five per cent of glycerine. This prevents the paper from curling.

In reference to their acid hypo fixing bath, Messrs. J. J. Griffin & Sons, of 20-26, Sardinia-street, Lincoln's Inn-fields, W.C., write to point out that it has hitherto been sold by them packed in wooden boxes, but that they have now improved upon this method of packing by providing an air-tight tin, so that the contents are well preserved from the effects of air or

damp. Messrs. Griffin add: "We have also increased the quantity, so that twenty ounces of solution for paper, or ten ounces for plates, may be made up. This bath, in its more concentrated form, will fix some hundreds of prints before being exhausted, and it is more rapid in its action. The price remains the same, *i.e.*, 6d. per tin."

### "ARGO" PAPER—AND A NEW ROLLABLE FILM.

THE Columbia Optical and Camera Company of 42, Goswell-road, London, E.C., the London agents for the Defender Photo Supply Company of Rochester, N.Y., are issuing a new gaslight developing paper, the "Argo," manufactured by the latter Company. A sample print lies before us, and, if it be taken as an average specimen of the results yielded by Argo paper, then we have no hesitation in pronouncing the latter a most excellent printing medium, the image from the deepest shadows to the highest lights being perfectly rendered. A better specimen

of bromide work could not be desired. The circular of instructions states that Argo is a new quick-printing development process paper combining the "chemical effects of platinum, or carbon," and rapid printing qualities of bromide papers, with simplicity in manipulation. But the word "chemical" in our quotation is, of course, a *façon de parler*, neither pigmentary carbon nor platinum entering into the composition of the image, which is metallic silver.

The "Tenet" is the name of a new rollable celluloid film that is being introduced by the Columbia Company. It is claimed to be exceedingly rapid, and it is, moreover, stated that, if stored with ordinary care, the film will keep for years in any ordinary climate. The Columbia Company draw special attention to the stout material which they use, allowing the film to be developed almost in the same way as an ordinary plate, and with any developer. The stout material also prevents the tearing of the film, and is of great advantage in printing out, as it lies flat almost like a plate. The Tenet film is made in all sizes, suitable for existing film cameras up to half-plate.

#### ADUROL IN CONCENTRATED SOLUTION.

ADUROL-SCHERING, for which Messrs. A. and M. Zimmermann, of 9 and 10, St. Mary at Hill, E.C., are the agents, and which has many times been referred to in our columns, is now sent out in the form of a concentrated solution, three and half ounces of developer costing a shilling. It keeps indefinitely, and is recommended for plates, films, and lantern slides. Messrs. Zimmermann inform us that the makers—Schering, of Berlin—recommend adurol in concentrated solution as the most advantageous form of using this developer. From our former experience of adurol, we can recommend it as an admirable type of the modern quick-acting non-staining developer, so much in favour amongst amateurs for "universal purposes."

#### THE PAGET PRIZE SPECIAL RAPID PLATES.

Manufactured by the Paget Prize Plate Company, Watford.

We have received from the Paget Prize Plate Company, Watford, a sample of their Special Rapid Plates, which we have tested and found fully equal, if not superior, to any we have used of this well-known brand. We used ortol with metabisulphite of potash and carbonate of potash as a developer, and kept the quantity of restrainer at a minimum. The plates with very rapid exposures gave negatives with a long range of delicate gradation. The fineness of grain, the coating, and the quality of the glass leave nothing to be desired.

#### A HANDBOOK OF PHOTOGRAPHY IN COLOURS.

By THOMAS BOLAS, A. A. K. TALLENT, and EDGAR SENIOR.  
London: Marion & Co., Soho-square, 343 pages. Price 5s.

Two years ago, when writing in our ALMANAC on the subject of colour photography, we suggested the preparation of a book treating comprehensively on the subject, and this present handbook, if less exhaustive than the one we had in our mind's eye, comes nearer to our ideal than any of the works by which it has been preceded. Save in one respect, it is expository rather than practical. The exception is the section on Lippmann's process of interference heliochromy, by Mr. Edgar Senior, the only English experimentalist, we believe, who has succeeded in obtaining good results by this method of colour photography. In his short digest of the process Mr. Senior gives working formulæ based, it appears, on actual experiment. The first 100 pages of the book proceed from the pen of Mr. Bolas, who, with his customary thoroughness, traces the historical development of colour photography from the time of Seebeck down to the present; but by far the largest share of the labour of compilation has been accomplished by Mr. Tallent, who, in the 200 odd pages at his disposal, gives an exhaustive *résumé* of three-colour heliochromy, to which he appends an account of Professor R. W. Wood's system with diffraction gratings.

In a prefatory note Messrs. Marion & Co. remind us that thirty-one years ago they published the pioneer work on photography in colours, by Louis Ducos du Hauron, and it is remarked that, as compared with that remote time, photography in colours is now an industrial fact. To be sure! and yet it is incontrovertible that as yet colour photography has not acquired much hold of the commercial mind. It cannot be pretended that three-colour block-making enjoys considerable industrial success, while the kromskop system of Mr. Ives and the Joly process have not secured the favour they merit. On the other hand, Mr. Sanger Shepherd is making strong efforts to popularise his stained film transparencies, and they are so beautiful that we sincerely hope they will achieve very great vogue.

We make this observation for the purpose of pointing the remark that the laboratory accomplishments of colour photography, beautiful and interesting though they undoubtedly are, are chiefly remarkable as being scientifically interesting rather than as giving scope for industrial development. But this is a matter that deprives the book before us of none of its undoubted merits. All three authors have done their work well, Mr. Tallent, a very able lecturer and writer, having been most painstaking in his researches. We must own to having indulged in a

smile at some references to the work of Mr. Bennetto, whose strange utterances on colour photography attracted our close attention in these pages a few years ago. We can cordially recommend *A Handbook of Photography in Colours* to the student of the subject. We ourselves shall value it as a book of reference to a branch of photographic thought and investigation that fascinates by its very difficulties and elusiveness.

## Studio Gossip.

A PRESIDENTIAL CANDIDATE AT A PHOTOGRAPHIC CONVENTION.—On the occasion of the Convention of the Nebraska Photographers' Association the members of the association were introduced to Mr. W. J. Bryan. The announcement that he would be present at the morning session was enough to cause every member and friend to be present. He spoke of his experience with photographers, of the many men in the profession whom he had been privileged to meet, and the one quality all possessed alike, viz., a happy expression. His experience with photographers has been quite extensive, and he said that he believed he had never yet sat for a picture but that, when he thought all was over and he had resumed his natural expression, the artist would hold up his hand and say, "Just one more."

## News and Notes.

THE murderer of King Humbert, Bresci, being an amateur photographer, took as his last photograph that of the monument of Victor Emmanuel II. at Milan.

THE CONVENTION GROUP.—Mr. Percy Lund kindly supplies the following names, which are missing from the Key of the Convention Group, given with the JOURNAL a fortnight ago: 22, Mrs. Perkins; 61, Miss Hastings; 78, Mrs. Puckering; 112, Mr. T. Fitzgibbon Forde.

HIS Majesty Don Alfonso XIII., King of Spain, the Queen Regent, and court arrived a few weeks ago at San Sebastian. The day after his arrival the young King, having with him his "Kodak," went out walking accompanied only by an aide-de-camp. He took several photographs on the road, this being a favourite amusement of his Majesty.

CRIPPLEGATE PHOTOGRAPHIC EXHIBITION.—The annual Exhibition organized by the Cripplegate Photographic Society, and the Essex Middlesex Cycling Union, Ltd., will be held at the Cripplegate Institute, Golden-lane, E.C., from November 7 to 10, inclusive. The Hon. Secs. are Mr. A. T. Ward, Cripplegate Institute, E.C.; Mr. G. F. Sharp, Sach-road, Upper Clapton, N.E.

AN open competitive examination to fill vacancies in the staff of Assistant Examiners in the Patent Office will be held in London in September next. The present number of vacancies is ten. Limits of age, twenty-one and twenty-four. Particulars of the examination and forms of application, which must be sent in on or before August 23, can be obtained from the Secretary, Civil Service Commission, London, S.W.

PHOTOGRAPHY AT NIGHT.—Mr. T. Stokoe, of Clare, Suffolk, writes: "Thinking that it may be of interest, I send you print from negative of Walton-on-Naze Pier, taken about 8.30 p.m., after the electric lights were turned on, and showing them distinctly. The negative is absolutely untouched." The photograph is very good, though, of course, deficient in shadow detail. Most noticeable, however, is the fact of no halation showing about the electric lamps, which are sharply outlined.

A GOOD EXAMPLE.—We read in a Reuter's telegram that the Spanish Government has prohibited the reproduction of the portrait of Bresci, the assassin of King Humbert, in the newspapers. If this example were followed more generally, we cannot but think that it would be for the good, and tend, to some extent, to check morbid curiosity. It would also tend to good in another way. Anarchists, and other fanatics, love notoriety and the knowledge that their portraits will be published, far and wide, when their crime is done is often a further stimulant to the deed; but for photography the publication of the portraits of criminals of this class would almost be a thing unknown.

THE KNIGHT OF THE CAMERA.—Down in the lower mysteries of the Houses of Parliament is a dark room, and in it Sir Benjamin Stone develops his photographs. He took a *Daily Mail* representative there last week leading him through a maze of stone passages, then out on the terrace, and off again beneath tons of stone. "This," said Sir Benjamin, stopping at one of a series of his Windsor Castle photographs, "is a picture of the carvings done by prisoners in the Norman Tower." Hung on the rough stonework, centuries old, was a steel helmet with some cavalry swords. Carved in the stone, in perfect preservation, were names of prisoners who had languished there in 1642. "When we have got over the general election, I shall go to India. I have received invitations from the Maharajah of Baroda and other Indian princes, and shall go round photographing them and their Courts."

A PHOTOGRAPHER'S WIFE MURDERED.—An inquest was held on Thursday, August 2, at Hackney, on the body of Mary Ann Woodall, aged 43, the wife of a photographer, of Gilpin-road, Clapton Park, who met her death at the hands of some person unknown on the previous Sunday evening. George Woodall, the husband, stated that, at 6.30 on Sunday evening, he was

on the Essex bank on the river Lea, opposite the Robin Hood. He photographed four men in a boat, and each of them had a photograph, but one refused to pay. All four returned to their boat, and were making off, when witness's wife called out, "Don't rob a poor man." The man who refused to pay jumped out of the boat, and made a rush at the camera. The deceased went to protect it and the ruffian then struck her a blow on the left side of the neck, felling her to the ground and smashing the camera. She got up, but was again knocked down. All four men then rowed away as fast as they could in the direction of Lea Bridge. The deceased, who was unconscious, was ferried across the river to the Robin Hood and then taken home in a van. The deceased died on the following day. The man who committed the assault was young and dark. He had a slight moustache and a thin face, and wore a suit of blue striped plaid and close-fitting trousers, such as were worn by costermongers. A doctor said the death was due to the rupture of a small blood-vessel in the brain, and was the result of direct violence. A detective stated that inquiries were being made, but they had not been able to find either the man or the boat. The jury returned a verdict of "Wilful murder against some person unknown."

## Commercial Intelligence.

MR. HARRY WADE, of 29, Blackfriars-street, Manchester, asks us to state that he is prepared to give trade demonstrations for a firm of high-class reputation. He is well known amongst the photographic societies of the country, and would be glad to hear from any firm who desire a demonstrator.

MR. C. T. SUTTON, of 114, Akerman-road, Brixton, S.W., writes: "Having occasion to refer to your issue of July 6, I noticed, in Answers to Correspondents, an inquiry for 'Machinery for manufacturing P.O.P.' Should your correspondent be still open, I may be able to put him in the way of obtaining same if you would acquaint him with the fact."

MESSRS. RAE BROS. of 134, St. Vincent-street, Glasgow, inform us that they have acquired the old-established photographic and lantern business of George Grieve, 29, New Scott-street, Perth. The business has been in existence for over a quarter of a century, first in High-street, and latterly in New Scott-street. Mr. Grieve is retained as manager of this branch shop.

GLASSWORKERS' STRIKE IN BELGIUM.—Last week, out of nineteen glass factories, eleven closed. Ten thousand workmen are on strike, and their numbers will be added to. The strikers demand the dismissal of the non-society men. This strike will probably deal a fatal blow to the glass industry in Belgium. Many large manufacturers have decided to take this opportunity of definitely closing their works, which suffered much by the increased price of coal.

THE PARIS EXHIBITION.—A meeting of the Exhibitions Committee of the London Chamber of Commerce was held on Tuesday, Sir Albert K. Rollit, M.P., presiding, at which it was decided that the chairman should be requested to prepare a general report on the subject of the Paris Exhibition and the action of the Royal Commission with reference to the British Section and other matters affecting British exhibitors. The opinion was generally expressed that the representation of British commercial elements at the Exhibition has been most unsatisfactory.

GREAT BRITAIN AT THE PARIS INTERNATIONAL EXPOSITION.—"It is truly strange," says *Feilden's Magazine*, "that, however great the space of time allotted to contractors and exhibitors may be, the opening days of nearly all great exhibitions find everything in a state of ill-disguised chaos, and weeks—nay, months—elapse before the various displays are in working order. This has been demonstrated once more in connexion with the Paris Exposition, where, even at this late date, some displays are still in an unfinished condition. Early visitors to the Paris Exposition have seen little more than a group of buildings in their nascent condition, while the exhibits are hardly unpacked as yet, though there were a few notable exceptions. The exhibits of Great Britain did, unfortunately, not belong to the latter class. As we are informed, by a reliable commissioner whom we engaged to give an impartial report on the subject, there existed, even at a very recent date, quite a chaotic condition in the sections allotted to British enterprise, and many of the exhibitors are yet deprived of the power required to drive their machinery. How much of this state of affairs is due to the indifference or intentional neglect of their French hosts is a question which we prefer to leave unanswered. For a great portion, however, of the unsatisfactory state of the British exhibit the exhibitors themselves must be blamed, since their phlegmatic nature and self-satisfied indolence did not permit them to rise to the occasion, as some of their Continental and, still more so, their Transatlantic competitors have done, who got their show into order in spite of the obstacles placed in their way. But, even after having got their displays into shape, the British exhibitors still remain at a disadvantage in Paris because of the lack of linguistic attainments on the part of their representatives, and their foolish assumption that intending customers will go to the trouble of getting the English catalogues offered to them—and offered, moreover, it seems, not very liberally—translated." The author of the article then repeats what has been repeated over and over again by our consuls and foreign representatives, namely, that our manufacturers lose a great deal of the modern trade by their injudicious adherence to obsolete methods and their stubborn refusal to make concessions to their customers. "If we wish to regain," he adds, "our industrial supremacy, which, to a certain extent—fortunately to a very small extent only—we have lost, we must make up our mind to be abreast of the times. Once we do so, we must succeed, for, as regards wealth, conditions of existence, and perseverance, there is no nation equal to our own. All we need is to decide at once upon what is necessary, and, having realised this necessity and decided to meet it, our very stubbornness, so much in our way at present, will be our surest guarantee of success."

## Patent News.

THE following applications for Patents were made between July 23 and July 28, 1900:—

COLOURED PHOTOGRAPHS.—No. 13,317. "Improvements in Coloured Photographs and the Process of Making them." Complete specification. Communicated by the Grenier Art Company, United States. S. E. PAGE.

CAMERAS.—No. 13,364. "Improvements in Photographic Hand Cameras." J. H. RANSOM.

SHUTTERS AND CAMERAS.—No. 13,377. "Improvements in Photographic Shutters and Cameras." J. E. THORNTON.

SHUTTERS.—No. 13,378. "Improvements in Photographic Roller-blind Shutters." J. E. THORNTON.

SHUTTERS.—No. 13,379. "Automatic Timing Device for Photographic Shutters." J. E. THORNTON.

PRINTING FRAMES.—No. 13,392. "Improvements in Photographic Printing-out Frames." H. HIGGINS.

CAMERAS.—No. 13,416. "Improvements in Cameras." T. BAKER.

PLATE-HOLDER.—No. 13,427. "Plate-holder to a Photographic Plate." F. THÉRÉMIN.

APPARATUS AND PROCESSES.—No. 13,430. "Improvements in Photographic Apparatus and Photographic Processes." M. HIRSCHENSOHN.

SHUTTERS.—No. 13,527. "Improvements in Photographic Shutters." W. H. Morgan.

RECTIFYING PHOTOGRAPHS.—No. 13,555. "Apparatus for Rectifying Photographs." T. A. G. STRICKLAND.

## Meetings of Societies.

### MEETINGS OF SOCIETIES FOR NEXT WEEK.

August.	Name of Society.	Subject.
14.....	Hackney.....	Question Box.
18-25 .....	Ashton-under-Lyne.....	Excursion: Bettws-y-Coed.
18.....	Oroydon Microscopical .....	{ Excursion: Kew Gardens. Leader, Mr. Baldock.
18.....	Redhill and District .....	{ Excursion: Hampton Court. Leader, Francis H. Ellwood.
18.....	West London.....	{ Excursion: River Colne, from West Drayton to Uxbridge.

### LONDON AND PROVINCIAL PHOTOGRAPHIC ASSOCIATION.

AUGUST 2.—Mr. S. H. Fry in the chair.

The HON. SECRETARY passed round some pamphlets and samples of kachin, which members promised to try and report on.

The CHAIRMAN raised the subject of stand development, and inquired whether, in the opinion of members, the method possessed any practical advantages?

Mr. P. EVERITT thought it useful, inasmuch as a number of plates, some of which might be under and over-exposed, could be successfully developed in the same dish. He had, however, noticed that the outline of the high lights was sometimes followed by a transparent line which completely spoils the negative.

Mr. HENDERSON passed round a transparency, which was badly stained. He explained that the stain was caused by alternately placing the plate in new and old developer. He had been unable to obtain the effect by any other means.

Mr. WELFORD considered the stain was caused simply by prolonged development.

Mr. FRY thought it was occasioned by some peculiarity of the gelatine.

Mr. HENDERSON showed a badly distorted negative of Durham Cathedral, and from which he had obtained a transparency, the lines of which were perfectly rectilinear.

Mr. EVERITT passed round two very fine examples of work done with the new Beck-Steinheil lenses. The subject was a difficult one, being a piece of lace with a very intricate pattern, and it was agreed to be a striking proof of the high quality of these lenses.

Mr. TEAPE showed an excellent portrait on enamel. He had made a lengthy series of experiments, and had tried all published formulæ for enamels without success, but had succeeded in inventing one of his own, which had proved completely satisfactory.

### PHOTOGRAPHIC CLUB.

A DISCUSSION took place on Wednesday, August 1, on the variation of colour in Velox, Gravura, and kindred papers. It appeared to be the general experience that, in order to alter the colour of the print, not only a variation in exposure, but also a variation in the developer, had to take place. Mr. FOXLEE, however mentioned that, if an iron developer be used, a change in the composition of the developer was not necessary, prolonged exposure and prolonged development being alone sufficient to produce reddish tints, whilst with a shorter exposure blacks could be obtained with the same solution. Messrs. Griffin sent some samples of a new form of kachin developer, in conjunction with which potassium carbonate may be used, which was not the case with the old form.

## FORTHCOMING EXHIBITIONS.

- 1900.
- August 21..... Royal Cornwall Polytechnic Society. W. Brooks, Laurel Villa, Wray Park, Reigate.
- Sept. 21-Nov. 3 ..... Photographic Salon, Dudley Gallery, Piccadilly. Hon. Secretary, R. W. Craigie, Camera Club, Charing Cross-road, W.C.
- October 1-Nov. 3 ... Royal Photographic Society, New Gallery, Regent-street. The Hon. Secretary, 66, Russell-square, W.C.
- November 7-10 ..... Cripplegate Photographic Society and the Essex and Middlesex Cycling Union, Ltd. The Hon. Secretaries, A. T. Ward, Cripplegate Institute, E.C., and G. F. Sharp, Sach-road, Upper Clapton, N.E.
- „ 12-17 ..... Ashton-under-Lyne.
- „ 21-23 ..... Hackney Photographic Society.
- 1901.
- January 14-19..... Blairgowrie and District Photographic Association. The Hon. Secretaries, Blairgowrie, N.B.

Those who desire to send photographs to the above Exhibitions should write for prospectuses to the Hon. Secretaries, whose addresses are given in the second column above. The dates mentioned are those at which the Exhibitions open.

## Correspondence.

\* \* \* Correspondents should never write on both sides of the paper. No notice is taken of communications unless the names and addresses of the writers are given.

\* \* \* We do not undertake responsibility for the opinions expressed by our correspondents.

## STRENGTHENING METHYLATED SPIRITS.

To the EDITORS.

GENTLEMEN,—Replying to a query in the JOURNAL of the 27th ult., "B. G." can strengthen methylated spirit without trouble of distilling, and, I should think, without infringing the law, by simply shaking it up with some sub-carbonate of potash, known as salt of tartar; the water in the spirit dissolves the salt, and, becoming of greater specific gravity, settles to the bottom, when the lighter spirit, deprived of most of the water, can be drawn off.—I am, yours, &c., THOS. STOKOE.

Clare, August 1, 1900.

## NATURAL CLOUDS IN LANDSCAPES.

To the EDITORS.

GENTLEMEN,—Referring to your leaderette on "Natural Clouds in Landscapes," on the 27th ult., permit me to say that I managed a short time ago, to reduce—with Farmer's solution—a good cloud in a hayfield scene. By holding the negative, sky end down, after fixing, I succeeded with the aid of a camel's-hair brush dipped in the solution and carefully applied, in reducing the cloud sufficiently so as to make it printable along with the view. I wish we had tried some such plan years ago, as many an excellent cloud has been rendered useless by being too dense.

I enclose a spoiled print to show result, and regret we have not a good one printed to send you.—I am, yours, &c., WM. BROWN.

8, Janefield-place, Paisley.

[The clouds in the print are naturally rendered, and are in harmony with the rest of the photograph. There is, of course, nothing new in our correspondent's suggestion, but it may in this connexion be useful to other workers.—EDS.]

## PHOTOGRAPHY AT COLOMBO AND KANDY.

To the EDITORS.

GENTLEMEN,—We might mention, for the benefit of amateur tourists, that we have dark rooms at their disposal at Colombo and Kandy, and that any advice will be willingly given them as to tropical exposures. Most amateurs are under the mistaken impression that they can give a marvellously short exposure in the tropics, with the result that they get many disappointments. We find they go with their cameras and expect to get good results on subjects such as tropical foliage, native characters, &c., and often use a small stop, which, of course, does not give the plates or camera a chance.—We are, yours, &c., LL. MADDOCK.

Kandy, Ceylon, July 16, 1900.

## THE PLATE-MAKERS' ASSOCIATION.

To the EDITORS.

GENTLEMEN,—I note, in your Answers to Correspondents, that you state that the Plate Paper-makers' Association "have arranged a scale of discounts for *bonâ-fide* dealers." Allow me to inform you, and your correspondent, that the fact that one is a *bonâ-fide* dealer, and does not cut prices, and gives complete proof thereof, is of itself no help whatever to getting plates and paper at dealers' prices.—I am, yours, &c., G. WATMOUGH WEBSTER.

Studio, 33, Bridge-street-row, Chester, Aug. 5, 1900.

## LOSS OF COVERING POWER IN A LENS EXPLAINED.

To the EDITORS.

GENTLEMEN,—Some time ago I asked you a question, *viz.*, If a lens could fall off in its marginal definition and covering power? I asked the question because a lens of mine appeared to have done so. It may interest you to know the cause, which I accidentally discovered. The wheel diaphragm screw had got loose. It is a shouldered screw, and the diaphragm was running on the threaded part, and was considerably out of true—*i. e.*, the apertures were not axial with the lens.—I am, yours, &c., J. E. GUBBINS, Lt.-Col.

Westward Ho! Bideford, August 6, 1900.

## EXHIBITION OF THE PHOTOGRAPHIC SOCIETY OF INDIA.

To the EDITORS.

GENTLEMEN,—By to-day's mail I have pleasure in forwarding to you a copy of the Prospectus of our Exhibition, to be held in Calcutta early in January next,

Will you be kind enough to draw attention to it in your JOURNAL, as we are anxious to make the event as successful as possible.

Arrangements are being made whereby London exhibitors will be able to send their exhibits to an address in London, whence they will be dispatched to India at the expense of the Society, and I hope to furnish you with the particulars during the next fortnight.

Five gold, ten silver, and fifteen bronze medals will be awarded, but we shall be very pleased to receive pictures from persons who are willing to assist us by exhibiting but not desirous of competing.—I am, yours, &c., T. C. DOWNING, Hon. Exhibition Secretary.

57, Park-street, Calcutta, July 18, 1900.

[For the information of European exhibitors we extract the essential portions of the prospectus]:

The Exhibition is divided into two classes:—(a.) Open to the world, amateur and professional. (b.) Amateurs of the Society. Provided the Judges deem the exhibits of sufficient merit, the following medals will be awarded:—A special medal for the best photograph in the Exhibition; five gold medals; ten silver medals; fifteen bronze medals; which it is proposed to apportion as follows: For all exhibitors, professional or amateur: three gold medals; seven silver medals; ten bronze medals. For amateurs of the Society: two gold medals; three silver medals; five bronze medals. It is proposed, provided they fill, to medal the best in each of the following classes: Class 1, Landscape; 2, Architecture and Interiors; 3, Portraits and Groups; 4, *Genre* Pictures and Studies; 5, Photographs of Objects in Motion; 6, Lantern Slides and Transparencies; 7, Photo-mechanical Processes; 8, Apparatus and Appliances. Pictures should be sent framed, if possible. Where this is impossible, the Society will provide frames without charge, during the Exhibition, for photographs approved by the Judges. This does not apply to Indian exhibits, which will only be framed by the Society at the expense of the owners. There will be no charge for wall space. Exhibits from Europe should be dispatched before November 15; America, November 1; Australia, November 1. All goods and pictures should be addressed to the Hon. Exhibition Secretary, Photographic Society of India, 57, Park-street, Calcutta, and must reach him not later than December 25, 1900.

## PHOTOGRAPHS REGISTERED:—

Watson & Senior, 6, Church-street, Inverness.—Photograph of painting, entitled "Saved from the Wreck."

E. Smith, 170, High-street, Lewes, Sussex.—Photograph of Earl De la Warr. Two photographs of triumphal arch, Station-road, Bexhill. Photograph of triumphal arch, Old Town, Bexhill. Photograph of group of coastguards. Photograph of Earl and Countess De la Warr and family. Photograph of dinner-table at Hotel Metropole, Bexhill. Photograph of Countess De la Warr and infant Baron Buckhurst. Photograph of presentation of illuminated address to Earl De la Warr. Photograph of Earl de la Warr addressing the Council at Bexhill.

## Answers to Correspondents.

\* \* All matters intended for the text portion of this JOURNAL, including queries, must be addressed to "THE EDITORS, THE BRITISH JOURNAL OF PHOTOGRAPHY," 24 Wellington-street Strand, London, W.C. Inattention to this ensures delay.

\* \* Correspondents are informed that we cannot undertake to answer communications through the post. Questions are not answered unless the names and addresses of the writers are given.

\* \* Communications relating to Advertisements and general business affairs should be addressed to Messrs. HENRY GREENWOOD & Co., 24, Wellington-street, Strand, London, W.C.

**DIRECTORY OF PHOTOGRAPHERS.**—R. C. asks where he can obtain a list of the professional photographers of England?—In reply: Messrs. Percy Lund & Co., of Bradford, publish a directory of photographers.

**FLAT PORTRAITS.**—T. COSTORPHINE: From what you describe as "all the faces looking flat," we suspect you are using too much direct front light. If you send us two or three examples, we may probably be able to assist you; we cannot without.

**SHELLAC VARNISH.**—VARNISH. Neither orange nor button lac will completely dissolve in alcohol. There will always be a sediment, for the reason that certain constituents of lac are not soluble in spirit. All you can do is to let the insoluble portion subside and then decant the clear solution.

**REORDERS.**—J. A. HOWARTH asks: "Is an order for an enlargement from an old negative (originally taken for cabinets) considered as a reorder or not?"—We are afraid we do not quite understand this query. A first order for an enlargement can certainly not be termed a reorder even if it is from an old negative.

**GELATINE MOUNTANT.**—H. C. McPHERSON. The formula as given in the ALMANAC is quite right, but you have employed the wrong kind of gelatine, hence the reason of its precipitation when the spirit was added. Nelson's No. 1 gelatine was given in the formula, and you have used Coignet's, which is of quite a different character, and it will not bear the quantity of spirit given without precipitation.

**GLASS POSITIVES.**—W. HAMMOND. The glass positive reached us smashed to pieces. However, by putting them together, we can see the cause of the frosted-silver streaky appearance on the glass side of the picture. It is due to the glass being imperfectly cleaned before the collodion was applied. The remedy, in future, is obvious. The formulae you are using are quite correct, and the collodion can be relied upon.

**REDUCER FOR BROMIDE PRINTS.**—PICKAXE writes: "I should be glad if you could tell me of a good and simple reducer for bromide prints, which cannot stain like ferridcyanide potassium. Is chloride of lime any good? I find it dissolve the gelatine."—In our issue for June 22 last is given a method of reducing bromide pictures with cyanide of potassium. Personally we do not think reducing prints worth the trouble, as they are rarely so good as prints that have not been reduced.

**SALTED PAPER.**—W. CASSIE asks "where a good photographic paper, plain can be obtained, such as used to be employed many years ago for salted paper prints?"—It is a little difficult to say, off-hand, where it is to be obtained now unless in wholesale quantities. Messrs. Otto König & Co., Cross-street, Finsbury, are the wholesale agents for the Saxe papers, and Messrs. Marion supply the Rives. The latter house will, no doubt, supply you with a quire or two. For salted paper prints the thick paper was used, somewhat thicker than is generally now used for albumenising.

**FIXING.**—DOUBTFUL says: "For fixing our negatives we use the grooved porcelain tanks. For some time we have been in the habit of renewing the hypo in the tank by pouring in the solutions used (of course, only once) in fixing bromides and ordinary gelatine P.O.P. Would you consider that there would be any danger to the permanency of the negatives in using this plan, which saves time in mixing solutions? The hypo solution is quite clear and presumably not much weakened."—Probably not; that is, if the solution is still strong enough to properly fix the negatives. We should, however, prefer to use a new solution, as hypo is so very cheap.

**A FINE-ART UNION.**—S. & S. write: "Will you kindly tell us whether there is a Fine-Art Union that acquaints its members with the latest-published fine-art plates, and, if there is such a Union, who is the Secretary? Should there not be such a Union can you make a suggestion as to how we may obtain names and addresses of the different fine-art dealers?"—In reply: We are not cognisant of the existence of such an institution as that mentioned by our correspondents. With regard to the addresses of art-dealers these can be obtained from the various directories. Such a directory may be published by Messrs. Kelly. The information asked for hardly comes within our province to supply.

**THE PROCESS BUSINESS.**—R. B. writes as follows: "I know nothing of photography, but I am told that the process-block business is a very lucrative one, and I should like to learn it. Will you please tell me if it is a trade a young fellow can teach himself, and the probable cost of an outfit?"—In the first place, our correspondent is under a misapprehension in imagining that the process-block business is a very lucrative one. Skilled workers tell a very different tale. Whether our correspondent will be able to teach himself will depend, of course, upon his intelligence and perseverance. As regards cost of outfit, Messrs. Penrose & Co., Upper Baker-street, W.C., will supply a price-list of the necessary appliances.

**GUM-BICHROMATE.**—G. U. M. If you wish to give the gum-bichromate process a fair trial, follow Mr. Packham's instructions implicitly, using good gum arabic, and not so-called "office gum." You may probably trace your failures to the use of that.

**OPALINES, &c.**—H. COXHEAD. The metal rims, and plush fittings, for opalines are supplied by all the large houses that supply photographic material, such as Marion's, Houghton's, Fallowfield's, and the like. Any of the above houses will also supply lenses and cameras for stamp portraits. Also floral masks—indeed, all the other things you inquire about.

**COPYING PAINTING.**—PROVINCIAL. Coating paintings with glycerine and water has been mentioned as a means of rendering them easier to copy, and that is, possibly, what you refer to; but it is not to be recommended, and no owner of a valuable picture would allow of its being subjected to any such treatment. The glycerine might, on account of its deliquescent properties, very materially impair the durability of the picture, unless it was completely removed—a very difficult thing to do.

**INTENSIFICATION.**—W. CONWAY says: "I have heard that negatives can be intensified with bichloride of mercury alone, when only a little intensification is required, without any second treatment. Will you please say how it is done?"—The first action of a solution of bichloride of mercury is to darken the image and then to bleach it. The action must be stopped by washing before the bleaching sets in, as it does very quickly. This is an excellent method of intensification when only a little more density is required in the negative.

**FURNELL'S LENS.**—G. POWELL writes: "I see, in an old volume of the JOURNAL, a description of a lens by Mr. Furnell, in which the back glass is a spectacle lens, which can be replaced by others of different foci, so as to alter its focal length. Will you please tell me who is the maker, as I should like to get one?"—So far as we remember, the lens was not put upon the market. But sufficient description of it was given in the article for any optician to construct one for you, or for you to construct it for yourself.

**SENSITISING ALBUMEN PAPER.**—T. GARDNER says: "On floating albumen paper on the silver bath it curls up towards the back, and I cannot get it to lie flat on the solution so that it will be evenly sensitised. Can you tell me a remedy, as I am quite a novice in sensitising my own paper?"—Some papers are very prone to this when they are exceptionally dry, as they are likely to be with the dry and hot weather we had a little while back. However, the remedy is very simple. When the paper is floated, just breathe gently on the back for a few seconds, and it will then lie down perfectly flat.

**OBSTRUCTED LIGHT.**—ALPHA writes: "I have just taken the above premises and gone to great expense in putting up a studio having a fine north-east light. Now the next-door neighbour is putting up a huge wooden hoarding, which will quite stop off all that side light. On remonstrating with him, he says that he objects to his windows being overlooked by my customers, and that he will not think of taking it down. Cannot I compel him, as it obstructs all my side light that I want for my business?"—No. Your neighbour has as perfect a right to put up what he chooses on his premises as you have on yours. You have no remedy that we can see.

**A PUZZLE PHOTOGRAPH.**—THE DRAPED FIGURE writes: "Can you tell us why the globe in enclosed photograph comes in the position in which it is? The photograph was taken some years ago, on a fast plate, unbacked, by magnesium powder flash. The cap was off whilst the slide was drawn, and the flash made directly after. Half the globe could be seen by the head and the reflection in mirror behind, the gas being lit. The developer was pyro. No other mirrors in room and another gas bracket at the other side of one seen. It is quite a puzzle to us and to many other photographers."—The only suggestion we can offer is that the plate received a double exposure—the first, or second, sufficiently long for the gas globe to be impressed on the film.

**STAINED ENLARGEMENTS.**—R. C. V. L. writes: "Could you tell me the probable cause of the following difficulty:—I have been enlarging on bromide paper, using amidol, washed for a couple of minutes and then fixed, some in plain hypo and some in acid hypo; in each case, during washing, brown stains have come up which ruined the whole enlargement, some appeared after a few minutes' washing, others after a couple of hours. I have used the same paper and developer, &c., often for small contact prints without any stains. Could you suggest the cause. If a portion of the print was exposed to the air in the washing, could that cause a stain? It is possible that might happen when washing large prints."—Without seeing an example we cannot give a definite opinion. Possibly the stains may be caused by insufficient washing before the prints are fixed, or they may be due to the print being unduly exposed to air while fixing. We do not imagine that they are caused by exposure to air while they are washing.

**TONING TROUBLES.**—ANXIOUS writes: "Along with this note I send you two photographs toned with gold and platinum (matt paper). The one you will see is unstained, and was done some months ago, the other is not only badly stained, but seems to be reduced, eaten away, the colour quite taken out in the parts stained especially, and was put on the mount last Thursday. A number of others done at the same time have gone the same way. The instructions, especially with regard to clean working and washing, have been followed to the letter, and I am quite at a loss to say what is causing the mischief. Might I ask you to favour me with an opinion? I can't say how much obliged to you I will be for any help you can give, as I have a large printing department under my care, and it is a terrible business to get such results."—Beyond saying that it is due to something in the manipulation, we are afraid, with no details, we cannot help you much. If we saw the work carried out, no doubt we could. We would suggest greater care in the washing in the different operations; also a longer fixing in a perfectly new solution of hyposulphite of soda.

### EX CATHEDRÁ.

WE are pleased to state that our last week's appeal on behalf of an old photographer, in whom advanced age and misfortune have not withered the honourable ambition of earning his own living, has met with success. Sums of money have reached us from several sympathetic readers, and we thank them heartily for their generous offers of assistance. In all probability this form of aid will not be required, as we have had an offer of a whole-plate camera, which will, no doubt, meet the requirements of the distressed photographer. Mr. J. B. Payne, of the celebrated firm of Mawson & Swan, Newcastle-on-Tyne, writes us as follows: "In answer to the paragraph contained in last week's BRITISH JOURNAL, I write to say that we have a whole-plate camera, mahogany, bellows, body, with focussing screw and two double slides. It is a well-made instrument and has never been used, but it is of the old-fashioned pattern and not quite light enough for modern ideas. If you think that it would prove serviceable to the gentleman who is placed in the unfortunate position mentioned in the paragraph, kindly

let me know and I will send it up for his acceptance." We have, of course, accepted Mr. Payne's kindly offer, and have undertaken to see that the camera is properly bestowed. If it should require some slight alteration, perhaps our friends who have sent us money would wish it applied to the necessary purposes? We will hold their remittances in the mean while, and again ask them to accept our thanks for their help.

\* \* \*

THE third Annual Report of the Council of the Röntgen Society for the year 1899-1900 has been sent to us. There is now a total membership of 178, and of that number sixty-two gentlemen joined during the year, many of them residing in distant parts of the British Islands and the colonies. The Society now possesses a permanent home at 20, Hanover-square, and the attendance at the meetings has averaged thirty. One passage in the report is of special interest in relation to the deplorable South African War, which every one must hope is nearing its termination: "Of the growing use of the Röntgen rays in surgery the reports from the medical officers in South Africa are sufficient evidence of the recognition of their value in military service, and we may hope for interesting papers later from members of the Society who have been using various forms of apparatus in the field." The report concludes: "The Council has much pleasure in announcing that Dr. J. B. Macintyre, of Glasgow, has consented to being nominated as the next President, and feels sure that the Society will welcome in this position one of the earliest and most prominent of practical X-ray workers." We wish the Röntgen Society a continuance of success in its valuable work.

\* \* \*

MESSRS. CADETT & NEALL, the well-known dry-plate manufacturers of Ashted, Surrey, send us a sheet of well-printed half-tone illustrations, designed to point out the advantages of using the Cadett spectrum plate in three-colour work and in the correct reproduction of coloured objects in monochrome. Included is a three-colour print from a lithograph, the combined colour and half-tone negatives having been taken direct on the Cadett spectrum plate with the Sanger Shepherd trichromatic light filters; but, of course, no opportunity of comparison with

the original is available. On the other hand, a vase of flowers supplies occasion for the reproduction, in half-tone, of (1) a negative on an ordinary plate, and (2) a negative on a spectrum plate exposed through the Absolutus light filter. In the one case the values are totally wrong; in the other they appear, so far as we can judge, to be accurately rendered. We wish Messrs. Cadett & Neall success in their endeavours to stimulate the interest of photographers in the direction of colour correct work. It has seemed to us that of very recent years there has been a tendency on the part of many to lapse into a state of things that prevailed in the early eighties, when orthochromatic photography with gelatine plates was very little practised indeed. Messrs. Cadett & Neall have done and are doing much to educate photographers in the importance and desirability of securing correct renderings in photographs; but it is missionary work of a kind which must never cease, for every year thousands of people take up a camera for the first time, and perhaps only a very few of them stumble across a little orthochromatic knowledge by accident.

\* \* \*

FOR the purpose of drawing public attention to their lenses and cameras, Messrs. Goerz, the optical house, of Berlin and London, are issuing a half-tone illustration, which is worth mention, if only on account of its uncommon size. The block measures  $31\frac{1}{2}$  inches by 15 inches, and it is printed on stout surfaced paper, the dimensions of which are 38 inches by 26 inches. The enlargement from which this block was copied was made from a half-plate negative taken with a Series III. Goerz double anastigmat. A shutter exposure was given the subject, which represents a number of cavalry soldiers putting their horses over a stone wall. The engraving is a very good one, and, apart from the merits of the production, which, in the absence of more specific data relating to the lens, exposure, &c., can scarcely be discussed, is undeniably striking in effect. Avowedly sent out as an advertisement, the engraving is one that can hardly fail to achieve its object. Messrs. Goerz recommend it to photographic dealers in these words: "This picture forms a first-class advertisement, and, when put into your shop window, sale-room, or office in a conspicuous place, it will quickly attract the attention of the public. We would recommend enclosing the picture in a plain frame, which will increase the effect considerably and prevent the picture getting soiled." The house of Goerz is obviously not lacking in business enterprise.

\* \* \*

A RECENT advertiser in the JOURNAL received the following answer to his advertisement, and has handed it to us to be used at our discretion. It is a lithographed circular, and we reproduce it word for word:—"275, High-street, Hammer-smith, W. Dear Sir,—I have seen your advertisement in THE BRITISH JOURNAL OF PHOTOGRAPHY. As the manufacture and sale of a good article used generally by the profession offers such a much better opportunity than photography alone to make a good income, I write to ask you if you were shown in the most conclusive manner that you could start the making of P.O.P., and it was also proved to you that the paper you would make would be far superior to that turned out by any of the large firms, would you pay a reasonable sum to be thoroughly taught and put in the way to work up a connexion, that you might carry on a business on your own

account, either by itself or in conjunction with photography? Those who do not practically understand are under the impression that P.O.P. must be made by machinery, but I know, and can show conclusively, that paper coated by my system, that is, by hand, is far superior, and, although of course it cannot be done so quickly, it is purer in colour, and quite free from the many faults to be found in all brands of P.O.P. coated by machinery. It is the most profitable and certain business any one with small capital can embark in. It requires only one moderate-sized or two small rooms, anywhere (London, country, or seaside), and 20*l.* capital would be sufficient not only to provide all the necessary apparatus, but sufficient paper, chemicals, and everything else (including circulars, &c.) to make a good start. One person, *without any assistance whatever*, can turn out five quires a day, complete for sending to customers, by light work of seven hours. To make a quire by my process costs 6*s.* inclusive; the usual selling price is 15*s.* and 6*d.* extra for postage, with ten per cent. allowed to the profession who take a certain quantity per month. I recommend selling at 12*s.* 6*d.* per quire, post free. This allows 6*s.* profit on every quire sold, so that, if you only sell twenty quires a week, you make 6*l.* profit, and your expenses scarcely anything. You will, doubtless, know as well as I can tell you that in England alone there are over 20,000 professional and quite a million amateur photographers, and I can show you that orders can always be got from all parts of the world for a good paper. It is cash with order, and business is done by sending out circulars and small samples by post. Even the smallest photographers use one quire a week, so that even twenty such customers would give you a profit of 6*l.* per week. After I have furnished you with absolute proofs of success, and show you there is no risk whatever, I undertake to teach you thoroughly until you can do everything for yourself, draw you up a suitable circular, and show you how to get a connexion for a premium of 25*l.* I guarantee that after two or three lessons you shall be able to do everything perfectly from beginning to end, after which you can either do all the work yourself or simply mix the formula as required, and can get a young man or young woman to do all the rest. If you think my offer sufficiently good to wish to go further into the matter, you can see me here at any time if you send me a line first, giving me time to answer in case I could not be in. I will then go fully into everything, affording you absolute proofs and satisfy you on every point.—Yours faithfully, A. Morris. The demand for a good P.O.P. is practically unlimited."

\* \* \*

THE handwriting of Mr. "Morris" is familiar to us. When last we saw it at the foot of a letter it traced a different name, and in those days it was a process for the preparation of ready-sensitised albumenised paper that was offered for sale. In the foregoing document there is at least one glaring error of fact. There may be a million amateur photographers in England—although we doubt it—but there are not "over 20,000 professionals;" a quarter of that number, say 5000, would be nearer the mark. Mr. "Morris's" fondness for round figures has betrayed him into an exaggeration. The scheme described in his circular can be dismissed in a few words. The person who, after paying twenty-five pounds for instruction in the hand preparation of gelatino-chloride paper, embarked a sum of twenty pounds as capital in the expectation that a profit of 6*l.* per week would result, would probably lose his money as the P.O.P. market is already well stocked. Why, it may be asked, if

money is so easily made in this manner, does not Mr. "Morris" himself engage in the commercial production of a paper which, according to him, is "far superior to that turned out by any of the large firms," and that can be sold at 12s. 6d. the quire, to yield a profit of 6s.? At this particular juncture we know of no business so hazardous as that of the manufacture and sale of gelatino-chloride paper, either on a large or a small scale, and it is one against which the small capitalist in particular should be emphatically warned. But Mr. "Morris's" circular is not one that calls for lengthened discussion. We need only remind our readers that a year or two ago we came across cases in which persons were induced to take up the preparation of albumenised paper on a small scale, only to find that the market was already well supplied with that article. Into some of those cases we made personal investigation, and in two of them we were the means of preventing a further outlay of money which would have been sheer and deliberate waste.

### AUTOMATIC PLATES.

**LATITUDE** in a plate is a quality upon which plate-makers have recently laid particular emphasis. More than one maker of repute has based his claims to patronage not on the production of the very greatest rapidity, but on a plate which, while being of considerable rapidity, leaves room for a considerable departure from correct exposure or—it is the same thing—undertake the correct reproduction of subjects containing a very long range of light intensities. In other words, the importance of a long straight portion in the characteristic curve of the plate as planned by Hurter & Driffield is insisted upon even by makers who do not adopt Hurter & Driffield measurements nor use their terminology. With the ordinary means by which plates of "long straight curve" are to be produced we do not now propose dealing. We wish to refer to two proposals by which an automatic character is sought to be given to the plate. The first of these is not exactly new, but assumes topical interest from the fact that plates thus made are being placed upon the (French) market. It was, in fact, some ten years ago that Monsieur P. Mercier, a well-known experimenter among our neighbours across the Channel, recorded the curious results obtained when plates were treated with certain organic substances before exposure to light. He found that some substances, among which are oxidised developers, and particularly oxidised amidol, act as retarders when plates thus treated with them come to be developed, whilst others, including morphine, tartar emetic &c., act under similar conditions as accelerators. He claims to be able to prepare a plate, by previous treatment with a solution of oxidised amidol of strength from .01 to .05 per cent., which yields good negatives even if 100, 1000, or 10,000 times the correct exposure be given.

The plate for which claims somewhat of this character are made is now we are informed, being made by M. Jouglu under the name, "L'Intensive;" the inventor speaks of it as follows (we quote from a recent paper before the French Photographic Society):—

"A mixture of retarders and accelerators enters into the composition of this plate with the result that it possesses the following apparently contradictory properties.

"(1) It develops rather more quickly than ordinary plates in rapid developers such as amidol or metol, giving, with short exposure, the maximum of vigour and freedom from fog.

"In slow developers, on the other hand, such as glycin, hydroquinone, pyrocatechin, used in conjunction with carbonates or alkaline phosphates, and with more or less bromide, the image appears twice or thrice as quick, and develops much more vigorously and brilliantly than do ordinary plates.

"Hence, in cases of great over-exposure (amounting to, say ten or twenty times the normal exposure), a liberal proportion of bromide can be added to the developer, and yet good negatives obtained quickly. Ordinary gelatine plates would require extremely slow development to give passable negatives.

"The 'intensive' is thus an automatic plate which can be exposed to any extent and developed in any developer, but yet gives a perfect negative. With ordinary plates a rapid developer is advisedly used for under-exposures and a slow developer for over-exposures, but in the case of 'intensive' plates this does not hold good.

"In the matter of developer, metol-hydroquinone, which is apt to give hard negatives with snap-shots, gives images very transparent in the densest portions. Amidol acts similarly. Pyrogallol behaves with the 'intensive' much as with other plates, except that it gives a yellow stain which disappears in the fixing bath.

"But the properties of the plate are most notable when it is developed with slow developers of the hydroquinone-carbonate type, the image appearing quickly, and good results being obtained with five or six times the correct exposure without any alteration of the developer. In cases of gross over-exposure or of under-exposure, the developer is to be suitably modified. It is not claimed for the commercial 'intensive' plate that it can resist the extraordinary excess of exposure possible to a plate treated with oxidised amidol only. It has been made to give, when treated with a suitable developer, equally good results, in the three cases, of considerable under and over-exposure and correct exposure."

It is not the easiest thing to account for the behaviour of the plate described above. Take the case of the amidol-treated plate. The effect, whatever it is, is due to the action of the amidol in the film on the developer, for the results are observed whether the plate be treated before or after exposure to light. Hence the solution of the question is to be looked for in the altered condition of the film, subjected to the developer's action.

There seems no reason to suppose that the retarding action of the oxi-amidol is to be ascribed to any chemical action of the latter upon the latent image. Although an "oxi" compound, oxidised amidol is most probably quite incapable of supplying oxygen to the sub-chloride or oxi-chloride forming the latent image. A more reasonable explanation lies in the physical or chemical effect of the oxi-amidol on the action of the developer. Each molecule of light-affected haloid is surrounded by a protecting layer of oxi-amidol, which, besides opposing the entrance of the developer into the film by absorption, may behave towards the gelatine with which it is in congruity in the same way as many other oxidised developers, viz., harden it. When the developer is applied, the reduced silver forms a loose combination with the oxidised developer by which it is surrounded, a kind of simultaneous intensification and development taking place and producing an image which is largely made up of organic stain. In parts containing less light-affected compound, the addition of colouring matters will be less, and that not fixed by the reduced silver is removed from the plate on fixation; or, possibly, the reduced silver has a

chemical action on the oxi-amidol, producing an insoluble compound in part forming the image.

Some such action as the above would seem to take place, although it does not completely account for the behaviour of the plates.

The second process, resulting in what may likewise be called an "automatic" plate, was described not long ago by Professor Francis E. Nipher before the Academy of Sciences of St. Louis. Professor Nipher had found that a plate which, from over-exposure, gave no image on development, developed as a positive when development took place in the light. "Since then," we quote a more recent communication in *Nature*, "the same results have been obtained by first opening up the plate-holder and exposing the film to the lamp-light until it is all converted into the zero condition. If covered with an opaque punched stencil, no trace of the design will appear on the film when developed in the illuminated bath. The slide is then closed, and the plate afterwards exposed on the camera in the usual way. Such a plate cannot be over-exposed in any reasonable time. It may be exposed for a minute or for four hours to a most brilliant landscape, and the most superb results can be obtained. There is no restraining developer needed. The tendency to fog when the exposure is too short is corrected by taking the developing bath nearer to the light."

These results, which are at present quite in the embryo stage, offer particularly enticing inducements to the experimenters among our readers, to whose notice we submit Professor Nipher's results with the remark that the subject is one which can be undertaken by any one who has the simplest photographic installation, and that much interesting information is likely to proceed from a series of carefully made and explicitly recorded experiments.

**Uranium Salts Sensitive to Light.**—There is a fascination about the study of uranium, which tends to increase rather than lessen, accentuated too, as it has been of late years, by the discovery of the Becquerel rays in connexion with this metal, its salts, and those of the alleged new metals accompanying it. The Bulletin of the French Chemical Society recently contained a further addition to our knowledge of this metal in connexion with light action. The writer, M. J. Aloy, refers to experiments by Elbemen, who discovered that, on the exposure of an aqueous solution of uranic oxalate to sunlight, decomposition took place, resulting in the deposition of a flocculent precipitate of a violet-brown colour. M. Aloy varied this experiment by using other more soluble salts of this metal, and found especial success with the acetate. The light action on aqueous solutions was slow, but became rapid upon the addition of certain organic substances, particularly alcohol and ether. An aqueous solution of the acetate, exposed to sunlight, gave in a few minutes a very abundant violet precipitate. A solution of the same salt in alcohol gave similar results. After washing with water the deposit contained no acetic acid whatever. It is a hydrate described by M. Aloy as a hydrated uranoso-urassic oxide, amorphous and flocculent. It would be, of course, premature and useless to predict, but there seems undoubtedly here sufficient matter for consideration as to whether we have not in M. Aloy's work the germs of a photographic process, capable of useful elaboration to produce a real "uranium process."

**Meteorological Forecasts.**—It has been the fashion in some quarters to ridicule the weather forecasts issued in this country, in utter disregard of the fact that, owing to the diversified surface conditions of our land, an immense number of stations is

needed to enable local conditions to be taken into account; the presence, *e.g.*, of hills, flat marsh lands, elevated plateaus, &c., all tend to affect a general prediction, but that there is a larger percentage of correct results given of late than was formerly the case cannot be gainsaid. The scientific observers at the head of the British Meteorological Service cannot be surpassed for ability by those of any other country; but it is possible to have greater facilities than we enjoy, and to that cause may be put down the great success of the Japanese in their meteorological work. From the accounts published it would appear that a photographer there, setting out for a day with the camera, could obtain beforehand a very reliable forecast of the weather he would experience, for, from a pamphlet published by the Tokio Observatory, for presentation to the Paris Exhibition, upon their service we learn that the forecasts have an average success of 82 per cent. The observations, made three times daily, are published in their weather reports, together with forecasts for the following day. They have eighty stations of the first and second order, and about 900 at which rainfall or temperature only is recorded. To give some idea of the extent of the data they obtain, it may be mentioned that all vessels of over 100 tons' burden, either in the imperial or merchant service, are compelled to make observations six times daily, and the logs are forwarded to the central observatory, the staff and attendants of which number fifty-three.

**Balloon Photography in the Far East.**—On Saturday last a mounted balloon section of the Royal Engineers, comprising three officers and seventy-five rank and file, left the Royal Albert Docks on the P. and O. liner, *Bombay*, for China. They took with them a large quantity of material and appliances, including apparatus and retorts for the manufacture of gas in the field, and fully equipped outfits for repairs—a very necessary precaution. Lieut. Colonel Macdonald was in command, the other officers being Captain Hume and Lieutenant Leake. Very complete photographic apparatus was taken, it is scarcely necessary to say, and we hear from good authority that most of the lenses were the Stigmatic. There was also a camera, with a rigid body some three feet long, fitted with a portrait lens of three and a half inches in diameter, with a Dallmeyer tele-photo attachment. We are not sure if a lens and tele-photo attachment of this size have been used before for war purposes. It was the late Mr. W. B. Woodbury who did so much for the advancement of photography, if we mistake not, who first suggested and demonstrated the advantages of balloon photography on the battlefield.

**Rontgen Rays from a Twenty-thousand Cell Storage Battery.**—The high storage necessary for producing the X rays is, as is well known, usually obtained by the intervention of a coil, the primary current being produced either by a comparatively few volts, from primary cells, or from a Wimshurst or other similar machine, but Professor John Trowbridge has recently described, at a meeting of the American Academy of Sciences and Art at Harvard University, the results he has been able to attain with a series of twenty thousand Planté cells. These gave a voltage of forty-two thousand, and, when Leyden jars were used, three million. He easily obtained discharges six or seven feet in length. They closely resembled lightning, and with them he was able to reproduce all the photographic effects obtained by students of the natural phenomenon. The part of his lecture most interesting to photographers is that we have here a new source of X rays. "All the methods now in use," he states, "give a light which is far from constant, the rays are of unequal strength, or, when equal, are generally alternating in character," the result being a shifting radiant print and imperfect definition. With this immense battery traces of the rays were produced with a steady current of five thousand volts, they are strongly produced with twenty thousand. A steady current at forty thousand, the exhibition of rays is surprising, a fluorescent screen is lighted with extreme brilliancy, and marvellous shadows of bones of the hand are obtained. "In my experiments I was surprised at the small amount of current necessary, with a voltage of forty thousand to produce a strong

development of X rays. The use of ten milliamperes was dangerous to the tube; the anode grew white hot, and the Crookes tube resembled an arc lamp." Professor Trowbridge regulates the strength of his current to any degree of nicety with a liquid resistance. He says "it seems possible, by carefully regulating the strength of the current and the voltage, to obtain photographs of the tendons, and probably the muscles, for the photographs which I have already obtained show great contrasts, and there are indications of muscular layers and tendons. The contrast between the bones and the flesh is remarkable, much greater than the pictures, usually obtained by the Ruhmdorf coil."

### JOTTINGS.

BEING what Miss Fanny Squeers, I believe, termed a "human man," I am not displeased at reading that the remarks I made on June 22 relative to the absurd things done in the name of pictorial photography by some American amateurs have earned the approval of many of my *confrères* on the other side of the Atlantic. The editor of the *Camera* says: "Our English cousin 'Cosmos' refers particularly to those gentlemen of the *dizygraph* school resting on a slender pedestal in a way that we like, and particularly hits several over-rated amateurs in a proper manner. The article voices our sentiments completely. Whilst the persons referred to in the article certainly have done much talking, it must be remembered that we have many artistic photographers in America—numbers of them; but they are modest, their work speaks for them." The *Photo-Beacon* quotes what I wrote in an article headed "An Imported Epidemic." The ably conducted *Photo-Miniature* also quotes me; calls me caustic; says I have become infected with the anti-American fever; and winds up by apostrophising me as "venerable." Now, now, friends, it is not so. I call as a witness the enlightened Mr. John Beeby, of the New York Camera Club, with whom I had a long and agreeable chat on American photography only this very week. He will arrive in New York at the same time as this number of the JOURNAL, and, if he says I am caustic, anti-American, and venerable, I must really cross over and demonstrate the contrary.

THIS matter of forcing the lens, the dry plate, and the printing paper to produce results which even an imbecile would not mistake for photographs in the expectation that common-sense persons will accept them as necessarily pictorial is no new theme for my pen. For years I denounced the absurdity of the business. Here it has long since died the death, of course; but I remember the temporary indignation of a friend who objected to my description of one of his modish exhibits as "a high light and a smudge." Years afterwards he justified me by admitting that I was right. Refusal to bow down and worship astigmatic blurs and other kinds of flat and fuzzy abominations brought me by way of reward such polite references as "a bitter foe," "an implacable enemy" of—pictorial photography! Strange! The walls of my room, in which I am writing, are fairly well covered with photographs by, amongst others, James Craig Annan, H. Walter Barnett, William Crooke, George Davison, Robert Demachy, Dr. P. H. Emerson, Frederick H. Evans, Frederick Hollyer, Captain Puyo, Alfred Stieglitz, and Herr Watzek. If appreciation of these men's work is a mark of invincible opposition to pictorial photography, I suppose I am past praying for. In the States, the journalists who are rightly discounting the bad photography and the nonsensical twaddle that is written about it by Mr. Hartmann and other windbags are coming in for the same sort of mud-throwing to which I was subjected. Only men really great in their avocations or professions can successfully stand against continued ridicule. I know no photo-faker who is not, intellectually, a very small person indeed, and for whose "mind diseased" a little wholesome scorn is the best medicine that can be prescribed.

THE essential parts of the Platinotype Company's specification for the excellent oximagnesium lamp which has been in use for some time are published on another page. This lamp is certainly one of

the most convenient things that has lately been brought to the notice of photographers. For 8*l.* a perfectly efficient system of artificial lighting for the studio is available, and the apparatus is so portable that the whole of it, battery, gas-holder, stand, the "bell jar" of oxygen, and the reflector may be easily stowed away in a corner. In a few weeks from now the shortening autumn days will revive interest in artificial light portraiture. I can certainly recommend this lamp to the notice of my professional readers, who may then wish to make themselves independent of daylight at not too high a price. From the sitter's point of view, I believe that nothing could be more agreeable than this plan of electrically igniting magnesium strands in oxygen. I have "sat" to the light several times, and must compliment it on its behaviour, which is so good and gentle that the most nervous sitter could scarcely be startled by it. While the exposure is being made, one is conscious of a gradual glow of light, and so soon as it attains its maximum brilliancy it just as gradually fades away. There is no noise or sputtering, the direct source of illumination need not strike the eyes, and altogether I think that those photographers who take up the lamp for studio portraiture will find their sitters appreciate it.

THOSE who take the side of "actuality" against "art" in the fight between photography and hand drawings for pride of place in the illustrated papers will enjoy the following paragraph. It is taken from the *Scientific American*, a paper of the highest standing, which long held out against the use of photographic illustrations in its pages. Nowadays a very considerable number of its blocks are made from photographs. "The vagaries of American journalism" is a favourite theme with the Transatlantic editor, especially at such times as, for want of a better topic, he must fall back upon his list of stock subjects for an inspiration. It is possible that now and then we, on this side of the water, do allow imagination to trespass upon the domain of fact, but never, surely, have we eclipsed the performance of our contemporary. In a representation of the scene of the Hoboken fire, published in one of the leading English illustrated weeklies, the Hudson River is shown to be spanned by two colossal bridges, one at Twenty-third and the other at Fifty-ninth Streets. Where the imagination of the artist received its stimulus we cannot tell—though we might hazard a guess—but certainly this view was not drawn 'upon the spot,' or even 'from a photograph.' The two structures exist only on paper." This is about as bad a case of erratic illustrating as I have come across, and yet there are complaints that many able black-and-white men cannot earn a living, as they have been displaced by photographers. All this looks as if the accuracy of the camera is preferred by the great reading public to the imaginative but misleading sketches of clever artists working in Fleet-street back offices or St. John's Wood studios. The fact of the matter is that photography is rapidly asserting itself as the only practicable method of illustrating weekly periodicals. The latest of these, the *Traveller*, which, I am told, has been two years in preparation, relies almost wholly upon phototypic illustrations—a very significant sign of the times indeed. In passing, may I suggest to the editor of this beautiful paper that a few photographs of home scenery would be welcome to his readers? Hitherto he has given us nothing but foreign views. It is really wonderful to see how strong to-day is the reliance of the illustrated press upon the once-despised photographer. A few more artists' drawings of rivers crossed by non-existent bridges, and hand drawings in topical weekly papers will cease to be tolerated by readers—and advertisers!

"PHOTOGRAPHS are too cheap," writes a friend in an interesting letter, and then he goes on to outline a suggestion with regard to portrait-making by photography which may be worth taking into consideration by some ambitious worker who is anxious to run a business on original lines. Briefly, my friend's idea is that it might pay a good man to devote himself entirely to the production of life-size, or at any rate large, portraiture, supplying only the one print and destroying the negative. He adds the further suggestion that a sitter having secured a satisfactory or pleasing portrait might be induced to agree to its reproduction in photogravure, and, if the

plate as well as the negative and transparency were destroyed after a limited number of good impressions had been pulled, the impossibility of obtaining direct reproductions from the original negative would send up the value, intrinsic and esteemed, of the photogravure. What my friend has in mind is that the photograph might be made in this respect something like the limited engraving, the oil painting, or the water-colour drawing, that is, appreciated in the inverse proportion to its rarity. Practically he would return to the Daguerrean order of things, where the sitter was given what he sat for, a single, unreproducible picture of himself. The photographer then did not retain possession of a negative, for no negative was taken, of course. My friend's idea, which, he may be assured, is not wholly original (originality nowadays is rather scarce, my brothers), if generally adopted, would obviously have an effect upon commercial photography the reverse of stimulating, and it is one, of course, which only a photographer of great originality and ability dare think of. Something of the kind is already done by two men of my acquaintance, but more as an exception than a rule. The suggestion is that it should be made the rule and not an exception.

THE prospects of a well-filled and successful Exhibition of the Royal Photographic Society at the New Gallery are exceedingly bright. It has already been stated that the whole of the space in the Apparatus Section has been taken. In the General Professional Section such firms as Messrs. Morgan & Kidd, the London Stereoscopic Company, the Autotype Company, and others, have booked spaces of thirty feet "run" and more. Mr. W. Crooke, the renowned portrait photographer, will cover a wall space of thirty-three feet with a collection of his admired work. Mr. James A. Sinclair, who has been travelling in Spain, will, of course, send in; so too, I believe, will another great photographic traveller, Mr. John Bushby, of Penrith. New York will, it is hoped, be represented by Mr. John Beeby, whose work is ready. That very earnest photographer, Mr. T. C. Turner, of Hull, will, I am told, submit a large collection of recent work. These are only a few of the names that occur to me while I am writing. From what I heard, I might give a list of intending exhibitors that would fill this page. It is needless to do so. The point is that the first Exhibition at the New Gallery gives every promise of being truly representative of all phases of modern photography. Two or three correspondents have directed my notice to the fact that the composition of the Selecting Committee has been adversely criticised. The source of the criticism removes all necessity for paying the least attention to it; but, for the benefit of intending exhibitors at the New Gallery, it may be stated that the Selection Committee is chosen by a responsible executive of twenty-eight gentlemen, which, in its turn, derives its authority from an elective body of over seven hundred photographers. Here is the Committee: Rev. Mr. Lambert, Mr. W. Thomas, Mr. J. A. Sinclair, Mr. J. C. S. Mummery, Mr. H. Vivian Hyde, and Mr. Mackie. The first two gentlemen are regarded by the complaining person (and others) as authorities on pictorial photography; Thomas, Sinclair, and Mummery, in addition to other qualifications, have won the Society's medal; Hyde is a distinctly cultivated pictorial photographer, who has frequently exhibited by invitation at home and abroad as well as at Pall Mall; while, if I were asked to name a photographer more experienced or more capable in the selecting, hanging, and organizing work of an exhibition, I should not look beyond Mr. Mackie. The Selecting Committee is possibly not an ideal one, but it is less open to objection from any standpoint than some other exhibition executives and judicial bodies which might be named.

A YEAR ago I wondered what an American "clambake" was like, and one or two friends in the States sent me the recipe. Apparently it is a vast dish of fish, flesh, and fowl. Now, my *confrère*, Mr. John A. Tennant, writes: "You desired to know about the clambake. Here it is." The "it" consists of three photographs of the National Association of Photo-engravers, in one of which the members are shown seated at a very substantial meal. My thanks to Mr. Tennant. One of these days I hope to eat clambake at an American Convention; I shall not be happy till I do. Meantime, in default of being able to make Mr. Tennant's mouth water with a photograph of an English delicacy as fascinating and complicated

as a clambake must be, I am happy to congratulate him on that capable effort of photographic book-making, the *Photo-Miniature*. Fifteen numbers, each complete in itself, are before me, and the subjects dealt with are as follows: 1, Modern Lenses; 2, The Pose in Portraiture; 3, Hand-camera Work; 4, Photography Outdoors; 5, Stereoscopic Photography; 6, Orthochromatic Photography; 7, Platinotype Processes; 8, Photography at Home; 9, Lantern Slides; 10, The "Blue Print," &c.; 11, Developers and Development; 12, Retouching Negatives, &c.; 13, Photographing Flowers and Trees; 14, Street Photography; 15, Bromide Printing. The series is admirably done. Each subject is intelligently and fully treated, and, if I wanted to make a present to a young photographer, the bound volumes of the *Photo-Miniature*—an original and successful departure in modern photographic journalism—would be found on my list to select from.

COSMOS.

FOREIGN NEWS AND NOTES.

Sensitiveness of Dry Plates to Invisible Radiation.

—Professor R. Namias, in writing upon this subject in his paper, *Il Progresso Fotografico*, mentions a very interesting experiment made by Gustave Lebon. A statuette was covered with calcium monosulphide and exposed to sunlight for some time. It was then kept in the dark for several hours until all trace of luminosity had disappeared. A dry plate was then placed near the statuette, and upon development gave an image formed by the statuette. The writer holds that, after visible luminosity has ceased, rays are emitted by calcium monosulphide which affect the photographic dry plate. But, more strangely still, these rays appear to be emitted for an indefinite length of time. After the statuette had been kept in absolute darkness for eighteen months, the same action was observable upon exposure of a dry plate in proximity to the statuette. It therefore seems to be an established fact that, after visible radiations have ceased, rays are still emitted by calcium monosulphide, to which silver bromide is sensitive. These rays appear to be analogous to those emitted by uranium, thorium, polonium, and radium.

**Testing Persulphate.**—In the *Chemiker Zeitung* Mondolfo gives the following test: Two to three grammes of the persulphate are dissolved in 100 c. c. of water. Warm 10 c. c. of the solution with  $\frac{1}{4}$  to  $\frac{1}{2}$  gramme of iodide of potassium in a stoppered bottle for about ten minutes, raising the temperature to about 60° to 80° C. Iodine is liberated. Add a few drops of boiled starch, which will be immediately turned blue, and then from a burette of normal ten per cent. solution of thiosulphate of soda add sufficient solution, drop by drop, until the blue colour is discharged. The percentage of persulphate may then be calculated from the formula—

127 parts of iodine liberated will be equal to 135 parts of persulphate. In this way 1 c. c. of ten per cent. solution of normal thiosulphate of soda is equal to 0.0135 gramme of persulphate of potash, or 0.0114 grammes of persulphate of ammonium.

**Intensification.**—The *Photographische Chronik* gives the following table of the comparative effect of various methods of intensification compiled by P. Von Jankó.

Bleaching Solution.	Intensifying Solution.	Rates of Intensification.
Bromide of Copper . . . .	Metol . . . . .	15 : 14
"	Hydroquinone . . . . .	15 : 13
"	Pyrogallol . . . . .	15 : 12
"	Nitrate of silver . . . . .	15 : 8
"	Iodide of mercury . . . . .	15 : 10
Bichloride of Mercury . .	Sulphite of soda . . . . .	15 : 14
"	Oxalate of iron . . . . .	15 : 13
"	Hydroquinone . . . . .	15 : 12
"	Hyposulphite of soda, or ammonium . . . . .	15 : 11
"	Ammonia . . . . .	15 : 10
"	Ammonia, the plate being dried after bleaching . .	15 : 8½
"	Ammonium sulphide . . .	15 : 7
"	Uranium . . . . .	15 : 6

From this it appears that mercury and ammonium sulphide, and the process of intensification with uranium give the most contrast, which is also the experience of photographers.

**Incandescent Burners.**—The *Photographisches Wochenblatt* gives an extract concerning incandescent mantles formed of woven wire. Hitherto they have not been a success owing to their liability to melt before the maximum illuminating power is reached. Emil Ferbecke, of Brussels, has invented a process, in which the warp and woof of the mantle are formed of different metals or alloys, with very high, but different melting points. The advantage is, that the temperature may be raised almost to the melting point of one metal, whilst the other metal remains sufficiently rigid to act as a support. The following alloys have been found very serviceable. For the warp: 88 parts of platinum, 10 parts of iridium, 2 parts of rhodium; for the woof: 90 parts of platinum, 5 parts of iridium, 2 parts of rhodium and 3 parts of palladium. The second has the lower melting point.

**Photo-mechanical Work in Germany and its Remuneration.**—The *Photographische Chronik* has a very interesting article upon this subject, from which we tabulate the following particulars concerning the hours of work, wages, &c. :—

	Berlin.	Leipzig.	Munich.	Stuttgart.	Nuremberg.	Dresden.
Number of Firms .....	19	12	6	8	2	3
Number of Workmen	295	217	212	82	18	29
Number of Apprentices	59	38	25	17	3	2
Number of Assistants	55	20	39	6	2	2
Hours work per week ...	46½ to 51.	48 to 54½.	48 to 51.	48	48 to 54.	48 to 54.
Wages :—	Average 50.	Average 53.	Average 48½.	—	Average 50½.	Average 51½.
Photo-graphers	35 marks.	34½ marks.	40 marks.	38 marks.	32½ marks.	— marks.
Printers ...	30 "	26½ "	37 "	21 "	22½ "	35 "
Etchers .....	32½ "	29½ "	31 "	34 "	27 "	28 "
Retouchers .....	31½ "	25 "	27 "	23 "	22 "	32 "
Engravers...	33 "	28½ "	33 "	33 "	30 "	30 "
Press-hands & Mounters	26½ "	25 "	27 "	28 "	—	20 "
Assistants...	18 "	17 "	19½ "	—	—	—

In nearly every establishment the workmen receive pay for holidays, and in Berlin it is customary to give fourteen days' notice. In Berlin extra pay, ranging from ten to fifty per cent., is given for overtime. In Stuttgart overtime is paid twenty-five per cent. extra till eight o'clock in the evening, thirty-three and one-third per cent. till ten, and fifty per cent. after ten and on Sundays.

**Heat-resisting Lubricants.**—The *Moniteur de la Photographie* recommends the incorporation of sulphur with lubricants, it being a bad conductor of heat. Take 100 kilogrammes of best colza oil, add five kilogrammes of sulphur, and heat it to at least 130° to 140° C. In about an hour the whole of the sulphur will have been taken up, and it will remain in solution and not impair the lubricating quality of the oil. The sulphur prevents heating, and consequently adds to the serviceableness of the lubricant.

**The Ventilation of Laboratories and Dark Rooms.**  
—The *Photographisches Wochenblatt* gives the following test for the purity of the air in dark rooms and laboratories upon the authority of Lebedeff, quoted from the *Chemiker Zeitung*. The usual test hitherto has been merely for the quantity of carbon dioxide present, but it is very important to check the quantity of organic impurities thrown off by the skin and lungs, which likewise contaminate the atmosphere. Lebedeff estimates the quantity of these impurities by the volume of oxygen necessary for their destruction. A test solution is made by dissolving 0.036 gramme of permanganate of potash in a litre of water, to which 100 c. c. of dilute sulphuric acid (1:3) has been added. A solution of oxalic acid, 0.063 gramme per litre of water, is used as reagent. The strength of this solution is just sufficient to discharge the colour of an equal quantity of the permanganate solution. To determine the quantity of organic impurities present, pass a measured quantity of the air through 100 c. c. of the permanganate solution. If the air is pure, the solution will remain unaffected, and 100 c. c. of the solution of oxalic acid will be required to discharge the colour. But, if the permanganate has been deprived of any of its oxygen by organic impurities in the air, less than 100 c. c. of the solution of oxalic acid will be needed to discharge the colour, and the difference is the measure of the impurity. For example, if 90 c. c. of oxalic acid solution are used, 0.08 milli-

gramme of oxygen will have been wanting, since 1 c. c. of permanganate solution gives off 0.008 mgrm. of oxygen. The following results have been obtained from practical experience, and represent the loss of oxygen: In the open air, 0.078 mgrm.; in an unoccupied laboratory, 1.075 mgrm.; in a laboratory in use, 3.628 mgrm.; in a workman's dwelling, 8.625 mgrm.

STRENGTHENING ALCOHOL.

A FEW weeks back we answered a correspondent with reference to the strengthening of methylated spirit and the cost of a licence to use a still. In the reply we intimated that it was illegal to tamper with methylated spirit. In a letter we inserted in the Correspondence column last week Mr. Stokoe calls attention to the well-known method of strengthening alcohol by shaking it up with carbonate of potash to absorb the water, and mentioning that this treatment would not be infringing the law. We do not think it would, though it would not answer our correspondent's purpose. He wanted (we did not insert the query in full) a spirit much stronger than the commercial article, in fact, absolute alcohol. At one time methylated absolute alcohol was allowed to be sold; now it is not.

The methylated spirit as supplied by the methylators is generally from 62 to 64 over proof; we have had it stronger than that occasionally. The samples we have obtained from the oilshops have not been much weaker than that. Now, alcohol (64 over proof) has a specific gravity, approximately, of .820. If alcohol of that strength be treated with carbonate of potash, its strength will not be materially improved; indeed, if the carbonate of potash is not thoroughly dried beforehand, it may be weakened by the treatment. If we wish to get alcohol much stronger than about .820, we must resort to chloride of calcium, or quicklime, and distillation; then it may be obtained with a specific gravity of .794. It is then absolute alcohol, but it is difficult to retain it as such. The commercial absolute alcohol has a specific gravity of .805, and that strength (of the methylated kind) was at one time permitted to be sold. Unless spirit strengthened by carbonate of potash is distilled, it will be alkaline, by reason of some of the carbonate of potash being retained in solution by the water present—nearly ten per cent. With spirit that is weaker than that referred to (the commercial), it can be materially strengthened by the carbonate of potash treatment. For example, spirit that has been used for drying negatives, or weakened by similar uses, can be brought up to its original strength with the carbonate of potash. Whenever this salt is used for the purpose, it should be thoroughly dried beforehand. A good way of doing that is to put it in an old frying-pan and make it thoroughly hot over the fire, and then put it, while still hot, direct into the spirit. We have not thought it necessary to take into consideration the slight difference in the specific gravity of alcohol and wood naphtha in these notes, as they make no practical difference in the figures we have given.

OUR NATIONAL PORTRAIT GALLERY—AND A SUGGESTION.

THE Trustees of the National Portrait Gallery have just issued their report for the year ending March 31 last. From it is seen that the Gallery was visited from January 1 to December 31, 1899, by 122,167 persons, made up as follows: free of charge, 103,248; on payment of sixpence, 7080; on Sunday afternoons, 11,839. It would be interesting to know how many professional photographers figured amongst these numbers who went there to study portraiture. Those who did, no doubt saw much to avoid, as well as much to copy, in the way of posing and lighting. The National Portrait Gallery is much handicapped in the matter of funds, and for that reason it was unable to acquire several portraits that would be of national interest. 750*l.* a year is all that is allowed by the Treasury for the purchase of fresh pictures. Seeing that the object of a National Portrait Gallery is to present portraits of national interest, why should not photography be recognised? There are thousands of persons who have distinguished themselves in warfare, literature, arts and sciences, &c., who have never had an oil painting of themselves, or, if they have their families prize it too highly to present it to the nation. Yet their portraits would be of great interest in a national collection, though they could not be shown but for photography, either in the form of reproductions from the family portraits—paintings—or photographs from life. We know that many photographers who hold negatives of persons of great national interest would be only too pleased, with the sanction of their friends, to present enlargements of them to the nation, if there were a place for their reception and exhibition.

Of course such portraits would be produced by a permanent method, such as the carbon or the platinotype process. We now have a National Photographic Record Association, that is collecting photographs of ancient buildings and places of interest before they disappear, which find a place in the British Museum. Why should not a similar thing be done with regard to portraits of individuals who have distinguished themselves in their country's advancement? Setting aside the portraits of immediate national interest, why should not the Royal Photographic Society, now that it has a home of its own, have a complete collection of portraits of those who have, by their discoveries and researches, brought photography to its present state of perfection? Photography is still young, though we are sorry to say that many who, by their researches and discoveries, have advanced it so greatly, have passed away, and we now know them only in name; but a gallery of their portraits at the Royal would be valuable, particularly to after-generations. Portraits of all of them are, doubtless, to be had now, but they may not be a few generations hence.

#### A PLEA FOR SLOW PLATES.

To the pages of the *Photo-American* Mr. Charles Thael contributes the following notes of advice on the use of slow plates for summer work:—

"The slow plate fogs but rarely under all reasonable treatment; chemical fog is practically unknown on it, and the body is better—that is, there is more to work on than upon the extra-rapid ones. As for developing them, slow plates develop incomparably easier than the fast ones when properly exposed, and are not slow in doing it either; they start right, keep gathering good, honest density after the detail is out, and do not fix out weak. They are *certain* to give the best results when their use is permissible. Of course, they are not suitable for races, express trains, or rifle balls; they are far out of the race on that class of work, but how few of my readers do much of that kind, and how easy it would be, when they want to do such things, to buy a dozen extra-rapid plates and use them. Ask the plate-maker which are his best plates, and, if he be frank, he will say, 'the *slow* ones.'

"Now let us consider what of the summer's work can be done on slow plates. Outdoor portraiture can certainly, and for this branch the slow plate is eminently suitable—just an open and shut of the shutter, say a half a second's exposure, and the portrait is sure to be about right. There is no under-timing, no over-timing apparently; it develops neatly, acts rationally, needs no sudden change in the make-up of the developer, but just *satisfies* one as it plods along, behaving normally in all respects, and when fixed and dried what an excellent printer it does make, crisp and bountiful in detail. One never has the amount of trouble dodging and doctoring slow-plate negatives as with fast ones. Then, for the innumerable landscapes that will be taken this year, what could approach the slow plate? I venture to say that if two novices went to the country, one with a gross of fast plates and instructions to 'press the button,' the other with a like amount of slow ones and directions to give three to five seconds with stop 32 in the lens, the latter would have eight times as many good negatives as the former, and a vastly greater average of *perfect* ones.

"It has always seemed a pity to me that film for Kodaks is not to be had slower than the admirable fast emulsion supplied; the fast film is certainly right in its place, but slow film is as much a necessity as slow plates. When a country road, a noble oak, an old cottage, and a sleepy cow happen to be the principal components of an artistic picture, it will readily be understood that an exposure of a one-hundredth of a second is as unnecessary as it would be for a graveyard, and, if one can secure a far better negative with slow plates and the tripod, it is our business to do so. One who takes a day's trip out in the fields can well afford to carry *some* fast plates, but, if best results at least expenditure of time and trouble are desired after the actual taking of the picture is concluded, let me strongly urge all to carry the majority of their holders full of slow plates. It will pay all who entertain any doubts as to the wisdom of my remarks to actually make the test and be convinced. Once a few such plates are developed, and the comparative ease of so doing is noted, and the bright negative printed, all doubts as to the advantage of using slow plates when possible will vanish, and the word failure will begin to sound unfamiliar to the successful user of the best plate for outdoor work. In the course of the summer I shall use perhaps two gross of plates of various sizes, and, as much of my work will be outdoors, I figure that four dozen fast plates will be the very most I will require. I run far less chance of failure, have incomparably easier work in all respects, and produce a more satisfactory negative in every

way, shape and manner, with slow plates. I believe the best slow-plate negatives, minutely examined, point for point, will be found superior to the best fast-plate negative ever made, presupposing, of course, that each was sufficiently and properly exposed. It would cost some of my readers very little trouble to investigate this matter, and, if twelve good negatives to the dozen, after summer's work, is any incentive, I can say that such a percentage is not improbable. Those having experience with fast plates might reckon up what percentage of success they had last year, and think the matter over."

#### THE PRESERVATION AND USE OF GELATINE ROLLERS.

[Translated from the *Photographische Chronik*.]

THOSE who know how difficult it is to cast good, durable rollers, and how expensive it is to replace them, will appreciate the following instructions given by H. Gauger, manufacturer of printer's inks.

1. The rollers should be kept in a dry place at a uniform, moderate temperature.

2. The rollers should be cast from uniform material, and, if possible, in the autumn (September to October) for winter use, and in the spring (April to May) for summer use.

3. Inking rollers should only be cast or recast from fresh material, and should be allowed to stand a few days before use, to season.

4. Old composition should only be employed for casting rollers that are not used for inking blocks, writing, &c.

5. In recasting old rollers, they should be first washed clean and the skin removed with hot water. The ends, and all cuts and holes, in which ink may have lodged, should be removed with a sharp knife. The composition should then be stripped off the spindle, broken in small pieces, and thrown in the melting pot.

6. The receptacle in which the composition is dissolved should not be heated by steam, but in a hot-water jacket, otherwise the composition may be over-heated and spoilt.

7. The mould should be warmed, especially at the bottom, but it should not be hotter than the hand can bear. This may best be done with a handful of cotton-waste saturated with spirit, suspended by wire inside the mould, near the bottom, and burnt. When the mould is warm, smear it thinly and evenly with olive oil or fresh pork fat.

8. The spindle should be warmed before placing it in the mould, and it should be perfectly dry. Small iron spindles may be wound round with cotton thread, but in this case it is better to prepare them the previous day by fastening the thread to the spindle with Cologne glue.

9. When the composition is completely dissolved and fluid (the temperature should never exceed 60° C.), the mould should be filled in a place free from draught, by pouring the composition gently down the spindle, making occasional pauses of two to three minutes each. When the mould is full, set it up near the fire to allow any bubbles to rise.

10. The mould should be allowed to cool down gently for about eight to ten hours and the roller may then be withdrawn. It should be cleaned with a sponge dipped in benzine to remove the grease, and should not be used for a couple of days.

11. No admixture (*grème*) should be added to the composition taken from old hard rollers, unless softer rollers are required for winter use, and then the proportion should not exceed ten per cent.

12. The reserve set of rollers should be kept in a cupboard to preserve them from draught and dust.

13. In damp localities, or in damp weather, the rollers should be covered with a coating of very thin newspaper ink (old, bad ink, mixed with lubricating oil), which should be removed before use. This prevents swelling or shrinkage.

14. The washing of rollers should be carefully avoided. If, however, it must be done to change the colour of the ink, first clean the rollers with waste paper, then with petroleum, and finally with benzine.

#### A SIMPLE METHOD OF OBTAINING THE CONJUGATE DISTANCES OF A LENS.

[A paper read before the Royal Photographic Society.]

THE practical photographer occasionally has need to know the conjugates of a lens when these are in a given ratio. For this end various useful formulæ and tables have been published, but these are not always easy to remember at a moment's notice.

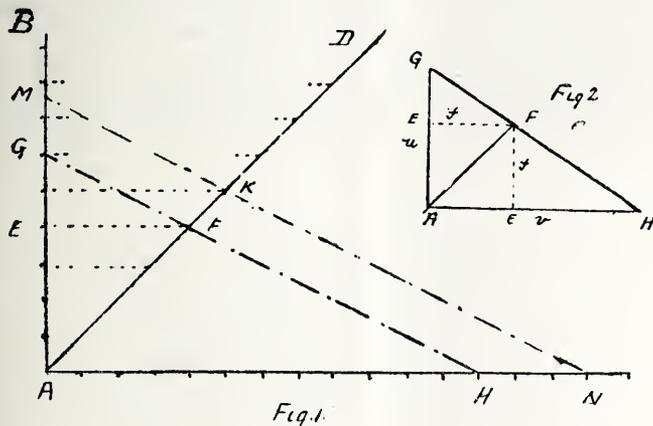

The method I propose showing has the advantage of eliminating formulæ, is easy to remember, avoids calculation, and only needs the use

of a graduated linear measure and any convenient form of parallel ruler. For example, our apparatus may conveniently take the form of a sheet of cartridge paper, a penny tape measure, a broom-stick, and two or three pins.

The method consists in applying two elementary principles of plane geometry which have been known to the world since the days of Euclid circa 300 B.C., and are therefore old enough to have been forgotten by many. I may therefore perhaps be pardoned if I remind you of these two old-world facts.

In fig. 1. AB and AC are two straight lines meeting at right angles at A. The angle BAC is bisected by the line AD. A straight line GFH meets these three lines at the points G, H, and F respectively.

Then, if FE, the perpendicular distance of F from AB, represent the equivalent focus of a lens, its conjugate distances would be represented

by the lines AG, AH. It may be an aid to memory to briefly glance at the reason of this. (See fig. 2.) Let us for brevity's sake call  $f$  the perpendicular distance of F from AG or AH and  $AG = u$ ,  $AH = v$ .

Now, the whole triangle,  $AGH =$  the two smaller triangles  $AFG, AFH$ , and the area of a triangle may be expressed by half the product of the base and altitude. Hence, taking all these double to avoid fractions,

$$AG \times AH = AG \times FE + AH \times FE.$$

$$uv = uf + vf.$$

Dividing by  $uvf$  we get

$$\frac{1}{f} = \frac{1}{v} + \frac{1}{u}$$

which we recognise as a fundamental formula.

Secondly.—Another ancient bit of Euclid tells us that, if the line GH move parallel to itself, the ratios of AG, AF, AH, remain constant. Or, in the language of modern geometry, we may call AB, AC, AD, three concurrent rays of a flat pencil and GFH a transversal moving parallel to itself.

And now to apply these fragments to the needs of the practical photographer.

Suppose that AB and AC be marked in inches and that AD be similarly graduated by EF, &c., parallel to AC.

First take the case of a 4-inch lens used for enlarging to the scale 2 to 1. We know that one conjugate must be double the other. In other words, the distance AH (fig. 2) must be double the distance AG. Therefore we place our parallel ruler so as to cut AB and AC at any two such points, say the third mark from A along AB and the sixth mark from A along AC. Then move it parallel to itself until the fourth mark (F) along AD is coincident, and now read off the distances AG and AH. In this case they are at the 6 and 12-inch mark exactly.

Thus  $\frac{1}{6} + \frac{1}{12} = \frac{1}{4}$ , or, expressing all as twelfths,

$$\frac{2}{12} + \frac{1}{12} = \frac{3}{12}$$

If now we move GH parallel to itself until we reach the mark K, corresponding to a 5-inch-focus lens, we find our conjugates AM and AN at  $7\frac{1}{2}$  and 15 inches.

But the more useful applications are, when we want to know conjugates of less simple relationship than 2 to 1. For instance, enlarging from quarter-plate (say  $4 \times 3$ ) to  $15 \times 12$ . Now, four times  $4 \times 3$  is  $16 \times 12$ , but our limits are  $15 \times 12$ , i.e., proportions 4 to 15. Thus, placing our ruler at the 4-inch mark along AB and the 15-inch mark along AC, we can, by moving it parallel to itself, read off conjugates for any lens marked along AD.

THREE-COLOUR PRINTING.

ARISING out of the reference to three-colour printing recently made by a writer in the *Daily Chronicle*, the following correspondence has since appeared in that Journal. The Editor of the *Studio* writes: "In his tiltings at colour printing in general, the writer, under the heading of 'The Art World,' in the issue of the *Daily Chronicle* for the 6th inst., allows himself to fall into the error of classing the colour reproductions in the *Studio* with the imperfect three-colour prints employed in American and other magazines. This is the second time in a short period that the writer in question has demonstrated his lack of discernment with regard to colour printing, and the misleading nature of his remarks compels me to beg permission to state that the colour reproductions in the *Studio* are not executed by the cheap 'three-colour process,' but by a very much more elaborate and expensive method that frequently involves the employment of a large number of blocks.

"With reference to the statement that 'reproductions in colour are always out of place in a well-printed book,' this is a subject upon which opinions may vary, but there can be no doubt about the advisability of employing a method of reproducing colour tints in dealing with coloured artistic work and introducing such work to the general public. A magazine may be regarded either as an artistic object in itself, or as a medium for disseminating intelligible information to its readers, and if a publication of the latter class—such as the *Studio*—has to do with coloured decorations and paintings, the quality of the work dealt with will be made more intelligible by means of colour prints than by reproductions in black and white. Moreover, if the exact reproduction of original colours is more feasible on a fine bright-faced paper than upon a coarse, dull one, it is obviously advisable to use the medium calculated to convey the best impression of the original drawing."

The rejoinder of the *Daily Chronicle* critic was as follows: "I did not say that the reproduction of Mr. Alexander's portrait in the *Studio* was done by the three-colour process. As to the rest of Mr. Holme's remarks about colour reproduction and printing, he seems to have misunderstood the *Art World*. I have always advocated the reproduction of specially prepared drawings in colour. Between the intelligent reproduction of such drawings, however, and the indiscriminate reproduction of oil paintings never intended for reproduction there is a vast and impassable gulf fixed."

Mr. R. B. Roxby also sent the following letter: "I read your notes in the *Daily Chronicle* of the 6th inst. with reference to colour printing, and also Mr. Holme's letter in to-day's issue. Whilst your observations with regard to the ordinary three-colour process are quite correct, and to a large extent are also applicable to lithography, I think that to reproduce pictures by a superimposed method is not quite so impossible as the current prints, which you rightly style vile, would lead one to suppose. I should be very glad for an opportunity to show you some three-colour prints, which I think would lead you to modify to a considerable extent your present opinion with regard to the possibilities of reproduction by the primary colours method. As to the prints referred to by Mr. Holme, they are certainly three-colour prints, or rather three-colour prints which are as far as possible improved by the interpolation of one, two, or more blocks printing a neutral or other tint. In a measure, therefore, Mr. Holme is quite correct in stating that they are not three-colour prints. Obviously they are not if more than three colours are used. At the same time the fact remains that fundamentally they are primary colour prints, made better by adding skilfully several neutral printings."

THE PLATINOTYPE COMPANY'S OXYMAGNESIUM LIGHT.

[Patent No. 22,747 of 1899.]

WE append the essential portion of the Company's Patent Specification:—Various means have been proposed and employed for producing light for photographic purposes, for example, electric arc lamps, electric incandescent lamps, incandescent gas-burners, and lamps known as "flash lamps," in which metals or other substances are burned. All of these methods, however, as heretofore practised, have certain objectionable features. For instance, arc lamps are expensive and troublesome to manage; electric incandescent lamps are deficient in actinic rays; incandescent gas-burners, if made sufficiently powerful for studio work, develop too much heat; and flash lamps are dangerous by reason of their liability to set fire to inflammable objects near them, besides which they are objectionable because of the diffusion through the atmosphere of the studio or room of burnt and partially burnt products arising from such lamps.

Moreover, it is found in practice that an artificial light to be of any real value must be strong enough to allow of its being reflected from a suitable surface or filtered through a translucent screen, when necessary

for proper "lighting," upon the object to be photographed, instead of being thrown directly upon such object.

It is known that magnesium or other suitable metal burned in oxygen gives a satisfactory light for photographic purposes, the rays being very actinic and therefore adapted to be used, after reflection from or filtration through a screen, for illuminating the object to be photographed. The method heretofore used for producing such light is not, however, convenient for practical and repeated use, and the object of the present invention is to provide simple and easily manipulated and portable apparatus for burning magnesium and other suitable metals in oxygen in an unobjectionable manner and so as to form or give a sufficiently strong actinic light to be used where necessary by reflection or filtration.

An important feature of the invention is the provision of means for lighting the metal ribbon or wire by a current of electricity, ignition being ensured by means of paper, sulphur, wax, or other readily inflammable substance as hereinafter described.

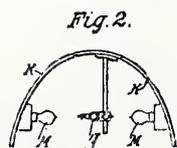

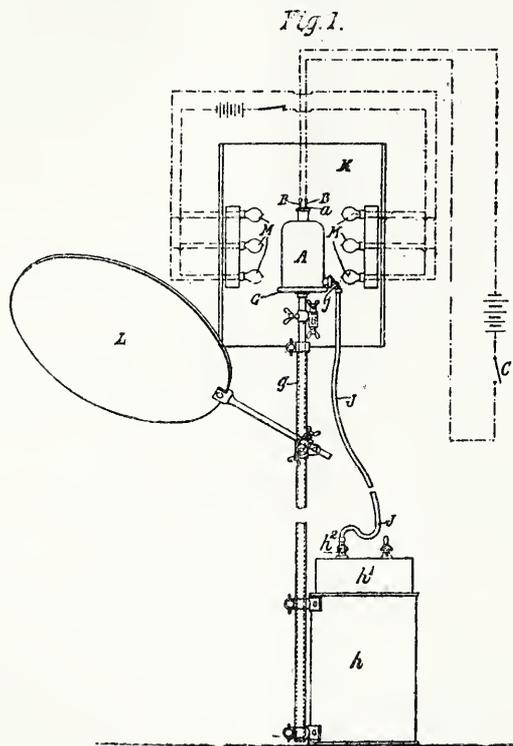

Another important feature is the construction whereby the oxygen consumed during combustion is replaced automatically by fresh oxygen from a suitable source of supply.

A further feature of the invention is the construction whereby the combustion of the metal takes place in a closed and tightly stoppered vessel containing if desired a small quantity of water, which vessel is in

certainty. We find it convenient to form the strip of igniting paper in the form of a hook *e* attached to the magnesium ribbon and adapted to hook on the conductor *D*. In lieu of using paper as above described, we may apply sulphur, wax, or other readily inflammable substance, to the end of the ribbon to ensure ignition. Moreover, we find it advantageous to slit the ribbon at the end for the same object.

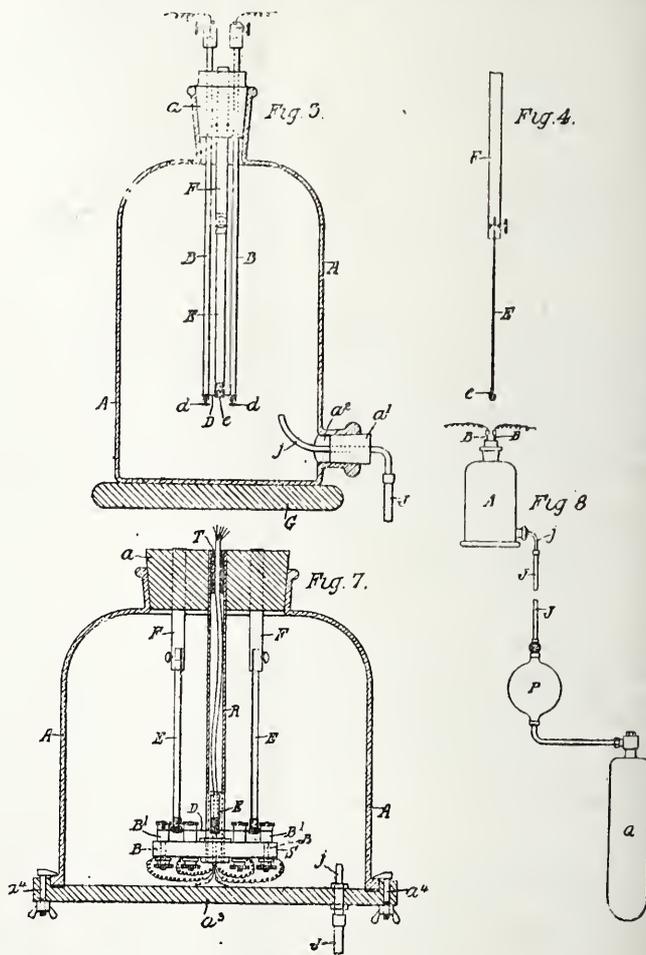

The vessel *A* is supported on a table *g*, which can be raised and lowered as may be required, the same being carried, for example, by a telescopic tube *g* which is shown connected by clamps to the outer case *h* of a holder for containing oxygen gas. Any other suitable form of portable stand may be provided for supporting the vessel *A*. The gas-holder may conveniently comprise a rising and falling bell or dome *h*<sup>1</sup> of any usual type arranged in the outer case *h*. It is connected to the vessel *A* by a flexible tube *j* which for convenience is joined to a rigid tube *j* that enters the vessel *A* through a stopper *a*<sup>1</sup> inserted in an opening *a*<sup>2</sup> formed at the side of the said vessel, the rigid tube *j* being bent upwards as shown, so that the water which is sometimes used in the vessel *A* to absorb the products of combustion cannot readily enter the tube when the vessel is being shaken.

The action of this apparatus is as follows, that is to say, the gas-holder or reservoir being first filled with oxygen gas from any convenient supply, the combustion vessel *A* is now placed in communication with it by the

communication with another vessel, gas-holder or floating bell, of sufficient size, containing the oxygen supply, whereby no excessive pressure can be generated in the combustion vessel, while at the same time the products of combustion are confined and prevented from being diffused through the atmosphere of the room or studio.

Referring to figs. 1 to 4, *A* is a transparent or translucent vessel in which the combustion takes place, and which, for isochromatic photography, may be made of suitably coloured glass. The neck of the vessel is closed by a stopper *a* of indiarubber, for example, through which a pair of electric conductors *B, B* are passed, said conductors being in circuit with a suitable source of electricity and a switch or contact-making push represented by *c*. The conductors *B, B* are connected by a third conductor *D* secured by screws *d* or otherwise, the same being a thin wire of high resistance which becomes heated when the current is switched on. The magnesium or other ribbon *e* to be burned is fixed at one end in a clamp *F* carried by the stopper *a*, and the other end is maintained in contact with the thin conductor *D* in any suitable manner. To ensure that the metal ribbon shall light up when the thin conductor is heated, a strip of paper, saturated in nitrate of potash, for example, may be wrapped round the junction of the ribbon and conductor. This paper is ignited by the heated wire and serves to ignite the magnesium with

tube *j* and filled with oxygen. The stopper *a* fitted with the conductors *B, B* is then inserted to close the neck of the vessel and the current is switched on, whereupon the thin conductor *D* becomes heated and the magnesium or other metal ribbon or wire *e* is lighted. The pressure induced by the sudden heating of the contents of the combustion vessel momentarily forces back some oxygen into the gas-container, but this is followed by a return movement wherein fresh oxygen takes the place of that consumed. The fumes or combustion products contained by the vessel *A* are then absorbed by the water therein, which process is facilitated by shaking the vessel, after which the stopper *a* can be removed and replaced by a fresh stopper fitted with conductors and another piece of metal ribbon or wire ready for a second flash. A cock *h*<sup>2</sup> is provided to shut off the gas container, to prevent escape of oxygen while the stopper *a* is removed or at other times when required.

With this apparatus the fumes or combustion products do not enter the room or studio, and there is no danger of blowing the stopper out, or of bursting the combustion vessel. If desired, the water can be dispensed with.

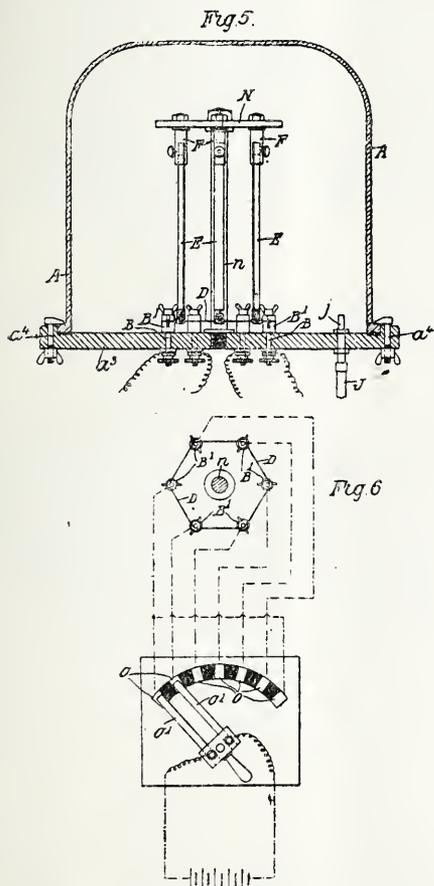

*K* is a curved reflector carried by the telescopic tube or standard *g* and adjustably arranged behind the combustion vessel *A* to throw the light in one direction either through an adjustable muslin or other suitable

filtering screen  $\kappa$  before reaching the object to be photographed, or upon a white screen where it is reflected upon the object to be photographed. In either case the object being photographed, if a person or animal, is not startled by the flash and perfectly natural expressions of face and feature can thus be obtained. The screen  $L$  is shown adjustably mounted on the standard  $g$ .

In order to light up the sitter while focussing the camera, we provide, for example, electric glow lamps  $m$  or other suitable lights within the reflector  $\kappa$ . The great advantage of this arrangement is that the light for focussing purposes comes from the same direction as that used for taking the picture, and hence the adjustment of the sitter can be effected with the utmost precision.

In lieu of the gas-holder shown in fig 1, an expansible gas-bag or bellows  $p$  (fig 8) may be used for the same purpose. Such a bag may be attached to a cylinder  $q$  or other vessel containing compressed gas, whence the gas is allowed to escape at a low pressure through the usual reducing valve provided on such cylinders.

If it is desired to produce several combustions before the combustion vessel is opened, we provide a number of conductors and magnesium ribbons arranged between them, with means for firing the ribbons successively. One such arrangement is shown in figs 5 and 6 in which we provide for six successive combustions without opening the combustion

vessel. In this construction the vessel  $A$  is in the form of a bell clamped on a suitable base  $a^3$  by means of screw clamps  $a^4$ . The six conductors  $B$  pass through the base  $a^3$ , and they are furnished with means such as screw clamps  $B^1$  at their upper ends by which the thin conductor  $D$  to be heated is secured to them. One wire extending round the six conductors  $B$  is used, the same being heated, ignited, or fused, in six different places successively as hereinafter described. The magnesium ribbons  $E$  are suspended in clamps  $F$  which depend from a plate  $N$  supported by a central pillar  $n$ , and the said ribbons make contact with the several sections of the conductor  $D$  as in the single arrangement above described. The electrical connections may be arranged as follows, that is to say, as indicated in fig 6, the conductors  $B$  are electrically connected respectively to terminals  $o, o$  on a switchboard having two switch arms  $o^1, o^1$  operated by a common handle so that contact is made with two terminals simultaneously. By providing seven terminals  $o$ , connected as shown, any adjacent pair of said conductors can be switched into circuit and the wire  $D$  connecting such conductors thereby heated, ignited, or fused.

In fig. 7 we have shown a modification of fig. 5 in which the bell is provided with a large neck fitted with a stopper  $a$  from which the clamps for holding the magnesium ribbons are suspended as in fig. 3. The clamps or terminals  $B^1, B^1$  are in this case mounted on a slate or other non-conducting plate  $s$  which is suspended by means of a central tube  $r$  from the stopper. The wire conductors leading to the terminals

$B^1, B^1$  pass through the tube  $r$  so that the conductors, terminals and ribbons are all carried by the stopper, and are removed and replaced together as in the first-described arrangement. The magnesium ribbons can thus be changed without requiring to raise the bell, and therefore without wasting the oxygen. Escape of oxygen gas through the tube  $r$  is prevented by packing the latter with any suitable packing material  $t$ .

The pipe  $j$  for conveying the oxygen to the bell is shown in both figs. 5 and 7, for convenience passing through the base  $a^3$ .

### FAMILIAR TROUBLES WITH P.O.P.

A STORY went its rounds some time ago how an artist Judge at a certain photographic exhibition, which shall be nameless, wished exceedingly to give a medal to an execrable double-toned gelatino-chloride print on the ground that the colour contrast was so striking and original, and was only dissuaded by the emphatic and forcible protests of his photographic colleagues.

Be the tale true or otherwise, it serves at least to support the contention that unscientific methods of toning are by no means the monopoly of the guileless beginner. It really seems, judging from the innumerable questions constantly asked and answered in the inquiry column of the photographic journals, that the gelatino-chloride printing process, though, professionally speaking, more used than any other, is comparatively little understood as regards its working theory. Why this should be is not so clear. Ample directions are, as a rule, issued with the paper by the different manufacturers, a common-sense adherence to which ought to ensure satisfactory results. The average photographer, unfortunately, has a fine contempt for printed instructions of any kind, just glances hastily at them, throws them aside, and follows them afar off, with free-and-easy variations of his own. Others, slavishly obedient to the letter, wander away from the spirit, and, while they would stand aghast if there were a fraction of a grain more of any given constituent in their toning bath, stumble over some simple matter not especially dealt with, but which a little intelligence would have helped them to avoid.

By far the larger number, probably, of those who come to grief over this process will be found among the ranks of men accustomed to working albumenised papers. They fondly imagine that the manipulation of these does not vary much in essentials from that of their later rival, P.O.P. When any one starts with this assumption, unless he has the advantage of practical advice from those familiar with gelatine papers, the result is a foregone conclusion. For a few weeks, perhaps, he will stock his show-case with glossy-surfaced prints, of varying degrees of excellence, or the reverse, soon to be banished again in favour of his first love. He will assure his friends that, "after all, there is nothing equal to the old albumenised paper, though certainly you cannot obtain it nowadays like it used to be. These gelatine papers are so uncertain, you can never get two batches of prints to tone alike," and so on. Are we not all familiar with the oft-told tale?

Now, these convictions are simply the natural result of trying to fit a square peg in a round hole, or, in other words, to apply a totally unsuitable system of working to a printing process very sensitive to any disturbing influence.

The albumenised process is so delightfully easy. The bath can be used over and over again, without any very serious attention. If a print is a shade too dark or a trifle over-toned, it does not very much matter, a little longer stay in the hypo will remedy this. As to washing, the prints can knock about for hours at their own sweet will without injury, while the mounting and finishing also present no special difficulties. In fact, this process may be called the elysium of the happy-go-lucky man. With the advent of P.O.P., "nous avons changé tout cela," a long farewell must be said to all old careless rule-of-thumb methods if success is here anticipated. Leaving the combined toning and fixing bath out of the question as being scarcely suited for employment commercially, the first difference we note is that the bath cannot be used more than once—in itself not a disadvantage, as far as concerns the production of uniform prints.

An often-ignored point is that the employment of distilled water—always an improvement—is sometimes a necessity, in making up the bath, and for the last washing water before toning. The least trace of acidity should be carefully guarded against, and the importance of an even temperature will soon force itself on our attention. The bath should always be tested with a thermometer before use, and never allowed to vary much of either side of 50° F. Working at too high a temperature is often the unsuspected cause of many of the bilious-looking prints so much lamented over.

When a bath containing ammonium sulphocyanide is used, the prints are generally passed through an alum solution, prior to toning, to counteract the softening of the film which follows the employment of the former salt. This is often carelessly and hastily done, especially the washing out of the alum, with the resulting consequence of uneven tones.

Sufficient care is not always taken to ensure the purity of the chemicals used; a trifling adulteration, that would perhaps have no evil effect on albumenised paper, may be fatal to success with P.O.P.

There is no need for any misgiving on this point if all purchases are made from a respectable dealer or chemist.

Probably the majority of failures in working gelatino-chloride papers have this in common, that, after fixing, the prints go down alarmingly in tone, assuming a dirty yellowish-brown hue of a decidedly patchy character. The cause, in nine cases out of ten, is over-toning. The unsuspecting printer, used to the comparatively leisurely manner in which albumenised prints conduct themselves during this operation, complacently suffers those on P.O.P. to, figuratively speaking, take the bit in their mouth, and fairly run away with themselves. A properly toned gelatine print loses but little in the fixing, and dries darker in proportion than one on albumenised paper. Owing to the extreme rapidity with which P.O.P. sometimes tones, with a bath of average formula under normal conditions, any but experienced workers are courting certain disaster if they attempt dealing with too many prints at once; about a dozen at a time will be found quite enough to attend to. It is perfectly useless to judge the tone by looking at the face of the print, they must be examined by transmitted light, in other words, held up and looked through.

When all reddishness has disappeared except in the darkest shadows, toning is completed, and the print should be immediately taken out. The cardinal mistake made by a good many well-meaning people is that they wait until the print appears toned all over alike when looked through. If this is done, over-toning has taken place, as the behaviour of such prints in the fixing bath will speedily demonstrate. The slight redness in the shadows, previously alluded to, will disappear on drying, leaving a rich and satisfactory tone.

Another cause of yellow prints is working with an exhausted bath. A certain quantity of solution will tone a definite number of prints and no more. If it is attempted to exceed that number, one of two things will happen; either the first few prints will be toned all right and the rest spoilt, or all of them may come to grief. Very much the same thing results even with a proper allowance of bath if the first few prints are left in too long, thus robbing the others of their fair share of gold.

The old happy way of using a stock toning bath, adding a little gold from time to time to replenish its exhausted vitality, and having no particular cause for alarm, though the mixture became thick, black, and sirupy, will not do with P.O.P. Fresh bath must be used each time in measured quantities, according to the number of prints, and thrown away when done with.

A favourite complaint against this paper is its undeniable propensity to what is called double toning. The explanation of this is simply that the toning solution has acted too rapidly on the surface of the print, before it has had time to penetrate through the gelatine to the deeper deposit of silver in the shadows. To a certain extent, perhaps, this is beyond prevention, though a properly toned print never exhibits it to any noticeable degree. A very slight warmth in the shadows is often, in artistic hands, rather an improvement than otherwise. When, however, we see two or three entirely different colours, ranging from a dirty grey to brick red, in the same picture, the thing becomes an eyesore and an abomination. Prevention is certainly better than cure in this case, for no remedy exists once the thing is done. If the happy medium is kept between too strong and too weak a bath, if careful attention is paid to maintaining a uniform temperature, if suitable negatives are used, and due precaution taken against prematurely exhausting the friendly gold, this woful affliction of chameleon toning will be overcome.

Expert P.O.P. manipulators may smile pityingly at much that has been said, thinking it perhaps a trite and unnecessary repetition of what, to them, is so familiar, and presents no difficulties. On the other hand, there are probably many who, for want of some such information, have long groped vainly in search of the golden rule that should make their work a success instead of a failure. It is not so long ago that one sorely tried printer, not necessarily incompetent, sent his query to a photographic contemporary, asking how to avoid whole batches of prints turning yellow after fixing, winding up, poor fellow, with the significant and sad remark that, if he could not get his next toning satisfactory, his place would probably know him no more. Perhaps enough has now been said to prove that the foregoing hints and cautions are not entirely uncalled for, nor likely to be thrown away, even though to many they may convey nothing strikingly new or original.

A. LOCKETT.

#### ROCKWOOD'S IMPROVEMENT IN PROCESSES OF PRODUCING HALF-TONE NEGATIVES.

[Patent No. 9447 of 1900.]

The invention consists in the process of producing a screen negative for use in making a photographic half-tone printing plate which comprises, first, surface-drying the initial dry-plate negative, then photographically making a wet-plate positive image on glass from said initial dry-plate negative, and then photographically making a screen negative from the reversed plate bearing said positive image.

The initial negative is first taken, as a dry or gelatine plate negative, and by means of a piece of blotting-paper applied to its surface the drops or "tears" are taken up therefrom in a very few minutes, when the said

negative is in condition to be presented to the camera. Then by means of a camera, and by the wet or collodion process, a positive image from said initial negative is photographed upon a glass plate. The plate bearing this positive image, after drying, is then reversed in a camera box and a screen negative is photographically made therefrom. The screen negative thus produced may now be printed on the sensitised zinc plate, and the positive image thus imprinted on said plate may immediately be etched.

The performance of the entire process of producing the screen negative need not consume more than a few minutes of time, and the production of the etched plate, ready to be printed from, can be made in a like short space of time.

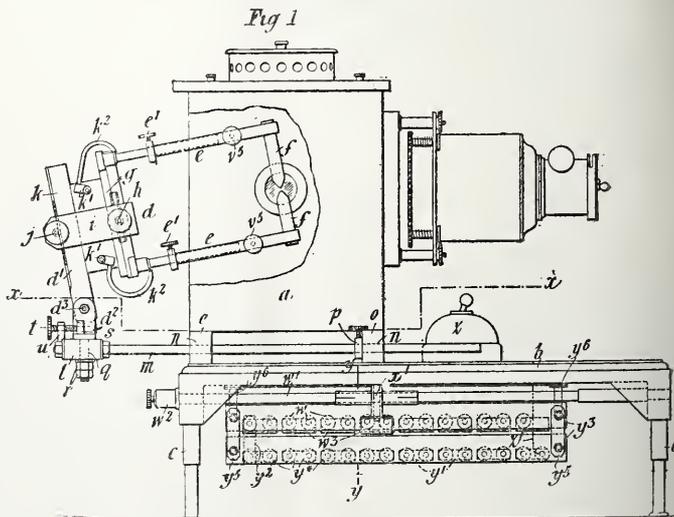

In addition to the economy in time and labour resulting from my described process, other and further advantages are thereby secured. For instance, the glass plate bearing the positive image photographed from the initial negative, being free from the grain of a photographic print or picture on paper, the said positive image may be an enlargement, photographically, of said initial negative image, so that a small snap-shot negative of, say, two by three inches, can, as soon as developed, be photographically enlarged up to, say, eleven by fourteen inches, or, in some instances, to even greater dimensions in said positive image. The said resulting positive image will be an image only, and free of texture or grain of paper. Again, the possible injury to or distortion of a delicate and elastic film, in reversing the said positive image, which is likely to occur in floating off from its plate the film bearing said positive image, turning said film over and then floating it on to another plate, as is at present done in the process of producing screen negatives for use in making half-tone printing plates, is wholly avoided. Furthermore, a "hard," under-timed initial negative, which would not make a good paper print, can be softened by the proper exposure in the camera, and a good brilliant positive image on glass be obtained; while a "soft" or over-exposed initial negative, useless for printing on paper, can be made to give a brilliant positive on glass in the manner described.

#### KAMM'S IMPROVEMENTS IN ELECTRIC ARC PROJECTING LANTERNS.

[Patent No. 15,967 of 1899.]

*a* is the lantern of any ordinary construction and *b* the base thereof supported on the legs *c*. *d* is the lamp of known construction, that is to say, it has rods *e* for supporting the carbons *f* and carried by rack bars *g* operated by the pinion *h* for moving the said carbons towards or away from each other, the said pinion being carried by side plates *i*, which also carry another pinion *j* engaging a rack-bar *k* so that the arc can be adjusted vertically. *k*<sup>1</sup> are terminals for the attachment of the wires conveying the current to the lamp and in electrical connexion with the rods *e* by the wires *k*<sup>2</sup>.

The patentee says: "I arrange for the longitudinal adjustment of the

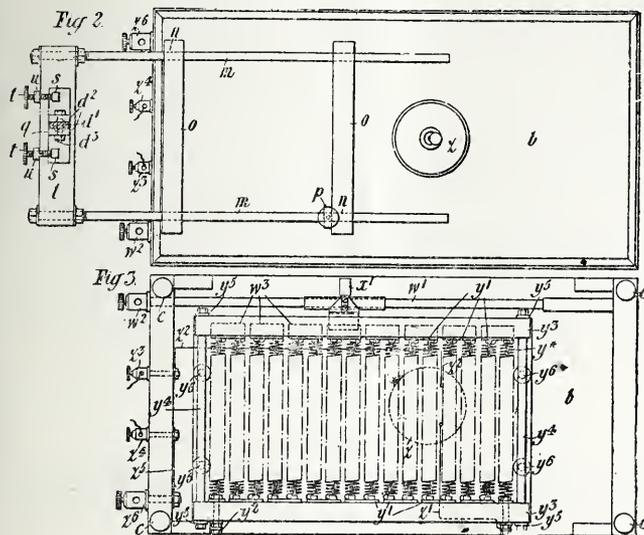

arc by placing the lamp *d* on a platform *l* at the back of the lantern, the said platform having connected thereto rods *m* designed to slide in guides or bearings *n* in cross-bars *o* connected with the lantern. A stop *p* (or stops) in the form of a collar fixed by a set-screw may be arranged to limit the movement of the lamp in one direction.

"For adjusting the arc at an angle in a vertical plane to the condenser I form the lamp frame in two parts *d*<sup>1</sup>, *d*<sup>2</sup> hinged together at *d*<sup>3</sup>, the one part *d*<sup>1</sup> carrying the carbons, whilst the other part *d*<sup>2</sup> is attached to the platform *l*. By moving the part *d*<sup>1</sup> on the hinge *d*<sup>3</sup> the arc can be adjusted at an angle in the vertical plane.

"For adjusting the arc laterally I provide for turning the lamp on a vertical axis. For this purpose the part  $d^2$  of the lamp frame is provided with a pin or bolt  $q$  passing through but free to turn in the platform  $l$ , and held therein by nuts  $r$ . I also provide the said part  $d^2$  of the lamp frame with lugs  $s$  on opposite sides of the pin  $q$ , against which lugs bear set-screws  $t$  passing through lugs  $u$  on the platform  $l$ . By slackening one set-screw and tightening the other one the lamp frame will be caused to turn upon the axis of the pin  $q$  and move the arc laterally.

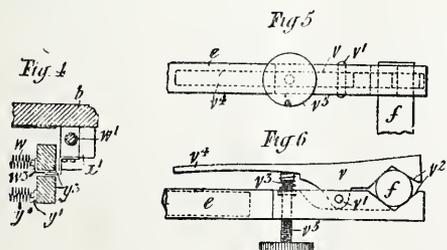

"The rods  $e$ , for supporting the carbons  $f$ , I form telescopic as shown in fig. 1, whereby their length can be varied for the purpose of adjusting the arc nearer to or farther from the frame  $d^1, d^2$ , set screws  $e^1$ , or the like, being employed to fix the parts when adjusted.

"For holding the carbons  $f$  to the said rods  $e$  I provide clips or bars

$v$ , hinged at  $v^1$  to the said rods as shown distinctly in figs. 5 and 6, the said clips and rods being recessed as at  $v^2$  to receive the said carbons. I also provide springs  $v^3$ , which, while normally causing the clips to press and hold the carbons against the rods  $e$ , will yield when extensions  $v^4$  on the said clips are pressed towards the rods  $e$  and release the carbons.  $v^5$  are set-screws passing through the rods  $e$ , and which can be caused to bear against the clips  $v$  to fix the carbons securely in position. By the described arrangement it will be understood that it is not necessary to hold each carbon with one hand while fixing it in position by the set-screw with the other hand, the carbon being first inserted between the clip  $v$  and rod  $e$ , and then the screw tightened.

"I also arrange in connexion with the lamp a series of resistance coils,  $w$ , which are placed beneath the base  $b$  of the lantern, a sliding switch  $x^1$  being arranged in connexion with the said coils  $w$  so that more or less resistance can be put into the lamp circuit. The said switch slides

upon and is guided by a rod  $w^1$ , connected to one of the terminals  $w^2$  of the lamp circuit and is designed to make contact with plates,  $w^8$ , at one end of the coils, which plates together with similar plates at the other end of the coils connect the coils in "series."  $y^*$  is another series of resistance coils connected in "series" by plates,  $y^1$ , and in electrical connexion with the coils  $w$  through the strip  $y^2$ . The coils  $w$  and  $y^*$  are carried by frames consisting of bars  $y^3$  of insulating material and rods  $y^4$ , the frames being connected together by plates  $y^5$  and suspended beneath the base  $b$  by rods  $y^6$ .  $z$  is a switch for switching on the current from the generator, which current enters at the terminal  $w^2$ , passes through the rod  $w^1$ , the switch  $x^1$ , the coils  $w$ , between the said switch and the strip  $y^2$ , the said strip, the coils  $y^*$ , the wire  $z^1$ , to the switch  $z$ , the wire  $z^2$ , from the switch  $z$  to the terminal  $z^2$ , thence to the lamp by a wire connected to one of the terminals  $k^1$ , and back from the other terminal  $k^1$ , to the terminal  $z^4$ , wire  $z^5$ , and terminal  $z^6$ , back to the generator."

## Our Editorial Table.

MR. W. H. TOMLINSON, of 81, Dale-street, Liverpool, is issuing a neat catalogue of fifty pages. It illustrates and describes a considerable variety of apparatus and material suitable for the requirements of amateur photographers, prominence being given to Mr. Tomlinson's speciality, the Practical Hand Camera.

*Over the Alps on a Bicycle*, by Mrs. Pennell, is a gaily written account of how the lady established a wheel record, which she apparently thinks deserves to be bracketed equal with the achievements of Hannibal and Napoleon. The authoress insists, perhaps too strongly and too often, upon her American nationality, and now and then forces her humour almost to the sacrifice of good taste; but the book is so amusing that possibly these things will escape the notice of the ordinary reader. The illustrations are by Mr. Joseph Pennell, the "J" of the book, who (we quote the authoress) "always collapses, somewhere, somehow, on these trips." Fie! Mrs. Pennell! The book, which is published by Mr. Fisher Unwin, price 1s., contains the following complimentary references to the Geneva photographers: "We came to Geneva, and wheeled down the long street, at the end of which Mont Blanc, according to all photographic shops, rears its head so proudly. But Mont Blanc was not there, and a second glance showed that it would not have been in the photographs either if the photographer had not painted it in. I began to wonder if, like the Swiss waiter, it had gone abroad to make its fortune."

### CONVENTION PHOTOGRAPHS.

WE continue to receive pleasant photographic reminders of the Newcastle Convention, a successful gathering all through, as we are still constantly hearing. Our friend, Mr. F. A. Bridge, the Hon. Secretary and Treasurer (commendatory adjectives are quite superfluous), kindly sends us a little print of a group of three posed and photographed by himself on the steps of Houghton Castle. The portraits are those of Mr. Crooke, Mr. Pattison Gibson, and another, who here thanks Mr. Bridge for the excellent photograph. The official group, taken by Mr. W. Parry, of South Shields, has excited the very greatest admiration. The figures were well placed, amidst beautiful surroundings, and a faultless negative was the result. A richly toned gelatino-chloride print hangs in our office, and, for our private use, Mr. Parry has supplied us with a tastefully framed print in sepia platinum, and a fine and vigorous piece of photographic work it is. We left the framing of the picture to Mr. Parry, who chose a new dark wood moulding of a singularly appropriate character. The indefatigable stereoscopist, Mr. Alfred Seaman, sends us a dozen binocular views, chiefly taken, to quote his own words, "on that very memorable and enjoyable afternoon in Jesmond Dene." Groups and portraits of prominent Conventioneers, as well as views, are the subject of these slides, copies of which Mr. Seaman kindly offers to send to friends. Mr. Seaman certainly knows how to make a good stereograph, and not for the first time are we called upon to thank him for evidences of his skill in this direction. Lastly, we have to thank Mr. S. Herbert Fry for some capital snap-shot portraits taken at Hexham.

THE first number of Hurman's *Photographic Chat*, a journal for amateur photographers, has reached us. It is issued by the well-known firm of photographic dealers, Messrs. Hurman, Limited, of St. Nicholas-buildings, Newcastle-on-Tyne. The new comer, which has our best wishes for a long and useful career, quite fulfils the promise of its title, and gives the amateur reader fourteen pages of simply and clearly expressed photographic information of a useful kind. From an article on Stereoscropy we extract the following lucid definition of binocular work, it could hardly be improved on: "A stereoscopic camera is like the two eyes without the brain. It separates the object or landscape into two pictures, obtained from different points of view. The stereoscope is the instrument which aids us to recombine them into a solid perception. We look through the two prismatic glasses which serve to bend the lines of sight outwards, and so, when we turn our eyes inward to look at the central object of the view, we think and feel as if both eyes were looking at one object from different points, as in nature; whereas, in reality, we are looking at two views, one with the left eye and the other with the right." *Photographic Chat* is published monthly, price 1d.

## Studio Gossip.

REMOVAL OF FOXY STAINS FROM ENGRAVINGS AND PAPER.—The copper or steel-plate engraving is immersed in a six per cent. solution of sodium phosphate for from two hours to two days as is required; it is then washed with clean water and dried.—*Deut. Am. Apoth. Zeit.*, 21, 19.

THE LATE LORD RUSSELL OF KILLOWEN.—The following anecdote is related of the late Lord Chief Justice:—Once, perhaps, for a brief moment, he was taken aback. A photograph of himself, together with his young marshal, a son of Sir Squire Bancroft, was printed in *Sketch* with the underline, "Lord Russell of Killowen, and the author of *Teresa*." Lord Russell, who was in the same position towards *Teresa* that Lord Coleridge held towards Connie Gilchrist and Mr. Justice Day towards Mr. Conan Doyle, was travelling in Ireland when the picture appeared. At a wayside station a bookstall man approached and asked him if he had seen himself in *Sketch*, seated with the author of *Teresa*. "Teresa whom?" asked the Chief in a tone that startled his informant. The paper was produced, and by degrees the situation was cleared up.

## News and Notes.

PHOTOGRAPHY is to have a place in the Blackburn Technical School curriculum next session. A class for theoretical and practical instruction in photography is to be established, provided a sufficient number of intending students enter their names.

WE are sorry to learn of the death on Sunday last of Mr. H. J. White, the Manager of Messrs. Fallowfield, a position he had occupied for over twenty years. The deceased gentleman, who was widely known and respected in the photographic trade, succumbed to an attack of pleurisy and bronchitis. He was forty-one years of age, and leaves a wife and family.

A TELESCOPE DISCOVERS A THEFT.—*The Scientific American* states that a telescope was recently being tested at the Bausch & Lomb Optical Works, at Rochester, N. Y., and it was turned on a bridge, and the observer saw a young thief take a tub of butter from a waggon and conceal it. The police were telephoned to, and the thief was captured as he was attempting to carry away his prize a few hours later. This is an interesting use of the telescope.

THE Fifth Annual Exhibition of the Hove Camera Club will be held at the Town Hall, Hove, on November 22-24. The following are the Open Classes:—Class A, Landscape and Marine; B, Figure and Portraiture; C, Architecture; D, Any other subject than the above; E, Lantern Slides, any subject, in set or sets of four; F, A set or sets of four pictures by exhibitors who have never gained an award in photography. Prospectuses will be ready in October, and copies will be sent in due course upon application to Mr. C. Berrington-Stoner, Hon. Secretary, 24, Holland-road, Hove.

PHOTOGRAPHY AT OBER-AMMERGAU.—*The Church Times* prints a warning against cinematograph representations of scenes from the Ober-Ammergau Passion Play. It is well known that no visitor is permitted to employ or even to take into the building (it is really now a theatre) any photographic apparatus whatever. But it is not so well known that the managers of the Passion-Spiel—one, if not more, of whom is an opera director from Munich—sell the photographic rights of the Play to the highest bidder, and in due course the photographs are purchased at extortionate prices.

ANOTHER RESTRICTION IN THE SALE OF CHEMICALS.—After years of perseverance, the pharmaceutical chemists have secured the same monopoly in the sale of carbolic acid as they have in some of the chemicals used in photography, the bichloride of mercury and cyanide of potassium to wit. Now, if one wants a little carbolic acid for disinfecting purposes, he must go to the pharmaceutical chemist instead of the oilshop for it, and pay whatever he likes to charge, the same as he has to for the two chemicals just named. Of course, every one knows that he has to pay the chemist a much higher price for the latter than he used to pay the photographic dealer, while, in the case of the cyanide, the material, as a rule, is not so good as we used to get from the dealers. The worst sample of cyanide we ever had to do with was purchased at a pharmaceutical chemist's. It remains to be seen if there will be fewer suicides and accidents from carbolic acid, now that chemists have the monopoly in it, than there were formerly.

EXHIBITION AT DURHAM.—In connexion with the Twenty-eighth Annual Exhibition of the Durham Floral Society, to be held September 11 and 12 next, there will be an industrial department, of which photography will form a section. We extract the following particulars from the schedule:—Section 5, Photographs (open to all). Entry fee, 1s. per frame or exhibit. 18, Flowers, fruit, vegetables, or kindred subjects: 1st, silver medal; 2nd, bronze medal. 19, Landscape or seascape: 1st, silver medal; 2nd, bronze medal. 20, Hand-camera work: 1st, silver medal; 2nd, bronze medal. 21, Portraiture or any subject other than Classes 18, 19, 20: 1st, silver medal; 2nd, bronze medal. All photographs must be mounted, but framing optional. The full schedule, entry forms, &c., may be obtained of Mr. R. Hauxwell, The Avenue, Durham. It will be remembered that, on the occasion of the Convention excursion to Durham, Mr. Hauxwell was a most assiduous and courteous leader, and, no doubt, he would be pleased to receive entries from some of the photographers gathered in Durham on that occasion.

A PHOTOGRAPHER UNDER FIRE.—An amusing instance of a photographer's "nerve" was told by Mr. Donald McDonald, at the Town Hall, Melbourne, two or three months ago. "During one of the battles in or around Lady-smith, Mr. McDonald and another correspondent, finding themselves under fire," says the *Australian Photographic Review*, "were forced to lie flat to avoid the bullets that were flying around them. To their surprise, a small photographer walked coolly past them some fifty yards right into the thick of the bullets, and proceeded leisurely to set up his apparatus, the Mauser bullets hitting the ground all round him with their peculiar clicking noise. His bravery astonished the correspondents, who were neither nervous men. At last it dawned upon them that perhaps the artist didn't know his danger. One of them cried out, 'Hey! do you know you're under fire?' 'The devil!' said the photographer, 'I thought they were insects.' And, snatching the camera up, he made for the nearest ditch, where he carefully hid till the completion of the battle. Needless to say that, though the photographer exposed himself, the plates were never exposed."

ON Wednesday, August 8, the Earl of Crawford received the freedom of Wigan, as a mark of grateful appreciation of many generous acts performed by his Lordship towards the community, and of the interest he has always taken in its welfare. Our contemporary, the *Daily Telegraph*, states that, in returning thanks for the honour, the Earl of Crawford, who received an enthusiastic ovation which proved the esteem in which he is held by the people of Wigan, said he was proud to link with his name that of the ancient house of Bradshaigh, who, in the olden times, lived at Haigh Hall (now his Lordship's principal residence), and to whom they were indebted for starting in that part of Lancashire the great coal industry. Speaking of libraries, he said his mind was carried back 300 years, when a predecessor in the title collected what was considered to be the finest library then existing in private hands in the north of Scotland. Troublous times, however, arose, and the library was dispersed and sold to cheesemen to wrap up pats of butter. Years moved on, and his father commenced the renewal of the library at Haigh, whilst he himself had done fairly well towards the preservation of that great work. He accepted the town's honour with the greatest thankfulness, and trusted he might not be the last of his house who would render himself worthy of equal recognition. Subsequently, Lord Crawford was entertained at a banquet, and, in response to the toast of "The New Freeman," briefly referred to his political career, and said he held the unique position as a member of Parliament, because he was the only man in the world who made a maiden speech in the House of Commons at eight o'clock in the morning. A member in those days was much more free in his action than now, when he was kept in the House practically "doing time." The *Daily Chronicle* reminds us that the Earl is a shining light in science and letters. Thirty years ago he formed part of an expedition to Spain to observe a total solar eclipse, and the Dun Echt Observatory owes its origin to his endeavours. He was President of the Royal Astronomical Society in 1878 and 1879, and has filled a similar office in connexion with the Library Association, the Bibliographical Society, and the Photographic Society, whilst for twenty-two years he has been President of the Central Association for dealing with distress caused by mining accidents. The Earl is Colonel of the 1st V.B. of the Manchester Regiment, and counts the K.T. among his titular honours.

## Commercial Intelligence.

THE Thorn & Hoddle Acetylene Company, Limited, have declared an interim dividend of five per cent. per annum, for the six months ending June 30, 1900.

THE PARIS EXHIBITION.—It may interest many readers to know that Messrs. Gaze, the well-known tourist agents, under whose auspices the Society of Chemical Industry, the Iron and Steel Institute, and other prominent trade societies are visiting the Paris Exhibition, will be pleased to answer inquiries of visitors who contemplate doing this great world show. The firm possess exceptional facilities and a complete organization on the Continent, which they put at the disposal of patrons. Individual inquiries will receive prompt attention if addressed to Messrs. Gaze, tourist agents, 142, Strand, London, W.C.

THE Thornton-Pickard Manufacturing Company, of Altrincham, send us a copy of the new French edition of their illustrated catalogue. This completes the series of catalogues—English, German, Spanish, and French—for 1900. The Company add: "Our wholesale agents for the United States of America also issue 20,000 catalogues of our goods, with the prices arranged to include duty payable on these goods, and therefore specially suitable for the American market. In distributing all these various editions, we endeavour to reach the best photographic dealers, also professional and amateur photographers in the world."

AMERICAN CAMERAS IN ENGLAND.—"A rather curious feature of our British exchanges at present is the large amount of advertising they carry announcing American cameras and specialties manufactured on this side of the Atlantic," says the *Photo-Miniature*. "We say 'curious' because in many instances the British agents for American manufacturers are apparently able and willing to spend much larger sums in advertising American specialties abroad than our manufacturers are able to afford in the home markets. Looking over these advertisements, there can be no doubt that the American manufacturer of photographic goods is woefully lacking in enterprise when compared with his foreign agents. When will our American manufacturers awaken to the fact that advertising is the soul of business, and that the cultivation of the home market by a generous amount of legitimate advertising is more profitable than selling their output to foreign agents on a pitifully small margin of profit over cost of manufacture?"

WE are informed that the Bausch & Lomb Optical Company, Rochester, N. Y., are again adding to their lens-making plant. The present building has a floor area of 138,000 square feet. The new wing is 96 feet long and 22 feet deep, the whole having a floor area of nearly 40,000 square feet. The Roebling Construction Company, builders of the Brooklyn Bridge, have the work in hand, their fireproof construction being employed throughout. As the larger wing will be used for the grinding and polishing of photographic lenses, it is constructed with the utmost solidity, the piers of which the walls are composed being three feet thick at their bases. Huge windows occupy the spaces between the piers, admitting an abundance of light. The floors are especially designed to prevent vibration, being tested to 4000 pounds per square foot, or a total weight for the building of 160,000,000 pounds. About half of the smaller wing will be occupied by vaults for the storage of valuable material, such as optical glass.

Re FRANK EDWARDS BROWN, manufacturer of photographic apparatus, 36, Charlotte-road, and 3, Exeter-street, Birmingham.—The statutory meeting of the creditors interested hereunder took place at the offices of the Official Receiver for the Birmingham district on the 9th inst. The statement of affairs filed by the debtor disclosed gross liabilities expected to rank amounting to 1503*l.* 2*s.*, and the assets were estimated to produce 198*l.* 3*s.* 8*d.*, thus leaving a deficiency of 1304*l.* 18*s.* 4*d.* It appeared from the report and observations of the Official Receiver that, until January 1898, the bankrupt was engaged with his grandfather, who was trading at 3, Exeter-street, Birmingham, as a manufacturer of photographic apparatus, when he transferred the business to the bankrupt. No balance-sheet was prepared, but the bankrupt stated that the leasehold premises and fixtures were mortgaged for their full value to his bankers, and that the available assets were insufficient to pay the liabilities. Notwithstanding this fact, he undertook to pay his grandfather an annuity of 156*l.*, and, on his death, to continue the payment to his own mother. The explanation given by the bankrupt for taking over an insolvent concern without capital to work it was that it was an old-established business, and he thought that with perseverance, and the overdraft at the bankers increased from 1200*l.* to 1500*l.*, he would be able to succeed. A balance-sheet, dated December 31, 1899, disclosed liabilities amounting to 3205*l.* 17*s.* 3*d.*, and assets 4127*l.* 3*s.* 1*d.*, but the surplus of 920*l.* was subject to the annuity referred to. During 1899, in consequence of an increase in orders, the bankrupt purchased further plant, amounting to about 500*l.*, which had improved the bank's security. The trading account from November 1898 to December 1899, after providing 156*l.* 17*s.* 3*d.* for bank charges, and 191*l.* 10*s.* annuity, showed a profit of 454*l.* 19*s.* 5*d.* The trade fell away in the January following, and on May 24, 1900, a deed of assignment was executed, and Mr. F. H. Haswell appointed trustee. The landlord distrained for 50*l.*, arrears of rent, and sold a portion of the effects at, according to the bankrupt's statement, a great sacrifice. According to the balance-sheet above referred to, the stock in December 1899 amounted to 1777*l.* 0*s.* 6*d.* whilst it is now estimated at only 175*l.* On March 10, the bankrupt assigned his book debts to the bank in consideration of an advance of 250*l.* Eventually the estate was left in the hands of the Official Receiver for summary administration in the usual manner.

KODAK, LIMITED, IN GLASGOW.—Although the Glasgow branch of this enterprising Company has only been open for a matter of days, Mr. Frank H. Burr, the Manager, says the business already done has exceeded his most sanguine expectations. The Company have been fortunate in two respects—in their choice of premises and in their choice of a decorator. At 72, Buchanan-street, their retail warehouse is in the very centre of Glasgow's most fashionable shopping quarter, while their wholesale depôt for Scotland, at 74, Buchanan-street, is within a minute's walk of the stations of the three great railway companies. Mr. L. P. Kerkham, the architect of the Company, has worked wonders in adapting the premises to the business now to be carried on in them, while Mr. George Walton has had a free hand in designing the show-cases and in decorating and furnishing the various rooms, the net result being a commercial establishment wholly unique even for such a go-ahead city as Glasgow. As regards the wholesale depôt, it may be sufficient to say that it is a miniature Clerkenwell-road, the American system of storing, packing, and dispatching goods being reproduced in every detail. It is intended to meet the demands of the wholesale trade in Scotland from this depôt. In the retail department no expense has been spared, with a view to making it artistically attractive. The fittings are of oak, made at the Company's works at Harrow from Mr. Walton's designs, and the mural scheme displays that designer's native originality to the full. On the walls are shown numerous direct photographs and enlargements, typical examples of Kodak photography. This department may be said to be a reduced facsimile of the great Oxford-street warehouse. On the first floor, and communicating with the retail shop, a large and richly furnished demonstrating room has been fitted up, with a dark room adjoining. Here it is intended to give demonstrations of photographic work in all its branches, from the insertion of a spool of film to the production of a finished negative or a Dektro print. The basement floor has been equipped with a hydraulic hoist for the reception of goods, and it communicates in turn with the retail and wholesale flats by means of a smaller hoist. A section of this flat has been fitted up for the development of films, the dark room being a model of its kind, special attention having been paid to its ventilation. The whole establishment has been wired for electric light. Mr. F. H. Burr, who has been appointed Manager, after setting the Liverpool branch agoing, enters upon his new sphere full of hope.

## Meetings of Societies.

### MEETINGS OF SOCIETIES FOR NEXT WEEK.

August.	Name of Society.	Subject.
20.....	Southampton .....	<i>The Platinotype Process.</i> S. G. Kimber.
21.....	Hackney .....	Hand-camera Work.
25.....	Birmingham Photo. Society ...	{ Excursion: Henley-in-Arden and Beau-desert. Leader, A. C. Gilbert.
25.....	Bootle .....	{ Excursion: Hoylake. Leader, Captain Sibthorpe.
25.....	Borough Polytechnic .....	{ Excursion: Wimbledon Common. Leader, A. Bedding.

### LONDON AND PROVINCIAL PHOTOGRAPHIC ASSOCIATION.

August 8.—Mr. T. E. Freshwater in the chair. Mr. HENDERSON passed round the transparency he had shown at the previous meeting, and from which, in one portion, he had completely removed the stain by moistening the film, and placing the plate on a measure containing a solution of ferricyanide of potassium. There had been no contact, the reduction being carried out by the fumes of the ferricyanide.

Mr. W. D. WELFORD showed a carbon-film negative which was covered with small opaque spots, and inquired if any member could account for them. Mr. S. H. FRY did not consider they arose from any error in manipulation, but were due to a defect in the manufacture; probably they were insoluble portions of the coating, which had by some means escaped filtering. Mr. A. L. HENDERSON stated that he had been making experiments with potassium cyanide as a restrainer, and had found it immensely superior to bromide; he had also found that a combination of quinol, metol, and adurol possessed great advantages as a developer. His formula was:—

	No. 1.	
Quinol .....		120 grains.
Metol .....		40 "
Adurol .....		40 "
Water .....		27 ounces.
	No. 2.	
Sodium sulphite .....		2 ounces.
Sodium hydrate .....		60 grains.
Potassium carbonate .....		60 "
Water .....		27 ounces.

Equal parts of each to be used.

*Restrainer.*—Potassium cyanide, 20 grains to 1 ounce of water, and of which 1 ounce could be used to every 4 ounces of mixed developer.

Mr. HENDERSON recommended that two developers should be made up, one containing the restrainer and one without. Then, if the image flashed up in the latter, the plate should be at once transferred to the solution containing the restrainer. It would be then found that, instead of the shadows fogging over as usual, they would remain perfectly clear, and a perfectly graduated image would be the result.

Some discussion took place respecting Mr. Welford's demonstration of rapid development.

Mr. HENDERSON maintained that the success of the method depended a great deal on the class of subject. It would be impossible to obtain a satisfactory negative, in this rapid manner, of a very flat subject. He had not experimented, but was confident that he could produce a developer that would act quite as quickly as Mr. Welford's.

It was finally agreed that a trial should be held at some later date to decide as to the merits of the developer prepared by Mr. Henderson and that which Mr. Welford had used in his demonstration.

### PHOTOGRAPHIC CLUB.

AUGUST 8.—Mr. John R. Williams in the chair. The Photographic Society of India sent an invitation to participate in their Exhibition in 1901.

The Société de Photographie de St. Pétersbourg sent a circular referring to their Exhibition of lantern slides, which will take place at the end of the present year.

Mr. George E. BROWN showed an ingenious contrivance which could be used either as a washing apparatus, drying rack, or printing frame. The apparatus was well made in incompressible metal, and the idea was generally considered rather clever. Whether, however, the contrivance will ever find a place in the dark room of the practical photographer this is, as Rudyard Kipling says, "another story."

Mr. WILLIAMS mentioned a very good method of drying negatives very quickly and economically. Some gelatine is placed in a rather deep dish, the wet negative is put on the top, and the whole flooded with alcohol. The alcohol then mixes with the water contained in the negative, and at the same time the gelatine attracts the water which in this way has become part of the solution. The result is that the alcohol can be used over and over again, whilst the gelatine at the end of the operation is exposed to the air to dry, and it is then ready to begin its water-wolffing work.

Mr. BROWN showed some prints made on a silver phosphate paper made by Dr. Johannes Meyer, of New York, by dissolving silver phosphate in tartaric acid. This forms an emulsion, which is applied to the paper without the use of any other medium. The paper, which is a print-out paper, is then exposed under a negative, care being taken not to over-print, as no reduction takes place during fixing. The print is then fixed for a few minutes in a three per cent. solution of hypo, which has been made alkaline by the addition of sodium carbonate, and finally washed. The result is a print of a very good brown colour, which it is possible to convert into a grey by toning either with gold or platinum. From the results shown it would, however, appear that the toning, especially the toning with gold, is hardly an improvement on those prints that have only been fixed, and it would seem best to leave the precious metals alone when using the paper in question. Mr. Brown mentioned that, according to Dr. E. Valenta, the phosphate emulsion above referred to would be mixed with a bromide emulsion, to which alcohol and glycerine had been added, and that a paper coated with the resulting emulsion would print by gaslight. Mr. Brown distributed some samples of the phosphate paper, which is not yet commercially obtainable.

### FORTHCOMING EXHIBITIONS.

1900.  
 August 21..... Royal Cornwall Polytechnic Society. W. Brooks, Laurel Villa, Wray Park, Reigate.  
 Sept. 21–Nov. 3 ..... Photographic Salon, Dudley Gallery, Piccadilly. Hon. Secretary, R. W. Craigie, Camera Club, Charing Cross-road, W.C.

- October 1–Nov. 3 ... Royal Photographic Society, New Gallery, Regent-street. The Hon. Secretary, 66, Russell-square, W.C.
- November 7–10 ..... Cripplegate Photographic Society and the Essex and Middlesex Cycling Union, Ltd. The Hon. Secretaries, A. T. Ward, Cripplegate Institute, E.C., and G. F. Sharp, Sach-road, Upper Clapton, N.E.
- 12–17 ..... Ashton-under-Lyne.
- 21–23 ..... Hackney Photographic Society.
- 22–24 ..... Hove Camera Club. Hon. Secretary, C. Berrington-Stoner, 24, Holland-road, Hove.
- 1901.
- January 14–19 ..... Blairgowrie and District Photographic Association. The Hon. Secretaries, Blairgowrie, N.B.

Those who desire to send photographs to the above Exhibitions should write for prospectuses to the Hon. Secretaries, whose addresses are given in the second column above. The dates mentioned are those at which the Exhibitions open.

## Patent News.

THE following applications for Patents were made between July 30 and August 4, 1900:—

- CAMERAS.—No. 13,667. "Improvements in or relating to Photographic Cameras." Communicated by F. A. Brownell. KODAK, LIMITED.
- CAMERAS.—No. 13,668. "Improvements in or relating to Photographic Cameras." Communicated by G. Eastman. KODAK, LIMITED.
- CAMERAS.—No. 13,829. "Improvements in or relating to Photographic Cameras." Communicated by F. A. Brownell. KODAK, LIMITED.
- PANORAMIC CAMERAS.—No. 13,830. "Improvements in or relating to Panoramic Photographic Cameras." Communicated by F. A. Brownell. KODAK, LIMITED.
- CINEMATOGRAPH.—No. 13,833.—"Improvements in or relating to Kinetoscopic or Cinematographic Apparatus." W. FRIESE-GREENE.
- FOCUSsing SCREEN.—No. 13,916. "An Improved Suction Device for Attaching a Lens to a Focussing Screen of a Photographic Camera and for like Uses." W. BROOKES.
- X-RAY TUBES.—No. 13,966. "Improvements in Röntgen-ray Tubes." Complete specification. Communicated by E. Thomson. THE BRITISH THOMSON-HOUSTON COMPANY, LIMITED.
- PACKING CHEMICALS.—No. 14,047. "Improvements in Receptacles for Holding Small Quantities of Photographic Chemicals or other Materials." J. J. GRIFFIN & SONS, LIMITED, and F. H. IBBETSON.
- DEVELOPING FILMS.—No. 14,068. "An Improvement in the Development of Photographic Films." E. R. BRICKELL.

## Correspondence.

- \* \* \* Correspondents should never write on both sides of the paper. No notice is taken of communications unless the names and addresses of the writers are given.
- \* \* \* We do not undertake responsibility for the opinions expressed by our correspondents.

### PHOTOGRAPHY AT THE PARIS EXHIBITION.

To the EDITORS.

GENTLEMEN,—I write to ask if you could kindly give me information as to how to find out who are the prize-winners in the Photographic Section of the Paris Exhibition. I understand there was a photographic section and the prizes have been awarded to successful competitors, and, for certain reasons, I desire to know whether certain photographs which have been presumed to have been exhibited have been successful or not, as I am asked to purchase one on that understanding. If such is the case, I presume there will be a secretary to that section, and a list of successful competitors and subjects should be able to be obtained, and if so I thought it possible you might be able to supply me with either his name and address or advise me as to what steps to take to obtain it. If you would kindly give me your advice in the matter, I should esteem it a favour.

A. JEFFREY.

46, Queen-street, Keighley, August 8, 1900.

[No medals will be awarded to British photographs at the Paris Exhibition. The space allotted was so small that the organization of the displays of pictorial and scientific work now on view was left to Mr. R. W. Craigie and General Waterhouse. Thus, photographs for competition not being invited, it follows that no awards will be made.—Eds.]

## Answers to Correspondents.

- \* \* \* All matters intended for the text portion of this JOURNAL, including queries, must be addressed to "THE EDITORS, THE BRITISH JOURNAL OF PHOTOGRAPHY," 24 Wellington-street Strand, London, W.C. Inattention to this ensures delay.
- \* \* \* Correspondents are informed that we cannot undertake to answer communications through the post. Questions are not answered unless the names and addresses of the writers are given.
- \* \* \* Communications relating to Advertisements and general business affairs should be addressed to Messrs. HENRY GREENWOOD & Co., 24, Wellington-street, Strand, London, W.C.

PRINTING FROM KODAK FILMS.—J. MILNE writes for information how to print Kodak films so as to prevent the films absorbing the silver from the printing paper.—Fix and wash the films thoroughly; then, if they and the paper are thoroughly dry, there will be no trouble. Unless this is attended to, the prints will become stained with continuous printing.

LICENCE FOR STILL.—J. O'CONNEL writes enquiring an answer we gave a short time back as regards a licence to use a still. He wants to know if a licence would be required if the still were only used for distilling water.—Yes, a licence is required whatever the still may be employed for. It is illegal to have a still on the premises without a licence.

MAKING AN ENLARGING BOX.—MACK writes, asking where he can find instructions how to make an enlarging box.—We are afraid we do not quite understand what you mean by an "enlarging box." Enlarging is usually done in a room, or in an enlarging camera, *i.e.*, a camera with a long, extending bellows. On pp. 696–822 of the ALMANAC for 1898 there are articles that may be of service to you.

MARKINGS ON PRINTS.—J. H. B. writes:—"Can you account for the star-like marking in the enclosed two prints? One, the carbon, is from a print I tried to do; the other, a P.O.P., is by a friend of mine. Both seem to be due to the same cause, and it, apparently, looks to be bacterial."—As the markings appear both in the carbon and the silver prints, the cause must be looked for in the negatives. They have every appearance of being hyposulphite of soda that has crystallised in the film.

NEW PLATES FOR OLD.—J. C. H. says: "I have several gross of negatives that are of no use. Can you give me the name of any good plate-maker who would take them for the glass, and give me new plates in exchange? I have written to the makers from whom I had the plates, and they say they are not worth the trouble of cleaning off. I should not mind if they would give me a dozen plates for every gross of negatives."—We do not surmise that any plate-makers would take the glass, as new glass is now so cheap, and so much less trouble to clean than old is.

LORD KELVIN'S LECTURE.—PHOTOPHIL writes: "In your issue of April 13 last you announced that a lecture would be given by 'the Right Hon. Lord Kelvin on "Nineteenth-century Clouds over the Dynamical Theory of Heat," &c.' This is not yet published. Could you kindly give me a hint as to where I might find the best or fullest report of the same—*Nature* or the *Times*—as I would get it if possible?"—In reply: We have not seen a published report of the lecture. A letter to the Secretary, Royal Institute, Albemarle-street, would probably bring the desired information.

STAINED NEGATIVE.—T. RAY writes: "Will you please tell me the cause of the stains on the negative I send herewith? I have a number like them, and the stains did not appear until they had been printed from several times. They were stainless at first. Do you think it is the fault of the plates? they are — plates."—No, certainly not. The stains are due to the plates not being properly washed after the fixing, and the hypo has either absorbed moisture from the air and thus become damp and stained by the silver in the paper. Or, maybe, the paper was not thoroughly dry when it was put upon the negative.

DOUBLE IMAGE ON FINDER.—P. MARKS writes: "Can you please account for the following? In taking some sunset pictures recently, I noticed a double image of the sun on the finder; but, to my astonishment, when I developed the negative, the sun was all right. The finder contains a silver mirror, and the lens is —'s?"—The thing is easily accounted for. The mirror is silvered on the back, and therefore reflects a double image, one from the surface of the glass and the other from the silver at the back. This double image is not noticeable except some bright object, such as the sun, forms part of the image.

EXECUTION OF ORDERS.—HORSHAM writes: "About a year back I photographed a group of workmen. I submitted proofs to time-keeper, as requested; he wrote me in return to this effect: 'I've made inquiries among my men, and they wish one and a half dozen with —, one dozen without —, and half a dozen with —.' Now he returns a number of photographs, saying he can't dispose of them. I may say I was four weeks before completing order. Don't you think when I submitted proofs, and he ordered, were I to raise an action I should be successful? He says 'he bought nothing from me, but at my request he undertook to sell photographs.'"—The question seems to be as to whether the time-keeper undertook to sell the photographs for you, or he bought them outright. Of that you are a better judge than us. If he bought them, you can recover, but not otherwise. We may say that four weeks appears to be a long time to keep such a small order in hand, and during that time it is probable that the passing interest in the group was lost, and hence the restricted demand for it. Orders for this kind of work should be executed promptly, while the interest in it lasts.

## EX CATHEDRĀ.

THE hundreds of readers who, during the last few years, have written us concerning the peculiar business methods of M. "Tanquerey," of Paris, will be interested in the following paragraph, which we take from the *Daily Mail* of the 17th instant: "Tanquerey, the notorious portrait swindler, who lives at 9, Rue de St. Pétersbourg, Paris, states that he is now in London. The police might give him a call, for his nefarious practices still continue. Tanquerey issues with his letters what he is pleased to call testimonials. Among these testimonials is an extract from the *Daily Mail*, taken from an article in which his fraudulent methods were fully exposed." If widely circulated newspapers such as the *Daily Mail* would persist in warning the public against parting with their photographs or their money to Tanquerey, something would be done towards scotching the ingenious, but disreputable, system of sharp practice on which this Parisian enlarging agency, with the tacit approval of Her Britannic Majesty's Post Office, obviously thrives. By the way, Mr. Vincent Crummies was

not a Prussian, and we are told that M. "Tanquerey" is not a Frenchman. He is of American nationality, and, if we are not misinformed, a very great deal of his bromide enlarging work is done in London.

\* \* \*

THE *Electrical Review*, of New York, has made a somewhat tardy discovery. It tells us that an interesting experiment in photography by electric light has recently been conducted by a well-known New York photographer, and then supplies the following details of this very novel departure: "In attempting to take portraits by electric light hitherto it has been usual to employ arc lights, which generally have the effect of half blinding the sitter, causing a pained expression about the eyes, while the distribution of light cannot be so good as if the sources were more numerous and scattered than in the case of the usual arcs and reflectors employed. The new method employs incandescent lamps, which are attached to an umbrella-shaped contrivance placed over the head of the sitter. This carries twenty-two lamps, of which twenty-one are of 100 candle power each, and the other, at the centre, of 150 candle power. The umbrella is covered with white silk, tending to make a diffused radiation of the light. A few of the lamps are used in focussing, and, when all is ready, all are turned on, the voltage employed being about double that for which the lamps are rated. Under these circumstances the lamps burn with intense brilliance, giving a soft, pure, white light, aggregating about 5000 candle power for the whole device. With exposures from two to three seconds admirable photographs have been taken, showing good detail and the soft and diffused illumination which is such a desideratum in portrait photography." Of course, the use of incandescent electricity for photographic portraiture is no new thing, as every photographer quite well knows. In the system spoken of by our contemporary, the function of the centre lamp, and its high c. p. are not explained. But this may be the novel part of the experiment? From our practical experience of the matter, it would need very rapid plates and a large aperture of lens, to say nothing of extreme suitability of subject as regards colour, to enable the photographer to cut down his exposures to two seconds with a c. p. of 5000.

OUR contemporary, *Nature*, of last week, summarised some information as to the actual experience of nations who have adopted the metric system as given in a number of reports from Her Majesty's consular and other officers in Europe, which have just been brought together and published by the Foreign Office. "H.M. representatives in twenty-two States were asked to give information upon the following points: (1) The ease or difficulty with which the change of systems was made, the manner of introduction of the metric system, and the time occupied in making the change; (2) how far the metric system is satisfactory in its practical operation, and whether there is any desire to return to former systems; (3) as to the effect the adoption of the metric system has had upon the commerce of the nations adopting it. The answers received to these questions go to show that the best way to introduce the metric system is to make it compulsory after a specified period. The change from the old to the new system is slow in country districts; but, as new generations come on familiar with the metric measures, the old measures gradually drop out of use. In Turkey, the difficulties of enforcing the system upon an ignorant and illiterate people have proved insurmountable; but, in the majority of States from which information has been received, the system is becoming more extensively used every day. Once the system has been adopted, there is no desire to return to the old measures, and the effect upon commerce is always beneficial. In fact, the reports greatly strengthen the position of those who urge that the metric system should be adopted in England, if only for the sake of British trade." In England the metric system makes headway only slowly, for the Government lends little or no assistance to the agitation for its adoption; but so cogent an argument as the interests of British trade should not be lost on those manufacturers who still hesitate to put themselves in line with their foreign competitors in the important matter of weights and measures.

\* \* \*

THE use of acetylene for photographic purposes has not become so great as was once thought would be the case, although it has been demonstrated that, for portraiture and small projections and enlargements, it is a safe and efficient illuminant to employ. The assumed danger in the storage of the carbide has resulted in the promulgation of municipal and other restrictions that have undoubtedly interfered with the full development of acetylene for lighting purposes. Time and experiment are obviously needed to educate the public into familiarity with a form of lighting probably no more dangerous in use than carburetted hydrogen or mineral oils. We are indebted to the Thorn & Hoddle Acetylene Lighting Company for some details of a strong test to which packed calcium carbide was put in the recent great fire at Ottawa. It is said that this disastrous fire settled to the entire satisfaction of the scores of insurance agents, inspectors, and adjusters who assembled at Ottawa in connexion with the fire losses, the question of risk from the storage of carbide.

\* \* \*

WE are told that, when the fire reached the furnace room of the Dominion Carbide Works, everything in it that would burn was consumed. Three pigs of carbide in three crucibles remain in perfect condition as evidence that they did not explode. The grinding and mixing department and warehouses were in

another building. Every effort was made to prevent the fire from reaching it, but the terrific wind and the vast rush of flame enveloped every building in the vicinity, and they were in a few minutes reduced to ruins. When the carbide warehouse burned, everybody, incited by alarmists, looked for an explosion, but none occurred. In the warehouse were fifteen tons of carbide, packed in rolled steel cans with screw covers. When the floor of the warehouse burned, many tons of carbide dropped through into the cellar, in which a foot of water had collected from the firemen's hose. Several cans were broken in the fall, owing to the intense heat having melted the seams, and the carbide was dumped into the water. Gas was at once generated in immense quantities, but it simply burned with a low, steady flame, making less show than two piles of coke on fire, one in an adjoining chamber and another across the street. Had the cellar been dry, the carbide could all have been saved after the fire, but it continued to soak up the water and make gas for some days, and the burning gas kept the carbide so hot that it could not be handled. When the mass cooled sufficiently to enable men to work at it, about a ton of it was shovelled out and packed in new cans. Two of the cans were dug out whole from the hot mass and saved with the carbide, though the cans were burned like old worn-out stove pipes, but the carbide was uninjured. According to this account, which appears in the *Journal of Acetylene Gas Lighting* for July, a more severe test could hardly have been devised for showing that, when properly stored, calcic carbide does not explode even under the severest inducements. The *Journal* adds that the insurance agents who have examined into the matter now declare their conviction that carbide is not a dangerous fire risk. English insurance agents, we fancy, are less easily open to conviction.

#### QUICK-DRYING AND MOUNTING OF GELATINE PRINTS.

THE use of albumenised paper is, in very many studios, by no means yet abandoned, notwithstanding the many advantages and attractions of gelatine papers, P.O.P., and bromide. Its superiority is claimed still by some workers, and it has physical properties of its own, quite apart from the artistic aspect of the case, which will always tell in its favour. Not the least of these is connected with the subject we are now dealing with. An albumenised print once finished and washed can, if necessary, be taken straight from the washing water, dried, and mounted, and burnished if desired, ready for delivery, in less than five minutes; but under ordinary conditions this is quite impossible with a gelatine picture—print-out or developed. There is no fear of the surface melting if a little extra heat be applied to expedite the finishing, no sticking or injury to the surface if dried between blotting sheets or placed face down on the drying racks. In the ordinary course of business a professional photographer, if he be wise, naturally does his best to send out his orders quickly, but our remarks bear more particularly upon extra-ordinary work. A finished print, for example, is wanted for special reasons mounted and finished in a few minutes, or a batch of prints is required for the illustrated papers through a sudden demand for a particular subject. As a case in point we may give such an instance which came under our own notice. An important official dignitary suddenly died at eight o'clock one evening. The local photographer happened to have a negative of the place where he expired, but it was

getting late when he heard of the occurrence, and his post closed at ten. But before that time he and an assistant between them printed, dried, and mounted some sixteen or seventeen prints, packed them for post, and had them dispatched to various papers for publication purposes before the clock struck ten. This was quick work, as any would say who remembers the time taken in the mere act of packing and addressing, but it would have been utterly impossible without some quick process of drying and mounting. It may here be said that, when important pictures are sent to the papers for reproduction, the mounting is by no means essential; but where it can possibly be done we strongly advise that it should be, for the most eagle-eyed illustration-editor will find more attraction in a nicely mounted and finished picture than in a bare limp print.

Few things are more awkward to handle than a bromide print straight from the washing water; if it is dried between blotting-paper sheets, it will be inevitably spoiled; if it is not "bone dry," it will stick to the paper placed over it while rubbing down; if it is placed in front of the fire to dry, there is danger of its melting. All these difficulties, however, can be successfully battled with. The first point is the rendering the print less tacky, and, indeed, to make the surface insoluble. In the first case, if it be allowed to dry first and then be mounted, it is far more easily handled than if pasted and placed on the mount while still wet. But this would lose time; hence, for our purpose, it would be best to make the gelatine insoluble, and this can be readily done by means of an alum bath, but still better by one of formalin—one of two to five per cent. strength would be ample. The prints may then be handled without fear of sticking, and will bear with safety a considerable degree of heat. But the quickest and safest method is to immerse them in a dish of methylated spirit, press the spirit out by placing the prints in a heap and applying the squeegee, and repeating the process twice over, carefully separating them when placing in the fresh baths of spirit. At this stage, when all the water is eliminated, they will appear quite different from an ordinarily treated print; they will be semi-translucent, and, when the picture shows through the paper, it may be considered that all the water is dissolved out by the spirit.

The next step is, without waiting for the spirit to evaporate, to paste them on the back in the usual way for dry mounting, and then to dry them and finish by dry mounting. The advantage of the dry mounting is that, as soon as the print is made to adhere to the card, it can be safely sent by post without further treatment, and with no risk of sticking to the wrapper or accompanying letter. It may be added that, in the quick making and dispatching we referred to, no time is allowed for washing. The only object of washing is to ensure permanence, and this, when producing the print merely for making a block from, is of no consequence whatever, and where every moment is of importance one or two changes of water is all that is necessary.

Finally, we would point out the desirability of first conspicuously marking such unwashed prints as "non-permanent;" and, secondly, taking care that all blotting sheets, if used for drying, are afterwards destroyed, for fear of contaminating future prints; that the paste brush is washed and the paste itself is rejected. These are trivial points, but such as, in the hurry of quick dispatch, might readily be lost sight of, to the material injury of future prints where permanency was a consideration.

#### **The Bradford Meeting of the British Association.**

—So far the authoritative forecast of the proceedings does not show any subject connected with photography, but the meeting generally promises to be of remarkable interest from the many matters of importance and scientific interest. Possibly those interested in the optical side of photography may find matters germane to their study in the lecture on "Range-finders," by Professor W. Stroud, who takes the Monday evening for his subject.

**Prizes for Colour Photography.**—The French Society for the Encouragement of National Industry has published its programme of prizes and medals offered for 1901 and following years. Among them we notice that a prize of 3000 francs (120*l.*) is offered for the invention of a method allowing of the production of an indefinite number of positives in colours, either by a direct method or with a Lippmann negative. These prizes are open to persons of all nationalities. The theses must be sent in before the last day of the year, and be written in French.

**The Great Photographic Star Map.**—The work is going on apace, and the fourth meeting of the International Committee was recently held in Paris. The work is being vigorously pushed forward in all the observatories except those of Rio de Janeiro, La Plata, and Santiago (Chili), where it has entirely fallen through. The last two places have found substitutes through the generosity of the Argentine and Uruguay Governments respectively. In connexion with the estimation of photographic magnitudes is seemed to be the general belief that the estimation of diameters by means of a scale is a surer plan than that by means of a micrometer, but no definite ruling was given. The original plan was to make three exposures of thirty minutes each, but now the Directors are to be allowed to use their own judgments. The French observatories have made enlarged copies of the charts by heliogravure; but, as the carrying out of this method would involve an expenditure of some 10,000*l.*, its general adoption does not seem probable.

**Photographing Sound Waves.**—In *Nature*, for August 9, there is a long illustrated article by Professor R. W. Wood upon the photographing of sound waves, which is of the very highest interest, and should be read by all students of optics. It has a wealth of illustration, the diagrams being reproductions of cinematograph pictures taken of the actual sound waves themselves, the paper descriptive of them being devoted to showing the analogies of sound and light. These sound waves, as seen, are apt to become complicated, and cannot be well studied; but, by means of cinematograph pictures, their appearances can be made permanent, and studied at leisure. The chief apparatus consists of an electric spark-producer, a diaphragm for regulating the light, and a lens of high quality, which, for photographic purposes, should not be less than 6 feet focus. Professor Wood used the objective of an Alvan Clarke telescope. The wave is started by the production of an electric spark, and then, before it has left the field of view, it is illuminated by another spark. It is no good to give an extract of a paper on such a theme; those interested should obtain a copy of the periodical and study it at leisure. We predicate that they will rise from its perusal with a closer practical and theoretical knowledge of the paths of light rays, or, as Professor Thompson calls them, wave fronts, than it was likely they had before. We may add that lantern slides of these sound waves are now purchaseable from Messrs. Newton & Co., of Fleet-street.

**The Weather of Last Month.**—Some interesting details of the weather of last July are given in the number of the *Observatory* for August. We had three weeks of drought beginning July 6, and the great heat started on the 10th, the sunshine recorded being altogether 71 per cent. of the total possible. On the 10th it had the longest duration—15.3 hours, 94 per cent. of the utmost possible. July 25 gave us the highest recorded shade temperature since July 15, 1881—94° against 97.1°, this latter being the highest for close upon

fifty years. It is rather a singular thing that this month, as noted by a writer in the *English Mechanic*, was the hottest and the coldest for many years, the temperature at its commencement being far below the average. Notwithstanding the absolute drought for twenty-four days, the thunderstorms at the close of the month brought up the rainfall to the respectable aggregate of 1.41 inches. It needs no argument to show that such great meteorological variations are inimical to the interests of the poorest photographer. Ladies and children form usually the largest proportion of their *clientèle*, and, as matters of dress are an important consideration, it is evident that such climatic vagaries must sadly interfere with their costume arrangements.

#### ON THINGS IN GENERAL.

THE notification copied into these pages that the photographic war correspondent, Mr. Shelley, intended to give a series of lectures on his South African experiences, together with the remarks in the *King* on the relation of illustrated literature to photography and art, leads, by a natural sequence of ideas, to thoughts of what photography has done for illustrated journalism. It is scarcely exaggeration to say that it has revolutionised this class of literature; but, at the same time, it has destroyed its art aspect. There is no call to rake up the embers of the old, old fire—the art *versus* photography discussion—but few will gainsay the statement that what, in its illustrations, journalism gains in exact delineation and verisimilitude it loses in art. So long as a photograph depicts a scene or a person interesting to the general reader, it is bound to be reproduced, however deficient in art feeling it may be, or however it sins against the recognised canons of composition of either lines or of lighting. The public wants a literal transcript; it will have it after the lines taken by the editor of a leading illustrated journal, who once informed a contributor who had sent a sketch of an Indian view, and complained about the introduction into an engraving from it of palm-trees, when none stood in his sketch or in nature, "The British public want palm-trees in Eastern pictures, and must have them." So, in its representation of current topics, it gets a literal transcript, and often a bad one at that, but it rarely gets art. Illustrated journalism is debased as much as it is popularised by photographic aid. The more is the pity.

To return to the subject that has drawn these comments, I recommend those of my readers who get the chance to hear Mr. Shelley not to neglect it. He is a real practical photographer, has had unrivalled experience, and withal is *bon camarade*.

As touching the relation of art to photography, the remarks of the writer in the *Studio*, as quoted in these pages, are interesting enough, but would have had more weight if he had aired his views on concrete facts, instead of his ignorance of abstract principles. "It is absolutely absurd," he says, "to attempt to reproduce an oil painting in printer's ink by the three primary colours, when not a single one of them was used by the artist in doing his work." In the first place the printer would be very glad if he could get the three primary colours in printer's ink, and, in the next, he could, by the aid of such colours, get every colour in the rainbow, or that ever appeared on the canvas or panel of an artist from Cimabue to the latest R.A. However, your critic who soars into the realms of art-cum-science is nothing if not cocksure. He has only one rival in that line—the photographic neophyte. We all know him, and his ally, the mere average photographer. They know absolutely everything, you can't teach them anything. What a delightful instance, for example, was on view at the L. & P. P. A. the other day. He had just started learning, yet he knew more than Mr. Philip Everitt of all others, and, to show this, he must need pillory himself by his aid at a recent meeting of this society, by its being proved that Mr. Everitt could teach him something.

The "art" men are very decidedly not having a good innings at present; the fielding is too strong for them, and the bowling most destructive. We have had a perfect plethora of downright straightforward Anglo-Saxon in, first, the "Bubbles" of Dr. Emerson, and, next, the views of Mr. W. Edwin Ward on the æsthetics of the

ambitious young men who had been exhibiting their lordly contempt of American work generally. There is no beating about the bush in these two combatants; they slash right and left in true manly, English fashion—they say what they mean, and they mean what they say—and what they do say is well worth reading, if only for the choice epithets they scatter, some of which, I think, will prove to have come to stay. What could be more to the point, for example, than "gum splodgers?" what more droll than Mr. Ward's "godlings?" I don't remember who invented the expression "a little tin god on wheels," of which this is a variant really he deserves a medal, for he and his disciples have enriched the language, for the expression lends itself to an infinite amount of variety, from the "little gods in glue," as applied to that terrible *vehmgericht*, the Plate-makers' Association, to the most recent creation, the godlings of the Linked Ring. There has been some correspondence lately about "Photographic Pests;" but, if it comes to be a question of eradicating pests, the one that could best be eradicated would be these writers who discourse highfalutin rubbish about tonalities and the rest of the studio argot, which only brings genuine photographers into common ridicule by artists.

To refer to the letter about "Photographic Pests," the writer can be sympathised with, and the Editor's comments are entirely justified as regards the expression employed and the position the papers take up, but there cannot be two opinions about the hardships suffered by local men through these touting brothers of the camera. If the opinion of all the professional photographers in the kingdom could be taken, there would be a nearly unanimous vote of condemnation of the system. No matter how well a neighbourhood is supplied with photographers of skill, the touts for groups are not restrained from calling. Once upon a time it was considered a degrading thing to employ a tout, but nowadays the country is flooded with touts. The paper was quite right to point out that these touts pay no rent, no local taxes, give no subscriptions to local charities. They simply scoop the money up and leave nothing whatever behind.

Let us turn away from this topic, and get to good practical photography such as, thank Heaven, we usually get, for instance, at the meetings of the L. and P. P. A. By the bye, who does the reporting for these meetings? I ask because there are sometimes to be read in accounts of the proceedings some very remarkable dicta as emanating from well-known men. Take for example a recent meeting where drying of dry plates was under discussion. Now, no one will accuse Mr. Henderson of knowing only a little about photography, yet in the pages of this JOURNAL for August 3 we have him reported as saying that a gelatine negative grew thinner as it dried. Now, taking these words in their ordinary sense, it is very improbable that Mr. Henderson said anything of the sort, for every practical photographer knows that a wet gelatino-bromide negative is far denser after drying than it is when fresh from the washing tank.

If we want further interesting matter of a really practical nature, the Answers to Correspondents column affords an endless fund of instruction, and, be it added, amusement. It is simply marvellous what mistakes and misfortunes come under the editorial eyes. I should like to discuss a few of them, to embroider, as it were, the editorial matter. Let us take the case of "Studio-building," replied to a fortnight ago. The writer says his studio used to have an angle of 35°, but he altered it to 60°, in deference to Mr. H. P. Robinson's teaching; but it has, since the alteration, given flat pictures. Clearly, therefore, he has not narrowed the vertical angle of the lighting area. Hence we may legitimately assume that it is a ridge roof with the ridge in the centre. But mark his figures: The studio is 10 feet wide, 13 feet to ridge, and 7 feet 6 inches to eaves. Yet he calls this an angle of 60°, which is perfect nonsense. A reference to any simple mathematical work containing a list of so-called natural tangents will show that it is as near as possible 45° only. For 60° to be obtained with 7 feet 6 inches eaves, his ridge should be over 16 feet instead of 13.

Then we have an inquirer about home-made platinotype paper. It is, of course, a very desirable and a praiseworthy thing to know by actual experience the details of making every prepared plate,

paper, or chemical employed in photographic work; but, if the writer hopes to be able to rival, even for his own use, the products of the immense works presided over by the Platinotype Company, he will quickly find out his mistake. Paper prepared sheet by sheet cannot possibly equal that produced in long bands; and, further, the selection of the paper itself requires knowledge and experience, only to be bought at much cost, as, no doubt, larger producers than the correspondent in question have already discovered. Finally, even in a mere question of economy there would be no gain. The paper as made for so many years is sold at a very low price considering what goes to the making of it.

I should like to end my remarks by a few words about the selection of a half-plate or a  $5 \times 4$ , one-third size it used to be called years ago. Why is not the term reintroduced to avoid periphrasis? We have whole-plate, half-plate, and quarter-plate, yet, singularly enough, no one ever speaks of third-plate size! Well, our correspondent asks which is best, half or one-third size. Few will be inclined to disagree with the Editor, who prefers half size. But there is one most important consideration in regard to this matter that is rarely, if ever, alluded to. Let us suppose that for a one-third size ( $5 \times 4$ ) a lens of six-inch focus is deemed a good one for all-round purposes, then at the same ratio a half-plate should be provided with an eight-inch (or nearly). Now, anybody with practical experience knows that an eight-inch focus lens is far too exacting for ordinary snap-shot work. Six-inch focus is trying enough, but an eight-inch would be very unsatisfactory for street scenes. For instance, the very fact that the point beyond which all objects are in focus has to be almost double the distance for an eight-inch that it has to be with a six-inch (1.7' exactly), brings it practically under the category of "long-focus" lenses. Particular attention should be given to this phase of the question, one so generally ignored, if not lost sight of.

FREE LANCE.

#### BRITISH AWARDS AT THE PARIS EXHIBITION.

LAST week, in replying to the question of a correspondent, we stated that there would be no awards for British photographs at the Paris Exhibition. Simultaneously with the publication of the JOURNAL in which our answer appeared the official list of the Paris awards was issued, and, to our surprise, we discovered that we had erred in the matter. But there were good grounds for the view we took that no prizes would be given to British photographs as distinct from apparatus and scientific exhibits. The space reserved for the exhibits from this country was so absurdly small that a thoroughly representative exhibition could not possibly be organized on the basis of an open competition. The Royal Photographic Society and the Camera Club, having wisely declined the invidious task of selecting a few "technical" and "pictorial" photographers to represent the whole of the United Kingdom at Paris, the work, at the invitation of the British Commission (a body which with characteristic South Kensington incommunicativeness has kept the photographic public in complete ignorance as to Exhibition matters), was undertaken by General Waterhouse and Mr. Craigie. These gentlemen, as we have before acknowledged, acquitted themselves well in a difficult and thankless task. It would naturally appear that, as photographs for competition were not invited by the Paris Executive, no awards would be bestowed. The exact opposite has, it seems, proved to be the case; and, in view of this unexpected result, we can only regret once more that some authentic information on the matter was not forthcoming last winter, when the work of invitation was taken in hand.

The list of awards for British apparatus and photographs, which we print below, is probably neither perfectly complete nor quite correct; but, as we are at present at work in sylvan surroundings, where no sources of verification exist, we are forced to rely upon telegraphic extracts from the not ideally accurate official list published last week.

Class XII.—Photography.—Grand Prix: Royal Observatory, Greenwich. Gold medals: Autotype Company; Ross, Limited; J. H. Dallmeyer, Limited; W. L. H. Skeen & Co.; Captain E. H. Hills, R.E.; W. Watson & Sons; T. & R. Annan; Penrose & Co.; Newman & Guardia. Silver: E. J. Spitta; C. S. Cochrane; F. H. Glew; McKenzie Davidson; Meisenbach Company; F. W. Bois; F. Downer & Sons; T. Manly; W. Norrie; Werner & Sons; W. J. Byrne; James Lane (of Watson & Sons). Bronze: C. P. Butler; R. N. Wolfenden; Lascelles & Co.; Strand Engraving Company; W. P. Marsh; Raithby, Lawrence & Co.; Carl Hentschel; R. B. Lodge; Hort Player; Lafayette.

In Class XI. (Typography) the Grand Prix was awarded to Messrs. Waterlow & Sons; a gold medal to Messrs. Bemrose; a silver to Messrs. W. H. Ward & Co.; a bronze to Messrs. Penrose & Co.; and a gold to Mr. W. Gamble.

In Class XV. (Mathematical and Scientific Instruments) gold medals were awarded to the Cambridge Scientific Instrument Company and Messrs. Ross, Limited. The foregoing are the names of the principal British prize-winners; but the list before us is none too clear, and we have no opportunity of submitting it to revision. As compared with 1889, the number of awards is very much larger. We congratulate the recipients, who possibly will not over-rate the value of prizes which signify much less than they might.

It cannot be pretended that the value of an award at a modern universal exhibition is quite what it appears to be. The juries are notoriously guided by precedent in distributing the honours placed at their disposal. Firms who, in the years 1878 and 1889 exhibited in Paris and secured awards, were certain beforehand of similar recognition this year; and so it happened, as any one who cares to study the foregoing list and compare it with those issued eleven and twenty-two years ago, may see for himself. In the case of firms which have stands of goods, amongst which a shield of previously obtained medals figures prominently, the jury frequently consider it unnecessary to submit the exhibits to examination. It is enough for them to know that the jury of 1889 considered a medal properly bestowed in a particular instance; and the addition of another award may be interpreted as an official expression of satisfaction that the particular firm still continues in the ranks of exhibitors, and appreciates the efforts of the French nation in holding an Exposition. French houses to whom medals are awarded at foreign exhibitions find favour, if we are correctly informed, in the eyes of the Government, and a number of industrial successes of this kind often meets with reward in the shape of the bestowal of one of those coveted little bits of ribbon which indicates enrolment in the Legion of Honour.

We order these things differently in this dear country, of which the Government is supremely indifferent to the success or non-success of English traders at foreign exhibitions. With regard to the gold, silver, and bronze medals awarded at Paris, in the case of the first named, if we are correctly informed, an actual disc of the precious metal is not handed to a victor. He receives a paper certificate, which entitles him to prepare a gold medal—that is all. If he be wise, and wishes to include the medal amongst those that adorn his shield, he has an imitation made at the cost of a few shillings. Eight thousand gold medals were awarded at Paris. Let these be figured out at five or ten pounds a piece, and it will be seen that the cost would run into a very handsome sum, a sum which we do not think this by no means successful Exhibition could afford to disburse. Finally, we may say that in the foregoing list of awards there appear some names to which, in a suburban London exhibition, no distinction of a medal would be attached, according to the most modern lights. British photography at Paris was not well and representatively shown, and the plethora of awards is therefore all the more surprising.

#### THE ELEMENTS IN FORCE AND MATTER.

[Translated from the *Deutsche Photographen Zeitung*.]

IF we consider the philosophical and scientific conceptions of various ages at different periods of their history, we find great diversity in their ideas concerning the elements of nature. At one time the elements are primary, and form the constituents of all other substances; at another time they are forces, by whose functions substances are brought into existence. There have even been philosophers who reduce all that surrounds us to the imagination of the "Ego."

It is a mere supposition, yet behind the philosophy of the shadowy past there may be a lost science higher than that of modern times. It is indicated by the idea of a primary substance, to which we are again aspiring through the more recent discoveries of modern science. We refer to the fundamental proposition of the unity of nature, whether in substance or in force. Perhaps both these conceptions may be resolved to functions of the same primary power.

It is certain that the universe is pervaded by a force which we call ether. It transmits to us the light of the stars, conveys their power of attraction, and unites electricity and magnetism conductively.

The vast infinity of number, time, and space is derived from unity, and not only number, time, and space, but also force and matter, are formed from unity.

The old philosophers affirmed the fundamental proposition of the unity of existence and of force. This may have been derived from thought

but it may also have been a revelation of nature, of which we are part but, as science grew with its wealth of observation, the various phenomena were connected and defined, and it became necessary to classify the various properties of matter and its forces by uniting those which were related to each other and separating those which differed. In this way the forces of light, heat, electricity, gravity, &c., were discovered and studied, and the same also applies to matter and the elements.

If we observe the forces—light, heat, and electricity—in their various manifestations, they seem to be, and really are, interchangeable. From heat in its higher manifestations light is evolved, and from their combined action electricity or magnetism. These latter again evolve light and heat. Can these be different independent forces? Assuredly not. Nature in its vastness cannot be so complicated. These phenomena are but different manifestations of one and the same force.

In chemistry we meet with various elementary substances, such as metals—gold, silver, iron, &c.; the metalloids—chlorine, bromine, iodine, &c.; and the gases—oxygen, nitrogen, hydrogen, &c. We continue to discover other elements, and describe them chemically as simple substances.

But it is remarkable that we also find in nature certain well-known compound substances which behave as elements in their combination with other substances and exhibit all their characteristics. For example, we describe ammonia as a compound formed by nitrogen and hydrogen, but as an element, "ammonium," it behaves the same as other metals, and even forms an amalgam or alloy with mercury. In all its combinations it acts quite normally as an element.

As another example we have cyanogen, a compound of nitrogen and carbon. This also behaves in combination with metals exactly the same as the elements we call halogens—chlorine, bromine, iodine, &c. We have cyanide as well as chloride of silver, and in this respect cyanogen behaves as an element the same as chlorine.

Thus we have two definite instances in which compound bodies possess all the characteristics of elements, and this would entitle us to infer the opposite of the other elements, and conclude that they also are composite in their nature.

In 1881, Ciamician, of Vienna, in studying the spectrum of the elements, observed a similarity which points in the same direction.

This similarity, which also finds support in the atomic weights of the elements, relates to the various lines of certain elements which appear to be merely a displacement of those of the preceding series.

If we take the following series with their atomic weights,

Lithium,	Sodium,	Potassium,	Rubidium,	Cæsium,
7	23	39	86	133

we find a similarity in their spectra as well as in their atomic weights. The difference between the first three is 16, which is the atomic weight of oxygen.\*

Similarly, if we take Magnesium, Calcium, and Iron, and their atomic weights,

Magnesium,	Calcium,	and Iron,
24,	40,	56,

we again find homology of their spectra, with a difference of 16 in their atomic weights, which is that of oxygen.

Less striking homologies of a different kind are found in the series chlorine, bromine and iodine, and phosphorus, arsenic, and antimony.

It would be a daring inference to conclude from this that sodium (23) is formed of lithium (7) + oxygen (16), and that sodium (23) + oxygen (16) is equivalent to potassium (39); or, taking the second series, that iron (56) is formed of magnesium (24) + 2 parts of oxygen (2 × 16), or calcium (40) + oxygen (16). It would be a daring assumption, but the numerical relationship is striking, and we find still more remarkable connexion between the elements in these series if we examine their chemical properties.

Lithium, sodium, potassium, rubidium, and cæsium are alkali metals with ascending affinity for oxygen, as though they desired to unite.

If we take the whole series of the alkali metals with their properties and atomic weights, we find

$$\frac{7+39}{2} = 23, \text{ and } \frac{39+133}{2} = 86,$$

which might be explained thus:—

$$\frac{\text{Lithium, 7} + \text{potassium, 39}}{2} = \text{sodium, 23,}$$

$$\text{and } \frac{\text{Potassium, 39} + \text{cæsium, 133}}{2} = \text{rubidium, 86.}$$

} Potassium being common to both equations.

\* The difference between potassium and rubidium, and rubidium and cæsium, is also approximately 48, or 3 × 16.—TRANSLATOR.

Lithium burns when heated in the air, and decomposes water by straction of oxygen, but without ignition.

Sodium decomposes water readily, and is attended by combustion 60° C. Potassium ignites upon contact with water. The last member the series, cæsium, is absolutely unstable in contact with air.

We might add considerably to these proofs, but we desire to pass on to the latest discoveries of science in this direction.

We have already referred to possible combinations of elements with oxygen, and resultant higher atomic weights. If we now take the nitrogen group, we find the following relations:

Nitrogen, atomic weight,	14	} Phosphorus, 31 + antimony, 122	
Phosphorus, " "	31		} $\frac{\quad}{2}$
Arsenic, " "	75		
Antimony, " "	122		
Bismuth, " "	210		
		= 76.5, arsenic, approximately.	

But, apart from these numerical relations, we have chemical and physical analogies, and, what is of most importance for our theory, the results of highly interesting and important experiments by Professor Fittica.

This *savant* of high reputation has proved by exact experiment that arsenic is a compound formed of phosphorus with nitrogen and oxygen, and, moreover, that antimony is another such compound. He has produced arsenic and antimony directly from phosphorus by the action of compounds of nitrogen and oxygen.

If we make a calculation for these, we find—

$$\text{Phosphorus, 31} + 2 \text{ nitrogen } (2 \times 14) + \text{oxygen } (16) = \text{arsenic } (75).$$

$$\text{Phosphorus, 31} + 4 \text{ nitrogen } (4 \times 14) + 2 \text{ oxygen } (2 \times 16) = \text{antimony } (121).$$

Is not this sufficient? On the one hand we have spectroscopic analysis and certain speculations, and on the other definite practical proof. By such means the whole of our system of elements is reduced to a few primary substances.

But our theory will remain defective until experiment adduces the proof that there is but one single element. Call this what we may, universal ether, primary force, or what not, we are at last brought back to the beginning, and are forced to say, "Darkness was upon the face of the deep, and the Spirit of God moved upon the face of the waters."

Out of darkness came light, from light all that is visible, and the entire universe is but a complex whole.

A. COBENZL,

Chemist, Wiesloch (Baden).

#### MAFEKING BANK-NOTES PRODUCED BY PHOTOGRAPHY.

THE *Daily Telegraph* last week published an interesting account of the production, by photography, of the bank-notes circulated in Mafeking during the famous siege. We are told that Mafeking's currency was a matter which was promptly taken in hand by the authorities when war had been declared, and Baden-Powell's paper money is already as famous as General Gordon's Khartoum notes. The system of exchange and payment of labour worked admirably throughout; it may even be said that the siege of Mafeking paid itself. But the economic machinery did not work smoothly without taxing the resource and ability of Colonel Baden-Powell and his coadjutors.

It is well known, proceeds the account in our contemporary, that the first paper money issued was a series of notes for 10s., 3s., 2s., and 1s. These were printed on ordinary paper, and, as coins disappeared, buried, to a large extent, by the natives, they became the established currency. The main inscription ran: "This voucher is good for a sum of —." Then, during the last three months of the siege, Baden-Powell issued his celebrated 1*l.* note, in exchange for gold, repayable "on the resumption of civil law." Interesting details of the production of these documents we owe to Mr. E. J. Ross, one of those who took his share of the siege, and the actual printer of the notes. Mr. Ross has recently returned to England on a short visit, and brings with him a unique collection of photographs, 550 in number, and two or three volumes of documentary relics. It was to Mr. Ross, as an amateur photographer, that Baden-Powell turned when the proposal of the notes was first mooted. The first difficulty, that of the design, was no difficulty at all in face of "B.-P.'s" versatility of talent, and a sketch was quickly prepared. In an unfinished state—half pencilled and half in ink—it was placed before Mr. Ross's camera to see what could be made of it, and the result was sufficiently satisfactory to induce the self-appointed artist to finish it. The question of printing had next to be considered. There was little or no sensitised paper in the town, and none could be manufactured, for there were no eggs to supply the albumen. An ample store of note-paper existed, however, and, with the aid of a photographer's manual, Mr. Ross succeeded in preparing a ferro-prussiate solution. Then, with sheets of thick vellum or note-paper, of which a sufficient supply was found, the

wherewithal to print from the plates was achieved. As evidenced by Mr. Ross's specimens (which a representative was privileged to see recently), the chemical took very well, and not alone from the artistic point of view, the one-pound note was a triumph of the siege. "B.-P.'s" design, simply and directly composed, sums up in itself the history of the defence of Mafeking. The central figure, a kneeling woman with a child in her arms, represents the helpless inhabitants of the town, and grouped around are the instruments of her salvation. Above her waves the Union Jack; a rifleman of the Protectorate Regiment stands erect; on the extreme right is one of the loyal Dutch—a bearded sniper; on the left a member of the gallant Town Guard similarly engaged; the little brass and steel howitzer Wolf gapes ready for action, with a pile of the home-made 4½ in. shells lying beside her. As a child of the siege this gallant piece of ordnance has a rightful place in Baden-Powell's emblematic picture, but it is to be feared that the erratic time-fuse made her shells more terrible in discharge than in execution. With Lord Nelson and her other companions—a quintette of old crocks—the Wolf now enjoys a well-earned rest in the market square of Mafeking. It was in the same quarter, at the back of his former business premises, that Mr. Ross carried out his operations for providing the town's currency. The work-room was just a dug-out, and it was called the Mafeking Mint, while an inscription, "No admittance," warned off the prying strangers, for Captain Greener, the paymaster, had lost a batch of the earlier vouchers. In his mole-like surroundings Mr. Ross turned out the notes at the rate of twenty a day, until in all a total of over 500 had been taken up by the public in exchange for pounds sterling. They were redeemable by the Standard Bank at the end of the siege, but the remarkable fact has to be recorded that not one of them has been presented. Among Mr. Ross's specimens of the one-pound note is an unnumbered one, which is endorsed "cancelled," and happily illustrates the kind of "stratch" material which went to their manufacture. Near the edge are embossed in red the mysterious letters "B. B. P.," surmounted by a crown. The explanation is that among the note-paper used was some of the old official stationery of the Bechuanaland Border Police, and an embossed sheet had been inadvertently printed in the Mint's dark room.

#### THE INVENTIONS OF EMPLOYEES.

FOR the following article, by Mr. D. W. Brown, we are indebted to our contemporary, *Invention*, which reproduces it from *Power*. It deals with an interesting subject of constant recurrence in photographic manufacturing: In general, the law secures to every man the ownership of his own inventions and of the patents granted therefor. But this general principle is much modified by the special relations existing between the *employé* and his employer in particular cases. A wide distinction is made between the person who is employed merely as a skilled workman and the person who is employed as an inventor.

As to the former: If a skilled workman, while in the employ of another, but in his own time or after hours conceives an invention and constructs it at his own expense, using his own tools and materials, and doing the work after hours, or in time his employer does not pay for, then the invention, as well as the patent, is the exclusive property of the workman. The employer has no rights in it, nor any rights to use it in his business, even though it is adapted to that business. The employer, in this case, can obtain the right to use the invention only by contracting with the workman for it, and paying the price agreed upon.

But, if the workman conceives the invention in the time his employer pays for, and constructs it with his employer's tools and materials, and in the employer's time, then the employer obtains certain rights in the invention and patent granted therefor. If the invention is a machine, then the machine belongs to the employer, and he has a licence to use it in his business and to keep it in repair, and without paying any royalty to the workman therefor. If the *employé* obtains a patent for the invention and sells it, that sale will be subject to the licence to the employer, and the purchaser of the patent cannot prevent the employer from continuing to use the machine.

If the employer is running a machine shop, for example, and, after the patent is granted, converts his business into a corporation, so that the corporation is rather the continuation of the old business than a new concern, the licence to use and repair the machine continues over to the corporation. If the invention is not a machine, but is an article of manufacture, as a tool in which the employer deals, then, in the circumstances supposed, the employer has a licence to make and sell such tools without paying royalty, even after the patent is granted; and neither the inventor nor the purchaser of the patent can stop him from continuing to do so.

In this case also the employer's licence continues over to the corporation into which the employer's business is converted.

If the invention is a process, then the employer, or the corporation which continues his business, has a licence to use that process, without paying royalty, even after the patent is granted to the workman. In these cases, however, the licence to make and sell the machine or the article, and to operate the process, is not exclusive—that is, it does not give the sole right to the employer—it only secures to him a right to the invention in connexion with his particular business; and the inventor, or those to whom he sells the patent, can make, use, and sell the invention, and license others to do so, without let or hindrance from the employer.

As to persons employed to invent: If a person is employed by another to make inventions to be used in the employer's business, and is paid salary or wages on the understanding that his services are to be those of an inventor in improving the machines, tools, or processes which relate to the employer's business, then the invention which the *employé* makes relating to that business, and the patents granted therefor, are the exclusive property of the employer. In such cases, the court says that the *employé*, in making and perfecting inventions, is merely doing what he was hired to do. Should the *employé* leave that employ, he cannot use, or make, or sell the invention, or convey any rights to others under it, except with the consent of the employer.

Related to the question of the rights of employers and *employés* to inventions of the latter is that of the rights of the one to conceive an invention, and of the skilled workman who is employed to perfect it. In general, if A conceives an invention (which includes an idea of means to put it into operation) and employs a skilled workman, B, to perfect it, then A, and not B, is the inventor of the whole machine, article, or process, including any merely subsidiary inventions which B made in developing A's ideas, and A alone is entitled to the patent. If, however, the idea merely occurred to A that it would be well to do a certain thing, and he had no notion of the means to do it, then B is the inventor. A's rights as a licensee under, or owner of, the patent, will depend upon the special relations between A and B, as above considered, or upon the express contracts between them. But the applicant for the patent must be B.

It is unfortunate that the relations of *employés* and employers are often such as to prevent an explicit understanding between them, at the time the invention is being developed, of just what their rights are to be. Influenced by what seems their present interest in "keeping quiet," and trusting that something will happen that will enable them to secure more than the law will give them on the facts at the time, both parties avoid definite understandings, until after a lapse of time, when the real facts are forgotten, and perhaps the invention is becoming important, both, unconsciously or consciously, distort the facts in their own interest, and serious disagreements arise, which sometimes wreck the business and almost always injure the *employé*.

The security of both the *employé* and the employer requires that the relations of the parties should be explicitly agreed upon when the invention is developing, and that the terms of the agreement should be committed to writing.

#### "FREAK" PHOTOGRAPHY IN AMERICA.

THE following three extracts from the American contemporaries named below complete the series of criticisms that have been published during the last few months in the United States on the subject of "freak" photography, as it is called there. Almost every photographic journal published in America has ridiculed these productions—the like of which was frequently seen in London a few years ago—and we may therefore reasonably hope and expect that this weight of opinion will have the effect of ridding Transatlantic exhibitions of a kind of "photograph" which could hardly have been the productions of perfectly sane persons.

Mr. Edward W. Newcombe, in the *Camera*, writes: "It seems to me that a hundred dollars is something of a price to ask for a photograph, even a most extraordinary one. Yet there was such a price asked at the Chicago Salon, while others were priced nearly as high. Now, I don't believe any one wanted those prints at ninety-five per cent. reduction. The press seemed to entertain the same opinion, and what we, who are uninitiated, would like to know is, what the idea was in putting such ridiculous figures on the aforesaid prints. Did the price lend dignity to the Salon, or were the pictures such extraordinary freaks that the owners couldn't bear to part with them, and so put prohibitive prices on them? Do any of my readers think that a hundred dollars will ever be paid for a print from a negative? and, if not, will some one please inform me

what else but vanity and self-conceit ever prompted the makers of these prints to ask as much for work that both press and public laughed at openly as a reputable painter would for a good canvas? That is *one* way to 'elevate' photography—reduce the royalty and raise the price. In other words, 'sand the sugar, water the rum, and come in to prayers.' Notoriety at any cost made the reputation of P. T. Barnum, who, I believe, said, 'Have the public talk about you; well, if possible, but have them talk any how,' and it was the same man who declared that the public dearly loved to be humbugged. Perhaps we do, perhaps we do, but do we want to be taught advanced photography, the *new school*, by people who use humbug methods to gain notoriety? Are those methods what we want to convince us of the legitimacy of a kind of photograph we and nearly everybody else failed to understand? Would it not be better, more sensible, to give up the bluff, place the pictures *at auction*, and let a discerning public put the legitimate market value upon them? Then, if they fetch a hundred dollars, it might be very wise of us to kneel down to and become disciples of these exponents of the 'new photography.'

The editor of the *Camera and Dark Room* thus interrogates his readers: "What is it? What shall we name this off-shoot from our beautiful art that prevails at the modern photographic salon? It is not photography! It is not art! The spread of this spirit of nambypambyism has been illustrated at some expense by the editor of the *Photo-Beacon* in his June issue, which is given up to the Chicago Photographic Salon. We agree in the main with brother Todd's critique on the what-shall-we-call-ems, but he is too lenient. Why, in all dizziness, is such work held up as an example? A technically perfect photograph of nature in any of her moods is a picture, and valuable in that it perpetuates the passing scene. An ideal may be conjured and aptly illustrated; this is art, a picture that tells a story. The first style of picture is within the reach of most all painstaking photographers; the second is the *pons asinorum*, where so many make the miss-step from the sublime to the ridiculous. Why will people with a reputation for making good photographs hold themselves up to ridicule by exhibiting trash that has no excuse for existence, and why, oh, why will Judges hang the picture (save the mark!) and not the perpetrator? A knowledge of the first elements of drawing, of light and shade, values and perspective, would have saved us many of the exhibits. Others that look like an amateur's first attempts, with all the faults enlarged, may be funny, but they should not be held up as objects of emulation. It would take more whisky than is good for the system to put a level-headed man in the condition to see nature as some would-be artists would have us see it. That this delirium-tremens style of art, which originated in æsthetic London, was aped in New York, and garbled in Philadelphia, should have found support in the practical Western city is sad to contemplate. Where will it stop? And, before the next Salon, if this is to continue to be held up as the pattern of success, we earnestly hope the Judges will answer the question, What is it?

That usually astute critic, the office-boy, is sent by the *Photographic Times* to "do" a modern Exhibition, presumably at Chicago or New York. "Rusty"—for that is the lad's name—delivers himself in this manner: "Say, she's hot stuff, ain't she? But it wasn't anything like I thought it would be. Not many good pictures there, like I used to burnish up at Greggs'. A lot of fellows were goin' daft over some pictures by an English fellow with a kind of an automobile name—A Horseless Winton, or something like that, but I didn't think they were so much. A dude with an eyeglass and several ladies were ravin' over a set of pictures that the dude was the author of. They was all out of focus, and it would make you dizzy to look at them for a minute, and they looked as if they had been taken through a telegraph-pole insulator or the bottom of a beer bottle. Somebody ought to buy that duck a good camera with one of them anti-stigma lenses, like yours. There was another fellow there that had evidently got 'turned down' by the jury, for he just rippin' up everybody and all the pictures, and sayin' that they didn't any of them begin to compare with his own. I heard him tellin' another fellow that after this he wasn't goin' to throw any of his spoiled negatives in the ash barrel, but was goin' to keep them to print pictures from for the exhibitions, because he said the spoiled negatives of one year would produce the prize-winners of next year's show." Here "Rusty" was called away by the ringing of the telephone, but he returned immediately and continued: "But, say, what silly titles they give some of the pictures, and how badly they fit. One fellow had a picture of a sickly-looking girl holdin' something in her hand and looking sad, which he called *Woman with a Vase*. I heard a couple of girls talkin' about it, and they called it a 'voz,' but it was vase in my catalogue all right. *Woman with a Grouch*, *Man with a*

*Jag*, or *Child with the Measles*, would be more appropriate for some of them than the titles that were printed in the catalogue. And say, some of them landscapes looked as if they had been printed from the wrong side of the negative. One pointed bearded artist fellow was snickerin' at a fright that was labelled *The Weary Day is Drawing to a Close*. And it was certainly the weariest-looking day I ever saw closing. Before I ever went to work for Griggs I'll bet I could have made a picture like that with my shoe-brush and some of Bixby's three B's blackin'. That fellow's business may take him out at the hour when a landscape might look like that to him, but I would have to be comin' home about three o'clock on a rainy morning with a good comfortable jag on board to see nature look like that chromo. There was another freak there that was so bad that the fellow who took it couldn't look it in the face and name it, so he just called it *A Study*. After 'studying' it for about a half an hour, tryin' to make out what it was, I had to give it up, but I think it was either a gipsy girl or a picture of General Shafter, although it did look like a picture of Columbus that used to be in the Second Reader when I went to school down —" Just at this point a man called in to pay his subscription, and while he was out hunting up the Business Manager, I couldn't help but think that, in his way, "Rusty" was, doubtless, something of a genuine philosopher, as well as a clever, faithful office-boy.

#### COMPACT STEREOSCOPIC CAMERA.

[Translated from the *Photographische Mittheilungen*.]

ANY one who owns a pocket Kodak, and can borrow another from a friend, may readily extemporise a stereoscopic camera by combining them. They should be placed side by side upon a piece of wood taken from a cigar-box, or upon a piece of cardboard, of the size of the base of the two cameras. They may be attached to it by an indiarubber band. The camera is then quite ready for snap-shots, and the shutters may be released by pressing simultaneously upon both buttons with the two thumbs.

But it will be necessary to connect the two releases for time exposures. This will also be found convenient for instantaneous work, and may be effected as follows: Take a strip of wood rather longer than the space separating the two releases, and notch the side at each end to make it fit on to both triggers. The piece of wood should then be placed in position upon the cameras, and secured by a second indiarubber band passed round both. It will then only be necessary to push the piece of wood from right to left, or *vice versa*, to release both shutters simultaneously. I would not have troubled my friends with this trifling addition to the amusement obtained from a Kodak if the results had not been so surprising.

The small photographs may be seen to good advantage in any ordinary stereoscope, but it is far preferable to look at them in one made expressly for the purpose. It is possible to make a suitable stereoscope with very little trouble from three pieces of cigar-box wood, arranged like a footstool to support the picture. The optical arrangement consists of two simple lenses (magnifiers) of about 7 to 8 c. focus which are permanently fixed at the average separation of the eyes (68 mm.). The distance between the lenses and the pictures should only be slightly less than the focal length. It is preferable to place the pictures in position provisionally before mounting them, so as to avoid exchanging the right and left, and likewise to adjust them so that they combine perfectly.

Readers who are familiar with the stereoscope will understand that pictures viewed in this manner will have a far more realistic appearance. The secret depends principally upon the fact that the lenses of the stereoscope correspond in focus with the lenses of the cameras, and the rays transmitted to the eye consequently seem to come from the same distance as the objects. In addition to this, the pictures, on account of their small size, may be examined with lenses of considerable magnifying power. The apparent field of vision and the parallax difference are consequently larger than in an ordinary stereoscope, and this determines the stereoscopic effect.

One is astonished at the effectiveness of these small pictures. Details which were invisible stand out with remarkable distinctness. The smallness of the pictures is entirely forgotten, and all the advantages of the stereograph are obtained in undiminished degree. In conclusion, I wish to emphasise the fact that the manipulation of the process is very simple. It is not necessary to develop both pictures at the same time, and their density may differ considerably without impairing the effect.

The inconvenience and expense of a stereoscopic outfit interfere with the popularity of this branch of photography, and if these few lines bring new friends to the ranks, as I trust they may, they will have served a good purpose.

ROBERT DEFREGGER.

A COMPARISON OF DEVELOPERS IN ORDINARY USE.

[Translated from the *Photographische Mittheilungen*.]

THE following tables show the composition of the developing solutions in general use and their comparative cost:—

A.—SODA DEVELOPERS.

Per Litre of Water.	De-veloper.	Crystal-ised Sul-phite of Soda.	Meta-bisulphite of potash.	Soda.	Compara-tive cost, hydro-quinone being=1.
	Grammes.	Grammes.	Grammes.	Grammes.	
Hydroquinone .....	5.0	33	—	50	1.0
Pyrogallol .....	9.3	66	—	33	2.1
Eikonogen .....	12.5	50	—	38	3.1
Metol .....	5.0	50	—	50	3.3
Ortol .....	7.5	90	4	60	4.8

B.—POTASH DEVELOPERS.

Per Litre of Water.	De-veloper.	Crystal-ised Sul-phite of Soda.	Meta-bisulphite of Potash.	Carbonate of Potash.	Compara-tive cost, hydro-quinone being=1.
	Grammes.	Grammes.	Grammes.	Grammes.	
Hydroquinone .....	5.0	30	—	50	1.0
Pyrogallol .....	2.8	64	—	13	0.8
Pyrocatechin .....	10.0	40	—	50	3.0
Eikonogen (E. Vogel) ...	12.5	50	—	40	2.5
„ (maker's for- mula) ...	30.0	120	—	50	5.6
Para-amidophenol .....	6.7	40	—	40	3.4
Metol .....	7.5	75	—	25	3.8
Glycin .....	8.0	40	—	40	3.9
Ortol .....	7.5	90	4	30	3.9

The comparative cost, as given in these tables, should not be taken as representing the absolute cost in practical use, the relative density and stability in use being important factors, which must also be taken into consideration. It is well known that hydroquinone, which we have taken as the unit, gives great density, and oxidises slowly; but, on the other hand, when freshly prepared, it is more prone to veil than some other solutions, such as pyrocatechin and glycin, and it loses energy at low temperatures (under 14° C.). The old ferrous-oxalate developer is about twice as expensive as the hydroquinone developer mentioned above.

The potash developers are more rapid in action than the soda developers, and may therefore be used with more water for many kinds of work. H.

THE PHYSIOLOGICAL EFFECTS OF MODERN PHOTOGRAPHIC DEVELOPERS.

[Translated from *Der Amateur Photograph*.]

CONSIDERING the enormous popularity of photography, and the consequent wide-spread use of developing solutions, it is important to review their physiological effects by the light of experience.

Developing agents are offered to us in commerce either as colourless powders or small crystals. They are dissolved for use in water, and alkaline salts are added. These solutions are brought into contact with the hands and fingers of the operator. It is, of course, a very seldom occurrence that developers, in their original state or in solution, are taken into the stomach. But it is desirable, nevertheless, to take this opportunity to point out that many of our modern developers, and especially pyrogallol, must be classed with poisons. But it is of greater interest to the photographer to learn the conditions under which alkaline solutions have a deleterious effect upon the skin of the hands and fingers, causing painful inflammation often difficult to cure. Experience has shown that few persons exhibit a decided susceptibility to the action of developing solutions, and it has likewise been conclusively established that the alkali, as well as the developer, is capable of acting upon the skin. In the majority of cases that have come under observation, there can be no doubt that the alkali was the cause. With regard to the developing substances, only one is known to have caused inflammation, viz., metol, and that only in a few cases.

It is by no means unimportant which alkali is used in making up the developing solution. Developers like amidol, which are rendered active with the weaker alkalies, such as sulphite of soda, may be considered

harmless. There is no case on record in which the amidol developer has been the cause of inflammation. Not until we come to the alkaline carbonates, such as soda and especially potash, do we meet with any complaints, and it is noteworthy that those developers which require a considerable quantity of alkali are the more troublesome, whilst those with which little alkali is used, such as eikonogen or the more recent imogen-sulphite, may also be regarded as harmless. When the caustic alkalies are used there is increased danger, but here we must also discriminate and ascertain whether the alkali combines with the developer and forms a phenolate, or merely mixes with the solution. Kodinal is a characteristic example of the former, as only sufficient alkali is used to

convert the para-amido-phenol ( $C_6H_4(OH)NH_2$ ) to phenolate ( $C_6H_4(ONa)NH_2$ ).

(See the instructions for the use of para-amido-phenol.) In this way the corrosive action of the caustic alkalies is diminished and their deleterious effect upon the skin reduced to a minimum. The case is quite different when the developer does not combine with the caustic alkali and form a salt, as, for instance, when para-phenylenediamine ( $C_6H_4(NH_2)_2$ , meta-carbol)

is used. Such developing solutions are as strongly alkaline, and have the same corrosive effect, as a solution of caustic alkali of corresponding strength. It is scarcely possible to work long with these developers.

MAKING AND PAINTING BACKGROUNDS.

DURING the winter months the photographer must always have slack days. Knowing this, it is surprising that so few make preparations to occupy the enforced leisure in the profitable pursuit of background painting. I could instance professionals who use the same background day after day, month after month, until its constant appearance in every portrait cannot but make their clients rebel, seeking novelty, and a rival photographer.

One of the leading professionals, noted for easy and graceful portraiture, is not above painting a special background to suit the individual sitter, or half a dozen for as many different subjects; and the enthusiast who can follow this example is certain to rise above men who remain content to buy two or three backgrounds yearly, using them mechanically for every composition.

Want of skill in drawing is the first obstacle to discourage the majority of photographers, and it is a matter of regret that they pay so little attention to this art, when it should be regarded as an essential part of the training of every operator; until it is so regarded the painted background will remain unsatisfactory, since it is an aid in portraiture that can only be properly utilized by each worker painting his own.

The background gives style to a picture, it being remarkable how the individuality of a man will appear in his work if he uses backgrounds painted by himself. The style of a painter can also be caught by copying his backgrounds, and using them in a portrait. Gainsborough, Reynolds, Lely, or any of the old portrait painters with a marked style, may be imitated by such devices. Some of the work of the above-mentioned photographer is of this character, and his mastery of natural and simple posing is so complete that his imitations have all the spirit of the originals. It is a practice scarcely to be encouraged, though its success is a proof of the photographer's abilities. Professionals may often, however, employ it as an attractive novelty.

Elaborate backgrounds depend for success on power in drawing. Apparently the work is very free; actually it requires considerable artistic skill to produce the effect aimed at. With absolutely no knowledge of drawing, one can still make plain or clouded grounds; and, since the practical treatment is alike in both cases, the following description will be confined to the latter, leaving the worker to express his artistic notions according to personal taste and the accepted rules of lighting and composition.

*Preparing the Calico.*—The first need is calico of the kind known as "sheeting," this being usually stocked by drapers, the width ranging from 72 inches upwards. It may be of the bleached or unbleached variety; also of such a length that it consists of a single sheet, without seam or join, of the size of background required. If it is to be used on a roller, a rough wooden frame should be made to hold the sheet during the colouring operations. For convenience of working it is best fixed against a bare wall, taking the precaution of having a framework two inches in depth to keep the calico well away from the wall; otherwise, in subsequent processes, it may slacken and stick at the back. For a stretched background, a well-made frame of the usual kind, of wood not less than two inches square, will be needed. To allow of tacking along the sides it is as well that the sheet lap over the framework two inches all round.

The calico is next affixed, the work being done in one particular way. The sheet is laid over the frame, and first secured at the centre of each of the four sides, pulling it tightly across, driving the tacks along the

edge, and not into the front. These points secured, the tacking is continued from the centres towards the corners, keeping the calico quite tight, and inserting the tacks a few at a time on each side in rotation, finishing up at the corners simultaneously. By this method the sheet can be evenly stretched, and all rucks and creases avoided.

*Sizing.*—The calico is now ready for sizing. A best quality whitewash brush, one having long, flexible hairs is obtained; this is not a cheap article, but to use an inferior brush is to court failure. The common size used by decorators is employed; it is put into a convenient vessel, just covered by water, and dissolved by means of a slow heat. The exact strength is not material, but it should be of such a consistency as to flow easily over the sheet. When dissolved, the solution is strained through canvas to remove all particles, and finally applied, whilst still hot, to the calico. The application must be regular, the brush being worked in all directions, taking special care that every part of the surface is touched. No bare spaces must be left, nor the size put on in patches. This done, it is left to dry for about twenty-four hours. Some prefer to apply two coats of a very thin size, though this is not necessary if a single coat is put on with care. Enough size is melted to cover the whole sheet; roughly, a background eight feet square will soak up from a half to three-quarters of a house-pail of solution.

*Mixing the Colour.*—The next step is the actual colouring. For a plain background the proper shade is put down at once, whilst for a scenic background the middle tone is first put on, and the lighter and darker details worked in afterwards. For general photographic work, lampblack, whitening, and ultra marine blue are the only powders required, as every shade of slate colour can be obtained by mixtures of these.

The whitening is placed in a pail, covered with water and left to soak and dissolve. Meanwhile the lampblack and blue are made into pastes with water on a stone slab by the aid of a palette knife, and are ground down to a smooth creamlike mass. The whitening, after being well stirred, is allowed to settle, and the superfluous water poured off. The lampblack and blue are then added to the whitening in the right proportions to procure the shade of background that is wanted. As all powders dry light, the wet mass should appear much darker than the finished colour is to be. On this account it is advisable to spread a portion over some surface, leave it to dry, and thus secure a guide to the depth of the final shade. The correct shade arrived at, a solution of hot size is added to the mixture until it becomes sufficiently fluid to apply with the brush. This, in practice, means that it will be hardly so thick as cream, and yet not so watery as to run when put on the calico. The proportions usually taken are one pound of size to three pounds of whitening and colour. Some recommend using the mixture when cold and in a jellied state, but in my experience the hot mixture is more simple to deal with. Before use the colour, while at its hottest, is strained through a coarse mesh to remove any impurities.

*Applying the Colour.*—The whole secret of background painting consists in the method of laying on the colour. A common, stumpy brush is of little use, for a whitewash brush having a good spring is a necessity. To ensure success, a platform must be erected, in order that the upper part of the background is within easy reach, and making it possible to pass rapidly from one end to the other. The platform ought also to admit of quick removal, so that the lower half of the background may be immediately accessible. Enough colour to cover the whole calico should be mixed, which will mean about the same quantity as for the sizing. Have the solution almost boiling, and, when ready, commence at the extreme top of the frame. Move the brush in every direction, working quickly downwards, and always keeping a good flow of colour in the brush. In no case must the edge of the colour be left to become dry; this is a most important point, for every such dry edge will show as a streak in the finished background. Make no pause in the work when once started, and keep the edge of colour across the whole background continually moist. With a very large surface it is as well to have two persons working together. Taking these precautions, the surface, when dry, will present a uniform tint without a trace of inequality.

*Shading and Drawing.*—On such a ground any darker tint, having a sharp outline might be laid down in a similar manner. To produce shaded effects more skill is needed. The straightforward way is to work them in whilst putting on the ground. This demands an assistant, one worker starting at the top with a pail of light colour, whilst the other commencing from the bottom, or any given direction, with a pail of another shade, and when one approaches the other the two are skilfully blended. As a rule, backgrounds are shaded from top to bottom, though the choice is not limited to this one method, for the plain shading of backgrounds might rise to an art.

Any one who wishes to really learn the possibilities of a plain surface under artistic treatment should study the bare walls so often seen in paintings of the Dutch school. It is scarcely correct to call them "bare walls," so full are they of shadows and delicate gradations that lift them into the region of art. Certain it is that the pillar and curtain enter largely into the scheme, not for themselves, but rather as a means of throwing shadows on walls, to secure the needed relief. It may be that many photographers use like accessories for the same object. Following along these lines, we might have backgrounds shaded in many different ways, as various indeed as the shadows which fall upon the walls of a room.

On a plain ground many subjects can be sketched with chalk and charcoal. It is not recommended, as the powder is apt to rub off, and chalk is far too glaring. The better plan is to mix powders with size, and use them as ordinary paints. A pure white is employed with caution, and, in general, the high lights in a background should be in a much lower key than in ordinary colour painting. The cheap background of commerce is usually in far too high a key, being much improved by toning down.

A final point needing some attention is the position objects depicted in a scene are to occupy. Photographers often think some natural view would make a good background, but a very small proportion of natural "bits" can be pressed into the service. In nearly all cases some angular object cuts the outline of the sitter. For ordinary studio work it is as well to leave a bare space in the centre of a background, and to merely suggest accessories at the sides. Another course is to avoid all abrupt lines by shading surrounding objects into the space around the sitter's position. A third method is to paint one half of a uniform tint, to pose the subject against this, and to fill in the remaining part with slight detail.

Scenic backgrounds have been somewhat overdone by the professional, and, in my opinion, much finer effects in portraiture could be composed by following the Dutch painters in utilising the simple shadows obtainable upon a bare, uniform surface—a system, that is, of straight-line shading in contrast with the clouded background now so much in vogue.

JOHN A. RANDALL

#### PRACTICAL HINTS ON COPYING.

ONE of the most trying parts in work of this description, when operating away from home, is generally found in the difficulty of so adjusting the camera that the sensitive plate is placed exactly parallel to the plane of the object. To many at first sight (especially those who have never had work of this description to undertake) this may appear a matter of but little difficulty, for most handbooks on photography refer to this matter, and are generally found giving the advice that, by drawing a series of upright lines on the ground glass of the camera, and then so adjusting matters that the outline of the object exactly coincides with such marks, the object will be rendered true in form. No doubt, in some simple cases a procedure of this description will meet the requirements of an operator, but for really serious work, in different situations and under most trying circumstances, something more certain in the way of operating is required than the guidance of lines on the ground glass of the camera.

Take, for instance, the case where a panel, or, say, an oil painting has to be photographed in the position it occupies when against an ordinary wall (for in numerous instances they have to be dealt with without removal from where they are situated). Very probably the light is dim and it is a matter of considerable difficulty to distinguish the sombre colours both of the object and their surroundings. In such a case as this some trouble is entailed in so arranging for the plane of the object being absolutely parallel to the sensitive plate when working by means of lines on the ground glass, for no sooner does one proceed to rectify some apparent distortion in one direction than one immediately introduces an error in another.

When dealing with large plans or maps, or such subjects as contain well-defined outlines running round the extreme limits of the object, the adjustment of the two planes so that they are absolutely parallel to each other is a matter of the utmost importance indeed, for the slightest deviation will become painfully evident by the distorted shape in the copy. This is sometimes noticeable by one end appearing narrower than the other, or being wider at the top than the bottom. Some careless workers may say, "What does it matter?" by trimming the print square such distortion is not seen; but this argument is only a poor excuse for slovenly workmanship.

Of the numerous methods employed to ensure the two planes being parallel, mention may also be made of drawing parallel lines on the floor of the studio, or by employing the seams of the planking, when this runs fairly parallel to the wall of any room upon which the subject is held *in situ*. These expedients, however, are only clumsy makeshifts, and merely provide for an approximate parallelism in one direction only, and, further, are of no avail when the work has to be done in situations outside well-appointed studios, or in rooms where such facilities do not exist.

In photographing small objects, such as ordinary photographs or book illustrations, these difficulties do not arise, simply by reason of the fact that the merest tyro knows how to employ some copying board, upon which are ruled, at equal distances, parallel lines, and by so placing the upright carrying the object to be copied on one of such lines, and then the camera on another at any distance from the upright, the two planes are easily made parallel to each other. It is when working away from home on large objects that real difficulty arises, and then an operator wants some reliable and simple method of guidance.

On several occasions, when discussing this matter with clever workers, the writer has been forcibly impressed with the variety of opinions expressed as to the best method to employ to ensure success in this particular branch of work. In the main, however, the remarks generally

ended up by saying, "Get the object square on the focussing screen." Yes; but how? The answer to which clearly indicated that there was almost complete ignorance regarding a splendid little dodge which, when brought to bear upon work of this description, made the adjustment of an object to the sensitive plate a matter of easy accomplishment. This little dodge was known to a few workers of the old school nearly thirty years ago, but the secret has been well kept, or, at least, so far as the writer is aware, it has never been divulged in any of the handbooks or guides to photography, of which we have at present so great a number.

I remember on one occasion having a large quantity of oil paintings to photograph in an art studio or, rather, show-room, and had placed at my disposal for the removal of the different pictures an expert picture-cleaner, who had many years' experience in dealings with oil paintings, and, as he expressed it, "standing by" when they were being photographed, so as to render any assistance that was required. On my arrival to begin operations he had already made preparations, admirable enough in their way, no doubt, for the very purpose of dealing with the difficulty under discussion. These embraced the nailing down upon the carpet of the show-room of a number of lengths of narrow white tape, each length being about eighteen inches apart. On my expressing thanks for the kindness and trouble he had taken in the matter, but stating that I did not require such guides, he seemed surprised, and said, "That's the best way I ken o', and I have seen a when photographers working in my day." On my remarking that no doubt the white tapes were very useful, but that there was a much easier method, he said he would like to see it; and so, on his promising to keep my method of working a secret, I showed him the following little dodge, with which he was forcibly impressed.

Of course, in all well-appointed picture show-rooms or studios there are always to be found plenty of block easels. These at once permit any size of painting being held vertical, or with a small amount of tilting, either backwards or forwards, if desired; but, as a general rule, the exact position will depend upon the direction of the lighting. A top light, however, pure and simple, means the picture being held on the blocks vertically. The camera stand is then arranged (a tripod is of no use in work of this description), and, where the services of a good camera stand cannot be requisitioned, then the next best thing to employ is the services of one or two good packing-cases, wedged up so as to form a rigid support for the camera.

The picture and camera being situated at the requisite distance from each other, according to the size of the image required, the rest is easy; should, however, there be any alteration in the distance of the object from the camera, it is always best to move the easel, not the camera stand. In this there will be no difficulty, for all these high-class easels run on casters, so that, even with a heavy framed picture, they are easily wheeled into any position.

The dodge which the writer has found so easy and simple to secure the two planes being made parallel to one another consists in using a small tool, that he has termed "a dry level." Any one can make it for themselves in a few minutes; it consists of a square flat board with a round peg in the centre.

The following description of the one the writer employs may be read with interest by readers of THE BRITISH JOURNAL OF PHOTOGRAPHY. In making this, let a flat board be provided, ten inches exactly square by half an inch thick. When absolutely squared, draw lines from each corner to the opposite corner. These will cross exactly in the centre of the board. At this central point, by means of a carpenter's brace and a sharp bit, bore out a round aperture of one inch diameter. Now provide a piece of round wood, such as a good broom handle, and cut off a length of about three inches long. Of course the diameter of the peg must be such as will enable its fitting nicely into the cut-out aperture, and the ends must be cut square to the plane of the board. Let this round peg be inserted in the cut-out aperture, and, if the surface of the flat board be painted black, then must the projecting end of the round peg be painted white, or *vice versa*. The reason for this will soon be obvious.

Possessed with this little tool, we are now in a position to easily bring the two planes into a parallel position. To do this, by means of two strings, or any other simple means, hang the board so that it lies flat on or near the centre surface of whatever is being photographed. This done, proceed to examine the end of the round peg on the ground glass of the camera. If the planes are parallel, there will be a true circle seen on the focussing screen, and it is a good plan to have the centre of the focussing screen marked with a number of circles; this is easily done by means of a lead pencil and different stops of a lens; with any of these circles the peg will appear distorted if the planes are not parallel.

The whole thing is so simple that with a very little practice the least deviation is at once detected. I cannot at this distance of time remember where I first saw this dodge used or given. I rather think the credit for it lies with a Continental photographer, but I do know that I used it some thirty years ago, and I have found it invaluable when dealing with objects such as we are describing.

Oil paintings, as a rule, are best photographed without their frames; but, of course, circumstances will arise where, as is the case when they have to be copied on a wall, the frames require to be included; this often means employing kitchen tables and other homely articles in rigging up stagings for the camera, and in cases where the pictures are tilted forward, and the

corners of the wooden gauge or level cannot be inserted over the canvas, I have generally resorted to holding the peg over the surface of the painting by hand.

There are several other old-time dodges which seem to have dropped out of notice in these go-ahead days of snap-shot work, but which are of much value in all-round working.

T. N. ARMSTRONG.

#### SOME RECENT PATENTS IN COLOUR PHOTOGRAPHY.

DR. GUSTAV SELLE'S IMPROVEMENTS IN COLOUR SCREENS.

[Patent No. 12,515 of 1899.]

DR. SELLE says: "By reason of its purity and transparency collodion tinted with proper colouring is particularly adapted for light screens but in its normal condition it contracts so strongly upon drying that a net-like surface results which has a disturbing effect on the sensitive plate. I have found that this can be obviated if normal collodion be reduced by a suitable attenuant until the viscosity and molecular attraction is enfeebled to an extreme degree without at the same time destroying cohesion. I achieve this by treating normal collodion with an excess of ether or other substances having the same attributes. Taking for instance a three per cent. collodion I dilute it with about fifty per cent. of ether. With such solution I incorporate colours combining capacity of concentration and correctness of tint with extreme purity, transparency, and luminosity. For the blue filter I use a mixture of blue and red, gentiana blue and fuchsin or other colours having the same tints and attributes.

"For the green filter I use an admixture of emerald green and auramin yellow or other colours with the same tints and attributes; for the red filter I use a mixture of fuchsin red and saffranin yellow or other colours having the same tints and attributes: after covering glass plates with a layer of such tinted collodion by flooding and pouring off the excess the filters must be dried in a heated atmosphere (say about 60 degrees Celsius) to prevent irregularities in drying and a separation or precipitation of the colours which would otherwise frequently take place."

DR. SELLE'S IMPROVEMENTS RELATING TO THE SENSITISING AND RELATIVE SENSITIVE ADJUSTMENT OF PHOTOGRAPHIC PLATES FOR USE IN COLOUR PHOTOGRAPHY.

[Patent No. 12,516 of 1899.]

The patentee says: "The ordinary gelatine plate being perfectly adapted for exposures to the blue rays it is only the other two plates that require suitable preparation.

"For exposure to the green rays I employ a gelatine plate which I sensitise for green by immersion in a bath consisting of a solution of a red colouring substance, for instance the well-known erythrosin. But the solution must be so proportioned that apart from more colour sensitiveness the plate should both by itself and in relation to the other plates yield the equality above described.

"To this end and without prejudicing sensitiveness there should be sufficient resistance to the property of green rays to abundantly penetrate a silver plate so that a correct ratio between penetration and the formation of the image may be established. Taking for instance erythrosin I use a solution of 0.005 per cent. in water but other sensitisers may be substituted provided they fulfil the same conditions.

"The plate to be exposed behind the red filters needs to be sensitised with a combination of a red and blue colouring substance although either is by itself sensitive to the red rays. If a red sensitiser only were used most of the red rays would be reflected without being absorbed, thus the formation of a proper image would be prevented; on the other hand the blue sensitiser alone would be far more sensitive to the purely red rays than to the orange, so that incorrect contrasts and values would result; moreover it presents no obstacle to the property possessed also by red rays of penetrating abundantly a silver plate. By combining the two sensitisers and moreover in such a manner that their defects are rendered inactive which best results if the blue sensitiser be superimposed on the red, a balance is created which not only ensures the absorption of the total rays within the group, but establishes the necessary ratio between rate of absorption and formation of image.

"To achieve my object I use as a sensitising bath, for instance, a solution of say 0.002 per cent. of cyanin blue and erythrosin in a fluid composed of sixty per cent. water and forty per cent. alcohol. By this means the red dye which is more soluble in the water is carried into the film, while the blue dye which is more soluble in alcohol remains substantially on the surface of the plate. But other sensitisers having the same properties or result may be used.

"It will be seen from the aforesaid that apart from the sensitising of the plates individually my principal object is to obtain the proper adjustment of the three negatives to each other and it is obvious that other methods of sensitising than those described may be used so long as the same necessary adjustment is achieved.

"Owing to the difference in actinism each of the plates requires as already mentioned a different length of exposure. Nevertheless by observance of the method of sensitising herein described the reduction of the time necessary for exposure of the 'green' and the 'red' plates can be very greatly reduced below that formerly necessary.

"Given an identical light, electric light for instance there is no trouble in observing the necessary proportions but in daylight this is frequently very difficult.

"I assure exact proportionate exposures irrespective of variations in light by timing the exposures according to the gyrations of a radiometer (light propelled mill) which revolves faster or slower according to the intensity of the light playing on it.

"The exposure is directly proportional to the number of revolutions per second of the radiometer. The first plate exposed is the plate behind the blue filter, such plate requires hardly more exposure than the ordinary plate in ordinary monochrome photography and the necessary time for exposure of such plate is ascertained by means of an actinometer or similar contrivance and the number of revolutions made by the radiometer having been counted this will constitute the basis for estimating the number of revolutions necessary for the green and red plates. Assuming that the exposure of the 3 plates stands as 1 for the blue, 3 for the green, and 18 for the red and that the exposure required for the blue plate is in accordance with the actinometer, equivalent to 3 revolutions in a second then the exposure for the green plate will be equivalent to  $3 \times 3 = 9$  revolutions of the radiometer and the exposure for the red plate will be  $3 \times 18 = 54$  revolutions."

#### DR. SELLE'S IMPROVEMENTS IN FILMS FOR COLOUR PHOTOGRAPHY.

[Patent No. 12,517 of 1899.]

Dr. Selle says: "I use extremely thin layers of gelatine which on account of their fragility and also for the purpose of superposition are supported on collodion films. The effect of using such extremely thin gelatine is that the latter remains practically unaffected by the subsequent baths and those parts on which the light passing through the negative has acted undergo a chemical change whereby the bichromated gelatine is so to say converted into a mordant capable of attracting the colouring matter held in solution by the baths; moreover the combination imparts a satisfactory degree of permanency to otherwise fugitive colours such as the aniline dyes. It is obvious also that on account of their thinness the films when superimposed allow of an equable and luminous blending of the three colours. My present object is to describe details giving the best results. I have found that the strength of gelatine solution to be used should be one between 5 and 7 per cent. preferably 6 per cent. when poured on a rigid surface such as glass or suitably mounted paper and the excess allowed to drain off there will result a film of about 0.0015 mm. in thickness. A stronger solution would give not only a thicker and therefore less luminous film but also a somewhat blurred and dirty picture. On the other hand a weaker solution would not provide a sufficient hold for the colouring matter and would consequently yield a pale and feeble image. The bichromate sensitiser used (for instance, ammonium bichromate) should be a solution from 2.5 to 3 per cent. strong; if a stronger solution is used say 4 per cent. the sensitiser will generally crystallise giving an unserviceable surface; on the other hand a weaker solution say 2 per cent. would yield a weak image since the colouring matter cannot bite sufficiently. It is also desirable that the plate should drain off at a temperature of about 40° Celsius and not exceeding 60° otherwise the gelatine by drying too quickly would prevent an even draining off and a layer of unequal depth results.

#### KUNY'S PROCESS FOR COLOURING PHOTOGRAPHIC PICTURES.

[Patent No. 18,594 of 1899.]

A TRANSPARENT sheet (gelatine, paper or the like) is attached to the film side of the negative by means of a transparent adhesive substance (gum arabic, gelatine or the like).

The sensitive layer or film may be of asphalt or chrome gelatine coloured with pigments corresponding to the local tones of the original. In case the asphalt method be employed, the colours must be rubbed with turpentine oil and filtered. Several glazing or transparent colours are suitable for use; in most cases Parisian blue, sienna earth and carmine suffice. If the chrome gelatine method be employed, colours must be selected which are not attacked by chromate and which may be dissolved or rubbed in water. The colours in this case also are added filtered. Preferably the above-mentioned colours are employed, although numerous others are capable of being used.

The coloured solutions are applied to the transparent paper or gelatine after the latter has been coated with gum arabic or the like transparent and easily soluble adhesive substance and the coating has been dried, in such a way that in the case of a portrait, for instance, flesh tints lie over the face, whilst brown or the like tints lie over the hair.

After the whole surface has been coated with the asphalt or chrome gelatine film in a non-actinic light and dried in a dark chamber or a yellow light, the negative is reproduced on this layer by exposing it to light without removing it from the film. The use of a special printing frame is therefore not necessary, as by the transparent sheet being stuck on the negative a firm whole is itself formed. The picture is then developed in the ordinary manner and dried, after which the transparent sheet together with the picture may be drawn off the negative.

The copy where asphalt is used is developed with turpentine oil, whilst a copy where chrome gelatine is used is developed with warm water.

In order to facilitate the drawing off of the picture from the negative, the latter is rubbed with wax, paraffin, or the like, before the transparent sheet is stuck on.

In sticking on, the edges of the negative plate are preferably overlapped by the transparent sheet, in which case, before drawing off the picture, these edges must be first cut off.

The transfer of a picture to another medium or foundation for the purpose of developing is unnecessary, because the copying takes place from the side of the film (gelatine or paper sheet).

A "positive" results from the process. It has colours corresponding with the local colours of the original, and is perfectly coated on the under side with toned white colour. It is then conveyed in the ordinary manner on to cards or the like, after which the transparent sheet may be removed, as it was coated with gum arabic or other soluble adhesive substance, as before stated, before the emulsion was applied. This drawing off of the transparent sheet takes place when the positive produced is fully dry, for which object the surface of the transparent sheet is suitably moistened, so that after some little time it can be drawn off. By this means the coloured surface on the positive is entirely free, so that it produces the impression of a painting. The sticking of the transparent paper or the like on the negative has as a consequence the following advantages:—

1. The transparent sheet fits thoroughly on the picture film, so that a thoroughly smooth surface is thereby afforded.
2. Displacement of the transparent paper arising from variations in temperature or moisture or even by accident in using a copying or printing frame are entirely excluded.
3. In consequence of the adhesive substance the paper is uniformly transparent.
4. A copying or printing frame is rendered unnecessary.

## Our Editorial Table.

### THE USEFUL ARTS AND HANDICRAFTS SERIES.

Edited by H. SNOWDEN WARD.

London: Dawbarn & Ward, 6, Farringdon-avenue, E.C.

THE completion of the twenty-fourth number of this series of little books, which deal in a practical manner with the minor arts and crafts, gives us the opportunity of again drawing attention to them. The first twelve numbers have already been referred to in our pages. The subjects dealt with in the second part of the series are as follows:—

- No. 13. Church Decoration (Permanent). W. T. Whitehead.
- No. 14. Church Decoration (Temporary). W. T. Whitehead.
- No. 15. Home-made Lathes. J. J. Holtzapffel.
- No. 16. Fret-cutting. "Jack Plane" and C. G. Leland.
- No. 17. Repoussé and Metal Chasing. C. G. Leland.
- No. 18. Tools and How to Use Them. Thomas Bolas and C. G. Leland.
- No. 19. Soldering, Brazing, and the Joining of Metals. Thomas Bolas.
- No. 20. Wood-turning for Amateurs. Rev. F. C. Lambert.
- No. 21. Cycle Repair and Maintenance. A. W. Marshall.
- No. 22. Etching on Metal; Niello and Metal-inlaying. T. Bolas and C. G. Leland.
- No. 23. Stencil-cutting and Stencilling. "Jack Plane."
- No. 24. First Steps in Painting and Colouring Engravings. C. E. Dawson.

Each book is plainly written, the instruction matter is devoid of superfluous language, and the illustrations are well drawn and reproduced. For self-instruction in many branches of handicraftsmanship this series will be found of real assistance. The books are sold at the low price of 6d. each, and the bound volumes make excellent gift-books for persons of manipulative skill or training.

### THE BARNET BOOK OF PHOTOGRAPHY.

Published by Elliott & Son, Barnet. 287 pp. Price 1s.

MESSRS. ELLIOTT inform us that, since the first publication of this book in May 1898, they have sold over 25,000 copies. The edition before us is the fourth, and, besides the inclusion of twelve pages of formulæ, it has some new illustrations in half-tone. Such a popular volume is bound in due course to reach a fifth edition, and we suggest to Messrs. Elliott—one of the most enlightened and progressive firms in the photographic trade—that this would afford a convenient opportunity to express the formulæ throughout the book in metric as well as Imperial equivalents. "Every little helps," as the familiar saying runs, and even such a comparatively small industry as photography, by employing metric weights and measures, can do something to promote British trade in the manner suggested elsewhere in this week's JOURNAL.

The frontispiece to the book is a Barnet bromide print—a beautiful example of the process—from a negative by the Duke of Newcastle. There are fourteen articles by qualified authors, and about a dozen pages of half-tone illustrations. It is worthy of note that Messrs. Elliott evince great breadth of view by including an article on "Platinotype Printing" in their book. The other subjects dealt with are "Alpine Photography" (Abney), "Negative-making" (C. H. Bothamley), "Lenses" (Chapman Jones), "Portraiture" (Harold Baker), "Pictorial Photography" (A. Horsley Hinton), "Architectural Photography" (J. H. Avery), "The Hand Camera" (W. Thomas), "Lantern Slides" (Pringle), "Enlargements" (Hodges), "P.O.P." (F. C. Lambert), "Carbon" (Skelton). A really good book, tastefully produced, and worth double what is charged for it—one shilling.

MESSRS. R. & J. BECK, Limited, of 68, Cornhill, E.C., are issuing a little catalogue of eight pages, which gives the prices charged for fitting the Beck-Steinheil orthostigmat lenses to Frena and Kodak cameras.

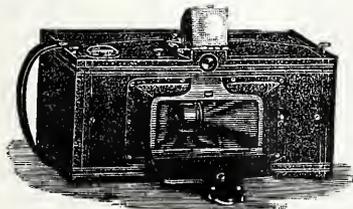

#### THE NATIONAL DRY PLATES.

We have received a sample of this brand of plates from the National Photographic Company, Cromwell-road, Southampton. This series, the Instantaneous, we find easy to manipulate and very sensitive. They are well coated and remarkably free from blemishes; and, as they are prepared by a well-known photographer of great experience, they promise to earn a reputation among the many popular brands now upon the market. We observe a novel recommendation in the instructions for use which deserves attention, although there are great objections to the general use of cyanide of potassium. The makers recommend flooding the plate with a 10-grain solution of cyanide of potassium after fixing and slightly washing. Ten minutes' subsequent washing will then suffice.

#### NEW KODAKS.

Manufactured and sold by Kodak, Limited, 43, Clerkenwell-road, London, E.C., and branches.

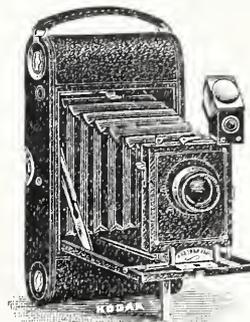

THE Panoram Kodak was introduced to the American photographic public last year, and in the JOURNAL, several months ago, we wrote appreciatively of some half-tone reproductions that we had seen from negatives made in the new camera. The appearance of the clever little instrument on the English market has been well timed, for it is the kind of camera which the autumn tourist, in particular, may be trusted to scan with a covetous eye. The narrow view,  $7 \times 2\frac{1}{2}$  inches, including an angle of considerably over a hundred degrees, and looking so much, if we may so express it, like a rectangular slice out of a natural scene, is just the kind of photograph upon which the gaze of the traveller would approvingly rest. The eye, in lens parlance, is a mid-angle instrument; but, when it comes to human consciousness, as distinct from human perceptiveness, it is another thing altogether. We most of us see, or think we see, panoramically, and photographs that are taken by means

of a mobile optical system seem to have, with the majority of people, a far more satisfying effect than views of less extensive angular inclusion.

This week the No. 1 Panoram Kodak was our companion during some loiterings in the Thames Valley between Chertsey and Windsor, and we have nothing but praise for the simple manner in which the instrument can be worked. River scenery in particular lends itself to great angular subtention, and there are parts of the beautiful region we have named that cannot be satisfactorily represented by the aid of, say, a five-inch lens working on a baseline of three or four inches. The Panoram, we may state for the information of those who have not yet tried it, is absolutely no more trouble to work than any other camera of the Kodak series. The film is bent round a curved surface, thus presenting a concave field to the lens. The shutter being set by the movement of the lever on top of the camera, the front flap is dropped, and the centre of the image being located on the finder, the exposure is made by the pressure of a metal button, which releases a spring that allows the lens to swing concentrically to the curved film. This is really all the photographer is called upon to do, and it will be seen that it differs very little from the familiar Kodak formula. Besides the finder, the camera has a spirit level, and the shutter has two speeds, quick and slow instantaneous. The Panoram Kodak is a beautifully finished little machine, and it is well worth the 50s. charged for it. It is bound to be a very popular instrument.

THE series of Kodak cameras has been further extended by the inclusion of a "No. 3 Folding Pocket Kodak." This takes  $4\frac{1}{4} \times 3\frac{1}{4}$  size photographs either vertically or horizontally, has a doublet lens, focussing scale in yards and metres, can be used on a stand, is fitted with a finder, gives time and instantaneous exposures, and admits of the use of glass plates. Withal, there is no sacrifice of portability as compared with

other cameras of the folding pocket series. The quarter-plate Kodak should be welcomed by the devotees of "regular sizes," and it is sure to be appreciated for its compactness and convenience. But the Panoram, like Mrs. Chickenstalker's muffins, has "come so pat" that we predict a great run on it. Certainly, it takes our fancy very strongly indeed. And, now, when may we expect a stereoscopic camera to issue from the wonderful workshop at Rochester, oh, mighty Kodak?

#### CATALOGUE RECEIVED.

R. J. Moss, 97, Great Hampton-street, Birmingham.

THIS catalogue treats in detail of acetylene gas apparatus for house lighting, the optical lantern and enlarging, cycle lamps, &c. The section which is of purely photographic interest is not the least important part of the catalogue, and a large variety of generators and jets are illustrated.

## News and Notes.

THE PARIS EXHIBITION.—The list of exhibitors recompensed includes no fewer than 42,790, and among these are distributed nearly 3000 grand prizes and 8000 gold medals.

We regret to learn that, on account of continued ill-health, Mr. W. Thompston has been compelled to resign the Hon. Secretaryship of the Newcastle and Northern Counties' Photographic Association.

In reprinting from the *Journal* of the Royal Photographic Society the paper, "A Simple Method of Obtaining the Conjugate Distances of a Lens," we omitted the name of the author. It is the Rev. F. C. Lambert, M.A.

THE Chancellor of the German Empire has issued an ordinance to the effect that the Réaumur thermometer will not be admitted to official control after January 1, 1901. This will lead to the exclusive use of the Centigrade thermometer in Germany.

INTERRUPTED PHOTOGRAPHY.—An extraordinary accident happened in the Abbey Field at Colchester one day last week. The 4th Battalion Essex Militia had constructed a trestle bridge over a wide gully, and the men were so proud of their work that 150 of them posed upon the structure and were photographed. Subsequently other groups were photographed, but, when the last batch was being snapped, the bridge collapsed, throwing sixty militiamen down twelve feet. Happily, not a single man was seriously hurt.

SERIOUS ACCIDENT TO A PHOTOGRAPHER.—Mr. W. Passmore, a native of Sidmouth, and carrying on business at Moreton-Hampstead as a photographer, was on Wednesday week cycling down Stonehill Hill, Willand, when he was seized with a fit and fell to the ground. Medical assistance was at once summoned, and he was removed to the Tiverton Infirmary. On the way, however, he had a succession of fits, and it required the strength of four men to hold him down. When he arrived at the infirmary, the surgeon decided that it would be advisable to detain him, as his condition was rather serious.

A PHOTOGRAPHER COMMITS SUICIDE.—An inquest was held at Powick, near Worcester, by the County Coroner, last week, on the body of Maximilian Ross, photographer, of 127, Princess-street, New Swindon. Mrs. Ross identified the body, which was found in the River Teme. She stated that her husband had been unsuccessful as a photographer at Swindon, and had sold his apparatus. He was well educated, and spoke several languages, and sought work at the Great Western Railway Works. He thought they would have given him a clerkship, but instead of that they put him to labourers' work, which he was unfitted for, and was afterwards discharged. Since January last he had tramped the country, and from time to time sent money for herself and the children. He was subject to fits of depression, and then gave way to drink. He had written to her recently to say that he had given up drink. Other evidence was given to show that deceased was seen to jump from the Old Bridge over the Teme. The jury returned a verdict of "Suicide by drowning, whilst temporarily insane."

**UNIVERSITY EXTENSION.**—Lectures were delivered last week to the University Extension students at Cambridge, by Mr. A. W. Clayden and Proff Moore Smith. Mr. Clayden took for his subject the "Development of Photography." The old clumsy method in use before the introduction of dry plates was touched upon, and the early attempts to devise a more convenient process were traced by Mr. Clayden, who also explained the process of the manufacture of films for plates, and referred to the long search after sensitive compounds other than those containing silver. Some of the results of that search were enumerated and described as valuable. The use of gelatine as a medium was also explained, and then Mr. Clayden went on to describe the gelatino-bromide plate, the introduction of which, he observed, was of enormous importance. Their rapidity was now well known, and he thought they might be adapted to photograph all parts of the spectrum. The concluding portion of the lecture was devoted to illustrating the applications of photography to investigations, notably, in physics, meteorology, and astronomy.

## Commercial Intelligence.

**THE AUSTIN-EDWARDS MONTHLY FILM-NEGATIVE COMPETITION.**—The prize camera for the current month has been awarded to Mr. J. Hartley, 21, Oxford-road, Waterloo, Liverpool, for his negative, *Feeding Chickens*.

**THE EUROPEAN BLAIR COMPANY.**—Mr. John Haddow, the Managing Director of the European Blair Camera Company, writes: "I have been informed that it is currently rumoured that the European Blair Camera Company, Limited, has been absorbed by Kodak, Limited. Will you allow me to give an unqualified denial to this statement?"

**THE WARWICK COMPETITIONS.**—The following is the list of awards of the Warwick Competition for August:—10l. prize, W. Kilbey, 57, Pagoda-avenue, Richmond, *Quick as Lightning and A Champion Hurdler*; 5l. prize, E. S. Baker, jun., 154, Bristol-street, Birmingham, *Bubbles*; 1l. prizes, Miss Armstrong, 5, Clifton-terrace, Monkstown, Dublin, "*Now I lay me*;" Rev. E. T. Clark, Brunswick-road, Gloucester, *Kittens*; T. G. Clarke, 2, The Yews, Llandaff, *North Doorway, Llandaff Cathedral*; Michael Dillon, 23, Ernest-street, Crewe, *Saxon Crosses, Sandbach*; Miss Donaldson, 80, Wellesley-road, Croydon, *Matins*; P. Figuera, Thundersley, near Hadleigh, *View of Funchal, Madeira*; H. Foyn, Burleigh House, Penmaenmawr, *From Italy and The Carriage Drive*; A. S. Green, Inglecroft, Mansfield-road, Reading, *Radiogram of Man's Hand*; R. S. Harding, Knypersley, Congleton, *Summer Time*; A. E. Horne, Queenstown, Co. Cork, *Figure-head of H.M.S. Black Prince*; M. C. Howie, 49, Arbour-street, Southport, *Resting*; A. Hunter, jun., Photographer, Beith, Ayrshire, *Portrait Study*; T. E. Innes, Photographer, Wellington-road, Heaton Chapel, *Dogs Shaking Hands*; C. F. Inston, 25, South John-street, Liverpool, *A Friendly Gossip*; J. McCleery, 20, Beaufort, Stranmillis-road, Belfast, *Crossing the Line*; W. H. Rich, Browning-road, Little Ilford, Essex, *Child Paddling*; J. Thomas, Holly Hall, near Dudley, *In the Hayfield*; W. Vick, Photographer, Muswell Hill, N., *My Little Greenhouse*; J. W. Wharton, Willesden-lane, Kilburn, N.W., *In Conference*; W. D. White, Leam-terrace East, Leamington, *Tea with Granny*.

## Patent News.

The following applications for Patents were made between August 7 and August 11, 1900:—

**PRINTING MACHINE.**—No. 14,223. "New or Improved Photographic Printing Machine." W. R. BARBER.

**ANIMATED PHOTOGRAPHS.**—No. 14,372. "Improvements in Apparatus for Projecting Animated Photographs." R. W. PAUL.

**COLOUR PRINTING.**—No. 14,427. "Improvements in or connected with the Reproduction of Coloured Pictures or Paintings by a Printing Process." Complete specification. E. TABOURET and C. GARNIER.

## Meetings of Societies.

### MEETINGS OF SOCIETIES FOR NEXT WEEK.

August.	Name of Society.	Subject.
28.....	Hackney .....	Photographic Suggestions. W. Rawlings.

### LONDON AND PROVINCIAL PHOTOGRAPHIC ASSOCIATION.

AUGUST 16,—Mr. A. Haddon in the chair.

Mr. DRAGE inquired whether members present adhered to the time-honoured rule of dusting plates before placing them in the slides. He thought that, considering the elaborate precautions observed by manufacturers to avoid dust, it was altogether unnecessary, and the effect was more often to produce dust than to remove it.

Mr. TEAPE thought much depended on the way the plates were packed. When two plates were folded over with the film unbroken, dust was less cur than when paper was placed between them.

Mr. HENDERSON had always been accustomed to dust his plates, but had recently omitted to do so, and had noticed no difference in results. Respecting packing of the plates, he was surprised that makers still adhered to the custom of separating them by slips of cardboard. A much more suitable material was tinfoil, which he had proved had no effect whatever on the film even after contact for a very lengthy time. On the other hand, the card was a frequent cause of fog. Mr. Henderson passed round some negatives produced on plates which were chemically fogged, and, by means of the cyanide restrainer mentioned by him at the previous meeting, had succeeded in obtaining excellent printing negatives. The comparison between the plate so treated and one which had been developed in the usual way was most striking.

Mr. TEAPE produced a box containing two half-plates, both of which some days previously he had seen Mr. Henderson expose to strong sunlight for two minutes. These two plates were removed by the Chairman from the box, and in full gaslight immersed in a developer by Mr. Henderson, who succeeded in obtaining two negatives, neither of which showed the slightest trace of fog. No particulars were given by Mr. Henderson as to his procedure, or as to what treatment the plates had received prior to exposure; but he promised at a later date to give full details of the method, his idea being, first of all, to hear what other photographers had to say about the matter.

The subject of rapid development was introduced by Mr. HENDERSON, and of which he gave a practical demonstration. A plate exposed behind a Warnerke sensitometer was developed to full density in a space of five seconds. The negative possessed excellent gradation and gave a reading of fifteen. The formula by means of which this result was obtained was as follows:—

No. 1.	
Hydroquinone .....	20 grains.
Metol .....	20 "
Adurol .....	40 "
Sodium sulphite .....	480 "
Water .....	8 ounces.
No. 2.	
Potassium bromide .....	10 grains.
Sodium hydrate .....	120 "
Water .....	8 ounces.

Equal parts to be used.

Mr. Henderson did not recommend the method for ordinary development, but thought it would be exceedingly useful where a large number of negatives of the same subject had to be produced for commercial purposes.

Mr. BULLEN introduced to members Mr. H. V. Lawes, an Australian photographer at present paying a visit to this country.

Mr. LAWES gave an interesting account of photographic society life in Australia, and, in concluding, mentioned that he hoped to be able to take back with him some slides and pictures by English workers in order that he might show some of the Australian societies what was being done in the old country at the present time. He appealed to those present to help him in this object, and stated that Messrs. Wellington & Ward had kindly offered to receive and pack all prints, slides, &c, sent them for this purpose.

### PHOTOGRAPHIC CLUB.

AUGUST 15,—Mr. H. Snowden Ward in the chair.

Mr. GEORGE E. BROWN showed a print on Pan paper, made by Liesegang, of Düsseldorf, and explained that this was a paper after the style of Gravura and Velox, which requires about twenty seconds' exposure by daylight. The paper is then developed, and it is possible to obtain black, green, olive, brown, red, or yellow tones by modifying the strength of the developer. A modification in the exposure to light will also have an influence on the resulting colour of the print, shorter exposures and stronger developers having both a tendency to give a range of darker tones, and *vice versa*.

Mr. FOXLEE, having examined the print shown, said it reminded him of the results obtained by the early chloride paper in 1886.

Mr. SNOWDEN WARD asked what was the opinion of the meeting on the keeping qualities of isochromatic plates, adding that his own experience had been very good.

Mr. MACKIE said that his experience had been somewhat varied. In one case he had found isochromatic plates which had been kept in slides for one whole winter, and then in a box for about two years, absolutely perfect, whilst in other cases plates which were kept for a much shorter time and under more favourable conditions were fogged.

Mr. FOXLEE had found plates—ordinary plates in this case—which had been made in 1886 quite good about eighteen months ago, and this despite the fact that they were packed with white blotting-paper between them, a method which is not now considered a good one. He believed that the secret of this success was that the plates as well as the packing paper and the boxes had been thoroughly dried before packing.

Mr. MACKIE said he had tried the new form of kachin developer, but he found that, when using carbonate of potash as an alkali, the plates developed very slowly.

Mr. FOXLEE had tried the same developer, made up according to the formula recommended by the makers, and he had found it to work very satisfactorily.

**North Middlesex Photographic Society.**—August 13, Mr. W. Taylor in the chair.—Mr. COX showed a photograph of four figures; the felt hat of one appeared transparent, the collar part of shirt-front and face of the man behind showing through it. One member suggested that, if the man had bent down his head towards the end of the exposure, it might account for the phenomenon. Mr. RAWKINS showed an ozotype print on fine-surfaced collotype paper, which appeared to prevent the spreading of the image noticeable in some prints. It was quite sharp. Mr. BEADLE said that he had succeeded in getting rid of the gloss on carbon prints by immersing in methylated spirit after the alum bath. Mr. CHILD BAYLEY gave a formula for kachin with sodium carbonate. To make 1 ounce of developer, take 40 minims of a ten per cent. solution of kachin, and, instead of water, make up to 1 ounce with equal quantities of ten per cent. solutions of sodium carbonate and sodium sulphite; no bromide is necessary.

## FORTHCOMING EXHIBITIONS.

1900.

- Sept. 21–Nov. 3 ..... Photographic Salon, Dudley Gallery, Piccadilly. Hon. Secretary, R. W. Craigie, Camera Club, Charing Cross-road, W.C.
- October 1–Nov. 3 ... Royal Photographic Society, New Gallery, Regent-street. The Hon. Secretary, 66, Russell-square, W.C.
- November 7–10 ..... Cripplegate Photographic Society and the Essex and Middlesex Cycling Union, Ltd. The Hon. Secretaries, A. T. Ward, Cripplegate Institute, E.C., and G. F. Sharp, Sach-road, Upper Clapton, N.E.
- „ 12–17 ..... Ashton-under-Lyne.
- „ 21–23 ..... Hackney Photographic Society.
- „ 22–24 ..... Hove Camera Club. Hon. Secretary, C. Ber-  
rington-Stoner, 24, Holland-road, Hove.

1901.

- January 14–19 ..... Blairgowrie and District Photographic Association. The Hon. Secretaries, Blairgowrie, N.B.

Those who desire to send photographs to the above Exhibitions should write for prospectuses to the Hon. Secretaries, whose addresses are given in the second column above. The dates mentioned are those at which the Exhibitions open.

## Correspondence.

\* \* \* Correspondents should never write on both sides of the paper. No notice is taken of communications unless the names and addresses of the writers are given.

\* \* \* We do not undertake responsibility for the opinions expressed by our correspondents.

## A CORRECTION.

To the EDITORS.

GENTLEMEN,—In your report of the proceedings of the L. and P.P.A., p. 527, a slight but important error has crept in, viz., the experiment in connexion with the removal of the stain in a negative should read cyanide of potassium, not ferricyanide.—I am, yours, &c.,  
Westmoor, Brimsdown, Middlesex. A. L. HENDERSON.

## LICENCES FOR STILLS.

To the EDITORS.

GENTLEMEN,—I noticed in to-day's JOURNAL an answer to J. O'Connell about a licence for a still. No licence is required if you get—as I did—a permission from the Inland Revenue authorities to use it. I applied for permission to use a still for the purpose of distilling water for photographic purposes, and got a letter from the Supervisor in this district to tell me that the Board of Inland Revenue had given me the leave I asked for.—I am, yours, &c.,  
Westward Ho! Bideford, August 17, 1900. J. E. GUBBINS, Lt.-Col.

## THE PURIFICATION OF ACETYLENE.

To the EDITORS.

GENTLEMEN,—I have had my attention called to an article on the purification of acetylene published in your issue of the 3rd inst. As this is likely to give a false impression, I shall be glad if you will allow me to make a few remarks. As a practical expert of nearly five years' standing, I question the statement that "no sooner does one process get published than it is written down by the upholders of another," and, being intimately acquainted with most of those in the trade of any standing, I think I have fair opportunities of knowing. Acetylene firms are only too glad to welcome any effective system of purification, which has from a very early stage been recognised as absolutely necessary; in fact, the number of materials used have been legion, beginning with those used in coal-gas purification and culminating with a very elaborate system of scrubbing. At the present time there are at least four useful and reliable materials or systems, three of which are generally known, but the fourth, though perhaps the most valuable, is not so familiar. The first is chloride of lime, either pure or mixed with some other material or chemical; but this has one great drawback, viz., the tendency to spontaneous combustion owing to the presence of free chlorine produced through the action of hydrogen; the need of frequent stirring to change the surface is another objection; but, with all its drawbacks, a considerable amount of success has attended its adoption, provided certain provisions are made to enable it to work under the proper conditions.

2. There is not a shadow of doubt that Dr. Frank's system does purify the gas, but one must candidly admit that the material cannot be renewed except by an expert or experienced mechanic.

3. Ullman's process is claimed in Germany to be the best yet introduced, and is, I believe, more generally used for large installations; but this, like Frank's, is not so easy to adopt for small plants. In fact, neither maker quotes for such.

4. The fourth material, puratylene, manufactured by the Gold and Silver Company, is also of German origin. It possesses the great advantage that no special case or holder is required, and, as it contains no free acid, an ordinary tin vessel is sufficient for the purpose; and, further, it is available for use even with the portable lantern generator. I do not say that some arrangement for condensation and arresting the fine solid particles is not an improvement, but it is not absolutely necessary. Some time ago I had this material submitted to me for test, and was more than pleased with the results, which I consider to be far in advance of anything hitherto accomplished in the matter of purification. I enclose the detailed report, which, after a careful test, I was able to submit to Mr. Bingham, the English agent, and trust the same may be of some service to your readers, especially those who use it for photography. Thanking you, and apologising for taking up so much of your space, I am, yours, &c.,  
R. J. Moss.

Birmingham, August 18, 1900.

[The report to which Mr. Moss refers is appended.—EDS.]

[COPY.]

C. Bingham, Esq., London.

Birmingham, June 14, 1900.

DEAR SIR,

I have submitted the sample of puratylene to very careful tests under various conditions, and with the worst quality of carbide obtainable. I find that, in a trial extending over two months, aggregate of burners 35, pressure purposely varied from 2½ to 5½ inches, your claims are fully borne out. There has been no trace of haze, fumes, or smell, and not one of the burners has given trouble. Burners include the following:—

1 Schwartz No. 3, used for about 500 hours in a dark office.

1 Falk-Stadelmann, all steatite, No. 2, about 150 hours.

1 Schwartz No. 4, 100 hours.

1 Phos No. 2, 150 hours.

1 Phos No. 00, 40 hours.

1 Phos No. 4, about 100 hours.

1 Rat-tail, 4 litre burner, 50 hours.

2 Bray's 00000 Union, 40 hours.

4 Bray's 00000 Union, lantern work, about 30 hours.

20 Bray's 00000 and 0000, in studio, probably about 10 hours.

1 Phos No. 3, for retouching in studio, about 100 to 150 hours.

The last-mentioned has given somewhat striking evidence. The young lady had been obliged to give up an appointment because the fumes from acetylene (which they were obliged to use) caused her continuous and violent headache. She was, however, assured that nothing of this need be feared with the purifier, and consented to give it a trial, with the result that she now works regularly and for long periods without any trace of her former complaint. Without being too confident, I must say that so far it certainly overcomes the drawbacks and objections hitherto existing.

Yours faithfully,  
R. J. Moss.

[Signed]

## PAINTING BACKGROUNDS.

To the EDITORS.

GENTLEMEN,—I have seen in your JOURNAL lately some inquiries as to the mode of painting backgrounds, and have been induced to search for a receipt which I used successfully years ago for one. Here it is from the *Photographic News* of 1861, in the shape of a letter to the editor of the time. Perhaps it may be useful to some of your readers, or for your ALMANAC for the new year. I used it myself soon after seeing it, and can personally vouch for it, but you will find another letter in the same volume at a later date from another correspondent who had tried it with success. I will only add that the precise tint will, of course, depend on the proportion in which the colouring matters are used, and that an artist could easily vary them so as to produce landscapes, &c.

Letter from Thomas Gulliver to Editor of the *Photographic News*. Dated Heathfield Street, Swansea:—

"Your correspondent, W. H. H. may make a background that may be rolled on a roller easily, and unrolled without creasing, thus: Stretch a piece of calico sheeting, seven feet long, on a frame, or tack it to a wall, then size it over with thin glue size. When quite dry paint it with soap flattening made as follows:—Have some lamp black, white lead, and Venetian red ground up in as little oil as possible, mix this with turpentine till it is a dark mouse colour; then shave one ounce of common yellow soap in six ounces of boiling water, and stir till it is dissolved, then add it while boiling to one and a half pounds of the paint, mix it quickly, and when cold paint over the calico, and, if necessary, give it another coat when the first is dry. When dry, the background can be rolled or folded without creasing."—I am, yours, &c.,  
J. F. T.

August 20, 1900.

## Answers to Correspondents.

\* \* \* All matters intended for the text portion of this JOURNAL, including queries, must be addressed to "THE EDITORS, THE BRITISH JOURNAL OF PHOTOGRAPHY," 24 Wellington-street Strand, London, W.C. Inattention to this ensures delay.

\* \* \* Correspondents are informed that we cannot undertake to answer communications through the post. Questions are not answered unless the names and addresses of the writers are given.

\* \* \* Communications relating to Advertisements and general business affairs should be addressed to Messrs. HENRY GREENWOOD & Co., 24, Wellington-street, Strand, London, W.C.

### PHOTOGRAPH REGISTERED:—

Oscillating Frame Cowl Company, Limited, 17, Market-place, Great Grimsby.—  
Photograph of smoke cowl.

H. WYATT.—You appear to be in need of an elementary book on the lantern. That by Dr. Manton, published by Messrs. Hiffe, of 3, St. Bride-street, price 6d., should meet your case.

LENS.—D. CONWAY. The diagram shows that the lens is one of the old orthographic or orthoscopic lenses. This form, though a good one for some purposes, has been obsolete for many years now. It has little or no commercial value, except perhaps for a museum.

PLUSH FRAMES AND BEVELLED GLASSES FOR OPALINES.—PROVINCIAL asks where these are to be had at professionals' prices.—All the requisites for opalines are to be had at any of the large dealers', such as Marion's, Houghton's, and the like. We cannot tell the price per dozen of the whole-plate size. Better write for price-lists.

ADDRESS WANTED.—J. B. writes: "Can you oblige me with the address of a firm who work for the trade who make *clichés* in relief for printing in phototype?"—In reply: We presume our correspondent means half-tone blocks. Let him address Messrs. Morgan & Kidd, Richmond, S.W., or other firms who advertise in our outer pages from time to time.

REMOVING SILVER STAINS FROM NEGATIVES.—W. G. writes: "Can you tell me of an efficient way of getting silver stains from negatives which have got wet during printing?"—These are not easily removable, and in some cases they cannot be removed at all. Try treating the negatives with a dilute solution of cyanide of potassium. If that fails, try King's solution, obtainable at Marion & Co.'s, Soho-square.

MATT VARNISH.—C. MARTIN complains that the matt varnish he has made according to the formula in the ALMANAC gives a very coarse grain, almost a reticulation. He wants to know how to make a matt varnish with a very fine grain like ground glass. The reason for the coarseness of the grain is that too large a proportion of benzole has been used. The less benzole the finer is the grain, and *vice versa*.

HUNT'S "RESEARCHES ON LIGHT."—A. REES asks where Hunt's *Researches on Light* is to be obtained, and the price. The work in question has been out of print for forty years or more. The only chance of getting a copy now is at some second-hand book-shop or by advertisement. The work is very scarce, though it may occasionally be picked up at a bookstall for a few shillings.

ROTARY PRINTING MACHINES.—H. C. writes: "Could you inform me where the machines are to be had, such as the Rotary Photographic Company use for turning out large numbers of small photographs for cigarette boxes, fancy goods, &c., as I have a customer who wishes to buy one?"—In reply: We believe the machines are patented articles, and cannot say if they are commercially obtainable. Possibly the Rotary Company, of 23, Moorfields, E.C., will inform our correspondent.

COPYRIGHT IN THE NATIONAL PICTURES.—LANTERNIST writes: "I want to make some lantern slides of some of the pictures in the National Gallery. Of course there is no copyright in them. And I assume I am at liberty to copy, for slides, any of the photographs of them that are published."—Oh, no. Although there may be no copyright in the pictures themselves, there is in the reproductions from them, and you must not pirate them. If you want copies, you must make them from the originals and not copy other people's work.

A QUESTION OF COMPETENCY.—A. L. says: "Messrs. — made an engagement with me for the season, ending November 1, and they have, after I have been with them three weeks, given me a week's notice to leave, because they say my work is not good enough for them. I gave them a reference to Mr. —, and showed them specimens of my work. Can I come down upon them for my salary up to November 1?"—If your work has, during the three weeks, been equal to the specimens you showed, we should surmise you could; but, if your work, on the average, has not been equal to them, the matter is doubtful. Any how, it is a question for the County Court.

SPOTS ON PRINTS.—A. A. C. writes: "We will be much obliged if you can help us to explain the spots on the enclosed photograph. We may say our customer condemns the mounts, but we are inclined to think that there is some other cause, as the mounts are by one of the best makers, and we have not found enamel mounts to cause spots before, except for another complaint just being investigated."—So far as we can judge by merely looking at the print, we are inclined to the opinion that it was imperfectly fixed in the first instance. Read leading article in our issue for August 10. If the mounts are suspected, why not test them? It is a very simple matter, and the method of doing so has frequently been described in the JOURNAL and in the ALMANACS.

REVERSING-MIRROR TROUBLE.—W. C. CLARE asks: "Will you please tell me the cause of the unsharpness in the enclosed photographs? They were taken with a reversing mirror, for single-transfer carbon work. The mirror is a piece of thick plate glass, which I silvered according to the method given in the ALMANAC, and the surface is perfectly bright and free from blemishes."—The cause is that the surface is not optically plane. Ordinary plate glass is of no use for a reversing mirror. It must be "optically" worked, so as to obtain an absolutely plane surface.

RENDERING PRINTS TRANSPARENT.—TAPU writes: "1. Can you kindly inform me of the best method to render prints transparent. 2. Also to secure permanency after being coloured in oils."—1. A great deal depends upon the process by which the prints are made. The best way to render albumen prints transparent is to soak them in castor oil or in melted paraffin. Bromide prints can be treated in the same way. Gelatine prints are more difficult to make transparent, on account of the baryta coating on the paper. 2. Thoroughly fix and wash the prints in the first instance, and no other treatment is required. Colouring in oils will aid to permanency rather than otherwise.

TONING SYSTEM.—PRINTER writes: "I came here as printer and toner at 30s. a week, P.O.P. being used. I have always been used to the combined bath, with which I can get very excellent tones; but the governor will not have that used, and will have the sulphocyanide bath; and, because I do not get good tones with that, he says I must leave in a week, though I was engaged for three months. Has he any right to dictate how the prints should be toned so long as they are good?"—Certainly he has. He, doubtless, considers the permanence of his pictures as well as their appearance. You should be able to get as good results by one system as with the other.

REMBRANDT EFFECTS.—REMBRANDT writes: "Could you kindly give me any information how to get Rembrandt effects in an ordinary studio without the use of blinds or reflectors? I have seen photographs of busts taken with strong light on the side of face and top of the head without the use of blinds, but I have always failed to get the top of head lighted. At what angle should I place the sitter?"—All must necessarily depend upon the studio. Most studios are fitted with blinds, and these are used according to requirements, whether "Rembrandt" or other effects are desired. It is possible that you may be able to place the sitter in such a position in the studio as to obtain "Rembrandt" portraits without using the blinds. But without seeing the studio we cannot, of course, tell you how.

PHOTOGRAPHY IN PARIS.—A. B. writes: "I should be greatly obliged if (1) you could favour me with the name of the best French photographic paper, and address of office—the one that holds the same position in the French photographic world as your JOURNAL does in the English. My object is to advertise for a berth in a Paris firm. 2. Would some kind reader of the JOURNAL who is acquainted with the photographic firms of Paris be so good as to communicate with A. B., 45, Broadway, Kettering, Northants, who would like to obtain a berth with a Paris firm, and would be very thankful for a few hints as regards the French photographers' methods of work."—In reply: 1. The *Moniteur de Photographie*, published at 55, Quai des Grands Augustins, Paris. 2. Will some French reader oblige our correspondent?

STAMPING AN AGREEMENT; PARTNERSHIP.—ORION writes: "1. We have taken over a studio and accessories from the late owner for a certain price, payable quarterly. An agreement has been drawn up, fully signed by him in the presence of two witnesses. Is that agreement legal or binding without being stamped? 2. I wish to dissolve partnership. Kindly give me the necessary information to dissolve; or can I do so whether the other partner is willing or not; partnership has been a decided loss to both. The other partner has had his share of the takings and a great part of mine, and I have also lent him money. Can I claim the accessories here to repay same, although they won't reach one-half due?"—1. The agreement should certainly be stamped; all agreements of that kind should be. 2. The deed of partnership will contain the terms upon which the partnership can be dissolved; read that or consult a solicitor. That is the best procedure in the case of a dissolution of partnership if you cannot come to a mutual arrangement between yourselves.

THE METRIC SYSTEM.—COL. GUBBINS writes: "On page 1029 of the ALMANAC for this year there is a formula for adurol developer, but it is put in grammes and grains, and by no means can I contrive to get the two to be in the same proportion. Adurol as 8:1, 1½ ounces, is not not 8 times 85 grains. What is the value of 100 c. c. expressed in fluid ounces on pages 990 and 991 of the ALMANAC, &c.? The c. c. is given with reference to a cubic inch. Not having a measure graduated on the metric system, I cannot make up solutions from these formulæ."—The formula is given both according to the metric and the English systems. By both systems the proportions are the same. There is no mention of adurol as eight to one. On page 548-9 of the ALMANAC there is a table of French weights and measures and their equivalents in English, from which you will see that 100 c. c. are equal to 3 ounces, 4 drachms, 9 minims. Measures graduated according to both the metric and the English systems can be had of any of the dealers who supply chemical apparatus, such as Griffin & Sons. With these the same measure will serve for both systems.

\* \* \* In consequence of our absence from town, many answers to correspondents and other communications are unavoidably held over.

### EX CATHEDRA.

THE Twentieth Annual Convention of the Photographers' Association of America, which was held last month, at Milwaukee, under the presidency of Mr. S. L. Stein, attracted the very large attendance of over eight hundred professionals, manufacturers, and dealers. A welcome by the Mayor; a Presidential address; papers; a competitive exhibition; excursions and entertainments, formed the chief items of the programme. The official report monopolises nearly the whole of the August numbers of several of our American contemporaries. Twenty-seven medals and diplomas were distributed amongst professional competitors in portrait and other classes, and there was a well-supported exhibition of apparatus and materials, no less than sixty-five firms contributing to it. A selection from the competitive portraiture is reproduced in the *Professional Photographer*. We should say that the work shown at Milwaukee falls behind that sent to preceding American Conventions. Professor A. H. Griffith, as usual, delivered several addresses, and we reproduce one of them in another

part of the JOURNAL. British, as well as American, photography may profit by the well-meant advice to make a special study of every sitter.

THE Thornton Film Company, Limited, of Altrincham, Cheshire, send us a prospectus and price-list of "Dayroll," the new negative film, which is to be supplied in the cut form for slides, and in the spool form for roll-holders and daylight loading cameras. From the prospectus we abridge the following statement of the special characteristics of the new film: "It is flexible, tough, unbreakable, and unflammable; it does not curl up in developing, washing, or drying, and can be retouched on either side, or varnished if desired. It can be printed from either side, thus saving the trouble of double transfer or reversing. It will keep just as long as any sensitive glass dry plate. It is as easy to use as a glass plate, and several negatives can be developed together in the same dish. Smaller sizes may be cut from large sheets with a knife or pair of scissors. The film consists of a film of pure gelatine rendered insoluble and coated with a very rapid emulsion, the whole being supported upon a backing of transparent paper. It is developed, fixed, &c., exactly like a dry plate, and, as the paper support and film is transparent, it is just as easy to judge the density of the negative, and also whether it is properly fixed, in the light or the dark room, as with a glass plate. After washing and passing through the usual glycerine bath, the film is merely hung up to dry (like a print). When it is absolutely dry, the transparent paper backing can be easily removed by merely pulling it away, leaving a perfectly flat, flexible, and transparent negative. There is no frilling in the solutions; no trouble in stripping; the film will not come off the transparent paper during any of the operations until purposely pulled off, and then it never fails to come off easily when required." Of course, time and experience must decide whether these claims are well founded. Should they prove to be so, the Thornton Film Company will have made a valuable addition to the resources of film photography.

\* \* \*

THIS week the Jubilee of the submarine electric cable between England and France has been celebrated, and our

contemporary, the *Daily Telegraph*, printed an interesting article on the subject. The writer tells us that the little fore-runner of the present system of nearly 200,000 miles of wire began modestly enough. A project was formed to lay a line about twenty-four miles long, from Dover to Cape Grisnez. The distance is somewhat less, but a margin had to be allowed for various contingencies. In 1846 Mr. Jacob Brett obtained from King Louis-Phillippe the sole right for landing cables from England in France, but the political troubles which followed, culminating in the flight of that monarch, interrupted the scheme. Still, it was regarded with a friendly eye both by Lamartine's Government and by Louis Napoleon, who stipulated that "the experiment should be satisfactorily proved" by September 1, 1850. On the final confirmation of the concession, a little syndicate was formed, with a capital of only 2000*l.*, the names of the adventurers, using the word in its honourable sense, being Mr. Charlton J. Wollaston (the engineer of the undertaking), Mr. (afterwards Sir) Charles Fox, Mr. Francis Edwards, and Mr. John W. Brett. Three of the four were under thirty years of age. Three of the four are now, alas! with the majority, but the survivor, Mr. Wollaston, who is verging on his eightieth year, looks out, hale and vigorous, from his little suburban villa on a huge and ever-growing institution which must transcend the wildest dreams of his pioneering days. Tall and erect, he has in his whole aspect something of that intellectual keenness which characterised the late Mr. Gladstone, and his bearing has the same suggestion of exceptional vital energy. Such is the man who tells the story of the first submarine cable. To photographers, interest in the personality of Mr. Wollaston will lie in the fact that he is not only one of themselves, but is also, we believe, the inventor of the diaphragmatic shutter, bearing his name, that was brought out some fourteen or fifteen years ago.

\* \* \*

FROM the editorial notices of our contemporary, *Wilson's Photographic Magazine*, we cull the following paragraph: "The G. Cramer Dry Plate Company, of St. Louis, announces that hereafter all Cramer plates will be protected with a label on the bottom of each box, giving the time within which the plates must be used if the best results are desired. Their intention in this desirable innovation is to protect users of Cramer plates against old or stale goods, and consumers are warned not to accept *Crown* or *Banner* brands prior to emulsion No. 13,180, or *Isochromatic* prior to emulsion No. 3916." Our *confrère* says that he is "emphatically of opinion that this is a step in the right direction." We are left in the dark as to the time limit adopted by Messrs. Cramer, and we should also like to know their reasons for taking a step in which we doubt if they will be followed by any English plate-makers. The articles and letters that we published some months ago on the subject of the keeping qualities of dry plates pointed to the conclusion that it is a difficult thing to set a time limit beyond which plates other than those of extreme rapidity do not deteriorate. Twelve, fourteen, and even sixteen years have been proved to make no material difference to the good negative-giving qualities of English-prepared plates. At one time within our recollection plate-users often asked for the specification of a time limit on the packing boxes of plates, but nowadays we hear nothing of such requests. Messrs. Cramer are plate-makers of large and long experience, so that their reasons for the adoption of a time limit can hardly rest on insubstantial grounds. We are curious to know them.

THE same number of *Wilson* also contains the following advertisement:—"Bureau of Art Criticism. Photographers desiring art criticism upon their work—constructive criticism, covering the artistic qualities of the photograph, composition, lines, arrangement, and light and shade—by an art teacher familiar with painting, photography, and other methods of artistic expression, can obtain same at a nominal cost. Especially valuable to those striving after pictorial effects and those preparing work for exhibitions. The work is suggested and indorsed by the editor of this magazine as a practical help for all progressive photographers. Terms, invariably in advance—25 cents for criticism of single prints. Six criticisms for \$1.00. All prints returned within twelve days after receipt. Send prints, charge prepaid, with sufficient, in addition to fee, to cover return charges, to A. Guvera Marshall, 388, Dean-street, Brooklyn, N.Y." A shilling per criticism, or half a dozen for four times that amount is not dear—provided that the critic is properly qualified for his somewhat delicate office. If we mistake not, we have come across Mr. Marshall's name appended to articles on art topics that have appeared from time to time in the American photographic journals, and the phraseology of his advertisement seems to indicate that he understands his subject. Without going so far as to say that it would meet a long-felt want, we have no doubt that a bureau of art criticism for the benefit of English photographers would be an interesting experiment to try, although, having regard to the many and conflicting ideas that exist on the subject of pictorial photography, it would not be easy to fix on a critic whose dicta would be assured of acceptance all round. Still, here is the idea, and we commend it to those most concerned.

#### THE OZOTYPE PROCESS.

It is now nearly two years since the earliest examples of the Ozotype process of Mr. Thomas Manly were first publicly shown. When they were, there was considerable speculation in the photographic world as to how they were produced. The only particulars given at the time were that they were "examples of carbon printing without actinometer, transfer, or safe-edge, and in which the pigmented gelatine did not come in contact with the chromic salt." At that time there was but one process of carbon printing that answered this description, and that was not generally known amongst any but the oldest photographers, and even by many of them it had become quite forgotten. We allude to the process of M. Marlon, which he named "Mariotype by contact." That process is this:

Instead of sensitising the carbon tissue, M. Marlon took slightly gelatinised paper, and sensitised it by floating it on a solution of bichromate of potash to which a little sulphuric acid had been added. It was then allowed to dry and was ready for printing. While printing, the picture could be watched as with silver printing, the image being brown on a yellow ground. When sufficiently printed, a piece of ordinary carbon-tissue was immersed in a dilute solution of bichromate of potash with the already printed picture; they were then removed in contact and squeegeed together. In this state they were put away, under slight pressure, for some hours in a still moist condition, when the insolubilising effect set up by the action of light was continued in the unexposed tissue. After the lapse of the necessary time the image was developed on the paper that had received the exposure in the manner of ordinary carbon printing. M. Marlon's paper, which he read

efore the Photographic Society, now the Royal, will be found on p. 242 of our volume of 1873. Now, it will be seen that Mariotype does not entail the use of an actinometer; there is no transfer, there is no safe-edge required, and the picture is not reversed. Therefore it is not surprising, when the Ozotype examples were first shown, that it was surmised they might be modifications of the Mariotype process. The actual manipulation of the two processes is almost identical. It is in their chemical aspects that they differ.

In the Ozotype process the gelatined paper is sensitised with a solution of bichromate of potash containing a manganese salt. In a paper that Mr. Manly read before the Royal Photographic Society he thus explains what takes place. He said that the paper is coated with a solution of a bichromate salt and a manganese salt, and by the action of light the eliminated oxygen entered and decomposed the molecules of the manganese salt, producing an image in the sesquioxide or manganic oxide, the active oxygen being thus locked up for future use (see p. 222 of our volume of last year). The necessary materials for working the process have recently been put upon the market, so that every one now has the opportunity of trying it.

The Ozotype Company have been good enough to send us a bottle of the patent sensitising solution, some of the "pigmented plaster," also some paper ready-sensitised for trial together with a little booklet of instructions for using them. In this we read that it has been decided not to sell the coated paper for the present, but full directions are given for its preparation. They are these: Any good paper, according to taste, is coated with a two-and-a-half per cent. solution of gelatine by brushing, and allowed to dry. It is then coated with the patent sensitising solution, also by brushing, and again allowed to dry. It is then ready for printing. The paper when sensitised, we are told, will keep for three or four months. We used the sensitive paper we received in our trials, as we have as yet had no time to prepare any for ourselves. The paper is of the usual colour of bichromated papers, and takes the usual brown colour when printing. On trial we fancy it was rather slower in printing than ordinary carbon tissue; but it must be printed deep enough for the details to be fully seen in the high lights. The print is then washed, to remove all soluble bichromate, and dried. In this state it is said to keep indefinitely. The next operation is to apply the pigment plaster. This is done by immersing it in a dilute solution of acetic acid, hydroquinone, sulphate of iron, in water, at a temperature of 70° F. for a minute or so, and then introducing the dried print, and afterwards squeezing the two together and allowing them to dry.

In our issue for April 21, last year, in commenting on the want of sharpness some experimentalists with the process had found when using the ordinary carbon tissue, we suggested that probably a more highly pigmented tissue than that would be found more suitable for Ozotype. We notice that the plaster sent us is considerably more highly pigmented than the usual carbon tissue, also that the gelatine is of a more soluble character.

The temperature of the acetic solution seems to be of importance, for in our first trials that we employed was not above 60°, and, as the prints, as we afterwards found, were under-exposed, very much of the image washed away in the lighter portions. In our later experiments, with fuller exposure and the temperature of the solution at seventy

degrees, they did not. When the picture is to be developed, it is first soaked in cold water for half an hour or so, and then put into water at a temperature of 105° to 107° F. In a minute or so the plaster can be stripped off, and the superfluous pigment washed away by laving the water over it as in ordinary carbon printing. We noticed, while working, that the image was of a more tender nature, and would not bear the same rough usage as carbon pictures will in their development. In our hands the prints developed in less time than fully exposed carbon prints would have done. When developed, the prints should be alumed like carbon pictures. Using the materials we did, we got, after the first essay, some very good results. It will be seen that the operations involved are about the same as those in carbon printing by the double-transfer method, and more than those in the single-transfer method. With the latter, however, unless we have a reversed negative, or prints from a thin-film one, we get, as regards right and left, a reversed picture, while with the Ozotype process we do not. One of the advantages of the Ozotype process is that, in printing, the image is a visible one, whereas in the ordinary carbon process, unless we use an actinometer of some sort, we have no more to guide us as to the right exposure than we have in the exposure of our dry plates or bromide papers.

If we might throw out a suggestion to the Ozotype Company, it would be that they should, as the papers keep so well, supply some papers ready-sensitised. If this were done, we imagine it would aid in popularising the process. Amateurs, as a rule, like to obtain their pictures with as little trouble as possible, and the gelatining and sensitising are two distinct operations, and these may tend to deter some from trying the process on account of the trouble involved. Moreover, in preparing the paper on a commercial scale, with suitable appliances, it can be done more uniformly than a novice could possibly do it on a small scale by applying the materials with a brush.

---

**Hardening and Preservation of Wood.**—The Hasselmann method of preserving wood now being introduced by the Xylonite Company has a double interest to photographers in that wood treated by it becomes far less inflammable, and nonliable to alter under the effect of moisture, and, further, is not liable to shrink or warp. Painful experience has taught most of us that cameras made of the very best seasoned wood will become stiff and the dark slides unusable if they are kept any length of time in a damp atmosphere, while many a cracked or broken negative is traceable to warping of the wood through this or other causes. Hence a mode of treatment which for carpenters' work would render wood practically uninflammable in case of fire, and make our cameras, dark slides, printing frames, &c., indifferent to summer sun or winter humidity, would be valuable indeed. Yet this is virtually what is promised us under this process, though the chief stress of the claims made for it is in the direction of woods for what may be termed rougher work. Thus the Bavarian Government are using it largely for their railways, for their sleepers and telegraph poles; up to the year 1905 these are all to be treated by the Hasselmann process, and the Swedish State authorities have already ordered more than half a million sleepers to be Hasselmannised. Obviously, if these larger pieces of wood can be preserved, smaller ones would be equally amenable to similar treatment. This is simple enough in action. The first thing is to dry the wood; this is done by extracting the moisture by a huge air pump, and perfectly green wood may be used at this stage. The pores are then freed from sap and left in what might be termed a spongy state. They are then kept in their air-tight receptacle, and a solution of mineral and metallic salts let into it. The liquid is rapidly taken up by virtue of the same action, which in the old experiment filled

up with mercury the pores of a piece of cane tied down under mercury and placed in the exhausted receiver of an air pump. The action is further accelerated and intensified by steam pressure at a temperature of about 130°. The dissolved salts are sulphate of copper and iron, with aluminium, magnesium, and potassium. Besides conferring the properties already mentioned, it is stated that soft woods under the process become quite hard and capable of receiving a high polish, so that altogether wood so changed would seem to have promise of a very brilliant future before it if no concurrent drawbacks be found to exist. It would seem to be a reasonable expectation that a studio whose wood fittings were of wood impregnated this way should appeal to the fire-insurance authorities, as the ready inflammability of studios is one cause of the high premiums insisted upon by them, even though the danger of fire through collodion accidents is now virtually eliminated, though we have been credibly informed that it is the black sheep of the profession who are the cause of the heavy insurance rates as compared with other risks. The British Fire Prevention Committee during their eighteen months' existence have tackled this subject in a very exhaustive manner, and it may be hoped that their labours may possibly lead to the lightening of the photographers' heavy burden of increased premiums. We learn from an announcement made by their Chairman that they have made a large number of fire tests—twelve with fire-resisting doors and nine with similar partitions, twenty-three with different forms of wood and iron doors, and eight with various forms of glazing, and, finally, several with treated wood.

**The Nipher "Zero Plate" Process.**—Further particulars of this process, which has of late been attracting considerable attraction, have been given in *Nature* by its inventor, Professor Nipher, of Washington University, St. Louis, Missouri. "The plate is placed under a punched stencil in a printing frame. It is exposed at 1 cm. from a 16 candle-power lamp. By a few trials one can find the time interval of exposure so conditioned that nothing will develop on the plate in a developer of fixed composition, strength, and temperature, and at a fixed distance from the 16 candle-power lamp. This is a standard developer. With a shorter time of exposure than that giving the zero plate, a negative will result; with a longer trial, a positive. A plate to be used in taking any picture to be developed in the standard developer (as a positive) is all exposed to the 16 candle-power light at a distance of 1 cm. for a time, which experiment has shown will put the film into the zero condition when developed in the standard bath. It is then put into the plate-holder, and given a camera exposure in the usual way, after which it is developed. It is not important that the developer should be at any particular distance from the lamp. The plate is pre-exposed so that a zero plate will result in that particular bath at any fixed distance from the lamp. I usually make this distance about eight inches." The use of zero plates was described in the *JOURNAL* of August 17, p. 516.

**The Dark Flash.**—To the same number of *Nature* Mr. J. B. Hannay, of Cave Castle, Dumbartonshire, contributes a short letter, in which he gives what to him is a clear illustration of the reason why some of the lightning discharges in a photographed thunderstorm appear dark. At Wednesfield, Staffordshire, about mid-day on Thursday, July 19, there was a number of double flashes, that is, two discharges occurring rapidly in the same apparent region, but following different courses, and separated in time by from one-eighth to one-half of a second. But one flash, says Mr. Hannay, quite near to where I stood (one second and a half between flash and sound), gave a repetition following absolutely the same path as the first flash, and practically as bright. The only difference was that two faint branches of the first flash were not repeated in the second discharge. The second flash followed so quickly (about an eighth of a second, I estimate), that the impression on the retina of the first discharge had not died out when the second exactly covered it, so that I could appreciate the absolute coincidence. Mr. Hannay suggests that a few cinematographic records of thunderstorms would show whether or not such repetitions are common, and whether they are the cause of dark flashes on the photographic plate.

**Salaries of Photo-mechanical Workers in Germany.**—We often are told that labour in Germany is so much cheaper, and that the hours worked are longer, than they are in this country, and therefore England cannot compete with Germany in price, &c. In our issue of a fortnight back we gave, on the authority of the *Photographische Chronik*, a tabulated list of particulars of wages paid and the hours worked in photo-mechanical establishments in Berlin, Leipzig, Munich, Stuttgart, Nuremberg, and Dresden. Of course these, assuming they are correct, are averages, and must not be read to imply that all or nearly all workers receive the same wages in the same town. Some receive more and some less than others; it is the average only, and that includes the wages of apprentices, that is given. We happen to know that in some establishments in Germany the highest skilled labour is paid at a higher rate than it is here. We also know that second or third-rate skill is paid far less than it is in this country. From the tables given it will be seen that the highest average wages are paid in Munich. As to the hours' work, about which so much has from time to time been said in England, it seems that the average hours worked in German photo-mechanical houses are not longer than they are here. The greatest number of hours worked, it seems, is in Leipzig, where they average fifty-three per week, whilst in Munich they are but forty-eight and a half. We cannot help thinking that the average low wages paid and the long hours worked will not entirely account for so much of the highest-class reproduction work—photogravure, for instance—leaving this country to be "made in Germany." We are afraid we must seek some other reason.

**War Portrait Buttons and Brooches.**—Some weeks back we commented upon the number of war portraits of the above type that were to be seen in a very wo-begone appearance, and asked what other could well be expected at the price at which these portraits must have been produced to sell retail at the figure they were sold. To give an idea of what the price was, we quote from the report of a case that came before the City of London Court one day last week. The plaintiffs, a Bohemian firm, sued the defendant for 49*l.* for 250 gross of these buttons. The defence was that the buttons were not delivered in the time specified, viz., fourteen days. It was suggested by the plaintiffs that no promise as to time was given, and that the defendant had obtained other war buttons at a cheaper rate from America. In the end the Court gave judgment for 30*l.* instead of the 49*l.* originally claimed. Now, it will be seen, at the original contract price, 250 gross for 49*l.* is less than fourpence per dozen, including a brooch with a pin. This does not allow much for the production of the photographs, or for such care to be bestowed upon the fixing and washing, and who can be surprised that in a short time they show signs of decay? If the American productions were sold in this country at a less rate than the above, it would be interesting to know at what price the photographs themselves were produced, and the profit they carried, for there is no question they carried some, or they would not be made at all.

**Should Plates be Dusted?**—At a recent meeting of the London and Provincial Photographic Association a question was asked as to whether the members still dusted their plates before putting them in the slides. The speaker said, considering the great precautions taken by the makers, it was unnecessary, and the effect was more often to produce dust than to remove it. That might certainly be the case unless the dusting were carefully done and a perfectly clean brush used. In packing the plates the makers take every care to avoid imprisoning dust, but that is not always to be avoided when opening the parcels. Fibres of the packing papers and cards are liable to become detached and settle on the plates, so also are particles of dust—often of a pernicious character—always present in the room, and unless these are removed they will often make themselves unpleasantly manifest when the plate is developed. There is no question that, in some instances, more harm than good may be done, but then the work is done carelessly. Too many amateurs are not careful to see that their dusting brush is clean and free from dust before they use it, and, when this is the case, the plates had better been left as they were.

that you can lead that man, will find out he will lead you. He is built like the Irishman's fighting cock, with his two fate on the ground, and all the devils can't trick him. That stubbornness may be a good and may be a bad characteristic. Every man's character is brought right out in his make-up. It is the studying of this character indication, together with thorough familiarity with all the laws of manipulation of the materials with which you have to deal mechanically, which will make successful photographers. A few years ago everybody was making Madonnas; there wasn't a single exhibition at which there were not a lot of Madonnas, that Mother of the Christ; and what a host of sacrilegious women they were, beautiful, but without soul; and I damned you for it; I told you to leave Madonnas alone, that there was only one woman in a million who could pose for a Madonna, and you could not live with her. A Madonna would be a woman who was so far above you and all the world, secure in her own place both here and in heaven, because she was the mother of the King of the world, that no power, surely no human power, could live in the same house with her; and you stopped making Madonnas then, and you began making old men's heads and old women's heads; and every old man and old woman in the whole country was drawn out and filled up your exhibition. And I am glad of it, because it gave another phase of character: but now, as I take a glance at your exhibition I find young men, and young women, children, middle-aged and old people; and I find that you are on territory that you can handle, on territory that you understand, on territory that you know. Yesterday your President said, "Don't follow fads;" be honest to yourself is what I mean. Some man makes a misty dreamy picture, like George Inniss, of an evening landscape, and puts into it all the poetry of the dying day, all the mystery of that hour between daylight and darkness, when everything is indistinct and gloomy and full of haze; George Inniss could do that. But because you people go out and take a smudgy, fussy, cottony-looking picture, don't think that you have made an Inniss; you have not done it; you cannot put the soul into it; and it is the soul that makes the picture. Now, I don't care whether a painter uses his brush, or his fingers, or a pallet knife; what I want is the result; and I don't care if you make your pictures sharp, so long as you don't cut the picture out of the background, or I don't care if you give it to me as soft as nature meant to make it under certain conditions, only give me a picture of the friend whose friendship I prize, of the woman whose love I would die for, of the father I honour and respect, of the mother whom I love. Don't take out a single wrinkle that you can leave there; every wrinkle is hallowed by the sixty or seventy years of trial and tribulation in fighting the battle of life, and they are all honourable scars; every one is a crown of glory to that old head and that old face; don't take them out. Make youth as symmetrical, as beautifully round as you may, make it full of happy ambitions, of love and affection, as full of the joyousness of young life, the gladness of living; make childhood with no care, with nothing but indifference to all about them of pain or evil, in unconscious abandon of innocence; but let old age show evidence of having fought the good fight and kept the faith, reaching out with confidence to the life to come. Put into it all the serenity of a nature at peace with itself.

But now every once and a while I am told, "That's all very well to talk of, that's theory, but here comes a man that wants his picture taken, and we want their money, and we have to take them." I have said to you again and again, never let \$2 get out of your place if you can keep it in; rent comes due promptly, the stock dealer comes around for his money; never allow a dollar to get out of your place that you can keep in it; but, if you set your price at \$1, you will be a dollar man. Raise your standard high and bring your patrons up to it, and all your people; make your pictures tell their story, and then there will be no trouble about price. People in this country are waking up to the fact that we are leaving the days of rag carpets and bare walls; they want the best, and they are willing to pay for it; and they only know the best as you make the standard for them; if you make cheap pictures in your territory, the people will know nothing but cheap pictures, and they will only pay a cheap price. You can make a class of good pictures, and, even if they don't always meet your highest ideal towards which you are striving always, you can demand a price within reason, and get it, and that is far better. Await your opportunity to make great pictures; make good pictures all the time; and now and then, when some face comes into your gallery that you find is ample for use in any direction that you want, that you can mould like sand, that is your opportunity. Actors walk the boards for \$10 or \$12 a week for years, doing good work, excellent work, awaiting their opportunity when the star may be sick, or incapacitated from any cause, and then step into his shoes, into his reputation, and then they are no longer cheap men. Just so await your

opportunity; it comes to every man. There is a tide in the affairs of men, which, taken at the flood, leads on to fortune; grasped at the right moment it will mean success, and success means money and fame. Press and magazine writers have toiled with their pens for years, using their best energies in the struggle, until suddenly they sprang into prominence and position. Why? Because they seized the opportunity as it presented itself.

A young man writing for one of the London papers at \$8 a week was sent to France to report a reception given by the Emperor and Empress of France to Queen Victoria and Prince Albert. He was an unknown man, simply paid a salary of \$8 a week and his expenses; he crossed the Channel, secured a ticket into that great reception and banquet given for the sovereigns of England, and then he kept his eyes open; and he watched the table, every movement, every pose; he noticed that, when Prince Albert and Queen Victoria sat down to table, they sat down like monarchs, knowing that there was a chair placed behind them by the servant. When the Emperor Napoleon III. sat down, and the Empress Eugénie, both looked back to see if there was a seat for them, showing that they had come out of the people, a trait of character, and he wrote it up; and then came a cheque to him and a letter saying that his salary was increased to \$25 a week, and a position assured him for ten years it he wanted it, simply because he caught something of the people's character; because he was observant, and could see things well and tell about them. Now, there is an opportunity for all of you people; grasp the thoughts and ideas that are presented to you; take hold of the idea instantly as it suggests itself; it will never come to you unless you are ready to see it as it comes within range. Visit every picture gallery, study every painting that comes within your vision; there is no doubt but that at any moment some one will come in that will afford the opportunity for you to make your fortune and your reputation, but you must be ready. Your President spoke of many good points; he gave you many good ideas on the business side, as well as the art side. He spoke of the people whom you would meet; he spoke of how to handle those people. I think most of you neglect the financial side, most of you fail to see where the dollars and cents come in; most of you fail on the score of feeling that that is good enough; there never was anything good enough. Millet, when he painted his picture which set the world on fire, those potato-gatherers waiting in the growing twilight for the bells of the angelus to ring across the fields, said: "Oh, if I might only have that picture again to paint it over!" And yet it sold for \$115,000, and you could carry it under your arm. Now, you must never be satisfied with what you have done. Satisfy your people always; do everything that is possible to please and take care of your picture and your customers; but within yourself set your ideal so high above all that you have already done, that you, in striving to reach it, are bound to win the praise of others, and to deserve it. Study your people, if possible, when they come in; don't take them out and seat them at once for a picture. I remember of that remark by an artist of the old-time methods when he said that when he went to have a photograph taken it gave him the "shivers," because they always seated him on a chair, and clamped two cold, clammy things up to the sides of his head, and it made him shiver through and through. That is not necessary to-day; you can catch the expression of your sitters without doing that; you can avoid giving them the "shivers," and catch them as they come; but first you must understand them. You meet people and you don't like them at first; you say, "I don't like that man." By-and-by you learn to know him better, and you do like him; and usually these are the firmest friendships that begin just that way. Try to take your sitters and get in touch with them. Let me tell you of two young men who both clerked in the same store; both were of equal intelligence, bright in looks, and dressed well. One Saturday night they both started out from Cincinnati to a country place to spend Sunday, and come back on Monday. Charley was cold-blooded and calculating, and while he met people, and they were free with him, genial and pleasant and cordial; yet Harry saw everybody and talked with everybody; so next Monday the two came back to their accustomed routine, and the following Tuesday the old farmer whom they had visited came into the store; Harry at once went up to him with a "How d'ye do? how is your wife, and the young man we met at dinner—I cannot call his name now?" &c. He at once put himself in touch with the old man. The result was that that farmer ever after would pass by Charley with a civil "How do you do?" but he always had Harry to wait on him, and Charley never could understand why the old man didn't take to him. There are a good many of you people who are too busy to take care of your customers. I heard a story out West while I was gone away of a certain man going into a gallery out there, and the proprietor was too busy to see him. The lady in the

reception-room took in word that a gentleman was in waiting, and returned with the message that the proprietor was too busy to see the gentleman then. The caller went out and never came back. That is the greatest blunder in the world. Lord Essex, of England, became Lord Chancellor by taking the cloak off his back and spreading it in the mud so that Queen Elizabeth might step from the carriage to the curb with her feet unsoiled.\* That was an act of courtesy that has gone down into history, and his name has gone with it. Little things that you do in your galleries, in your studios (not in your "operating" room), in your workshop, are the things that make you friends: they are the things that count. It is the dollars that you don't see that come into your pocket by-and-by. Treat all your people as though they were the only customers you had. Make them feel at once that everything depends on their patronage, and not that you simply bring them out, and take them before the camera, take out the bung, and take their picture, and tell them to come to-morrow for it, or day after to-morrow, as some of my audience suggest, and then give them anything you have got, and make them take it and make them feel that it is the best. Be lavish with your plates, and stingy with your paper; that is, don't be afraid to use enough plates to secure a good negative; then be stingy enough with your paper to print only from the best negatives you can secure. But by all means get in touch with the people; make them feel that their interest is yours, and that you wish to make pictures of them that will speak, that are the best that can be made. Make up your mind that you will be the best photographer in your city, that you are going to lead, that you are going to demand and obtain the best prices for the best work.

PROFESSOR A. H. GRIFFITHS.

#### A NEW CRUSADE.

RIGHTLY or wrongly, to Paris has long been assigned the disagreeable reputation of being one of the chief centres for the distribution of risky and improper photographs, and recently the mutoscope has been pressed into the service of this salacious traffic. Matters have been carried to such audacious extremes that the authorities have intervened for the purpose of suppressing the scandal. The Paris correspondent of *The Referee* writes: "To no man do I accord a higher esteem than to Senator Berenger. He fears no one, and amid a howl of jeers and derision he attacks no matter what kind of amusement, or literature, or illustration, that he deems likely to pollute the mind of the young or the slightly older. I make that concession to him, and then I would respectfully ask how he runs his up-to-date morality show. He has by his endeavours induced the police to seize a quantity of illustrated post-cards, which were being openly sold and exhibited in the shop windows. That is a good move, because the sale of this kind of art was becoming a painful feature of Paris life outside the cafés. There was hardly one well-made *figurante* of the music-halls that did not willingly pose in various attitudes with attendant costume that suggested the going-to-bed attire. All this was duly photographed and reproduced on post-cards, and was on sale to the smallest urchin for one penny. This annoyance, that has rendered the terraces of the cafés of the Boulevards impossible to any Englishman with lady friends, has been going on since the opening of the Exhibition, and, if, as it seems, Berenger is the only man who can scruff Dame Immorality by the neck, why did he not do it before? He has, however, it seems, got the police to seize these photographs and post-cards, and folks are saying what a wonderful man he is. Admitting at once that he has secured the seizure of the photographs of the minor lights of the stage in the various sections of their preparatory somnolent process, I would ask M. Berenger if he is not aware that for the last seven years this sort of show has been a feature of Parisian life in theatre and variety hall. I was not particularly well last week, and during a few off-days I wandered through the Exhibition with the carefully concealed intelligence common to the average tripper. I was on Government territory, and I wasted a few pence by looking at the revolving shows, allowed and approved by M. Picard and M. Millerand. I can candidly say this much, that they were pointless, and that their only possible object was to be suggestive, and unpleasantly suggestive. If M. Berenger really means to carry out his task, then let him go not merely for simple photographs, but for those pictures that are, by these modern contrivances, turned into living studies. The average child, once out of swaddling clothes, has probably arrived at the conclusion that his father and mother do not sleep in their hats and boots, but I am at a loss

\* The Professor probably means Sir Walter Raleigh, who, however, did not become Lord Chancellor.—Eds. B. J. P.

to understand why, in the year 1900 as ever was, they should be carried at every corner to see exactly what a complicated training was necessary to divest in order to get to bed. These shows are disgusting, and I hope that what I have just heard is correct, and that the police will seize them, and that the proprietors will be prosecuted. I care no more about a high state of prudery than a monkey does about logarithms; but, when I see a crowd of children hanging round one of these penny-in-the-slot shows, and seeing what the hardiest Palais Royal frequenter would blush at, I say that it is time to kick, and I hope with all sincerity that Berenger will come out on top."

The *Daily Telegraph's* representative in Paris also tells us that the *corps-de-ballet* of the Grand Opéra has objected to the wrongful uses to which their photographs are put. He says that photographers have made free with likenesses which the dancers had had taken, but which they intended to be reserved for their personal use, and not to be converted into public property. These pictures have been fraudulently sold to various purveyors of illustrated post-cards, pocket biographs, and so-called miniature mutoscopes, as well as views for large cinematographs. For some time past the police had been contemplating interference with this sort of trade, in which there has been a wild boom since the Exhibition opened, but had not so far taken action in the matter, when a reproach for their backwardness came in the shape of a protest from a quarter whence possibly they hardly expected it. The ladies of the Opéra ballet forwarded a petition, requesting the seizure of various pictures in which their photographs had been reproduced entirely without authorisation. They objected to appearing in mutoscopic and other views, particularly as their consent to such exhibitions had not been asked by the unscrupulous purveyors of the entertainments. Thus roused by the action of the professional beauties themselves, the police have immediately set to work with tremendous zeal. They have confiscated no less than 50,000 picture-cards, 600 photographs, 400 pocket mutoscopes, and 40 cinematograph views. The new crusade starts rather late in the day, it is true, but, for the sake of photography in general and the "animated" branch of it in particular, we wish the Paris censors the utmost success in their clarifying aims. Years ago the stereoscope and stereography fell into popular disrepute on account of the disgraceful binocular subjects that were printed and widely published, and it would be a thousand pities if a similar reason led to the ostracism of animatography. But some such danger is to be apprehended if a check is not put upon the doings of low-minded people at home and abroad who simply photograph for corrupt purposes.

#### THE METRIC SYSTEM.

LAST week we gave a general summary of the information supplied by British Consular and other officers abroad relative to the experience of foreign nations who have adopted the metric system. Our contemporary, the *Pharmaceutical Journal*, gives some details of a particular character which are of interest in connexion with the time taken for the introduction of the metric system. It appears that the experience of Austria and Hungary shows that a transition period of four years was quite sufficient to prepare the public for the compulsory use of the new system, and there is not the smallest desire evinced in any quarter to revert to the older and more cumbersome method. In Belgium it took about forty years to establish the new system, but it is now firmly established. Bulgaria has not yet got entirely rid of its old weights and measures, but the commercial classes prefer the newer ones. Denmark had not adopted the metric system at the time the report was prepared in November last. France and Germany, of course, find the metric system perfectly satisfactory, and desire no change, though the older systems are not yet forgotten by the public. In Greece, where the metric system is not yet compulsory, though it has been legally established since 1836, the general public will not make use of it. Italy has found the transition difficult, and in some parts of the country it is still far from complete; in its practical operation, however, the metric system is stated to be quite satisfactory, and there is no question of going back. The Grand Duchy of Luxemburg agrees with Belgium, France, and Germany on the subject; Montenegro finds the new system works well; the Netherlands, Portugal, and Roumania have got it established satisfactorily, after more or less trouble. Russia can only point to unhappy Finland as having successfully introduced the metric system, but Servia has proved it to be satisfactory in practice. Spain is adopting it gradually, town by town, much passive resistance having to be overcome in substituting the new for the old system. That resistance is found to proceed from ignorance on the part of the public of the relations between the two systems. Knowing how much they require of certain articles, purchasers ask for

what they require in terms of the old weights and measures because they are ignorant of the corresponding amounts for which they should ask in accordance with the new system. Sweden and Norway have effected the change without any great difficulty, Switzerland has also adopted the metric system in its entirety, and only in degenerate Turkey have the authorities had to repeal the law which made that system compulsory. With that exception, in every country where the metric system has been adopted it has been found an improvement on older systems, and there is no desire to revert to former conditions.

#### MARINE PHOTOGRAPHY.

THERE are still some weeks left in which the holiday-making photographer can select his opportunity for photographing yachts and other vessels when they appear near his favourite seaside resort, and, for the benefit of those who are inclined to use a few plates on subjects of this kind, we reproduce the following succinct notes of advice. The writer presumes that something larger than a hand camera is to be used, for the reason that, although quite as good results can be had with such a camera as with a larger one, there is too much temptation with the small size to expose on everything that comes along, and this tends to carelessness and poor work. The camera should not be less than 10×8, and it may be as much bigger as the operator is inclined to have it. The plate-holders must be beyond suspicion, as far as light-tightness is concerned, and there must be no flapping focussing cloth around. The shutter may be any of the fast-moving instruments of the day, without vibration and not given to stick by reason of damp at some awkward moment. A finder is absolutely necessary, and the most useful is one which gives, on a fairly large scale, a direct proportion of what is given on the large camera. The writer adds that he has used a 5×4 camera with a seven-and-a-half-inch focus lens as a finder for a 20×16 camera with a thirty-inch lens, the two having the same movements for raising and lowering the fronts. Focussing to scale is advisable, and the scale should be made up at home, any open view with marks set up at various distances, and the camera marked accordingly. "We will assume your eye to be on a schooner running free with all sail set; there are plenty of strong clouds about; there are few occasions where the lack of clouds is admissible. Your aim must be to cut her off and get on her lee bow, as photographs taken to windward are seldom good. See your dark slide is out, your shutter bulb in hand. Now watch through your finder till you get the size you want, snap your shutter and close up your plate, and turn out for something else. This watching for the right moment requires coolness and quickness, for, if you miss the instant when the best effect is to be gained, you seldom have time to get another chance. In photographing racing yachts," concludes the writer, "the photographer must be extremely careful not to get to windward of the yachts and spoil their wind; you will only get yourself hated and do no real good by getting to windward. The best place to get yachts is to leeward, and when they turn the mark-boat, but whoever has the camera and the boat can soon find out for himself where the pictures come." The article from which we take the above extracts appears in a recent number of the *Photo-Beacon*, and it carries at foot the initials "W. H. H." If we are not mistaken, these stand for Mr. W. H. Hyslop, from whose pen contributions on the subjects of orthochromatic and marine photography appeared in our pages thirteen or fourteen years ago.

#### ROYAL CORNWALL POLYTECHNIC SOCIETY'S PHOTOGRAPHIC EXHIBITION.

##### [JUDGES' REPORT.]

THE Judges in this department congratulate the Society on the fine display of pictures brought together, which have been difficult to get, owing, no doubt, to the unsettled state of the times. In the professional section there are some very interesting works of large size, notably Mr. W. J. Byrne, of Richmond, who sends some very fine direct work in portraiture; Mr. J. C. Douglas, of St. Ives, is well represented, and the quality is greatly in advance of his work of former years: Mr. W. Brooks, of Reigate, sends ten pictures, some of large size, of course not for competition, he being one of the Judges; Mr. J. H. Coath, of Liskeard, is well to the front again. In the Amateur Section the work is good. Mr. Henry Speyer, of Alpine fame, shows a marvellous picture (panoramic), which gives the whole circle. In the Photographic Appliance Section, Messrs. J. H. Dallmeyer, Limited, of London, send for exhibition a camera fitted with their latest improved tele-photo lens. To enhance the value of this exhibit, and show its full capabilities, Mr. Brooks has taken several pictures without the tele-photo attachment,

which gives a very small distant picture, and then from the same position with the tele-photo attachment, the subjects being from one mile to over two miles distant, the result giving the impression that the negatives were taken about twenty or thirty yards from the subject, being absolutely sharp and clear, which practically demonstrates the utility of the apparatus. These specimens are exhibited in the glass case with the instrument. To this section, Mr. Thos. Thorp, of Manchester sends a very interesting collection of his replicas of diffraction gratings, being casts from Rowland's metal gratings of 14,438 lines to the inch. He also shows some direct-vision spectroscopes, giving a very brilliant spectrum, far superior to and cheaper than those constructed in the usual way with a series of prisms. These spectroscopes are very useful for screen-testing for three-colour work. He also shows a negative of the solar spectrum, and the spectrum of iron, taken by these reproduced gratings, which no doubt will be of great service in the future. Messrs. Shew & Co., of Newman-street, London, show some very ingenious cameras, &c.

##### PROFESSIONAL SECTION.

The first in the catalogue are the work of Mr. W. Illingworth; he takes an award of a first bronze medal for a study of a tramp; the same artist has several other meritorious productions.

Mr. P. Garland shows some careful work, some of them tend to hardness. Mr. A. A. Jane sends a number of pictures; the Judges think there is a slight improvement in his work to former years, and they think there is still room for greater improvement, some of his pictures are very flat and wanting in high lights; he also shows some work done with a spectacle lens; in an exhibition the result is the test; it matters not whether the lens cost only one farthing or 50l.

Mr. J. C. Douglas, of St. Ives, is well to the front with a large and varied collection, and the Judges are pleased to note the great advance in the quality of this exhibitor's work, his sea and wave studies are charming; (No. 27), *The Sunken Rock*, is perfect as a picture, and also in technique; to this has been awarded a second silver medal, his other exhibits are well worthy of close inspection. Mr. R. A. Jowett sends two pictures of the *genre* type, a little too stagey in effect. Mr. W. Norrie sends a frame of well-chosen cloud and sea studies which are charming; he takes first bronze medal. Mr. J. L. Shawcross is represented by pictures showing careful study. Mr. A. Patterson sends some good work, the same also may be said of Mr. G. Bird. Mr. C. M. Wane takes first bronze medal for his *Study of Swans*; his *Military Sports* is well worthy of attention.

Mr. H. C. McBurney sends some good examples. Mr. H. T. Jessop sends a pretty little *genre* picture; his enlargement, *A Young Briton*, wins first bronze medal. Mr. W. J. Byrne, of Richmond, shows some exceedingly fine work in his well-known style. No. 89, *Study of a Head*, is life-size taken direct, and it is a masterpiece, taking first award, viz., first silver medal. He also has two other large portraits of great merit, and also a large frame of home portraits which are very interesting. Following next is a large and varied series by Mr. J. H. Coath, of Liskeard, his *genre* picture, *A Faithful Guardian*, second silver medal. A large dog and child well posed and in keeping with title, all his other exhibits are of a very high order. Mr. W. M. Harrison, of Falmouth, receives first bronze medal for his enlargement of *H.M.S. Ganges leaving Falmouth*, the same exhibitor sends some portraits. Mr. E. Baker sends some good work. Mr. J. M. Whitehead has been awarded a first bronze medal for a pretty little study of fruit beautifully grouped and very effective.

##### AMATEUR SECTION.

Mr. A. E. Berg sends two pictures of merit. Mr. W. R. Bland sends a fine interior of *Wirksworth Church*. Mr. E. A. Rees sends a picture, *The Mill Wheel*, fairly good. Mr. E. Griffiths takes second bronze medal for an enlargement of the wreck, *Peace and Plenty*, on the Cornish coast. The subject is well rendered. Mr. T. P. Padwick is represented by five examples of his work. No. 161 (*A Sussex Pasture*), a picture of sheep grazing, is very effective and artistic. To this has been awarded a first bronze medal. *Anchored for the Night* is also well rendered. *The Morning Paper*, a figure study reading. This is too much out of focus and woolly to be pleasing. Mr. C. H. Dymond sends some pretty examples. Mr. W. J. Nicholls shows some very artistic and effective little pictures, (No. 184) *A Squall*. A second bronze medal has been awarded Mr. J. W. Welsh for five frames of good subjects. Mr. Henry Speyer sends one of the finest examples of Alpine photography, giving the whole circle, taken from the Grosvescheron. The manipulation is perfect. It is printed in platinum from nine negatives carefully joined, and the tone throughout is very even, and the delicate gradations in the snow are very effective. The Judges have awarded this picture a first silver medal. Mr. G. Hepworth sends a frame of three views of Beverley Minster in his well-known style. Mr. J. T. Coleman sends some examples of Truro Cathedral. Several of them show halation and also evidences of flare, and some of the lines are not upright, which can be overcome by practice. Mrs. James Blamey shows some fine examples of hand-camera work, and receives a second bronze medal. A great improvement on her former work is very noticeable. By the same lady is a frame of *Studies of Dogs*, which show skill and careful work. Mr. C. H. Oakden shows a very fine interior, *The Ambulatory Abbey-dore*. To this has been awarded a first bronze medal. Mr. G. Cleland sends two examples.

## PHOTOGRAPHIC APPLIANCES, &amp;c.

Messrs. J. H. Dallmeyer, Limited's tele-photo camera and lens have been fully tested practically by Mr. W. Brooks, and the Judges have awarded a first silver medal.

Mr. Albert Maurice sends several models of appliances; several are far from new, and others have been on the market for a long time.

Mr. H. Coventry sends a plate and film-washer, which is said to wash plates and films effectively in ten minutes. The Judges think this open to doubt.

Mr. Thomas Thorp, of Whitefield, Manchester, sends some very important exhibits, before mentioned. The Judges have awarded this gentleman a first silver medal for his replicas of diffraction gratings and direct-vision spectrosopes, and consider it an award most worthily bestowed.

Messrs. Shew & Co., of London, make a large exhibit in cameras and appliances. The workmanship is of high order, and the price of the various instruments is very reasonable considering the good work that is put into them. Awarded first bronze medal for ingenuity and workmanship.

WM. BROOKS.

(From a Representative.)

FOR many years this has been an annual event, a section of the Society's general Exhibition, but last year there was no show. The present is the sixty-seventh Exhibition of the Society, which was founded to encourage good craftsmanship, science, and art in a day when such was not so much the vogue as now. It has always helped photography by considerable encouragement in the way of awards. The Photographic Section has been under the care of Mr. W. Brooks, of Reigate, who has worked assiduously, with the help of local gentlemen, to do the best with the work submitted. The present show is by no means so numerically strong as many that have preceded it, but it is certainly the best in average quality, and the highest that has been held. The falling off in numbers had made for gain in the comfort of observing and the better hanging. The following is the classification:—

## PROFESSIONAL.

*Outdoor Photography.*—1. Landscape, not less than 20×16 inches. 2. Landscape, 12×10 inches, and under. 3. Genre. 4. Architectural (exterior). 5. Instantaneous, including Marine. 6. Animals. 7. Enlargements.

*Indoor Photography.*—1. Portraits, not less than 20×16 inches. 2. Portraits, 15×12 inches, and under. 3. Home Portraiture. 4. Still Life, Flowers, &c. 5. Interiors, Architectural or otherwise. 6. Enlargements.

## AMATEUR.

1. Landscapes. 2. Architectural, Exterior or Interior. 3. Alpine Scenery, including Caucasian. 4. Hand-camera Work, not less than twelve examples, quarter-plate. 5. Instantaneous, including Marine. 6. Still Life. 7. Enlargements.

*Apparatus.*—Photographic Apparatus generally, including the Lantern and its Appliances.

On the walls the classification is not apparent, but this is no disadvantage, as the room is not particularly well adapted to the purpose, and the pictures are grouped as they will fit. Perhaps at no Exhibition of this calibre do so many works come from single individuals, so that it comes out the number of exhibitors are proportionately fewer in relation to works than is usual. Mr. W. Illingworth contributes 6 frames; Mr. P. Garland, 5; Mr. A. A. Jane, 14; Mr. John C. Douglas, 20; Mr. R. A. Jowett, 2; Mr. Wm. Norrie, 1; Mr. J. L. Shawcross, 3; Mr. W. Brooks (not for competition), 10; Mr. A. Patterson, 5; Mr. Graystone Bird, 4; Mr. C. M. Wane, 3; Mr. H. G. McBurney, 10; Mr. H. Trevor Jessop, 4; Mr. W. J. Byrne, 4; Mr. John H. Coath, 16; Mr. W. M. Harrison, 4; Mr. E. Baker, 4; Mr. J. M. Whitehead, 1; Mr. A. E. Berg, 2; Mr. W. R. Bland, 1; Mr. E. A. Rees, 1; Mr. E. Griffiths, 2; Mr. T. P. Padwick, 5; Mr. C. H. Dymond, 19; Mr. W. J. Nicholls, 5; Mr. John W. Welsh, 5; Mr. Henry Speyer, 1; Mr. George Hepworth, 1; Mr. J. T. Coleman, 2; Mrs. James Blamey, 4; Mr. C. H. Oakden, 1; and Mr. George Cleland, 2. It will be seen that very few persons are represented by one frame.

The awards for pictures are:—

First silver medal: Messrs. W. J. Byrne and Henry Speyer. Second silver medal: Messrs. J. H. Coath and J. C. Douglas. First bronze medal: Mrs. James Blamey, Messrs. W. M. Harrison, W. Illingworth, H. Trevor Jessop, William Norrie, C. H. Oakden, T. P. Padwick, C. M. Wane, and J. M. Whitehead. Second bronze medal: Messrs. E. Griffiths and W. J. Nicholls.

In the Apparatus Section the following awards were made:—

First silver medal: Messrs. J. H. Dallmeyer, Limited, and Thomas Thorp. First bronze medal: Messrs. James Shew & Co.

Of Mr. W. Illingworth's varied contributions, all of high merit, but varying in subject, perhaps there is no better bit of work than *A Study of a Tramp* (No. 3), for which a first bronze medal is awarded. The model has a very fine head, and as a bit of portrait work this example is most excellent. Mr. John C. Douglas is another worker who has variety and

quantity, and all his work is clean and praiseworthy. *A Stormy Evening* (No. 26), and *The Sunken Rock* (No. 27) surf and rock studies with combination of cloud-laden skies, are strong, the second-named getting a second silver medal. His *Old St. Ives* (No. 28) is a study from ship to shore of the place that has perhaps more artists to the square acre of beach than any place in England. This Cornish town is full of photographic subjects, as well as being a painter's paradise. The group of children entitled *The Smile* (No. 35) is happy, and the smile is broad and ample. His *Sea Urchins* (No. 37) tells its own story well. Mr. William Norrie has a set of small prints—*In Storm and Calm* (48)—which are sea- and sky studies, but they are very fine; if set large and the work of the artist in colour, some of them would be magnificent. For these he deservedly gets a first bronze medal. Mr. Charles M. Wane has for years shown himself a lover of swans, and he keeps to his text with great ability. He has a frame of *Studies of Swans* (No. 72), and *A Quiet Corner* (No. 71). The latter is evidently an enlargement; but it is a very charming thing, swans in the quiet corner of a pond or lake, with happy combinations of red and surroundings. For this he gets a first bronze medal. His *Military Sports* (No. 73), tent pegging, &c., is full of life and vigour, and he is happy in several cases in having secured his impression at the right moment. Mr. H. Trevor Jessop has a very commonplace treatment of a very ordinary arrangement of a nude child, *A Young Briton* (No. 88), for which he is awarded a first bronze medal. In its way, though there is nothing extraordinary about it. Mr. W. J. Byrne's *Study of a Head* (No. 89), life size and direct, is good; and the award is a first silver medal—possibly a hardly warranted distinction. Mr. John H. Coath has been known for a number of years for his fanciful treatment of children in combination; he has departed from this strictly pronounced manner, and has work in variety. He gets a second silver medal for *A Faithful Guardian* (No. 95), a little girl asleep across the body of a St. Bernard dog, another smaller one lying near by. But he has more pictorial and better work surely in *What is it?* (No. 105), a group of boys "mit nodings on," standing on a rock jutting into the sea, with their backs to the spectator, and keenly interested, every muscle and attention strained, watching something ahead. It is one of the best things he has ever done. He has a faculty for handling animals, and *Playmates* (No. 96), a girl and a setter resting together, is a good example. Mr. Wm. Harrison has set on record *H.M.S. Ganges leaving Falmouth*, for which he has a first bronze medal. This old craft, a three-decker, was removed from Falmouth the other day by the inexorable fiat of the Admiralty, to the sorrow of all concerned. The picture is interesting, if not great. Mr. Edmund Baker's *Spare Moments* (No. 113), a pretty child and a kitten at an open window, is not without quality. Mr. J. M. Whitehead has a fine *Fruit Study* (No. 167), for which he secures a first bronze medal. It is in every way admirable. *The Silent Ebb* (No. 151) and *Towards Evening* (No. 152), by Mr. A. E. Berg, are examples of the soft, mud flat order, but they are, after that, of some artistic excellence. Mr. E. Griffiths is the recipient of a second bronze medal for *Wreck of the "Peace and Plenty"* (No. 155), but for what reason it is impossible to discover. The subject is by no means interesting, and the work is certainly of only average merit. Mr. S. P. Padwick has versatility. He secures a first bronze medal for *A Sussex Pasture* (No. 161), which might be much better than it is by a little carefulness in printing, so that the foreground, mid-distance, and background could have some change in value. His portrait work in *The Morning Paper* (No. 157), an elderly gentleman engaged in getting at the news—though, perhaps, a little too much at arms' length—deserves praise. *The Old Style and the New* (No. 158), a study of shipping on a river lit up with sparkle, and over which there floats smoke and steam, is most interesting. Mr. C. H. Dymond has many things on view, but none of them stand out strongly—though the average merit is most commendable. His *The Fringes of the Hearth* (No. 180) is not quite commonplace, but the subject has been fully done. *On the Tamar, near Calstock* (No. 178), wants some gradation in the whites, but the picture has a nice soft quality. Mr. W. J. Nicholls *A Summer's Morning* (No. 182), a combination of lake, mountain, and fir trees, is a very enjoyable picture, exceeding in quality, in every way, surely, his *A Squall* (No. 184) for which he is awarded a second bronze medal. The suggestion of the squall is most remote, and the subject is treated on too small a scale. Mr. John W. Welsh has a charming little thing in *Sea Urchin* (No. 186), a row of mirthful nude lads upon the sands, all seated in varying and natural manner, brimful of something which has fun in it. There is rather a fine study of fir-trees by him in a series of twelve quarter-plates (No. 190) in one frame. His *Lugger Inn, Fowey*, is a tit-bit from one of the Cornish villages that photographers might with advantage look up. There is good work indeed in three architectural subjects in one frame by Mr. Geo. Hepworth. A very beautiful *Panorama from the Gross Viescheron* (No. 191), by Mr. Hy. Speyer, giving mountain-peaks, glaciers, snowdrifts, and crevasses with fine rendering of tone value, has deservedly won a first silver medal. Mrs. James Blamey shows three enlargements (No. 195) which have quality in each case, but one is greatly superior to the rest. The same lady gets a first bronze medal for some instantaneous (No. 198) work on the sea beach. *The Ambulatory, Abbeville* (No. 199) is an example of Mr. C. H. Oakden's best work, an interior full of charm, and rendered in the way we are accustomed to see with this worker. He is awarded a first bronze medal. Mr. W. Brooks, of Reigate, who has helped the Society for so many years by his care of

the Photographic Section, has a valuable contribution of ten exhibits, all of the best quality, and which is rather a revelation, because Mr. Brooks is not a contributor to exhibitions in a general way. None of his exhibits are for competition. He has two portrait studies of *A Tower Warder* (Nos. 52 and 53), which are as fine things of their kind as we remember to have seen. The model is a handsome old man, and, of course, the uniform of a yeoman of the guard helps the picturesqueness of the study. There is nothing finer of its kind in the exhibition than these. *A Surrey Lane* (No. 54) is a very delightful bit of landscape, admirably selected and perfect in technique. *A Pond in the Wood* (No. 56) is a gem of its kind, but it would be far more effective if very much larger, the abundant detail being almost obtrusive. An architectural example, *Reredos, Truro Cathedral* (No. 61), shows that this worker can ably render a very difficult selection. We hope to see the figure subjects at one of the principal exhibitions.

In the matter of photographic appliances the Exhibition is not numerically strong, but it is high class. Messrs. J. H. Dallmeyer, Limited, show tele-photo apparatus and lenses, and are awarded a first silver medal. Mr. Thomas Thorpe shows spectroscopes, transmission gratings, and is distinguished with a first silver medal. Messrs. Jas. Shew & Co. show a lot of their Xit cameras and other photographic apparatus, for which a first bronze medal is awarded.

#### THE CITY AND GUILDS EXAMINATIONS IN PHOTOGRAPHY.

FROM the programme of technological examinations held under the auspices of the City and Guilds of London Institute that has been sent to us we extract the following particulars relating to the examination in photography that will be held in May next:—

The Examination in Photography will consist of two parts:—Section A, Pure Photography, and Section B, Photo-mechanical Processes. Candidates may be examined in either of these two Sections.

##### ORDINARY GRADE.

The Examination in the Ordinary Grade of either Section will consist of a *Practical* and a *Written* Examination.

No candidate will be admitted to the Written Examination who has not previously passed the Practical Examination.

To enable Candidates to qualify for the Written Examination in the Ordinary Grade, Local Practical Examinations will be held at convenient times in the Session preceding the Written Examination. A practical Examination may be held in any town where there is a class registered by the Institute, or in such other places, distant ten miles from the class, where at least five Candidates notify, through the Local Secretary, their wish to be examined. The Local Examinations will be held under the personal supervision of Examiners appointed by the Institute. The date at which a Local Examination is to be held may be fixed at any time between January 1 and March 2 that may be arranged between the Secretary of the Local Committee and the Local Examiner, provided that at least fourteen days' notice is given to the Institute of the date fixed for such Local Examination; and the Local Secretary will be required to forward to the Institute, within eight days after the holding of such Examination, under the signature of the Local Examiner, the names of any Candidates who may have satisfied the Examiner of their practical knowledge of photography. The subjects of the test are given in the Syllabus of each section.

The Candidate for the Practical Examination in either section may elect to make his negative in collodion or gelatine, and his print may be produced by any of the methods in ordinary use. He will also be allowed to supply, if he so desire, his own apparatus, chemicals, &c., or he may use those provided by the Local Examiner. The fee for the Practical Examination only will be 2s. 6d. The fee for the Written Examination is 1s.

##### SECTION A.—PURE PHOTOGRAPHY.

I. *Syllabus*.—(1.) The Local Practical Examination will include the following tests:—To focus, expose, and develop a negative of a person or landscape; to print, tone, fix, and mount an ordinary print.

(2.) The Written Examination will include questions on such subjects as the following:—

1. The elements of Photographic Optics. The Photographic Camera and its adjuncts, lenses, diaphragms, shutters, shades, &c.
2. A general knowledge of the practice and theory of the wet-plate process.
3. The practice and theory of the gelatine dry-plate process, exclusive of emulsion-making; the composition of and defects in gelatine dry plates; the defects of gelatine negatives, their causes and remedies.
4. Various methods of developing, fixing, intensifying, and reducing negatives, with a general knowledge of the chemicals employed.
5. Silver printing by print-out processes, including vignetting and printing in clouds, toning and fixing; contact printing on gelatino-bromide paper.
6. Retouching and spotting; mounting prints.
7. The lighting of the dark room.
8. The studio and lighting of the sitter.

##### SECTION B.—PHOTO-MECHANICAL PROCESS.

(1.) The Local Practical Examination will include the following tests:—

To focus, expose, and develop a negative of a drawing in line or wash; to prepare or etch a zinc or copper plate (a) for a process block, (b) for a photogravure plate; to make a collotype plate or a photo-litho transfer.

(2.) The Written Examination will include questions founded on the following subjects:—

1. Cameras and lenses for copying and process work, ruled screens, prisms, reversing mirrors, the appliances in ordinary use for electric and artificial lighting for photographic purposes, and the apparatus employed in photo-mechanical processes.
  2. A practical knowledge of collodion (wet and dry), and gelatine dry-plate photography.
  3. A general knowledge of various methods of developing, fixing, intensifying, and reducing negatives.
  4. A general knowledge of the properties of gelatine, albumen, fish glue, bitumen, resin, inks, etching solutions, and other chemicals and materials used in photo-mechanical work.
- The principles and practice of at least two of the following processes:—
5. Photogravure.
  6. Block making—line, half-tone, and three colour.
  7. Photo-lithography.
  8. Collotype.

The Written Examinations in the Ordinary and Honours Grades will be held on Wednesday, May 1, from 7 to 10.

##### HONOURS GRADE.

Candidates for Honours in either Section must have previously passed in the Ordinary Grade of that Section.

The Honours Examination is both Written and Practical.

The fee for the Honours Examination (Written and Practical) in either Section is 3s. 6d.

For the year 1901, Practical Examinations will be held in London only, unless ten Candidates at least apply to be examined in the same Section (A or B) at some other centre.

##### SECTION A.—PURE PHOTOGRAPHY.

(1.) *Written Examination*.—Candidates will be expected to answer more difficult questions in the subjects for the Ordinary Grade, and, in addition, a knowledge will be required of—

1. The theory of the photographic image, of development, fixing, intensification, and reduction.
2. The theory of light as applied to photography, including a general knowledge of spectrum and orthochromatic photography.
3. The principles of photographic optics.
4. The theory and practical use of sensitometers for testing the speed and gradation of plates; and also their uses in printing processes.
5. The principles and practice of the preparation of gelatino-bromide and gelatino-chloride emulsions.
6. Collodio-bromide emulsions, their preparation and use.
7. Platinotype and carbon printing; other methods of printing with bichromate and with iron salts; enamels.
8. Enlargements and lantern slides.
9. Applications of photography to scientific and technical purposes.

(2.) *Practical Examination*.—Candidates will be required to show proficiency in conducting, in presence of the Examiner, any of the following practical operations:—

1. To develop gelatino-bromide plates previously exposed (correctly or otherwise) by the Examiner.
  2. To reduce or intensify gelatino-bromide negatives.
  3. To print, tone or develop, fix, and mount a silver, platinotype, or carbon print.
  4. To test a sample of glass or fabric to be used in lighting the dark room.
  5. To test the sensitiveness and gradation of a plate.
  6. To find the focus of a lens either corrected or uncorrected, or to examine a lens as to its suitability for different photographic purposes.
  7. To copy a drawing or engraving.
  8. To make an enlargement from quarter-plate.
  9. To make a lantern slide by contact or in a camera.
- The Practical Examination will be held on Saturday, May 4, between 2 and 6.30, and at other times if found necessary.

(3.) *Specimen Work*.—Candidates will also be required to send in, not later than April 24, not fewer than three nor more than six negatives, not less than quarter-plate size nor more than whole-plate, together with mounted prints made from each of them by any ordinary photographic printing process or processes that the Candidate may select. The negatives and prints must be accompanied by a Statutory Declaration made by the Candidate to the effect that the selection of the subjects and the whole of the work (except the manufacture of the plates, sensitive paper, and mounts) involved in the production of the negatives and prints has been done by the Candidate without any assistance from any other

person, and within the twelve months preceding the date of the Examination. Forms for the Declaration may be obtained from the Institute.

#### SECTION B.—PHOTO-MECHANICAL PROCESSES.

(1.) *Written Examination.*—Candidates will be expected to answer more difficult questions in some of the subjects of the Ordinary Grade, and, in addition, to show a practical knowledge of the principles and operations in one or more of the following processes:—

1. Photogravure.
2. Line negatives and line blocks.
3. Half-tone negatives and half-tone blocks.
4. Chromo-typography (negatives and blocks for three-colour process).
5. Photo-lithography.
6. Collotype.

(2.) *Practical Examination.*—Candidates may be required to show proficiency in practical operations in one or more of the above processes, numbered 1, 2, 3, 4, 5, 6, including the preparation of negatives suitable for each class of work, from (a) pictures in colour, (b) drawings in monochrome, (c) originals in black and in tints, (d) natural objects.

Candidates in Section B may select the particular branch of practical work in which they desire to be examined.

In order that Candidates may know what apparatus and material they will be required to provide for the Practical part of the Examination in Section B, full information as to the practical tests may be obtained from the Examiner on Friday, May 3, for the Examination to be held on the following day.

The Practical Examination will be held on Saturday, May 4, between 2 and 7.30, and at other times if found necessary.

The Examiners for next year are Mr. C. H. Bothamley and Mr. G. Watmough Webster, and it is intimated that the Syllabus has been revised as regards Section A (Pure Photography), and the arrangements as regards the Practical Test in the Honours Grade have been altered. Candidates are required to submit Specimen Work.

The following questions were put to Candidates at the Examinations held in the spring of this year:—

#### ORDINARY GRADE.

##### SECTION A.—PURE PHOTOGRAPHY.

*Eight questions only to be attempted.*

1. Explain, with the aid of a sketch, why a single lens, when used with a stop either before or behind it, gives a distorted image. Why does a rectilinear lens of the ordinary form give no similar distortion?—30 marks.
2. Describe as fully as you can any one of the newer forms of photographic lenses, and state what are its merits and defects.—35.
3. What are the resemblances and differences between hydroquinone (quinol) and metol as developers? Describe fully how you would use each of them for the development of gelatino-bromide plates.—40.
4. How would you proceed to reduce a gelatino-bromide negative with a view to (a) increased contrasts, and (b) reduced contrasts?—30.
5. If you were building a studio for general portrait work, how would you arrange (a) the light, and (b) the blinds or screens?—40.
6. What tests would you apply with a view to ascertain the purity and general suitability of a new batch of mounts?—40.
7. What do you know about the causes of fading of prints on gelatino-chloride printing-out paper, generally known as P.O.P.?—35.
8. What is formalin, and what is its effect on gelatine? In what ways can this effect be turned to advantage in practice?—30.
9. What points have to be kept in mind when selecting pigments to be used for spotting prints of various kinds?—30.
10. What are the comparative advantages and disadvantages of plates and films respectively? How would you develop a long roll of films?—35.
11. What kind of shutter do you regard as best for all-round work, and why? What are the advantages or otherwise of fixing the shutter (a) before, (b) behind, and (c) between the lenses?—35.
12. When photographing a large group of people, what arrangement is best, with a view to secure good definition, freedom from distortion, and satisfactory grouping?—40.

#### SECTION B.—PHOTO-MECHANICAL PROCESSES.

*Six Questions only to be attempted.*

1. Describe the principle of making ruled screens for half-tone blocks, and explain the effect of these screens in the making of negatives for blocks.—50 marks.
2. Explain the use and working of a mirror or prism in negative-making.—30.
3. What means are adopted to reverse collodion and gelatine dry-plate negatives when made without the aid of a prism?—40.
4. What is collodion, and how is it prepared for negative-making?—50.
5. Describe the preparation of the resist and etching of a photogravure plate.—40.
6. Describe the processes of making negatives for line and half-tone blocks.—40.
7. State generally the principles of the preparation of tri-chromatic negatives.—60.

8. Give details of the process of etching line blocks on zinc.—50.

9. Describe the working of the enameline process on copper, and give details of the operation of etching the half-tone block.—50.

10. What do you know about the action of bichromate salts in solutions of gelatine? and explain in what way this action is made use of in the processes of photo-lithography and collotype.—50.

#### HONOURS GRADE.

##### SECTION A.—PURE PHOTOGRAPHY.

*Eight Questions only to be attempted.*

1. Why is the "effective aperture" of a lens diaphragm not always identical with the area of the hole cut in the diaphragm? How would you ascertain the "effective aperture" of a given diaphragm when used—(a) in front of a single lens; (b) behind a single lens; (c) between the two components of a rectilinear lens?—40 marks.

2. What are the advantages and disadvantages of pinholes and lenses respectively as a means of producing images? How does the size of the pinhole affect the definition of the image and the exposure required when photographing it?—35.

3. What character of gelatino-bromide plate would you prefer to use for—(a) dimly lighted interiors with strong contrasts, and (b) the reproduction of line drawings? Give reasons, and describe fully how you would develop in each case.—40.

4. Describe the methods of using uranium salts for (a) the intensification of gelatino-bromide negatives, and (b) the toning of gelatino-bromide prints. On what chemical changes do the processes depend, and what precautions must be taken to ensure success in each case?—35.

5. Explain fully the principles on which carbon printing by double transfer depends, paying special attention to the chemical changes, if any, that take place at each stage.—40.

6. What is the platinotype process? How would you keep, expose, and develop the paper? Give full reasons in each case.—30.

7. What do you know about the relation between the chemical constitution of organic compounds and their power as photographic developers?—35.

8. Describe and explain processes for producing (a) blue prints, and (b) black prints, with salts of iron, suitable for the reproduction of plans, drawings, &c.—40.

9. Write a concise account of the nature, use, and dangers of magnesium flash powders.—35.

10. How would you test a sample of red glass, intended for use in a dark-room lamp, with respect to—(a) effective screening, and (b) good illumination? Give reasons for your methods.—35.

11. Describe in detail the arrangement you would adopt for photographing an opaque object under the microscope.—30.

12. How would you proceed to obtain a direct enlargement on platinotype paper?—30.

13. What points have to be kept in mind, and what special precautions or devices are necessary, when photographing objects for the purposes of a photographic survey or record?—30.

#### SECTION B.—PHOTO-MECHANICAL PROCESSES.

*Eight Questions only to be attempted.*

1. Give a description of the camera, screen, lighting, and appliances necessary for the production of negatives by the half-tone process.—40 marks.

2. How is collodion iodised for making negatives for line blocks? and give a formula.—40.

3. Describe "direct" and "indirect" processes for producing tri-chromatic negatives, giving particulars of the colour filters employed, and the treatment of the negatives.—50.

4. Give the working and formula for sensitising ordinary dry plates for the making of tri-chromatic negatives.—40.

5. Explain fully the treatment of dry and wet-plate negatives for the production of half-tone blocks. Describe stops, exposure, development, and other operations.—50.

6. What are the constituents of a sensitising bath for collodion plates? State how it is tested, and how kept in working order.—40.

7. Describe the working of the enameline process on copper, giving formula, and state if any modifications are necessary for using the same process on zinc.—40.

8. What is the "bitumen" process of printing on zinc, and how is it employed?—35.

9. Describe the process of making photogravure plates, giving details and formula.—50.

10. Describe fully, with formula, the process of etching line blocks on zinc.—50.

11. Describe fully, with formula, the process of etching half-tone blocks on copper or zinc.—50.

12. Describe fully, giving formula, the process of making photo-lithographic transfers, and printing the same on stone.—50.

13. Describe fully, giving formula, the process of making collotype plates.—50.

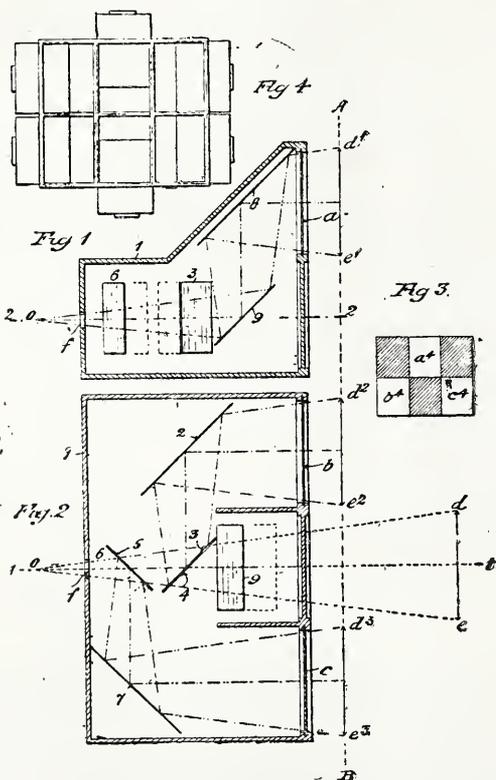

14. How are collotype plates printed, and what treatment is necessary to keep the plates in working order?—40.

15. State what kinds of paper are most suitable for collotype printing, and what operations are necessary for the production of glazed prints to imitate ordinary silver print photographs.—50.

### DR. SELLE'S CAMERA FOR THREE-COLOUR WORK.

[Patent No. 13,666 of 1899.]

DR. SELLE says: "Ever since 1865, when Ducos du Hauron first gave some practicable methods for reproducing the colours of nature by means of a primary colour photography, it has been known that if in conjunction with three-colour filters light was transmitted through three monochrome transparencies representing the three primary colour sensations, three coloured images would arise, which when superimposed would yield an image in the three colours of the original. With a view of facilitating such projection and superposition, apparatus more or less identical was devised by Zink, Ives, Nadar, and others. The commercial value of such methods is, however, small. In the methods above referred to the three transparencies are projected in the colours of the light filters, *i.e.*, the monochrome image representing the blue sensation is transmitted blue, the monochrome image representing the red sensation is transmitted red, and the monochrome image representing the green sensation is transmitted green. But, when three colour sensations have to be reproduced on paper or other opaque substance either by pigment photography or by pigment printing, the pigment used must not be

of the same tint as the light filters or a false picture would result, but the tint must be spectroscopically complementary to the filters, *i.e.*, the red sensation image must be printed in green, the green sensation image in red, and the blue sensation image in yellow. I effect the reconstitution of a non-pigmentary coloured image by reflection projection instead of by transmission projection, and thereby obtain an image made up of the complementary tints. I achieve this by making from three negatives, obtained in the well-known manner, three positive black prints on a white opaque surface, preferably for instance photographic silver paper. If light be now allowed to fall on such prints and then by suitable means be reflected back through the corresponding light filters on to a common point the result will be a combination of three complementary colour images. If in such an apparatus I substitute sheets of white paper for two of such prints the third print will be seen coloured to a tint complementary to that of the filter through which it is seen. In this manner a printer can readily ascertain not only the tint, but the depth of pigment to be employed in printing the particular image, and he can also judge of the length of time for printing the negatives in the production of the printing blocks, matters of great importance because a three-colour print being in substance nothing else but an effect of various reflections of colour rays an excellent result can only be obtained if the tint and depth of the layers of pigment on the paper correspond with the gradations of the negatives. The reflection projection may be carried out by means of

suitably arranged mirrors, but with a view of facilitating this to non-experts, I have constructed an apparatus which apart from arrangement in detail is based on well-known principles. It is obvious that any other similar construction may be used so long as it meets the intended object.

"The apparatus is shown in the annexed drawing, in which fig. 1 is a vertical section on line 1—1 of fig. 2, and fig. 2 a horizontal section on line 2—2 of fig. 1. Figs. 3 and 4 are diagrammatic plan views of dark slides for use with the apparatus when used as a camera.

"A chamber or box 1 is constructed having in one wall three orifices *a b c* and in another wall an eyehole *f* or an eyepiece. Within the chamber are certain reflecting mirrors namely four opaque mirrors 2, 7, 8, 9 and two transparent mirrors 3, 6. The backs 4, 5 of the latter are coloured, that of the one 4 green and that of the other 5 blue, the green and blue coatings being also transparent. This apparatus views simultaneously three prints placed in the same plane *A—B*. One of these prints  $d^3 e^3$  is reflected from an opaque mirror 7 to a transparent mirror 6 and thence to the view point *o*. Another print  $d^2 e^2$  is reflected from another opaque mirror 2 to the other transparent mirror 3 thence through the first transparent mirror 6 to the view point *o*. The last print is reflected from the third opaque mirror 8 to the fourth opaque mirror 9 and thence through the two transparent mirrors 3 6 to the view point *o*. The opaque mirrors may be quicksilver mirrors.

"Whilst the course of the rays entering the apparatus follow well-known laws the reflecting devices are so arranged as to yield an image combining the greatest luminosity with correct superposition. The two transparent mirrors 3 6 standing at nearly a right angle to each other are parallel each to one of the quicksilver mirrors 2, 7, all four being fixed on one base; the third quicksilver mirror 8 is placed as near as possible to the corresponding opening in the case so as to receive as bright and distinct an impression as possible and the fourth quicksilver mirror 9 is so placed that the rays reflected therefrom shall pass in a direct line through the two transparent mirrors 3, 6. The angles at which the rays are reflected from the prints being identical and the respective distances being equal they can be adjusted to coincide in superposition when arriving at the common viewing point *o*. The three openings *a b c* may contain the three light filters, but a red light filter at *c* is sufficient when the aforesaid coloured transparent mirrors are used, since in that case the latter act by themselves as light filters. The three monochrome black prints, having been mounted on a suitable support in a similar order to the position of the three openings or windows of the chamber, are placed at a sufficient distance at the back of the apparatus to allow day or artificial light to fall upon them. The prints thus reflected one over the other will give at the view point *o* a coloured image composed of three reflections in complementary tints. To explain the complementary reflection more particularly I will describe the procedure to be observed when it is intended to project the prints singly or in partial combination so as to serve as a guide and a proof to the printer. Assuming that the image to be reproduced is a black circle on a white ground, the positive prints will be three black circles on a white ground. Having placed these prints at the back of the apparatus as already described, we would first constitute the yellow image, since that is the colour with which printers usually begin, *i.e.*, the first print to be reflected would be the one  $d^2 e^2$  representing the blue sensation. If the other two prints are covered up with black the uncovered print alone will be reflected, and will appear at the view point as a black circle on a blue ground. If now a white surface, a sheet of paper, for instance, be substituted for the black at one say  $d^1 e^1$  of the former prints, so that, for example, the light of the green filter will be projecting on to the former image, it will efface the black circle and give instead at the view point a green circle on a blue + green ground; if now a white paper be substituted for the black at the last covered print  $d^3 e^3$ , the red filter light will be projected on to the double projection already formed, so that the circle will appear red + green (yellowish) on a red + green + blue (*i.e.*, white) ground, thus yielding the yellowish image complementary to the blue sensation print. If again we reflect the print  $d^1 e^1$  before the green filter, covering up the others with white paper, we shall get a red + blue (*i.e.*, purple red) circle on a red + blue + green (white) ground, *i.e.*, the pinkish image complementary to the green sensation; if, lastly, we reflect the third print  $d^3 e^3$ , covering up the others with white, we get a green + blue = light bluish circle on a red + green + blue (white) ground. It will be seen from the above that if the three prints are reflected simultaneously the result is, minus, red green and blue, = black circle, on a plus red green and blue = white ground, or a reflection by subtraction on a reflection by addition.

Apart from its value to printers, the method is of great advantage to the amateur, since, in conjunction with the easily made silver prints, the reflection as described offers a ready means of producing the constituent negatives for a coloured picture. If a lens be fixed at the view point *o* and a slide containing the sensitive plate be placed at the back of the apparatus, the latter can be used as a camera. The three photographs are then taken either simultaneously or consecutively. In the former case the difference in actinism between the three groups of rays have to be provided for by retarding screens or other suitable equalising devices, in the second case the exposures are effected successively by making the re-

reflections operative one at a time only. This is accomplished by substituting two removable opaque mirrors for the transparent mirrors, 6, 3 and withdrawing the first after the red exposure and the second after the blue exposure. Further, the successive exposures may be made by means of a special slide, as shown in diagram in figs. 3 and 4, namely, a frame having three openings  $a^4 b^4 c^4$ , corresponding with the openings  $abc$  at the back of the apparatus. The openings in the slide are provided with shutters as in fig. 4. The plate having been inserted in the slide, one would proceed by drawing the shutters at the three openings consecutively. It is obvious that, instead of taking the three images on a single plate, separate plates may be used for each aperture, which is the preferable course when it is intended to produce subsequently a photograph or print in pigments, or when plates of different colour sensitiveness are used. The slide may also have, as shown in fig. 4, six apertures and shutters instead of three, so that by turning the slide upside down it might be used for another series of exposures, and this again may be duplicated on the back of the slide, forming a double slide, suitable for four series of exposures."

## Our Editorial Table.

THE *Photographer's Exposure Register*, compiled by Mr. G. T. Fields-Clarke, M.S.A., and published by Mr. R. G. Porter, High-street, Bedford, at the price of one shilling, has columned spaces ruled for no less than nineteen entries relating to printing and developing. The careful photographer can record particulars as to (1) number of plate, (2) date, (3) hour, (4) direction of camera, (5) number of slide, (6) subject, (7) light, (8) focus of lens, (9) stop, (10) exposure, (11) speed of plate, (12) developer as per formula, (13) proportions A and B, (14) result, (15) brand of paper, (16) distance from flame, (17) exposure, (18) developer, (19) general remarks. Of the many exposure note-books that have been sent us, the one now under notice is certainly the most comprehensively planned. It appeals to the systematic worker.

### CONVENTION PHOTOGRAPHS.

To the Convention mementoes with which he has already favoured us, Mr. S. H. Fry, of 12, South-villas, Camden-square, N.W., kindly makes the handsome addition of no less than seventeen portraits of "notable personages" in attendance at the Newcastle meeting. These portraits, which are all good and characteristic, were taken by Mr. Fry himself. Here is a list of the originals: Messrs. Frank Bishop, W. Barry, J. Crawford, W. J. Croall, J. Cox, W. E. Dunmore, J. Pattison Gibson, A. L. Henderson, C. Phipps Lucas, George Mason, J. Stuart (Glasgow), J. T. Sandell, Alfred Seaman, H. Snowden Ward, E. J. Wall, and G. Watmough Webster.

THE Platinotype Company also send us a print in platinum from a negative of the President, taken at Newcastle-on-Tyne by the oxymagnesium lamp, which was so largely used there. Lighting and likeness have been pronounced good, and the portrait is declared to be an excellent example of the kind of work produced by the light.

## News and Notes.

WE are very sorry to learn of the death on Friday, August 24, of Mrs. Stuart, the wife of Mr. John Stuart, of Glasgow and Helensburgh. The deceased lady, who had been ailing some little time, endeared herself to all by her great courtesy and gentleness. We offer our friend, Mr. Stuart, our sincere sympathy in his bereavement, and we are sure we shall be joined in our condolence by very many readers of the JOURNAL.

AN amusing illustration of the extent to which the mind of British youth is coloured with "khaki" tint, says a writer in the *Daily Chronicle*, comes from one of our public schools. According to the *Edmundian*, a natural science master desired his class to note that "hydrogen is not found in the free state." Subsequent investigation disclosed that every note book contained the startling information: "No hydrogen is found in the Free State."

WE are pleased to hear that Messrs. West, of Southsea, are adding fresh pictures to "Our Navy," and are keeping it well up to date. By permission of the Lords of the Admiralty, one of the firm has spent the last three weeks on H.M.S. *Jupiter*, and has secured some excellent cinematograph series of the naval manoeuvres, such as evolutions of the fleet, ships in a heavy sea, heaving the lead, officers playing cricket on the quarter-deck, and sailors running along the boat boom to man the cutter, with one of them falling overboard and his mates to the rescue.

THE Röntgen Society of the United States will meet in New York City, December 13 and 14, at the Academy of Medicine. Addresses have been promised by eminent men at home and abroad, and a successful meeting is assured. Visiting members may obtain information in X-ray work. It is especially desired that all those who are using the X ray in any way, either

professionally or experimentally, send their names and addresses to the Chairman of the Committee of Arrangements, Dr. S. H. Monell, 45, East Forty-second-street, New York City. The Society is the only one of its kind in America, and is for scientific purposes only.

THE Sefton Park (Liverpool) Photographic Society's Second Annual Exhibition will be held at the High Schools, Arundel-avenue, Tuesday, Wednesday, Thursday, Friday, and Saturday, October 30 to November 3, 1900. The Judges are Messrs. F. Anyon, Paul Lange, and Geo. E. Thompson. The following are the open classes: Landscape and Seascape, Portraiture and Figure Studies, Architecture, Hand-camera work (camera must have been held in the hand during exposure), Lantern Slides, Champion Class. Entry forms and fees only are to be sent to Mr. Geo. Birtwhistle, 7, Gainsborough-road, Sefton Park, Liverpool, who will send copies of the prospectus on application.

CRIPPLEGATE PHOTOGRAPHIC SOCIETY.—The first meeting of the new session will be held on Monday, September 3, 1900, at 7.45 p.m., when Mr. W. D. Welford, will give a demonstration on the new "Thornton Film." Applications for membership of this Society should be addressed to the Hon. Secretary, Mr. Alfred T. Ward, Cripplegate Institute, Golden-lane, E.C., who will be pleased to supply the necessary particulars. The Annual Exhibition, held in conjunction with the Essex and Middlesex Cycling Union, Limited, will be held on November 7, 8, 9, and 10. Entry forms will be ready shortly, and may be had on application to the Hon. Secretary as above.

THE KAISER AND THE PHOTOGRAPHS.—The King tells the following anecdote of the Austrian Emperor: "During one of the audiences which he frequently holds at the royal palace overlooking the Danube, a Magyar blacksmith approached him, and, drawing from his pocket two photographs, asked for the signatures of the King and Queen. 'The Queen is not here,' said the King, 'and besides I cannot give you my signature at the present moment, for I have neither pen nor pencil.' 'I have brought a pencil with me,' said the smith. The King immediately did as his subject wished, and handed back the photograph with the customary bow of dismissal. But the smith making no attempt to retire, the King said, 'Is there anything else I can do for you?' 'Yes, your Majesty, I am waiting for my pencil.' The King searched his pockets, found that he had absent-mindedly appropriated it, and then returned it with a laugh."

"So much has been written in this column," says the art critic of the *Daily Chronicle*, "about colour prints, that no further reference would be made to the subject at the present moment but for the specimens that are being continually sent in, and for another protest from Mr. Holme. Mr. Holme says, at great length, that his colour prints in the *Studio* satisfy artists, and even deceive them into taking the reproductions for the originals. This is not to be doubted for a minute. Every one knows the story of Rembrandt picking up the gold pieces which his students painted on the floor—a story which would tell in Mr. Holme's favour. Mr. Holme also says that 'a drawing in flat tints suitable for reproduction by lithography or by wood blocks, is not well adapted to the half-tone block process.' But, certainly, the drawing in elaborate washes that appears as frontispiece in this month's *Studio* is scarcely suited to the half-tone or any other mechanical process. It is to be hoped that the reproduction, amusing as it is, is not a perfect facsimile of the original. There is another suggestion, too, that might be made to Mr. Holme—that he should give, in his table of contents, the names of the engravers who reproduce the colour prints in the *Studio*, and the methods by which these were done. It would be of extreme use to artists. Mr. Holme seems to think that drawings lose by too great reduction in size. Of course, some do. But that is not the question; it is simply that many colours, to say nothing of an endless range of tones, cannot be reproduced by any mechanical process whatever. Mr. Holme is doing very interesting, and at times very good, work in publishing these colour prints; but that is no reason why they should be declared perfect. A number of other prints have been sent in, among which a pastel drawing by Ludwig van Hoffman, reproduced by the Sella-graph process, and submitted by Mr. Roxby, does retain somewhat the effect of pastel in different passages. But it, too, is only a proof of the difficulties of colour reproduction, as other portions of the print are as crude as possible. In fact, the cruder the original is, frequently the better it comes out. A print of some fruit and flowers is more like the natural objects than the print is like art."

## Patent News.

THE following applications for Patents were made between August 13 and August 18, 1900:—

AUTOMATIC APPARATUS.—No. 14,459. "Improvements in and relating to Automatic Coin-free Photographing Apparatus." Communicated by: E. Feret and M. Benart. A. F. SPOONER.

CAMERA.—No. 14,466. "Combined Plate and Film Camera." Complete specification. A. P. GILL.

FINDER.—No. 14,473. "Improved Finder and Levelling Device for Photographic Cameras." Complete specification. F. W. O. LISCHKE.

LENSES.—No. 14,487. "Improvements in Astigmatically Corrected Lenses." Complete specification. C. P. GOERZ.

DEVELOPMENT.—No. 14,530. "An Improved Method of and Means for Treating Exposed Photographic Films." J. W. FOSTER.

WASHER.—No. 14,654. "An Improved Washing Device for Photographic Prints." J. S. SMITH.

FLASHLIGHT.—No. 14,700. "Improvements in Flashlight Apparatus for Use in Photography." J. SCHMIDT.

## Meetings of Societies.

### MEETINGS OF SOCIETIES FOR NEXT WEEK.

September.	Name of Society.	Subject.
3.....	Cripplegate Photo. Society .....	{ Demonstration: <i>The New Thornton Film.</i> W. D. Welford.
3.....	Southampton .....	Print Competition: <i>Architecture.</i>
4.....	Aintree .....	{ Demonstration: <i>The Lantern Slide and How to Make It.</i> G. H. Jackson.
4.....	Bootle .....	{ Demonstration: <i>Beginners' Faults and their Remedies.</i> G. H. Heathcott.
4.....	Gospel Oak .....	Prize Slides.
4.....	Hackney .....	Members' Open Night.
8.....	Borough Polytechnic .....	{ Excursion: <i>Cashiobury Park.</i> Leader, P. C. Cornford.
8.....	Brentford .....	{ Excursion: <i>St. Albans.</i> Leader, A. R. Read, jun.
8.....	Redhill and District .....	{ Excursion: <i>Zoological Gardens.</i> Leader, J. O. Grant.
8.....	South London .....	{ Excursion: <i>Perry Vale.</i> Leader, F. Goddard.

### PHOTOGRAPHIC CLUB.

AUGUST 22.—Mr. F. A. Bridge in the chair.

Mr. George E. Brown was unanimously elected a member of the Club.

Mr. MACKIE, referring to the remarks he had made about the kachin developer at the last meeting, said that he had since found out that the solution he used was not made up according to the makers' instructions, and he thought that this was no doubt the reason of the slow action of the developer. At the same time he remarked that the formula given in No. 2101 of THE BRITISH JOURNAL OF PHOTOGRAPHY could not possibly be correct, as the B and C solutions given were identical, containing both one ounce of sodium carbonate to nine ounces of water.

The following question was found in the question-box: "How do you know when a negative is fixed?"

A lengthy discussion took place, in which nearly the whole meeting took part, and the combined wisdom of the members present eventually furnished the following reply:—

A plate may be considered properly fixed after it has been in the fixing bath as long again as it took to remove the last traces of white on the back of the plate. To fix a plate thoroughly means to allow a sodium thiosulphate solution to act on the silver bromide in the film until the latter solution has been completely transformed into the double thiosulphate of silver and sodium ( $\text{Ag}_2\text{Na}_4(\text{S}_2\text{O}_3)_3 \cdot 2\text{H}_2\text{O}$ ). There are two distinct chemical actions taking place during the process. The silver is, first of all, transformed into silver sodium thiosulphate ( $\text{AgNaS}_2\text{O}_3 \cdot \text{H}_2\text{O}$ ), and this salt again combines with a further quantity of sodium thiosulphate to form the double salt above referred to. It takes twice the quantity of sodium thiosulphate to form the second salt as it takes to form the first; and if in conjunction with this fact one bears in mind that the first salt is opaque, while the second salt is only partially opaque, it may be safely assumed that the operation of fixing has been about half completed as soon as the negative has become quite transparent.

Mr. MACKIE remarked that a rough-and-ready way to find out whether a plate was properly fixed was to put one's tongue to it. The first salt formed being very sweet to the taste, its presence could be easily detected; and, if the negative had a sweet taste, it would be a sure sign that it was not yet sufficiently fixed.

Mr. FOXLEE said that, in dealing with the question as above, it must, of course, be assumed that a fresh fixing bath was being used, as the rule might not hold good with an exhausted bath. An exhausted fixing bath was, in his opinion a most dangerous compound, and he warned photographers not to be too economical in this respect, as doing so might mean "to spoil the ship for a ha'porth of tar."

North Middlesex Photographic Society.—August 20, Mr. J. C. S. Mummery in the chair.—Mr. H. W. BENNETT gave a lecture on SILVER PRINTING AND TONING.

As this was one of the monthly instruction meetings, he confined his remarks to an elementary description of the best methods of getting prints on albumenised and gelatino-chloride papers, and the best toning baths to use. A red image on the paper as it comes from the frame is best, as it is more easily managed in the toning bath. For warm tones, albumen prints require to be printed for about twenty-five per cent. longer than it would take if stopped at the depth required when finished. Gelatino-chloride would take more, say fifty per cent. For purple tones the printing should be carried still further. He did not like the usually recommended sulphocyanide toning bath, as it was almost impossible to avoid double tones. He gave several others which answered for albumen and P.O.P. 1. Sod. acetate, 24 grains; gold chlor. 1 grain; boiled water, 10 ounces. Mix 24 to 48 hours before using. 2. Borax, 80 grains; gold, 1 grain; water, boiling, 10 ounces. Add gold after cooling. This turns purple, but is then in best condition for toning. 3. Sod. phosphate, 24 grains; gold, 1 grain; water, 20-30 ounces. Not for albumen. This tones quickly. Use the larger quantity of water for warm tones. The temperature should not exceed 60°-75° for albumen, 60° for P.O.P. A weak salt bath used after toning stops further action. Fix in hypo 3 ounces to pint with 1 drachm ammon. '880, 12 to 15 minutes.

Redhill and District Camera Club.—On Saturday, August 18, the Redhill and District Camera Club had an excursion to Hampton Court. Starting from Redhill at midday by rail and cycle, the members on their arrival at the ancient Palace were conducted over the historic building by the Secretary of

the Club (Mr. F. H. Ellwood), who drew attention to the principal objects of interest. After roaming through the apartments and galleries, the members proceeded to take full advantage of the special permission which had been obtained to photograph the Palace within and without. A goodly number of plates were exposed, and, as it was a perfect day for photography, some good pictures should have been obtained. Whether any of the historic ghosts have appeared upon the members' negatives, we have not as yet heard.

### FORTHCOMING EXHIBITIONS.

- 1900.
- Sept. 21–Nov. 3 ..... Photographic Salon, Dudley Gallery, Piccadilly. Hon. Secretary, R. W. Craigie, Camera Club, Charing Cross-road, W.C.
- October 1–Nov. 3 ... Royal Photographic Society, New Gallery, Regent-street. The Hon. Secretary, 66, Russell-square, W.C.
- „ 17–20 ..... Rotherham Photographic Society. Hon. Secretary, H. C. Hemmingway, Tooker-road, Rotherham.
- November 7–10 ..... Cripplegate Photographic Society and the Essex and Middlesex Cycling Union, Ltd. The Hon. Secretaries, A. T. Ward, Cripplegate Institute, E.C., and G. F. Sharp, Sach-road, Upper Clapton, N.E.
- „ 12–17 ..... Ashton-under-Lyne.
- „ 21–23 ..... Hackney Photographic Society.
- „ 22–24 ..... Hove Camera Club. Hon. Secretary, C. Ber-  
rington-Stoner, 24, Holland-road, Hove.
- 1901.
- January 14–19 ..... Blairgowrie and District Photographic Association. The Hon. Secretaries, Blairgowrie, N.B.

Those who desire to send photographs to the above Exhibitions should write for prospectuses to the Hon. Secretaries, whose addresses are given in the second column above. The dates mentioned are those at which the Exhibitions open.

## Correspondence.

\* \* \* Correspondents should never write on both sides of the paper. No notice is taken of communications unless the names and addresses of the writers are given.

\* \* \* We do not undertake responsibility for the opinions expressed by our correspondents.

### A SUGGESTION.

To the EDITORS.

GENTLEMEN,—Permit me to suggest, before we commence the year 1901, that there be a cyclopædia compiled and published from and including the first year of your publication and that of this year 1900, somewhat similar to the cyclopædia published in 1893 of the *Scientific American* journal, which is a summary under various headings of the most valuable articles in back numbers of the *Scientific American* journal, and saves all searching through the back numbers. I consider if such a cyclopædia of THE BRITISH JOURNAL OF PHOTOGRAPHY were published, it would prove a most valuable work as far as photography is concerned, more particularly if it had a good index, and so save searching through back volumes for sometimes most valuable articles not to be found in any work. Many of the contributions might be omitted, as instance those recounting travels of photographers, many others much curtailed and the others compiled under separate heads, as, for instance, wet plate, dry plate, &c.; mechanical processes—colotype, zinc, copper, &c.; printing—albumen, gelatine, bromide, platinotype, carbon, &c.; mechanical printing processes, &c. There have been many processes since the first days of the JOURNAL, some little used now, why, I cannot imagine; some produced most beautiful results, and I even use them occasionally now; and some afforded great facility to an artist for colouring, and most beautiful results were obtained. I should say, if it were made known that such a cyclopædia was about to be published, sufficient subscribers could be got as would cover all expenses of compiling and publication, so as to leave a certain profit for the volumes sold to non-subscribers. You may not think much of my suggestion, as I am only an amateur, but rather an aged one now (in my seventy-fifth year). However, my experience is rather long—from 1853, when I was working at the Daguerreotype before I left the old country to come to Australia. I am pretty well aware of, and can work, most of the photographic processes; in fact, I have strayed into paths not much frequented by amateurs, namely, the various photo-mechanical and printing processes, and not to be, perhaps you will consider, rather egotistical, those in the trade, not only the portrait men, but the mechanical men, have consulted me; in fact, the owner of one of the largest businesses in the Colony, and most successful as an engraver and lithographer and photographer in illustration by half-tone, &c., was induced through me to learn and go into the

business. He was only an ordinary seaman before the mast. He never had any instruction from a professional instructor. I hope you will take my suggestion into consideration.—I am, yours, &c., R. W. HOLMES.  
20, Webster-street, Ballarat, Victoria, Australia, July 17, 1900.

[We are very pleased indeed to have a letter from a correspondent whose photographic experiences antedate even that remote historical occurrence, the foundation of THE BRITISH JOURNAL OF PHOTOGRAPHY in 1854. The suggestion he kindly makes shall be kept in view.—EDS.]

#### BRITISH AWARDS AT THE PARIS EXHIBITION.

To the EDITORS.

GENTLEMEN,—We have pleasure in advising you that our exhibit at the Paris Exhibition has received the highest award—the Grand Prix.

We take the opportunity of remarking that the great interest evoked by the introduction of the Panoram Kodak, No. 3 Folding Pocket Kodak, and, notably, by the ingenuity and efficiency of the little Brownie, must be of enormous benefit to the photographic trade generally. The latter camera alone has, beyond a doubt, added many thousands of amateurs to the photographic public.

If you will kindly give publicity to this communication in the columns of your esteemed publication, we shall be much obliged.—We are, yours, &c.,  
KODAK, LIMITED.

43, Clerkenwell-road, London, E.C., August 20, 1900.

To the EDITORS.

GENTLEMEN,—We have been awarded two gold medals at the Paris Exhibition for cameras and microscopes; and the manager of our camera factory has also been awarded a silver medal.—We are, yours, &c.,  
W. WATSON & Sons.

313, High Holborn, London, W.C., August 21, 1900.

To the EDITORS.

GENTLEMEN,—In an article headed "British Awards at the Paris Exhibition," which appears in your issue of August 24, it is stated that we have been awarded gold medals in Classes 12 and 15. This is not quite correct, our awards consisting of a gold medal in Class 12 and a Grand Prix in Class 16.—We are, yours, &c.,  
ROSS LTD.

111, New Bond-street, London, W., August 24, 1900.

To the EDITORS.

GENTLEMEN,—We have pleasure in informing you we have been awarded a gold medal for our exhibit at the Paris Exhibition and a bronze medal for the Reliance Press which forms part of our exhibit.

Mr. W. Gamble has been awarded personally a gold medal as collaborateur and as editor of the *Process Year Book* and also of other photo-mechanical publications.

Our representative, Mr. Paul Neven, has also been awarded a silver medal for his services in the Exhibition.—We are, yours, &c.,  
A. PENROSE & Co.

8 and 8a, Upper Baker-street, Lloyd-square, London W.C.  
August 25, 1900.

To the EDITORS.

GENTLEMEN,—We notice that you stated in your last issue that we have been awarded a silver medal in the Paris Exhibition.

Our award was a "Grand Prix," as you will see by enclosed copy of a letter from our agents in Paris, confirmed by two further letters of inquiry.—We are, yours, &c.,  
W. J. BYRNE & Co.

Richmond, Surrey, August 27, 1900.

[We are much obliged to those firms who have advised us of the awards that have been made to them at Paris. As we stated in our last week's article, a correct list was not available through the ordinary channels of information. The public has had to rely on newspaper reports or the advices of exhibitors for intelligence as to the destination of awards. To most minds it might appear that one of the functions of the British Commission would be to procure at the earliest possible moment a list of awards to exhibitors from the United Kingdom, and give it the utmost publicity.—EDS.]

#### THE METRIC SYSTEM.

To the EDITORS.

GENTLEMEN,—I notice in the Answers to Correspondents in your issue for August 24 one to Colonel Gubbins on the metric system. I fear your note will not help him much, and hope that you will allow me to amplify it.

Colonel Gubbins appears to have noted that to the metric formulæ he quotes the proportion of the sodium sulphite in the adurol is 8:1, and

remarks that it is not the same in the two versions of the formula given; in this he is quite correct, but a reference to preliminary remarks on p. 1018 of your ALMANAC will show him that, when the publishers of formulæ give their own versions of equivalent values, they have been adopted; that has been done here. The people who supply these data use round numbers, and apparently have considered that the approximations given are sufficient for practical purposes, though a nearer approach might be given to the metric formula. That is the simple solution of his difficulty, either proportion will be sufficiently accurate, as is manifest to any one who considers the parts which the two chemicals play in the development.

Allow me, however, to express my dissent from the last part of your reply: Colonel Gubbins will, I think, do better to have separate measures for the English and metric systems, and adopt one or the other entirely. I am aware that you have stated that you have marked your metric weights with their equivalents in English weights, and made them useful for both purposes; but I think most people will agree with me that to make up most English formulæ by the metric weights would involve a troublesome arithmetical calculation, and be a fertile source of errors; that too, would I believe be also, though to a less extent, the result of using measures divided both for English and metric units. Any one who makes up solutions by the two sets of formulæ will soon find out the greater simplicity of those on the metric system in use.—I am, yours, &c.,  
J. F. T.

#### ELEVENTH INTERNATIONAL EXHIBITION, CALCUTTA.

To the EDITORS.

GENTLEMEN,—With reference to my letter of 18th ulto. I have pleasure in furnishing you with complete details regarding the arrangement made by the Society for dispatch to Calcutta of the photographs of intending Exhibitors.

Mr. C. H. Coates, late Treasurer of the Society, at present on furlough, will receive any photographs that may be sent to him, c/o Messrs. W. J. Keymer & Co., 60 Fenchurch-street, London, E.C.

These will then be packed and dispatched by him to Calcutta on October 31. Pictures must be delivered at this address, free of cost to the Society, who, however, bear all charges for freight to and from India.

Competitors may, of course, send their exhibits direct if they prefer to do so. They should be dispatched not later than November 15.

If you will kindly draw attention to these points in your esteemed JOURNAL, I shall be greatly obliged.—I am, yours, &c.,

T. C. DOWNING, Honorary Exhibition Secretary,  
Photographic Society of India, Club and Dark Rooms,  
57 Park-street, Calcutta.

#### KACHIN.—A CORRECTION.

To the EDITORS.

GENTLEMEN,—In my article on Kachin, which appeared in your issue of the 10th inst, are two typographic errors in the 10 per cent. solutions, page 502, which kindly allow me to correct. In solution C, instead of sodium carbonate, read sodium sulphite; and, nine lines below, for sulphate read sulphite.—I am yours &c.,  
E. W. FOXLEE.

Acton, W.

#### THE TANQUERAY FRAUDS.

To the EDITORS.

GENTLEMEN,—In to-day's issue of the *Daily Mail* the Tanqueray fraud is again exposed.

If photographers in every town throughout the country would cut out that paragraph and place it in a conspicuous position in their windows or show-cases, I venture to think the "Société Artistique de Portraits" would soon "find their occupation gone."—I am, yours, &c.,  
Leicester, August 24, 1900.

HENRY M. WARD.

#### AN OFFER.

To the EDITORS.

GENTLEMEN,—I am fairly well advanced in portrait painting, but desire a few lessons in life-size work, and am willing to offer the hospitality of my house and board (piano, &c.) free for a fortnight in return for about an hour's lesson a day. I may say Dolgelly is a favourite holiday resort, being near sea, &c. Every effort will be made to make holiday most enjoyable. Not knowing an oil artist, I should be much obliged for your kind suggestion to obtain same. Thanking you in anticipation, I am, yours, &c.,  
A. HAWKINS.

Dolgelly, August 25, 1900.

[Some reader, having the necessary ability and the desire for a seaside holiday, will probably communicate with our correspondent. Failing an advertisement, this is the only suggestion we can offer.—EDS.]

## ABOLISHING THE DARK ROOM.

To the EDITORS.

GENTLEMEN,—In your BRITISH JOURNAL PHOTOGRAPHIC ALMANAC for 1900 is an article by Mr. E. Howard Farmer, on "Abolishing the dark room," p. 803, in which he appears to refer, for an account of the light filters used, to a communication to the Royal Photographic Society, May 1898. As I should like to repeat his experiments, could you inform me where I can get a copy of the information *re* filtering material?

I have devised an apparatus for determining the density of negatives, which I find very useful in all printing processes, saving a great waste of time and paper. If you consider it worth a place in your next PHOTOGRAPHIC ALMANAC, I enclose an account of the apparatus, which you are at liberty to make any use of you may think fit.—I am, yours, &c.,  
Wanganui, New Zealand. C. W. BABBAGE.

[A copy of the *Journal* of the Royal Photographic Society, containing Mr. Farmer's first paper, can be obtained of the Secretary of the Society, 66 Russell-square, London, price 1s., plus postage. The interesting communication sent us by our correspondent will appear in our forthcoming ALMANAC.—EDS.]

## Answers to Correspondents.

\* \* All matters intended for the text portion of this JOURNAL, including queries, must be addressed to "THE EDITORS, THE BRITISH JOURNAL OF PHOTOGRAPHY," 24 Wellington-street Strand, London, W.C. Inattention to this ensures delay.

\* \* Communications relating to Advertisements and general business affairs should be addressed to Messrs. HENRY GREENWOOD & Co., 24, Wellington-street, Strand, London, W.C.

## PHOTOGRAPHS REGISTERED:—

C. A. Walker, 176, Upper-street, Islington, N.—Photograph of L. W. Pursey.

J. Mack, Alexander-terrace, Coleraine, Co. Derry.—Two photographs of Sir G. S. White.

T. W. Calcutt, 21, Castle-street, Hill Top, West Bromwich.—Photograph of two old folks in a donkey cart.

A. Burchardt, Brashfield, Bicester.—Photograph of Lieutenant F. Tait, Mr. E. Blackwell, and T. Morris.

T. McKey & Son, 62, Hill-street, Newry, Co. Down.—Photograph of group of the Newry Roman Catholic boys' brigade.

N. N.—Send us your name and address, and we will answer your question. As a reader of the JOURNAL, you should be aware of the rule you are breaking.

OVER-EXPOSURE OR FOG?—TROUBLED (Bradford). The negatives sent do not exhibit signs of over-exposure. They are slightly veiled, it is true, and this might be due to too-prolonged development. The plates do not appear to be faulty.

ARISTOTYPE PAPER.—PAPER writes: "Where can I get the American Aristotype paper in England? I am under the impression that there is an agent in England."—In reply: Write Messrs. O. Sichel & Co., 52, Bunhill-row, E.C.; they may be able to supply you.

ADDRESS WANTED.—G. THOMAS DAVIES writes: "Referring to the first paragraph in the second column of p. 500 of the JOURNAL, I should be grateful to know the address of the firm, or a firm, from whom I can obtain the prints."—From Franz Hanfstaengl, 16, Pall Mall East, or through any printsellers.

PURATYLENE.—ACETYLENE writes: "As a user of acetylene, I should esteem it a great favour if you would give in your next issue the address of the Gold & Silver Company, where the puratylene mentioned by your correspondent, Mr. R. J. Moss, may be obtained."—In reply: Better address Mr. Moss, at 97, Great Hampton-street, Birmingham. We have, this week, no means of directly ascertaining the address for you.

FELLOWSHIP OF THE R.P.S.—S. FINNEY writes: "1. How can one obtain an F.R.P.S.? 2. In what subjects would one have to pass? 3. What fees are required? 4. Also, would one have to reside in London to study for same?"—In reply: 1. By election at the hands of the Council of the Society. 2. There is no examination, but a candidate's qualifications are examined by a Fellowship Admissions Committee. 3. None; but the subscription of a Fellow is 2l. 2s. per annum. 4. No.

STUDIO DESIGN.—COSMO. As the studio has to be built close to the wall of the house, there would be no advantage whatever in having the ridge roof; indeed, it would be a disadvantage. Therefore have the lean-to form shown in sketch B. The position is admirable, as you will have a direct north light, and be shielded from the sun, so that a simple system of blinds will suffice. If, in such a studio, you do not get as good portraits as ever were taken, it will be your fault, and not that of the studio.

A COPYRIGHT QUESTION.—T. KING writes: "A few months ago I sold a view of our church to a local grocer. When I did so, he told me he wanted it for a traveller. I thought it was some one interested in the place, who would like to have a photograph of it; now it turns out he has used it for the decoration of china of various firms. Can I do anything in it? I do not see why he should be allowed to use my photographs for such a purpose without my permission."—In reply: You can proceed, and recover for infringement of copyright—we presume the photograph is registered.

THE "PHOTO-MINIATURE."—PHOTO writes: "I should esteem it a favour if you would inform me concerning the *Photo-Miniature*, so favourably reviewed by "Cosmos" in your issue of August 17, p. 518. 1. Whether it is a regular periodical, or a series of small handbooks that may be obtained in individual numbers. 2. The price per issue or number. 3. The publisher or agent in this country."—In reply: 1. It is a monthly publication, each number being devoted to the treatment of a separate subject. 2. Twenty-five cents, say, one shilling. 3. Dawbarn & Ward, Farringdon-avenue, London, E.C.

PHOTOGRAPHY IN SOUTH AFRICA.—L. T. C. L. writes: "Two young men, professional photographers, are thinking of going to South Africa when the war is over with a view of travelling through Cape Colony and practising outdoor photography. Will you kindly give your opinion as to the wisdom of the undertaking?"—In reply: A matter upon which it is obviously difficult for us to advise. Between the years 1881-99 we had personal knowledge of South African photographers who were prospering. So far as we are in a position to form an opinion, our correspondents might do worse than put their intention into execution.

P.O.P. TROUBLES.—F. WILSON writes: "I am using a good make of gelatine P.O.P., but prints on drying have a dead dull surface, unlike a gelatine paper; this has only been so a few weeks. The makers say that the hot weather may be the cause, as it has given them trouble in the manufacture of the paper. I use the sulphocyanide bath, and alum after fixing."—As the makers say that the trouble is due to the hot weather, we have no doubt it is. The only suggestion we can make is to procure some paper made since the weather has been cooler. Excessively hot weather causes a great deal of trouble to workers with gelatine.

STUDIO-BUILDING.—JOHN E. EDWARDS writes: "I am about to commence business as a photographer, and should esteem it a great favour if you would kindly give me some information concerning the erection of a suitable studio. My intention is to build a studio (a lean-to), say, thirty feet in length and about fifteen feet wide. Will you kindly inform me how high the building should be on the light side, what degree should be the slope of the roof, and how many feet across the roof ought to be glazed?"—If the height to the eaves be made about seven feet six inches, and to the top about twelve or thirteen feet, the slope will be very suitable. Have about five feet six or a little more at either end, top and sides opaque, and the rest may be glass.

ALBUMENISED PAPER.—M. N. MOSDIKHIAN, of Cesarea, Asia Minor, writes: "The JOURNAL is my best delight—I cannot get on without it; many thanks also for the phototype copy of the members of the Photographic Convention. Will you be, sir, so kind as to give me the best way of sensitising albumenised paper, and the best toning formula for the same to obtain good violets on prints?"—Float the paper on a sixty-grain solution of nitrate of silver for from two to three minutes. The following bath will give deep tones: Chloride of gold, 1 grain; phosphate of soda, 20 grains; water, 8 ounces. Other formulae will be found on p. 1080 of the ALMANAC. It should be borne in mind that the tones of the print depend as much, or more, on the character of the negatives as they do upon the constituents of the toning bath.

COPPER DEVELOPING TANK FOR CARBON PRINTS; LENS APERTURES.—W. J. BARBER writes: "I am about having a new developing tank made for carbon prints, and would like to have it in copper; would you kindly say whether bich. potash would have any injurious effect on that metal? Or would it be advisable to have the tank in tin-plate, as usual? 2. Also, I have recently had a new set of stops supplied to a portrait lens by Suter, and he has numbered same according to uniform system of this country, *i.e.*, Nos. 2, 4, 16, &c., but the largest aperture is marked 0.65. Kindly say the value of the latter stop. I presume it is somewhere about  $f/3\frac{1}{2}$ ."—1. Copper will do very well, and will be far more durable than the usual tin or zinc vessels. 2. Ascertain the focal length of the lens and divide it by the aperture of the largest stop, and that will give you the *f* value.

HOME PREPARATION OF DRY PLATES.—DRY PLATE writes: "I have occasion to use nearly three gross of plates weekly. 1. Could I by following any really good formulae reasonably expect to be successful in making my own dry plates, coating same separately as with wet plates? 2. If with some little care and brains you think I might succeed, would you be good enough to recommend a formula, or the best book on emulsion?"—In reply: We cannot recommend our correspondent to take up the home preparation of gelatine dry plates. The difficulties in the process are not great, but uniformity of quality is difficult to secure in a succession of small batches. At one time many photographers, amateur and professional, made their own plates, but the commercial articles were much dearer than they are now and not so good. "Dry Plate" had best leave well alone, we think.

SPOTS ON PRINTS.—W. SLADE writes: "I should feel very grateful if you could inform me the probable cause of the spots on two enclosed prints. They turn up every week. For two years I've tried all means to avoid them, but cannot. Are some of them in the paper, so cannot be avoided? I am using at present Otto P.O.P., and my proper studio camera. Lately, sharply focussed subjects have turned out out of focus, and I am at a loss to know where the defect lies. I am using my outdoor camera at present, and get every negative sharp by it, so there is something wrong."—1. The spots appear to be due to particles of something that has come into contact with the paper while it is wet. Particles of iron in the washing waters, prior to toning, would produce similar spots. 2. It is obvious that the plane of the focussing glass does not coincide with that of the plate. The two require adjusting. If you cannot do that yourself, you had better send the camera to its maker.

The ALMANAC for 1901 will appeal to photographers all the world over as a daily reference guide in practical work. The formulæ will be revised where necessary, and the latest departures in theory and practice will be chronicled. The year's advances will be recorded, and wherever practicable new features of an informative nature will be added.

Adhering to an old and much-appreciated custom, we invite short contributions on practical subjects for the pages of the 1901 ALMANAC. Those of our friends intending to co-operate with us in this respect can help us by letting us have their MS., sketches, &c., at the earliest possible date.

Secretaries of societies will oblige if they will forward us lists of officers and other details for inclusion in the directory of photographic societies. We shall also be glad to receive any additions that may be made to the list of telegraphic addresses of the trade, &c. As usual, a section of the ALMANAC will be devoted to notices of the latest introductions in photographic apparatus, &c. Those firms who wish to take advantage of this feature should communicate with us as early as possible.

The publishers ask us to remind advertisers that many of the advertisement pages of the ALMANAC are already booked, and that, to ensure insertion and good positions, orders and copy should reach them without delay.

## EX CATHEDRÀ.

IN the Notes and News of the Camera Club *Journal* for September there are some items of information relating to well-known photographers which may be of general interest. One of the oldest members of the Club, a contributor of papers to the now abolished Conferences, Mr. H. H. O'Farrell, is back again in England, enjoying leave from his official duties in India. Baron Meyer Watson, who, with the Baroness, has been paying a visit to Sir Claude Macdonald at Peking, left the city before the investment actually commenced, and is now understood to be in Japan. Colonel Holbeche has been promoted to be a Knight of Grace of the Order of St. John of Jerusalem. Amongst the forthcoming lectures to be delivered at the Club will be one by Mr. H. C. Shelley, the war correspondent of the *King* and the *Westminster Gazette*. The subject will be "War

## THE BRITISH JOURNAL PHOTOGRAPHIC ALMANAC FOR 1901.

Edited by THOMAS BEDDING, F.R.P.S.

THE fortieth annual issue of THE BRITISH JOURNAL PHOTOGRAPHIC ALMANAC will be published on December 1 next. Its preparation is already receiving attention. This year's ALMANAC reached a total of 1516 pages, and, as was the case in 1899, the entire edition of 20,500 copies was sold out within about three months of publication. Of no other photographic book ever issued can two such unique facts be recorded.

The striking favour with which past ALMANACS have been received is the surest proof that the lines upon which that publication is produced meet the requirements of its readers and supporters. Upon such lines we propose compiling the volume for 1901. At the same time we shall be pleased to receive and consider suggestions for increasing the value of the ALMANAC in directions which may occur to our readers as susceptible of improvement.

on the Veldt," and it will be illustrated by slides made from the author's negatives. Mr. Shelley's lecture will probably pack the Club meeting-room to the limits of its seating and standing capacity. The number of the Club *Journal* from which we are quoting is full of exceptionally interesting articles and papers. Mr. A. C. Beard describes, in a chatty manner, life on board a battleship during the Naval Manœuvres. "The Autocar of To-day," by Mr. Henry Sturmey, is a topic of universal interest at the present time. Professor Cecil Bendall, M.A., supplies some notes of a recent tour in India and Nepal; Japan is dealt with by Mr. J. W. Groves, F.L.S.; and "Sixty Years of Frontier Warfare," by Major A. C. Yate, I.S.C., is another interesting paper. "The Siege of Kimberley," by Mr. G. M. C. Luard, M.A., one of Reuter's correspondents, concludes a singularly varied and readable number.

\* \* \*

OF their *Anglo-Saxon Guide to the Paris Exhibition*, Messrs. Boot & Son, Limited, of 24, Old Bailey, E.C., are issuing a second edition. It is prefaced by a complete list of the British awards, and thus it is worth preserving for future reference. Running to some 240 pages, the book is really an admirable guide to the Exhibition and the sights of Paris, fully illustrated, and written throughout in an easy colloquial style which makes it pleasant reading. One of the special articles, of which there are a considerable number, treats of the attractions of Paris from a photographic point of view. This tells the would-be photographer what to take and when to take it, and supplies him with many other hints that are likely to be of service. The writer of the article remarks: "As a rule, the photographer will not find his movements impeded in France so long as he steers clear of fortifications. But he will always be well advised to carry a passport as a constant companion to his apparatus, especially in country districts, where the gendarme is apt to be particularly inquisitive directly he spies a camera. In Paris the guardians of the 'public safety' have more modern ways, and comparative, if not absolute, freedom exists—any how, as far as the taking of photographs is concerned." It is to be feared that, during the remaining two months the Exhibition will be open, very few people from these islands will visit it; but those who do so may be recommended to provide themselves with a copy of Messrs. Boot's book. The official guide, of which we bought a copy when in Paris, is a dry and uninforming compilation, which may have its uses as telling one what the main features of the Exhibition consist of, but is in no sense a proper guide. It synopsis and does not direct. Messrs. Boot's guide is published at a shilling, and it is well worth it.

\* \* \*

THE officers of the South London Photographic Society have so assiduously cultivated the art of organizing photographic tours that everything of the kind they undertake turns out a success. Whether it be to Ireland or to an English cathedral town, large parties are always catered for on very low terms, and the opportunities for interesting photography which these excursions supply are fully availed of by the satisfied tourists. One of the South London's principal excursions this year has been to the Rhine Valley and Ahr-gau, and a short account of it appears in another part of the *JOURNAL* this week. The work of organization fell on the capable shoulders of Mr. W. F. Slater, whom we here invest with the style and title of the photographic-tourist's own Thomas Cook, and his party reached

the very handsome number of fifty-four. The excursion was so successful that a desire has been expressed for its early repetition. Mr. Slater writes from 5, Firs-parade, High-road, Lee, S.E.: "By special desire of some friends who would like to make the trip, I have decided to repeat the programme on Saturday, September 22, arriving back in London Monday, October 1, if I can get a party of at least thirty, at the inclusive charge of 5*l.* 10*s.* This, taking place in the vintage season, will have the additional attraction. Those desiring to join this excursion must let me know by return, with the sum of 3*l.* towards travelling expenses." We have much pleasure in giving publicity to the foregoing particulars, and we hope Mr. Slater will be so well supported in the second excursion that it will be in every way as successful as the first.

\* \* \*

IN the early part of the year Mr. E. Sanger Shepherd delivered, at the Society of Arts, a series of four Cantor lectures on the "Photography of Colour." The first of the lectures is printed in the Society's *Journal* of last Friday, August 31 and the remaining three, it may be presumed, will be published in the three succeeding issues. We draw attention to these lectures in order that those interested in the subject may have the opportunity of procuring them. The *Journal of the Society of Arts* is published by Messrs. George Bell & Sons, York-street, Covent Garden, London, at 6*d.* weekly. The scope of the series of lectures is indicated by Mr. Sanger Shepherd's introductory remarks: "I propose to recall to you the principal facts of our knowledge of light and colour, laying special stress upon such points as we shall require to aid us further on, and then to describe to you how lights and shadows are measured, for we must remember that, however well we may understand the theory of a photographic process, it is only when we reduce that theory to actual practice in accordance with accurate measurement that we can hope to obtain perfect results. In the second lecture," he adds, "I shall show you how to correctly represent a coloured object as a monochrome print, work usually spoken of as orthochromatic or isochromatic photography. In the third lecture I shall show you a number of lantern slides in natural colours, explaining how they are made, and the final lecture will be devoted to colour photography in relation to the printing press." To the first lecture, which deals with many of the phenomena of light, sound, and colour, there are twenty-two illustrations.

\* \* \*

By an advertisement in one of the popular monthly magazines we note that the Artistic Photographic Company, of 90, and 92, Oxford-street, London, are offering the public phototypic engravings of modern paintings by such artists as P. R. Morris, A.R.A., and J. C. Hook, R.A. The engravings are on plate-paper, measuring 25 × 20 inches, and they are sold at 2*s.* 6*d.* each. We have not seen a specimen print, but the idea is good, and in our opinion a money-making one, especially if the engravings are in half-tone. We wish we could extend our commendation to another part of the same advertisement—it appears in *Cassell's Magazine* for September—in which five-and-sixpenny bromide enlargements are offered, with the inducing statement that "one guinea and upwards is usually charged" for them. In an earlier advertisement which appeared in a daily paper a few weeks ago, the Company say that "ordinary photographers charge from one to two guineas" for similar 12 × 10 bromide enlargements. The Artistic Photo-

graphic Company know better, of course, and we are surprised at their continued disingenuousness in the matter, but that frolicsome publication, the *Sporting Times*, or the "Pink 'Un," is committing a similar sin in sheer ignorance, no doubt. This blushing print, to whose witty columns we are indebted for many a hearty laugh, has followed in the wake of hundreds of its contemporaries, and succumbed to the cheap enlargement device. Six-and-sixpenny enlarged portraits in bromide are offered to its readers, and the paper incurs the responsibility of the statement that they are worth 2*l.* 2*s.*, the inference being that this sum is what a professional photographer usually charges for productions of the kind. These cheap enlargement schemes are legitimate enough in their way, but it is to be regretted that they are not conducted with a closer regard for fairness. "Ordinary photographers" are not the cormorants they are inferentially called. Mr. John Corlett, the editor and proprietor of the "Pink 'Un," is a fair-minded sportsman, who, we are sure, would not wish his columns to be used for statements reflecting on an honourable profession like photography, and we hope to see that he has given directions for the withdrawal of the "Two Guinea" fiction from the advertisements of the enlargements he is offering his large circle of readers.

#### EXPRESSION IN PORTRAITURE.

It has been well and truly stated that facial expression is governed by the inner workings of the mind, and there are but few photographers, who make a special study of portraiture, who do not know the immense importance attaching to the rendering of pleasing and natural expressions in the faces of their sitters. To many this may appear a simple and easy matter, but the fact is, it is one of the most difficult things a portrait photographer has to cope with, and, in numberless cases, the most exquisitely executed photographs fail to give satisfaction, by reason that some particular expression, which may almost be termed "one's individuality," is not strongly apparent in the picture. That sitters themselves are responsible for many of these so-called failures is beyond all doubt, for the number of people presenting themselves to be photographed who lose their individuality in expression the moment they enter a studio, is much greater than many imagine. Then, again, it is quite surprising how some sitters are influenced towards liking and disliking the expression in their pictures by the strictures they hear passed upon the photograph on the part of their friends, for rarely indeed will two individuals be found who think alike on such a matter. One will say, "Oh, it is a good and speaking likeness;" while another will declare, "No, I don't like that, it is not your expression at all;" and the poor photographer is censured, of course. Or, very probably, some amateur friend, who, of course, knows so much about photography, will be asked his opinion, and, notwithstanding that he never took a studio portrait in his life, will, out of the depths of his knowledge, charitably condemn the production on the score of expression, and possibly faulty retouching. If sitters, and their friends who so lightly pass censure on the photographs they examine, would only realise the fact that so much depends upon the sitters themselves in the matter of expression when being photographed, how much better would it be for the poor photographer and themselves also! Yet no, somehow the public have come to expect so much from a photographer, that he is called upon to make crooked noses

straight, plain people to look pretty, and to cover up numberless failings.

No doubt, on the other hand, as is quite well known, a clever photographer, by following out certain well-recognised rules and resorting to numerous subterfuges, can do something towards covering up defects on the part of his sitters' appearance: but, generally, his power in this respect is limited, and, more often than anything else, consists of carefully posing those who require special treatment of this kind. Strive as he may to conjure up natural and pleasing expressions on the faces of some sitters, he is met by sheer failure, simply by reason of the fact "that from some cause or other beyond his ken the inner workings of the mind on the part of the sitter are such as to make it impossible for him to yield a pleasing and natural expression." That there are very many individuals thoroughly sensible to the importance which attaches to themselves in this respect when being photographed is, fortunately, quite true, for now and again we do meet with those who exclaim, "No, I won't go to-day, the market has gone against me in pigs." Or perhaps it may be Miss So-and-So has seen her best young man in company with her hated rival on her way to the studio, and at once changes her mind by resolving, "Not to-day. I could not look happy if I tried." It is such little incidents as these that militate against success in portraiture to an extent those outside the sphere of studio work have no conception of. Expression in portraiture does not mean a silly, inane giggle, or even a forced laugh, such as sitters are wont to put on at command. This is purely artificial or spurious, and, no matter how desirous he or she may be to yield a pleasing or natural expression, unless it is governed entirely by the inner workings of the mind, the will is powerless to produce it.

It has been said that much may be done in posing to make or mar a picture. This can be strikingly exemplified by any one who cares to go to the trouble of carrying out a few well-recognised rules in posing, and, when a good model is provided, much may be learned from this alone, *i.e.*, without any need of exposing sensitive plates, for the model's appearance in varying positions will be at once apparent and highly instructive. Perhaps no more striking examples of the wide range in appearance capable of being introduced in a picture are to be found anywhere than those from the pen of E. K. Hough, written many years ago. These instructions should be read by all photographers who aspire to the production of good work in portraiture. In the numerous examples given this clever writer shows, by merely altering the position of the head and body to that of the camera, how a very wide range of contrasts are produced, such as, when the body, head, and eyes are in a certain position to the camera, the pose can be made to yield an easy, animated appearance, and then, by slightly altering it, a greater amount of activity and interest is introduced. Then, again, other positions are described, in which the model is caused to yield an absorbed or deeply interested appearance, verging into anxiety, surprise, or other similar emotions, according to the face and action of the sitter, or again, by slightly altering the position of the eyes to the head and body, an uneasy, insecure, jealous, watching appearance is unpleasantly introduced. Then, again, positions are described which yield an easy, direct, sincere, manly attention, and these, in turn, by further changing the position of the sitter, give place to shyness, coquetry, suspicion, according to facial action; and finally, by altering the position of the head and eyes upwards, an appearance of adoration, spiritual contempla-

tion, or supplication is introduced, according to the other accompaniments, while, by further changes still, it is easy to yield a cowardly, shrinking, or sinister, watching appearance of suppressed anger. As stated, it is not necessary that a student in photography should resort to the exposure of sensitive plates to see how these results are achieved, although a series of photographs taken under different conditions are undoubtedly highly valuable, and prove instructive, when special effects are desired in a picture. Much of this sort of thing is noticeable in some of the works of our great painters, and is traceable also in sketches by clever artists, and it is quite surprising what effects can be produced by closely studying the art of posing.

It has been well said that there never was a face which could be deemed absolutely expressionless; but, on the contrary, there is always present some pervading individuality of character, and it is therefore the photographer's duty to carefully study these peculiarities, and then, by the most effectual method of posing, endeavour to portray the likeness. To do this satisfactorily, not only must attention be bestowed upon posing, but the utmost care observed in so lighting the sitter that the most satisfactory results are obtained. The subject of lighting is one of great importance in portraiture, perhaps quite as much so as that of posing and the yielding of expression. It will be found also that a very large number of people recognise the truth of the saying, "that every individual has a best side of his face," *i.e.*, one side looks better than the other. Of course, a clever photographer will know how to satisfy his clients in this respect. Noses also are seldom or never found straight, and what in vulgar parlance is termed squinting all come in for special treatment at the photographer's hand.

**Toning and Purple Tones.**—Mr. H. W. Bennett, in a recent lecture on printing and toning, gave several formulæ for toning baths. The lecture reminds us that we have recently had many queries to reply to as to how to obtain rich purple tones on silver prints, and the formula for toning baths for the purpose. Now, we do not know if a reaction is setting in against the brown tones that have been so prevalent during the past few years or not, but we perceive that many desire purple ones just now. For years past we have pointed out that the colour of prints is more dependent upon the character of the negative than the toning bath employed. Let us quote an example. The acetate bath is said to be specially adapted for red-brown tones, and our older readers will remember the *furor* that was created here in the sixties by the famous pictures of the late Adam Solomon, which were all of a deep, rich, purple-black, yet all those pictures were all toned in the acetate bath. Some time ago we had the opportunity of seeing several of Mr. Solomon's negatives, and, although they were taken when vigorous wet-collodion negatives were in vogue, we never saw more vigorous ones than these. The deepest shadows were literally clear glass, while the highest lights were, practically, quite opaque. With such negatives any tone is obtainable from red brown to black on albumen paper; but that is not the case with the comparatively thin gelatine ones. The albumen paper used for these pictures was not the highly glazed paper of the present day, but one with the old surface. It may be mentioned that the higher the gloss on albumen paper the greater is the difficulty of getting deep purple black tones upon it. These tones are almost, if not quite, impossible on the highly glazed gelatine papers of to-day, whatever negative or toning bath be employed. With some collodion papers and the sulphocyanide bath, with very vigorous negatives, almost a blue black is obtainable; indeed, nearly the whole of the silver forming the image can be replaced by gold—without staining the paper. If we want the rich purple blacks of the days of old, we must fulfil the conditions then prevailing.

**Are there too many Photographic Societies?**—At first sight it might be thought that, for the advantage of photography, there could not be too many societies; but, on the other hand, it may be argued that fewer would be more advantageous, provided they were well attended, for one strong society is, in every way, better than half a dozen petty ones, and these, it seems, are gradually increasing in different neighbourhoods. One or two in a large provincial town are all that is required, and where that number only exists they are usually in a flourishing condition, but where there is a plethora of them they are generally weak in the number of members and the work they do. Therefore, as we have said on former occasions, one good society in a district is quite sufficient. We allude to this matter once more, for we are told that an attempt is being made to form a photographic society or club at Shepherd's Bush. One would have thought that this suburb was fairly well supplied with societies, seeing that it already has four well within a radius of three miles, the Ealing, the Brentford, the West London, and the Chiswick, this being a split off from the West London. It might also be mentioned that the Richmond Camera Club is but a couple of miles from Brentford. In small societies petty jealousies too frequently arise, internal dissensions follow, and sometimes a split. A correspondent sends us, as an example, a local paper, in which nearly a column of it is taken up by letters with reference to the Brentford Society, in which the terms "cliqueism," "pot-hunting," "fresh blood wanted," &c., figure, yet this Society is only three or four years old. Now, many will think that, if all these four Societies and the proposed fifth were to combine and meet at some central place, it would be to their mutual advantage. Those who have novelties to bring before the photographic world, or new processes to describe, do not care to do so before little societies, with only a dozen or two members, the majority of whom do not attend the meetings.

**When is a Negative Properly Fixed?**—The other night at the Photographic Club the question was asked, "How do you know when a negative is fixed?" This is a very simple question to put, but it is one that is not so easy to answer. The consensus of opinion of the members present was that if the negative were left in the fixing bath for as long again as it took to remove the last visible traces of the bromide, as seen from the back of the plate, it might be *considered* properly fixed. So it may be; but that scarcely answers the query, which was, how do you *know*? Assumption is not knowledge, and, strictly speaking, the question was not answered. However, it may fairly be assumed that, when a plate is left in the hypo solution for the same time as it took to remove the last traces of the bromide, it is really fixed. But too often the plates are taken out as soon as, or a little after, the last traces of the bromide have disappeared, with the result that the negatives frequently become stained when printed from, particularly if the paper happens to be a little damp, also if they have to be afterwards intensified. As we have said on many previous occasions, unless negatives and prints are properly fixed in the first instance, no amount of after washing will eliminate the hypo salts, hence staining troubles. We would suggest that, when a negative is of special value, or it has to be dealt with afterwards in the way of intensification, if the fixing bath has been in use for many negatives, it should be put for five minutes or so in a fresh solution of hypo. This, though it may not be actually a necessity, is a precaution. It involves but little extra trouble, and hypo is cheap, though it is often unwisely economised.

**Photographic Evidence.**—From time to time we have chronicled the novel purposes to which photography has been put in legal matters. One of the latest was in connexion with proceedings under the Smoke Abatement Act, where photographs were shown of the chimneys caught in the act of offending. Last week we see by a newspaper report that, in the case of a doctor charged with cruelty to a lunatic brother, photography had been utilised by the defence as regards the evidence of a neighbour who said she had watched the doctor from her garden. Here is an extract: "By her consent two

photographs were taken at the exact spot where she was standing, and at the height of her eyes. The photographs only succeeded in showing the top of the doctor's hat as he stood in the enclosure." In the same issue of the paper is an account of a bullock escaping and going up the stairs and into a bedroom of an inn at Bedford, and, like the proverbial "bull in a china shop," doing much damage. When the animal retired the room, it is said, was photographed. Possibly this photograph may be utilised to show the damage the innkeeper sustained by the intruder. The photographs in both these cases, in the circumstances under which they were taken, might be open to challenge.

**Incongruous Photographs.**—The glaring incongruities that may often be seen in albums of old portraits are not so prevalent now as formerly. Yet they are often to be met with. We recently noticed in a suburban show-case (within five miles of the Marble Arch) a very pretentious display of portraits, which highly amused us. For example, there were ladies, gentlemen, and groups leaning on a rustic fence with an elaborately painted background of an interior, apparently a drawing-room, and others posed against an imitation stone balustrade with the same background; but perhaps the most amusing pictures of all were those of a volunteer in khaki, kneeling with his rifle as if he were going to "pot" a Boer, the same drawing-room background being shown. Now, amusing as these incongruous photographs are to the general public, they are not more so in the eyes of artists than many of those of the mud-flat type that have been shown, with their wiped-out patches, to represent impossible lights and their equally impossible skies. Yet such pictures have been highly eulogised by those who our American cousins have recently christened the "godlings" of "art photography." But, as intelligence increases, we hope to see fewer of these glaring incongruities, alike in portraiture and in so-called "artistic photography."

**A New Lens.**—At a meeting of the Deutschen Photographervereines, in Berlin, on the 3rd ult., Dr. Holm, scientific adviser to the well-known optician, C. P. Goerz, described a new lens manufactured by this firm, which is called the Hypergon Double Anastigmat, and the following *précis* of the description may be interesting: The lens is symmetrical, and absolutely corrected for astigmatism and distortion, and angle included =  $140^\circ$ , or, if it be assumed that some of the rays are cut off by the mounting, it includes at least  $135^\circ$ . The diameter of the field of view, or, in other words, the diagonal of the plate covered, is five times the focus, or the longest side of the plate is almost four times the focus, for a lens of 90 mm. focus will cover a plate  $30 \times 34$  cm., and the diagonal of this is 45 cm. In all wide-angle lenses up to the present, in the most favourable cases the longest side of the plate has been about double the focus. On account of the peculiar construction of this lens, it is impossible to correct spherical and chromatic aberrations, but this will not be of much moment in practice, as the spherical aberration can be cured by stopping down, and the chromatic aberration is obviated by shifting the lens after focussing and before exposure. The lens is provided with only two diaphragms,  $f/20$  and  $f/30$ . If  $f/20$  is used for focussing, and it is considered desirable to expose with this aperture, the lens must be shifted nearer the plate, but when  $f/30$  is used for focussing and exposure, this is unnecessary, as at this aperture both the spherical and chromatic aberrations are obviated. It is claimed that the Hypergon Double Anastigmat, on account of the lenses being constructed of white and very transparent glass, is very rapid. As is well known, with all wide-angle lenses there is a considerable falling off of illumination toward the edges of the plate, and this it is proposed to obviate by the introduction of a "star" stop, which will equalise the illumination of the plate.

#### THE PHOTOGRAPHER'S YEAR.

##### SEPTEMBER.

SEPTEMBER in many respects is a delightful photographer's month, in others a disappointing one. Getting well into autumn, it is a time more for men over, than under, fifty. A young man may appreciate the beauties of the season, but he does not feel them like he who is himself

approaching the "sere and yellow leaf" of life. The deeper, apt suggestion is unfelt in the one case, whereas it is in the other. The weather as a rule is as near perfect as it can be. The heat of summer that many find oppressive, and most carrying a camera would like a little less of, has passed away. On the other hand, it is yet too early for any suggestion of coming cold and frost. It is also a calm month, a consideration where foliage enters into the picture. So far so good. It is when we look at the masses of varying colour in the foliage, and realise the powerlessness of photography to render them, that the feeling of disappointment comes in. Orthochromatic plates and colour screens are very valuable and desirable towards the correct translation of colour into shade, but it does seem a pity not to be able to turn these gorgeous yellows and rich browns into anything better than degrees of black. The many workers in the direction of reproducing colour should spend as much time as possible in the woods in September, in the hope of catching something of inspiration towards the solution of the problem they have in mind and at heart; or, if inspiration in these matter-of-fact, scientific, and prosaic latter days be out of the question, the regret at having to leave so much unrecorded may stir the brain into brisker and more sympathetic action to good effect. Autumnal tints, too, would give colour photography its most artistic field, in that they are laid on in such broad masses. There is nothing finicking about nature in the autumn. She spreads her colours with a lavish hand. Making the best we can of what we have got, the same broad display of colour, expressed even in black and white, can give highly artistic effects. The lengthening of shadows and lowering of light helps to the same end.

This is the time of the year for impressionist pictures. That is, the true impressionism of broad masses, low, but workable, light, and mist to blot out excess of detail. There is no need now to slop about flat estuaries with their mudbanks and creeks in the evening for the necessary conditions. Any town possessing a castle, or with a river running through it, has an ample supply of subjects for all the artistic impressionists living in it. Most fortunate of all, although it is in a very minor measure that he is aware of the fact, the Londoner has the Thames. Twenty miles of incomparable pictures, within compass of a shilling ride, with all the grime and sordidness blotted out by morning and evening mists! Bridges, lighters drifting with the tide, barges, tug-boats, wharves, tall warehouses, ships coming in from the other side of the world, steam-boats starting upon voyages as long, and all toned down by haze and mist to their most artificially suggestive but shape and form. We go far from home for pictures far less telling.

As allied with soft mist effects it must be a standing regret to all photographers with a touch of the artistic in their souls that the September moon—the harvest moon—and its effects are not yet photographable. There is a restful charm about moonlight that appeals to all. We are not compelled to take in all the detail that sunlight forces upon us, yet have plenty of light for broad shapes and masses. Then, beyond the value of rarer presence, there is a wealth of sentiment associated with the moon that asserts itself in a sub-conscious way when under the recurring period of her sway. Love-making and moonlight go together, and many pleasing emotions as a consequence are laid by in the memory for future pleasure of vague remembrance on moonlight nights.

It is rather a peculiar fact that no moonlight picture is really complete to us unless there be a silver lane of the light on water shown in it. Is it due to the evolution of feeling as affected by an insular position that gives plenty of water? If so, would the Arab find his characteristic moonlight effects in the glint of light upon sand? the dweller in tropical lands in the lighting of a forest glade? Whatever can be said in praise of moonlight in general is all emphasised in that of the harvest moon, far and away the best of the year. We certainly have "moonlight" photographs—all, of course, "faked." Whether the faking is justifiable or not is a question upon which there is much diversity of opinion. Speaking generally, the amount of faking done is in direct ratio to the amount of original sin in the constitution of the faker, so discussing its ethics would not be of much purpose. Original sin is not open to argument. Some purists will have nothing whatever to do with it, others are convinced, and honestly so, that the means being strictly subservient to the end, it matters little what they are, provided the end be attained. The best workable general line of action, perhaps—for it is of no use ignoring original sin, more than trying to argue with it—is going in the middle. The line between right and wrong, in this case, as in many others, may be a wavy and not a straight one. Faking a photograph required as evidence, or as a record, should be put down on one side—the one of wrong. Modelling a face is also wrong, touching out a wrinkle or two is not; something must be yielded to the frailty of human clay. In the particular case of moonlight pictures there is no great objection to faking

more than there is to mock turtle or electro-plate. They are all admittedly false, and known as such. In time, probably, a "moonlight" plate will be placed on the market, and we will have the genuine article.

Turning regretfully from the moon, there are other practicable subjects in the month. The last load of corn, if one is fortunate enough to be about at the time, has a something joyfully ceremonious and significant about its entry into the rickyard and unloading. It is now becoming, it is true, but a survival of what it once was. A good harvest is still of great importance, but not of such vital importance as it was when the price of the loaf depended upon home-grown corn only. It is very occasionally that we hear nowadays the thankful addition to the favourable comment upon the weather, as good harvest weather of, "and please God we shall have a cheap loaf," still it is a turning down when we do hear of the loaf at a significant place in a comparatively recent chapter of the economic history of the country. A picture of the farmyard with the gathered spoils of the year well in evidence, beyond serving its lighter purpose of a Christmas card, would make an illustration to the chapter. The "harvest home" is, perhaps, too impracticable for the camera. Introducing it and the flashlight would spoil both the supper and the picture. When that lens which will give everything beyond two feet in universal focus has been put together, and the emulsion that will register a snap-shot by candle light, spread upon its plate, we will attempt it. What a pity, by the way, that in the established order of things the scientific mind and the artistic temperament should be opposed to each other. Were it otherwise, we would gain a good deal that we now sadly need.

There are rustic festivities in September that are practicable. The village flower and fruit show is generally postponed until after the harvest. The flower show as a whole would probably turn out as disappointingly as such pictures as *On the Sands at M—*, or *The Mafeking Celebrations at N—*. The interest is diffused too much. But some choice little bits can be got by taking pains. The "First Prize" winner, for instance, with his marrow at his feet, or his cabbage under his arm, and joy—plus just one pint of beer—illuminating his face. "First Prize for 12 lbs. of honey in pots," would give another, and a higher type of face. The man who takes an interest in bees is quietly philosophical in a minor way. He hasn't, as a rule, seen any very heavy trouble in life.

Such are some September subjects. They take a little looking for and thinking over; but, then, so does everything else worth having.

## ON THE RECENT PROGRESS IN DIRECT PHOTOCHROMY.\*

### I.

I PROPOSE to give a short account, mainly composed of references, of the recent progress in direct photochromy, which may serve as a supplement to the "Bibliography of Photography in Colours," begun by Mr. Bolas (1897) and continued and supplemented by myself (1899). At the same time, I shall make a few remarks on the importance of the classification and abridgment of knowledge attained, and also on the apparent tendency of modern research in direct photochromy.

Classification of knowledge in photography is, of course, neglected in England, and yet even in Germany, where all science is classified in the best way, photography has not, compared with other sciences, reaped the full advantage of method. The reason of this seems to be that photography is, to a great extent, incapable of it, owing to its vaguely defined province as a science; and so an excuse can be found for English neglect, though probably the whole truth is not brought out by this excuse.

There does not seem to be any immediate prospect of our being able to call photography a science; this can only happen when it is capable of being strictly defined, apart, of course, from any reference to picture-making. Perhaps the nearest approach to a science-making definition would be: Photography is the science of the chemical and physical effects of radiation; and, by combination with the theory of optical instruments, we get an art of photography. Even with this indefinite definition we have a science connected with the very hearts of the two main natural sciences, yet too small for any great generalisation and explanation out of its own province, and too large and with boundaries too vague to be thoroughly worked like some sub-departments of science are.

However, photography possesses such sub-departments, with limitations clearly defined, and which can receive all the benefits of classification and method in their study. Such a one is direct photochromy. Applying

\* I am indebted to Miss D. P. Turnbull for some translation from the German.

our definition, we have "radiation" narrowed to "visible rays," and the "effects" become *special* effects, those only which correspond to the wave-length of the incident light in a definite way.\* But the *final* elucidation of photochromatic methods, like that of, probably, all important photographic problems, rests on considerations based directly on the principles of physics and chemistry, and from these principles new methods, when they arise, and thus enter the region of direct photochromy, arise in general directly.†

Thus we get, naturally, two main divisions, clearly separated from one another, in a classification of the literature of direct photochromy: the one concerning the *principles*, which is not by any means purely photographic; the other, purely photographic, concerning the *processes*. It is, as one might expect, in the latter that the greater part of recent progress has been made. This is pre-eminently the province of the photographer; he is there practically independent of other knowledge, such as physics and mathematics, and his work is almost wholly experimental. This kind of work is of very great value; for, though it is unlikely that anything should be found by its means which throws light on the real nature of photographic processes, yet not only is the present usefulness of those processes wholly dependent on it, but subsequently such researches will form abundant means of verification of theory or rejection of hypothesis. More particularly, in our present subject, the new and improved emulsions discovered for Lippmann's process would hold the same place with any other process based on the same "principle of position," as I have called it. Among the improvers, photographically, of Lippmann's method, Dr. Neuhauss must be mentioned in the first line.

Dr. R. Neuhauss,‡ during 1898, made numerous experiments with Lippmann's system, which he described in the *Photographisches Rundschau*. Dr. Neuhauss began these experiments in 1894, and in Eder's *Jahrbuch* for 1898§ he gave a summary of his results,|| including a description of his photo-micrographical work, and a full description was given in Dr. Neuhauss's work mentioned below. In Dr. Eder's *Jahrbuch* for 1899¶ (pp. 70-74) he gave an account of the researches carried on in the summer, when the experiments of the previous year were repeated and fully confirmed.

Professor Lippmann\*\* has given a new formula for the emulsion to be used in his method, and for the development of the plates.

E. Valenta†† remarked that the necessity of giving exact exposures for mixed colours is connected to a certain extent with the colour-sensitising. The greater the difference of sensitiveness of the silver bromide for the principal spectrum colour, the more difficult it is to fix on any exposure which will give the best results. The ideal plate would be panchromatic, and, by the choice of suitable sensitizers, one must get as nearly as one can to the ideal. Valenta found glycin-red (Kinzelberger of Prag) very satisfactory, 12-14 c. c. in 100 c. c. of his emulsion.‡‡

References to other recent methods of direct photochromy, and to work on the principles, must be deferred to another occasion.

PHILIP E. B. JOURDAIN.

## THE THORNTON FILM.

[Paper read before the Cripplegate Photographic Society, September 3, 1900.]

My purpose to-night is to demonstrate before you a new film, one possessing many advantages, and one that is simplicity itself in the manipulative details.

Of the relative merits of plates *versus* films, and *vice versa*, I do not

\* This may even mean that colour effects need not be *visible*, as it is conceivable, e.g., that a definite structure should be formed by each definite wave-length, and yet not return any colour.

† Example, Zenker's theory; contrast the *empirical* origin of the process of Seebeck and others. *Indirect* photochromy analogously has its origin (with Maxwell) in principles far removed from photography itself.

‡ For a short account of Herr Neuhauss's book, *Die Farbenphotographie nach Lippmann's Verfahren* (Halle a/S, 1898), and his application of photo-micrography, to show the Zenker laminae in the Lippmann film, see my "Further Contributions, &c.," in *Photography*, June 22, 1899, pp. 422, 423.

§ English translation in THE BRITISH JOURNAL OF PHOTOGRAPHY SUPPLEMENT, July 1, 1898, pp. 50, 51; ALMANAC, 1899, 815-818.

|| Reference may also be made to the series of notes in the "Acta Eruditorum" of the *Amateur Photographer* for 1897, December 3, 17, and 31 (vol. xxvi. pp. 458, 498, 538); for 1898, February 4, and April 1 (vol. xxvii. pp. 86, 246), for 1899, January 27, p. 66.

propose to touch, as it is a subject you are all familiar with. But there is one point sometimes overlooked, which is a distinct disadvantage to films. It is, that you cannot have one of those accidental smashes, so useful to reduce the stock of negatives against your will, and for which all the same you are thankful.

The Thornton film consists of a film of pure gelatine, rendered insoluble, and coated with emulsion, the whole being supported upon a backing of transparent paper. The following points may fairly be claimed for it: 1. Simplicity in use. 2. No curling in development. 3. The transparent paper enables density to be accurately gauged. 4. There is nothing in the support that can detrimentally affect the emulsion. 5. It is non-inflammable. 6. It is very thin and flexible, yet tough and unbreakable. 7. The troublesome squeegeeing is avoided. 8. All operations are, with the exception of pinning up to dry, the same as a glass plate. 9. It is always flat. 10. Lastly, the price is the same as that of dry plates.

It would, perhaps, hardly be fair to describe the last as the most important, but to many workers the question of cost is a consideration—I know it is so to me.

The film is issued in all cut sizes packed flat, and also in daylight-loading spools in various sizes. For the purposes of this demonstration I am dealing with the flat standard sizes, and it is flat, very flat. It lies perfectly even and flat in the dark slide, with a plain piece of cardboard behind it; it remains so during development and fixation, and during washing, if that operation be not too prolonged. It is hung up to dry, after passing through a glycerine bath, with a pin at each corner. When dry—and, of course, it must be really dry—the film is stripped off in the easiest possible fashion from the paper support, and you have a beautiful negative or positive upon an absolutely transparent film, with ample density, finest gradation, free from halation, and with a very fine grain, finer indeed than some brands of plates.

No special developers are required. Naturally, with the instructions, formulæ are given which give the best results; but, in my developing, I have used my own bottles of hydroquinone, ortol, metol-hydroquinone, and pyro soda. It is a great advantage to have a film that does not need a special developer, or that does not bar the use of any particular developer. The transparent paper enables the density to be judged as easily as a glass plate, and the image can be seen just as clearly the whole of the time. Compared with films on paper of the usual sort, this is a very distinct advantage, as, when the paper is opaque or partially so, allowances have to be made, and therefore the actual result is not under such complete control.

After development, a hardening bath of chrome alum is required; but the makers recommend, and I cordially endorse it, a combined hardening and fixing bath, as it saves tiresome washing. This bath consists of—

Chrome alum .....	1 ounce.
Sulphite of soda .....	2 ounces,
Water .....	20 "
Hyposulphite of soda .....	6 "

the hypo being added after the alum and sulphite have dissolved. This bath can be used over and over again, until it won't fix, in fact.

When washed, the films are placed in a bath of glycerine, 1 ounce to 25 ounces of water, and then pinned to a board by the four corners to dry.

Compared, perhaps, with a plate, the glycerine bath is an extra operation, but it has to be used, we know, with thin celluloid films, so that it need not trouble you. And I think you will agree with me that pinning up to dry is much easier than squeegeeing, which is not a favourite occupation of the ordinary amateur, at all events, to say nothing of troubles in stripping off the board later on.

The stripping is a very strong point of the Thornton film. It is not a case of saying it will strip, but it does strip, and when you see the operation later on you'll admit it, I will let your Chairman strip a film. I prefer to do this, as, if he fails, I can blame him. Casually I may add that I've never had to blame any one yet. And no film that I have ever used stripped with such ease and absolute certainty.

Naturally, the film may be varnished as a protection against damp, and may be retouched in the usual way.

In concluding these introductory remarks, the point I have striven to make clear is that the manipulation of the film is as easy as a glass plate. Whether that is the best recommendation I can give it I do not know, but there it is, and it is so.

WALTER D. WELFORD,

IMPERFECT FIXATION OF PRINTS.

To any one who, like myself, has seen so many what I may call modern professional photographers—who pride themselves upon the fact that they have entirely taught themselves, and “never had a moment's tuition, sir”—at work, especially toning, fixing, &c., there is no wonder at the constant appearance of the above words in your Correspondence column; and, in fact, the general instructions given are misleading. Take, for instance, the preliminary washing. This is usually recommended to be done in running water for a quarter of an hour or so. To carry out these directions some workers fill up a flat dish with water, shove the prints in one, two, or three, or more at a time, and, when all the batch are in, turn on the tap and leave them for the quarter hour washing in running water. Others fill up the washing machine (used to wash hypo out of the prints and plates), and shove the prints in here for the quarter hour's wash, and each one wonders why he gets stained prints, and at once blames the paper.

Then, again, for fixing, the prints are placed in the hypo, not separately but in batches, just carelessly separated, and then left for the time the book says they require for fixing, and without any more moving about than the curiosity to see some of the prints prompts. The whole lot are lifted out of the hypo, pitched either into a flat dish or that abomination, a washer, the tap turned on and left for the regulation two hours. The result of all this is the Editor has to wade through acres of letters, full of bitter denunciations of So-and-So's paper, and of disappointment at the pictures, and to find some remedy.

Some little time ago you, sir, reviewed an ALMANAC containing a compilation of all good formulæ, &c., for P.O.P., and suggested that that chapter be reissued in book form. To that I would say, “Certainly;” but before that book is issued let the working details be revised by a practical printer. The need of this can be understood when it is pointed out that the compiler recommends the washing of the prints before toning in running water, without any directions as to keeping the prints separate, and without any caution as to using a washer used for hypo.

To succeed in obtaining good, clean, stainless prints, they must be put separately into a dish of clean water, then taken out of this water separately and put into another dish of clean water, and so on for six or seven changes, each print being handled separately each time, until the last change of water is quite clear of any trace of milkiness, showing that all free silver has been removed. After toning, each print on being removed from the toning solution should be put into a solution of sodium chloride (common salt), but care must be taken that the fingers that touch the salt solution are not put into the toning bath, or that compound will strike work. After toning give a wash of two changes of clean water, again handling each print separately. Then put each print separately into the fixing bath, and keep turning over and over each print the whole time necessary for the action of the fixing solution, and finally washing in twenty or thirty changes of water, with a bath of alum if preferred after the first twenty changes.

Keep the prints in motion during all the operations, handle each print separately at all stages and sub-stages, avoid alum before fixing, avoid washing in running water (especially in flat dishes or in so-called “washers”), and, above all, be especially careful to avoid any taint of hypo getting near the prints before they are toned.

W. T. WILKINSON.

THE SOUTH LONDON PHOTOGRAPHIC SOCIETY'S CONTINENTAL EXCURSION TO THE RHINE VALLEY AND AHRGAU.

THE South London Society's annual Continental excursion, under the leadership of Mr. William F. Slater, F.R.P.S., is becoming one of the popular features in the photographic world. The small party of eleven which attended the first excursion three years ago to Hamburg has increased year by year to a party of fifty-four (seven of which were ladies), representing fourteen societies, amongst whom were some well-known photographers from Bolton, Croydon, Exeter, Fakenham, Manchester, Reading, Usk, and the Scilly Islands. The following account of the excursion is contributed by one of the party:—

On Saturday, August 18, we met at Liverpool-street Station, where our leader handed each a special badge to wear for the occasion. A large saloon and two compartments were reserved for us, in which we travelled to Harwich, thence to the Hook of Holland, by the s.s. *Dresden*, the finest boat in the G.E.R. Company's fleet, where all our berths had been reserved, our party occupying seventeen cabins. Arriving at the Hook of Holland early Sunday morning, we travelled to Cologne, and then on to Remagen. On arriving, we at once proceeded to the Hotel Victoria-berg, our headquarters, where everything was done by the proprietor and staff to make us comfortable. It was rather a long job in getting the bedrooms settled, and hard work for our leader, as the hotel could only sleep twenty-four, the other thirty being placed in private houses in the locality, and all were satisfied with the accommodation provided. Our programme was gone through without any deviation whatever, our leader keeping us up to time. Exactly at six o'clock we took our seats for dinner, our menu consisting of soup, salmon, beef, veal, chickens, ices, and fruit, and each day during the week we sat down to a similar repast.

Dinner being finished, and most of us very tired after so much travelling, we very soon retired.

On Monday morning many were up early, to find our leader waiting with the railway tickets for the day's trip. After a good meat breakfast we made our way to the station, and travelled to Bingerbrück, a ride of over fifty miles through very fine scenery, as the rail skirts the Rhine nearly the whole way. After travelling some distance, many were eager to sample the fourth-class carriage, so most of the party left their reserved carriage to travel in a class lower than we can in this country, and came to the conclusion it was better for a party, as all could be together and not shut up in compartments. It was what one might call a third-class saloon. On arriving at Bingerbrück we followed our leader to the pier at Bingen, where he dismissed us for two hours, and on our return he was waiting with the tickets for our boat ride back to Remagen. This is through the finest scenery of the Rhine, but we did not have the luck to see it at its best, for as we left the pier the lightning lightened, the thunder thundered, and very soon the rain it rained. No; it more than rained, it came down in torrents, so we had a wet journey nearly the whole way, which is about sixty miles. It was a good thing it happened this day, as we could keep under cover and still see the scenery. The Rhine steamers are very fine and the catering perfect; one can obtain any fare, from the modest roll and butter to a *table-d'hôte* dinner. We arrived back somewhat late, owing to the storm. After dinner we were entertained by some of the party with singing and recitations. Tuesday we went to Cologne by train. The Cathedral here is the centre of attraction, where our leader had permission for us to photograph inside. It is hard to find an adjective to describe this grand edifice, it wants seeing; one cannot really describe it without spending a much longer time than we had to inspect it. We also had permission to photograph inside St. Gereon's Church, which is highly decorated with many colours, but contains many subjects suitable for the camera.

After dinner this day we had a good concert, our artists being Mr. Taylor, pianist, Mrs. Walker, and Messrs. W. E. Dunmore, Benzon, Hardee, G. Slater, Oakley, Holland, Walker, and Knight. Herr Nelles, a German, sang us some German songs, so we called for three cheers for the German Emperor, one for the Empress, and one for his grandmother, this put us on good terms with our German friends. A Mr. Van Dam, from Rotterdam, sang us the Dutch National Anthem, after making a speech saying how friendly he had always been treated by the English, and was proud to be in our company in Germany, so, of course, we called for three cheers for Queen Wilhelmina, our leader stating that two years ago this excursion was taking place in Holland. We brought the concert to a close by singing the English and German national anthems. Wednesday we were called at 6 a.m., breakfast at 7, and left by the 8 o'clock boat for Königswinter, and on arriving we at once commenced the ascent of the Drachenfels; some went up by the cog-wheel railway, but they missed all the fun. It was a fine sight to see some well-known photographers riding on donkeys up the hill, but we who walked had all the fun and the best chances of snap-shooting. From the top of the Drachenfels one gets a fine view of the Rhine as it winds through the rocky hills, but those who took the trouble to climb the great Oelberg were well repaid, from the top of which a grand panorama was spread before them; in one direction Cologne Cathedral could be plainly seen and the winding of the Rhine, with the Drachenfels and other hills in the foreground, was a finer sight than one can describe. We returned to Königswinter and then by boat to Remagen.

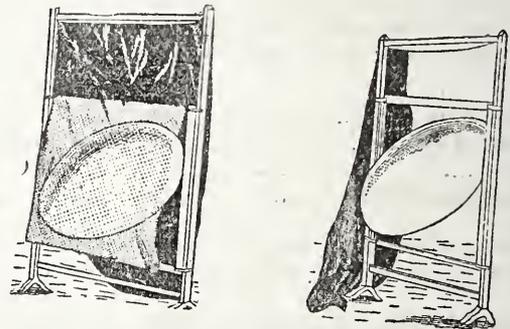

Thursday was the crowning day of the week. We travelled by train to Ahrweiler, whence we were to start our dreaded walk of seven and a half miles which our leader had imposed on us; but he knew best, and we would not have missed this walk through the incomparable scenery for anything. Ahrweiler is a quaint, old-world town; with its walls, gates, and old buildings, one can find plenty of material for picture-making. Our leader took us on by easy stages to Walporzheim, and on through the romantic scenery of this valley we pass the "Bunte Kuh" and the poetical villages of Marienthal and Dernau, where there is plenty of work for the camera. A little further on we leave the road for a time, and cross the bridge over the Ahr to visit the very old village of Rech, where one can get pictures at every turn. In fact, one of the party remarked that, if we stopped here and at Dernau for a week, we should have to buy the whole stock of a well-known firm of plate-makers. We now go on to Mayschoss and Lochmühle, through the tunnel, and pause to look at the view before us. We then retrace our steps to the footpath, and ascend through the vineyards to the top of the hill, from which we get a grand view. On one side we can follow the valley of the Ahr, and on the other we look down on the prettily situated village of Altenahr, our destination. We return by train to Remagen, with all our plates exposed. I cannot say how many were actually used between us; one of the party was known to have exposed sixty plates on this day. After dinner we had another concert, and during the evening a choir of ten Germans gave us some fine music, and, in reply to a vote of thanks we passed them, said they had thoroughly enjoyed themselves in our company, and were glad for us to be hand in hand, especially as Germany and England were at the present time the same in China. I may say here that everywhere we went during our stay we were received and treated with the greatest civility, and on no occasion was any antagonism shown us.

Friday we travelled to Bonn by boat. The Munster Church is very fine. We had permission to photograph inside, which is so very dark, and in consequence a large amount of photographic work was impossible. It contains some fine subjects, but the exposures would be very long. After dinner Mr. H. Newson, in some appropriate words, proposed a vote of thanks to our leader, and asked Madame Benyon to hand Mr. W. F. Slater, on behalf of the party, a small present to show our appreciation for the trouble he had taken in giving us so fine a holiday, after which we drank his health with musical honours. Saturday being an off day on the programme, our leader said we had been good children all the week so he would give us a day's holiday. So some took themselves off to Coblenz and Boppard, while others went to Godesberg and Cologne, but the majority of the party revisited the Ahr Valley, where they had enjoyed themselves so much on the Thursday. Sunday morning was spent in Remagen, some going to the Apollinaris Church; others crossed the river to Erpel, and found it abounded in work for the camera, wishing they had another day left to photograph there, having a mid-day dinner, after which a vote of thanks was passed to Herr Langen, the proprietor, for the able manner he had catered for all our needs. Any one visiting Remagen cannot do better than stop at the Hotel Victoriaberg. We left Remagen by the 3.12 train, breaking our journey at Cologne for one and a half hours. We then proceeded to the Hook of Holland, and once again on the s.s. *Dresden*, having the same berths reserved for us as on our outward journey. The sea was not so smooth as we should have liked, but we arrived safe in London soon after nine o'clock on Monday morning, having spent a most happy week with jolly company, nothing to trouble about, as our leader had arranged everything for us and carried the programme through without a hitch.

#### THE USE OF CONCAVE REFLECTORS IN AT-HOME PORTRAITURE.

A HINT on the subject of illuminating the shadow side of a sitter's face, in at-home or non-studio portraiture, is given by Mr. A. P. Sargent in the *American Journal of Photography* for August. He remarks that reflectors are often very injudiciously employed. In the endeavour to illuminate the shadow-side of the head so much light is thrown upon it as to entirely obliterate all texture, to represent which, in proper subordination, should be the aim of every good photographer. The operator is not always possessed of that great aid in proper illumination, the modern slant light, and, having to make the best use possible of the means at his command, must depend to a considerable extent upon lighting up shadows. Where the skylight is small, or where there is no skylight at all, so to say, it is of special requisition.

"The reflector which I employ," proceeds Mr. Sargent, "I did not invent

myself, I believe the inventor's or adapter's name is Griswold. The reflector is a concave one, a yard in diameter, made of sheet iron or tin, hammered into shape and afterwards planished. It turns on pivots within a frame, so that it may be turned at any angle desired. The frame carrying the reflector runs up and down like a window sash within another frame about six feet high, which is mounted on legs like a background frame. By this means the light may be thrown up or down, or in any direction the case may demand. On the back of the outer frame is fixed an opaque curtain, which can be drawn across the outer frame to cut off all reflection, except from the reflector itself; for, in ordinary sitting-rooms where portraits are made, the reflections are often very annoying and perplexing. But this dark curtain keeps out all except that desired to be reflected. When the light is strong, it will be found necessary to screen the reflector with cheese-cloth or tarlatan, or some other gauzy material. By placing the cloth over the face of the reflector the light may be beautifully modified and some pleasing effects produced by employing gauzes of different colours. When the sitter has a full round face and light hair, a child for instance, make use of a buff gauze. Greater contrast is thus secured in a negative. For dark complexions or sharply defined features, a sparseness of countenance, blue is very advantageous. The accompanying cuts will give better ideas of the construction than a verbal description."

### PHOTOGRAPHIC CLASSES AT THE GOLDSMITHS' INSTITUTE, NEW CROSS.

A CIRCULAR has been sent us giving particulars of the classes in photography which will be held at the Goldsmiths' Institute, New Cross, during the approaching winter. For the information of likely students we append full details:—A course of twelve lectures and demonstrations on practical photography will be given on Friday evenings at 8.30, commencing on September 28, 1900. The following is the syllabus: Apparatus. Dark room. Dry plates, films, &c. Exposure and development with practical demonstration. Intensification and reduction of negatives. Varnishing, retouching, and spotting out. Printing and toning on various P.O.P. papers, vignetting, masking, printing in clouds, &c. Gaslight printing on bromide paper, Velox, etc. Carbon and platinum printing, mounting, enamelling, burnishing, spotting out, &c. Lantern-slide making by contact and by reduction on wet collodion, on gelatine dry plates and by carbon process. Enlarging on bromide paper and making enlarged negatives. Isochromatic photography, &c. The first lecture of the series (September 28) will be an explanatory one, and will be supplemented by an exhibition of negatives, prints, lantern slides, &c., made by past pupils and by members of the Goldsmiths' Institute Camera Club. All who contemplate joining photographic classes at the Institute are invited to attend. The fee for the Course is five shillings.

A course of twelve lectures and practical demonstrations on practical photography, for ladies only, will be held on Thursday evenings at 7. Commencing on October 4, 1900. The fee for the Course is five shillings.

A series of twelve advanced classes in photography will be held on Tuesday evenings, from 7 to 9.30, for individual practice in particular branches of the subject. Students joining this class can obtain individual instruction in the technique of ordinary photography, copying, enlarging direct or from enlarged negatives, transparency making, photomicrography, three-colour photography, &c. This class commences on October 2, 1900. The fee for the Course is twelve and sixpence.

A series of twelve classes for individual instruction and practice in photo-lithography and colotype will be held on Wednesday evenings at 7. Commencing October 3, 1900. The fee for the Course is twenty-one shillings.

A series of twelve classes for practical demonstration of, and instruction in, process engraving in half-tone, will be held on Monday evenings from 8 to 9.30. Commencing October 1, 1900, the fee for the Course being twenty-one shillings.

A series of twelve classes for instruction and practice in photogravure will be held on Friday evenings from 7 to 8.15. The fee for the Course is also twenty-one shillings.

The instructor in all the foregoing classes is Mr. W. T. Wilkinson.

The photographic studio and dark room are very completely equipped, and are fitted with electric arc lamps for copying and portraiture. The department is provided with studio, landscape, lantern slide and copying cameras, an enlarging lantern, and a powerful electric projection lantern; it also possesses complete outfits for photo-lithographic and colotype work, for platinotype and carbon printing, and for retouching and other branches of modern photographic practice.

Students must provide their own sensitive paper and plates, but all chemicals and apparatus required will be furnished by the Institute.

Since the photographic classes are necessarily limited in number of students, applicants will be accepted in order of application. Should a sufficient number of applications be received, other classes will be held on separate evenings.

### PHOTOGRAPHIC CLASSES AT THE NORTHAMPTON INSTITUTE.

A book of 200 pages is occupied with the announcements, educational and social, for the Session 1900-1901, of the City Polytechnic, as the Northampton Institute, St. John-street-road, E.C., is alternately called. The educational aim of the Northampton Institute is to provide classes in technological and trade subjects, a branch of educational work scarcely touched by the sister Institutes. To this end attention is paid first to the immediate requirements of Clerkenwell, the district in which the Institute stands. We extract from the section of the book which deals with the Applied Physics department the following particulars relating to the classes in colour photography and process work:—

#### TRICOLOUR PROCESS WORK AND COLOUR PHOTOGRAPHY.

The following special lecture and practical courses for photo-process workers and general photographers have been arranged in co-operation with the London County School of Photo-engraving and Lithography, Bolt-court, E.C.

*Tricolour Process Work.*—Lecturers, Dr. R. S. Clay and Mr. Charles W. Gamble (Bolt-court School).—A course of eight lecture demonstrations with practical work, on Tuesday evenings, from October 2 to November 20 inclusive.

*Lecture Demonstrations.*—Tuesdays, 7 to 8 p.m.—Syllabus: General introduction; absorption and reflection of colours; primary spectrum

colours, and "primary" pigment colours; choice of pigments and screens for tricolour work; influence of order of printing; use of ruled screens; best conditions of lighting and using the camera; production of the negative; general outline of the production and treatment of blocks; selection of paper; printing.

*Practical Work.*—Laboratory Work, Northampton Institute, Tuesdays, 8 to 10 p.m. Photo-process Work, Bolt-court School, Fridays, 7 to 9.30 p.m.—Only those engaged in the process trade can be admitted to the practical class at the Bolt-court School in accord with the rule in the tricolour class. The laboratory work at the Northampton Institute will consist in the production and spectroscopic testing of colour filters and pigments, and the arrangement of the camera and lighting and production of the continuous tone negatives. At the Bolt-court School screen negatives and blocks will be prepared, and the necessary finishing, mounting, and taking of the prints will be carried on.

*Colour Photography and Measurement.*—Lecturers, Dr. R. S. Clay and Mr. Charles W. Gamble.—A course of eleven lecture demonstrations with practical work on Tuesday evenings, from November 27 to February 19 inclusive, as a continuation of the preceding course. The course is further intended for professional photographers and others having a good knowledge of ordinary photographic work, and who desire to become familiar with colour photographic processes.

*Lecture Demonstrations.*—Tuesdays, 7 to 8 p.m.—Syllabus: Nature of white and coloured light; principle and use of spectroscope; Maxwell's colour vision curves; addition and subtraction of colours; making and testing of colour screens; colour sensitiveness of photographic plates; orthochromatising; choice and testing of dyes for orthochromatising. Absorption Methods:—Explanation of Ives's, Joly's, and Lumière's processes and their working. Kromskrop and other viewing arrangements. Interference Processes:—Lippmann's process and its explanation; recent developments of Lippmann's process. Primary and complementary colours, formation of all colours from primary colours; peculiarities of colour vision and colour blindness; Lovibond's tintometer, explanation and mode of use; measurement of colours and classification of pigments.

*Practical Work.*—Tuesdays, 8 to 10 p.m.—In the laboratory the students will have an opportunity of testing and preparing colour screens by the spectroscope, and of photographing the spectrum, and also of orthochromatising plates. At the Bolt-court School they will use these screens and plates for actual photographic work, and will then be shown at the Northampton Institute how to mount their results for viewing.

*Half-tone Process Work.*—Lecturer, Mr. Charles W. Gamble (Bolt-court School).—A course of six lecture demonstrations with practical work at the Northampton Institute, on Tuesday evenings, from February 26 to April 2, 1901. The object of this course is to give the simplest possible exposition of the scientific principles underlying half-tone work, and also an account of the best practical methods and plant to be employed.

*Lecture Demonstrations.*—Tuesdays, 7.15 to 8.15 p.m.—Syllabus: Object of breaking up half-tone into line and dot for relief printing; mechanical methods of converting bas-relief into line and dot; use of V tool; optical methods of breaking up; use of cross-line screen; conditions for securing true optical V; influence of width of screen ruling, size and shape of stop, distance of screen and sensitiveness of plate on the results; practical details of process cameras, lenses, and accessories; lighting, exposure, and development; preparation of block, exposure, etching, &c.; finishing blocks, fine etching; routing; details of finishing and printing machinery; choice of paper and printing.

*Practical Work.*—Laboratory work, Northampton Institute; Tuesdays, 8 to 10 p.m. Photo-process Work, Bolt-court School, Mondays, 7 to 9.30 p.m.—The laboratory work will be taken after the lecture, and will consist of experiments illustrating the effect of the screen, stop, and distance on the form of the dot, performed with the help of special apparatus, and the whole of the procedure up to the production of the negative. At the Bolt-court School the whole of the processes of making and finishing the block, and the printing therefrom will be carried out.

### THE PHOTOGRAPHIC CAMERA AS AN ACCESSORY TO LECTURING.

THERE is always a danger of confusing our audience if we use a string of technical terms and calculations without supplementing such with practical demonstration. This is particularly true when we are treating the subject of optics.

The photographic camera has often been compared with the human eye, and, indeed, its structure and function are very similar, so that, roughly speaking, we may say: What the photographic artist is able to do by means of his camera, plates, and chemicals, every common observer instinctively accomplishes by means of the eye, nerves, and brain. Hence it is not surprising so many refer to this particular instrument when they wish to illustrate "what we see and how we see it."

Thus, assuming that the lecturer has so made use of these comparisons, we next consider how he may utilise his instrument still further for demonstrating to his audience the truth of his remarks. Let us select

that condition of vision known as long sight, illustrating the defect and the remedy. For this purpose we require a large camera G (fig. 1), dimensions according to size of our audience. The camera is attached to a substantial table or stand by means of the ordinary T screw. It is connected in this manner, so that it may be swivelled round at different stages of the experiment. A long rod F, shown in all three diagrams, is now fixed to the front of the camera, so that it moves with the camera as the latter is turned. At the end of this rod an incandescent electric lamp C is fixed, deriving its current from an accumulator E (fig. 1) placed in a suitable position underneath the table or stand.

The screen B consists of a piece of ordinary ground glass, rather wider

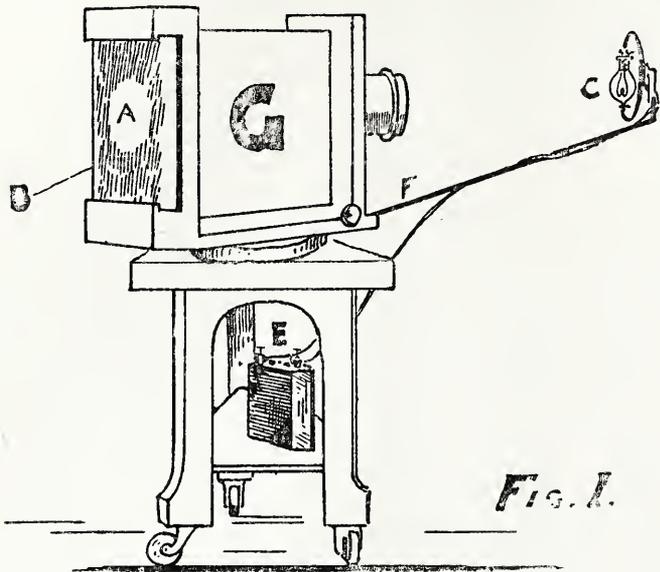

Fig. 1.

than the back of the camera, so that it may be readily withdrawn and replaced at will.

Having so arranged his apparatus and provided himself with a double convex lens D (fig. 3), the lecturer is ready for his public demonstration. The light in the hall is turned low, and the electric light C switched on. The camera being so placed with the screen B turned towards the audience, a blurred image of the lamp C will be seen on the screen at A. "Ladies and gentlemen," says the lecturer, "having observed the similitude of the photographic camera to the human eye, we shall now endeavour to illustrate by means of this apparatus some of the phenomena of sight. In the first instance, please regard the camera as it is now adjusted, as a long-sighted eye. A long-sighted eye cannot see near objects clearly because the rays are not brought to a focus soon enough, the humours not being sufficiently dense. Hence we observe a blurred image of the

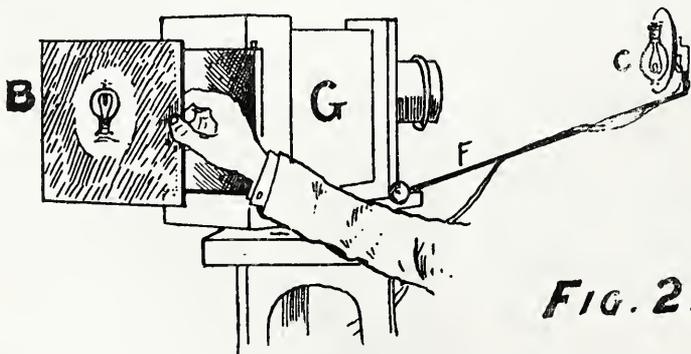

Fig. 2.

lamp upon this screen." (Here the camera is swivelled round to give every spectator a proper view of the image.) "Now, if such is the case, we shall find the distinct image somewhere behind the eye; with the present apparatus, somewhere behind the screen." (Here the ground glass is withdrawn from the camera and gradually moved towards the audience, until the distinct image is found, as shown in fig. 2.)

"Here" (continues the lecturer) "we discover the distinct image, proving that the refraction of the lens of this camera, which we are regarding as a long-sighted eye, is not sufficient to bring the rays to a focus upon the retina, the screen in its first position. (Placing this ground glass back again into its original position, the lecturer continues.) This defect of the eye, when it is not accompanied with disease, may be completely remedied by a convex lens, which makes up for the flatness of the crystalline, and enables the eye to converge the pencils flowing from near objects to distinct foci on the retina." (Here a double convex lens D (fig. 3) is taken, and held between the lamp and camera lens as shown,

when the image of the lamp, hitherto indistinct, is sharply focussed upon the screen.)

It is obvious that similar experiments may be made to illustrate various other defects in sight by changing the arrangement of the apparatus and using other forms of lenses.

It should be remarked that, to ensure complete success with the

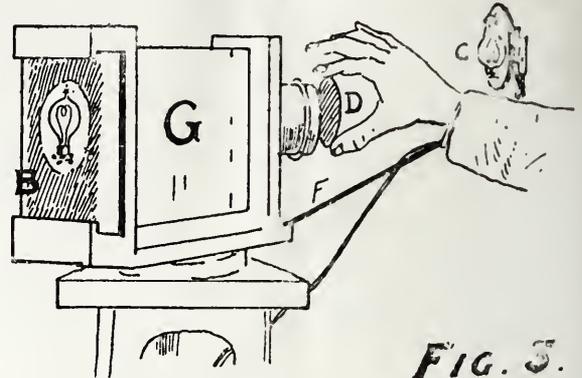

Fig. 3.

experiment described, the camera should be adjusted previous to public demonstration, so that the lamp C is sharply focussed upon the screen when the lens D is held before the lens as shown in fig. 3. By taking such precautions all after-focussing will be unnecessary, and no confusion will result.

THEODORE BROWN.

BILBIN'S SUPPORT FOR FOCUSING CLOTHS AND SCREENS.

[Patent No. 15,693 of 1899.

THE appliance can be made in the form of a solid bar rod or tube of brass or other suitable material and can at the option of inventor be in either of the following forms. Drawing (fig. 1) is a hollow tube into which B slides. The rod B being kept in position by the keeping screw C. The rod B being supplied with a hole J at the extremity for the admission of a wire, cord or rod S. The tube A is pivoted or hinged to the slab K at the point D. F is a keeping sheath which is pivoted under the milled screw G. H is a metal slab with two or more holes, I, through which screws pass for fixing. A ball and socket joint may be placed beneath the keeping screw G, to regulate the tube A and bar B. In operation

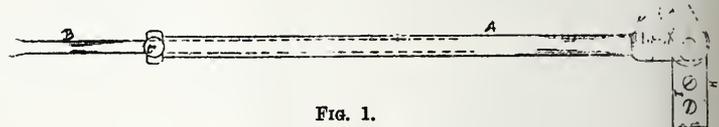

Fig. 1.

the tube A, being brought into its socket K, is kept in position by the keeping sheath, F, the screw G being tightened to prevent the keeping sheath F from movement.

The metal or other slab H is provided with two or more holes through which screws pass for securing the fixed appliance to the side top front or any other portion of a photographic camera or other apparatus. Drawing A is a bar composed of brass or other suitable material. B is another bar of brass or otherwise, each being provided with any equal number of holes in the centre and opposite each other at convenient distances.

The bar A is hinged or pivoted to the slab I at the point D. F is a

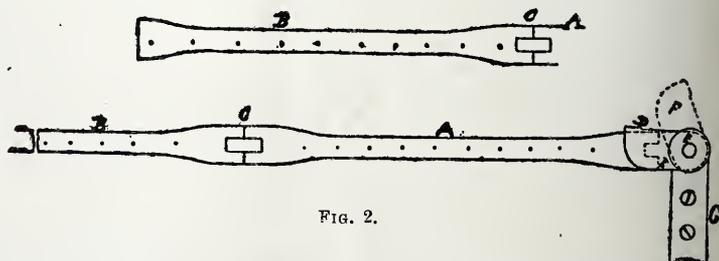

Fig. 2.

keeping sheath. E is a keeping screw. G is a brass or other slab provided with two or more holes for screws to pass through for fixing purposes.

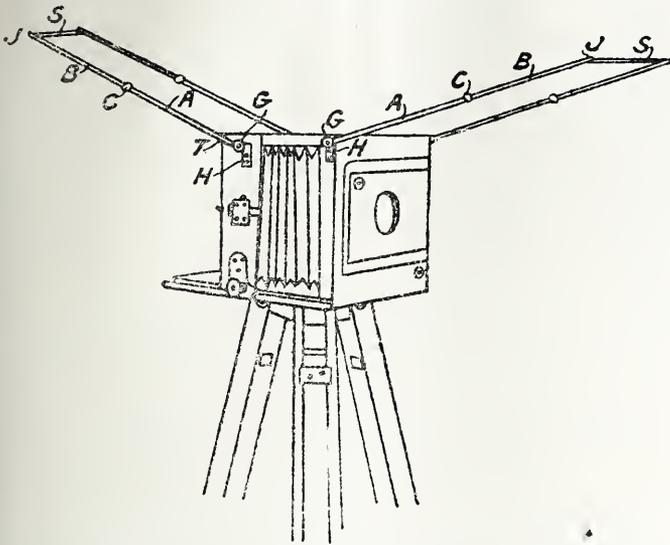

In operation the sheath F being brought over the hinged or pivoted portion of bar A at the point D keeps this rigid when the milled screw E is tightened.

The hinged portions at D and C are both stop. The holes in the centre of bar A and B at equal distances are for the purpose of putting a wire

or rod through to support a cloth or other material to form a screen, and when the distance from the lens is required for short or wide-angle lenses the bars A and B are folded together to get the desired length of screen.

Slab G is provided with two or more holes through which screws pass for securing the fixed appliance to the side front top or any other portion of a photographic camera or other apparatus.

The fixed appliance can be arranged to any angle required, by loosening

milled screw G or E (fig. 2, complete specification) thereby keeping cloth or screen out of angle of lens.

The tubes of brass aforementioned can be reversed and used to form a support for cloth when focussing, or camera can be fitted with duplicates either in the form of a rod, bar or tube. When used as a support for focussing cloth the metal slab H or G can be attached to the side or top of back of camera at T. When not in use for either purpose the brass rod or tube A, B drop over the top of camera either in front or at back by releasing the milled screw G or E and keeping sheath F.

**LOESCHER'S IMPROVEMENTS IN ROTARY PHOTOGRAPHIC PRINTING MACHINES.**

[Patent No. 10,282 of 1900.]

The principal disadvantage of the photographic printing process consists in the comparatively long duration of exposure, which is necessary for transferring the negative to the positive paper. Since, moreover, each sheet of paper is generally put singly within the copying frames, still further loss of time ensues, which is specially noticeable in the production of photographic copies on a large scale or in large quantities.

In order to overcome these drawbacks, quite a number of copying processes have already been suggested and also partly carried out in practice for the use of bromic silver paper. The same have for their object to reduce the space of time required for copying to a minimum, to make the manipulation of the copying independent of the intensity of the daylight, and moreover to carry out the copying in a continuous process.

The majority of the processes introduced for such copying show, however, in practice, a number of drawbacks, which render a competition of the so-called machine photographs with the photographs made by the hand-copying process extraordinarily difficult. These disadvantages consist essentially in the fact that either the copying with exposure machines, which possess a cylindrical negative, mostly produce only indistinct positives, or that the mechanism of the exposure machines, which work with flat negative plates, only allows of an intermittent but not continuous working, and consequently is less reliable, and unmanageable.

The invention relates to an exposure machine with rotary negatives, as is shown in the drawing.

In connexion with the construction of the new exposure machine, the arrangement known *per se* of transparent negative cylinder is made the starting point. The new machine contains such a transparent cylinder a, on whose shell or casing the photographic negative is provided as a film in a suitable manner.

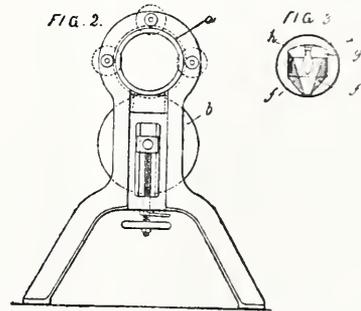

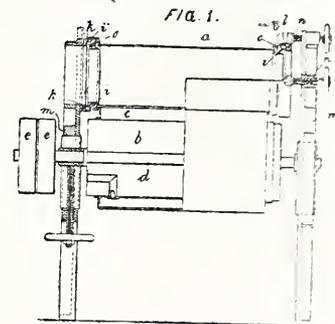

Opposite the cylinder a is located a second cylinder b, whose casing or mantle is formed by an elastic air cushion e; this elastic cushion effects the transmission of the rotation of the one cylinder to the other without fear of sliding or slipping. The machine is driven from the one or other cylinder, preferably, as shown in the drawing, from the cylinder b, whose preferably vertically adjustable axle d receives two pulleys e for this purpose.

The sensitised paper is inserted, by means of suitable guides not shown on the drawing between the two cylinders in such a manner that the film is opposite to the transparent negative cylinder a. Now, if the glass cylinder a provided with the negative is illuminated from within, the sensitised paper between both cylinders will be exposed to the light and can then be developed in suitably constructed machines.

For the production of distinct positives on the sensitised paper, the uniform guiding of the same is of special importance, which, as already mentioned, is uniformly pressed by the air cushion c of the cylinder b against the contacting part of the cylinder a.

In order to make this guiding possible, the rotatable negative cylinder must be mounted in the most careful manner, which has hitherto always been neglected in similar machines. Such bearing can, however, only be attained by mounting the whole periphery of the cylinder ends on balls. Such bearing is also necessary of making the inner space or chamber of the negative cylinder accessible from the sides. The bearings for the cylinder a consist of the rings k, l serving as travelling surfaces for the balls i, such rings being secured on the standards m of the machine in any suitable manner. The one ring l is preferably adjustable against the cylinder end by screw spindles n with hand wheels. The counter bearing rings o are secured at the end edges of the cylinder a in a suitable manner. In this manner is attained an absolutely secure bearing of the hollow rotatable glass cylinder a, and the interior of the same remains accessible from the side.

In order to avoid a preliminary or subsequent exposure of the sensitised

paper the exposure may of course only take place on a comparatively very small strip of the cylinder mantle or casing. There must therefore be provided in the transparent cylinder a a light-collector or reflector connected air-tight to the latter and allowing of the light to pass through the cylinder mantle or casing only that part where the sensitised paper is pressed by the air cushion c of the cylinder b against the cylinder a. The reflector with the light has, of course, not to participate in the rotatory movement of the cylinder a.

Fig. 3 shows the exposing arrangement in question. The reflector consists of the air-tight side parts or wings f, which are fitted within the frame g, that is firmly connected to the frame block m of the machine but may easily be detached therefrom. The frame g, which preferably consists of blank or bright metal, bears the electric incandescent lamps h or any other light source which may be used. The side parts f forming a box for the lamps are preferably controlled by springs, so that their inner edges are tightly pressed against the cylinder a. These edges of the side parts f only leave a narrow slot free, through which the light acts upon the positive paper.

In such an arrangement the exposed negative on the cylinder a must produce on the paper or its sensitised film exceedingly distinct or sharp positive copies, for, in contradistinction to the exposing machines with flat plates, a uniform pressure of the paper against the negative takes place on all parts of the exposure. Moreover, by this arrangement, in which a continuous feed of the paper takes place, a much quicker progress of the work can be made than is possible with intermittent feed of the paper in plate-exposure machines. Moreover, the described arrangement of the machine allows of the negative being observed during the exposure.

In order to expose a larger number of paper rolls at the same time, several cylinders can, instead of one cylinder b, of course be also pressed with the paper of the rolls against the negative cylinder a.

## GARCHEY'S IMPROVEMENTS IN COLOUR PHOTOGRAPHY.

[Patent No. 19,843, of 1899.]

ALL photographic processes, says the patentee, by powdering hitherto described are based upon bichromate solutions as devised by Poitevin. The chief objection to these solutions is the fragility of the film which on washing in most cases disappears or is damaged, thus destroying the photograph.

One object of my invention is to strengthen this film by incorporating a reinforcing substance with the emulsion. Collodion presented itself, but there was great difficulty in mixing it with the sensitive emulsion. All these solutions contain much water, and if collodion were introduced it would be decomposed forming a precipitate of cotton. In order to avoid this difficulty I have devised the following process.

1. I first dissolve the bichromate in the least possible quantity of water, or I employ a saturated aqueous solution.

2. With this I incorporate sirupy matter, such as honey, glucose, or dextrin.

3. I add alcohol and a small quantity of anti-photogenic colouring matter.

4. And, lastly, I introduce collodion, which melts in the mixture without decomposing, or, instead of collodion, I introduce ether and then cotton to dissolve in it and form the collodion in the mixture.

The anti-photogenic colouring matter introduced is intended to prevent the soft effects of the interference of luminous rays which sometimes present themselves on proofs on glass, opal or the like.

The emulsion prepared as above described is employed to sensitise plates, and these, after the image is developed can be repeatedly subjected to acidulated washings without injury, and thus very large plates may be employed, such as could not be used when methods hitherto known are used.

For applications of photography in colour or in producing impressions in various tints I have found it necessary to isolate the photographed and developed film between two successive positives.

Thus before each new print I cover the film which has already on it a first colour impression, with a layer of a weak, about two per cent. solution of organic material, such as gum or gelatine. I can then apply emulsions to the negative as often as I desire, the isolating layer preventing the new emulsion from dissolving the previous ones.

For producing enamels I prefer to use plates of glass, porcelain, metal or other material that can be baked, and for developing the pictures I employ coloured powders of vitrifiable enamels.

For producing prints on paper, paste-board, celluloid or the like, which are not intended to be baked, I operate in the same way provided that the negatives are in the first place made impermeable, and I develop the pictures with coloured vegetable or mineral powders.

If, for instance, Ducos du Hauron's method of photographing with the three fundamental colours is employed, I operate as follows:—

After having printed and developed, by yellow powder for instance, and washed with acidulated water, the bichromate film strengthened with collodion which has been exposed to the plate forming the yellow screen, before being treated for the other tint colours, has spread over it a layer of isolating matter and is dried. Then a fresh emulsion can be applied, and the film can be exposed to the screen for blue and developed and powdered with blue. After washing with acidulated water the like operations are repeated for the red. Many other tints might be applied if necessary.

As I have stated, my process allows of very large films being employed, but, in order to avoid the use of very large screen plates, I print by projection and direct enlargement, and thus I can decorate large surfaces with photographs in colours.

The application of pictures in black or in colour to large glass plates is objectionable because, if the pictures are transparently looked at, the half tints become thin and have only their value when the surfaces are covered with a layer of translucent enamel.

I remedy this by first applying over the whole surface white or dull enamel powder, thus having a translucent ground for the desired colour. On this ground I put a layer of the isolating material, sensitise afresh and develop as many times as desired, as above described. On baking, the ground becomes indelible and the desired effect is obtained.

## Studio Gossip.

LAST week Mr. Mullins, of Ryde, had the honour of taking photographs of the Queen and the Royal family at Osborne, and of their Royal Highnesses the Duke and Duchess of York's children, who are staying at Kent House.

MESSRS. GUNN & STUART, of Richmond and Sloane-street, have been honoured with sittings by H.I.M. the Shah of Persia, the Grand Vizier, and suite at Ostend. A considerable number of photographs were taken of H.I.M., some singly and others in groups, and some are characteristic of his love of sport. In one of them H.I.M. is taken in the act of firing at a coin tossed into the air and in other attitudes, forming a unique series.

"VISITORS to the Ober-Ammergau Passion Play will hear with interest that if they had only saved their money, stayed at home, or taken their holiday at a well-known East-coast resort," says *The Traveller*, "they might have witnessed the great play there on Sunday nights—*cinematographically!* One who has come back from a neighbouring chaplaincy, and knows all there is to be known about the Tyrolese village and the arrangements in connexion with the play, warns the unwary that a reproduction of the play taken from life is absolutely impossible, as it is forbidden to take even a hand camera into the great theatre, so that the cumbrous apparatus of a cinematograph could never escape detection."

THE SHAH AS SNAP-SHOTTER.—"Although the Shah of Persia has proclaimed a ban against the snap-shot photograph when he is himself its victim," says *The King*, "he is not averse to trying his own hand with the festive camera. While he was in Paris the Shah spent an almost fabulous sum in buying photographic material, and, hastening to the gay and festive Ostend, immediately proceeded to test the value of his easily won and easily spent money. Perhaps in time he may prove himself an expert photographer, and, if by chance the royal throne of his ancient monarchy should become vacant, he can put to practical use the experience gained in his hours of ease and affluence. In the mean time, however, he will probably learn to know all the little ironies of life which confront the amateur photographer at every turn."

AN ALL-NIGHT PHOTOGRAPH.—Mr. C. Harrington, of the Custom House, Harwich, writes in the *Strand Magazine*: "I had been engaged in photographing my bedroom, and had found that my plate, a Sandell landscape plate, was very much under-exposed at *f*-32 after two hours' exposure. It then occurred to me to leave it exposed all night. I went to bed at 11 p.m., took off the cap, and went to sleep, never waking till 4.45 a.m., when I remembered my camera, and hastily jumped out and replaced the cap. On developing I found the room was fairly correctly exposed—the blind was down—but the face and bed, being light, were over-exposed. The face had been slightly blurred by breathing, but I do not remember any previous instance of an amateur photographer taking his own portrait whilst asleep."

OUGHT TO BE PROUD OF HIM.—John Hawkey, a photographer of Cleethorpes, Grimsby, who was charged at the Grimsby County Police Court on Wednesday with a breach of the Sunday Observance Act on August 25, caused considerable amusement by the defence he made to the magistrates. He said he had never been interfered with in Lancashire, although he had committed the offence there at least four hundred times. He now told the magistrates that they could not convict him either by by-law or by moral law. The heaviest penalty they could impose was 5s., and the proceedings were taken under a mildewed Act of Charles II. In conclusion, he remarked, "I am one of the smartest young men who ever put foot into Lincolnshire, and you should be proud of me. One day I shall sit in the Council of Cleethorpes." The magistrates, who were greatly amused at the pompous manner of defendant, ordered him to pay a fine of 5s., with costs 5s. 6d.

## News and Notes.

THE Empress of Germany is exhibiting 1100 photographs, all taken by herself, at the exhibition of photographs now being held at Berlin.

A DESTRUCTIVE fire occurred on Friday morning at Kingston in the studio of Messrs. Newton & Co., photographers, Fife-road, resulting in the complete destruction of the building. The Royal County Theatre had a narrow escape. The damage amounts to upwards of 600*l*.

THE winter series of weekly lectures, demonstrations, lantern shows, &c., will be inaugurated at the Croydon Camera Club Rooms on Wednesday, October 3, with an address by the President, Mr. Hector Maclean, F.R.P.S., which will be followed by a demonstration on "Recent Advances in Lantern-slide Making."

AN illustrated journal for showmen and all entertainers has just made its appearance under the title of *The Showman*. It appeals to those connected with variety shows, both travelling and fixed, roundabouts, nigger troupes, menageries, travelling museums, illusions and sleight of hand, phonographs, gramophones, lantern and cinematograph exhibitions, &c. The first number contains an illustrated article on circus life by Mr. T. C. Hepworth, and another entitled "How War Films are Made." Reports of various shows and entertainments, illustrated descriptions of apparatus of interest to showmen, a column for conjurers, and a tabulated list of coming events are also included. *The Showman* is published at one penny monthly, at 15, Harp-alley, Farringdon-street, London, E.C.

"THE war has supplied many remarkable cases of recovery from bullet wounds which were regarded as fatal," says the *Daily Chronicle*. "Not the least extraordinary is that of Trooper L. A. Palmer, of the Australian Horse. Nearly six months ago he was wounded in the head with a Mauser bullet, and, after a stay in various hospitals in South Africa was invalided to England. Last Tuesday week, at the University College Hospital, Mr. Horsley, the well-known surgeon, having taken a Röntgen-ray photograph of the bullet, which appeared to be imbedded in the brain, extracted it in the presence of an admiring audience. On Monday Trooper Palmer accompanied the Colonials to Windsor, and said he felt perfectly fit. Almost the only inconvenience he felt from the wound was a violent headache, which came on about ten days before the operation."

THE MOST INTERESTING PLANET.—"Jupiter is the most interesting planet of the solar system, considered as a subject for telescopic investigation; and he is certainly one of the easiest objects we have, on account of his large size and the conspicuous character of many of the markings he displays." So

#### LONDON AND PROVINCIAL PHOTOGRAPHIC ASSOCIATION.

AUGUST 30,—Mr. S. Herbert Fry in the chair.

Mr. WALTER D. WELFORD passed round some negatives on the new Thornton film, of which a demonstration had been arranged for the next meeting, when a discussion regarding its merits would be in order. In the meantime a general discussion upon the subject of films arose. Mr. Welford showed how the finished negative was stripped from its support, and, challenged by Mr. Henderson, replied that the film was quite different from the Secco film.

Mr. HENDERSON found that the stripped negative was a gelatine film and affected by water, and that there was glycerine present, presumably to prevent the film from becoming too hard and dry. He did not think that P.O.P., with its free silver, placed in contact with a glycerine-treated film, would conduce to the best results, and said that stains would naturally follow.

Mr. WELFORD testified, however, to the fact that practically there was no cause for the last speaker's alarm, as he had taken many prints from such films and without the disastrous results alluded to.

The CHAIRMAN made references to the Wellington film and some recent trials he had conducted, especially with reference to the stripping operations, in which he had not been altogether successful. His own attitude towards films, he thought, was best stated in the following way: He took out a camera with several glass plates and several films and exposed them. The plates he was able to develop and print with ease and assurance; the films were not yet finished. He did not assert that the films were necessarily bad, but he found that they required the expenditure of an amount of trouble, and patience, and time not at all warranted by the results to be obtained. With Mr. Haddon he agreed that films would, for ordinary purposes, be always at a disadvantage until they were coated on a rigid surface, and this was particularly noticeable in the case of large sizes.

The suitability of developers for Wellington film other than pyro ammonia, which was specially recommended, was the subject of a short discussion. It was stated that almost any developer except pyro soda and those containing the caustic alkalies, were of use with the film.

Mr. HENDERSON handed to the Chairman the enamel which Mr. Haddon had made and presented to the Association, nicely mounted in a leather case. Examined by daylight, he found that the heaviness of the shadows noticeable by gaslight quite disappeared. He thought the enamel was a very good piece of work. Mr. Henderson then introduced the subject of the difference in density between a wet and a dry film, reading some observations made by a friend in a letter to him.

Mr. MACKIE agreed with Mr. Henderson that a plate was a little less dense when dry than when wet.

Mr. HENDERSON said that this held good with plates that had not previously been dried after development, but not, he believed, with rewetted plates. His observations led him to expect a different result with intensified plates, which, he thought, would be found to dry more intense.

Mr. H. C. RAPSON had examined plates of two different brands with reference to the same action. They were developed almost at the same time, washed together, and put in a rack to dry. One distinctly showed a thinning as drying proceeded, and the other got denser. The plate that seemed to be denser when wet had a highly glazed surface when dry.

Mr. HENDERSON showed a glass plate from which the negative film had been partially stripped. The bare glass bore distinct traces of the image to be seen on the film, and Mr. Henderson humorously asserted that pictures might, in time, be produced in this way. The plate was a bromo-iodised plate. The negative had been made twenty years, and in the intervening period had been outside, knocking about as useless; during all this time the atmosphere and other influences had produced a species of engraving on the glass which it was impossible to get rid of.

Mr. HADDON said that the plate was similar to that shown a month or two ago by Mr. Thomas. He ascribed the action then to a disintegration of the glass surface by moisture and carbonic acid, and he thought his statement was confirmed by this later example.

Mr. J. S. TEAPE spoke of a similar thing noticed by him quite recently, in the case of a wet-plate negative which he stripped. The glass, when breathed upon, showed the image distinctly.

#### PHOTOGRAPHIC CLUB.

AUGUST 29,—Mr. J. W. Mason in the chair.

The following question was put to the meeting: "Is it possible to preserve a collotype plate, say, for a few years, and afterwards to recommence printing from it?"

Mr. E. W. FOXLEE stated that, while he had never kept a collotype plate for a matter of years, he had for a few months. The keeping quality of collotype plates depended very much on how completely the bichromate had been washed out. The longer, however, the plate was kept the harder the film became, and it would want a lot of soaking before it could be again used.

rites Mr. Denning in the current number of *Knowledge*. "It is in the study of changes in the figure and motion of these markings that Jupiter offers attractions of a more distinct and special kind than those of any other planet. Venus is beautiful as a crescent, but her disc shows no more than mere suspicions of dusky areas, of which it is exceedingly difficult to trace the outlines or discern variation. Mars displays an interesting configuration, a reference to which we have still much to learn, but he is of small dimensions, and only visible to the best advantage at comparatively long intervals. Saturn exhibits a novel and picturesque effect, but his details are somewhat faint, and this, combined with his great distance and relatively small apparent diameter, has occasioned a good many dubious observations of late years. No doubt there are occasional irregularities in the belts, and definite spots now and then appear, for there is every reason to believe that the surface phenomena of the planet is somewhat similar to that operating on Jupiter. In 1878 and 1879, when the great red spot developed into striking prominence, and became an attractive object for study, the planet Jupiter was surveyed by a nearly every telescope, and our knowledge of his phenomena was much enhanced. . . . The spots having considerable proper motion, and being subject to extensive changes, cannot be regarded as material parts of the planet's surface. . . . During the last few years Jupiter has received much further investigation. The red spot is still present, though only as a dusky stain in the bay or hollow in the south side of the great southern equatorial belt."

## Commercial Intelligence

WE are informed that Mr. Ernest Human has severed his connexion with Mr. Walter D. Welford, and will henceforth carry on business on his own account as a manufacturer of cloud and border negatives, vignettes, &c. Developing, printing, and enlarging will also form a branch of this new business. His address is 50, Sherringham-avenue, Little Ilford, E.

THE Thornton Film Demonstration in the hands of Mr. Walter D. Welford commenced on Monday night at the Cripplegate Institute. There will be one to-night before the London and Provincial Association (White Swan, Tudor-street, E.C.), to which visitors will be welcomed. Mr. Welford asks us to state that he has some open dates in September which he would be glad to fill. His address is Warwick Lodge, 166, Romford-road, London, E.

Re WILLIAM LANDER, photographer, 1, Regent's-parade, Station-road, Shanklin.—The public examination of this debtor was held at the Newport, Isle of Wight, Bankruptcy Court, before Mr. Registrar Blake, on Monday. The statement of affairs filed by the debtor disclosed liabilities amounting to 159*l.*, and assets estimated to produce 61*l.*, thus leaving a deficiency of 98*l.* Replying to questions put by the Official Receiver, debtor stated that he commenced business as a photographer at Shanklin in November 1897, in partnership with a Mr. Jolliffe, and they carried on business under the style of Lander & Jolliffe. Witness put 92*l.* into the business, and his partner contributed 200*l.* They did not keep any banking account. They paid the former proprietor of the business 30*l.* for the goodwill, negatives, &c., and 49*l.* for the apparatus, &c. They both had a good knowledge of the business, and they devoted the whole of their time and energies to it. The partnership was dissolved in February of this year, when debtor agreed to pay his partner 150*l.* as his share of the assets. Since then debtor had carried on the business alone. His wife claimed the furniture. The examination was closed.

THE AMERICAN MECHANIC.—Commenting on some of the more recent articles in the *Times* on "American Engineering Competition," of which the most striking observations are reproduced, *Feilden's Magazine* emphasises the contrast between the American working man, who is paid according to his merits, and consequently uses his utmost energy to produce the highest quality of work—as by so doing he not only benefits his employer, but himself—and the British workman, who demands the pay fixed by the trades union, and works no more than just enough for food and beer, takes no interest in his work, and stupidly but obstinately opposes the introduction of labour-saving machinery. "We have touched very lightly on this subject," says the journal, "but it is one whose importance cannot be over-estimated. Something has been done in this country to improve matters, but very little; and there are no signs of any great movement towards further organization on the part of the engineering employers. On every hand we see a growing tendency for municipal bodies to join the conspiracy against industrial prosperity by insisting on the trades-union labour clauses in all contracts. Occasionally we hear that members of the Engineering Employers' Federation are so wanting in good faith as to accept contracts in which such clauses occur. More than this, we have even seen a specification, drawn by the London agent of a firm associated with the Employers' Federation, in which the same pernicious clause was inserted. So long as apathy, jealousy, and sometimes disloyalty, continue to be the distinguishing features of employers, so long will the mechanic be the master of the situation. British employers, as well as British workmen, have still a good deal to learn from the United States."

## Patent News.

The following applications for Patents were made between August 20 and August 25, 1900:—

ANIMATED PHOTOGRAPHY.—No. 14,848. "Improvements in Apparatus for Projecting Animated Photographs on to a Screen." E. T. SAUNDERS.

BUSH AND TRIPOD TOP.—No. 14,980. "New Improved Bush and Tripod Top for Photographic Cameras." W. D. HAZELTON.

SPRING-BACK FOR FRAMES.—No. 15,140. "A Spring-back for Photograph Frames." W. GUTTENBERG.

Mr. H. SNOWDEN WARD said that it was stated by a certain firm connected with the collotype industry, that if the ink were entirely removed from the plate, after use, by means of turpentine, and the plate thoroughly soaked with water and allowed to dry in a current of air, it would keep for years, and could be again made ready for printing by treatment with water and glycerine solution. Amongst most collotype workers he believed the practice was to ink up the plate before putting it aside. He asked whether any present had ever seen a case of the glass surface being torn away by shrinkage of the gelatine film. He had seen such a thing, which, however, must be distinguished altogether from a separation of the film from the glass.

Mr. FOXLEE said it frequently happened if a plate were over-dried. He had shown plates here on more than one occasion of which the surface had been stripped in the same way. A collotype plate was ground first, and then coated with a substratum containing bichromate which was exposed to light through the glass. By this means a very hard quality was given to the film where it was in contact with the glass, and it had so strong a grip of the glass that it easily tore away the surface if, when the second coating had been applied, it was dried too much. The patterns produced were very peculiar. Soft gelatines and brittle gelatines gave patterns of different characteristics.

Mr. F. A. BRIDGE came across, some years ago, some thickly coated plates that had split the surface of the glass in a similar way.

The next question, "After pyro which is the best developer for plates?" was the source of much discussion. The question was defined by one speaker as an inquiry for the developer that would give the best results under the widest possible range of circumstances. Kachin, ortol, ferrous oxalate, and many other well-known developers were mentioned during the debate, not as supplying the answer to the question, but for certain characteristic good qualities. It was asserted that in France photographers continued to use ferrous oxalate for a long time after the introduction of pyrogallol, and this seemed to point to ferrous oxalate as a very reliable developer.

Mr. FOXLEE said that in Munich, so recently as 1897, photographers were still largely using ferrous oxalate.

Mr. BRIDGE supposed that this would be under certain given conditions, such as for copying or for studio work.

Mr. FOXLEE added that Mr. Witcombe, of Buenos Ayres, until recently used the ferrous-oxalate developer for all his work.

Mr. BRIDGE mentioned that, in pyro development, action could often be hurried up a little by the addition of a trace of metol powder. As regards the alleged impossibility of tinkering with the ferrous-oxalate developer, he could only say that it was not the case, and a great deal could be done to modify its action.

Mr. G. E. BROWN said he had recently spoken with Mr. V. C. Driffield upon the question of development. Everything that Messrs. Hurter & Driffield published they held to the last, and Mr. Driffield still held this to be strictly true. He said that one could not tinker with one's developer and calculate previously what one would get, that is when the tinkering was done by the addition of other substances to the developer; whereas, if one used a plain developer such as pyro soda, without bromide, one could calculate exactly the density for a certain definite exposure. Mr. Brown was shown a plate on which were three patches of different densities, one clear glass, one medium, and one quite dense. Mr. Driffield challenged any photographer to expose a plate behind that plate, and by suitable exposure to produce therefrom three patches of equal density without trial. He claimed he could do this by attention to the photo-chemical laws laid down in their writings. It was true that one might know in which direction tinkering might make our results tend, but one cannot control the amount, whereas with a bromideless developer one could absolutely calculate what alterations one was going to make in the gradations.

Mr. BRIDGE thought it was once more a case of theory *versus* practice. Supposing he wanted to produce a certain result, tinkered for it and got it, how did that conform to Mr. Driffield's assertion? As a practical man he asked, Why calculate? He never had difficulty in getting the result he wanted. The fact that the same thing could be done by calculation was no proof that it could not be done in any other way.

Mr. H. MÜLLER agreed that, while a scientific explanation of facts might be very desirable, it was unreasonable to think that it was the only point from which a phenomenon could be looked at and studied.

Mr. BROWN added that Mr. Driffield was, in the first place, an amateur before he commenced his researches with Dr. Hurter. His particular bent was portraiture; this was in the collodion days and he sensitised his own plates. He knew their speed and the exposure required. When gelatine plates came in they were very irregular in point of speed, and there was no means of telling the exposure, so the well-known series of experiments were made entirely for themselves.

Mr. BRIDGE confirmed the statement regarding irregularity of speed with early gelatine plates. The gelatine was in itself so variable a factor, that much of the want of uniformity might be attributed to this.

North Middlesex Photographic Society.—August 27, Mr. J. Austin Keen in the chair.—Mr. F. C. TILNEY gave a lecture entitled,

#### ROSSETTI, PAINTER AND POET.

A most interesting account of the life and works of this artist was given by the lecturer, who was evidently well up in his subject. He had a great number of reproductions of the artist's works on view, and the explanation and description of them made the audience feel that they would understand and appreciate better the originals when they saw them. A number were illustrations of the artist's own poems, extracts from which were quoted when they helped to explain the picture. Rossetti, with Millais, Holman Hunt, and the sculptor Thomas Woolner, founded the Pre-Raphaelite Brotherhood, which exercised an enormous influence upon the art of the day, which was in a very low state. The strong point in his paintings was colour, which was extremely glowing and rich.

Newcastle-on-Tyne and Northern Counties' Photographic Association.—A meeting of the Newcastle-on-Tyne and Northern Counties' Photographic Association was held on August 21 in the Mosley-street Café, Newcastle, to consider the question of the secretaryship, Mr. William Thompson having been obliged, with much regret, to tender his resignation as Secretary, owing to the recurrence of ill health. Mr. W. S. CORDER (Vice-President) was in the chair, and said they all deeply regretted that it should be necessary, because of Mr. Thompson's ill health, to appoint a new Secretary. He (Mr. Corder) had had a good deal of work to do in connexion with the Society during the last twelve months, and it had been the greatest pleasure to work with Mr. Thompson. He had the interests of the Society at heart, and had done an enormous amount of work on behalf of the Society. In fact, one feared that his illness had been to some extent accelerated by the work he had done for the Society. It was agreed, on the motion of Dr. Blacklock, that Mr. Corder should write to Mr. Thompson, stating that the Society had accepted his resignation with regret; that they appreciated the able service he had rendered to the Society, and sincerely hoped that his health would soon be restored. After some discussion, Mr. Edgar Lee consented to go on acting as Assistant Secretary until the annual meeting, Mr. Corder and Mr. T. M. Clague undertaking to assist him. The meeting cordially agreed in this arrangement. The CHAIRMAN explained that it was proposed, on behalf of the Society, to present a silver stop-watch to Mr. Thompson, and some pieces of silver to Mrs. Thompson. Mr. and Mrs. Thompson were married only this summer, and they were all extremely sorry that Mr. Thompson, for whom they had a sincere affection, should have been so ill. The watch and the silver cream jug and sugar bowl were handed to Mr. James Baty, who undertook to convey them to Mr. and Mrs. Thompson.

#### FORTHCOMING EXHIBITIONS.

- 1900.
- Sept. 21–Nov. 3 ..... Photographic Salon, Dudley Gallery, Piccadilly. Hon. Secretary, R. W. Craigie, Camera Club, Charing Cross-road, W.C.
- October 1–Nov. 3 ... Royal Photographic Society, New Gallery, Regent-street. The Hon. Secretary, 66, Russell-square, W.C.
- „ 17–20 ..... Rotherham Photographic Society. Hon. Secretary, H. C. Hemmingway, Tooker-road, Rotherham.
- November 7–10 ..... Cripplegate Photographic Society and the Essex and Middlesex Cycling Union, Ltd. The Hon. Secretaries, A. T. Ward, Cripplegate Institute, E.C., and G. F. Sharp, Sach-road, Upper Clapton, N.E.
- „ 12–17 ..... Ashton-under-Lyne.
- „ 21–23 ..... Hackney Photographic Society.
- „ 22–24 ..... Hove Camera Club. Hon. Secretary, C. Berrington-Stoner, 24, Holland-road, Hove.
- 1901.
- January 14–19 ..... Blairgowrie and District Photographic Association. The Hon. Secretaries, Blairgowrie, N.B.

Those who desire to send photographs to the above Exhibitions should write for prospectuses to the Hon. Secretaries, whose addresses are given in the second column above. The dates mentioned are those at which the Exhibitions open.

#### Correspondence.

\* \* Correspondents should never write on both sides of the paper. No notice is taken of communications unless the names and addresses of the writers are given.

\* \* We do not undertake responsibility for the opinions expressed by our correspondents.

#### THE SALE OF POISONS.

To the EDITORS.

GENTLEMEN,—I enclose a cutting from the *Gardener's Magazine* of the 25th ult. It may be of interest to your readers, as it shows that photographers are not the only prey of the Pharmaceutical Society. Perhaps some of the dealers most interested might be glad to know of the Society formed to combat the pharmacists' tyranny.—I am, yours, &c.,  
Lewin Cottage, Lewin-road, Bexley Heath, Kent. G. C. LAWS.

TRADE IN POISONS FOR TECHNICAL PURPOSES.—The Traders in Poisons or Poisonous Compounds for Technical or Trade Purposes Protection Society have taken offices at Nos. 5 and 6, Clement's Inn, Strand, London, W.C., and the Committee have appointed Mr. T. G. Dobbs Secretary of the Society; Mr. G. H. Richards, of 128, Southwark-street, London, S.E., Hon. Treasurer; and Messrs. Dobbs & Hill, legal advisers. A strong representative committee has been formed, and the Society is now seeking support by way of subscriptions or donations from all classes of traders, the objects of the association being

stated shortly as follows: (1) To promote and protect the interests of traders in poisons and poisonous compounds for technical or trade purposes; (2) to take steps, as the Executive Committee may consider desirable, for opposing legislation which is calculated to injuriously affect such traders; (3) to secure the removal of repressive and vexatious restrictions in regard to the sale of poisons and poisonous compounds for technical and trade purposes by traders other than pharmacists; (4) to promote and support by all constitutional means the passage through Parliament of any Bill or Bills comprehending the above objects; (5) to advise and assist members of the Society in any litigation in which the general interests of the traders in poisons and poisonous compounds for technical or trade purposes are, in the opinion of the Executive Committee, injuriously affected.

[The Order in Council with regard to the sale of carbolic acid provides that, in future, all liquid preparations of the acid containing more than three per cent. of the poison can only be sold retail by registered chemists and druggists. Preparations containing carbolic for use as sheep-wash, or for agricultural and horticultural purposes, are excluded from the Order. Every vessel used must be labelled with the word "Poison," the name of the article, and the name and address of the vendor. Further, all liniments, embrocations, and lotions containing carbolic acid must be sent out in bottles rendered distinguishable by touch, and bearing a notification that the contents are not to be taken internally.—EDS.]

### THE PARIS EXHIBITION.

To the EDITORS.

GENTLEMEN,—We have pleasure in informing you that the Actien-Gesellschaft für Anilin-Fabrikation, Berlin, for whom we are sole agents in this country, have been awarded the gold medal at the Paris Exhibition for their photographic preparations.—We are, yours, &c.,

A. & M. ZIMMERMANN.

9 and 10, St. Mary-at-Hill, London, E.C., August 31, 1900.

### THE R.P.S. EXHIBITION.

To the EDITORS.

GENTLEMEN,—I should be glad if you would kindly remind your readers that the last date for the reception of exhibits, packed in cases, intended for our forthcoming Exhibition, is Tuesday, September 11. Exhibits delivered by hand will be received at 66, Russell-square, until eight p.m. on Wednesday, September 12. Prospectus and entry forms can be had on application.—I am, yours, &c.,

A. W. W. BARTLETT, Assistant Sec.

Royal Photographic Society, 66, Russell-square,  
London, W.C., September 1, 1900.

### THE "PHOTO-MINIATURE."

To the EDITORS.

GENTLEMEN,—May we point out that your answer to a correspondent on p. 560 of the current issue may mislead him as to the price of the *Photo-Miniature*. Though the American price is 25 cents (the equivalent to 1s.), the English edition is sold at 6d. per copy, post free 7½d., and it can be obtained from most dealers in photographic materials.—We are, yours, &c.,

DAWBARN & WARD, LIMITED.

6, Farringdon-avenue, London, E.C., August 30, 1900.

### THREATENING A RIGHT.

To the EDITORS.

GENTLEMEN,—A lady came and engaged me to photograph a certain public-house. I went, and the tenant objected, in fact, incited many people to obstruct the views I took as much as possible. I asked the publican the reason for his objection, and he said the lady had no right to have the place photographed, and she wanted the photographs to object to his licence. She had no claim at all upon the property. He also said, if I published the photographs at all, the Licensed Victuallers' Association and the owners of the property—a brewery company—would prosecute me for doing the same.

After thinking it over, I decided my best course was not to go on with the photographs, as both owners and tenants objected, and she had no pecuniary interest in the matter. I told the lady so, and offered her the deposit she had made, viz., two shillings. She refused it, went to a solicitor, from whom I received a letter stating he knew all the facts of the case, and I need not be afraid of proceeding with his client's order; also, that if I refused I should be held liable for damages for breach of contract (not a written one, only a verbal one).

☞ I have already suffered to a slight extent. The place is a small one, and I must not set popular feelings against me. Will you kindly advise me through your columns if there has been a similar case to mine, and also how I stand with regard to the bad business.—I am, yours, &c.,

COMPLETION OF ORDER.

[Let not our correspondent be perturbed. He has a perfect right to photograph the public-house, and not all the publicans, Licensed Victuallers' Associations and brewing companies in the kingdom can stop him. We cannot recall a case bearing on the point, but we advise him to execute the order and ignore the ridiculous threat of "prosecution."—EDS.]

### A NEW LIGHT FOR THE STUDIO.

To the EDITORS.

GENTLEMEN,—Already the signs are appearing of the approach of winter, with its dark days and long evenings, and with it comes the demand for a satisfactory artificial illuminant which, with a minimum trouble and cost, will make the professional photographer independent of daylight. Recently I was invited to inspect a new light, which fulfils the above conditions so well that it is almost a duty to bring it before those who are interested. Its characteristics are simplicity, cheapness, safety, great brilliance, and extraordinary actinic power. Briefly described, the burner is after the style of the Welsbach, with mantle but no chimney. The combustible gas is simply atmospheric air, driven, by means of a small fan, through a saturator, or carburiser as it is termed, and burns with a non-luminous but intensely hot flame, which raises the mantle to a dazzling brilliance approaching limelight, but more diffused, and consequently softer. The fan which I saw was driven by a diminutive motor connected with the street electric supply.

To demonstrate the actinism of the light, some three-quarter length cabinet portraits were taken in a white-washed cellar, from which daylight was excluded. The exposures were from five to seven seconds, with three burners in a row, and one on the opposite side, on a Barnet medium plate, stop *f*-11.3, and were pronounced by a professional photographer to be daylight portraits. (I enclose one for your inspection). Furthermore, a P.O.P. print was made in twenty minutes, at about six inches from the burner.

The same gas can be used as a motive power for gas engines. In this case no fan is required, the engine drawing the air through the carburizer by its own suction. A three-quarter horse engine was connected by a rubber pipe to a diminutive saturator, about the size of the smallest calcium tubes used for storing platinum paper, and it was ludicrous to see the fly-wheel spinning madly round at the instigation of an old tin canister, without reservoir or gasometer. As the inventors point out, there is no danger of escape or explosion, there being nothing to escape. Directly the air supply is stopped the production ceases. The appliances are so simple that I should imagine a perfectly efficient studio installation could be fitted up for a 10l. note or so. By way of showing how easily a photographic light could be produced for occasional use, the tin canister thing was coupled on to a burner, and air blown through by a rubber ball with a sixpenny balloon between. For the lantern it should be eminently suitable, and, by reducing the area of light by a diaphragm, an ideal illuminant for the enlarging lantern.

I may add that I am in no way connected with, nor interested in, the invention. I believe it is patented here and abroad, and a private Company to be formed. Any one interested can obtain further information by applying to the Atmospheric Gas Company, 5 New Bond-street, Leeds, who would, no doubt, be willing to allow practical tests with the camera.—I am, yours, &c.,

A. A. PEARSON.

21, New Station-street, Leeds, September 3, 1900.

[We are exceedingly obliged to Mr. Pearson for his interesting letter. The photographs sent certainly favour the system of lighting referred to, for they are characterised by softness and evenness of illumination. If our Leeds friends can favour us with any further particulars, we shall be pleased to publish them.—EDS.]

### THE PHOTOGRAPHIC SALON, 1900.

To the EDITORS.

GENTLEMEN,—I shall be obliged if you will kindly notify in the current issue of your paper that entries for the Photographic Salon close September 10.

Pictures, accompanied by Entry Form, may be delivered by hand at the Dudley Gallery, Egyptian Hall, Piccadilly, London, W., on that day, between 10 a.m. and 9 p.m., or may be sent by September 6, marked "For the Photographic Salon," to Mr. Moore, Manager of Messrs. Whiteley's Shipping Department, Queen's-road, Bayswater, London, W., who will attend to their delivery.—I am, yours, &c.,

REGINALD CRAIGIE, Hon. Sec.

Camera Club, Charing Cross-road, London, W.C. Sept. 3, 1900.

## Answers to Correspondents.

\* \* All matters intended for the text portion of this JOURNAL, including queries, must be addressed to "THE EDITORS, THE BRITISH JOURNAL OF PHOTOGRAPHY," 24 Wellington-street Strand, London, W.C. Inattention to this ensures delay.

\* \* Correspondents are informed that we cannot undertake to answer communications through the post. Questions are not answered unless the names and addresses of the writers are given.

\* \* Communications relating to Advertisements and general business affairs should be addressed to Messrs. HENRY GREENWOOD & Co., 24, Wellington-street, Strand, London, W.C.

### PHOTOGRAPH REGISTERED :—

C. H. Skillman, 22, Uxbridge-road, W.—*Photograph of Mr. J. Bailey.*

PUZZLED READER.—The context shows the meaning, viz., a distance experimentally ascertained.

W. H. H.—Without seeing a specimen, we cannot assist you. Send us an example of the trouble, and we can, no doubt, help you, which we shall be pleased to do.

BLACKENING BRASS.—H. KELLETT. The reason the black is uneven on the surface is that the metal was not evenly clean all over. The best way of cleaning is with very fine emery cloth such as is sold for watch-makers' use. The blackening solutions you have employed are all right.

FANCY GOODS.—CATALOGUE writes: "Will you please give me the address of two or three firms where I can purchase fancy goods of every description suitable for photographer's shop?"—In reply: Messrs. Marion & Co., Soho-square, probably supply the kind of goods required.

P.O.P.—NOVICE asks, which of the many P.O.P.'s that are being advertised as the best we would recommend him, as a beginner, to use.—It is quite against our rule to recommend any particular maker's wares. All the recognised brands are good. We should recommend our correspondent to get a sample sheet of different brands, and decide for himself which he likes the best.

EFFECT OF ALUM ON P.O.P.—P. LLOYD writes: "Will you inform me if P.O.P. prints put into a solution of alum, after fixing to harden gelatine, would cause fading of the prints if they were well rinsed?"—If the hyposulphites are perfectly washed out before the prints are put into the alum, and the latter is removed by washing, the permanence of the prints need not be impaired.

STUDIO BLINDS.—R. C. says: "I have just taken premises, and the studio is a lean-to, built against a high wall facing N.E. I shall have to fit it with blinds of some sort. Will you please say what would be the best material and colour?"—With that aspect, we should suggest either a tolerably dark blue or a light green. Either would answer quite well, and would be a very agreeable colour to the sitter. The usual window holland would be a good material for the purpose.

RIVAL PHOTOGRAPHERS.—XENO. "I enclose a circular that another photographer is sending about in this district, to the great disparagement of my work, as well as my character. I was formerly in his employ, but am now on my own account. Can I stop him?"—We should say that you certainly could. It is libellous, and shows a great amount of malice. Not only can you stop him, but we expect you can recover damages. Put the matter in the hands of a solicitor without delay.

RETOUCHING WITH A NEEDLE.—W. MARSHALL writes: "Will you tell me what tools are required for retouching with a needle? 1. Whether you can get any special needle, and from where? 2. If medium is used; if not, what is used?"—We believe that most retouchers who work in this way simply use a needle forced in the stick of a penholder or similar contrivance. Very possibly Messrs. Marion & Co. sell needles specially for the purpose. Inquire of them. No medium is required.

COLOURING ALBUMEN PRINTS.—H. T. HILLHOUSE writes: "I want to colour some albumen prints which are pasted in an album, but find water colour does not properly adhere to same, and there is great difficulty in getting same to take. Will you please tell me what to coat the prints with so that I can easily work on them?"—If the surface of the prints be washed over with a little oxgall very much diluted with water, the colour will take readily. Prepared oxgall may be had from any of the artists' colourmen.

DAMAGED LENS.—R. SIMMONDS says: "I have accidentally let my half-plate R.R. fall, and it has caused a slight chip in the back glass. I don't know who the maker is, as there is no name upon it, so cannot send it to him to do the needful. What should I do?"—Simply put a little black varnish on the chip to prevent reflection from it, and you will find that no material injury has been done. Theoretically, the lens will be a very little slower from the slight loss of light, but it will be quite a negligible quantity.

PERMANENCY OF COLLODIO-CHLORIDE PRINTS.—H. G. M. C. asks: "1. Can you tell me whether collodio-chloride prints are fairly permanent? 2. As compared with albumenised paper, if treated with the same care, are they more or less liable to fade and become yellow?"—In reply: 1. Properly prepared collodio-chloride prints should be as permanent as a photograph can be. One great advantage of the process is the chemical inertness of the vehicle. 2. We should ascribe fading or yellowing to imperfect manipulation.

PAPER FOR BACKGROUNDS.—J. A. FOX writes: "I have seen brown paper recommended for backgrounds. Can you tell me where it is to be had in sheets large enough for the purpose without folds? None of the stationers here have any nearly large enough, and what they have is folded in the middle."—The paper may be had of almost any length, and about five feet wide, under the name of "carpet paper." It is not usually kept by stationers, but by furnishing warehouses, and is used for putting under carpets when they are laid.

TRAVELLING EXPENSES.—OPERATOR says: "I accepted an engagement for the season at a Scotch watering-place, and the railway fare (third class) was nearly two pounds. Who should pay that? On asking for it when I received my first month's salary, I was told that I must bear that expense. Will you please tell me what is the rule in such cases?"—So far as we are aware, there is no rule, it is simply a matter of arrangement at the time of making the agreement. Usually the agreement is for the employer to pay the fare one way, that is when an agreement is made.

MATERIAL FOR BACKGROUNDS.—GLOW writes: "I have often read that some of the best photographers use special backgrounds to suit different sitters, particularly for vignettes, which they hastily prepare for themselves. Will you please tell me of what material they are made of, as it seems to me that canvas strained on frames cannot be used for the purpose?"—Brown paper, which may be had in rolls up to about five feet wide, under the name of "carpet paper," is very suitable for the purpose, as it forms an excellent ground colour, and may be readily lightened or darkened where desired with powder colour rubbed on.

TROUBLE IN CARBON PRINTING.—W. LOWE writes: "I am in trouble with carbon printing. The trouble is this: I cannot get the exposed tissue to adhere to the flexible support, or to the single transfer paper. I have tried soaking it for all times, but with the same result. I have squeezed it well, and even kept it screwed down in a copying press for half an hour; and when I took it out, and put it in the warm, the tissue at once came clean off the paper. Can you explain why?"—In all probability the tissue has become insoluble. Place a piece of it in warm water (unexposed, of course), and, if the colour does not begin to dissolve in a minute or two, it is insoluble, and that accounts for the trouble at once.

INDIARUBBER MOUNTANT.—RUBBER writes: "I recently saw in an old book that indiarubber solution was excellent for mounting photographs with. Now it has occurred to me that, as there so many bad mounts in the market, that this would be the best thing to use. As the indiarubber is waterproof it would protect the print from the injurious matter in the mount. As I have a lot of mounts that I am suspicious of, will you please tell me how the rubber solution is made?"—Simply dissolve the rubber (unvulcanised) in benzole. The best way is to get some of the thick solution, as sold at the indiarubber shops, and dilute that with benzole; it will save trouble. The objection to indiarubber as a mountant is, that after a time it is liable to perish, when the print will leave the mount.

OVER-EXPOSURE.—PRINTER writes: "I took a photograph of a view of this town, from a distance of 200 yards or so, using stop  $f/32$  and one second exposure, on whole plate. I mixed developer for a plate that would be expected to be over-exposed. I may say the sun was shining. On developing, the plate was rather a long time coming out, and I could not get sufficient contrast even in the sky. There was an abundance of detail, and some of the objects were even more dense than the sky. I used pyro-soda developer, with plenty of bromide of potassium. It was taken on Barnet ordinary plates."—Apparently the negative was considerably over-exposed, as you surmise. But what do you wish to know about it? you put no query. Possibly, if it were intensified, you might get fair prints from it.

SPOTTED NEGATIVES.—FAULTY PLATE writes: "Would you kindly inspect the enclosed negative, and if possible inform me what these spots are due to? I do not notice them when they are fixed, but soon after starting them to wash they appear. Is it any fault of mine or the plate, as it is only on quarter-plates that they come? I developed whole-plates, half-plates, and quarter-plates last night, and this morning nearly all the quarter-plates are spotted similar to enclosed; some not very much, others are unprintable. It has only appeared this last few days, and, having had some new plates in, I fear it is a fault of the maker, but I should like to have your esteemed opinion first. I have had splendid results with them up to now."—In reply: We should be inclined to suspect the water you use for fixing and washing; if it contained traces of iron or other impurities, it would produce similar markings. Filter the water through flannel; this should intercept all solid particles and prevent such markings.

THE FERROTYPIC PROCESS.—A. E. D. writes: "Would you kindly let me know how to proceed with the ferrotype process, wet plate? Quantity of iodiser with collodion, if it is to be any different according to hot or cold atmosphere? Quantity of nitrate of silver (recrystallised), how long plate to be in bath, and what developing formula will you advise for quick exposure, say, one to three seconds in shade summer and winter, and what fixing bath? I have lenses  $f/8$ . I am working the dry-plate process, not the ferrotype plates, only I should like to know how to proceed with ferrotype wet plates."—All the formulæ for collodion, bath, developer, and fixing solution, are given on pages 1088-9 of the ALMANAC; but we should advise you to purchase the collodion ready made, as then you will ensure getting a good one. As you are, apparently, quite unacquainted with the wet collodion process, we should recommend you to get an old manual of photography. In that you will find full working details of the glass positive or ferrotype process.

## THE BRITISH JOURNAL PHOTOGRAPHIC ALMANAC FOR 1901.

Edited by THOMAS BEDDING, F.R.P.S.

THE fortieth annual issue of THE BRITISH JOURNAL PHOTOGRAPHIC ALMANAC will be published on December 1 next. Its preparation is already receiving attention. This year's ALMANAC reached a total of 1516 pages, and, as was the case in 1899, the entire edition of 20,500 copies was sold out within about three months of publication. Of no other photographic book ever issued can two such unique facts be recorded.

The striking favour with which past ALMANACS have been received is the surest proof that the lines upon which that publication is produced meet the requirements of its readers and supporters. Upon such lines we propose compiling the volume for 1901. At the same time we shall be pleased to receive and consider suggestions for increasing the value of the ALMANAC in directions which may occur to our readers as susceptible of improvement.

The ALMANAC for 1901 will appeal to photographers all the world over as a daily reference guide in practical work. The formulæ will be revised where necessary, and the latest departures in theory and practice will be chronicled. The year's advances will be recorded, and wherever practicable new features of an informative nature will be added.

Adhering to an old and much-appreciated custom, we invite short contributions on practical subjects for the pages of the 1901 ALMANAC. Those of our friends intending to co-operate with us in this respect can help us by letting us have their MS., sketches, &c., at the earliest possible date.

Secretaries of societies will oblige if they will forward us lists of officers and other details for inclusion in the directory of photographic societies. We shall also be glad to receive any additions that may be made to the list of telegraphic addresses of the trade, &c. As usual, a section of the ALMANAC will be devoted to notices of the latest introductions in photographic apparatus, &c. Those firms who wish to take advantage of this feature should communicate with us as early as possible.

The publishers ask us to remind advertisers that many of the advertisement pages of the ALMANAC are already booked, and that, to ensure insertion and good positions, orders and copy should reach them without delay.

## EX CATHEDRÀ.

MESSRS. CARL HENTSCHEL, Limited, of 182-4, Fleet-street, E.C., send for our inspection a specimen sheet which they are just issuing of the Carl Henschel Colourtype process. Messrs. Henschel's accompanying letter may speak for itself: "We believe this sheet is the largest yet issued of an artistic character, and we would draw especial attention to the variety of subjects treated. There are examples of oil and water-colour paintings, as well as reproductions taken direct from an old book cover, and a delicate Royal Worcester vase. With reference to this process, which differs from any other, we might add that we have reproduced a number of medical and natural-history subjects with the best results. Several of these difficult objects had been attempted abroad, but without success. We contend that the Carl Henschel Colourtype

process is as useful for the delicate illustrations required in medical, surgical, and scientific books of reference as it is for the child's picture book, now so largely reproduced by lithography, often to the complete destruction of the artist's scheme of colour, while for books of travel and tales of adventure it will be found most attractive. The process is also equally applicable to commercial subjects, facsimile reproductions of large originals, as magazine insets or leaflets for distribution are capable of being reproduced by the million at a cheap rate."

\* \* \*

WE have conceded to Messrs. Hentschel the privilege of speaking their own mind in this matter as some reward for their well-known enterprise, and not because we agree with all that they say. The sheet of pictures sent us measures 28 x 20 inches of subject. This is not by any means the largest yet issued, for we possess larger specimens by the same, or, at any rate, a very similar, half-tone colour process, and just as good. Again, we are bound to query the statement that the Hentschel Colourtype process "differs from any other." We have followed three-colour work for a good many years, and we should like to know the points of difference between the examples before us and others that have preceded them. Let it be understood that we make these remarks in no carping spirit; we rather wish to suggest that Messrs. Hentschel, an excellent process house which is comparatively new in the field of three-colour work, are inclined to overweight themselves with unnecessary and inconvenient claims. As to the sheet of specimens before us, we must say that we have not seen more beautiful specimens of the kind of work. In particular, Mr. T. B. Hardy, the well-known water-colour artist, should feel highly pleased, for the reproduction of his view of Rye, Sussex, gives us the impression of being perfectly true to the original. But the whole sheet of specimens is remarkably beautiful, and, if three-colour work so good as this is obtainable in the ordinary way of trade, we shall be quite satisfied; and we shall also be surprised.

\* \* \*

IN the JOURNAL of June 1 last we reviewed a book on Burma by Max and Bertha Ferrars. It is published by Messrs. Sampson Low & Co., and the 455 illustrations it contains are from the author's photographs. On the latter point we penned the following remarks: "For ourselves the immediate interest of the book centres round the fact that it is illustrated by considerably over 400 phototypic reproductions from photographs. When a book is illustrated in this manner, one of two things usually happens: either the original photographs are bad, or, if they are good, the reproductions are not. Frequently both are poor. In the present case neither the one thing nor the other happens. The original photographs, it is obvious, were marvellously good, and they have not only been well reproduced by the Swantype Company, but are flawlessly printed. In the whole of our experience we have not come across a book so well illustrated by means of photography as is this fine work on Burma. After many hours spent in its study we are left regretting that no explanatory preface is given." It is a pleasure to us to learn that Mr. Max Ferrars, the senior author, proposes to make public the system of working by which he produced the wonderfully good technical work that we admired in his book. He is to lecture on the subject at the Photographic Club, Anderton's Hotel, Fleet-

street, on Wednesday evening, September 19. The meetings of the Club are open to visitors, and those of them who take advantage of the Club's hospitality should have an instructive evening. *Burma* is one of the finest books of the year, and a great deal of its value is due to the excellence of its phototypic illustrations.

\* \* \*

AMONG the things noticeable during the great summer exodus from town, seaward or elsewhere, is the evident favour with which the *voyageur* regards a hand camera as an addition to his portable belongings. Men and women who scarcely ever at other times care to trouble about exposing plates seem to fly to photography as an eminently suitable holiday pursuit, which it undeniably is, though perhaps professionals, to whom there art possesses no magic glamour, but rather a tiresome every-day monotony, may not regard it in such a light. A photographer of some repute was asked the other day, whether he intended to take a camera with him during his annual sojourn by the sad sea waves. "No fear!" was his emphatic reply. "When I go for a holiday, I mean to leave such things behind." There is a good deal of sound sense in his resolution if we ponder it a little. Perhaps we should not hear of so many premature breakdowns among the ranks of our young enthusiasts if a little more of the true holiday spirit were exhibited. One can have too much of a good thing, even of the production of "pretty" negatives. The man who makes the camera his life companion by necessity is, perhaps, well advised to leave it behind him in those none too frequent intervals when tired humanity courts rests and recreation.

\* \* \*

To the ordinary amateur, or *dilettante*, none of these words, of course, apply, and, as we are saying, certainly one of the most striking facts of to-day is the popularity of the camera as a holiday adjunct. Seaside photography, however, is singularly barren of results, at any rate in inexperienced hands. Of all the thousands of plates exposed by our amateur friends on wave and ripple, breaker or looming storm cloud, how very few seem to have repaid the taking! Perhaps it is that unfamiliar conditions of light and subject deceive the novice and lead him astray, or it is that, beautiful to the eyes and romantic to the senses as the azure sea may be, it is photographically commonplace and uninteresting, having its subtle beauty more in colour than in form? Certain it is, without undue dogmatism, that the most successful seascapes have been those in which shipping, maritime surroundings, or weather-beaten fishermen have formed the principal objects; while landscapes seem, as a rule, rather to suffer than to gain by the presence of figures or accessories. The evidence seems to force us to the conclusion that the sea, however mystery-laden and beautiful, is, taken by itself, subject rather for the painter and the poet than the photographer. Many are the difficulties that beset the tyro who undertakes sea photography. One of the greatest is, of course, that of exposure. The actinic value of the light round the coast is so remarkable, compared with what he has been used to in town, even on the brightest days, that some allowance may surely be made for him when he tells the old tale of flat and lifeless negatives. Nothing but experience and a penitent recollection of past failures can give that sureness and correctness of exposure which is the ambition of every worker. It may be said, without much fear of contradiction, that marine subjects are best attempted in a comparatively weak light, as, for instance

ust after dawn or near sunset, or when gloomy cumulus clouds reign supreme over the sky. This, needless to say, does not apply to studies of shipping or the inevitable tarpaulin-clad seaman, where we must follow the old rule of exposing for the shadows.

\* \* \*

THERE is necessarily a great lack of seriousness about holiday photography that goes against truly satisfying results, or, as most of us very well know, ideal pictures are not the invariable product of light-heartedly "pressing the button," and trusting to good fortune for the rest. It is too much to expect the man who is down for the sole purpose of basking in the sun, and inhaling contentedly the health-laden fragrance of the seaweed-scented air, free, meanwhile, let us hope, from every worry and vexation; it is too much, we say, to expect him to take any very great pains with anything. There is a large body of men, however, who do take seaside photography seriously of necessity. We allude to the industrious army of "tintype" workers, who form so familiar a feature in any populous watering-place. What photographer, be he professional or amateur, can avoid a lurking feeling of sympathy with them, as he watches them trying to beguile the newly arrived tripper into patronising their *al-fresco* studios, with their carpet of sand or shingle, their roof the sky, and their only background some well-worn white sheet, dexterously kept in motion by an assistant? They are not society lights, these sand portraitists; half of them, perhaps, never even heard of the theory of development or the properties of an isochromatic plate. They can hardly be considered as shedding much lustre on their chosen profession, either individually or by their work, of which latter the less said the better, and yet, to some of us at least, there is a strange, unaccountable fellow-feeling for these distant photographic relations of ours that often checks our smile at their painfully inartistic productions, and, maybe, even prompts us to give them a sitting, though the resulting portrait be evermore anathema. But why this sense of complacent superiority? We are too apt to forget the comparatively recent expansion of our art, and that, in its infancy, results little, if at all, better than those of our comrade of the beach were hailed with admiring enthusiasm.

\* \* \*

AMONG the little drawbacks of the summer visitor's work at the seaside must be considered the very often far from satisfactory dark-room accommodation. Those who have had much experience in that direction will unhesitatingly bear out the statement that quite a large proportion of the rooms in which they have had to change their plates during holidays could hardly be considered safe. Where any doubt exists, it is far better to wait till it is dark, and change "by touch" in one's own room, which, with one or two simple and obvious precautions, is perfectly free from danger. We know one who always adopts this method, having a vivid recollection of the complete loss of a week's exposures through, as afterwards ascertained by experiment, a light-struck dark room. So much for indoor troubles. A frequently very grievous outdoor one is the truly extraordinary amount of dust and grit, blown about by the ocean breezes, settling on our lenses, and trying hard to prevent our shutters from working, if any of the mechanism happens to be outside. An occasional gentle

dusting with a very soft camel's-hair brush will repay itself, while a separate one might be retained for the lens, and never used for anything else. Another evil to be laid to the account of the inevitable sea-wind is the liability of its moving the camera. When it is blowing "half a gale," quite an every-day occurrence, the avoidance of motion becomes decidedly difficult, if not impossible, except with heavy apparatus, which, of course, is not often taken on a holiday. To be sure, a slight and almost imperceptible movement is often of no ill effect, with the extremely rapid exposures generally used. Still, it remains true that many a plate is spoiled from that cause alone, and that desirable views are often impossible to take on account of the high wind. When it is considered that it is just at the very time when the breeze is roughest, and steadiness of hand most improbable, that the sea is at its best, pictorially speaking, the infrequency of satisfactory seascapes being secured becomes less remarkable. It must also be remembered that the finest seas are not only during the breeziest days, but are also closely connected with dull, if not stormy, weather. Bearing in mind, then, the many obstacles to success which harass the photographer in his attempts to secure permanent reminders of some of the ever-changing ocean's many aspects, we shall be disposed to render due credit to the numerous really excellent pictures that continue to be offered to our notice at exhibitions and elsewhere. We are perhaps too apt to pass them by in favour of some superficially attractive landscape that strikes us momentarily by its novel lighting or composition, but which probably cost its producer not half the trouble and ingenuity freely expended on the neglected seascape. When apportioning our praise or blame to any work of the camera, a fair estimate is only obtained by taking into consideration the difficulties incident to its production. We have, it is hardly necessary to say, not the least intention of calling a picture good merely because it was hard to obtain. Like everything else in this critical and keen-sighted age, it must first stand or fall on its merits.

#### STUDIO-BUILDING.

As our Answers to Correspondents columns testify, the questions of, perhaps, all others that we are most frequently called on to reply to are those bearing upon the designing and building of studios. Some of the queries are, in varied language, so frequently repeated that we might almost keep a stereotyped block of replies. We propose on the present and succeeding occasions to bring together a number of considerations more or less applicable to these queries, and to point out the bearing of general principles upon their treatment. The point upon which information is most frequently asked for is the proportions of the studio—length, breadth, height. Where space is restricted to a given confined area, the question almost answers itself; but, where considerations of cost are the only governing principles, the builder may be supposed to have a fairly free hand.

First, as to length of studio. It must be taken for granted that at least such space must be included as will permit of the taking of cabinet full-length portraits. This is a question purely of lens and perspective. The lens-makers' catalogues all give instructions as to the distance required between lens and sitter for each lens when cabinets are to be taken.\*

\* See also table on page 1087 of the ALMANAC for 1900.

Usually two or three lengths of foci are given, requiring respectively from fourteen to twenty feet between lens and sitter. It will be found, however, that if a smaller distance than eighteen, or, at the outside, seventeen, feet is chosen, the perspective will be so exaggerated—the floor appearing to slope upwards, and the slightest prominence of hand or foot producing these parts in huge proportion—that the result will be eminently unsatisfactory. This result, it may be pointed out, is purely a function of the focus, and has nothing whatever to do with the quality or make of lens.

Let us, then, assume that a distance of eighteen feet is required. This does not mean a studio eighteen feet long; allowance is to be made for length of camera and for space behind it to work in. Two and a half feet for these spaces is a minimum. Then, at the other end of the studio, the sitter's end, as it is impossible to put him right against the background, a further allowance to permit of the occasional use of a head-rest or the projection of accessories must be made, and this cannot safely be put down at much less than three feet—addition from the two ends, five or six feet; total length, twenty-three or four feet, for taking cabinet full-length portraits with comfort.

But this is only part of the story. Good lenses are costly, so that the photographer might not actually, in all probability, possess more than one cabinet lens, and, if a group of people had to be taken, the lens would have to be retired for a considerably greater distance than eighteen feet, as much as eight to ten feet being necessary for, say, a group of a dozen figures. This brings us to a studio length of thirty feet, a distance which will not permit of much reduction by grouping the figures in two rows, one behind the other, for the front figures would be so much larger than the back if the camera were approached too closely to the group.

In taking groups it needs no argument to point out that the farther the camera is removed the more pleasing the proportion of the various sitters composing the group. Hence, in most respects, a studio longer than thirty feet would be advantageous from a purely optical point of view. That, however, is not the only point; a very important one has to be taken count of, that is the atmosphere. In summer time it is of little importance, but when autumn or winter, with their accompanying frequent fog and smoke approach, experience teaches that, too frequently, foggy, muddy pictures result if there be much space between sitter and lens. The result is that at such times excessive length of studio is a drawback, and, if groups, and sometimes, even, full lengths, are taken at all, it will be wisdom to use a special shorter-focus instrument and risk the evils of exaggerated perspective rather than produce photographs of indifferent appearance through fog.

The foci of lenses and the length of studio being subjects so completely intertwined that they cannot be separated in treating the latter, it will be useful at this stage to enunciate a generally useful rule. If the length of the studio is to be governed by the use of lenses already in the possession of the photographer, it will be found that to take full-length cabinet pictures it will be desirable to have the studio five or six feet longer than half as many more feet than the lens has inches of focus. Thus, a twelve-inch (equivalent, not back) focus of lens should have eighteen feet and six feet, total twenty-four. This is a simple and useful rule, and suggests the focus always desirable for full-length portraits, *i.e.*, two-thirds as many inches as there are feet between sitter and lens. We will shortly return to a further series of considerations.

**The Glasgow Exhibition, 1901.**—This great international Exhibition, of which photography is to form an important part promises, we are pleased to learn, to fulfil the aims of its promoters "to present a full illustration of the produce and manufactures of the British Empire, its dependencies, dominions, and colonies," with an adequate representation from other countries. The inaugural date has been fixed for May 1 next, and it is intended that it shall remain open for a period of at least six months. Glasgow has high hopes, but no definite assurance, as to the personage by whom the opening ceremony will be performed. As the city lies in the centre of the great manufacturing, shipbuilding, and engineering industries of Scotland, the collection of machinery will be exceptionally large and important, and for it an enormous building, which, although temporary, presents effective architectural features, is now practically complete. We further learn that the commanding features of the group of buildings, connected by spacious covered avenues, are the new Art Gallery and Museum, which are to be the future home of the art and science collections of the Corporation of Glasgow. This magnificent structure may be regarded as a direct outcome of the 1888 Exhibition, and it is in connexion with its inauguration that the Exhibition has been organized. With the 1888 surplus as a nucleus, the subscriptions of private citizens have provided towards the cost a total of about 130,000*l.*, and the profit of the coming Exhibition will be handed over to the Corporation, to be applied towards reduction of the balance—the galleries are to cost about 200,000*l.*—and for the promotion of art and science generally. Holding that the beginning of the twentieth century affords an appropriate occasion for reviewing the art of the preceding hundred years, the Executive Council of the Association have decided to form a loan collection of pictures and sculptures, and the appeal which has been made to art collectors has met with such a cordial and ready response that the display of objects of artistic and historical value promises to be unique. Her Majesty the Queen has intimated her purpose of making appropriate loans from the Royal collections, and the Prince of Wales readily consented to enrich the section by sending several artistic treasures for exhibition. As President, the Fine-Art Section has Lord Balfour, of Burleigh, the Vice-Presidents being Sir E. J. Poynter, Sir George Reid, Sir Francis Powell, and Sir Charles Tennant.

**The Cinematograph at the British Association.**—For the first time in the history of the peripatetic Parliament of Science the cinematograph has been used for illustrative purposes at a meeting of the British Association. A report of Monday last's proceedings at Bradford states that the Mechanical Science Section (G) allowed the electrical engineers to have a field day, and all the seven papers read before it related to either the generation, measurement, or use of electricity. The first paper, by Mr. J. G. W. Aldridge, was upon the use of the automobile for electric street traffic, and the rumour that it was to be illustrated by the cinematograph caused an unwonted number of ladies to gather in the dark and gloomy lecture theatre in which Section G meets. If the ladies expected a display of animated photographs rivalling the nightly exhibits at certain London places of entertainment, they would be grievously disappointed, for the cinematograph pictures only numbered two, and neither of these was exactly up to the London standard. However, as the first attempt of the kind at a British Association meeting for illustrating a scientific paper, the display deserves mention, and Mr. Aldridge must be congratulated upon initiating a custom which will, no doubt, find numerous imitators in later years. There are, of course, many subjects of scientific interest which lend themselves to cinematographic illustration, and no doubt, in future years, the authorities of the British Association will not neglect such an obvious opportunity of attracting large audiences to some of the meetings.

**The Business Instinct.**—An amusing instance of the business instinct of the fair sex, which has, no doubt, been fostered by the photographic advertisements of enterprising firms, is furnished

y a morning contemporary. It remarks that maternal rapture and business enterprise are effectively combined in a letter received by a West-end firm of baby-carriage builders. It runs: "Dear Sir,—I have one of the loveliest babies imaginable, and the envy of the neighbourhood, a photo of which I beg to enclose. If you will resent me with one of your baby carriages, I shall have much pleasure in recommending you to all my friends, which would undoubtedly be a better advertisement for you than the ordinary papers." The sending of the photograph was an inspiration. A baby as a perambulating advertisement of everything it had on, of the vehicle in which it rode, and the special brand of food it was reared on, would introduce a novel excitement in park and suburban life. But the story is not complete. In our opinion the lady deserved the carriage as a reward for her enterprise. Of course there is only one lovely baby in the world, and every mother has it; but, if they are all photographed with the view of obtaining juvenile furniture and clothing on the cheap, legitimate trade in those necessary articles is in danger of suffering.

**Photography at Irkutsk.**—In the course of a series of articles in the *Daily Chronicle* on Irkutsk, the capital of Siberia, Mr. Henry Norman remarks that there is an air of well-being about the place which says more than any catalogue of facts. "I have seldom been more surprised than when, on the evening of my arrival, I started out to make a few purchases. I wanted some sardines and sugar, and similar supplies, and I found myself in a shop which, for size, arrangement, and variety of stock, would compare with any in the West-end of London, except, perhaps, such exceptional purveyors of luxuries as Morell's and Fortnum & Mason's. Next I wanted some photographic materials, and the first thing that caught my eye was a complete assortment of Zeiss lenses of the latest pattern, the most expensive lenses in the market. Two stationers' shops and a chemist's were certainly equal to the average of such places in any of the capitals of the world, and in another I saw such a stock of guns, rifles, revolvers, cutlery, and electric fittings as I have never seen in one place before. I should be at a loss where to look in London for such a selection of telephones, for instance, of every make and size, as were displayed in this Siberian shop." In most minds Siberia signifies desolation and dreariness, and it will, no doubt, surprise many English readers to learn that its chief town is so well advanced in modern civilisation that it is comparable in some respects to London, and is not behind it in the important matter of photographic apparatus.

**The Fulham Camera Club.**—We are pleased to learn from a local contemporary that the newest London photographic society, the Fulham Camera Club, has made its first public appearance under circumstances which augur equal prosperity and pleasure. On Wednesday, September 5, the Chairman, Mr. Arthur C. Baldwin, delivered his inaugural address at the headquarters, Darlan Hall, where the Club has a comfortable little room on the ground floor. Ere long, it is added, we shall, doubtless, see the walls of this apartment adorned with the fascinating work of members. Mr. Baldwin's address, which we reprint elsewhere in the *JOURNAL*, was exceptionally appropriate. "He had to deal with a scientific subject, and dulness would have been excused in any one else. But he so lighted up the darker portions of his subject with lambent humour that he retained the keenest interest of his hearers till the very end. The whole was concluded with an apt quotation from the poet Baldwin-spere, this effort affording proof that the Chairman of the Camera Club can really overcome a tendency which some regard as irresistible." The next meeting of the Club will be held on Wednesday, September 19, 1900, at eight o'clock, p.m., at the Large Hall of the Conservative Club, Shorrolds-road, Fulham, when a lecture will be given by Mr. E. J. Wall, F.R.P.S., on "What Photography can do," illustrated by lantern slides. The chair will be taken on this occasion by Mr. Thomas Bedding, F.R.P.S., Editor of the *BRITISH JOURNAL OF PHOTOGRAPHY*.

## JOTTINGS.

THE four counties of Surrey, Middlesex, Berks, and Bucks, touch corners at a distance from that gilded artery, the Strand, which may be comfortably traversed in less than three-quarters of an hour. There, amongst scenery as beautiful and as solitudinous as one may find in most parts of England, I have been resting, recuperating, photographing. On my favourite moor "every prospect pleases, and only man is vile." To be precise, it is man's handiwork that I object to in my retired haunts near the little river Colne. The greatest possible sympathy with the inhabitants of the East End of London in their occasional lack of drinking water cannot stop me from lamenting that the Water Companies are ripping up eight miles of pretty country, building vast reservoirs, and affronting the face of Nature with their ugly engines and derricks in order that there may be no more famines in Adam's ale five and twenty miles away. East London may just as well be as remote as Timbuctoo for all the real solicitude in the matter one can feel when one contemplates 3000 or 4000 stalwart navvies laying unsympathetic hands on pretty little spots one has quietly meditated in at occasional intervals for twenty or thirty years. You wonder why Mile End-road does not go at once to Wales for its drinking water, as it surely must do sooner or later. But water companies, besides other failings, suffer badly from shortsightedness. A Welsh water scheme would have suited the inhabitants of the Tower Hamlets just as well as one which originated at Wrayshury; it would have left the silent country side near this tiring metropolis in undisturbed possession of the priceless charm of quietude, and it would not have interfered with my photography this early autumn.

OF course I think the last consideration the most important. The greed of big dividends is uglifying Greater London so quickly that very soon we shall want Mr. Behr's ninety miles an hour mono-railways radiating north, south, east, and west, so that the town brain-worker may be able to make a nightly escape from the bricks and mortar, and rapidly travel to his office in the morning. Even Brighton must before long lose its suburban character, and people will have to live a hundred miles off. But, to have done with grumbling; I wonder if any fellow-photographer has ever been undeceived in the same manner as I was in the course of my recent wanderings? I have had before me the mental vision of a house in West Middlesex, which I last saw thirty years ago, when I was a small boy. For the purposes of the descriptive parts of a book, which, with the acquiescence of a friendly publisher, I may one day lay before the reading public, I wanted a photograph of this house, which, to let the reader into a secret, was that hated institution, a school, the most horrible thing in the world at the age of ten. All these years I had been picturing the building as large and lofty, and the clock tower, with its warning and unsympathetic hands, as looking down from a cloudy height on to a series of prison-like houses set in a prim and geometrically designed park. Recalling the cramped situation of the place, I wondered on the way if I could "get in" on my plate all that I wanted of this imposing pile of buildings and the surrounding trees. But, alas! yet one more of youth's illusions was to go. The place was delightfully easy to photograph; my wide-angle lens was not wanted; the clock tower and the other buildings were not half the size I had pictured them, and before me is the photograph to show that the ideas that I had on the subject as a lad were terribly exaggerated and unreliable. Now I am wondering if the place would have looked so small to me if I had not been a photographer. It is curious into what trains of retrospection the habit we all have of revisiting scenes in which we moved in the long ago may beguile us. Looking at the disappointing clock tower, it seemed to be only a matter of months back that, in company with a small boy of equally tender years, I made my first experiments in photography. He owned a quarter-plate solid-body camera, a French portrait lens, and a tent, and I, out of a limited amount of pocket money, "stood" the collodion, the silver, and some other things, in order that I might have a share in some Sunday morning photography in a back garden. If I am not mistaken, Mr. Edward Dunmore, so well known to readers of this *JOURNAL*, sold me the chemicals twenty-five years ago.

SILLY-SEASON paragraphs have this year been fewer than usual, owing, no doubt, to the war news, of which one may easily see that everybody is quite tired; but, in place of the big gooseberry and the sea-serpent, the newspapers now and then fool their readers with some strange things about that godsend to the modern penny-a-liner or brain-fagged lady journalist, photography. Two or three of these productions lie before me, and they may amuse others as they have amused me. One is to the effect that "the latest photographic novelty is intended to supersede tattooing. The device is printed from a negative on to a portion of the skin, which has been converted for the nonce into P.O.P. All the usual ceremonies are carried out. We are not told how long the patient has to sit out in the light with the negative tied on to his epidermis, or whether the chemical preparation of the same is altogether pleasant or conducive to its welfare. The idea, whatever it may be worth, is due to a Russian, M. Dinkeresco." I never heard of M. Dinkeresco, and I should not be surprised to learn that, Mrs. Harris-like, there's "no sich person;" but his idea may at once be put down as stupid and worthless, even were it practicable. A tattooed image is not easily affected by soap and water, but how M. Dinkeresco (or the Fleet-street scribe) proposes to make a gelatino-chloride image permanently adhere to the skin is not clear.

THEN we have a yarn about a photographic record, made in America, of course, and recently referred to, if I am not mistaken in a photographic paper published here: "A photographic record was made during the recent session of the Ohio and Michigan Photographic Association. A negative and finished print were made at ten o'clock at night, to test the utility of artificial light. The experiments were conducted by O. H. Smith and D. Rosser, of Pittsburg; the negatives were made with four seconds' exposure by acetylene gas, and the print was done by the same means. The total time consumed in the operation, beginning with the exposure and ending with the finished picture mounted on a card, was eight minutes and twenty-four seconds, this constituting the world's record." This is smart work; but, if I were a betting man, I would back myself to do it quicker, or produce a dozen photographers who could, although I would not guarantee the quality or the permanency of the negative and positive. But how do the Ohio photographers and the Fleet-street persons know that the above-quoted *tour-de-main* constitutes "the world's record?" What was the previous "record"—if any? I always understood that breaking a record meant doing something better than it had been done before. I am under the impression that a negative and print have been produced in quicker time than eight minutes twenty-four seconds. Still, it does not matter if it has not, so far as I know, or come to that, care.

ANOTHER writer has something to say about "biographic improvements" at a London hall of entertainment, the Hippodrome, near Leicester-square. He tells us that "the cinematograph, biograph, and bio-tableaux, to the ordinary pleasure-seeker, all mean one and the same thing, the presentation of 'living' pictures." He had an interview with Mr. Walter Gibbons, whose pictures, now being shown at the Hippodrome, are as fine as any in London. "He told me that he was about to introduce a new contrivance whereby the 'flickering' can be avoided. For those who do not understand the working of this form of 'magic lantern,' it may be mentioned that the film falls between the light and the lens, and that after each picture—there are 20,000 in some scenes—a shutter falls to separate one view from the other. What Mr. Gibbons' invention is cannot be publicly stated, but it will mean that this shutter no longer causes a dash of black on the screen between each picture. Mr. Gibbons hopes to produce eventually stereoscopic pictures, instead of the flat views now generally seen; and coloured pictures are also being inquired for. Some dexterous people manage to colour the film, but this is both expensive and laborious. A system whereby the rays of light could be coloured is receiving Mr. Gibbons' attention."

I SHALL be quite satisfied to die without seeing any more animated photographs, of which, as an individual, I am sick and tired; but, for the benefit of others who like looking at these pictures and object to the flicker, I will mention two ways in which the movement may be very greatly minimised. One is to hold the hand, fingers apart, in front of the face, when looking at the screen. By this device the eyes are certainly saved from the disagreeable effects produced by the jumping of the rapidly passing images. The second way is to look at the screen through one of the perforated fans introduced by Messrs. Lumière and Messrs. Gaumont some year or two ago—this has the same screening effect as the interposed fingers. With regard to Mr. Gibbons and his contrivances for avoiding flickering; making the pictures stereoscopic and colouring them: how often, I wonder, have these things been promised since the time, just five years ago, when animated photography was being introduced to entertainment-seekers. I don't wish to discourage Mr. Gibbons, but he is rather late in the field.

THE photographic columns in the country newspapers are, as a rule, well compiled and reliable, for in nearly all cases the writers are indebted for their information to the photographic papers. The *Leeds Mercury's* photographic notes, in particular, are well done, but the writer should guard against a tendency to contradict the statements of those who have an authoritative advantage as to sources of information, to which he can hardly lay claim. For instance, in the *Mercury* of Saturday last he somewhat rashly impugns the accuracy of this JOURNAL as regards a matter of fact upon which it is hardly likely to go wrong. He writes: "The BRITISH JOURNAL OF PHOTOGRAPHY, in commenting upon a case recently tried in the City of London Court in respect to the delivery and price of war portrait buttons, in which the plaintiffs, a Bohemian firm, sued the defendant for 250 gross of these buttons, remarked upon the low price (less than fourpence a dozen), which includes a brooch and pin, and added that this does not allow much for the production of the photographs, or for much care to be bestowed upon the fixing and washing, and asks, 'Who can be surprised that in a short time they show signs or decay?' I should have thought our usually well-informed contemporary would have known that these photo buttons are not produced from ordinary silver prints, but are collotype reproductions, the fading properties of which are practically *nil*, and the cost of production infinitesimal in comparison with the chemically made prints." Collotype buttons are, no doubt, produced in large numbers, but it is doubtful if the greater proportion of these little emblems are not printed in silver. At any rate, before me as I write, are some twenty or thirty specimens drawn from the stock of probably the largest photo-button makers in the world; and the prints are in albumen, gelatine chloride, bromide, and velox, coloured and uncoloured. In the stirring months of March, April, May, and June, millions of these silver-printed photo buttons were sold. I should not have troubled to put the *Mercury* contributor right on this point were it not that his photographic notes are generally so good that it is a pity they should be marred by excessive cocksureness. Another Leeds paper also prints photographic notes and comments; but these lack the good points of those printed in the *Mercury* and have a monopoly of many bad ones.

Two or three questions in the Answers columns of the JOURNAL, relating to English operators obtaining employment in Paris, not having been replied to, a note on the subject here may interest others besides the inquirers. I have frequently come across instances in which young portrait photographers have hankered after berths in Paris studios without knowing how these latter establishments compared with English photographic *ateliers*. From inquiries made on the spot, I would not recommend English operators to go to Paris if self-betterment is the object. People are apt to think that, in the Lutetian home of taste and refinement, portrait photography is something higher in esteem and excellence than it is in London and the other large towns in Britain. Not so. At one time, according to a friend of mine who has had an intimate knowledge of French photography for forty years, the products of the best Paris studios were far more beautiful, more artistic, more to

the tastes of cultivated folks than the best English work. It is the other way about now. In time to come the pendulum may swing back again, but at present a talented English portrait photographer would only be wasting his time in going to Paris. He would be far better paid, and get a readier access to the front rank of "the movement" here in London, or in Glasgow, Edinburgh, Manchester, Brighton, or Dublin. Socially, too, I believe, the photographer on the Continent is looked down upon. Here persons of noble birth do not disdain to enter the profession, and fifteen years ago the mighty Lord Mayor of London himself was a photographer. COSMOS.

#### EXPERIMENTS WITH LIPPMANN'S PROCESS BY DR. LUPPO CRAMER.

IN the current number of the *Photographische Correspondenz* the above writer gives an account of some experiments he has been making with this process, and has discovered a peculiar blue colour in the infra-red, which is not without interest to workers in this process, particularly as he has made special tests of some of the sensitisers, and he points out that the number of them which can be used for this process is very limited. Besides the old and well-known dyes, such as erythrosine, chinoline red, and chinoline blue, Neuhauss has recommended glycin red and nigrosin B, and these were tried without success.

Of the larger number of dyes which have been discovered by Valenta, Eberhard, and others, for sensitising silver bromide to the region of the spectrum between D and A, there are few which act than cyanine better for Lippmann's process, in which the *sine-quânon* is an exact reproduction of the whole visual spectrum when taking mixed colours; the absorption band of this dye is in the orange red, but its sensitising power for the red with normal highly sensitive silver bromide is, however, very little.

When working with "grainless" silver bromide, however, there is soon noticed a marked difference between the "grainless" and the coarse-grained silver bromide, with respect to its disposition for the optical sensitisers, whilst with very sensitive silver bromide, even with the best sensitising, the action of the blue is always so much stronger, that a colour-correct result is not possible without a yellow filter, with a grainless emulsion such a preponderance of the sensitiveness for the rays of less refrangibility may occur that a blue or green light filter may be used.

But it is not only in the sensitiveness for the rays of longer wave-length over that of the shorter wave-lengths that the two silver bromides differ. The bands of sensitiveness in the grainless bromide lie much further towards the red than with the coarse, and thus is explained that with cyanine sensitising not only sensitiveness to the whole of the red is possible, but, according to some authors, why traces of the infra red have been obtained.

The author tested other dyes as to their behaviour on grainless silver bromide. He first tried chlorophyll in the form of a freshly prepared alcoholic extract of grass. With this the red was much broader in the spectra obtained than with cyanine plates. It frequently happened with the author's chlorophyll plates that, in the infra red, a narrow strip of blue appeared; since, however, such colour anomalies appear in Lippmann's process so frequently, this anomalous blue did not appear of very great interest.

From the impossibility of accurately determining the exact quantity of chlorophyll used, the author soon turned his attention to the artificial dyes, whose sensitising action for red was well known, and he used formyl violet, wool black 4 B, and malachite green, and also a dye not previously tried, benzyl blue.

In using these and large numbers of other dyes the author obtained every time, besides the very broad red stripe, a stripe of beautiful brilliant blue. While all the colour anomalies in Lippmann spectra can, almost without exception, be reconciled with Zenker's theory, by finding as the cause a change of the distance of the laminae in consequence of the expansion or contraction of the gelatine film, this could not be done for this particular blue stripe.

Dr. O. Buss first pointed out to the author that the wave-length of the rays on the infra side of the red, where the anomalous blue

appeared, might possibly be double the wave-length of the normal blue, which corresponded in colour to this anomalous blue. Here is a blue which was produced by laminae in the infra red. The further following out of this theory has been left to Dr. Buss.

Dr. Buss's explanation, which appears to be worthy of acceptance, is supported by a further series of facts, which have been partly observed by others. This blue in the infra red region of the spectrum, which, from analogy with the contra octave in acoustics might be called the contra blue, does not appear to have been previously observed, for Krone obtained, beyond the A line, a dark purple, and Neuhauss a peculiar dark green, which he did not describe as a specific colour, and which, according to his descriptions, appears to have nothing in common with our blue. As the said experimenters only sensitised with cyanine and erythrosine, it is also conceivable that "contra blue" did not show itself to them. But this blue shows itself in other ways in spectrograms, if the emulsion was not sensitised at all. If, for instance, a finished spectrum is breathed on, the colours, as is well known, pass successively, with increasing dampness, from blue to red, and on the red follows regularly a blue, just as, when drying a Lippmann plate, the blue always appears immediately before the red.

This blue, which always occurs next to the red, without the intervention of yellow and green, was an anomaly which is absolutely enigmatical if it is not a blue which is formed in quite another way to the normal blue.

That the "contra blue" is a colour which is produced by the separation of laminae beyond the infra red, is proved by the following experiment: If a colour spectrum is placed in benzole, the colours as determined by Wiener and Neuhauss shift towards the blue end. If for this experiment one of the author's spectra is used, which shows the contra blue, the latter becomes red, since the infra red rays now, as the result of the refraction of the medium benzole, reach our eyes as visible red rays.

A further proof of the assumption that the contra blue is produced by films which have, relatively, a great distance from one another, that is to say, by the laminae of the infra red, is that in all cases in which a relatively coarse grain has been produced, for instance, through ripening with ammonia, the contra blue always showed itself without fail, even if the normal blue did not appear, and the green and red only appeared dull. It is, indeed, a frequently observed fact that with Lippmann emulsions, when by not sufficiently quick working, the use of too much gelatine and other mishaps a coarsening of the grain is obtained, violet and blue may easily be not obtained, whilst the green, yellow, and red still appear distinctly. For the production of the normal blue there is required obviously the finest grain, whilst for the formation of the infra red or the contra blue a grain may be sufficiently fine though about twice as coarse. Further, the fact that with comparatively thick coating of plates the contra blue appeared with special brilliancy, whilst the other colours were much duller than with a thin coating, appears to support Buss's explanation.

A very instructive experiment, which shows that a brilliant blue is produced where no blue ray can have fallen, is made by exposing a Lippmann plate, sensitised with the above-mentioned sensitisers, through an aurantia screen. The normal blue is absolutely wanting, and there is obtained three bands of about the same breadth in the unusual order, green, red, and blue.

The heliochromes which were prepared by Becquerel, Poitevin, and others with silver sub-chloride as the base before Lippmann's discovery in 1891, suffered, amongst other things, from the disadvantage that they could not be fixed, because, by the dissolving out of the unchanged silver haloid, the thin Zenker's laminae produced by exposure must naturally be altered as regards their relative positions. Lippmann's results excited therefore considerable interest, because he was the first to succeed in producing fixable, that is to say, for all time permanent, pictures in natural colours.

Curiously enough, nobody appears to have thought that a picture prepared according to Lippmann's process need not actually be fixed. If a plate coated with grainless silver bromide be half covered with black paper and be laid in bright daylight, the exposed half becomes coloured only after some hours, which may be seen when it is laid on

white paper. The maximum of colour is soon reached, however, and has no effect on the reflection of the incident light in colour records if an unfixed picture is exposed for days and weeks. The author, in this and all the following experiments, has always made very careful comparison, by taking as broad a spectrum as possible in the middle of the plate, so that, when the plate was taken out of the slide, it had only to be cut down the middle in order to have two plates with exactly the same latent image on each. In this way errors were avoided which might otherwise have been met with if successive exposures had been given, in which case exact comparison could not have been made, as every source of light is inconstant. In consequence of the inconstancy of sunlight, when the Fraunhofer lines were not required, the spectrum of the electric arc was used, as has been recommended by Valenta, Krone, and others.

The fixing of Lippmann's heliochromes is, according to the author's views, quite unnecessary; but, on the other hand, as fixation is no trouble, there is no reason in laying much stress on the importance or uselessness of fixation; but, as regards the use of the dangerous or, at least, unpleasant potassium cyanide, the author states that he could find no advantage in the use of cyanide over thiosulphate. It is true indeed that the cyanide removes any faint fog, but it also very quickly attacks the image itself, and it is therefore more advantageous to remove any existing fog, after fixing with thiosulphate, or after drying, when one can properly estimate the colours by a very weak Farmer's reducer. An increased brilliancy and clearness of the picture after fixing with cyanide, as compared with thiosulphate, could not absolutely be confirmed.

Neuhauss<sup>1</sup> has mentioned that Lippmann's heliochromes dissolve very easily in hypo, and advances this behaviour as the difference between grainless and ordinary silver bromide. Now, although it is correct that the coarse silver grain of a highly sensitive plate dissolves only slightly in hypo, whilst a Lippmann picture is strongly reduced in a five per cent. solution of thiosulphate after two hours. This is no peculiarity of heliochromes, for all fine-grained silver, for instance, printing-out paper or a fine-grained chloride of silver plate for development, dissolves to a considerable extent.

If to the hypo some bisulphite is added, as is very general at the present time, there will be only a scarcely noticeable amount of silver dissolved after some hours' action on a heliochrome. The bisulphite prevents the oxidation or sulphuration which, according to Sexton,<sup>2</sup> and Haddon, and Grundy, is necessary in order to enable the silver to dissolve in the hypo.

If it is desired, therefore, to fix a Lippmann picture so as to make it absolutely permanent, a good acid fixing bath should be used, and no disadvantages need be feared if one should accidentally leave a picture in the fixing bath for a long time.

Neuhauss questions, in the face of the latest publications of Professor Wiener, whether the films of a finished heliochrome actually consist of metallic silver.

According to the author's researches, there is no fundamental difference, either in a chemical or physical respect, between the precipitate of a Lippmann picture and the silver which is produced in any other photographic process. Some of the author's experiments have given quite different results to those obtained by Neuhauss.

Any retrogression of the latent image could not be confirmed. The plate was, after exposure, cut in half along the spectrum, the one half developed at once, and the other after forty-eight hours in a developer of the same composition, and for the same time; not the slightest difference between the two halves could be seen. A weakening of the latent image, in consequence of soaking the plate in water before development, as stated by Neuhauss, never occurred with the author's plates.

Neuhauss's observation<sup>3</sup> that the coloured picture was extraordinarily resistant to nitric acid, and that even after twenty hours' stay in dilute nitric acid the precipitate had suffered not the least change, appeared very striking to the author. The silver of the author's heliochromes was, after thirty seconds of nitric acid, sp. gr.

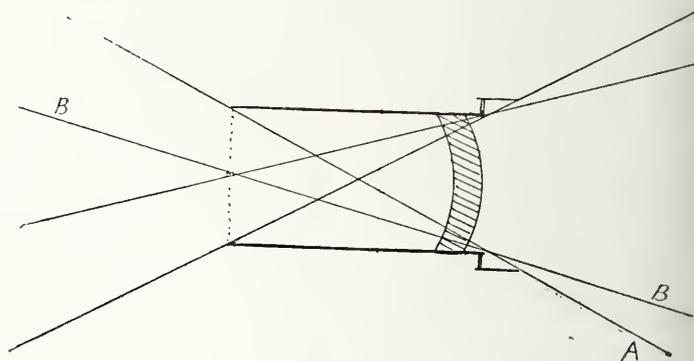

1.153, corresponding to 25 per cent.  $\text{HNO}_3$ , completely dissolved, whilst an ordinary negative required considerably longer time to dissolve its silver.

There is therefore no cause to assume that the picture, the laminae in the nodes of the stagnant waves, can consist of anything else but metallic silver, for it answers to all the reactions, and when Wiener says "that it might be coherent silver, but that, on the other hand, its brown colour when looked through is against this, for coherent silver is blue when looked through," the author points out that the colour of the silver is of no importance. With silver chloride plates for development, such as are used for lantern work, it is possible with various developers, by variation of the time of exposure and many other means, to produce almost any desired colour. No one, however, will conclude from this that there are essential different kinds of silver.

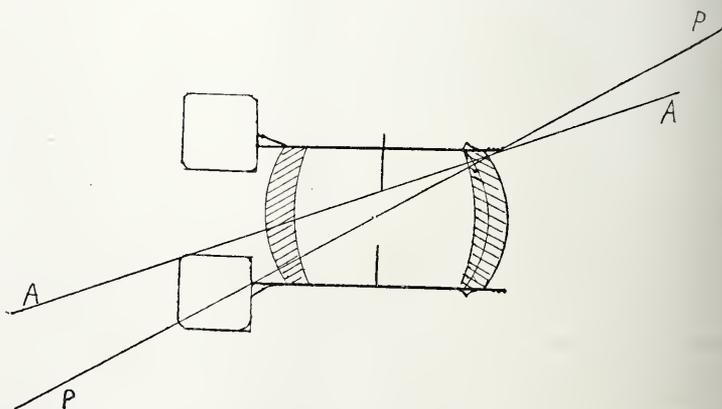

#### ONE EFFECT OF STOPPING DOWN.

BEFORE the days of photographic text-books, there was a common notion that a lens stopped down covered a larger plate than it did at full aperture. Since the advent of text-books, photographers have been told that this fallacy was due to the fact that a lens gives better definition at the margin of its field of illumination with a small diaphragm, and hence may be used satisfactorily on a larger plate. The extent of the field of illumination, however, the text-book writers say, remains precisely the same under any diaphragmatic alteration.

This latter statement is hardly accurate. In fact, as regards single-

lenses, it is absolutely untrue, the truth being that the smaller the diaphragm, the smaller—within limits—is the field of illumination; and, as regards doublet lenses, it requires qualification to this extent, that, when any aperture before or behind the lens, such as a prominent lens-hood, a shutter, or a hole in the front of a box hand camera, is of such dimensions as to cut off rays that would otherwise pass through the lens.

the field of illumination is diminished by the introduction of a small diaphragm. The accompanying diagrams will make this clear.

A A, is a marginal ray passing through a single lens at full aperture. B B, is the extreme marginal ray that can pass at pinhole aperture.

The same reasoning applies to the doublet, under the conditions mentioned.

<sup>1</sup> Eder's *Jahrbuch*, 1900, p. 179.

<sup>2</sup> Eder's *Jahrbuch*, 1897, pp. 414, 415.

<sup>3</sup> *Loc. cit.*, p. 189.

Suppose a rectilinear, fitted with a before lens shutter, two sizes too small, and protruding enough to cut off some rays that would otherwise pass through the lens, e.g., P P.

The result is that a diminution of aperture reduces the field of illumination. A A, an extreme marginal ray, clearly could not pass through the lens if a smaller stop were inserted.

This is true only when some rays are prevented from passing through the lens by an aperture either before or behind it; because, in a symmetrical lens, in which the components are symmetrically mounted relatively to the diaphragm, the marginal rays pass through the centre of the diaphragm, and a reduction of aperture has no effect on the dimensions of the field covered.

Photographers should see that the plate is covered with the stop they are going to use. Sometimes it is well to have the corners covered, however bad the definition may be.

J. C. SMITH.

NOTES ON GOLD-SODIUM CHLORIDE.

[A Paper read before the Photographic Section of the Franklin Institute.]

If any one will take the trouble to obtain quotations from the various manufacturers, or consult their price-lists, it will become apparent at once that there must be either a considerable margin of profit for some, or that the gold-sodium chloride varies much in composition. The difference in prices, or information on the labels, are such, however, that the various makes come into direct competition with one another. For example, one ounce of gold-sodium chloride, U.S.P., in 1/8-ounce vials, is quoted by several makers (wholesale price-list) at \$5.90, \$6.10, \$7.50, \$9.60, and \$14.50, respectively. Again, some makes, without any specifications as to quality, are generally quoted a few cents below those containing information as to quality.

It must be remembered that the 1890 Pharmacopœia requires this article to contain thirty per cent. of metallic gold, and a commercial article may contain less for photographic purposes; but the latter should be so labelled as not to be brought into direct competition with the more costly article. If a certain article is prepared for photographic purposes, or for some other purpose, let it be so labelled as not to be misleading.

In order to get positive information about this article, the writer secured a number of samples, and a careful examination of the same gave the following results:—

ANALYTICAL DATA OF GOLD-SODIUM CHLORIDE.

Number.	Condition.	Reaction to Ammonia on Glass Rod.	Reaction to Litmus.	Weight in Grains in 15-gr. Vial.	Solution Containing 15 gr. in 100 c.c. Dist. Water.	Marks on Labels.	Actual per Cent. of Metallic Gold Gravim.	Per cent. of Gold Based on 15 Grains Gravim.
1	Quite moist	None	Acid	13.55	Slightly opalescent	15 grs.	23.55	21.29
2								
3	Dry	"	"	14.86	Slightly opalescent	15 grs.	25.00	24.68
4	Dry	"	"	17.53	Clear	15 grs. U.S.P.	28.31	32.91
5	Slightly moist	"	"	14.45	Clear	15 grs. U.S.P.	30.30	29.02

The amount of material contained in each vial was estimated by removing the stopple, determining the gross weight, then carefully removing the chemical by means of water, drying the vial, and obtaining its weight. From these weights the amount of gold sodium in each vial can readily be calculated, and, if there should be an error in any direction, it is quite likely to be in favour of the chemical.

The metallic gold was estimated as follows: Transfer the contents of a vial into a 250 cubic centimetre evaporating dish by means of 100 cubic centimetres of a one per cent. solution of pure sulphuric acid. In this mixture dissolve two grains of pure oxalic acid, then place the whole on a steam bath for two hours, or until all the gold is reduced to the metallic state. Decant the clear liquid as closely as possible, wash the gold with distilled water, dry, ignite, and weigh. This method works well, but the volumetric process for this purpose appears to be valueless.

From a careful perusal of the data contained in the foregoing table it can readily be seen that all the samples were of good quality, but there is a wide variation in the percentage content of gold.

In order to fully comprehend the actual difference in money value existing between the various samples, it is only necessary to compare the figures below:—

Number.	100 ozs. Gold-sodium Chloride contained Pure Gold.	Cost at \$21 per Ounce.
1	21.29	\$447.09
2	26.13	548.73
3	24.68	518.28
4	32.91	691.11
5	29.02	609.42

The greatest difference, based on the cost of the gold only, amounts to \$244.02, or by eliminating the highest, which appears to be somewhat abnormal, the difference becomes \$162.33. In other words, the purchaser of 100 ounces of the article containing the smallest per cent. of gold is paying \$162.33 for something he is not getting. In this case, as in many others, the cheapest is the most costly.

LYMAN F. KEBLER.

AMERICAN PHOTOGRAPHIC COPYRIGHT.

THE following circular, which we reprint from *Anthony's Bulletin*, has been issued by the Copyright League of America to United States photographers. By the tenor of the circular it would seem that American photographers as a body are as indifferent to the value of copyright in their photographs as were their British brethren up to six or seven years ago, when the Photographic Copyright Union took steps to arrest the apathy that had hitherto prevailed.

"The American photographer as a rule is keenly appreciative toward any movement which promises him an advantage in business. The growth and importance of the State and national photographic associations are practical evidences of his earnestness in seeking business success. In his business methods, in his enterprise, and in his professional ability he easily outstrips his European fellow-professional, as we have known him in Germany, France, and Great Britain.

"But, with all his alertness and progressiveness, he has almost completely overlooked a business advantage which, of all others, he should be the first to perceive and grasp. We refer to his strange apathy concerning photographic copyright.

"In no other country are pictures and illustrations so popular or so important a feature in every-day life as in America. Illustration is, in fact, universal. The daily and weekly papers, the periodicals, and printed matter of every sort with which we are literally deluged at every turn, depend largely for their interest upon illustration. Portraits of prominent people and scenes, pictures which interest as news records or by their pictorial attractiveness, records of incident and life at home and abroad, in-doors and out of work, and sport, of humour and pathos—all these are sought for, gathered in, and published far and wide by every conceivable method of reproduction. The public demands pictures and the public pays for them. But who makes the pictures and who profits by their sale? Here are two plain questions. Let every photographer answer them for himself, and we are sure of his interest hereafter in the question of photographic copyright.

"A glance at any illustrated paper will show that the photographer bears the burden of the public demand for illustrations. Nine-tenths of the pictures published in our newspapers and periodicals are direct reproductions from photographs. In how many instances does the photographer profit by this use of his work? We venture the answer, Not in one instance out of ten. Why should he not profit by this use of his work? If he equips himself for its making, if he produces by his skill something which has saleable quality, should he not be the first to profit by his skill and labour? Does the publisher furnish his paper to the public without money and without price? Why should the publisher profit by selling the photographer's work, and the photographer be content with 'glory'? Does the publisher pay the photographer for the use of his productions? Sometimes, when he is compelled to do so; never, if he can avoid it. Why? Because the photographer has not yet learned to appreciate the value of his work to the world—its plain matter-of-fact value to those who purvey news or information to the public.

"These things are worth thinking over. By availing himself of the protection of copyright the photographer may secure for his own benefit certain legitimate profits arising from his business which at present he permits to go to waste, or, rather, to go for the enrichment of other business men who can turn his product into hard cash.

"It must not be imagined that we impute any blame to the publisher.

As a business man it is his chief interest to get and reproduce what the public will buy. If he can get his materials without cost, so much the more profitable will be his business. The mistake lies with the photographer, who is so careless of the sources of income or profit rightly belonging to his business. The remedy lies in a better appreciation of the advantages of copyright and in united action to secure these advantages. If it is found that the photographer is not properly protected by copyright laws at present existing—as is, indeed, the case—there is all the more need for photographers to unite in the effort to secure proper legislation.

“We believe that, as soon as the American photographer looks squarely at this question of photographic copyright, he will perceive its obvious advantages and insist upon his reasonable rights. Therefore, we urge again, as we have urged before, that photographers should enrol themselves as members of the Photographers' Copyright League, and put themselves in touch with the work this League is doing for their benefit and advantage.”

### SHADOWS.

THE first meeting of the Fulham Camera Club was held at headquarters, Darlan Hall, Darlan-road, on Wednesday evening, September 4, Mr. Arthur C. Baldwin presiding. The Club now numbers fifty, and among those present were Dr. T. A. Appleton, Mr. Peter Lawson, Mr. C. Pretty, and Mr. Littleboy, the Hon. Secretary. Mr. Baldwin delivered his inaugural address as Chairman. Having tendered his thanks to the members for the kindness which had prompted them to elect him to his present position, Mr. Baldwin said his address would bear the title of “Shadows.” Should any one take umbrage at the title, Mr. Baldwin referred him to Nuttall's Dictionary for the various meanings of the word. He would not, from motives of expediency, say whether photography was a science or an art, although Sydney Smith had regarded it as high art because studios were near the roof. “Shadow” was sometimes said to be an inseparable companion. Such must be the case with photography, for had not many operators married receptionists? The pursuit of photography was a pursuit of shadows, thus exemplifying Burke's sad reflection “What shadows we are and what shadows we pursue!” Taking a more serious turn, Mr. Baldwin now proceeded to trace the series of scientific discoveries and inventions whose collective force had resulted in the photography of the day. To his mind there were four clearly defined periods in photography. The first began, 1432 B.C., with the discovery of iron, and it included the making and using of lenses by the Greeks, 424 B.C. It terminated in 1839. The second was the Daguerreotype period, from 1839 to 1857. Thirdly came the Collodion period, from 1857 to 1871, a process invented by Scott Archer, which gave place in turn to the present or Gelatine period. This latter year marked the beginning of the success and the adoption of the dry-plate process. The Club would remember that Roger Bacon had greatly advanced the cause of photography by the construction of the camera obscura in 1297. Baptista Porta improved upon this in 1550, and Sir Isaac Newton made the invention almost what it was in the present day. It was, however, to Mr. J. Dollond, who, in 1750, first made double achromatic lenses that the gratitude of photographers was chiefly due. Having dealt scientifically with a number of other matters interesting to photographers, Mr. Baldwin claimed that the art or science had accomplished much for the human race. He referred chiefly to the Röntgen rays, of course. Art and photography, in some people's hands, were distant relations, indeed—in fact, he did not think they could be said to have come from the same family. But certain it was that a vast amount of pleasure was got out of photography, the artistic sense was stimulated, and the scientific faculty assisted. Returning to his lighter vein, Mr. Baldwin said: Having brought you thus far on the subject of shadows, I think I may safely leave it. At the same time I do not claim to have altogether exhausted my theme. It would not be right for me, as your Chairman, addressing you for the first time assembled for the business of the Club, without in some measure giving you a charge. I have been accused—and may I say I own the soft impeachment?—that on some occasions I save racking my brains for words to express my sentiments. I fall back on those of Shakespeare, and, like the little boy when asked to define a lie, said it was an abomination unto the Lord and a very present help in time of trouble, so do I find quotations a salvation indeed. This time, great as my reverence is for the sublime bard of Avon, I am about to take an unwarrantable liberty with the text of Polonius's advice to Laertes. Hamlet called his uncle's chamberlain a tedious old fool. I

trust I have not been playing such a part to-night. However, to my charge:—

My blessing with thee  
 And these few precepts in thy memory  
 Look thou character. Give thy dealer no order  
 For any unproportioned formula to make.  
 Be thou artistic, but by no means fakish.  
 The apparatus thou hast, and their utility tried,  
 Grapple them together in a nice leather case,  
 But do not waste thy time with trying  
 Each new-hatched, unfledged process. Beware  
 Of entrance to a shop; but, being in,  
 Purchase, that they who keep it may rejoice in thee.  
 Give to dealers thy cash, but few thy bills;  
 Take each man's portrait and preserve his friendship.  
 Costly thy camera as thy purse can buy,  
 But not of necessity bound with brass, mahogany, or teak:  
 For the outfit oft proclaims the man:  
 And they in Fulham of the best rank and station  
 Have a most select and proper choice in that.  
 Neither fixed focus nor twelve ten have:  
 For fixed focus loseth both perspective and sky,  
 And twelve tens pull the weight down so.  
 This above all: to thine own Club be true,  
 And it must follow, as the night the day,  
 Thou canst not then be on the tramp elsewhere.

Looking back upon our subject—I mean photography—and seeing by what means we are enabled to assist nature to reproduce herself, we are still led to agree with Shakespeare that

“The best in this kind are but shadows,”

and then for a moment let us pause and conclude that the worst are nothing more.

### NOTES FROM THE NORTH.

BETWEEN the weather and the war those who make a living by photography in Glasgow and the West of Scotland have had great reason to complain during the past six months, the cry on every hand having been from first to last, “There is nothing doing.” With the approach of winter hope is not altogether dormant, but, should another blank season be drawn, the business boom expected in 1901, when our International Exhibition will open its doors and attract the money-spending multitude, will be the only bright spot in the gloomy outlook.

The dealers have done fairly well. Mr. Lizars reports having passed through the busiest season on record, alike in the wholesale and retail departments. Certain lines of his Challenge cameras have never been in stock throughout the summer, the home and colonial demand has been so great. Plate and film cameras have been in about equal demand; but, judging from the film-developing business he has done of late, the supremacy of plates, among the moneyed class of amateurs at least, is at length being seriously challenged. And there have been practically no complaints regarding the uneven quality of the films supplied, a testimonial the film-manufacturers may accept with pride or humility, according as they take blame or not for the pranks films have too often played their users in days gone by.

Preparations are now afoot for another busy winter with the cinematograph and lantern. Mr. Lizars has a cinematographic and photographic outfit on hand at present for a lecturer who intends to go round the country with it, an outfit which will cost something like 150*l*. Indications are rife that the slide departments will be strained to supply sets illustrating the most exciting incidents in the siege of Mafeking, Kimberley, and other South African towns. A lady, the wife of a professional photographer in Mafeking, has entrusted a large collection of very fine negatives depicting the leading events in the defence and siege of that historic town to Mr. Lizars to make a set of slides for lecture purposes.

Mr. Warneuke is sending nothing of his this year's work to the Royal Society's Exhibition, his time having been fully occupied in getting his palatial and sumptuous studios at 4, Blythwood-square into ship-shape order. He is more than pleased with the results he has produced so far, and hopes to make another step or two towards the attainment of his exacting ideal of what constitutes an artistic portrait. A number of his earliest portraits taken at Blythwood-square are on view in a handsome show-case at Sauchiehall-street and Mains-street corner, within a minute's walk of the studios.

The attention of local workers is being gradually centered upon the work of the Committee in charge of the Photographic Section of the 1901 Exhibition. At the last meeting of the Committee it was reported that the saloon set apart in the new permanent Art Galleries for the display of photographs would provide space for about 500 frames, but, if additional hanging space be required, the Committee trust to be able to provide it. Mr. J. Craig Annan is devoting no end of time and labour to the organization of the Section, and, unless his expectations are

belied, it will create a record among international exhibitions of photography.

Messrs. T. & R. Annan, Glasgow, are to have the sole right to photograph inside the Exhibition buildings. One of the conditions attached to the concession is that they must erect a studio in the grounds to the satisfaction of the Council. The site granted for the studio is on the slope below the University terrace. Plans are being prepared by Mr. James Miller, architect of the Exhibition buildings.

*The Old Closets and Streets of Glasgow* is the title of a volume which Messrs. Maclehose, the University publishers, are about to issue by arrangement with the Corporation. Fifty plates have been reproduced in photogravure by Messrs. Annan, representing chiefly scenes of picturesque squalor which have been swept away by the operations of the City Improvement Trust. Mr. William Young, R.S.W., has written an historical introduction to the volume, the issue of which is to be limited.

To open four branches inside six months argues the possession of an unusual stock of enterprise and courage, surely. Early in the spring Messrs. Rae Brothers, opened their first country branch in Paisley. This step was followed at a short interval by the opening of another in Perth. A second branch was started in Perth a few weeks ago, and only last week they took possession of the shop and stock of Messrs. Lawson & Redpath, Charing Cross Mansions, Glasgow, where they will carry on business, after holding a clearing sale. The firm's Glasgow branch at 77 Renfield-street, was only acquired last year from the trustees of the late Mr. James More, so that they are now in possession of six separate businesses, when little more than a year ago they had but one.

Mr. George Walton is so closely associated with photography as decorator of exhibitions, studios, and warehouses, and maker of frames, that his recent acquisition of extended premises for workshops at 35 and 37, Buccleuch-street, Glasgow, is of interest to the craft. These workshops replace his small and scattered quarters in Wellington-street. It is unfortunate—perhaps it was unavoidable—that the front elevation to Buccleuch-street, a quiet residential thoroughfare, is not in keeping with Mr. Walton's artistic instincts and sympathies. A rambling brick building, with a wood stack in the foreground, and surrounded by a closely boarded six feet fence, strikes a jarring note on the æsthetic sensibilities of the passer-by who happens to know what Mr. Walton has done in his own particular line.

Widespread interest has been excited in this quarter over the gratis demonstration scheme just launched by Kodak, Limited. The attendance at the opening demonstrations was large enough to bespeak the necessity for such a simple course of instructions as the Kodak Amateurs' Association aims at providing.

The trepidation roused in England by the introduction of a special water rate for amateur photographers is not shared here. The suggestion has often been mooted, but has as little chance of being adopted as a Government tax on matches. Loch Katrine water is so soft that the photographer who must condense or boil all the water he uses for his solutions would, no doubt, gladly pay a small rate if he could be spared the labour nature has refrained from imposing upon us. The tendency here is to reduce the water rate, both for domestic and commercial purposes, and the pleasant prospect is being held out of a coming generation enjoying a free domestic supply, the rates for commercial purposes being expected by-and-by to defray the expenditure on the maintenance of the water works.

None of the societies have started business yet, October being the month when they begin to break into life. During last winter there was much searching of heart regarding the future of the Glasgow Photographic Society, the oldest of the local societies and the one at which professional workers mostly congregated. Of late years the attendance has fallen miserably low, a dozen or so members being present even when the lecturer or demonstrator had come all the way from England. The quality of the members present may have compensated in some measure for the paucity of numbers; but, when an organization sinks so low, it comes to be a pressing question whether it should not go into hibernation for a period, until interest revives, or cease and determine, as the lawyers say.

Fire broke out, one day last week, in the warehouse under the studio of M. Pearlman, St. George's Cross, Glasgow, and for a time it seemed as if the entire block of buildings would be destroyed. Fortunately, the timely arrival of the fire brigade checked the progress of the conflagration. While the fire raged the access to the studio was cut off, and the occupants had to make their way to a place of safety by going through the hatchway, and climbing along the roof-ridge for some distance to another hatchway, which gave entrance to a stair away from the burning building. The members of a theatrical company were being photographed in costume at the moment the fire broke out, and, when the alarm was raised, they too had to escape by the roof, several of them clad in scanty attire. The anxiety of the crowd for the safety of the party was mingled with amusement at the figure they cut while crawling along the roof.

Messrs. Anderson, Brothers, who have been in business for many years in Dalry, Ayrshire, have recently opened a branch studio in Sutherland-street, Springburn, one of the populous and thriving working-class quarters of the city. The studio adjoins Wellfield U. P. Church, and is wholly situated on the street level, with an open frontage to the north-east, extending to sixty-five feet. Deducting the space occupied

by the reception room and offices, the studio proper measures forty feet by twenty feet, the back wall being twenty-two feet high. It is in the treatment of the gables and back wall of their studio that the Messrs. Anderson have taken a forward step. The question of backgrounds received the fullest consideration until they came to the resolution to dispense with these accessories in the usual sense, and utilise the wall and gables as a composite background. The commission was placed in the hands of Mr. Leo Wasser, who has already decorated a number of London and Continental studios, and he came down to Glasgow early in July to execute the work. The task occupied fully a month, the canvas covered representing over 2500 feet of painting.

The completed design shows thirteen panels in all, beginning with an Elizabethan theme on the immediate right, and passing to an outdoor scene with a carriage drive, on to a conservatory interior and other familiar background subjects to the left, where a Louis Quatorze interior completes the background. In all there are thirteen panels, so that a fair variety of backgrounds is offered either for indoor or outdoor effects. The *tout-ensemble* is exceedingly pleasant, each of the panels blending into its neighbour without the slightest incongruity. In furnishing the studio the proprietors have displayed a strict regard for historic accuracy, the equipment including furniture both of the Elizabethan and Louis XV. periods, as well as the usual outdoor accessories. The convenience of the background system they have adopted, and the saving in time it will effect have already strongly impressed themselves upon the Messrs. Anderson, who are unrestrained in their appreciation of the results of Mr. Wasser's labours. In respect of its equipment and background departure this studio shows a great advance on the city studios which professedly cater for a working class *clientèle*, and it is to be hoped the proprietors will reap the reward their enterprise merits.

#### WINTER PHOTOGRAPHIC CLASSES AT THE BIRKBECK INSTITUTE AND THE BATTERSEA POLYTECHNIC.

At the Birkbeck Literary and Scientific Institution, Bream's-buildings, Chancery-lane, W.C., a course of about thirty lectures on photography, practical and theoretical, will be given by Mr. E. Senior (Honours medallist and prizeman, City and Guilds Institute; 1st class honours in chemistry), on Friday evenings at 7.30, commencing October 5. This course will be arranged, as far as possible, to suit the requirements of both amateur and professional students, and will cover the syllabus of the City and Guilds of London Institute, at which examinations in May next students will be expected to sit if required. On the result of these examinations certificates and prizes are awarded to those who prove themselves qualified.

The following are the fees for the course of lectures, 7.30 to 8.30; members of the Institution, 6s.; non-members, 9s. Practical work (per term), 8.30 to 9.30, members of the Institution, 6s.; non-members, 8s. Inclusive fee (per course) for lectures and practical work, members of the Institution, 15s., non-members, 20s.

At the Battersea Polytechnic, Battersea Park-road, S.W., the evening classes commence Monday September 24, 1900. Mr. E. Senior is the teacher of photography, and the following are the particulars of the fees (a reduction of 1s. per class is made to members):—

		Trade Students.		Amateurs.	
		Half-Session.	Half-Session.	Half-Session.	Half-Session.
Elementary (25 Lessons)	Lectures—Tuesdays, 7.30 to 8.30	4s.	—	6s.	—
	Practical—, 8.30 to 10.0	7s.	3s. 6d.	10s.	5s.
*Advanced (30 Lessons)	Lectures—Thursdays, 7.30 to 8.30	5s.	—	7s.	—
	Practical—, 8.30 to 10.0	10s.	5s.	12s.	6s.

The Photographic Department contains a large studio fitted with Joel arc lamp and reflector, for photographic work at night; two commodious dark rooms, lit with electric lanterns, and fitted up with every convenience for work. The equipment includes a 8½ x 8½ studio camera and lens, a 10 x 8 copying camera, fitted with Zeiss lens, an electric light enlarging apparatus with ten-inch condenser, a complete set of carbon and platinum-type printing apparatus, and a special camera for lantern-slide making, so that ample provision exists for practical work. The classes are primarily intended for trade students, but others are admitted upon payment of higher fees.

Students will be provided with necessary chemicals and apparatus free of cost, but must provide their own plates, sensitive paper, &c.

Students who desire to gain a thoroughly sound knowledge of the science connected with photography are strongly advised to join a chemistry class, and to attend the lectures on light.

A special class in enlarging will be held on Tuesdays, 8.30 to 10. Fee for ten lessons, 9s.; half-course, 6s.

An electric light enlarging apparatus has been added, and students joining this class will receive individual instruction in making plain and vignettted enlargements on bromide papers, and in modifying the colours of prints by toning.

REJECTED!

(BY A WOULD-BE EXHIBITOR.)

A CHANCE prospectus coming to my hand  
Told me that there existed a we'rd band  
Of Art Photographers, called the Linked Ring,  
Whose autumn custom was exhibiting  
At "England's Home of Mystery" (rightly named)  
About two hundred pictures, each one framed  
And priced from ten bob upwards! Then arose  
Within my breast a wish to be of those.  
. . . . I made a lovely print on P.O.P.,  
An Oxford frame enshrined its brilliancy,  
And this I sent off to the gallery.

But a little after that came the postman's rat-tat-tat,  
And a letter through my doorway was injected  
To say, with charming grace, that regretted lack of space  
Compelled my work of art to be "Rejected."

Discouraged, but not vanquished, I resolved  
To try again. The subtleties I solved  
Of "Composition," "Chiaroscuro," "Tone,"  
And the strange fact that mere technique alone  
Is not enough; your print must show "control"  
(With Indian ink), and, above all, some "soul."  
Far beyond this, if you'd successful be,  
Eschew the very vulgar P.O.P.  
. . . . So the next time I sent a bromide view  
Of "Cows" (which looked as though they wished they knew  
Whether to run away or merely moo).

I thought it would be hung, for my friends its praises sung,  
And said they felt 'twas sure to be selected;  
But my labour was in vain, for the missive came again,  
Saying, politely, that I was "Rejected."

"Impressionistic" was my third attempt:  
It was a picture of a maid unkempt,  
And wearing my old dressing-gown, her hair  
Drooping in tangled bunches on a chair  
(At least, a chair was what 'twas meant to be,  
Though a Pears' soap box in reality).  
For I had found by visiting the Shows  
That "Portraiture" is now the thing that goes.  
Given a model with a Turkish gown,  
Hair that successfully can be let down,  
And titled *Clytie*, you should take the town.

But once more I was quite wrong, for it wasn't very long  
Till I heard that all my pictures were "Rejected;"  
So I gave them—which was kind—to a College for the Blind,  
And I've got a note to say that they're Accepted.

GLASGOW FLOWER SHOW—PHOTOGRAPHIC EXHIBITION.

THE Directors of the Glasgow and West of Scotland Horticultural Society having resolved to repeat last year's venture, viz., the linking of a Photographic Exhibition in connexion with their Annual Flower Show, this interesting feature was again seen in connexion with the Autumn Flower Show, held in the St. Andrew's Hall, Berkeley-street, Glasgow, on Wednesday and Thursday, the 5th and 6th inst. Last year, the venture being new, and probably owing to the fact that what may be termed floral photography was practised by not a great number in the West of Scotland, the exhibit was numerically a small one. This year, however, sees a most gratifying improvement in this respect, and, merely judging alone from the great increase over last year, it is quite evident more attention is being paid to floral photography throughout the length and breadth of the land than many would imagine. In one sense the British photographic press has done much to cultivate a taste among all classes of photographers for this special class of work, during the past year or two, by giving publicity to many valuable articles on the subject. The outcome is seen in the hearty response from all parts of the country to the present Exhibition in Glasgow.

Upwards of two hundred photographs were sent in for competition, and it may interest those that might care to compete on future occasions to mention that, in the great majority of instances, these were merely mounted on good stiff supports, not framed, as in the case of regular photographic exhibitions. This has economised space, which, in the case of a flower show, is a matter of no little importance.

Speaking generally of the photographs exhibited, they are unquestionably of a very high order, as may be judged from the fact that in one case a set of floricultural subjects, which gained a valuable prize at a recent trade exhibition, are in this instance quite out of it.

Among the names of the leading exhibitors may be mentioned those of Edward L. Brown, Edinburgh; C. Metcalf, Halifax; John Hummell, London; J. Shawcross, England; T. Whitehead, Alva; W. J. B. Halley, Glasgow; W. Louis Primrose, Glasgow.

The judging was practically confined to Mr. Alexander Robb, of Greenock, and Mr. Archibald Watson, of Hyndlands, with Mr. Dewar, Curator of the Glasgow Botanic Gardens, and there is no doubt the points of difference in several instances were very close indeed.

Hummell, of London, shows some splendid work, and so does Metcalf, of Halifax, but the latter has only succeeded in gaining second honours in the different classes.

Brown, of Edinburgh, takes two first positions, and the gold medal, presented by Messrs. Lizars, goes to Mr. W. J. B. Halley, of Glasgow, who likewise secures the bronze medal in the class for *Specimen Trees*.

In the class for Views of Ferneries, &c., Mr. Shawcross carries off the coveted honour.

Speaking generally of the medium employed for printing these floral studies, it may be said that the successful exhibits are printed on gelatino-chloride samples of paper, the aim evidently being to render the utmost amount of detail possible in the negative, and the size of picture mostly on view is whole-plate.

Mr. Halley's studies of named trees are among the best things in the Exhibition, and he has succeeded in a very difficult task by so rendering the picture as to throw the trees into prominence in an otherwise charming series of landscapes.

Our Editorial Table.

CHALLEN'S "INFALLIBLE OPERATOR."

Published by E. G. Wood, Queen-street, London, E.C.

"REMEMBRANCER" would, perhaps, be the better name for Mr. Challen's device, the object of which is to keep the photographer in mind of the necessary particulars of his exposures. The "Operator" is sent out in the form of a book of "tear-off" leaflets, and this is a specimen page, which we take the liberty of reproducing in order to give the reader a clear idea of Mr. Challen's system of memoranda:—

DARK ROOM.

- Dust out dark slide and fasten both shutters ...
- Dust plates and place them in slide (films out-wards, black division between plates) } ...

TO TAKE THE PICTURE.

- Subject—
- Adjust lighting ... ..
- Fix camera firmly, square with object and level ...
- Stop lens (f ) focus, re-cap, and cover } ...
- camera with cloth } ...
- Place plate (No. ) in camera (with No. of ) } ...
- plate next to lens and away from operator } ...
- Determine length of exposure ( Secs.) ...
- Open shutter furthest from you ... ..
- Expose plate and re-cap ... ..
- Replace and fasten shutter ... ..
- Remove slide and guard it from light ... ..
- Remove stop ... ..
- Class of plate used

Conditions

Mark off each process in the right-hand column as you complete it, and

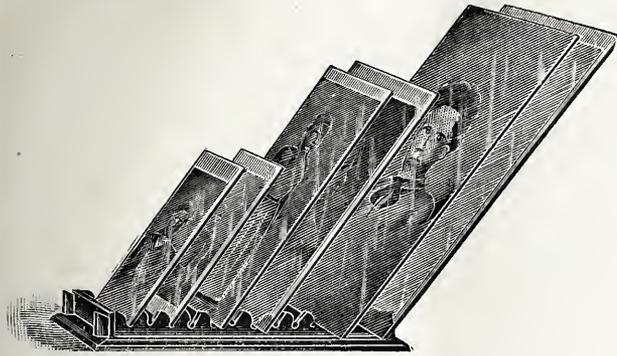

YOU NEED NEVER SPOIL A PLATE.

A book of fifty leaves, printed as above, costs fourpence. If such an investment ensures a photographer getting fifty good negatives out of fifty exposures, it is a very profitable one.

## A CONVENIENT PLATE RACK.

Sold by Marion &amp; Co., Soho-square.

CONVENIENT we at once certify this rack to be, for it already finds a place in our dark room, and, carrying a dozen negatives, takes up little space. Made in *papier mâché* it holds plates from quarter-plate size up to whole

plate, and sells for the small sum of eightpence. The illustration conveys a perfect idea of how the rack is used.

MESSRS. THOMAS ILLINGWORTH & Co., the enlargers and trade printers of Villesden Junction, London, N.W., in a recently issued circular make the following interesting announcement regarding the first-named department of their business: "We don't want you to forget that we make enlargements of all kinds, and it is no idle boast to say that our results are as good as human man can possibly make them. When we tell you that we are making over 700 enlargements every week, you will understand that we are no novices at the game, and that the results for a long time past must have been very satisfactory to have secured us so large a share of patronage." The principal part of the circular (from which we take the foregoing extract) relates to the establishment of a new department of Messrs. Illingworth's business—that of frames and framing. Their work appears to be both tasteful and cheap.

## LANTERN-SLIDE NOVELTIES.

Manufactured and sold by Walter D. Welford, Warwick Lodge, 166, Romford-road, London, E.

On the eve of the lantern season Mr. Welford is bringing out a series of little novelties which appeal to those photographers who prepare transparencies for projection, and naturally wish to have them shown to the best advantage. In number they are three, and here is a description of them: 1. Frame lantern slides.—This is a series of frame and mount designs which are used as cover glasses, a clear space being left for an ordinary landscape or portrait, which is made upon a lantern plate, registration being assured by the use of a mask in printing. The result on the screen is a view or portrait surrounded by a frame or design. 2. Design lantern slides.—A series of designs with a clear space for writing titles, notices, and other purposes. The writing or printing may be done on the design slide or upon the cover glass, or an ordinary lantern plate can be utilised printed from a negative. Landscapes and portraits can also be used with the slides. 3. Cloud lantern slides.—These consist of slides upon which are printed clouds ready to be bound up as a cover glass to a landscape. They are made in black and brown tones to match hydroquinone and pyro negatives, and other developers giving similar tones. By the use of these the amateur can do away with white skies in his lantern slides without the trouble of making cloud cover glasses or printing in clouds on his lantern plate. These adjuncts to the art of lantern-slide making are neatly produced, and we have no doubt that many makers will appreciate them. They emanate from a practical lantern-slide maker of great experience.

## Studio Gossip.

WE are sorry to learn that the well-known and respected photographer, Mr. Thomas Fall, of Baker-street, is confined to his house through illness. His many friends, we are sure, will join us in wishing him a speedy recovery.

THE GERMAN POST-CARD CRAZE.—"A novel and time-saving device has originated in Germany in the way of a postal card, the possession of which will deprive even the laziest of sojourners in *lotus-land* of any excuse for not communicating with their friends. One side of the card bears the postage stamp and the address. On the other side are printed words," says the *Daily Chronicle*, "followed by blank spaces for replies to the questions suggested. An example, with the replies made in one instance by the person who sent the card is as follows:—Arrived: Aug. 20. Society: Mixed. Health: Good. Scenery: Magnificent. Fun: Immense. Lodgings: Fair to middling. Weather: Showery. Money: Send me more by return. General remarks: Would like to live here. The pictorial post-card—the *Ansicht-Karte*—has

risen from a fashion to a craze and a mania in Germany. The average German's notion of a holiday is to walk up a hill and spend the day over beer and post-cards—"mit Ansicht." This week's 'Simplissimus' touches off the mania very neatly with a picture of a man trussed for the guillotine. Chaplains and officials stand solemnly round. The executioner bares his arm. But the condemned criminal turns aside on the plank to write 'the last picture-post-card.'"

BRITISH ART AT THE PARIS EXHIBITION.—The correspondent of a daily contemporary complains of the misrepresentative character of the British exhibits in the Grand Palais des Champs Elysées. It is a regrettable fact that many names, which in recent years have been instrumental in imparting strength and vitality to English art, are conspicuously absent. Nor is this state of affairs confined to the present Exhibition. Whenever collections of our national art are sent to the Continent, the executive, with amazing regularity, appear quite unable or unwilling to furnish a show which, by any stretch of imagination, could be called representative. Exhibition passes Exhibition, and the British section is invariably little more than the reflection of a typical academy. When this is of constant occurrence, and when almost every other nation in Europe makes strenuous efforts to give a characteristic and worthy reflection of the state of its contemporary art, I think, he adds, that the time has arrived when some attention should be drawn to the singular manner in which such things are conducted in this country. I am quite unacquainted with the names of the Art Committee or the means by which the gentlemen are appointed, but when those who are best qualified to judge, both here and on the Continent, deplore the inadequacy of the Exhibition, and agree in condemning it as among the worst sections in the whole Palace of Art, some idea can be gathered of the method in which the Committee has accomplished its task. Where other sections are marked with a catholicity of selection, embracing all societies, guilds, and institutions of repute, that of Great Britain goes no farther than Burlington House. Much of the art that is strongest and most vital in England at the present time flourishes outside the precincts of that institution, and it is indeed disappointing to find by far the greater proportion of space devoted to the type of uninteresting and mediocre work which is so prevalent within its walls. The dislike of true and sincere painting, unassociated with commercialism, should hardly extend to those who are responsible for our international art representations. It is as obvious as it is regrettable that men, who for years have been honoured on the Continent and everywhere in England but in the Academy, are most scandalously and unjustly treated in not being given an opportunity of showing their work, and one marvels at the outlook of those responsible persons who could draw out a list which contains so much that is meretricious and unnecessary, and so little that is true and sincere art. A careful selection of English paintings, embracing the Glasgow School and the New English Art Club (both unrepresented in Paris), could have brought together a collection that it would have been difficult to excel in any country, besides calling attention to many painters who, although not recognised as "official," are deemed by competent authorities to be among our greatest artists. Quite the same state of affairs prevails in the Applied Art Section, in the Esplanade des Invalides. Most persons are aware of the fact that during the last twenty or thirty years, there has been a strong movement in decoration and architecture in England, a movement which has had considerable influence on the modern development of these arts. Under the circumstances it would not have been unreasonable to expect that here, at any rate, every effort would be made to bring together a thoroughly representative collection. But the visitor searches in vain for the presence of those lovely exhibits of books, jewellery, stained glass, metal work, and furniture to which the Arts and Crafts Society has so long accustomed us, or for a thorough representation of our extremely beautiful and vigorous school of modern architecture. Without resorting to stronger language, it would be well within bounds to describe the condition of affairs as deplorable; and, after the repeated evidences of incompetency which characterise the management of our art exhibitions on the Continent, we may well question the advisability of intrusting our "official" art wholly and solely to the members and sympathisers of the Royal Academy.

## News and Notes.

PHOTOGRAPHIC CLUB.—Wednesday evening, September 19, at eight o'clock. Mr. Max Henry Ferrars on "Method in Photography," illustrated by slides of Burma. Visitors welcomed.

MR. THOMAS MOORE, F.R.C.S., a leading surgeon at Blackheath, who had held many public appointments, and had made a special study of microbes, has died at his residence suddenly, at the age of sixty-two. Mr. Moore was also a deeply interested student of the Röntgen rays, and was treasurer of the Society.

MR. ALEXANDER WILSON, photographer, 11A, King-street, Whitehaven, died on Sunday, the 9th inst., in his forty-seventh year, from consumption. He was a member of the Whitehaven Council, and took a great interest in the town affairs, and his death has caused great regret in West Cumberland, where he was well known. Mrs. Wilson will still continue to carry on the business.

THE RECENT SOLAR ECLIPSE.—The report of the expeditions organized by the British Astronomical Association to observe the total solar eclipse of May 28, 1900, will be contained in a volume shortly to be issued from the office of *Knowledge*. The work will be edited by Mr. E. Walter Maunder, F.R.A.S., and will contain many fine photographs of the various stages of the eclipse.

A LOAN COLLECTION OF SLIDES.—The collection of lantern slides selected from members' competitions of the Borough Polytechnic Photographic Society has now been completed, and numbers about eighty. Full descriptive notes

and a brief criticism of each slide by one of the Judges will accompany the set, which is at the disposal of other societies free. Application should be made to the Hon. Secretary, Mr. P. C. Cornford, 103 Borough-road, S.E.

ACCORDING to a Dalziel's despatch, an alarming explosion occurred in the Rue du Mail, Paris, on September 3. Three employes of an illustrated paper were developing plates in the dark room, when one of them struck a match to light a cigarette. A jar of powdered magnesium was beside him, and at once exploded. The building was shaken to its foundations, the windows were blown out, and the inmates terribly frightened. When assistance was forthcoming, the three men were found lying senseless on the floor of the dark room.

PRIOR to the meeting of the Glasgow Corporation last week, members were invited to see specimens of the plague bacilli exhibited under microscopes in one of the committee rooms. A photograph was taken of one of the bacilli magnified to a thousand times, and accompanying it was a blood corpuscle magnified to a like extent. The corpuscle is about twenty times as large as the bacillus. The photograph will be utilised for a magic-lantern slide for use at the lectures given in the afternoon to the medical profession in Belvidere Hospital.

LANTERN SLIDES A RECRUITING AGENCY.—Under the auspices and with the ready assistance of the War Office, a lecture, illustrated with animated pictures and lantern slides, has been prepared, entitled "Our Army." It is descriptive of the life of a soldier from the day he becomes a recruit. The Commander-in-Chief is much interested in the movement for popularising the army. Two *matinées* will, therefore, be given on the 19th and 20th inst. respectively, at three o'clock, at the Polytechnic Institute, Regent-street, W. Admission will be by invitation ticket only, which may be obtained of Mr. Ernest Esdaile, Holly Lodge, Elmer's-end, Beckenham.

ONE of its most respected and prominent members has been lost to the City Corporation by the death of Mr. A. A. Wood, which occurred at his residence, 16, Finsbury-square. Mr. Wood became a Common Councillor in 1888, and enjoyed some of the highest positions the Council were enabled to offer him. He was Chairman of the Library Committee, the Guildhall School of Music Committee, and several others, and was the strongest opponent of the successful proposition of Alderman and Sheriff Sir William Treloar that the Guildhall Art Gallery should be open on Sundays during the Art Loan Exhibition. He was a member of the Dyers' Company and the Spectacle-makers' Company, and was on the advisory committee of the latter in regard to the examinations for the Company's diplomas.

THE UNIVERSITY OBSERVATORY at OXFORD.—"F. R. A. S.," in the *English Mechanic*, remarks that "the main thing which has occupied the Director and his staff during the year under review would seem to have been the measurement and reduction of the plates for the Astrographic Catalogue. At the date of the report, 736 plates of the 1180 required were measured, and 705 of them completely reduced. One very interesting result in connexion with these plates may well find mention here: In continuation of the investigation on optical distortion of a photographic doublet, Professor Turner has arrived at the conclusion that such distortion varies as the cube of the distance, if the star images form the centre of the plate. Should this prove to be really the exact law of distortion, very large fields may be employed for measures of great accuracy, as the reduction will be obviously very simple."

EXPERIMENTS WITH X RAYS IN AN ELECTROSTATIC FIELD.—"The well-known fact that light movable bodies, when placed in a Crookes tube, enter in movement under the action of the cathode rays, is used to support the hypothesis that these rays are formed of material particles moving with a certain velocity. Nevertheless," remarks the *Scientific American*, "it is remarked that the presence of cathode rays is not necessarily connected with the production of the movements, for these are observed to commence before the rays appear, and to cease when the rarefaction is pushed to a certain point, even though the cathode rays are still very intense. It is more probable that the movements are due to electrostatic action, especially if they are compared with those which have been studied by Groety in the case of Röntgen rays. This experimenter disposes a very light movable body, carried on the point of a needle, between the two plates of a charged condenser. In this constant field the body remains at rest, but, when Röntgen rays are brought into the field, it enters into rotation, which lasts as long as the rays continue to act. With condensers of small dimensions and a movable arrangement formed by two discs of copper foil united by an insulating cross piece, the direction of rotation is found to change with the direction of the electrostatic field. The position of the tube emitting the rays also affects the sense of rotation. The two plates of the condenser are not indispensable in the experiment; they may be replaced by a small sphere, or even suppressed altogether, and the vanes placed in the air in the neighbourhood of a Crookes tube. The rotation is not a direct effect of the Röntgen rays, for it ceases when a sheet of ebonite or aluminium is placed between the tube and vanes, the rays still passing through this screen."

## Commercial Intelligence.

GERMAN PATENTS.—During last year 21,080 patents were applied for in Germany, compared with 20,080 in 1898, and 18,347 in 1897. Of these, 7430 were awarded after examination by the Patent Office, the corresponding number during last year having been 5570. Thus, while the number of applications only increased by 3.7 per cent., the number of successful applications increased by 33.4 per cent. During the year, 5171 patents have expired or become void, and the total number of patents in force is 22,198.

AMERICAN AWARDS AT THE PARIS EXPOSITION.—Forty-two thousand seven hundred and ninety exhibitors out of 75,531 have received awards at the Paris Exposition. The United States obtained 1981 awards, of these 220 were

grand prizes, 486 gold medals, 583 silver medals, 422 bronze medals, 270 honourable mentions, and a long list of gold, silver, and bronze medals of collaborators. In the last Exposition only 1000 prizes, including those for collaborators, were given. The prizes were as follows: Grand prizes, 55; gold medals, 214; silver medals, 300; bronze medals, 246; honourable mentions, 229. The names of those who received grand prizes or gold medals have been made public.

AMERICAN *versus* BRITISH MACHINERY.—The following remarks of the British Commercial Agent in Chicago are quoted in the *Board of Trade Journal*: "In order to be able to turn out goods at such a rapid rate and in such large quantities, only machine tools of the very latest patterns are used. Every improvement and every invention by which labour may be saved or time economised, so that the resulting cost of manufacture may be reduced, is at once taken advantage of. In one large works which I had an opportunity of visiting, I found one man in charge of ten automatic machines, all working at the same time. Some were lathes turning small pieces, others were putting the thread on nuts and bolts, and many others. In this one shop there were fifty machine tools working, and in charge of only five men. It is not an unusual thing to see one man in charge of three or four of the ordinary small lathes. They are placed in such a position as to make this possible. Consequently, though wages are high, the actual cost per piece is very low on account of one man being able, thanks to these labour-saving machines, to turn out so much work. In one works I visited I was assured that ordinary labourers were being employed in place of skilled mechanics to take charge of some of the lathes and drilling machines, so as to avoid paying the higher wages of the more skilled men. They found it to answer perfectly, because, owing to the perfection in the construction of the machines, the work was almost automatic. Machine tools of British manufacture do not seem to be in favour in this country. The designs of some of the American tools are certainly very ingenious, and the work they do is exceedingly accurate. They also appear to run at a greater speed than the English ones."

## Patent News.

THE following applications for Patents were made between August 27 and September 1, 1900:—

KINEMATOGRAPH.—No. 15,226. "Improvements in Kinematographic Apparatus." J. A. PRESTWICH.

DEVELOPING TRAYS.—No. 15,303. "Improvements in and connected with Photographic Developing Trays." P. HUNAEUS.

CINEMATOGRAPHIC APPARATUS.—No. 15,319. "Dark Slide for Revolving Disc Cinematograph Apparatus." W. H. H. PALMER.

CINEMATOGRAPHY.—No. 15,415. "Improvements in means to be employed in the Taking and Viewing of Cinematographic Pictures." G. F. HATTON.

PHOTO-MECHANICAL PRINTING.—No. 15,546. "Improvements in Photo-mechanical Printing." W. A. WORRALL.

FILM PHOTOGRAPHY.—No. 15,551. "Improvements in Apparatus suitable for Developing and Fixing Photographic Films and the like." S. QUINCY.

## Meetings of Societies.

### MEETINGS OF SOCIETIES FOR NEXT WEEK.

September.	Name of Society.	Subject.
16.....	South London .....	{ Excursion: Chipping Ongar. Leader, C. H. Oakden.
17.....	Southampton .....	{ Print Competition: <i>Seascapes</i> .
18.....	Aintree .....	{ <i>A Visit with the Cycle and Camera to some English Cathedrals</i> . G. Harvey.
18.....	Bootle .....	{ <i>The City and Port of Liverpool</i> Thomas A. Dodd.
18.....	Brixton and Clapham .....	{ Demonstration: <i>The Thornton Film</i> . Walter D. Welford.
18.....	Croydon Microscopical .....	Ordinary Meeting.
18.....	Gospel Oak .....	{ <i>An Amateur's Work and his Tools</i> . W. J. Gorton.
18.....	Hackney .....	Members' Lantern Night.
19.....	Photographic Club .....	{ <i>Method in Photography</i> . Max Henry Ferrars.
20.....	London and Provincial .....	{ Lantern Night: <i>The Paris Exhibition</i> . A. L. Henderson.
21.....	Croydon Microscopical .....	Conversational Meeting.
21.....	Southsea .....	Paper: <i>Lantern-slide Making</i> .
22.....	Ashton-under-Lyne.....	{ Excursion: Mellor. Leader, Charles Taylor.
22.....	Borough Polytechnic .....	{ Excursion: St. Paul's Cray. Leader, F. W. Bannister.
22.....	South London .....	{ Excursion: Loughton. Leader, G. J. T. Walford.

### LONDON AND PROVINCIAL PHOTOGRAPHIC ASSOCIATION.

SEPTEMBER 6.—Mr. Thomas Bedding in the chair. Mr. WALTER D. WELFORD gave a demonstration of the new Thornton film and read a paper, the chief points of which are given on p. 566 in our last issue. The film is one of pure gelatine rendered insoluble and coated with mulsion, the whole being supported upon a transparent paper backing. Some of the qualities that may be mentioned are those of non-inflammability;

absence of curling tendencies; the purity of the gelatine film and its incapability to detrimentally affect the emulsion. It was stated that special developers were not with the Thornton film a necessity. Mr. Welford showed that density could be readily judged by transmitted light as are plates, the paper backing obstructing very little of the light. Some exposed films were successfully developed before the meeting, and members found no difficulty in stripping the dry negatives passed round from the paper backing. Left to themselves, the demonstrator said they would strip themselves more or less. As regards speed, he could say that during the week he had exposed several of the films at  $f/11$  for one sixty-fourth of a second, with no sun. In reply to some questions, he said that P.O.P. prints from the films had as much quality as those from glass plates. He had also made lantern slides and projected them up to six feet without their suffering thereby in the matter of granularity at all. He claimed, indeed, that the films were very free from grain, and better in this respect than some plates. It was quite true that intensification or reduction had to be decided upon before the negatives were stripped, as they could not be properly dealt with after they left the paper backing.

Mr. A. L. HENDERSON asserted, in the course of some observations, that he could produce a similar film to the Thornton film. His challenge was accepted by the members, and the results are shortly expected. He criticised the fact that the negatives had to be treated with glycerine, which he thought would have a very staining tendency with papers very rich in free silver.

Mr. WELFORD said that he could not say that one print he had made had suffered from this cause.

A member present stated that he found most films on flexible supports tended to fog. Necessarily the coating of emulsion was thinner than was usual for plates; consequently one had to get the developer well through the emulsion in order to get sufficient density, and, if the material forming the support, or something in it, had caused fogging, the image would naturally suffer. He believed this to be the case with all emulsions coated on supports other than glass, which alone was inert.

Mr. WELFORD replied that the negatives he showed were in no way fogged. For his own convenience he had passed round spoiled films to show the stripping process. These were not negatives at all; many were exposed to light and developed for the purpose of showing the stripping. He thought Mr. Thomas was needlessly alarming himself about an unequal contraction of the film in drying, which he thought he had detected. The film he alluded to was printed from without the slightest trouble, and the films would be found, he said, particularly free from tendencies to unequal drying.

The meeting closed after some discussion as to practice of varnishing negatives, which Mr. Drage thought must be fast drying out.

#### PHOTOGRAPHIC CLUB.

SEPTEMBER 5.—Mr. Charles Wallis in the chair.

Mr. G. E. BROWN showed a simple toy that produced colour without apparent reason. It was devised by Mr. C. E. Benham, and consisted of a cardboard disc, mounted on a pin for an axle. One side of the disc was black, and the other white. On the white side were cut three radial slits, separated one from another by half an inch or an inch, and in a line with the central slit, the other side of the axle, was a device, lettering, or other mark, in black ink. If now the disc be quickly rotated close in front of a mirror, with the white side towards the glass, and strongly illuminated by a lamp, and the reflected image examined through the slits, zoetrope fashion, the three images formed should each appear of different colours.

Mr. BENHAM, in speaking of these spectral colour phenomena, said the effect was undoubtedly physiological, and the colours showed also in the light of a sodium flame.

Mr. BROWN said they were not really spectrum colours, as they showed in any light, yellow or white. The colours of the images are reversed if the direction of rotation of the disc be reversed. The members made efforts to see the phenomena to be expected, but the lighting was not very strong, although some detected faint tints.

A question was taken from the box, and it appeared that the writer desired to know how to proceed in an attempt to portray a night street watchman in his box, in front of a fire in a perforated pail, with a red lamp hanging by. The gist of the discussion was that the watchman should be photographed by artificial light placed some distance away so as not to come into the field of view, and the fire and rest of the properties exposed for again without disturbing anything.

Mr. SNOWDEN WARD asked how one would gauge the quantity required for such a case, and spoke of the value of a table of quantities of magnesium for different distances. It would be a great convenience if one could refer to a table for the precise amount of magnesium required to illuminate a room of given proportions.

Mr. F. A. BRIDGE did not think such a table would be altogether a success, for very often only half the magnesium was consumed. It depended entirely on the lamp used, and still more upon the width of a room, its height and colouring. It would not be sufficient to give the mere floor area; in fact, every case would have to be taken on its merits.

Mr. SNOWDEN WARD also asked what difference in light value was to be found between a given weight of ribbon and the same weight of magnesium powder, but the ratio was not known. So much depended upon the method of combustion, that figures would have very little significance. Mr. Ward alluded later to the flashlight papers—sheets of paper coated with a mixture of collodion and magnesium. It was specially mentioned with regard to these that they had to be kept quite dry, or combustion would not be perfect. Considerable time was devoted to the discussion of flashlight matters, and many reminiscences were detailed.

**Croydon Camera Club.**—An open meeting, preparatory to the winter season, which will commence on Wednesday, October 3, was held last Wednesday evening, the 5th inst., at the Club rooms. It was announced that the

steam launch excursion of members and friends from Hampton Court, on the 15th inst., was being well supported, about fifty tickets being already subscribed. Arrangements were made for an unusually interesting series of meetings for the winter, particulars of which will be duly announced. The season will attain its height with the opening of the fourth Exhibition on February 20, at the Art Gallery, when a brilliant display of photographic productions is looked for. During the evening examples of negatives obtained on the new Cristoid and on the Wellington films were shown. Mr. J. Noaks displayed a large and interesting assemblage of Convention prints taken at and about Newcastle. They included some very curious archaeological subjects. Other sets were shown by Messrs. Irving and Bryan, while Mr. W. H. Rogers exhibited "Pictorial Studies," of which several were well up to exhibition form, and one of which, *The Open Door*, will, no doubt, be further heard of. Messrs. Smart and Strickland were elected members.

**Leeds Camera Club.**—The opening of the winter session of the above Club, whose vitality and penchant for hard work is so well known in the North, took place on Wednesday, September 5, at the White Swan Hotel, Call Lane, Leeds, in the form of a social evening, interspersed with an address by the President. There was a good muster of members, considering the fact that at this time of the year there are so many amateurs holiday-making; but those present appeared full of zeal, which augured to make the prospective session a most successful one. A very pleasant feature of the evening was to notice so many of the old members gathered in the new premises. Since last session the Club have, it is, perhaps, to be regretted for many reasons, found it desirable to leave their headquarters, which have been for a long time past at the Grand Restaurant, Leeds, and have transferred their patronage to the White Swan Hotel, Call Lane, which, if the situation is not exactly all that could be desired, has an excellent suite of rooms well adapted for all the purposes of a photographic club, and it is intended to furnish the members with accommodation for developing and enlarging their own negatives. A new feature in the syllabus is the absence of competitions amongst the members, and in place thereof an exhibition of members' own work will be held late in the session at a *conversazione*, and those pictures which show either technical or pictorial merit will be purchased by the committee to form the nucleus of a permanent collection which it is intended to secure for the decoration of the Club's premises, and as a means of teaching the younger members what they should aim at. The President (Mr. R. RUST) in the course of a short address to the members, said that, if any one had ventured to predict he would be occupying such a position twelve months ago, he should not have believed him. He thought he echoed the sentiments and feelings of every member of the Club when he said that he could have hoped that the late Mr. W. J. Warren, whose sad death they all deplored, was working in his sphere amongst them. In reference to the position of the Club as it was to-day, he thought it would bear a fair comparison with previous years. There were on the books 135 members looked upon as *bonâ-fide* members of the Club, and of which they had every reason to be proud. Referring to the syllabus, he expressed a hope that the way in which it had been sent out would meet with the approbation of every member present. As to the change of rooms, he wished it to be well understood that in coming there it was the best place at their disposal. The committee felt, in compiling the syllabus, they must have in view the capacities, desires, and expressed wishes of the members, and on perusing it could but come to the conclusion that it was of a very practical character from beginning to end. In conclusion, he hoped every member would work in the best interests of the Club, and set forth an ideal within himself which he would aim at, for the mutual benefits and interests of the members of the Leeds Camera Club. The enjoyment of the evening was much contributed to by songs, ably rendered by Mr. Watson, Major Norwood, and others, and accompanied by Mr. Ellison. Master Homburg gave several excellent selections on the piano. The health of the President was proposed by Mr. Homburg, and duly honoured. Next week is "Flower Photography," by Mr. Atkinson, one of the series of lectures instituted by the Yorkshire Photographic Union.

#### FORTHCOMING EXHIBITIONS.

1900.	
Sept. 21–Nov. 3	..... Photographic Salon, Dudley Gallery, Piccadilly. Hon. Secretary, R. W. Craigie, Camera Club, Charing Cross-road, W.C.
October 1–Nov. 3	... Royal Photographic Society, New Gallery, Regent-street. The Hon. Secretary, 66, Russell-square, W.C.
„ 17–20	..... Rotherham Photographic Society. Hon. Secretary, H. C. Hemmingway, Tooker-road, Rotherham.
November 7–10	..... Cripplegate Photographic Society and the Essex and Middlesex Cycling Union, Ltd. The Hon. Secretaries, A. T. Ward, Cripplegate Institute, E.C., and G. F. Sharp, Sach-road, Upper Clapton, N.E.
„ 12–17	..... Ashton-under-Lyne.
„ 21–23	..... Hackney Photographic Society.
„ 22–24	..... Hove Camera Club. Hon. Secretary, C. Ber- rington-Stoner, 24, Holland-road, Hove.
1901.	
January 14–19	..... Blairgowrie and District Photographic Association. The Hon. Secretaries, Blairgowrie, N.B.

Those who desire to send photographs to the above Exhibitions should write for prospectuses to the Hon. Secretaries, whose addresses are given in the second column above. The dates mentioned are those at which the Exhibitions open.

## Correspondence.

- \* \* Correspondents should never write on both sides of the paper. No notice is taken of communications unless the names and addresses of the writers are given.
- \* \* We do not undertake responsibility for the opinions expressed by our correspondents.

### A NEW LIGHT FOR THE STUDIO.

To the EDITORS.

GENTLEMEN,—The letter of Mr. A. A. Pearson is well timed and well placed, and the subject most useful, but there is one thing Mr. Pearson neglected to tell his readers, and that was what the saturator or carburiser was charged with—ether, oil, &c. If he gave some idea of the cost per hour of such light he would still further contribute useful information.—I am, yours, &c.,

R. S.

## Answers to Correspondents.

- \* \* All matters intended for the text portion of this JOURNAL, including queries, must be addressed to "THE EDITORS, THE BRITISH JOURNAL OF PHOTOGRAPHY," 24 Wellington-street Strand, London, W.C. Inattention to this ensures delay.
- \* \* Correspondents are informed that we cannot undertake to answer communications through the post. Questions are not answered unless the names and addresses of the writers are given.
- \* \* Communications relating to Advertisements and general business affairs should be addressed to Messrs. HENRY GREENWOOD & Co., 24, Wellington-street, Strand, London, W.C.

S. POWELL (Rushden).—A pleasing and well-executed photograph.

SALARIES AT CAPETOWN.—E. THORNE asks: "Could you say what salary they pay at Capetown to a good all-round assistant?"—In reply: A question it is impossible for us to answer. We insert our correspondent's query, as perhaps some Capetown reader may be able to supply the information.

DETERIORATED PAPER.—J. J. sends us some developed bromide prints, and wants to know the cause of the "fogged and stained appearance for half or three-quarters of an inch round the margins of them. They are all alike with this lot of paper."—The reason is that the paper is stale, and has evidently been made a very long time.

PHOTOGRAPHIC POST-CARDS.—W. C. BAX asks: "How can I produce view post-cards? I have been asked for them. I want to do them myself."—In reply: Perhaps the simplest plan would be to use the Velox cards specially prepared for the purpose. They are obtainable of Messrs. Griffin, Sardinia-street, Lincoln's Inn-fields, W.C.

PHOTOGRAPHING FRUIT.—T. SCOTT says: "I want to photograph some groups of fruit. Would you advise me to use orthochromatic plates and a colour screen? Also should the plates be backed?"—Yes; use orthochromatic plates and a screen, the depth of which should be governed by the colours in the groups of fruit. Unless the plates are thickly coated, they should be backed to get the best results.

ADDRESS WANTED.—F. VINER writes: "Can you supply me with the address of the people that make a speciality of doing the match-boxes with a view of public-house on, or a likeness of the landlord on same?"—Probably any collotype printer would do what you require. Crayon, Limited, 49, Brecknock-road, N., who make a speciality of war buttons and other small photography, would probably undertake your orders. Write to them.

RECOVERING GOLD FROM BOTTLES.—F. E. G. writes: "I have two old toning bottles in which the gold has accumulated on the sides and bottom until they look like pure gold from the outside. Will you kindly state how best to recover this?"—Drain the bottles and then pour in a little nitro-hydrochloric acid, one part nitric and four parts hydrochloric, diluted with one or two parts of water. That will dissolve the gold, which you will then have in solution to deal with in the ordinary way.

SILVER STAINS ON HANDS.—MESS writes: "I am trying the ferrotype process, and I get my fingers and hands in a dreadful mess with the silver. Can you tell me how to get the stains off?"—The method usually adopted by wet-collodion workers is to wet the parts with water and rub them with a lump of cyanide of potassium, followed by pumice-stone. Another way is to treat the stains with tincture of iodine, followed by a solution of hyposulphite of soda. Of course, you know that the cyanide is a poison.

IDENTIFYING AN OIL PAINTING.—PHOTO-ARTIST writes: "Will you kindly tell me the best way to proceed to ascertain whether an old oil painting, which is supposed to be by an old master, is genuine or not? To whom could it be submitted, and what would be the fee? Any information you can give will be much appreciated."—The only suggestion we can offer is, that the painting be submitted to an established firm of picture dealers, such as Agnew & Sons, Bond-street; Graves, Pall Mall; or similar firms. We do not know their fees. Better write to them for the charge for their opinion.

FORMULA AND ADDRESS WANTED.—VARNISH writes: "1. Some time ago I saw a formula in the JOURNAL for making unflammable celluloid; will you oblige by reprinting the same? 2. Also the address of firm that sells celluloid varnish."—1. Several methods, most of them patented, have been published for rendering nitro-celluloid unflammable, but we cannot for the moment call to mind the one our correspondent refers to. 2. The Anglo-American Varnish Company, Birmingham, supply different kinds of celluloid varnish. The Vanguard Manufacturing Company, Maidenhead, also, we believe, supply a celluloid varnish.

PROCESS WORK IN GOVERNMENT DEPARTMENTS.—H. A. W. writes: "Could you inform me if the Government employ half-tone process operators; and, if so, where are the works, and what are the qualifications to get the berth?"—We are not sure that the Government do employ process workers direct. The police sometimes utilise process blocks for the apprehension of criminals, but whether they make them themselves or get them made we are unable to say. The photo-mechanical processes are largely employed at the Ordnance Survey Office, Southampton, and we are not aware if that process is worked or not. If it is, it would be worked by the Royal Engineers.

THE FLOATING-ON PROCESS.—BRUM writes: "Can you inform me where I can get to know the 'floating-on' process, as used by wood-engravers, or any other effective method of photographing on the wood?"—We do not know quite what you mean by the "floating-on process." Cannot you send us a little more information, as we may know the process, though not under that name? A collodion film may be detached from the glass and floated on to a wood block. Is that what you refer to? The carbon process is also used for producing photographs on wood blocks. The powder process can also be employed. Most of those who produce photographs on wood blocks for engravers keep the process they employ as a trade secret.

RED STAINS ON COLLODIO-CHLORIDE.—B. WALDE writes: "Could you let us know the reason of the red stains on the collodio-chloride paper, or how to avoid them, and how to mix magnesium powder to take photographs with at night?"—We do not know the red stains referred to; we ourselves have not experienced any. If you send us some examples, we shall be pleased to help you, but without seeing them we cannot. No mixture is necessary if you employ the magnesium in any of the lamps sold for the purpose. Several formulæ for flashlight mixtures have, from time to time, been published, but they are all more or less dangerous in use. We should advise you to use the magnesium by itself in one or other of the lamps.

TONING P. O. P. WITHOUT WASHING.—NEMO writes: "I have lately been trying the effect of toning my P. O. P. prints without previous washing. After taking from the toning bath, transfer to a stop bath of dilute soda-sulphite solution, and after that two or three changes of water, then to a formalin bath; wash again two or three changes, and then fix. Do you consider there is any danger in the practice as regards permanency of results? I find a decided gain in not getting any double tones."—We think it would be preferable to wash out the free silver and acid before the prints are put into the toning bath—though its composition is not stated—as by so doing all risk of sulphur-toning is avoided and toning by gold ensured. With sulphur toning permanence is doubtful.

RESTORING FADED PHOTOGRAPHS.—INVESTIGATOR writes: "In the *Revue Suisse de Photographie* I found the following formula for restoring faded photographs: A. Water 500 c.c.; chloride of calcium, 1½ grammes; carbonate of lime 5 grammes; chloride of gold and of sodium, 5 grammes. B. Tungstate of sodium, 50 grammes; hyposulphite of soda, 50 grammes; water, 500 c.c. *Modus operandi*: Immerse for ten minutes in solution A, say until the print reaches a rich purple tone; after this, immerse in solution B until disappearance of the yellow tint. By the present I wish to inquire whether, in your opinion, the quantity in solution A of chloride of gold and sodium is right or out of proportion, one gramme and not five being meant."—We cannot say what is meant, but five grammes seems a large proportion. It may be necessary, however. We have not ourselves worked with the formula. We should recommend our correspondent to try it with one gramme of the gold salt, and, if that does not answer, to try with the larger quantity.

VARIOUS QUERIES.—PYRO asks: "1. With reference to the City and Guilds Examinations, will you kindly let me know through JOURNAL what the advantages are in connexion with them, and where books are to be got from which one may study these subjects; also if classes are yet established in the vicinity of Liverpool? 2. Where can I obtain handbooks on puroleum and crystoleum painting? 3. By what method is vignetting done in the camera? I find ground glass does not admit enough light to fog bottom of plate. Should the glass be of a certain colour—blue, for instance? 4. What kind of varnish is used for white-wood fancy work, and how is it applied?"—In reply: 1. The advantages of the examinations are obvious, not the least of them being that a candidate's knowledge of photography is tested. Get the complete book of Messrs. Whittaker, Paternoster-square; a list of photographic books to be studied is given in it. We know of no classes at Liverpool. 2. We are not aware that any are now in print on the subject, as that kind of painting is little practised. Several articles on the subject will be found in back volumes of the JOURNAL and also in the ALMANACS. 3. Different methods of vignetting in the camera were given on pages 163 and 211 of the JOURNAL for this year. 4. White wood is usually french-polished. White polish is to be had from all who supply french polish and varnishes. A special white varnish, to be applied with a brush, is also supplied by them.

- \* \* A number of reviews, answers to correspondents, and other matter are unavoidably held over.

The ALMANAC for 1901 will appeal to photographers all the world over as a daily reference guide in practical work. The formulæ will be revised where necessary, and the latest departures in theory and practice will be chronicled. The year's advances will be recorded, and wherever practicable new features of an informative nature will be added.

Adhering to an old and much-appreciated custom, we invite short contributions on practical subjects for the pages of the 1901 ALMANAC. Those of our friends intending to co-operate with us in this respect can help us by letting us have their MS., sketches, &c., at the earliest possible date.

Secretaries of societies will oblige if they will forward us lists of officers and other details for inclusion in the directory of photographic societies. We shall also be glad to receive any additions that may be made to the list of telegraphic addresses of the trade, &c. As usual, a section of the ALMANAC will be devoted to notices of the latest introductions in photographic apparatus, &c. Those firms who wish to take advantage of this feature should communicate with us as early as possible.

The publishers ask us to remind advertisers that many of the advertisement pages of the ALMANAC are already booked, and that, to ensure insertion and good positions, orders and copy should reach them without delay.

## EX CATHEDRÁ.

WE have received the prospectus and time-table of the sixth session, opening on Monday, October 1, of the London County Council's School of Photo-engraving and Lithography, 6, Bolt-court, Fleet-street, E.C. The prospectus states that "the object of the school is to give instruction in the craft of producing surfaces for printing. Of the various classes held some are concerned with the more artistic side of the work, others with the technical; there is, however, no real line of demarcation between the two, either in intention or practice, and the division is made solely for convenience of teaching. Instruction is given in drawing, design, lettering, lithography, elementary photography, photographic copying, and the chief photo-mechanical processes. The school is open to those who are genuinely engaged in business in any branch of the photo-

## THE BRITISH JOURNAL PHOTOGRAPHIC ALMANAC FOR 1901.

Edited by THOMAS BEDDING, F.R.P.S.

THE fortieth annual issue of THE BRITISH JOURNAL PHOTOGRAPHIC ALMANAC will be published on December 1 next. Its preparation is already receiving attention. This year's ALMANAC reached a total of 1516 pages, and, as was the case in 1899, the entire edition of 20,500 copies was sold out within about three months of publication. Of no other photographic book ever issued can two such unique facts be recorded.

The striking favour with which past ALMANACS have been received is the surest proof that the lines upon which that publication is produced meet the requirements of its readers and supporters. Upon such lines we propose compiling the volume for 1901. At the same time we shall be pleased to receive and consider suggestions for increasing the value of the ALMANAC in directions which may occur to our readers as susceptible of improvement.

mechanical, photographic, designing, lithographic, engraving, and printing crafts, and no provision whatever is made for amateurs. In some cases the classes are confined to those who are directly engaged in the particular branch taught. The Technical Education Board is open to consider applications from parents who intend placing their sons as apprentices to any of the above trades, and who may be desirous of giving them the advantage of a preparatory school training; but it is to be understood that such students must be duly apprenticed within some period to be arranged." The photographic classes include most branches of process work, the fees are reasonable, and the facilities for study and practical work exceptionally good. Any further particulars concerning the instruction and work of the school may be obtained either by personal application or by letter to the Principal of the School, 6, Bolt-court, Fleet-street, E.C., or to the Secretary of the Technical Education Board, 116, St. Martin's-lane, W.C.

\* \* \*

MANY photographers will shortly be preparing lantern slides for the forthcoming season; therefore we may remind them that the beauty of most pictures is enhanced by the introduction of clouds, presuming, of course, that the clouds are suitable to the landscape. Often when clouds are printed from stock commercial negatives they are used without discretion, and the result is ludicrously incongruous. We again allude to this subject because just now is about the time of the autumnal equinox, when gales may be expected, and good cloud effects may be said to be "in season." Therefore those who have not already a good stock of cloud negatives for their winter work should embrace the opportunity, and lose no time in securing them. As a rule, when the amateur takes cloud negatives for stock, he takes them far too near the zenith, and in such a position as they would never be seen in if a landscape were taken with the clouds included, hence they do not harmonise if afterwards used for one. Discretion must be used both in taking cloud negatives and in using them. It would be eminently incongruous to use heavy stormy clouds, which may be shortly expected, for a serene sunlit landscape, though it is too often done; but towards the end of this month and the beginning of next almost any variety of cloud negatives may be obtained. The best position from which to take the negatives is an eminence, or, better still, the seaside, as these may be secured near the horizon without including trees, housetops, and the like, and also be at about the same elevation as they would generally be if included in a landscape picture. The opportunity of easily securing good cloud negatives if lost during the next few weeks must be waited for till next year.

\* \* \*

IN our issue last week we quoted the number of patents applied for in the German Empire during 1899. It was 21,080. Of this number 7430 were awarded, after examination, by the Patent Office. The German Patent Office is conducted on quite different lines from the English Patent Office. In Germany a patent is not granted until the Patent Office has satisfied itself, by examination, that the invention is really original. Even then the patent is not granted unless the invention is of real public utility. Patents are not available for frivolous things. Here a patent is given for the most trivial idea, or for others that may be as old as the proverbial hills. The money is taken, no questions asked, and the patent sealed—not that it may be valid, for the patentee may afterwards find, perhaps after costly litigation, that his invention has been

anticipated. But he will get no redress from the Patent Office, not even the fees back that he has paid. It will be seen from the above figures that, after examination, not much more than a third of the patents applied for were awarded. It may reasonably be taken for granted that, when a patent is given in Germany, it is a valid one there, and that a patent for the same invention taken in any other country is also valid. We wish that the same thing ruled in our Patent Office, so that the patentee, after paying the fees, had a reasonable guarantee that his patent was a valid one.

\* \* \*

THE season is now coming on when artificial light will be invoked by many photographers. Already we have been asked for formulæ for flashlight powders. These we look upon as being all more or less dangerous, particularly in the hands of those who are unacquainted with their properties. In our News and Notes last week we quoted a dispatch from Paris to the effect that three *employés* were engaged in developing some dry plates when one of them struck a match to light a cigarette, and "a jar of powdered magnesium beside him at once exploded." The windows of the building were blown out and the three men were rendered insensible. Now, it is hardly conceivable that the jar contained magnesium powder by itself, to explode and cause so much damage, or to light so easily while in a jar. It is more than probable that the magnesium was mixed with one or other of the oxygen-forming compounds so much used in flashlight powders, and which are so dangerous to handle in large quantities. The components of these flash powders are all harmless enough when kept separate, and it is only when mixed together that they become dangerous compounds to deal with, as they are liable to "go off" when least expected, some spontaneously. We call attention once more to this subject in order to caution those who may be contemplating the manufacture of flashlight powders for themselves. In all cases where these powders are used the different components should be kept separate and only mixed at the time of using, and then only with the greatest care, using a piece of paper or cardboard to mix them, and only sufficient for a single flash should be taken at a time.

\* \* \*

SOME photographic societies and clubs possess apparatus which any of the members can borrow for use at home when not required at the meeting. Notably is this the case with lanterns; but, till now, we were unaware that any society made it a business to let them out on hire to the outside public. It would seem, however, that at least one does so. The Brentford Photographic Society evidently have an eye to business. A correspondent sends us the following paragraph from the local paper: "LANTERN SLIDES.—With regard to the notice we published recently about slides for lantern lectures, lent by George Newnes & Co., it may be added that any one wishing to use the lectures may hire a lantern and acetylene generator or lamp from the Brentford Photographic Society at a moderate cost." It is not stated whether the Society also undertake to supply an operator to manipulate the light, &c. Professional photographers have often complained of the alleged injury done to their business by amateurs. What will local opticians, who make a feature of letting out lanterns and slides for hire, say if it becomes a practice with the Society to compete with them in their business? However, we surmise that the example set by the Brentford Society is not to be followed by any other photographic society.

WE are indebted to Mr. John W. Glenny, of the Far East Studio, 1, Campden Hill-road, Kensington, for the opportunity of inspecting a number of Japanese photographs, chosen from a considerable collection for which he is the agent. Mr. K. Yamamura, of Nos. 2 and 16, Bentendori, Yokohama, is the photographer, and we gather that this gentleman produces coloured views, portraits and lantern slides. Of the first two kinds, the specimens before us are exceedingly good, the hand painting, for such it appears to be, being minute and tasteful. A collection of about twenty-four little pictures, bound up in book form, is entitled, *A Leaf from the Diary of a Young Lady*. The photographs, with brief descriptions in English, illustrate the domestic and social doings of one of those alluring little creatures to whom such sympathetic references were made in the article we printed in the JOURNAL of the 7th inst. As examples of interior and group photography it is difficult to convey an idea of the excellence and charm attaching to these productions, while the colouring, presumably partly hand and partly mechanical, is very tastefully and tenderly done. We have been altogether highly pleased with these examples of Japanese photographic work. Those interested may, doubtless, find Mr. Glenny, at the address given at the opening of this paragraph, willing to exhibit specimens.

#### IMPERFECT FIXATION WITH REFERENCE TO STABILITY.

IN concluding the article on "Imperfect Fixation," a few weeks back, we intimated that we should possibly recur to the subject with reference to the fixing of silver pictures. The previous article was chiefly confined to spots and stains, apparent when the prints were finished, or which made themselves apparent soon afterwards, arising either from careless manipulation, or, in too many instances, from lack of knowledge on the part of those into whose hands the work was put to be done without proper supervision. On this point, in the article, we thought it necessary, in the interest of photography itself, to make some rather strong comments, more particularly with reference to some photographers who take apprentices while they themselves are quite ignorant of even the elementary principles of their craft. That some do so is evidenced by the fact of the queries we from time to time receive from professionals as to the causes of stains, markings, spots, &c., which any one possessing but a superficial knowledge of his craft could at once locate at a glance when seeing the work in progress. But the queries clearly prove they are unable to do so; hence our strictures.

In the present article we propose to deal with the fixation of silver prints as affects their stability. A very general impression is rapidly gaining ground, not to the credit of photography, that silver prints are bound to fade after a few years, and that fading must occur as a matter of course, and we regret to say that many modern silver pictures tend to substantiate it. In face of that idea, however, is the fact that there are thousands of silver prints still intact that were made forty or more years ago. If such prints were produced then, why, with our improved knowledge of the chemistry of the subject, are such pictures not produced now? On former occasions we have pointed out the difference in conditions prevailing then and now, and it is not necessary to dwell upon them again here. We shall simply now confine ourselves to

the existing conditions, for, as they are, they do permit of the pictures being made, if not absolutely permanent, far more stable than the majority of them are at the present time, if more care and judgment were expended in their production. In many cases, when pictures fade, after a year or two the fading is frequently attributed to the mounts, or that they have been imperfectly washed, &c., while the real cause has been simply imperfect fixation. As we have said many times before, unless a print, whether albumen or gelatine, is properly fixed in the first instance, no amount of after-washing will rid it of the hypo salts of silver.

Recently the question was publicly discussed as to how one is to know when a negative is properly fixed. In the fixing of a negative we have some sort of a guide in the appearance of the film, and, if the plate be left in the fixing solution for the same time again as it took for the white bromide of silver to disappear, the negative may be considered, to all intents and purposes, to be properly fixed.

With paper pictures we have no such ocular guide. How, then, can we know when they are properly fixed? This query, we are reminded, was one put on one of the City and Guilds' examination papers some few years ago, but the propounders of it were unable to answer it themselves. With albumen paper it used to be assumed by some workers that, when a certain amount of mottliness, seen by transmitted light, disappeared, the prints were fixed; but, if the view taken of the fixing of a gelatine plate be correct, this was an inefficient fixation; hence, perhaps, a cause of fading. The only practical way we know of ensuring perfect fixation with paper pictures is to make sure, by overdoing it rather than underdoing it. No harm comes from that. The way is to employ plenty of hypo, and allow plenty of time for its action. This salt is cheap enough, though it is too often stingily used.

We once heard an employer complain that his printer, though an excellent hand, was very extravagant with the hypo. At the time we thought, and said so, that this was a high commendation of his ability. We may mention that, in our opinion, the formulæ for fixing baths issued with some brands of paper are, with the time given for immersion, far too weak to render the pictures stable, particularly when they are compounded as "acid fixing baths."

The strength we always use and recommend is four ounces of the salt to each pint of water, and the time of immersion not less than fifteen minutes. Under these conditions one can ensure that the insoluble salt of silver formed by the first action of the hypo is converted into the freely soluble salt, which is readily washed out by water. This strength and time of immersion may not be absolutely necessary, but it will undoubtedly ensure the pictures being thoroughly fixed. The quantity of solution is also a factor in the case, for if only a small bulk of the solution be employed, or if it is used for more than one batch of prints, its action will be weakened, and the conditions altered. It goes without saying that the prints should be kept separated and in continual motion while they are in the solution, otherwise it will not have a free and equal action. In all cases the hypo should be weighed and the water measured, and the bath not be compounded, as it frequently is, by so many handfuls of hypo to a pitcher of water. "Handfuls" are a very inconstant quantity.

The case of bromide papers is somewhat different from that of printing-out papers. In the former there is only the gelatino-bromide of silver on plain paper to be dealt with, and a shorter immersion than that mentioned above will suffice. Not so,

however, with the latter, because here we have, in addition to the haloid, free nitrate of silver, and also a substratum on the paper—the baryta coating—which is held to the paper by a vehicle of some kind, such as gelatine, starch, or flour paste, in an insoluble condition. Now, the free nitrate of silver may, and there is no doubt that it does, combine with that and forms an organic compound of silver, as in the case with albumen paper, which has to be got rid of by its being converted by the hyposulphite of soda into a soluble condition, for, if any of it remains in the paper, it will eventually darken by continued exposure to light, as witness many gelatine prints to be seen in show-frames. As the baryta coating is practically insoluble in water, the action of the hypo is chiefly confined to the front, and takes place through the gelatine as with a glass plate; therefore a longer time must be allowed for its action than is necessary with bromide papers. As we have said before, and as it is so very cheap, hypo should not be grudgingly used where permanency of the results is a consideration.

We intended to have said something on the washing of the prints, after fixation, and the effect it may, or may not have on the permanency of silver pictures, but that must be deferred till a future occasion.

**The Apotheosis of Scientific Photography.**—This is not an extravagant mode of describing the purport of Dr. Common's inaugural address at the British Association meeting in the Department of Astronomy in Section A. Comparing the report of Sir G. Airey, to be found in the very first volume of the Proceedings of that body, upon the progress of astronomy up to that date, with what has since been achieved, he said, "What has aptly been termed the new or physical astronomy did not then exist," and he "proposed . . . to allude briefly to the new astronomy, and to speak rather fully about astronomical instruments generally and the lines on which it is most probable future developments will be made." He described the various improved forms of instruments and appliances now in general use, but the chief *motif* of his remarks was photography, and what it had done for astronomical science and progress. Incidentally he repeated some old observations of Sir David Brewster in connexion with solar and stellar lines. Part of the quoted words may well bear repetition here: "Lenses of large diameter, accurate heliostats, and telescopes of large aperture are absolutely necessary for this purpose; but, with such auxiliaries, it would be possible to construct optical combinations, by which the defective rays in the spectra of all the fixed stars down to the *tenth* magnitude might be observed, and by which we might study the effects of the very combustion which lights up the suns of other systems." All these requirements have long been met. Brewster's remarkable and prophetic words have been realised. The invention of Bunsen and Kirchoff, the spectroscope, was not made public till years after (in 1859), yet here is, undoubtedly, the germ of their discovery; the use of photography alone, by which all these great observations are now recorded free from all errors of personal equation, was the one thing he had not foreseen. Dr. Common points out how Daguerre's invention was at once utilised, J. W. Draper, the two Bonds in America, Warren de la Rue in this country, and Foucault and Fizeau in France, being the pioneers of celestial photography which was so closely bound up with the progress of the new astronomy. Dr. Common proceeded to indicate the lines on which probable future large telescopes would be built. They would be fixed instruments with a large mirror of concave figuring—six feet has already been accomplished—and six or seven feet as a beginning should easily be achieved. There is here a point of considerable practical interest to photographers who use plane mirrors. Every one knows the trouble of resilvering them, but Dr. Common says that "now we have a method of silvering mirrors that is certain, quick, and cheap," though "up to quite recently the silvering of any five-foot mirror was a long,

uncertain, and expensive process." The whole address is replete with matter interesting to every scientific photographer, and should be read by all.

**Two New Spectrographs.**—Dr. Vogel, in the *Astrophysical Journal*, describes two new instruments supplied to the Potsdam Observatory for use with the great refractor there. There is a three-prism spectrograph, giving a deviation of 180°, which involves the camera and the collimeter being almost parallel to each other. The latter has an aperture of 3.2 cm. and 48 cm. focus. The lenses chosen are an astigmatic photographic lenses by makers well known for their photographic optical work. The prisms are of very white Jena glass, and its spectrum has a uniform focus from *b* to *k*. Then there is a single-prism spectrograph, with a still larger collimeter, and its camera is supplied with a photographic objective; the spectrum is uniformly sharp from *D* to *N*. Here, again, the use of lenses originally designed for high-class photographic work enables instruments to be constructed which would have been much inferior for the purpose if made prior to the introduction of anastigmatically corrected photographic lenses.

**A New Light.**—At a recent meeting of the Paris Academy of Sciences, M. Raphael Dubois read a paper on lighting by the cold physiological light called Living Light. This is a very remarkable phenomenon, which undoubtedly could be made to perform photographic work, though no details in that direction are available in the abstract before us. Full descriptions are given in the original paper as to how to set about the production of the light. Briefly, they consist in cultivating certain organisms in a special medium found suitable for them. It is stated that light is produced sufficient to illuminate a whole room with a soft lambent glow about equal in strength to moonlight.

**Photographers and Railway Companies.**—In reference to a recent paragraph under News and Notes, a correspondent writes us, saying that it is eminently characteristic of railway management that the unfortunate photographer who applied to the Great Western Railway Company for work was given something he was unfitted for, and not something which he could do well. "The photographers," he adds, "who are employed in some railway works are another illustration of the same principle. Frequently they are enlisted from the ranks of labourers, given the opportunity of learning what they can from books and by practice, and duly installed in the works studio. There would be no objection whatever to the Company pursuing this course, but it occasionally arises that they call in professional aid outside their own *employés*. Any photographer who thinks of taking such a post should first ascertain what his official position is to be, or he may find himself under the supervision of a man who is infinitely his inferior in ability, and who will be glad of the chance to get rid of him when he has learnt what he can from him. The same thing may be said to parents sending their boys as improvers or apprentices in the studio of a railway company. There are notable exceptions. For example, the Midland Company had Mr. Thomas Scotton for many years, and now his son, and the London and North-Western possess a staff which turns out very fine work, but it may be taken that in most cases the berths of photographers to the railway companies in this country are not worth having, and that those who are in them only stay there because they find it difficult, with their curious, one-sided knowledge of the craft, to get a place anywhere else. Wherefore the company can pay them wages which an outsider coming in to do the same work would refuse, which, again, is typical railway company policy."

**"Dartmoor Illustrated."**—The distinctive feature of the book bearing this title, which is published by Mr. James G. Commins, of 230, High-street, Exeter, is that it consists chiefly of phototypic illustrations, placed by themselves apart from the brief descriptive notes which preface the volume. The hundred photographs are separately printed on full-page paper. In a

publisher's note Mr. Commins remarks: "The ever-increasing interest displayed in Dartmoor and its antiquities, and the success and general approval which attended the publication of the third edition of the *Perambulations of the Ancient and Royal Forest of Dartmoor and the Venville Precincts*, edited by Mr. J. Brooking Rowe, F.S.A., has induced the publishers to make arrangements by which the value of that work may be very considerably extended; he has accordingly decided to issue a series of one hundred illustrations of the scenery and antiquities of Dartmoor, to be executed in the best possible manner, and printed on the finest art paper from photographs taken especially for this work by Mr. T. A. Falcon, M.A., whose knowledge of, and interest in, the Moor has been of the utmost value." *Dartmoor Illustrated* forms a handsome book, and Mr. Falcon has done his photography exceedingly well, while his notes are pithy and clear.

AIDS TO RAPID SOLUTION.

THE making of solutions is so constant and necessary a part of the photographer's routine that we give here a few expedients which are set down here also for the information of those who may be contemplating the preparation of dry developers, &c., to be dissolved by the purchaser.

We are afraid it is still necessary to point out that the usual custom of putting salts in a bottle or jug, pouring the water over them and occasionally stirring the mixture, is a very bad one from the point of view of speed. The liquid at the bottom becomes saturated, but the water in the salt does not get a chance to exert its solvent power. The theoretically right principle, which is likewise easy in practice, is to suspend the salt near the surface of the liquid. This can be done in several ways. A muslin bag is perhaps the simplest receptacle. A bottle with the bottom cut off (easily done with a piece of hot iron) and a piece of muslin tied over the mouth is another. It is hung inverted in the vessel containing the water. By marking the side, the solid to be dissolved can be measured instead of weighed.

Mechanical agitation of the solvent and the solid is generally bad from the photographic point of view as leading to aeration of the solution. When the solution is not of sufficient volume to make a top-solution method advisable, it is best to powder the salts as finely as possible, and mix them with the water (preferably heated) by stirring. This matter of powdering is perhaps neglected by those referred to above who supply ready-mixed preparations. Our experience of some of these shows us that the makers have not taken means to ensure a uniform fineness of division. Neglect of this is serious, because the large particles remaining delay the process of solution, which, when they are present, occupies many times the period required to dissolve the bulk of the powder. The only way to obtain perfection in this respect is to sift the powdered mixture and repowder that portion of it left behind, repeating this process until the whole passes completely through the sieve.

Increase of temperature accelerates the solution of almost all salts, but it should be noted that some are thereby altered in composition. Among these are sodium bicarbonate (which changes more or less completely into sodium carbonate), potassium metabisulphite (which loses sulphurous anhydride), and Schlippe's salt.

Some salts, such as borax, hypo, alum, potassium oxalate, dissolve much more freely in hot water than in cold, whilst in the cases of others (e.g., salt) there is little advantage in employing heat. A glance at the solubility tables in the ALMANAC will inform the reader of the property of any given salt in this respect.

Another and little-recognised aid to solution lies in the use of anhydrous salts. An anhydrous salt is one containing no water of crystallisation. Thus mercuric chloride,  $HgCl_2$ , is anhydrous. It must not be supposed that the mere fact of a salt being anhydrous is any indication of its solubility. The interest of the anhydrous salt appears only when we compare it with the same salt, but combined with water of crystallisation. Thus sodium carbonate crystallised has the composition  $Na_2CO_3 \cdot 10H_2O$ . The anhydrous salt is, of course,  $Na_2CO_3$ . The importance of this, from the point of view

of rapid solution, is that the majority of anhydrous salts raise the temperature of the water when they dissolve, whereas most hydrated salts lower it, some much, some little. On the Continent, anhydrous sodium sulphite is considerably used, though in this country the anhydrous salt rarely appears in formulæ. Probably anhydrous sodium carbonate has been made more prominent than any other anhydrous salt through the advocacy of it by Mr. Chapman Jones in formulæ for developers.

Most of the salts used in photography can be converted into the anhydrous or dry form by heat. The temperatures at which these take place are as follows for a few of the most used substances:—

Salt.	Temp. (°C.)	Remarks.
Sodium thiosulphate....	215 ....	Begins to decompose at 220°.
Sodium sulphite .....	150 ....	
Potassium carbonate....	130 ....	
Sodium alum.....	40-50 ....	
Copper sulphate .....	220-260....	Loses 4 of its 5 molecules of water at 100° C.
Sodium phosphate.....	100 ....	

In most of the cases given above the temperature must be kept within a degree or two of that given. If it fall below, dehydration will not be complete; if it rise much above, other decompositions will set in.

On the semi-large scale the salts are rendered anhydrous by exposure in an oven heated to the temperature required, which must be indicated by a thermometer. An apparatus for a similar purpose, which may serve as an idea for some of our readers, was described by G. P. Drossbach in the *Berichte* of the Berlin Chemical Society not long ago. It consists of a wide tube, which is heated by a furnace. It is provided at one end with a hopper, for the introduction of the powdered substance, and contains the Archimedean spiral, the axle of which runs loosely in the constricted end of the tube and in a bearing at each end. As the material is worked forward by the spiral it is continually turned over, and, before it reaches the exit end of the tube, is thoroughly ignited. Any gas in which it is desired to conduct the ignition is led into the apparatus at the constricted end, of the tube. The apparatus as thus described is intended for the ignition of minerals, &c., but, by arranging insulating media such as asbestos between the source of heat and the tube, and by passing a brisk current of dry air through the apparatus, it could serve as a dehydrating chamber.

Lastly, there are chemical aids to rapid solution, viz., chemical substances which, innocuous to the action of the substance to be used as a photographic reagent, yet aid its solution. There are not many examples; the only one that occurs to us as we write is ammonium chloride, an equal weight of which, added to powdered mercuric chloride, makes the latter salt dissolve very readily.

ON THE RECENT PROGRESS IN DIRECT PHOTOCHROMY.

II.

DIRECT METHODS OTHER THAN LIPPMANN'S. THEORY OF INTERFERENCE PHOTOCHROMY.

HERR DITTMAR\* discovered that a film of fuchsine, methyl-violet, or other aniline colourings, with thymol or some other phenol derivative, is sensitive to light, and stated that a plate or paper coated with a thick layer of this aniline colour, and exposed to light under an ordinary negative,† produces a coloured print. The mixture recommended by Dittmar was: Wood spirit, 350 grammes; fuchsine, 30 grammes; thymol, 8 grammes—boiled together, filtered hot, and poured on to previously warmed plates. After spontaneous drying, the plates must be warmed rather strongly to get rid of the tendency of the coating to be sticky, and to make it mirror-like and lustrous. The plates will then keep for months.

Neuhauss‡ used the mixture recommended by Dittmar. The thymol-fuchsine, even after exposure to sunlight for some seconds, gives a faint picture on development with cold water. Gelatine-fuchsine is also sensitive to light, becomes rather darker after exposure, and gives swelled reliefs.

\* *Deutsche Phot. Zeitung*, 1897, p. 340.

† Better, a positive transparency, and in direct sunlight for some hours.

‡ *Phot. Rundschau*, 1898, p. 291; a short account in *Am. Phot.*, Oct. 21, 1898, p. 834.

If a thymol-fuchsine plate is exposed for several days to direct sunlight, until its surface becomes violet-black, and is then exposed again for several days in the sun under a coloured diapositive, a reproduction of the transparency in true colours appears. In Neuhauss's opinion, this is a confirmation of Wiener's theory of pigmentary colours.\* Under the influence of red light, the red colouring materials present in the film reflect the red rays, and consequently are not changed. The rest of the colouring materials present at the same spot absorb the red rays, and therefore fade; and thus the red colouring matter alone remains. In this way the print reproduces the colours of the original plate.

Returning to Dittmar's process, after development the plate is immersed in a half per cent. solution of caustic alkali, and then in chlorine water or chlorinated soda, and exposed to the air. Then, and not till then, do the colours gradually appear; in the first bath the image merely darkens. The chlorination and exposure to air may be repeated until the desired colours are obtained. Neuhauss's experiments pointed to untruthfulness of the colours.

L. Delvallez,† starting from the facts that (1) a brass plate, used as anode in a mixture of the solutions of lead and copper acetate, becomes covered with rings of colour caused by the formation of thin films of an oxide of lead; (2) one of two silver or copper plates in an electrolyte exposed to light causes an electric current dependent in strength on the intensity of the light;‡ concluded that currents arise between two spots of the metal plate which are differently exposed and cause the electrolysis of the lead—copper—acetate solution, thereby producing colours. In an experiment a red object after an hour's exposure produced a red colour on the brass plate. A shadow of a leaf on the back of the plate in full sunlight gives a visible silhouette in ten minutes, and, with a photographic negative, different colours are obtained, but according to the depth of the shade. The plate may be well washed and dried, but the image alters (very slowly) in the light. The whole effect is unsatisfactory and indistinct, but, if looked at through a red glass and at a certain angle, it appears distinct and with almost correct colours.

From the sentence which I have italicised it appears exceedingly improbable—as, indeed, one would almost be justified in judging *à priori*, from the stated foundations of the method—that this is a process of photochromy in the true sense. It might become so only if the intensity of the current in Becquerel's experiment bore a relation to the *wavelength*, instead of (as it apparently does) *only* to the *intensity* of the incident light. Finally, it may be remarked that there is not much difficulty in formulating processes which will give colours which depend on differences of intensity of light, *e.g.*, differences of density in a monochromatic negative; but evidently such colours will be correct only in very special cases.

Turning now to work on the theory of interference photochromy, Herr A. C. Kitz§ argued that *two* images are found in Lippmann's process, the one direct and the other due to the mirror. The former may be similar in character to the interference effects on Becquerel plates (Wiener), or in a film containing silver particles (Graby). Neuhauss,|| in his above-cited paper, spoke unfavourably of Kitz's attempts; stationary waves arise by reflection from flat mirrors, not from reflecting particles in the film.

Finally, with respect to the *history* of the principles of direct photochromy. During the present year the work of Zenker—the originator of a principle which was afterwards made by Lippmann the foundation of an actual process of interference photochromy—has been made generally accessible by a new edition of his *Lehrbuch der Photochromie* (1868) in good (*i.e.*, better than the original) type and additions—a sketch of the further development of interference photochromy, a life, and even a portrait of Zenker.¶ The sketch of the development of direct photochromy on Zenker's principle, though admirably done in all respects but one, is, as I have already indicated elsewhere,\*\* lacking in mention of Lord Rayleigh. The importance of this omission lies in that the part played by Rayleigh forms an absolutely essential link in the development of interference photochromy. I shall endeavour to show this on another occasion. Briefly put, it lies in the following short history of inter-

ference methods. To Zenker is due the *principle*, to Rayleigh is also due independently the principle and also the idea (*lacking with Zenker*) of *transition from principle to method*: to Lippmann is due the *final method*.  
PHILIP E. B. JOURDAIN.

### THE PHOTOGRAPHIC METHOD OF PREPARING TEXTILE DESIGNS.

[The following is an abstract of a paper read at the recent meeting of the British Association by Professor Beaumont. A fully illustrated description of Szczepanik's process appears in THE BRITISH JOURNAL OF PHOTOGRAPHY of February 9, under the heading of "Photography in Weaving."—EDS.]

THE preparation of designs for the loom has, throughout the history of weaving, been regarded as a purely manual process controlled by the intelligence, ingenuity, and skill of the craftsman. It is only natural, therefore, that the invention of apparatus for this specific purpose should have created much interest amongst both British and foreign textile experts. Photography, as understood and practised, appeared as incapable of aiding the artist in the actual painting of his picture as the designer in the transference and execution of the plain sketch of the pattern on to the "scale" paper for the loom. Within the wide range of technical and scientific data in the construction and embellishment of woven fabrics there is, perhaps, no phase of the work more difficult to assail, by mechanical devices, than the application and adjustment of the manifold "weave" units which compose all figured textiles.

Design acquired in the loom is a distinct type of ornamentation involved in varied technicalities. It is not the result of one, but of a number of processes, overlapping each other, and yet uniting to construct and perfect the same woven effect. Fabric and design have to be simultaneously obtained. These can only be divorced by resorting to the arts of printing, embroidery, and painting. Obviously, in the preparation of the "design" sketch for weaving, numerous limitations have to be encountered, which, on a first consideration, seem liable to be increased rather than diminished by a photographic process of design-development. Much ingenuity has been exercised by Szczepanik in his solution of these "weave" problems. Szczepanik's apparatus is not for the origination of designs either in the theoretical or technical form, for in both processes the knowledge of the expert are demanded; but its province is to lessen, and, in some instances, dispense with, the monotonous manual labour necessitated by the present system. There are large areas of point paper in elaborate design to which the same weave effect has to be applied, and where some labour-saving device is much needed. Further, in the enlargement of the artist's sketch to scale there is much mechanical work that it ought to be possible to reduce. The photographic inventions of Szczepanik profess to accomplish these objects, and the designs submitted prove that there are possibilities of success in certain styles of pattern. A new field for experiment has been discovered, the extent of which it is not possible to forecast, but it may reasonably be anticipated that the genius and temerity of the discoverer will prove equal to its more complete exploration.

The essential purpose of Szczepanik's invention is to develop from the ordinary sketch and enlarge to a prescribed scale the technically prepared design, marked with the thousands, or may be millions, of dots grouped in different orders, and so fitted together as to impart precise definition to the several portions of the woven figure or design. The process is threefold, consisting (1) of the preparation of the ruled paper; (2) the development of the design from an ordinary photographic negative; and (3) the application of the weave units to the several parts of the figure. Primarily, the apparatus consists of an optical lantern with a suitable arrangement of lenses. One important factor is the "raster," or multiplying plate, containing some 435,600 perforations, through each of which the weave type passes, and is printed on the enlarged design. In addition, there are weave plates for determining the details of the pattern, and small metal slides for producing particular sections in distinct forms of type, so that they may be as readily distinguished from each other as if sketched in various colours.

The light from the lantern passes through the negative of the design, entering a pair of lenses, between which is fixed the small metal plate of the proper shape for developing the marks on the sensitised paper. The process consists in dividing and subdividing the "scale" pattern into rectangular spaces, and of marking each with the correct weave type. When there is no negative in the lantern, this type is repeated as many times as there are holes in the perforated plate, showing the feasibility of marking every square photographically on any kind of weaver's paper.

In the first place, the negative is made of the complete design, and

¶ I may also mention that, before the publication of this new edition, I felt the necessity of paying attention to Zenker's work (especially for photographers, his methods), and gave a rather full account of the *Lehrbuch in Camera Obscura* (during the past year), with the addition of a development, first sketched briefly in THE BRITISH JOURNAL OF PHOTOGRAPHY, from Zenker's principle, of a general "principle of position"—a fundamental view of physical methods of direct photochromy.

\*\* In a recent review of the above new edition in *Nature*.

all parts erased but the ground sections, allowing of these being printed with their supplementary weave elements. Negatives of every part of the pattern are similarly printed in succession until the entire design has been obtained. For the production of shaded work, e.g., portraits and pictorial subjects, selecting plates are employed. These secure an accurate graduation of tones perfectly in harmony with the photograph from which they are derived. Provision is made for the execution of patterns in compound as well as in single structure fabrics; but it follows, the more complex the build of the texture, the more intricate the process of design production. Certain textile designs may evidently be produced photographically by the Szczepanik system, so that it is now a question or demonstration whether designs so produced are comparable in legibility and equal for all practical purposes—as forcible in detail, as vital in execution—as those prepared by the much slower hand method.

FOREIGN NEWS AND NOTES.

**Metallisation of Wood.**—The following method of treating wood to give it the appearance of metal is published by the *Moniteur de la Photographie* as an extract from the *Intermédiaire de l'art et de l'industrie photographique*. The wood is soaked for three or four days, according to hardness, in a solution of caustic alkali at a temperature of 75 to 90° C. It is then transferred at once to a bath of hydrosulphite of calcium, to which a saturated solution of sulphur in caustic potash is added after a lapse of twenty-four hours. The wood should remain in this bath at a temperature of 35 to 50° C. for about 48 hours. Finally it should be soaked for about thirty to fifty hours in a solution of acetate of lead at a temperature of 35 to 50° C. These successive baths take some time, but the effect is surprising. After the wood has been dried at a moderate temperature, it may be polished with a burnisher of hard wood, and acquires a brilliant metallic lustre, which may be heightened by previously rubbing the surface with a piece of lead, tin, or zinc, and using a glass or porcelain burnisher. The wood then resembles a metallic mirror, and it is very hard and strong.

**The Quality of Zinc Plates.**—Franz Novak publishes some notes in the *Photographische Correspondenz* concerning the chemical composition of zinc plates from the point of view of their suitability for process work. At the instance of Dr. Eder the writer experimented with a number of samples, which were placed at his disposal by manufacturers of plates for photo-mechanical work. Each sample was found suitable for ordinary zincography and process work by the albumen and cold enamel processes, but with the hot enamel and similar processes considerable difference in behaviour was observable. Some samples became coarsely crystalline and brittle, much to their disadvantage in the subsequent processes of etching and printing, whilst others withstood the burning-in of the fish-gelatin film very successfully, and were characterised by a very fine grain. Some firms seem to be aware of these peculiarities, and select the plates they sell accordingly. The prevalent opinion that the purest zinc is the best is not borne out by the writer's experiments, and he inclines to the view that the presence of certain impurities is a distinct advantage. The following are the results of two of the writer's analyses:—

	No. 1.	No. 2.
Lead .....	1.16 per cent.	1.23 per cent.
Cadmium .....	0.209 "	0.072 "
Iron .....	0.0298 "	0.0117 "
Arsenic .....	a trace	a trace
Silver .....	—	—
Iridium .....	—	—

Sample No. 1 was found suitable for all classes of work, but sample No. 2 would not give good results with the hot enamel process. It follows from this that zinc containing a larger proportion of cadmium is better suited for hot processes, and that the presence of lead is not so injurious to the quality of a plate as many assert. The writer is continuing his experiments.

**Ammonium Persulphate.**—Professor Namias points out that this salt may not only be used as a reducer, but also as a means of destroying the action of light upon a dry plate. If a plate be immersed, after exposure, in a two per cent. solution of ammonium persulphate for five minutes, the image will be completely destroyed, and, as the action proceeds gradually, it is possible that this property may be turned to advantage in correcting over exposure.

Also, if an over-exposed carbon print be immersed for half an hour in a five per cent. bath of persulphate, to which one per cent. of sulphuric acid has been added, development will proceed normally in warm water. Professor Namias is of opinion that this is due to the formation of chromic acid by the action of ammonium persulphate upon chromic oxide.

**Colour Screens.**—The Actien Gesellschaft für Anilin Fabrikation has published directions for the preparation of serviceable colour screens, for lenses not exceeding about eight inch focus. Take a lantern plate with flat even glass; fix it, and after washing it well, immerse it for five minutes in a saturated cold solution of auramin O. To ensure the film being perfectly clean, immerse it afterwards for five minutes in running water. The intensity of the screen may be regulated by more or less washing. Auramin O absorbs blue and violet light.

**Reflection from Coloured Surfaces.**—The following table of the quantity of light reflected from surfaces of various colours has been published by the *Munich Med. Wochenschrift*. Although the calculation represents the percentage of visual light, whereas in photography the actinic rays exert most effect, the table is, nevertheless, very interesting to photographers.

Black velvet .....	0.4 per cent.
" cloth .....	1.2 "
" paper .....	4.5 "
Dark blue .....	6.5 "
" green .....	10.1 "
Bright red .....	16.2 "
Deep yellow .....	20.0 "
Pale blue .....	30.0 "
" yellow .....	40.0 "
" green .....	46.5 "
" orange .....	54.8 "
White .....	70.0 "
A mirror .....	92.3 "

Those who are interested in the subject will find that the actinic intensity of the light can best be estimated if the walls are painted pale grey slightly tinged with blue.

COLLODIO-CHLORIDE EMULSION.

UNDOUBTEDLY the manufacture of a collodio-chloride emulsion is a much more difficult operation than is the preparation of a gelatino-chloride, on account of the difference in the solvents, for water, being the most universal solvent, and nearly, if not all, the salts used in emulsion work being soluble in water, it is a comparatively easy matter to choose from among the large number of suitable salts, and many variations may be made; but, as alcohol-ether is the solvent in collodion, the choice is very much more limited.

The usual ingredients in a collodio-chloride emulsion are collodion, silver nitrate, an alkaline chloride, and a preservative.

As with gelatino-chloride, the selection of the colloid is a very necessary item in collodio-chloride, and to make it successfully, the pyroxyline must be carefully studied, likewise the specific gravity of the ether and alcohol, or no definite result will be obtained. For making up collodion, .720 ether and .820 alcohol should be used, thus ensuring as little water as possible in the emulsion, a very important item to consider, for water tends to destroy the strength of a collodion film. Methylated alcohol can be used for making collodion, provided it is methylated with wood spirit, and not with mineral naphtha. Before using methylated alcohol for collodion, mix the alcohol with water, and if it keeps bright and colourless it may be safely used, but if on the addition of water the alcohol becomes cloudy, it must be rejected. It is rather difficult to obtain alcohol commercially methylated with wood spirit, and that is why absolute alcohol is generally recommended, but in quantities this is quite out of the question on account of the expense. Alcohol methylated with wood spirit can be procured under an Inland Revenue licence, which may be obtained cheaply, and is generally readily granted, providing a guarantee is given that it will be used for manufacturing purposes only. Under this license methylated alcohol of .820 specific gravity may be obtained, which is a good strength for collodion; a higher specific gravity than this should not be used, on account of the extra water it contains, the aim in a collodio-chloride emulsion being to keep the water down to the lowest possible limit.

Pyroxyline is only supposed to be of two varieties, the high temperature and the low temperature, and while this is true in substance, it is not so in fact, for both high and low temperatures vary considerably. The success of collodio-chloride largely depends upon the pyroxyline

employed, and, unfortunately, the writer has not been able to discover a commercial pyroxyline which is exactly suitable for collodio-chloride without further treatment; but, fortunately, there is a process by which one commercial kind can be made eminently suitable. It is a great pity that low-temperature pyroxyline cannot be used as it is, or a very strong film could be obtained; but once the film of low-temperature pyroxyline dries, no toning will take place, as the silver salts seem to be locked up in the film. High-temperature pyroxyline, on the other hand, gives a film which can be easily worked when dry, as it is very porous, but the disadvantage is that it is rather rotten, and cracks. What is required for collodio-chloride is something midway between the two, combining the porosity of the high temperature with the toughness and strength of the low, and, unfortunately, this is not obtainable commercially. But, if a good and suitable low-temperature pyroxyline is dissolved in ether-alcohol, precipitated by water, dried, and redissolved, a very strong and porous film is obtained. The question is merely one of expense, and at first sight this seems a stumbling-block, but fortunately is not so in reality, for some of the low-temperature pyroxyline is very soluble, twenty to twenty-five grains dissolving in one fluid ounce of ether-alcohol, and even with the latter the alcohol may predominate, also ether of '730 can be used. With the better class low-temperature pyroxyline, a quarter pound may be dissolved in forty-five ounces of '820 alcohol and thirty-five ounces of '730 ether; this, of course, makes a thick, glutinous collodion, but one that is fairly workable. It should be left to thoroughly dissolve, and then either slowly poured into a fairly large body of water, or, better still, into a small wooden trough down which a small stream of water is playing. It is advisable to pour the water and pyroxyline into a canvas bag, as it is rather difficult to collect the pyroxyline otherwise; it should then be squeezed and drained of as much water as possible, and thoroughly dried before dissolving again. The solution is usually of a very pale yellow colour. It is not exactly understood what change takes place in the pyroxyline when it is washed or precipitated, but the hypothesis is that some water enters into combination with it; at any rate, that some chemical change does take place is proved by the absence of contractility after precipitation.

The addition of a small quantity of castor oil and Canada balsam is considered to reduce the contractility of collodion, but the writer advises discretion in the use of Canada balsam, as it has an effect upon the colour of the image.

Commercial collodion, as generally made up of five to six grains per ounce of ether-alcohol, is not much good for collodio-chloride work, and it will be found necessary to use about nine and a half grains of precipitated pyroxyline per ounce of ether-alcohol; and as large quantities of alcohol must be added with the silver chloride and organic preservative, it is advisable to make the collodion as follows at first:—

Pyroxyline .....	95 grains
Ether '720 .....	5 fluid ounces
Alcohol '820 .....	4½ „ „

thus allowing half an ounce for the extra alcohol in the salts.

In the choice of a chloride we are limited to about three, viz., calcium, lithium, and strontium; or, perhaps, as Mr. C. J. Leaper advocates in his *First Principles of Photography*, hydrochlorate of cinchonine may be used, although the writer cannot personally recommend this, as he has not found it work very successfully, perhaps owing to some mistake in the hydrochlorate, although it was purchased from one of the best, if not the best, and most reliable firms in the chemical trade; or it may be a printer's error in the formula, the quantity given being excessive. But be the cause what it may, although the writer has had many attempts, with greatly reduced quantities, the alcoholic solution of the hydrochlorate always being perfectly clear and bright on emulsifying, nothing but a heavy white precipitate has been obtained, so that the writer cannot recommend it from personal trial, although, as the nitrate of cinchonine is not deliquescent, and the nitrates of the above-mentioned metals are, a great advantage would be obtained by using cinchonine, for greater immunity from damp would be secured—an important item where paper has to be kept. It is necessary, when choosing a chloride, to study the colour of the image which each gives before deciding. Taking the three aforesaid chlorides, calcium gives a dark blue, lithium a medium red, and strontium a light red print. The writer prefers to use either lithium or strontium, as it is necessary to get a print as red as possible, and for this purpose the best would be strontium; but unfortunately it is not very soluble in alcohol, unless the latter is of a high specific gravity. Alcohol of '820 will only dissolve about one and a half grains per fluid drachm, and if strontium is used, the alcohol in the plain collodion should be still further reduced. Perhaps the most suitable chloride is lithium, the only disadvantage being its much higher price, this being about six times that of strontium.

The preservatives generally used are citric and tartaric acids. The choice of these should be regulated by the chloride used, and before deciding upon the preservative, it is best to mix a small portion of an alcoholic solution of the chloride with an alcoholic solution of citric and then of tartaric acids, leave them to stand for some time, and note what the effect is, for if solutions of lithium chloride and tartaric acid are mixed and allowed to stand for some time, a heavy white precipitate is formed. This may sometimes account for graininess in an emulsion, which must be particularly guarded against, as no satisfactory method of

filtering collodion has yet been found; and, although some writers say that graininess does not matter, or may be overcome to some extent by decanting, "prevention is always better than cure" with this evil, for evil it undoubtedly is.

As alcoholic solutions keep well, and collodion cannot be filtered, it is a great saving of time and trouble to make the acid and chloride up into stock solutions. Citric acid is very soluble in alcohol, and a solution of ten grains per drachm can be made. Tartaric acid and lithium chloride are soluble to the extent of five grains per drachm. These can be filtered before using. It will generally be found necessary to add a small quantity of castor oil to the collodion to make it more flexible, but discretion must be used in adding this, as too much is likely to ooze out, and cause white or red spots and lines upon the prints, for the oil will prevent the toning bath from acting. Five minims of castor oil should be mixed with half a drachm of ether, this being about the right quantity for ten ounces of collodion. The ether and oil should be added to the collodion just before mixing.

Glycerine is also a necessary addition to a collodio-chloride emulsion to keep the collodion film open and workable, and to prevent the silver from crystallising out; but, like castor oil, it must be used cautiously, as too much will keep the paper in a damp state, thus spoiling its keeping properties.

Collodion should always be allowed to stand for about a fortnight after it is made up to allow it to deposit any impurities, which will be found even in the best high-temperature pyroxyline.

It is sometimes suggested that, after a collodio-chloride emulsion is made, it should be precipitated in water and the salts washed away, but the writer is unable to see the necessity of doing so, as the emulsion answers perfectly well without washing; therefore it seems a waste of time, money, and materials to wash it.

Fifteen grains of silver nitrate per ounce of emulsion seem to be about the right quantity to give a good image, and with this about six grains of citric acid per ounce should be used to ensure the emulsion keeping well. If there is an insufficient quantity of citric acid, after a few weeks the paper will show white and yellow spots, either before or after printing. The question of free silver in the emulsion is a debatable point with collodio-chloride, as well as with gelatino-chloride. A certain amount of free silver is perhaps an advantage, but too much is a great disadvantage. The safest plan is to have as little as possible consistent with obtaining a good print.

A very good formula for collodio-chloride is the following:—

Collodion* .....	9½ fluid ounces.
Recrystallised silver nitrate .....	150 grains.
Lithium chloride .....	20 „
Citric acid .....	60 „
Glycerine .....	25 minims.
Castor oil .....	5 „

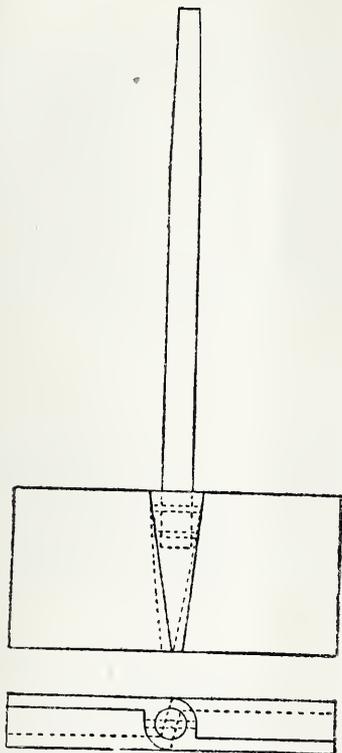

Silver nitrate is very soluble even in cold water, one grain dissolving in one minim of water, and more than this should not be used, as water tends to make the film rotten; the above quantity of silver should be dissolved in two and half drachms of distilled water, warmed to about 100° F., and then the glycerine should be dissolved in seven and half drachms of alcohol, this also warmed to about 100° F.—not more, or the alcohol and silver will be discoloured; in any case where methylated alcohol is used it is probable the solution will be slightly discoloured, but not sufficiently so to affect the emulsion. The silver should then be added to the alcohol and glycerine, and it will be found that the mixture of the glycerine with the silver will prevent the latter crystallising out, even in the coldest weather—a rather important point, as, should crystallisation occur, most probably the emulsion will be spoilt. On adding the silver to the collodion a slight opalescence will be noticed. The operations up to now may be conducted in daylight, but the emulsification must be done in an orange-yellow light, or, if artificial light is used, it must be either incandescent electric or a Davy safety lamp, as no naked flame must be anywhere near on account of the inflammability of ether; for the same reason no fire is permissible, either in the mixing-room or in an adjoining apartment, as the fumes of ether are very heavy, descend, and are likely to travel through the crevice under the door. The light from incandescent electric or a Davy lamp does not affect the emulsion, and the Davy lamp is perfectly safe even in the densest fumes, for, should they become too strong, the light is extinguished.

If stock solutions of lithium chloride and citric acid have been made up, as before advised, four drachms of the former should now be added to form the emulsion, after which six drachms of the citric acid solution should be added, when the emulsion is ready for coating. To make sure there is no grain, it is advisable to let the emulsion stand for a quarter to half an hour before using, then carefully decant into another vessel, as by that time the larger particles should have settled down.

A glass vessel should always be used for making collodio-chloride emulsion (except in very large quantities) as the operations can be watched more easily.

\* This collodion should be made up as before advised, containing five ounces ether and four and a half ounces alcohol. In making collodio-chloride emulsions it is necessary to get the salts into the collodion in as fine a state of division as possible. The silver should always be added first, it being much easier to see that no graininess takes place. The silver nitrate should be recrystallised, as the ordinary kind is usually too acid for emulsion work.

Mixing a collodion emulsion is a much more delicate operation than mixing a gelatine emulsion, as silver nitrate is not really soluble in alcohol, much less ether, consequently the writer recommends the following method of mixing in preference to the usually advocated way of pouring the solutions into the collodion, following this up by shaking and stirring, for by the latter method the solutions are put in very unevenly, and the mixing is very often still more so. A glass funnel should be placed in the ring of a retort stand, a small piece of glass tubing then drawn out to a fine point, and attached to the tube of the funnel by indiarubber tubing, bearing a pinchcock to regulate the flow of the solutions; into the neck of the funnel a small plugget of cotton-wool should be inserted to arrest any impurities in the silver. The cotton can be thrown among the residues afterwards. The solutions should be poured

into the funnel separately and alternately, and allowed to flow into the collodion in a very fine stream. Of course the funnel, &c., must be well washed out after the silver has passed through, or the chloride would be spoiled. After the washing it is as well to run a little alcohol through the funnel and tube to absorb any water which may be left. If a regular stirring is kept up with a glass rod or strip, while the solutions are streaming in, a very fine grained emulsion should result; but a much better way is to use the little implement shown in the accompanying sketch.

The whole of this should be made of mahogany, the stem being fastened into the blade by mahogany pins, as neither glue, nails, screws nor metal pins, must be used, or the emulsion may be spoiled. The end of the stem should be tapered off to fit into a socket, the friction holding it sufficiently tight, as very little power is required. It should be driven at about 150 revolutions per minute, either by hand, treadle, water, air, or electro-motor, and by its aid a very fine mix is obtained with absolute certainty, the solutions travelling right through the collodion. Before using, the whole of the blade and lower part of the stem should be well soaked in alcohol, to decolourise it as much as possible, and directly mixing is finished it should be placed in water, or great difficulty will be found in removing the emulsion. The mixer should be kept in the dark as much as possible, or it will be discoloured. This style of mixer may be used for bromide or chloride, gelatine or collodion emulsions, but a separate mixer should be kept for each class of emulsion.

If the emulsion is properly made, on dipping a glass rod into it, and looking at the light through the bead of emulsion which collects upon the end of the rod, a rich orange colour should be observed.

The emulsion must be used the same day as it is made, for it will not keep, owing to the rapid evaporation of the ether.

Collodio-chloride may be coated fairly well by hand after a little practice, if the edges of the paper are turned up to form a tray; the emulsion should be poured into this, and floated all over the paper, pouring the surplus back into the containing vessel. The great disadvantage about this way is, that it allows the ether to evaporate very rapidly, thus making the emulsion thick, and the coating is then sometimes uneven. As far as the writer's experience goes, he has not found a really reliable and satisfactory way of coating by hand.

In toning collodio-chloride it should be remembered that a bath, strong in gold, gives blue tones, and it is not necessary to use a stronger bath than the following:—

Ammonium sulphocyanide .....	15 grains.
Gold chloride .....	1 grain.
Distilled water .....	8 fluid ounces.

The sulphocyanide bath is the best for the above emulsion.

Unlike gelatine, collodion is practically inert so far as silver is concerned, for it does not enter into combination with silver and has no effect whatever upon the colour of the image, and this is probably the reason why collodion prints are the most stable of all photographs made upon printing-out papers, for a definite salt of silver is formed in collodion, instead of the indefinite gyltinate and albuminate.

In printing with collodio-chloride, if the negatives are thin, a better result is sometimes obtained by printing the image faintly, in the ordinary way, and then placing the printing frame under green glass to finish the print, when a much more plucky and vigorous image will be obtained. The theory of this is, that chloride of silver is only susceptible to the blue and violet rays, while citrate and tartrate of silver are affected by green and yellow rays as well; thus, when the print is under green glass, the chloride does not change, while the citrate and tartrate do.

The writer has had many attempts to increase the strength and tenacity of high-temperature collodion films by the addition of the following: Gum resins in small quantities, bleached lac, Canada and capaiba balsams, mastic, copal, elemi, sandarac, and dammar; but the result has not been particularly encouraging so far as increase of strength and tenacity is concerned, while (probably owing to their organic nature) they exercise an influence upon the colour of the image. If it is decided to use any of the above, no large quantity should be added, as they are insoluble in, and impervious to, water, and no toning, or only a very little and that of a slow nature, would take place if they were present in any large quantity. The writer has been in the habit of making a saturated solution of each of the gum resins, and adding about six minims of this saturated solution to each ounce of collodion. The saturated solutions of gum resins are very handy in the laboratory as ready-made adhesives, and, as they are all alcoholic solutions, there need be no fear that they will not keep.

All information regarding the conditions under which a license to use methylated spirit for manufacturing purposes is granted may be obtained at the local Inland Revenue Office. A mixture of high and low temperature pyroxylines will sometimes give a good collodion for collodio-chloride work if equal quantities of each are taken, but a small portion should be tried first, as some pyroxylines do not mix well. A reference to the writer's article on the manufacture and properties of pyroxyline, which appeared in THE BRITISH JOURNAL OF PHOTOGRAPHY of February 2, 1900, will give a better understanding of the subject, as it is of too lengthy and diverse a nature to be treated here.

If it is found inconvenient to use incandescent electric light, or a Davy lamp, to illuminate the mixing room, or as in many remote districts they are very difficult to obtain, a lamp may be placed *outside* the window of that apartment, taking care that it is completely isolated from the ether fumes. The one disadvantage of Davy lamps is that only a very feeble light is obtainable from them, but if all the preparations are made in daylight this is not a great drawback. C. T. SUTTON.

#### HAND COLOURING OF PHOTOGRAPHS.

To many the bare idea of colouring a silver print or photograph by any other process when printed on paper may appear an out-of-date operation, and quite beyond the limits of good taste, in these days of monochrome and matt-surface productions, and but few professional photographers are found giving any countenance to it, beyond the finishing in colour of a certain class of portrait enlargements well known in the trade. There is little doubt, however, that, in many instances, in what may be termed commercial photography, hand colouring is beginning to play a more important part than many would feel inclined to believe, and the sooner professional photographers realise this fact the better will it be for their pockets.

In portraiture monochrome will always reign supreme where merely small sizes are concerned, and it would require something like a revolution to cause a return to the coloured daubs of long ago; but it does not by any means follow that, because hand colouring has ceased to be practised in connexion with portraiture, it should be entirely banished from every other branch of photography, for it is quite true that, in commercial photography, certain subjects will be offered for execution in which much may be done to improve a general effect by the introduction of a reasonable amount of colour work. Any one who carefully studies some of the more recent productions in commercial work, chiefly of the advertising class, will soon see that many of our leading firms, who pay out a large sum annually for advertising purposes, are leaning decidedly to the side of high-class photographs in which a touch more or less of colour is introduced.

Take, for instance, the case of several of our largest steamship companies. It is well known that nearly all of them advertise more or less

by means of expensive "show pictures," sometimes even oil paintings and replicas, and, more frequently still, by means of large direct photographs and enlargements. Each of these large companies has its own distinguishing house flag, or burgee, and, what is of still more importance to them, they invariably make a strong feature of the colouring of their smoke stacks or funnels, and it is now quite a common occurrence for such firms to stipulate that any photographic show pictures supplied to them will require to be coloured, at least to a reasonable extent, not certainly so far as working up elaborately sea and sky effects, but merely so as to show a few of the distinguishing features connected with the company; and this practice, we find, is not confined to this country alone, it is quite common in America as well. Many of our large shipping firms think nothing of giving out an order for two or three dozen high-class photographs as show pictures, the cost of which may vary from two to three guineas each according to dimensions. These costly photographs are in evidence in several of our large hotels, and form striking objects from an advertising point of view, simply by reason of the fact, that they are far removed from the photo-mechanical or colour-printing class of posters commonly seen on hoardings. Many of our railway anterooms are also furnished with show pictures of this class, and they certainly never fail to draw public attention to their beauty as well as a striking feature in advertising. Among the first to realise the value of adding colour to photographic show pictures may be mentioned Mr. David Mac Brayne, whose fine steamer, "Columba," plies on the West Highland route during the summer season. This magnificent steamer is represented by numerous fine coloured photographs of from five to six feet in length, and very striking pictures they make. But what would they be without the introduction of more or less colour? Why, in monochrome they would be unrecognisable. It is not only in such large sizes as these, which, of course, are costly, that colour is being introduced. Several of our large Transatlantic steamship companies are beginning to learn that it looks much better form to advertise judiciously by high-class photographs, in good frames, than to go on expending money in common posters that are washed off by every shower of rain and covered over by designing bill-stickers to make room for a further supply. Hence we see good substantial orders for such serviceable sizes as 15 x 12 freely given out to such as make a point of expending some amount of care in working up certain effects in colour by means of the hand.

Speaking generally, there is really no great amount of labour entailed in producing these results, and certainly no skill is needed beyond that possessed by any intelligent photographer. The main fact is such class of pictures are in demand, and on the footing "that he who pays the fiddler chooses the tune" photographers would do well to encourage rather than throw cold water on orders where the addition of a little colour work would bring grist to the mill.

In all-round commercial work it will be found that there are many other special instances where colour work can be introduced with advantage. The half-tone block has done much to cut away the feet from many branches in photography, but there are those who are beginning to see that it pays to introduce a little colour, and there are times, when a limited number of copies are merely required, that photo-mechanical productions are out of the question.

For years there has been a dead set made against coloured photographs, and monochrome productions have reigned supreme, until it has come to be believed that colour and photography are quite separate factors. This prejudice, in one sense, may be well grounded where nothing but the highest artistic results are aimed at, but in commercial work there is a vast field in which both can go hand in hand, and, the sooner professional photographers are alive to their interests in this matter, the sooner will they keep in the profession a branch of work which has for years been slipping out of their grasp.

Much may be done to retain this work by judiciously recommending to customers the advantage of coloured photographs as an advertising medium, and in this they certainly can point with confidence to examples where they have been accepted in preference to photo-mechanical productions by leading firms who have not been slow to see what is the best for their interest.

A. T. NEWTON.

## Our Editorial Table.

### THE THORNTON FILM.

Manufactured and sold by the Thornton Film Company, Limited, Altrincham, Cheshire.

READERS of the JOURNAL hardly need reminding that the Thornton film has, within the last few weeks, been brought prominently to the notice of photographers, and that its salient characteristics have been fully described and discussed at the meetings of various societies. Some of the cut film has been in our possession for trial since the beginning of the month, and we have taken more than one opportunity of exposing and developing it. The film is borne upon a translucent paper support. Taken from the original package, it remains perfectly flat, no tendency to curl being observable. Our exposures were made in the Barnett single

slide, the film being backed up with plain pieces of glass. In the developer the film remained quite flat, the translucent nature of the support being all in its favour at this stage of the manipulations, for, when looking at the image by transmitted light, no excessive amount of opacity comes in to lead one astray in the matter of judging density. So far, nothing could be more satisfactory to use than this light, flat, translucent film.

But how, it will be asked, does it behave in the all-important matter of stripping? We reply that, in this respect, its behaviour could not possibly be better. When dry, the paper peels from the gelatine with the greatest ease and readiness. We had no suspicion of failure with the half-dozen quarter-plate films that were sent for our use. An examination of the images shows, as far as can be ascertained, that the support has been without influence upon the negatives, which give perfectly clear prints.

Details relating to the development of the film have already been given, so that their repetition is not called for. It must be said that the simplicity and certainty in manipulation of the Thornton film clearly manifest themselves in actual trial. It is unsafe to make predictions in matters of this kind, but we should be quite prepared to find that the Thornton Film Company had secured a great share of public approval for the film. It appears to be carefully made and is coated with a highly sensitive emulsion which yields dense images of good quality, whilst, besides ordinary development, no extra operations save a glycerine bath and the addition of a "hardener" to the fixing solution are necessitated. Flexible film photography will always command adherents, and the Thornton Company are wise in recognising this fact. We shall watch with interest the progress of the film, especially as regards its keeping properties. At present, both from observation and trial, we can cordially praise it.

### MERCK'S CRYSTALLISED PYROCATECHIN.

Manufactured and Sold by E. Merck, 16, Jury-street, E.C.

WE have received a sample one ounce bottle of this product, in the form of small white brilliant crystals. Mr. Merck points out that pyrocatechin in heavy crystals is more convenient to handle than the resublimed substance, and that, as the developing properties of both are identically the same, he has decided to supply in future the crystallised article only. It is added that this brand of crystallised pyrocatechin has already been tested on an extensive scale, and has proved fully satisfactory.

### LANTERN SLIDES OF ITALY, SPAIN, AND SOUTH AFRICA.

Prepared and published by G. W. Wilson, Limited, 2, St. Swithin-street, Aberdeen.

SEVERAL illustrated lists of Messrs. Wilson's famous lantern slides are before us. Italy alone is illustrated by a thousand transparencies, and Spain by seven hundred. Military subjects are included in one of the lists. Now that the distracting war in Africa is nearing the end, it is to be hoped that the coming winter will witness a revival of interest in optical lantern entertainments, and that Messrs. Wilson's slides will be in greater request than ever.

### IMOGEN-SULPHITE.

Agents: A. & M. Zimmermann, St. Mary-at-Hill, E.C.

THE latest developing substance, introduced by the Actien-Gesellschaft für Anilin Fabrikation, is in the form of an impalpable whitish powder. We find it to be a freely soluble product, and when used with sodium carbonate clean in working, and yielding well-graded negatives of a good colour. It appears to be not readily affected by the atmosphere, for we left some of the mixed solution exposed in a graduate for the whole of a night, and found that by the morning it had neither discoloured nor apparently deteriorated. The directions for use are as follows:—

*Solution A.*—A quantity of imogen-sulphite is dissolved in twelve times its equivalent of lukewarm water. This solution is quite permanent, and it is simplest to dissolve the contents of the original bottle in twelve times its quantity of lukewarm water, *i.e.*, twelve ounces of water to each ounce of imogen-sulphite.

*Solution B.*—This is a cold saturated solution of soda carbonate (washing soda), which can be prepared by putting a quantity of ordinary household soda into a large bottle and filling up with water. After shaking the water will become saturated with the soda and the superfluous crystals will sink to the bottom of the bottle. The clear part of the solution is to be used for development. Further experiments are needed to assign imogen-sulphite a definite place amongst modern developers, but, so far as we can gauge by our necessarily limited trials, it is a good specimen of the modern clean working reducing agent giving bright and dense negatives.

### THE "CARTOL" SYSTEM.

John J. Griffin & Sons, Limited, 20-26, Sardinia-street, Lincoln's Inn-fields, W.C.

THE "Cartol" system of packing accurately weighed quantities of un-compressed developing powders is one that may be freely commended to tourist photographers and others with whom economy of storage space is a matter of importance. From a little pamphlet issued by Messrs. Griffin

we extract the following description of the system, which, by the way, is patented. "A glass tube is divided off into two compartments. The

Plain Cartol Tube.

End of Cartol showing Sealing and Stamping.

Tool for Removing Cork.

smaller section contains the oxidiser, the larger section the accelerator. The divider prevents decomposition between the two. A wafer of cork

Stock Bottles—Old Method.

Cartol—New Method.

clothes both ends, which are then hermetically sealed and stamped. With each box of cartols a special corkscrew is supplied, and by its use the tubes may be opened without difficulty." The idea is an excellent one, and it is made the most of in the explanatory pamphlet. Pyro, hydroquinone, amidol, kachin, ortol, metol, and other "cartols" are issued.

**CARBONA P.O.P.**

Manufactured and sold by J. J. Griffin & Sons, 20-26, Sardinia-street, Lincoln's Inn-fields, W.C.

CARBONA paper is issued in both matt and glossy kinds. Some specimen prints produced upon it have been placed before us, and we are extremely pleased with the rich, warm tones of the images. A mixed borax and acetate bath is recommended, and the following are the formulæ:—

**FOR WARM TONES.**

Acetate soda .....	50 grains.
Borax .....	25 "
Water .....	6 ounces.
Gold chloride .....	1 grain.
Water .....	6 ounces.

Take equal parts of the two solutions.

**FOR BLACK TONES.**

Acetate soda .....	50 grains.
Borax .....	25 "
Water .....	4 ounces.
Gold chloride .....	1 grain.
Water .....	4 ounces.

Take equal parts of the two solutions.

Messrs. Griffin state that the advantages of the borax and acetate bath are: (1) No softening effect on the gelatine; (2) economy of gold and greater convenience, the chemicals not being influenced by air or damp.

Carbona is a capital printing paper, and we have had very pleasing prints prepared for us on the sample submitted to us. It is claimed for it that the colour of the image is pigment-like, giving rich browns and deeper blacks, "without the crude purple-blues and chocolates of the orthodox printing-out papers." The claim is well grounded, but the line we have italicised has probably escaped the attention of Messrs. Griffin, who, we are sure, will be the first to admit that the tones of competing printing-out papers (some of which have been on the market for many years) are not necessarily crude.

**Studio Gossip.**

**STEREOGRAPHS OF THE PARIS EXPOSITION.**—Messrs. Underwood & Underwood, of 26, Red Lion-square, are issuing a set of sixty original stereoscopic photographs of the Paris Exposition, together with a numbered map and key indicating the route in brief. With the map and the slides before one, a systematic study of the Exhibition by binocular agency is easily obtained. The idea is a most excellent one.

**"BIBBY'S QUARTERLY."**—The publishers of this beautiful periodical send us a copy of the September issue. The many illustrations, which are engraved half-tones from photographs, are of horses, cattle, sheep, poultry, and the like. The letterpress is exceedingly interesting, and an article on Farming in the Transvaal should command close attention just now. The publishers are Bibby & Sons, Exchange Chambers, Liverpool.

**A LONG EXPOSURE.**—"A fine-looking young couple came for a Daguerreotype," writes Mr. A. Bogardus in the *St. Louis and Canadian Photographer*. "They wished it in the act of kissing. As I was young and inexperienced (?), I began to wonder how I would pose them; they knew just what they wanted (probably been practising), and assumed the desired position. The sitting required some thirty seconds; they both kept perfectly still and did not

complain of the length of time. The expression was satisfactory. While the male member of the group was attending to the financial part of the transaction, the lady pocketed the picture and they went away smiling. With the instantaneous plate several sittings could have been made in the time required for that one. There may be a difference of opinion among the young folks as to which plate is preferable in such a pose."

**THE MAKING OF THE LENS.**—Upon the subject of amateur lens-making and altering, "An Old Lens-maker," in *The Photographic Era*, points out that the real value of a lens is its optical truth. Combining the crown and flint of a photographic lens, or, in fact, any achromatic lens (unless the operator thoroughly knows what he is working for) is a very difficult and dangerous task—difficult on account of the task of optically centering the crown and flint, and dangerous because of expansion and contraction of the different metal of which the crown and flint are composed, whilst in the oven for baking. When you make a lens hot for uncementing, the chances are that it will not part, as there is no cement there to melt. That is because the balsam is so completely backed that it has set absolutely. This is especially true in old lenses. Old-time lenses never come apart in baking, but are put, suspended in a bag, in a specially made kettle, and boiled, sometimes for two hours. The necessity for baking was evidently overlooked in the article mentioned. This is really a most important operation. The flint glass is usually a concave meniscus, so that the centre of this portion is extremely thin, and heating such will be attended with danger of cracking. The mistake of warming the lens and putting on cold balsam would cause steam or moisture, which is imprisoned between surfaces, and visible in finished lens. A lens allowed to cool, as the article says, would take a week to set firmly, during which time it would undergo many changes in temperature, and as many chances of decentering. Lenses are usually baked for about five hours in an oven, in cells purposely made to ensure the glasses being optically centered. When nearly hard, they are then pressed central, and in some cases the operation has to be repeated. Some firms have horizontal, and some vertical, spindles, running absolutely true, in which the lenses are placed for cementing, and centered by means of a light. One light is the image, and the other its reflection—or, as the workers call it, "the ghost." There are four lights visible in an ordinary achromatic combination—two images (one from crown and one from flint), and their "ghosts." The way the lights chase each other round is most bewildering to the novice. When the two lenses are optically central, these lights, although the lenses are revolving, appear at perfect rest, and this is an absolute proof of the optical centering of a lens. A good lens not optically centered is worthless, causing aberration, principally chromatic. If people only knew the fine work, care, and brains put into our high-class lenses, they would cease to wonder at the prices.

**News and Notes.**

**PHOTOGRAPHIC CLUB.**—Wednesday evening, September 26, at eight o'clock. "A Few Old Presentation Prints," by Mr. F. A. Bridge.

**MR. HENRY EVERETT**, the well-known Assistant Clerk to the Limehouse Board of Works, has just been elected a Fellow of the Institute of Secretaries.

**THE PATENT OFFICE.**—The official *Journal* states that, by the courtesy of the Commissioner of Patents of the United States, copies of drawings (with occasional text) of specifications of United States patents, dating from 1790 to October 12, 1853, have been presented to the Patent Office Library, and are now available for public reference.

**CINEMATOGRAPH EVIDENCE.**—A Paris correspondent states that the *Velo*, a paper devoted entirely to automobile news, puts forward a notion which, though highly ingenious, is hardly calculated to please readers. The idea is to the effect that policemen should be supplied with cameras working on cinematograph principles, to enable them to regulate the speed of motor cars and force drivers to respect the regulations. It is stated that a manufacturer has already submitted a machine of an extremely simple pattern to the Prefecture of Police. All that the policeman will have to do is to hide behind a tree or kiosque, and at the right moment press a button, when a series of twelve pictures will be instantly taken.

**"ARMY LIFE" AT THE ALHAMBRA THEATRE.**—By permission of Sir Evelyn Wood, Adjutant-General, and with the assistance of the commanding officers at the various military centres, Mr. Paul has taken a series of animated photographs. A soldier's life is first shown in outline, from recruiting, through the squad drills, Aldershot training, and so on to the finish of his career as a commissionaire. The second part of the series shows the work of every branch of the army. Cavalry, Artillery (field and garrison), Army Service Corps, Medical Corps, Infantry, Cyclists', Royal Engineers, are each fully represented by a number of pictures. Mr. Paul went out in a small boat and photographed a running target, while the twelve-pounder shells from a quick-firing battery splashed around the camera.

**THE Hackney Photographic Society's Annual Exhibition** will be held at the Morley Hall, Triangle, Hackney, on Wednesday, Thursday, and Friday, November 21, 22, and 23, 1900. The Judges will be Messrs. J. Craig Annan, F. Hollyer, and J. C. S. Mummery. Mr. Alexander Mackie will arrange the pictures for hanging. The following are the classes: Members'—A, Portraiture, Figure and Animal Studies; B, Architecture; C, Landscape, Seascape, and River Scenery; D, Instantaneous (pictures must represent objects in motion); E, Lantern Slides (sets of four). Open—F, Portraiture and Genre; G, Any Picture not included in F; H, Lantern Slides (sets of four); I, Stereoscopic Transparencies (sets of four). Entry forms and all particulars may be obtained of the Hon. Secretary Mr. Walter Selfe, 70, Paragon-road, Hackney, N.E.

**ELEMENTARY PHOTOGRAPHIC INSTRUCTION.**—The course of practical instruction evenings organized by the Borough Polytechnic Photographic Society last winter, by which elementary photographic work was dealt with in a series of simple lectures and demonstrations, will be repeated on similar lines during the forthcoming session. These meetings are held at the Society's rooms,

Borough Polytechnic Institute, 103, Borough-road, S.E., on every Friday evening throughout the season, and are specially arranged for beginners, and those about to take up camera work. There is no specific fee, membership of the Society (5s. per annum) alone being required. The first half of the course will commence on Friday, October 5, at 8.30 p.m. All particulars can be obtained from the Hon. Secretary, Mr. P. C. Cornford, 103, Borough-road, S.E.

The Cleveland Camera Club's Annual Photographic Exhibition will be held in the Cleveland Hall, Newport-road, Middlesbrough, on Wednesday, Thursday, Friday, and Saturday, November 21, 22, 23, and 24, 1900. The following are the classes:—A, To consist of Pictures that have been previously medalled at other Exhibitions, or hung at the Salon, or Royal Photographic Society's Exhibitions, in London, gold, silver, and bronze medals; B, Landscape and Seascape, gold, silver, and bronze medals; C, Portraiture and Figure Study, gold, silver, and bronze medals; D, Members' Class (any subject), gold, silver, and bronze medals; E, Lantern Slides (set of six), silver and bronze medals; F, Consisting of Photographic Work not included in the preceding classes, such as Architecture, Still Life, &c., silver and bronze medals. Entries close November 7, 1900. Any further information may be obtained from the Secretary, Mr. Fred. W. Pearson, 98, Victoria-road, Middlesbrough.

We have received the syllabus of the Municipal Technical School and Municipal School of Art, Manchester, for the session 1900-1901. It is a well-printed book of 352 pages, and illustrated by numerous half-tone photographs of the class-rooms. The section of the syllabus relating to photography gives the following information: Lecturer, C. F. Seymour Rothwell, F.C.S. First course, Monday, 7 to 8.15; second course, Monday, 8.15 to 9.30. Fee, 10s. for each course (this includes the special fee of 2s. 6d. for the City and Guilds of London Practical Examination). The first course comprises thirty lectures, and is suitable for those just beginning the study of the subject, either as apprentices or amateurs; whilst the second, or advanced course, also comprising thirty lectures, is intended for those already familiar with the processes described in the first course. The lectures will be illustrated by the most modern apparatus, and each process will be practically demonstrated. Text-book for the first course, J. A. Hodges' *Elementary Photography*. Text-book for the second course, Chapman Jones's *Science and Practice of Photography*. Book of reference, Sir W. de W. Abney's *Instruction in Photography*.

The syllabus of lectures of the Bradford Photographic Society for the session 1900-1901 has just been circulated, and gives promise of a very busy season. The session opens on October 1 next, with "Hints on Portraiture," by Mr. A. Priestly, Halifax, and the following week the members have an Open Night, which is succeeded in turn by an Exhibition of Members' Slides—a Velox demonstration, for which Mr. D. A. Nightingale, London, is responsible. Mr. Thomas Heaps, Keighley, will discourse on "Lantern-slide Making," while Mr. Godfrey Bingley, Leeds, is down for "Warwickshire, Gloucestershire, and the Wye Valley," and in turn Mr. Frank Nicholson, with "Bromide Enlarging with Lantern," Mr. Percy Lund on "Nature Poets and Nature Pictures," "Carbon Printing, Single and Double Transfer," by Mr. A. Senior, Heckmondwike; "A Cruise in the Solent," by Mr. G. Hudson Taylor, M.A., and one evening is devoted to the Yorkshire Photographic Union's Loan Collection of Lantern Slides. There are two subjects down, viz., Nomination and Question Night, and Ladies' and Children's Night, which do not usually find a place in a club's syllabus, and the General Meeting, on January 21, next year, foretells the close of the year's work. The simple character of the syllabus card gives one no idea of the quality of the lectures, which, it goes without saying, are always excellent at Bradford, and we wish the Club a prosperous session.

AN EXPERIMENT IN COLOUR BLINDNESS.—An experiment or simultaneous contrast was described by Mr. George J. Burch at the recent meeting of the British Association. He said it is well known that white objects seen against a red background look greenish-blue, and orange against a blue background. This phenomenon is shown in a striking manner in the following experiment due to Herin:—A small white disc is viewed with the left eye against a red background, and another similar disc is viewed against a blue background with the right eye. The discs are so placed as to occupy different positions in the field of view. The result, when the light has been properly adjusted, is that the observer sees an amethyst-blue disc and a topaz-yellow disc against a pale purple ground. The reason of this is demonstrated in the following experiment: Two pieces of glass, one red and the other blue, are inserted in a stereoscope in place of the usual slide, each glass having two small squares of black paper on it. Viewed binocularly, the four squares appear as two. In front of the instrument, but out of the direct line of sight, are two adjustable slits, and over the eye-lenses of the stereoscope are two diffraction gratings. The position of the slits is so arranged that the spectrum of the first order of the left-hand grating falls on the right-hand square, and that of the right-hand grating on the left-hand square, the two spectra, which can be adjusted to the same intensity, being thus seen side by side, one with the left eye on a red ground, and the other with the right eye on a blue ground. The red glass produces partial red blindness of the left eye, and the spectrum seen by it lacks red, the other colours being unaltered. And for a similar reason the spectrum seen by the right eye lacks blue, the effect being more noticeable owing to the contrast of sensation in the two eyes.

## Commercial Intelligence

THE AUSTIN-EDWARDS MONTHLY FILM-NEGATIVE COMPETITION.—The prize camera for the current month has been awarded to Master H. G. Palmer, 18, King's-gardens, Hove, Sussex, for his negative, *Arundel Castle Grounds*.

The recent Congress of British Chambers of Commerce at Paris, adopted resolutions urging the adoption of the metric system of weights and measures in our Government departments, and the teaching of decimals in public elementary schools at an early stage, as an essential part of arithmetic.

THE RATHENOW OPTICAL WORKS.—We have received from Mr. H. F. Purser, of 33, Hatton-garden, E.C., a little book which was recently issued to commemorate the centenary of the foundation of the firm of Emil Busch, and with it the optical industry in Rathenow. Mr. Purser informs us that on Saturday fortnight the whole of the town was taking part in a festival in celebration of the event, and the programme consisted of congratulatory meetings, and included the unveiling of the monuments of John Duncker and Emil Busch.

THE Directors of Kodak, Limited, have passed the following resolutions:— "That an interim dividend at the rate of six per cent. per annum for the quarter ending September 30, 1900, be declared on the preference issue; that an interim dividend of two and a half per cent., less tax, be declared on the ordinary shares in respect of the quarter ending September 30, 1900, and that, in view of the satisfactory increase in the net profits for the half-year ending June 30, 1900, a further dividend of two and a half per cent. be distributed on account of bonus for the year; that the above-mentioned dividends be payable on or after the 30th inst.; and that the transfer books be closed from the 15th to the 30th inst., both days inclusive."

Re WILLIAM HENRY BARBER, photographer, of Matlock Cliff.—This debtor, in the course of his public examination at the Derby Bankruptcy Court before Mr. Registrar Woodforde, stated that his liabilities amounted to 135*l.*, and his deficiency to 122*l.* His failure had been caused through bad debts, heavy expenses, and pressure by creditors. He took over a photographer's business at Matlock in 1895, and borrowed 90*l.*, which he used in the business. The security he gave was a reversionary interest under the will of his grandfather. In September 1897 he entered into partnership with a Mr. Smith, who put 150*l.* into the business. Afterwards the partnership was dissolved. Mr. Smith did not get his money back, nor any part of it, so he brought an action against the debtor, which fell through. His profit from the business had amounted to about 150*l.*

THE WARWICK COMPETITIONS.—The following is the list of awards of the Warwick Competition for the current month:—10*l.* prize, A. E. Lane, Photographer, McLucas Studios, Llanelly, *A Portrait*; 5*l.* prize, J. Fitzgibbon-Forde, Waterloo-place, Sunderland, *Jack*; 1*l.* prizes, H. Addenbrooke, Stratford-road, Birmingham, *An Old Church Porch*; J. P. Beeson, Southwell, Nottingham, *Capital, Southwell Chapter House*; E. R. Bull, Bovill-road, Forest Hill, S.E., *In a Baronial Hall*; W. J. Channon, Oberstein-road, New Wandsworth, S.W., *Lady Diving, Portrush*; H. B. Cookson, Kingswinford, Dudley, *Sweet Peas*; P. R. Drury, Newport-road, Cardiff, *A Group of Foxhounds in Kennels*; Miss Lillie Eager, Trafalgar-place, New Cut, Bristol, *Paddling*; S. G. Frith, Grange-road, Mt. Roskill, Auckland, N.Z., *The Scissor Grinder*; H. J. Godbold, White Rock-place, Hastings, *Fishermen's Welcome to Lord Brassey*; G. V. Grundy, Steven-street, Stretford, *On the Silver Wharfe*; Mrs. R. M. King, Ashcott Hill, Bridgwater, *A Lilac Sunbonnet*; D. Noakes, Central Hotel, Eastbourne, *Children in a Bath*; W. Norrie, Photographer, Cross-street, Fraserburgh, *A Reaper of the Sea*; H. Phoenix, Photographer, Chapeltown, Sheffield, *Full-length Portrait*; H. Price, Dennis Vale, Stourbridge, *A Country Lane*; J. T. Roberts, Hadlow-place, Upper Norwood, S.E., *Tintern Abbey*; Miss Alice Rogers, Southdown-avenue, Brighton, *Snap-shot, Brighton Pier*; P. F. Weeks, 13, High-street, Ramsgate, *Mercery Lane, Canterbury*; J. Wild, Sandon-street, Darwen, Lancashire, *View near Houghton*; F. G. Young, Alexandra-road, Penzance, *A Newlyn Fisherman*.

## Meetings of Societies.

### MEETINGS OF SOCIETIES FOR NEXT WEEK.

September.	Name of Society.	Subject.
25... ..	Birmingham Photo. Society ...	Negative Developing Competition.
25.....	Hackney .....	<i>Birch and Bracken: How to Treat it.</i> W. Thomas.
26.....	Photographic Club .....	<i>A Few Old Presentation Prints.</i> F. A. Bridge.
27.....	London and Provincial .....	Open Night
28.....	Croydon Microscopical .....	Conversational Meeting.

### LONDON AND PROVINCIAL PHOTOGRAPHIC ASSOCIATION.

SEPTEMBER 13.—Mr. R. P. Drage in the chair.

Mr. A. L. HENDERSON, in showing a transparency on opal, said that he thought it was a pity that glass-makers did not flash opal glass exceedingly thin. The transparency passed round would be much better if the opal were thinner. Opal was much to be preferred to ground glass, but, unfortunately, whether pot-metal or flashed, the former was always too thick, and absorbed too much light.

Mr. W. T. WILKINSON replied that flashed opal glass was difficult to cut. If cut on the plain glass side, the cut often failed to carry through the flash.

### COLLOTYPE PRINTING.

Mr. W. T. WILKINSON gave a lecture on the colotype process for the amateur or non-commercial man, and demonstrated the pulling of the prints from plates of several sizes. When the colotype process was mentioned, he said, it often suggested to the uninitiated expensive plant, and visions of many difficulties. It was to disprove this idea that he had come to-night, and he hoped to show that the process was one capable of being worked in a very simple and inexpensive manner. The press he proposed to use was an ordinary American wringer, that could be easily clamped to a work-table; but, although this was, so to speak, an improvised or make-shift press, the specimens he knew would show that such a simple apparatus was quite capable of giving good results. In the usual way, the colotype plate is prepared on patent plate glass of a quarter of an inch thickness. For the amateur work with the press shown, to which he was specially drawing attention, this glass was not necessary; he used the twenty-one ounce glass, and passed round a piece for

Inspection. First of all, a collotype-worker wanted an oven. The collotype plate must be dried—not baked, and the model of an oven suitable for the purpose was passed round. A paraffin lamp may be placed under the sheet on bottom for heating purposes, but better than this is an atmospheric stove, placed about six inches from the bottom. For reasons to be indicated later, there must have two plates at least at a time. Having obtained the twenty-one ounce glass, which must be ground on one side, and can be bought so for 3*l.* 4*s.* per foot, we proceed to sprinkle it with flour emery. Dealers have a very elastic notion of what constitutes flour emery, so, to be safe, it is better to procure some of Oakey's knife polish. With this, wetted, the plate of glass is reground until the surface is as even as it can be made, after which it is well washed. A substratum is then required for the plate. Usually this consists of beer and silicate of soda; the use of beer, however, having been known to draw forth sarcastic remarks, it may be stated that a good substratum is made of an ounce of dextrine to ten ounces of water, mixed with an ounce of silicate of soda. Silicate of soda, again, was a very vague term. That bought of some dealers is not ready for use for a month sometimes, but, if of the consistency of treacle, it will do very well. The mixture is filtered and applied to the plates, which must then be dried by heat. Directly the plate is dry, it is rinsed under the tap for a minute or two, and placed on end to dry spontaneously. Such a plate will keep any length of time. The substratum is to hold down, during subsequent processes, the sensitive coating yet to be applied. While this is being made ready, the plate is put in the oven, carefully levelled, and slowly heated to about 50° C. The sensitive mixture is prepared in the following way: Two ounces of a good gelatine, the harder the better, is soaked in ten ounces of water until soft, and then dissolved over a gas-stove. He found a gelatine at 3*s.* 6*d.* per pound, sold by Klimsch, was excellent for the purpose. Half an ounce of powdered bichromate of potash is then added. Some workers recommend bichromate of ammonia, but potash was best, he thought. The mixture is filtered through swansdown, and is then ready for coating. Plates must have a definite quantity of solution for the best results. One of 3×10 should have about six drachms. Plates of different thicknesses were shown. After coating, the plates are returned to the oven, quite level, and allowed to dry at a temperature of about 100° F., this operation taking about an hour. The gas is turned out and the two plates allowed to cool, after which one is turned over on to the other. This explains the necessity for two plates. It is one of the secrets to success. If left exposed in the oven, they could eventually be found to ink up with dirty whites, but the mere fact of having them face to face preserves them for as long as a fortnight. For printing, reversed negatives are required or a film negative. If clean margins to the prints are wanted, a mask of tinfoil is placed on the negative. An exposure meter is necessary, and a very good one is Wynne's print meter. When printed deeply enough, the plate is plunged into cold water without pause whatever. Much depended upon this, and no delay should be allowed. When wet, one may do as one likes, but not before. After the bichromate is removed, the plate is once more dried, and is then ready for the so-called "etching" solution—a misnomer. The action of this solution is really to swell the parts not influenced by light. It is prepared by mixing equal parts of glycerine and water with a little ammonia. When sufficiently swelled, the glycerine is dabbed off with a sponge, and ink applied by means of a glue roller. The ink must be of good quality, and should be diluted to working consistency with varnish. A piece of paper is next laid on the plate and the two passed through the press, when a print will be produced more or less perfect as the operations have been properly or improperly performed. Mr. Wilkinson printed a number of copies from various plates, and afterwards answered a number of questions concerning working details.

The lecture was heard with attention, and was much appreciated.

**Croydon Camera Club.**—Saturday, September 15, was a red-letter day in the history of the Croydon Camera Club. An excursion, arranged and conducted by Mr. Ben Edwards, turned out a record; no less than fifty-four members and friends (ladies and gentlemen) made up the party. Taking train to Hampton Court, where a steam launch was waiting, a run up the river to Chertsey, in glorious weather, was much enjoyed, where a good tea was well served on nicely decorated tables at Taylor's tea gardens, after which Mr. Ben Edwards read a letter from the President (Mr. Hector Maclean) regretting his inability to join the party. Mr. EDWARDS mentioned that it would, perhaps, interest those present to hear that the excursion was the outcome of a challenge to organize a successful social outing. In the absence of the President, he called upon the Vice-Chairman (Mr. S. H. Wratten) to welcome the visitors, which he did in a few well-chosen words. Mr. W. E. DUNMORE replied on their behalf in his well-known style, remarking that he thought the excursion was from Thornton Heath, as there seemed to be a good many from that little village, which, he regretted, he had not heard of before, and would like to know on what part of the globe it was situated. Those enthusiastic photographers who had brought cameras found their time so much taken up with enjoying themselves otherwise that they had little opportunity to use them. The official group was, however, taken by the Hon. Secretary (Mr. W. H. Rogers), and will be duly labelled, "The Croydon Camera Club, First Annual Social Excursion." The trip back was enlivened by music and songs, and the train home concluded a very successful and enjoyable outing.

#### FORTHCOMING EXHIBITIONS.

1900.  
 Sept. 21–Nov. 3 ..... Photographic Salon, Dudley Gallery, Piccadilly.  
 Hon. Secretary, R. W. Craigie, Camera Club,  
 Charing Cross-road, W.C.  
 October 1–Nov. 3 ... Royal Photographic Society, New Gallery, Regent-  
 street. The Hon. Secretary, 66, Russell-square,  
 W.C.  
 „ 17–20 ..... Rotherham Photographic Society. Hon. Secretary,  
 H. C. Hemmingway, Tooker-road, Rotherham.

- November 7–10 ..... Cripplegate Photographic Society and the Essex  
 and Middlesex Cycling Union, Ltd. The Hon.  
 Secretaries, A. T. Ward, Cripplegate Institute,  
 E.C., and G. F. Sharp, Sach-road, Upper  
 Clapton, N.E.  
 „ 12–17 ..... Ashton-under-Lyne.  
 „ 21–23 ..... Hackney Photographic Society.  
 „ 22–24 ..... Hove Camera Club. Hon. Secretary, C. Ber-  
 rington-Stoner, 24, Holland-road, Hove.  
 1901.  
 January 14–19 ..... Blairgowrie and District Photographic Association.  
 The Hon. Secretaries, Blairgowrie, N.B.

Those who desire to send photographs to the above Exhibitions should write for prospectuses to the Hon. Secretaries, whose addresses are given in the second column above. The dates mentioned are those at which the Exhibitions open.

## Patent News.

The following applications for Patents were made between September 3 and September 10, 1900:—

- FILMS.—No. 15,614. "Improvements in or relating to Photographic Films." J. E. THORNTON.  
 PHOTOGRAPHS.—No. 15,615. "Improvements in Photographic Pictures and in the Materials or Mounts therefor." J. E. THORNTON and C. F. S. ROTHWELL.  
 SENSITIVE PAPERS.—No. 15,616. "Improvements in Photographic Sensitised Papers and the like." J. E. THORNTON and C. F. S. ROTHWELL.  
 FILMS.—No. 15,617. "Improvements in Films and the Manufacture thereof." J. E. THORNTON and C. F. S. ROTHWELL.  
 HAND CAMERAS.—No. 15,640. "Improvements in Hand Cameras." THE THORNTON-PICKARD MANUFACTURING COMPANY, LTD., G. A. PICKARD, and C. G. WOODHEAD.  
 PHOTOGRAPHING COLOURS.—No. 15,647. "Improvements in Apparatus for Photographing Colours." Communicated by L. E. Dugardin. H. J. HADDAN.  
 CAMERAS.—No. 15,722. "Improvements in Photographic Cameras." E. D. BARTLETT.  
 DEVELOPING TRAY.—No. 15,775. "The R.E.F. Daylight Developing Tray." R. E. FRASER.  
 CAMERA REST.—No. 15,898. "An Improved Form of Rest or Support for Photographic Cameras." W. R. BRUNTON.  
 CAMERAS.—No. 15,926. "Improvements in Photographic Apparatus or Cameras." C. HOWELL.  
 DISHES AND TRAYS.—No. 15,999. "Improvements in Dishes or Trays for Use in Treating Photographic Plates and the like." Communicated by the Bayerische Celluloidwaarenfabrik vormals Albert Wacker A. G., Germany. W. P. THOMPSON.

## Correspondence.

- \* \* Correspondents should never write on both sides of the paper. No notice is taken of communications unless the names and addresses of the writers are given.  
 \* \* We do not undertake responsibility for the opinions expressed by our correspondents.

#### STEREOSCOPIC PHOTOGRAPHY.

To the EDITORS.

GENTLEMEN,—When examining a properly mounted stereoscopic print by crossing the axes of the eyes, so as to see the picture in relief, the latter is pseudoscopic. Now, take a negative: look at it through the glass, at the film, upside down—in fact, in any way it is possible to look at it—and the effect is always stereoscopically correct. This in spite of the fact that, when looking at the film (*i.e.*, film next the face) with the eyes crossed (the negative being upside down), the *right* eye is looking at the *left-hand* negative; and the same when looking through the glass with negative right way up. That is, no matter how you look at the negative, the effect is always stereoscopic. I don't know enough of optics to account for this.—I am, yours, &c.,  
 H. HANDS.

Pachmarhi, C.P., East India, August 26, 1900.

[We possess considerable power of converging or diverging the optic axes, and therefore can see widely mounted binocular prints stereoscopically, but we cannot cross the axes and therefore cannot see a properly mounted print pseudoscopically. But we can quite confirm, from actual experiment, what our correspondent says of the omnistereoscopic properties of a negative. Brewster in *The Stereoscope*, chapter xvi. p. 216, makes a reference to the subject which may help to explain a curious phenomenon: He refers to a "remarkable fallacy of sight which takes place in the stereoscope when we interchange the binocular pictures, that is, when we place the right-eye picture on the left side, and the left-eye picture on the right side. The objects in the foreground of the picture are thus thrown into the

background, and, *vice versa*, the same effect, as we have seen, takes place when we unite the binocular pictures, in their usual position, by the ocular stereoscope, that is, by converging the optic axes to a point between the eye and the pictures. In both these cases the objects are only the plane representations of solid bodies, and the change which is produced by their union is not in their form, but in their position. In certain cases, however, when the object is of some magnitude in the picture, the form is also changed in consequence of the inverse position of its parts; that is, the drawings of objects that are naturally convex will appear concave, and those which are naturally concave will appear convex. In these phenomena there is no mental illusion in their production. The two similar points in each picture, if they are nearer to one another than other two similar points, must, in conformity with the laws of vision, appear nearer the eye when combined in the common stereoscope. When this change of place and form does not appear, as in the case of the human figure, previously explained, it is by a mental illusion that the law of vision is controlled."—Eds.]

#### EXPRESSION IN PORTRAITURE.

To the EDITORS.

GENTLEMEN,—Will you kindly inform me if article by E. K. Hough, mentioned in your leader on "Expression," is procurable, and where?—I am, yours, &c.,

E. H. DEBENHAM.

To the EDITORS.

GENTLEMEN,—On page 563 of your JOURNAL you refer to the writings of "E. K. Hough." Will you kindly inform me who publishes his work on Posing and Lighting to which you refer?—I am, yours, &c.,

LIGHTING & POSING.

To the EDITORS.

GENTLEMEN,—I should be glad to know in what form the examples from the pen of E. K. Hough are published, and also who are the publishers? You mention the work in a recent JOURNAL under the heading of "Expression in Portraiture."—I am, yours, &c.,

H. P.

September 7, 1900.

To the EDITORS.

GENTLEMEN,—I should be obliged if you could advise me of the title, and, if possible, publisher, of the book by E. K. Hough, mentioned in your article on "Expression in Portraiture." Your eminently practical articles are much appreciated. Many thanks.—I am, yours, &c.,

JOHN G. WILLIAMS.

Bridge-road Studio, East Molesey, September 8, 1900.

[We append an extract from the article by E. K. Hough, which appears in Wilson's *Photographics*. The volume could doubtless be had from Mr. Edward L. Wilson, 289, Fourth-avenue, New York.—Eds.]

"We will suppose the sitter to be the centre of a circle with diverging lines, like the hub of a wheel with its radiating spokes. Suppose this wheel twenty feet in diameter, and the spokes one foot apart at the periphery. The junction of these spokes with the rim we will call points, like a compass.

"Place the sitter at the hub, looking straight before him, body, face, and eyes to the camera, ten feet away, at the outer edge of the circle.

"This may be called a position of neutrality, impassive, inactive. Now, the body remaining in front, the head and eyes turning to the left or right, *if ever so little*, there begins to be expressed activity, thought, emotion, in which the eyes play an important part, and a part that may be largely brought under control, else there were no use describing it.

"To illustrate: If the head be turned two points away from the camera, the body remaining front, the eyes, to express an easy, animated, but not deeply interested attention, should be turned nearly to third point.

"When the head turns from the body to the fourth point, the eyes, to correspond, should turn nearly to the sixth, thus expressing the same kind of easy, natural interest, but more active and more interested, and this corresponding divergence amounts nearly to a definite ratio, whether the turning be more or less, being as two to one, two of the head from the body to one of the eyes from the face; or, in other words, in turning the eyes to an easy point right or left, the head naturally turns about two-thirds the distance.

"This ratio of divergence we will call normal, and we shall find it giving about the kind of expression generally preferred in portraiture.

"Moreover, we shall see that any deviation from this normal relation immediately begins to express something different, often something not at all desired. For instance, the body remaining front, with the face and eyes *both* turned full upon the third or sixth, or any intermediate point, there would immediately begin to appear an absorbed, deeply interested gaze, expressing anxiety, surprise, or other emotion, according to the rest of the face and action; while, should the face remain fronting, with the body directly towards the camera, when the eyes turned two or three points away, there would immediately appear an uneasy, insincere, jealous, watching expression, not at all pleasant.

"Varying the illustration by placing the body fronting the third point away from the instrument, while the face turned to the first point away, and the eyes into the camera, you will have an easy, direct, sincere, manly attention; while, if you place head and body both fronting point three, when the eyes are turned full upon the camera, you obtain at once shyness, coquetry, suspicion, or other similar expression, according to the other facial action. Then, if you front the body upon three, while *face* and *eyes both* turn full upon

the camera, there would begin to appear a bold, domineering, look-you-out-of-countenance sort of expression, or other similar undesirable effect.

"The same principle holds good in looking upwards, for instance; the head slightly raised, with the eyes about half as much more, may express spiritual contemplation, adoration, supplication, &c., according to the accompaniments, while the face, remaining level or slightly drooped, with the eyes still turned upward, looking as they must somewhat from under the eyebrows, will express a cowardly shrinking, a sinister watching, or suppressed anger, according to the other features.

"These hints might be greatly elaborated, but the intelligent beginner will place his camera before the sitter and multiply these illustrations to any extent. The main thing to thoroughly understand is that, in every modification and turn of position, these relations of the eyes and face *will express something*, and, if not controlled to express what is desired, may give expressions quite undesirable."

#### A CORRECTION.

To the EDITORS.

GENTLEMEN,—*Re* your notice of our patent, No. 15,693, in your issue of September 7, will you kindly correct the title of same, which, according to the specification lodged at the Patent Office, should be, "An Improved Support for Focussing Cloths and Screens for Photographic and other Lenses."

From the heading in your paper it is difficult to know the purpose the invention is for, whereas, described by the above title, together with the description and illustration you kindly gave, it would have been better understood.

My name as inventor should also be Belbin, not Bilbin, as printed. Thanking you in anticipation, I am, yours, &c.,

CHAS. T. BELBIN.

75, Abbey Foregate, Shrewsbury.

[We shall be pleased to examine one of the supports if our correspondent will send it for that purpose.—Eds.]

#### A SOCIETY FOR PHOTOGRAPHIC ASSISTANTS.

To the EDITORS.

GENTLEMEN,—Would you kindly inform me of the name and address of the society or union your paper has been advising photographic assistants to join? I think you named it Clerks' and Shop Assistants' Union. I have been informed that a branch has been opened in Glasgow. On making inquiries, however, the Post Office people don't seem to know anything about it, and almost suggest that it cannot be quite respectable when they haven't got their address registered with them. The *City Directory* shows no trace of them either. I have become quite chary about the whole thing. Please say what inducements do they offer, &c., in sickness or out of employment. I would like your candid opinion on this affair. I mean as to stability and respectability, &c., and you might say what their Glasgow address is.—I am, yours, &c.,

Glasgow.

ALEX. CAMERON.

[There exists, we believe, a National Union of Shop Assistants in London, but our correspondent is in error in supposing that we have recommended photographic *employés* to join it. We know nothing of the Union. It is a regrettable thing that photographic operators do not, will not, or cannot combine for purposes of mutual help and support. Until this unfortunate state of affairs is remedied, the advantage to the isolated unit of joining unrepresentative organizations is difficult to perceive.—Eds.]

#### PHOTOGRAPHY IN PARIS.

To the EDITORS.

GENTLEMEN,—Bravo, "Cosmos!" It is always a pleasure to find one who knows and has the courage to express his opinion freely and frankly. Every one, except perhaps one or two photographic operators, knows that there is nothing to learn in France, especially in Paris (formerly Lutece or Lutetia), and, as far as taste goes, it is far behind all countries, and for that article one must go to England, and not even choose London, but any small city will do. It is now to be understood why England made such a poor show at the Exhibition. England did not want France to copy their good taste, &c., without coming over to that country, where it is to be seen anywhere, free of charge, of course. Yes, "Cosmos," you are right in your saying, and you could have even added to your advice, Gentlemen, stay at home. You can find plenty of studios where work is offered, and chances to improve immensely at very reasonable terms.

Reading carefully over THE BRITISH JOURNAL OF PHOTOGRAPHY and the different letters written by *successful* English operators, this "reasonable terms" may have double meaning. The artistic studio man will accept small remuneration to allow a pupil or apprentice to learn his trade to his full satisfaction, or he will allow reasonably poor terms to his operator to work for him, and he can learn tasteful posing and other things to his heart's content. Stay at home, "operators," and study the columns of Situations Vacant in your photographic journals. Now, my dear Mr. Cosmos, the situation may be exactly the same everywhere, but, when living in glass houses, do not throw stones. When it comes to art and taste, France has a little something to say, and there are not only

street-sweepers that go into photography, but a few noblemen, whose names could fill a few numbers of THE BRITISH JOURNAL OF PHOTOGRAPHY, but I do not think this is a proof that photography is less admired here than anywhere else, nor the photographer less of a gentleman.—I am, yours, &c.,  
A. Lévy.

Asnières, Seine, September 14, 1900.

THE STUDY OF PHOTOGRAPHY FOR BUSINESS PURPOSES.

To the EDITORS.

GENTLEMEN,—I am desirous of obtaining a thorough knowledge of photography to enable me to obtain a situation. I have had no previous experience, but I have a good knowledge of drawing and painting in both oil and water colour, and I am told that I possess good artistic taste. Will you be good enough to tell me the usual way to obtain a beginning?—I am, yours, &c.,  
EVELYN.

[Our correspondent, a lady, does not say the kind of situation she is anxious to obtain, but we presume she wishes to turn her talents to account in a portrait studio. In the sense implied there is no "usual way" of obtaining a beginning. Perhaps "Evelyn's" best plan will be to go through a course of study at the Polytechnic Institution, 309, Regent-street, and then endeavour to obtain a situation at a photographer's as improver.—Eds.]

BRITISH VERSUS GERMAN PRINTING.

To the EDITORS.

GENTLEMEN,—Could you inform me what firm or firms in England and Germany would do me about 20,000 pictorial post-cards from my own negatives? I would prefer to give it to an English firm, but I must compete with others, so must go where I can get good work cheapest.—I am, yours, &c.,  
F. FRY.

[We presume our correspondent requires collotype prints. If so, Messrs. Morgan & Kidd, Richmond; The London Stereoscopic Company, Cheapside, and other firms who advertise in this JOURNAL and its ALMANAC, execute such work in enormous quantities, and should be able to quote lowest prices consistent with good printing. With regard to German firms, we can give no information, but we conceive it a duty to use every legitimate endeavour to prevent work being sent out of this country.—Eds.]

NEWNES' LANTERN LECTURES.

To the EDITORS.

GENTLEMEN,—You have been courteous enough in previous years to allow us the use of your columns for the purpose of announcing the several lantern lectures which we are willing to loan to the several institutions, literary societies, working men's clubs, and kindred institutions.

This year we are able to offer your readers several new and interesting lectures in addition to those issued.

These latter, we may say, have been thoroughly revised and brought up to date.

For the direction of those who are not acquainted with the conditions of loan of these slides, we may briefly state that we require the carriage only to be paid to and from these offices, and certain easy rules observed.

The names of the new lectures are as follows:—

1. "A Day and Night in Newspaper-land."
2. "England's Beautiful Homes."
3. "Gems of Religious Art."
4. "Popular Artists and their Work."
5. "Famous Authors and How they Write Their Books."
6. "Some Popular Hymn Writers."

We shall be pleased to send full syllabus and conditions to any of your readers who will forward a stamped addressed envelope to these offices. Letters to be marked "Lantern Lecture."—We are, yours, &c.,  
GEORGE NEWNES, LIMITED.

Lantern Lecture Department, 7-12, Southampton-street, Strand.

We append Messrs. Newnes' conditions for the loan of the slides and lectures:—

1. The full date for which the slides are wanted, with particulars of organization under whose auspices one or other of the above lectures is to be delivered, must be stated at the time of application.
2. Slides required for the country are sent the day previous (or, if possible, earlier) to that on which they are to be used, and must be returned by first train the morning after being used.
3. Carriage must be paid both ways by the borrower, and the slides returned prepaid, per passenger train, marked "George Newnes, Limited, 7-12, Southampton-street, Street, London, W.C." No remittances need be sent to cover the amount of carriage, as the slides will be sent to the borrower carriage forward.
4. During the period the slides, &c., are in the possession of the borrower, he will be held responsible for any breakages. Should any breakages occur, a charge of one shilling for each slide broken will be made.
5. All applications, letters, &c., requiring a reply must be accompanied by a stamped addressed envelope.

6. Each lecture will contain a list of the slides sent. The lectures occupy about an hour and a half to deliver, and, should the lecturer desire to curtail the time, the lectures are so prepared as to enable this to be done with facility.

THE THORNTON-PICKARD COMPETITIONS.

To the EDITORS.

GENTLEMEN,—We shall be glad if you will again kindly call the attention of your readers to our Photographic Prize Competition, and remind them that the same closes on October 1. We should be glad if all intending competitors would kindly send in their entries as soon as possible.—We are, yours, &c.,

THE THORNTON-PICKARD MANUFACTURING CO., LIMITED.

Altrincham, September 15, 1900.

[We published full particulars of these competitions earlier in the year, but, for the information of those who have not yet entered, we append a list of the prizes:—

Class I.—For sets of photographs taken with the Thornton-Pickard "Amber" or "Ruby" camera and "Time and Instantaneous" shutter. First prize, 15*l.*; second prize, 10*l.*; third prize, 5*l.*; fourth prize, 3*l.*; fifth prize, 2*l.*

Class II.—For sets of photographs taken with the Thornton-Pickard focal-plane shutter, fitted to any make of camera. First prize, 15*l.*; second prize, 10*l.*; third prize, 5*l.*; fourth prize, 3*l.*; fifth prize, 2*l.*

Class III.—For sets of photographs taken with any of the Thornton-Pickard various patterns of "Time and Instantaneous" or "Snap-shot" shutters, fitted to any make of camera. First prize, 15*l.*; second prize, 10*l.*; third prize, 5*l.*; fourth prize, 3*l.*; fifth prize, 2*l.*

The Thornton-Pickard Company will supply entry forms on application.—Eds.]

THE SALE OF POISONS.

To the EDITORS.

GENTLEMEN,—Referring to the correspondence which has recently appeared in the columns of your valuable JOURNAL, I think it right, with your permission, to call further attention to the work this Society is doing for all classes of traders and users of poisons and poisonous compounds for trade and technical purposes. A Bill has been drawn and settled by counsel for early presentation to the Legislature. This Bill proposes to amend the law as it now exists with regard to the sale of poisons and compounds thereof so largely used in agriculture, horticulture, and photography. It should be clearly understood that the proposed Bill only deals with such poisons or compounds thereof as are used for trade or technical purposes; it is not intended in any way to invade the chemist's or druggist's province, which is the retailing and compounding of medicines that may or may not contain poisons.

Petitions in favour of this Bill are now lying in all the chief cities and towns of the United Kingdom and are being largely signed.

The Chemical Section of the London Chamber of Commerce has taken up the matter, and a second meeting is shortly to be held to specially consider and discuss the provisions of the Bill.

My Committee at the earliest fitting opportunity propose to approach the Privy Council on the whole matter. We are seeking support from all persons interested in seeing the present anomalous condition of the law altered, and, in order to make the movement a popular one, the annual subscription of members has been fixed at five shillings.

I shall be glad to afford your readers any further information in my power.—I am, yours, &c.,  
T. G. DOBBS.  
5, Clement's-inn, Strand, London, W.C., September 17, 1900.

[Mr. Dobbs encloses us a leaflet fully descriptive of the aims and objects of the Traders in Poisons and Poisonous Compounds for Technical and Trade Purposes Protection Society.—Eds.]

TONING P.O.P. WITHOUT WASHING.

To the EDITORS.

GENTLEMEN,—Under the above heading in last week's JOURNAL, replying to "Nemo," you write, "We think it would be preferable to wash out the free silver and acid before the prints are put into the toning bath." May I venture to defend the practice of your correspondent by the result of my own experience? For the last two years I have invariably followed the "dry treatment," which was, I think, introduced by Mr. Welford, and with perfectly satisfactory results. It saves the time and trouble of preliminary washings, and, if due care be taken to see that the prints are covered at once with the solution, and that there are no air bubbles, it is a perfect preventive of double tones. Of course, a little more gold is needed, but this to an amateur, who will only require one or two prints from a negative, is a matter of slight importance. There may be objections to the practice indicated of which I am ignorant—perhaps on the score of permanence; but, as posterity is not likely to be acquainted with my work, or to mourn over its fading beauty, it does not trouble me. To those who, like myself, only photograph for the present pleasure which it brings, I strongly recommend toning without previous washing.—I am, yours, &c.,  
F. H. C.

[The method certainly saves a little trouble, but it consumes more

gold, which is not all deposited on the prints, but wasted. This correspondent says he does not attach any importance to the ultimate permanence of his work, but that is not the case with the majority of photographers. They wish their work to last for more than a couple of years, and also desire to economise their gold, especially where large numbers of prints are turned out daily.—EDS.]

## Answers to Correspondents.

\* \* All matters intended for the text portion of this JOURNAL, including queries, must be addressed to "THE EDITORS, THE BRITISH JOURNAL OF PHOTOGRAPHY," 24 Wellington-street Strand, London W.C. Inattention to this ensures delay.

\* \* Communications relating to Advertisements and general business affairs should be addressed to Messrs. HENRY GREENWOOD & Co., 24, Wellington-street, Strand, London, W.C.

LANTERN SCREENS.—Z. asks for the address of the makers of the Crystal Palace Lantern Screens.—In reply: We believe they are made by Messrs. George Gill & Sons, Warwick-lane, E.C.

H. F. M. (Liverpool).—We regret that we must leave your query unanswered. It is a rule of ours not to recommend one make of camera in preference to another, and from that rule we never in any circumstances depart.

FADING.—ERNEST. We should say that the mounts have nothing to do with the fading, but, of course, we could not say for certain without submitting them to tests. We should be rather inclined to say that the fading is due to imperfect fixing. See article on another page.

BOOK FOR A BEGINNER.—INFORMATION asks: "What is considered the best guide-book for beginners in amateur photography?"—In reply: Beginners' books are very plentiful. As good as any is Mr. Ethelbert Henry's *Early Work in Photography*, published by Dawbarn & Ward, Farringdon-avenue, E.C.

COPPER TONING.—E. G. writes: "Will you kindly inform me in what number is given the formula for toning sepia bromides with copper?"—In reply: We presume our correspondent refers to the toning process of Mr. W. B. Ferguson, Q.C. Let him refer to the JOURNAL of January 12, in which it is briefly described.

ADDRESS WANTED.—H. S. NOAD writes: "Would you kindly oblige by letting me have addresses of firms who could undertake work as specimens herewith?"—In reply: The specimens appear to be by the collotype process. Apply to Messrs. Morgan & Kidd, Richmond, or one of the other houses advertising in the outer pages of the JOURNAL.

RED STAINS ON COLLODIO-CHLORIDE.—B. WALDE writes: "I am sending you some collodio-chloride prints with red stains on, and should feel much obliged to you for your kind advice."—The spots have very much the appearance of having been caused by minute air bubbles adhering to the surface of the paper when it is first put into the toning bath. If that is not the cause, try another sample of paper.

THE NALDA HAND CAMERA.—INQUIRER writes: "Will you kindly give the name of the makers of a hand camera called 'The Nalda,' Parson's patent? We bought it second-hand, but it is not perfect, and should prefer the makers to put it right if possible to get at them."—In reply: The Nalda (the name of which was at one time very familiar to us) does not figure in any of our recent lists, and therefore we are unable to give our correspondent the reference. Will some reader oblige?

PHOTOGRAPHY IN BRITISH COLUMBIA.—BOB asks: "1. Are wages good for photographic assistants out in British Columbia? and, if so, (2) could you inform me of any journal used out there for advertising purposes? Also (3) could you give any rough idea what it would cost from London?"—In reply: We fear we cannot be of much help in the matter. 1. We have no means of telling, but we should think wages would not be high. 2. None of a photographic character that we are aware of. 3. Better apply to a steamship company.

DIRECT CARBON ENLARGING.—J. S. POWELL writes: "Will you kindly let me know (if possible) name of maker or agent of the carbon paper for enlarging direct from negative, as in bromide work? I understand it is a very recent production."—We know of no carbon tissue as sensitive as bromide paper, or anything like. Monckhoven, of Ghent, used to make an extra-sensitive tissue for enlarging upon with the solar camera, but whether it is made now we cannot say. With any carbon tissue we expect you would have to use the solar camera or a very powerful arc light.

PHOTOGRAPHY ON METAL.—W. WARRINGTON writes: "A jeweller brought me a piece of bright silver and an old engraving, and asked me to copy the latter on to the former for him. I was very busy at the time, and, as he could only wait three days, I could not undertake the matter. I had intended preparing the metal with various things—tragacanth, beeswax, and so on, and if not successful I was going to send the job to one of the big houses. My process, by the way, was the carbon, of course. I should be very glad if you could tell me how I can make carbons take on a smooth surface such as burnished silver or glass, or if there be a method other than carbon."—If the metal surface receive a thin substratum of gelatine containing a little chrome alum, a carbon picture can then be transferred to it. The substratum will, however, somewhat degrade the polish on the metal. We do not know a better process for the work than the carbon.

AN EMBOSSEING PROCESS.—J. HUNTER writes: "I shall feel obliged if you could give me any information regarding Barker's embossing process. I believe it is a quick method of preparing dies by some photographic or etching process for printing type in relief. If you can tell me anything of the process or where I can purchase materials and the right to work it, I shall be very pleased."—We are not familiar with the process mentioned. Messrs. Penrose & Co. supply material for working all the photo-mechanical processes, and it is possible that they can supply all that is needed for this one. Better communicate with them. Their address is Upper Baker-street, Lloyd-square, W.C., and it is possible they can give you the required information.

APPRENTICESHIP.—W. says: "Two years ago I took a young man as apprentice with a small premium—only ten pounds—for three years. He was to have half-a-crown a week for the first year, five shillings for the second, and ten for the third. He is now an excellent operator and printer. Another photographer here, I know, has been trying to get him away for some time past, and has now offered him thirty shillings a week, and the apprentice has given me a week's notice. Can he leave before the end of the three years? I may say the agreement was a verbal one, but made in the presence of two witnesses who will testify to it."—Yes, he can, as he is, and has only been, a weekly servant. There must be proper indentures, duly stamped, to make an apprenticeship binding on either side.

DEVELOPMENT.—W. KEATING writes: "I see mentioned in several papers that amidol will not keep in solution, and yet the directions with it give a formula which they say keeps. Kindly say your opinion. 2. I tried standard development with amidol alone and metol alone. The result showed a thin negative, darkened all over, and no detail. My result with pyro soda was all right. Can you tell me the reason? 3. Can one redevelop a fixed and dried negative? 4. If so, can an under-developed negative be sufficiently developed by this final operation?"—1. Amidol, in our hands, does not keep for very long. 2. You ought to have got good results with either developer, and we cannot say why you did not if the negatives were rightly exposed. Try kachin or ortol; they are both good developers. 3 and 4. The reply to both these queries is in the negative.

PORTRAITURE.—VELOX writes: "1. Is it possible to take good photographs with only good side light, especially if I employ a good reflector on the shadow side? 2. Can you recommend a good gas light for photographic purposes? Do you know 'The Beaufort Studio gas light,' it has nine incandescent burners? are these the ordinary Welsbach burners, or are they special? is it possible to take good photos with this light, and what candle power would be required? Could you recommend me any book or any firm I could get information from?"—1. Yes; all the electric lights are used with the hood shape reflector, and excellent portraits are produced with it. 2. We have, personally, had no experience with the Beaufort light; but we believe it answers well. The arc light generally used for portraiture is from 6000 to 10,000 candle power. Messrs. Adamson Bros., 22, Christopher-street, Finsbury, E.C., are experts in artificial light for photography. Gwynne & Co., Brook-street, Holborn, also supply installations for photographic purposes. These are electric light. Of course, any form of gas light will require a much longer exposure than is necessary with the electric light.

REMOVING "SODA MARKS" FROM NEGATIVES: NUMBERING KODAK NEGATIVES.—SYSTEM writes: "1. Would you kindly let me know the simplest method of removing soda marks as shown on the enclosed negative. The marks do not show by transmitted light, but they do by reflected light, and make the negative look dirty. I know they (the marks) may be removed by rubbing the surface with a tuft of cotton-wool saturated with hydrochloric acid, 1 to 60 parts of water, after washing; but this is not always advisable, especially when the films or plates are inclined to frill at the edges. Is there any safe and simple method? Merely rubbing the surface with a tuft of cotton-wool saturated with plain water will not always remove the marks. 2. Also can you tell me of any good method of numbering Kodak spool films consecutively before development, if you start developing without cutting, and what is the best way of pencilling order numbers on them?"—In reply: 1. We have never failed to remove such marks with a pledget of cotton-wool when the plates are taken out of the washing water. 2. Write the numbers *small* on the gelatine film with a black lead pencil.

OZOTYPE AND COLOUR WORK.—SPECTROGRAPH writes: "1. Do you think the ozotype process could be utilised for three-colour printing? 2. Can the necessary colours be supplied for the three printings, from three negatives, so as to represent the colours of the original with tolerable accuracy? 3. Would it be necessary to use an isolating medium between successive impressions, to prevent the first being destroyed? 4. If three colours, which would form grey when mixed, were superimposed, would the effect of the uppermost layer destroy to any great extent the purity of the grey, and the same with mixed colours? 5. What is the most practical process for representing the colours of nature on an opaque ground, such as paper? 6. Is it likely to be of any commercial value to a single-handed worker if introduced as a novelty?"—We scarcely see how the process could be applied in practice, and we do not know if the Ozotype Company supply colour plasters suitable for the work. Better communicate with the Company, or make some experiments in the direction yourself. You will be able to form an opinion as to the commercial value it would be to you. If you are successful, it is very possible it might be.

\* \* We have again to hold over several reviews, letters, answers to correspondents, and other matter.

wish to take advantage of this feature should communicate with us as early as possible.

The publishers ask us to remind advertisers that many of the advertisement pages of the ALMANAC are already booked, and that, to ensure insertion and good positions, orders and copy should reach them without delay.

\* \* Will secretaries of societies who have not yet sent us lists of officers for inclusion in the ALMANAC kindly oblige us by doing so at once, in order that this section of the book may be proceeded with.

## EX CATHEDRÁ.

FROM a circular that has been sent to us we learn that Mr. Henry W. Bennett, F.R.P.S., whose address is Granville House, Arundel-street, Strand, London, proposes in future devoting himself to photographic work as a profession. His specialities will be carbon and platinotype printing; carbon enlargements: lantern slides; enlarged negatives and the working up and improvement of negatives. The claims that Mr. Bennett has upon all the encouragement and good wishes that we can extend to him are undeniably strong. As a photographer of architectural subjects he has won wide distinction for the exquisite qualities he has invariably imparted to his work. But he is by no means a man of one idea only, for the principal exhibitions during many years past have witnessed many evidences of his skill in other branches of photographic production. A frequent contributor to the proceedings and discussions of societies and the pages of the press, Mr. Bennett adds to his great practical skill a most admirable theoretical knowledge. For the work he proposes to undertake he could not be better qualified, and in wishing him the greatest success in his venture we can confidently recommend his printing and enlarging to those who desire very high-class results.

\* \* \*

THE September number of the *Journal of the Photographic Society of India* contains a photogravure portrait of the beautiful and gracious Vice-Queen of India, Lady Curzon of Kedleston, which forms a most charming addition to the fine illustrations our contemporary has recently inserted in its

## THE BRITISH JOURNAL PHOTOGRAPHIC ALMANAC FOR 1901.

Edited by THOMAS BEDDING, F.R.P.S.

The ALMANAC for 1901 will appeal to photographers all the world over as a daily reference guide in practical work. The formulæ will be revised where necessary, and the latest departures in theory and practice will be chronicled. The year's advances will be recorded, and wherever practicable new features of an informative nature will be added.

Adhering to an old and much-appreciated custom, we invite short contributions on practical subjects for the pages of the 1901 ALMANAC. Those of our friends intending to co-operate with us in this respect can help us by letting us have their M.S., sketches, &c., at the earliest possible date.

We shall be glad to receive any additions that may be made to the list of telegraphic addresses of the trade, &c. As usual, a section of the ALMANAC will be devoted to notices of the latest introductions in photographic apparatus, &c. Those firms who

pages. The negative from which the plate was made was taken by Messrs. Bourne & Shepherd, the well-known professional photographers of Calcutta, "the premier Indian firm." The beauty of the distinguished sitter rendered a pleasing picture inevitable; but, apart from this matter, there is an allied charm and dignity in this representation of the Vice-Queen's bejewelled figure which single the photograph out for special recognition. The editor of the *Indian Journal* gallantly refuses to admit that the print does justice to the fair original. We must again congratulate our contemporary on the readability of its contents. The following speculation on the possibilities of animated photography will show that some daring things are thought in Calcutta: "If photography, in its ordinary every-day aspect, can record only an evanescent expression forming a single link in the psychological manifestation of the subject, may it not be possible to plumb the inward spiritual depths of a man or woman by a succession of photographs which complete the chain of expression? 'Animated photography' is so much in the pupa stage of development that the mere suggestion that it may prove the salvation of portraiture will appear to many wildly absurd. And yet the absurdities of one age have turned out matters of fact in another." Even so; but how many of us, we wonder, would dare submit to having our "inward spiritual depths" made clear to all by photographic or other means! Very few, we believe, O Indian brother!

\* \* \*

"THE problem of photographing the colours of nature is now satisfactorily solved, and an extensive exhibit of natural-colour photographs by the Colour-Photograph Company, Birkbeck Bank Chambers, Chancery-lane, London, forms the leading attraction at this year's Exhibition of the Royal Photographic Society at the New Gallery, Regent-street." This is the first paragraph of a printed slip that has been sent us. The Royal Photographic Society's Exhibition does not open till Monday next, so that is slightly anticipating matters to speak of "leading attractions" already. One or two extracts from this "advance notice," which has evidently been prepared for the general press, may interest our readers: "The process by which the pictures are produced is known as the McDonough-Joly process, as its essential features were invented independently by Dr. Joly in Ireland and by Mr. McDonough in America, and were patented almost exactly simultaneously on the two sides of the Atlantic in 1894. Since that time large sums of money and a great amount of labour and skill have been expended in developing the details of the invention, but the honour of bringing it to a practical and commercial success lies with the Colour-Photograph Company, of Chicago, and its guiding spirit, Mr. D. K. Tripp, who has completed his success by the purchase of the rights under Dr. Joly's patents, to add to those of MacDonough. . . . The essential difference between the McDonough-Joly process and the processes of Ives, Lumière, and others is that, while the latter have to make separate exposures and separate negatives for the three-colour impressions, as well as three separate colour impressions in their positives for viewing, the McDonough-Joly process makes the three impressions simultaneously, by one exposure, upon one plate, through the intervention of a screen ruled with the three fundamental colours in very fine parallel lines. Further, the McDonough-Joly process can produce prints on paper by methods similar to those commonly in use by professionals and amateurs; and it can produce photo-mechanical

prints, for book illustration, in great perfection and at very low cost." It will be of interest to note whether success rewards the efforts of the American company to popularise a process that has already failed to "catch on" here, as the phrase runs. We wish the Colour-Photograph Company success in their venture, and can honestly say that, if they achieve it, they will richly deserve it. But it will be uphill work to persuade the general public into accepting colour pictures on glass as a satisfactory solution of the colour-photography problem after several failures in the same direction.

\* \* \*

THE subject of expression in portraiture and the best methods of securing it has recently been dealt with in our pages, and those of our professional readers to whom the subject is of paramount importance may be interested in some physiological aspects of the matter that we do not remember to have seen dealt with before. The ideas are those of Mr. Henry Jones, of the Sydney (N.S.W.) Phrenological Institute, who, in the *Australasian Photographic Journal*, discusses some peculiarities of sitters from the point of view of physique. Mr. Jones says that, when the flesh predominates, and a subject is what people generally call "fat" or "stout," there is a desire to sit in the most comfortable chair and take life easy. Anything or anybody compelling them to "take a chair" with a straight back, such as is often used in the "studio" for "bust" portraits, will not please them. "You will ruffle their feelings, make them feel uncomfortable and discontented. They are homely, jovial people, and their surroundings must be congenial if a reflex of the true feelings is to be seen in their features, and a true natural pose obtained. People in whom the bone predominates are quite dissimilar to the fleshy people. These bony people are rough and ready, are fond of work, and they can put up with indifferent surroundings; but they prefer solid, firm, and straight furniture. The proverbial studio chair would be more appreciated by this person than the fleshy one, better still if they are allowed to stand. A prominent-browed person should be made to observe, because he is more natural-looking than if he was taken full face with a vacant stare, as is the case in too many instances. Children with round-shaped ears should be attracted to look in the direction of where some musical sound comes from. Those with a fulness just behind the corners of the eyebrows wear a happier expression when any eatable is held up to them in a tempting manner. In the first case, the round ear shows love of music and sounds; in the second, appetite." Most of this studio philosophy falls within the category of the obvious, but the part of it relating to the treatment of children is based upon reasoning that might be less obscure. It imposes no strain upon the acumen of a photographer to differentiate between the accommodational needs of stout and thin people; but, if an attentive study of the minute facial characteristics of small sitters is to be gone through each time one of them appears, studio work will become somewhat irksome. Mr. Jones probably knows more about the inexact "science" of phrenology than practical portrait photography.

#### STUDIO-BUILDING.—II.

IN our recent article upon this subject, so fertile in queries from correspondents, we showed how closely the question of length of studio and the lens employed were interwoven, and we indicated a minimum of close upon thirty feet when full-

length cabinets and large groups were to be taken. We may now pass on to other aspects of the subject.

The breadth naturally presents itself first for consideration, but there is little that need be said here, save that, for the purpose of being able to take large groups, plenty of width is simply a necessity. Further, a wide studio gives far greater scope for varying the illumination of the sitter, as he can be taken from almost any direction, and many chance and other effects of lighting secured that would never be noticed in a narrow room. There are studios in which the camera moves on rails from one end to the other; but we cannot but think that this is a mistake, as, though work is facilitated, many advantages are lost, the mere shifting of the camera a few feet to the right or left sometimes enabling the operator to get the most advantageous light upon his subject.

We have now to consider the height of the studio, and this has many very important aspects, one of which, in particular, should be first disposed of. An impression prevails that a studio should not be extremely high, on account of the difficulty of reaching the blinds readily while controlling the illumination. This is a mistaken idea. In a lofty studio there is not the slightest occasion for the blinds, on whatever system arranged, to lie in close proximity to the glass. So long as they are clear of any movable object, as backgrounds and the like, they may be arranged in entire disregard of the lines of the roof, and the height of the room may be chosen without any reference to them.

A photographer's studio is generally looked upon, and too often justly so, as a typically hot place. In most cases this is almost entirely owing to want of height, for, granted that it is well placed as regards points of the compass and relation to surrounding buildings, a studio may be kept cool in the middle of summer, although upon whether it be built up against the walls of existing building or is unsheltered from the sun in every direction depends the temperature of the place. Again, the greater the height of any room, as a general rule, the freer from closeness is the air. Thus all considerations combine to cause a studio of lofty proportions to be chosen. There is still another argument in favour of a high studio, the importance of which is paramount. Whatever the form of roof, if the studio is to depend upon its own walls or roof for keeping the sun's rays out, it must be of a certain height. A well-known authority has given 60° as the angle of pitch of roof needed to keep the direct sun out. Adopting this rule, and remembering that the height of the walls is governed by the fact that a background cannot be less than eight feet high for general purposes, we readily arrive at a minimum height that shall fulfil the obviously desirable, if not indeed necessary, requirements for a studio built in the open. It is equally obvious that a typically perfect situation would be not in the open, but under the lee of a high building, which should shelter it from the sun when at its greatest elevation—that is to say, about noon—so that, in this part of the world at any rate, a studio built against a high wall that faced north would have many advantages. Of course, earlier, and more especially later, the protecting wall would be less valuable, as the sun would gradually work round, although, if the wall were, for example, the back of a long row of houses, its protection would continue long enough to be of virtually complete avail.

But, though keeping the room cool is a matter of vital consequence for the comfort of sitters, an end mainly attained by screening the direct rays of the sun in combination with

efficient ventilation, this screening is an absolute necessity in another direction. Under no circumstances whatever can the sun's direct rays be permitted to pass between sitter and lens; in other words, no sunbeams may be seen when looking towards the sitter from the camera standpoint. We have known instances where much trouble has been caused in this way, and quite unsuspected, through the building having been erected during winter and spring, and the sunbeams not having gained access till later in the year, when it is higher in the heavens. When the atmosphere is thus illuminated by the sun's rays, there is no remedy except by dispersing them with a translucent screen or by erecting an opaque screen.

So far, it will be noticed we have not dealt at all with the shape of the roof, but we have felt that it would be best treated after clearing the ground by establishing general principles. Their particular application to this point of the shape of the roof we will consider in a final article on the subject.

---

**Photography and the General Election.**—Now that we are in the midst of a General Election many photographers are busy in supplying portraits of the local candidates and those who take an active share in party politics. Just now provincial photographers will have little difficulty in obtaining sittings from their candidates and other prominent persons in politics, as they are all more or less anxious for popularity at such a time as this. The local photographer of little Pedlington, for example, would not be accorded a sitting by the Hon. Herbert Blank in ordinary circumstances; but, if the hon. gentleman becomes a candidate for the Little Pedlington seat, he is only too pleased to sit to the local man or men, and so are many of his prominent supporters of the "upper ten," with the idea of securing voters in the districts, and, usually, good orders follow. At other times these gentlemen only patronise the *élite* of the profession. It is rather a question as to whether local photographers will profit as much by this election as they may have done in some previous ones. Process blocks have now arrived at such a state of perfection that they will often be utilised where silver prints were once required. One silver print only is required to produce thousands of process prints. However, the process prints are usually anything but flattering to the candidates, owing to the wretched paper they are generally printed upon. Some we have seen are very much on a par with the portraits issued from Scotland Yard of culprits "wanted." Such portraits as those, we fear, will not much aid the candidature of an aspirant to parliamentary honours if he happens to be a stranger in the district.

---

**Coloured Portraits.**—In our issue of last week Mr. A. T. Newton directs attention to the subject of hand-coloured photographs, chiefly for advertising purposes, with large-size pictures. In the opening of this article Mr. Newton says: "To many the bare idea of colouring a silver print or photograph by any other process when printed on paper may appear an out-of-date operation, and quite beyond the limits of good taste, in these days of monochrome and matt-surface productions, and but few professional photographers are found giving any countenance to it beyond the finishing in colour of a certain class of portrait enlargements well known in the trade." What Mr. Newton says in this respect is quite correct. But why should it be so? At one time coloured photographs were a very lucrative part of the portraitist's business, but now they are quite neglected. Indeed, if we now visit a dozen photographers' reception-rooms, we shall not see half that number of coloured specimens exhibited, except they be expensive enlargements. This used not to be the case. In former days quarter, half, and whole-plate delicately tinted and fully coloured specimens were to be seen everywhere, and very profitable they proved; but that was before the *carte-de-visite* and cabinet pictures. Why, since then, their total neglect? It may possibly be accounted for in this way: When the first-

named style of portraits was introduced, they became such a rage that portraitists had little time to think of anything else, and so when the cabinet came to the fore and superseded it. Hence coloured portraits fell into oblivion, and have not since been resuscitated. Just now the public taste is for pictures generally in colour. That being the case, why should it not extend to portraits, if they were made a feature of by photographers? Face and hands of the half-plate size delicately tinted used to be charged for from 5s. upwards extra on the picture. The 5s. work did not take the artist, usually a lady, more than about an hour, yet it was effectively and well done, and it is manifest that it carried a good profit to the photographer. The same might well be done now with cabinet portraits. It would give remunerative employment to many lady artists as well as bring grist to the photographer's mill, if it were made a feature of. That there is still a taste for coloured portraits is evidenced by the craze there was a few years ago for the daubs, yclept "cristoleum painting," which was chiefly confined to portraiture.

**Despoiling the Lake District.**—Since the scheme was first mooted for connecting the different portions of the Lake District, under the Light Railways Acts, there has been a great flutter of excitement amongst artists and others. Every one knows how even telegraph poles and wires often mar the scene when they have to be included in a photograph. Not the less would the overhead system of electric traction mar the view if the standards and leads had to figure in the picture, though a painter could, of course, leave them out in his depiction of the scene. It is not often, however, that roads are shown in pictures of the Lake District, so that, after all, the projected railway would not so greatly interfere with the beauty of the scene as some would lead us to imagine. There is another side to the question that should be taken into consideration, namely, convenience and utility. Photographers who have spent their holidays in the Lake District know full well the inconveniences and the cost of getting from one part to another, when they have to depend upon coaches and similar conveyances, agreeable as the rides may be to those whose purses may enable them to take them. There is no question that a light railway connecting the principal places in the district would be a great boon to tourists, photographic or otherwise, with limited means. We read, and it is significant, in one of the daily papers that all the agitation has been promulgated by residents in the neighbourhoods, who have purchased plots of land and erected unsightly modern houses upon them, who fear that tourists and "trippers" would be brought in large numbers by the light railways, and so disturb their quietude. We suspect, however, that they will eventually have to give way to progress. The pleasure of thousands is paramount to the comfort of a small few. A short time back we read that the light railway scheme had been abandoned, but since then we have learned that it has not, but is only in abeyance for the present. Sooner or later, and there is no question about it, the different parts of this beautiful district will be brought into convenient communication, as has been the case in the equally beautiful spot, the Isle of Wight—and the Isle of Wight is none the worse for the innovation.

**Geological Photographs.**—A wide field of photographic work and interest was opened up at the recent meeting of the British Association, when Mr. Monckton dealt with the tenth annual report of the Committee for the Collection and Preservation of Geological Photographs. He said the only new contributing counties added to the list were Anglesea and Meath, but several counties had much improved their photographic contributions. Upon the whole, he believed that Yorkshire had every reason to be proud of itself for the way in which it had contributed to the splendid collection of photographs possessed by the Section. The total number of photographs from Yorkshire was 446. Mr. Monckton made the interesting announcement that the question of publishing a typical series of geological photographs had been considered, and, as a sufficient number of subscriptions had now been obtained, it had been determined to issue twenty photographs for each of three years, both as

prints and lantern slides. Local societies might obtain the loan of the duplicate collection. The work of the Society had been carried on vigorously, but there was still a great deal to be done.

**Sensitiveness of Metallic Silver to Light.**—During the same meeting Major-General Waterhouse read a paper, in the course of which he stated that he had found visible photographic images were formed on pure silver foil or silvered glass when exposed to sunlight in exhausted glass tubes; in thin films the effect penetrated to the back. Electrically deposited silver was also sensitive. A very curious action of light upon glass had also been observed. A silvered glass plate was exposed for about a month under a cut-out screen of thin aluminium, the unsilvered side of the glass being in contact with the aluminium, and not protected from the air by a covering glass plate. After exposure the plate was put aside for a few days with the exposed glass side in contact with the silvered surface of another piece of polished silvered glass, which was then found to have received an impressed image from the glass of the design cut out of the aluminium screen. The image was quite visible, clear, and sharp, and somewhat similar to the images directly impressed by light. Several days afterwards a second similar image was produced in the same way by contact with the glass upon another freshly polished silvered glass plate. These experiments of General Waterhouse, which follow others that have taken the same line of work as a basis, are being continued. Yet another paper of photographic interest, making some half a dozen in all that were presented to the British Association, was one by Professor S. P. Langley, Secretary of the Smithsonian Institution, describing the infra-red solar spectrum obtained by means of a 60° rock-salt prism. Curves were shown to illustrate the relative distribution of energy in the prismatic spectrum; in them each Fraunhofer line caused, by its relative coldness, a notch or deflection. The curves were produced automatically by photography, the spot of light being reflected by a galvanometer itself in connexion with the bolometer. The main result of the observations was the comparison and measurement of 579 absorption lines between the main lengths of 0.7 $\mu$  and 5.3 $\mu$ . By the employment of a glass prism of greater dispersion than rock salt, the total number of bolographically determined infra-red lines had been increased to 740. The accuracy of the measurement was shown by the fact that the position of most of these lines was determined within five or ten Angstrom limits. A general effect of the investigation was to reveal the marked changes in absorption in spring, summer, autumn and winter, the most conspicuous seasonal changes being between spring and summer. On the whole, it cannot be said that the scientific aspects of photography were neglected at Bradford whilst the annual Parliament of Science was in session.

#### NOTES ON THE DEVELOPMENT OF INTERFERENCE PHOTOCHROMY.

##### I.

In the first place it will be necessary for me to explain what I conceive to be the *object* of a history of the gradual development of a branch of science—an object which will be consistently followed in treating of photochromy; and, in the second place I will give a preliminary sketch and make some remarks on the *order* in which the matter is placed.

In most cases it is, and always has been, the custom to publish original researches in a form which affords little or no clue to the actual path of discovery.\* The reason for this is either that the necessity for such a clue is not recognised, or—and this reason, fortunately, is more rare nowadays—the deliberate suppression of all indications of the path of discovery. It is not difficult to imagine how a mind not given to accurate self-analysis†—and such a mind, far from being incapable of the greatest powers of investigation, is often found in great investigators—can be led to such ideas; but,

\* I am aware that this custom is less common in natural science than in mathematics, and this fact, while not, of course, affecting the argument that students of natural science may derive great benefit from the study of mathematics, constitutes, in my view, a most important advantage of natural science at present, and one from which mathematicians might well learn better ways.

† Cf. Mach: *Popular Scientific Lectures* (Chicago, 1898), pp. 279, &c.

and this seems very extraordinary to me, *others* (learners) often fail also to see this necessity in original discoverers. Against such people it would be easy to quote authority—Gottfried von Leibniz, Joseph Louis Lagrange, Dr. Ernst Mach\*—but it is not, of course, permissible merely to quote *authority*.

However, it is perfectly obvious that such clues are very valuable as *examples* of research, but for other objects (for instance, the thorough comprehension even of others' works), their utility is not so obvious; but, as their value as examples of research alone suffices to more than justify, to *necessitate*, their appearance, it is useless, for practical purposes, to dwell longer on the proof of the utility for thorough comprehension than to say that, from premises that would be granted by every one, one can deduce, in strict logic, this proof. This has been done, I think, in essentials by Mach.†

We now come to the function of a history. To trace the natural connexions of ideas, often in works where these connexions are suppressed, *must* be the function of a history. More than this, the distinction between the text-book and the history must ultimately break down; the text-book for all whose object is to get any true knowledge, and not a valueless erudition, in order that an examination may be passed quickly, that a trade may be "acquired," where time is the object and efficiency is not considered *must become* a history.‡

And, lastly, the order in which the leading discoveries in interference photochromy is presented is nearly unessential, for the reason that, up to the time of Lippmann, the discoverers were independent of one another. Lippmann and Lord Rayleigh did not, till long after their ideas were formed, hear of Zenker, nor Lippmann of Rayleigh. Lippmann's investigations, as Zenker's,§ take their origin with Edmond Becquerel. Thus, properly speaking, one should begin with Becquerel; it will, however, be more convenient to treat him with Zenker, and, in the first place,|| we will attempt to trace the ideas of Lippmann.¶

About 1883, Gabriel Lippmann, then "maître des conférences" at the Sorbonne, wished to show stationary waves to his pupils by producing them in a *fluorescent* substance. "L'expérience," he says, "mal faite, ne réussit pas." He afterwards thought of photography for fixing these stationary waves, but was stopped for years by the difficulties of obtaining sensitive media *without grain*. Finally, in reading Dr. Eder's *Handbuch der Photographie*, he saw that sensitised albumen was *kornlos*. He then took up again his experiments, and succeeded, in 1891, in fixing the spectrum.

It was only after this success that his attention was drawn to Zenker's *Lehrbuch der Photochromie*, and afterwards to the work of Lord Rayleigh, but he had long known (before beginning his researches) the work of Edmond Becquerel.\*\* In this work, says M.

\* Though these three names were taken somewhat at random, it is interesting to notice that they all, explicitly or implicitly, lay special emphasis on the *economical* side or character of science. Out of this an argument might be developed against those who maintain that an historical method is not economical in effort required to grasp ideas, an argument which at first seems to have great strength. Another, who was a great symbolist, and therefore paid attention to economy of thought, and who ranks with the two other greatest men in this respect—Leibniz and Lagrange—occurs to me, George Bode. He (cf. preface to his *Differential Equations*) emphasised the importance of historical methods.

† This seems to be one of the important consequences of the opinions which led him to write his "Mechanics and Heat" (cf. *Popular Science Lectures, &c.*).

‡ It is possible that, in the future, the truth of this may be so generally felt that memoirs will be published in a form which will make them bodily transferable to a history. If they *describe thoughts*, they will become much more detailed, because they *describe*, and also much shorter, because they describe *only thoughts*. I am not considering here cases in which it is necessary to give, in *non-permanent* memoirs, long tables of experimental results; but, as for these, they do not need description in a history, only the thoughts at their foundation, and, in the nature of things, they are superseded by others more perfect, and so on, until ultimately all is comprehended in *one* central point, a mathematical formula. In this desirable state of things, histories could almost be made by machinery, or by certain professional teachers provided with scissors and a gum-bottle.

§ After Lippmann, in a letter to me of September 8, 1900.

|| Reason: Chiefly because the good libraries in Cambridge are yet not accessible; they (at least, Trinity) are closed during the end of the Long Vacation. (See also the end of this paper.)

¶ I am indebted to M. Lippmann for the general sketch of the *marche de ses pensées*.

\*\* *La Lumière, ses Causes et ses Effets*, 2 vols., Paris, 1868. (The first volume is devoted to the "causes," the second to the "effects." Thus the second may be considered as a treatise on the science of "photography," photography being used in the wider sense.)

Lippmann, "Becquerel fait intervenir les ondes stationnaires, comme plus tard Zenker. Zenker n'a fait que développer l'idée de Becquerel. Ils ont eu tort de ne considérer que le sous-chlorure d'argent." I shall return to this important remark later, when considering Becquerel and Zenker, and, for the present, shall only quote from a paper read by Becquerel before the French Photographic Society in 1857\* (therefore long *before* the publication of his book): "These effects show that it is not by an action of the kind which gives place to the phenomena of thin layers that the substance reproduces the coloured impression of light, but on account of a special action, which causes the curious substance above named to have the faculty of only diffusing rays of the same refrangibility as those which have acted chemically upon it."

Lippmann's first communication of his process was to the Paris Academy on February 2, 1891.† He very briefly (as is usual with notes in the *Comptes Rendus*, on account of the restrictions placed by the Academy on the length of communications) laid down the necessary conditions for this "interference" method—the presence of a reflecting surface and practical grainlessness of the film.‡

With the publication of the *method* of photochromy, discovered by Lippmann,§ ends the first period of the history of interference photochromy. Having seen how a *method* arises from an abstract principle, it will probably now be of greater interest to photographers than before to trace the history of this principle, applied first by Becquerel and Zenker merely as an *explanation* of certain experimental results, then independently applied by Lord Rayleigh to the same purpose, and also—what is important as showing the gradual and organic growth of our sub-science—faintly perceived a possible *new method*.

The second period will begin when interference photochromy, as we understand it now, is generalised so as to include all processes (and there is a strong probability of there being at least one other) depending immediately on the purely metrical properties of light waves—the arranging of matter in correspondence with these metrical properties so as to be capable of returning colours by reflection or by transmission or both.

In the next place, then, we shall consider Edmond Becquerel and his observations on stationary waves. PHILIP E. B. JOURDAIN.

#### "PLASTIC PSYCHOLOGICAL SYNTHESSES" AT THE PHOTOGRAPHIC SALON.

THE Eighth Exhibition of the Photographic Salon consists of 239 prints contributed by 105 exhibitors. Of the latter, four are Frenchmen, who between them are responsible for 22 prints. American exhibitors total up to 28, and the comparatively large number of 70 examples are due to them. Nothing from Belgium, Austria, Germany, or Italy, is shown. The American Section is the predominant feature of an Exhibition the like of which we have not seen before, and upon which we are not eager to look again.

It is a difficult thing to take many of these American "photographs" —for so, we suppose, they must in courtesy be styled—quite seriously. With many of the productions of Mrs. Kasebier, Mr. F. Eugene, Mr. Clarence White, Mr. Watts Lee, and Mr. Holland Day, that have excited derision on the other side of the Atlantic, the pages of the American magazines and exhibition catalogues have long familiarised us, and habitual readers of the JOURNAL will not need reminding that, between the months of January and August of this year, we reprinted from those publications many references to the deplorable travesties of photographic

\* I have published a full translation of this paper in THE BRITISH JOURNAL OF PHOTOGRAPHY, May 12 and 19, 1899, pp. 292-294 and 309-311. For the reference see p. 309.

† *Compt. Rend.*, 1891, cxii. 274, 275. Further papers, Orthochromatised plates, dichromatised gelatine or albumen," *ibid.*, 1892, cxiv. 961, 962, and cxv. 575.

‡ For further particulars as to Lippmann, see my "Further Contributions," *Phot.*, June 22, 1899, 415; *Phot. Ann.* (C. H. Bothamley), 1892, 111, 112; 1893, 116-119; 1894, 97, 98; 1895, 190, 191; 1896, 179, 171; and 1897, 202. For M. Labatut's work (1891), see "Further Contributions," pp. 415, 416 (full translation).

§ M. Lippmann, it is interesting (but not surprising to any one who has at all studied investigators) to note, did not think his thoughts very important: "Je n'ai point noté l'histoire de mes idées sur la photographie, ne les trouvant pas très importants."

work which a handful of American photographers, encouraged by the adulatory writings of neurotic "appreciators," were deceived into believing "artistic" or "pictorial." These things are to be seen in Piccadilly just now, and, no doubt, some of them will be reproduced in books and annuals during the next few months. There will thus be plenty of opportunities for English photographers to examine the newest pictorial work (*sic*) that has reached them from a distance, and those of them who are sufficiently interested in the matter to keep in mind what is exhibited year by year will have no difficulty in perceiving that the productions of these very modern amateur photographers are, if anything, less defensible than the mere blurs and fuzzytypes that were mostly laughed out of the English exhibitions a few years ago. A specimen of the critical writing, which must in some measure be held responsible for the photographic inanities produced in America and now sent to this country for public exhibition may here be usefully quoted. The critic or appreciator has taken the work of Mr. F. Holland Day for his theme:—

"He is a psychologist, ever on the alert, ever seeking for this—to grasp and to express in material form the individual characteristics of his subject. What do I care for the blood flowing beneath the skin, for the network of swelling and throbbing veins? What matters the sight of the straining muscles full of life, if the invisible part, the mystery of this living being, be absent from the picture, if I cannot enter into communication with its spirit? I care not how brightly, how truly, the eyes may shine, if I know nothing of the thought, the fancy animating them. Even a flatness, or the projection of a bone, or the irregularity of a line, a deformity even, gives evidence of some habitual trait which, if at times contradictory, is, nevertheless, always full of interest. . . . As I said before, Mr. Day's art is one of delicacy and subtle refinement. To prove this, examine carefully the figures he so delights in. His subjects are intensely alike with the inner life, they seem heedless of all that might tear them from their own secret dreamings. They make no attempt at futile agitation, but are content with the thoughtful gestures of repose, the special poses and attitudes of pensive grace, in which the artist has fixed them. Look, for instance, at his portrait of Miss Ben Yusuf. How well he has caught her habit, her ordinary way of being, 'all her little ways.' One feels at once that the artist has photographed her with his heart, if such a thing can be said. The portrait thus conceived becomes a plastic psychological synthesis of the person represented."

Plastic psychological synthesis? Plastic psychological fiddlesticks! As we remarked in March last, when reproducing the article of which the above rhodomontade is an extract, the portrait so referred to was a very ordinary photograph of a tastefully attired young lady leaning against the door of a room. But Mr. Day—of whose striking figure work some few years ago we have the most vivid recollection—is not the only victim of this hysterical foolishness: Mr. Eugene, Mr. Clarence White, and Mrs. Kasebier have all been subjected to it, and, if we may trace back effect to cause, these worthy people, who can make good photographs if they choose, devote so much attention to the cultivation of the plastic psychological synthetic that they have clean forgotten all they may have known in their early days, and obviously stand in need of a few elementary lessons in posing, lighting, printing, and so forth. Are there no evening polytechnics in New York, Boston, and Philadelphia?

Those of us who have watched the drift of that new movement of which so much was said eight or nine years ago, are not astonished that it has culminated in the production of work which is the very negation of good photography. We saw it coming—this Cult of the Spoilt Print. To be in this movement you must take a negative hap-hazard and neglect all considerations of lighting, composition, definition, and other devices of the ignorant. Preferably make a portrait of some person whose likeness you may wish to bury in a mass of grey shadow. Pay particular attention to your printing process, and select one which gives you a great amount of "personal control." With gum bichromate it is easy to brush away as much of the pigment as you choose, but the process is not one to be recommended save in cases where it is desirable, from some cause or other, to raise strong doubts as to what was in front of the camera when the shutter moved or the cap was taken off. Local development with glycerine and treatment with a salt of mercury is an easy plan of securing "washed-out" effects, or, failing mercury for the flesh tint, a little of the iron may be left in the paper. It is a splendid yellowing agent. Care must be bestowed on the trimming and mounting. If the subject is a portrait, run the knife through the back of the head and shoulder. The edges of the print should be left rough. In mounting, any position but a central one should be chosen. Brown paper is an excellent support for photographs, and it takes pencil or brushwork well, thus giving you scope for

making a feature of your signature or initials, which, however, must be neither legible nor intelligible. The details of framing vary with the individual. A hen-coop supplies very good material for some purposes. On the other hand, the *passé-partout* system, which went out of fashion a quarter of a century ago, nowadays looks novel and uncommon.

And of such is the Cult of the Spoilt Print! Surely in this matter the lowest depths of folly have been plumbed! It is a small, as well as a painfully poor, Exhibition, and exceedingly dear at a shilling, we are bound, in common honesty, to remark, unless the visitor, to quote the phrase from *Pickwick*, "takes it out" in tea. The little wall on the left as you enter bears many repulsive-looking prints, for which those responsible for the hanging considerably—or shall we say ironically?—supply a powerful corrective in No. 36, Mr. H. Walter Barnett's magnificent platinum photograph of a helmeted girl, with flowing hair and a handsome, if not very saintly, face, called *Joan of Arc*. How this beautiful bit of photography seems to shame the wretchedly weak things by which it is surrounded! Mr. Davison is in many moods at this Exhibition. He shows large and small portraits, tree studies, and panoram marine views, some of which owe not a little of their effect to Indian ink, and, we believe, Chinese white. We like the snap-shot of moving figures on *Lowestoft Pier* (No. 32). In these little studies Mr. Davison manifestly aims at delicacy of treatment; but, on the whole, we do not think that this year he has given us of his best. Nos. 15, 19, 24, 35, 38 are shocking examples of bad photography, no more no less—a waste of good printing paper, and beneath criticism. We liked No. 44, a pleasing little portrait of the *Dean of York*, by Mrs. Archie Crommelin. The ecclesiastic is seated facing a bright light, and the effect is agreeable and natural. *Behind the Scenes* (No. 50), by Mr. Demachy, is a clever study of *dansesuses* at the wings of a theatre, printed in gum, of which process Mr. Demachy is by far the ablest exponent. We admire the consistency with which Mr. J. M. C. Grove sticks to his ideas of what constitutes pictorial photography. He always showed blurs, and we suppose always will. The "gums" that he sends here are explained by their titles, without which it would be difficult to say what the subjects were supposed to be. Mr. Eickemeyer has dressed up a pretty girl holding up a pretty child, put nimbi round the head, and calls the result *Madonna*. It is a very pretty photograph indeed; but, in our humble opinion, sacred and quasi-sacred subjects are best avoided by those very unidealising instruments lenses, cameras, and dry plates. Mr. Archie Cochrane's *Bonne Bouche* (No. 65) might be anything but what it purports to be; the boy's face and what he is putting in his mouth are so indistinctly rendered, that without the hint from the title we should not know what it was all about. We are a little curious, too, concerning No. 93, *When the Heart is Young*, by Miss Bessie Stanford. Two little girls are shown playing ball near a window, and the disc outlines itself sharply and clearly against the light. Was this in the negative or not? We should think a shutter photograph of a falling ball indoors somewhat difficult to get. No. 151, by Mr. J. C. Warburg, a group of four children and a man, is entitled a *Carpenter's Shop, Holland*, but the shop, if such it is, cannot be said to form a prominent part of the picture. At all photographic exhibitions we invariably meet with curiosities of titles. *Autumn Mists* (No. 159), by Mr. W. Thomas, is one of those productions which may be either very good or very bad. Looked at from various distances, we could see nothing in it but the effect of blur. Frank Sutcliffe's *Fisherman's Daughter* (No. 107) shows the crouching figure of a girl looking, presumably, out to sea, but there is nothing in the photograph to indicate the relationship of the young lady to a "toiler of the deep." Why will exhibitors indulge in these enigmas? Mr. Holland Day adds to our perplexity. For three of his pictures, which, to do Mr. Day justice, are not in his "Spoilt Print" vein, he asks the modest sum of ten guineas each. One is about half-plate size, entitled *Mother and Daughter*, and is a somewhat sombre little interior group study. We fail to see value for money in this, even granting its possession of plastic psychological synthesis—which we do not.

This exhibition is a curious mixture of the photographically good and bad, with a predominance of the latter. Again and again we looked at some of the things on the walls, only to be forced to the conclusion that they were hung because their merits were of a negative kind. But even a Salon is not all bad. This year, however, the things that are good and admirable are fewer than usual. To Mr. Charles Moss, perhaps, belongs the honour of the greatest advance. His two large "gums," No. 94, *The Seashore*, and No. 183, *Thunder Clouds*, are broadly executed bits of work, full of force and conviction. Mr. Moss has done nothing better than these. But photography in its best and non-"fake" aspects is well represented by the works of Messrs. J. Craig Annan, Karl Greger, H. P. Robinson, Ralph

Robinson, Harold Baker, and F. Hollyer, who, however, must find it difficult to avoid repeating themselves. The outdoor figure subjects of Mr. Annan show this very able photographer's mastery of lighting and composition. There is always a hint or two to be gained from his style of treatment, even though the student cannot avoid the reflection that the results are reminiscent of the work of painters. Mr. H. P. Robinson's hedge-side studies, with gracefully-posed female figures, are full of brightness, roundness, and most pleasing contrasts of light and shade. Mr. Ralph Robinson's little portrait studies are simple and delicate, and never fail to please. A level-headed man, we hardly think this worker is likely to be misled into wasting his time and abilities in making bad photographs by the aid of glycerine and other messes. The series of portraits by Mr. Hollyer happily show that he has abandoned the eccentricities of cross-lighting to which he was at one time treating us. Of Miss Weil's contributions, she is happiest with a very graceful study, No. 102, *Lady with Muff*. In fanciful portraiture of this order she is usually successful, and her prints have a depth, richness, and vigour which make the bilious glycerine-mercury abominations of her compatriots difficult to tolerate. Portraiture of a recognisable kind comes from Mrs. Kasebier—No. 116, *Mr. W. H. Lee*. The lady will be well advised if she sticks to work of this kind, and leaves plastic psychological syntheses severely alone. We are very pleased indeed to meet an old exhibition friend in Mr. Shapoor N. Bhedwar, who in No. 120, *With Idle Love Thoughts Pining*, shows a glowing bit of portraiture, the figure of the beautiful brunette being posed with that difficultly acquired art which conceals art. Mr. Craigie is successful with a profile portrait of a lady; but it is obvious that he was aided in the result by the graceful and photographable outlines of the fair sitter's head, face, and throat—a thing one cannot always reckon on in portraiture. Perhaps Mr. Craigie is at his best in (No. 190) *Scotch Firs*, an excellent bit of work firmly handled. C. Puyo, in (No. 208) *Fleurs d'Avril*, earns our thanks for a brilliant effect of high lights. A word of praise is due to Miss E. L. Watson for (No. 180) *Head of a Young Girl*, the best of the glycerine prints. The photographic qualities of the negative are so manifestly good that we are forced to wonder why "faking" was considered necessary; a good print could have been obtained in any ordinary medium, such as carbon, sepia platinum, Velox, &c.

As regards the display as a whole a little plain language becomes a duty, from the performance of which, however unpleasant it may be, it is a sin to shrink. The Eighth Exhibition of the Photographic Salon is an insult to the public upon whose support it relies to pay rent and other expenses. It does incalculable harm to photography by attracting to it the contempt of those who have no sympathy with the prostitution of a beautiful method of graphic expression to the lamentable idiosyncrasies of those whom Nature, for some inscrutable purpose, has endowed with a passion for the grotesque and the ugly, which may deserve our pity, but neither our admiration nor our imitation. We live in a free country, and fortunately, or unfortunately, there is no law to forbid people debasing the powers which sixty years of photographic research and progress have placed within their grasp; but when the painful productions of these perverted uses of photography are dragged from the impregnable security of privacy and held up to public view, then, in the minds of all sensible photographers, scorn, disgust, and contempt dispute for pride of place.

### STOPS, LENSES, AND PERSPECTIVE.

A paper read before the Royal Photographic Society.]

THE method of measuring or numbering stop apertures, as published officially by the Royal Photographic Society, is, I think, rather out of date. The method now employed for Continental lenses is to get the efficient aperture by focussing the sun on the ground glass, substituting for the ground glass a piece of ferrotype plate with a pinhole in it, putting a light behind the pinhole, and measuring the circle of light on the front lens. I cannot see why the old fashioned method of the actual diameter of the stop aperture should remain on the Society's books as the official method; that which I have described is used by all the best lens-makers, and I think the Society should expunge the other plan from its records. The U.S. stop apertures are equally antiquated, only  $f-8$ ,  $f-16$ , &c., are now used.

I have here four lenses of the same focus, but with working apertures of  $f-2.3$ ,  $f-5.4$ ,  $f-7.7$ , and  $f-11.3$  respectively. In my own experience I prefer the  $f-11.3$  lens; I seem to get sharper images with it than when using the other lens stopped down to the same extent, and I put it down to the thinness of the lens. There is no room for the light to go backwards and forwards inside, there is less stray light in the camera; and I

believe that a  $f-5.4$  lens, for instance, stopped down to  $f-11.3$ , will never give as good results as a  $f-11.3$  lens will give at full aperture. I have never seen any statement in print to that effect, but in practice I find that it is so, not only with big lenses, but also with cinematograph lenses, and I attribute it to the fact that there is less reflection and less stray light in the camera caused by the lenses being smaller in diameter and thinner.

The usual method of selecting lenses for cameras of different sizes is, I think, not quite satisfactory. I do not think it is on the right basis, and I want to propose some considerations that I have not found mentioned in any photographic book.

No person of normal sight can see any photograph correctly—perfectly correctly—unless it is at a distance of at least 10 inches from the eye. As a rule, I believe, the distance is about 20 inches. I find that nearly every one holds a newspaper 20 inches from the eye. Plates, &c., on a table are also about 20 inches from the eye. I think, however, oculists put the distance at 10 inches. For prints on paper I think no photograph should be taken with a lens of less than 10 inches. If, in the case of small cameras, half-plate or quarter-plate, a lens must be used of less than 10 inches focus, the lens with which the photograph is taken, or a lens of approximately the same focus, must be held to the eye in order that the image may be seen correctly. If a photograph is taken with a 5-inch lens, and it is desired to observe it correctly and comfortably and with correct perspective, and without holding a lens to the eye, it is necessary to enlarge the picture; that is to say, if a quarter-plate picture has been taken with a 5-inch lens, it must be enlarged at least twice, if not four times. The resulting picture is equivalent to one taken with a 10-inch or a 20-inch focus lens. It could then be held at a comfortable distance from the eye and seen correctly.

With regard to the rising front, a photograph taken with a raised front and the camera tilted must not be viewed with the eye exactly opposite the centre. At photographic exhibitions I do not think the hanging committees consider whether the pictures were taken with a rising front or not, but they should do so if the pictures are to be correctly seen. I propose to use an Abney level whenever I use the rising front.

This instrument can be carried in the pocket, and vertical angles can be very easily measured with it. Then, if a picture is hung on the wall, I should place it at such a height as to get the same angle, from the usual point of observation, as that from which the photograph was taken, and then the object will be seen correctly.

In taking tele-photographic pictures the level could be used in another way, by placing it on the baseboard of the camera, as the rising front is not usually used for tele-photo work.

I have here a print taken with a tele-photo lens giving about ten magnifications; it must be held at a particular angle above the observer's eye, and at a distance of eighty inches, to be seen correctly. If one looks at the centre of the picture, it appears absurd, but when held in the proper position it is seen quite naturally.

In the same way, an object taken with the camera perfectly level should be hung exactly opposite the level of the eyes, standing; if it were hung in a room, hall, or where it would generally be seen by persons who were sitting down, it should be placed at a suitable angle from the position at which it is usually seen.

I strongly object to photographs taken with very wide-angle lenses. I think, first of all, that they are absurd. In the case of a church tower, where a wide-angle lens has to be used to get all the subject on the plate, the print must be seen in a particular way, or, if enlarged, it must be enlarged to a considerable extent; as such subjects include a larger angle than can be seen by the eye at one time, the degree of enlargement must be such that the observer must turn his eye from side to side to see different parts of the photograph. I therefore suggest that a photograph of a church tower should be taken just in the way that the eye would look at a tower. If we are close to a rather tall tower, in many cases it will not be seen entirely without movement of the eye, and I suggest that such photographs should be taken in sections, at different angles, and then joined together—I think that can be satisfactorily done—and then the photograph of the whole will be natural. I think it would also, as a rule, have to be enlarged, or taken with a lens of very long focus, so that it could be held at a sufficient distance from the eye.

In connexion with the use of the Abney level, I should have mentioned that it does not matter how much the rising front is used, or if the camera is tilted as well. Cross lines must be used on the ground glass, and the object at the intersection of these lines must be observed with the level and the angle read off.

I think it is too much to expect that exhibitors will state on their photographs the angle at which they were taken and foci of lens used;

but still I think the hanging committee might notice whether a picture has been taken with the rising front or not, and hang it accordingly.

It is well known that artists often use very long paint brushes, and you will find that in a gallery people stand at different distances from the picture so as to focus it to their eyes.

As regards catalogues of lenses, I do not know whether it would be possible to adopt some other method than always suggesting, say, a 5-inch lens for a quarter-plate. I think it is a mistake to call any lens a half-plate or quarter-plate lens; and, as far as I am concerned, I never use that method. I suppose we shall hardly yet be able to have a catalogue simply giving the diameter of the image covered with different stops, but I think it would be the ideal arrangement.

Some time ago a member showed some prints from negatives taken with lenses of different foci; he preferred one taken with a rather short-focus lens, but I thought the long-focus one was much better. I think short-sighted persons will naturally prefer photographs taken with a short-focus lens, because they can hold them nearer to the eye; and those who are far-sighted will prefer pictures taken with a long-focus lens, and I think that, as a general rule, they are more pleasant to the eye. I have always found that objects seen through a telescope appear very beautiful; and I believe that, the narrower the angle at which an object is seen, the more comfortably it may be seen, and that, the wider the angle, the greater is the strain upon the eyes. I have known field glasses to give a very wide angle of view, but they have had to be dropped very quickly, because they seemed to hurt the eyes; and experiments made by my firm have borne this out. It has been found, too, that microscope eyepieces giving a very large angle produce a strain upon the eyes; some day I hope to get an eyepiece made with an iris diaphragm, so that the angle of view may be made very small, and I am sure the eye will be made more comfortable. Microscopists and people who use telescopes have found this to be the case, and I believe it is the same with photographs as well.

J. H. AGAR-BAUGH.

In the course of the subsequent discussion, Mr. W. E. Debenham said that, like Mr. Baugh, he used the swing back as little as possible, and he thought this was the general practice. If the rising front was used and the camera kept square, and it was desirable to register so exactly the height of the line of sight, it would be simpler to put a measure on the front of the camera, and to notice how much the lens was raised, than to use the quadrant level as suggested. If the swing back was employed as well as the rising front, a quadrant might be useful. With regard to the suggestion that a high tower should be represented by a series of two or three photographs joined together, the adoption of this method would cause a straight line to appear as a number of straight lines with angles between them, or an infinite number would be represented by a curve; but in either case the result would be a falsity, and in his opinion a more offensive falsity than would be produced by taking a single photograph of the tower with the camera back upright. As to the objection to the use of wide-angle lenses, although a narrow-angle was more agreeable to the eye, there were many views which could only be taken with a wide-angle lens, and were we to deny ourselves taking such views? He should say certainly not. It was sometimes said that the perspective in any photograph was right if the view did not include an angle of more than 60°, and that beyond that the perspective was false. This was a mere arbitrary statement, without foundation in fact. Of course, the narrower the angle the less one would see of distortion by displacement; but the President would probably remember that he (Mr. Debenham) once photographed a series of globes which were within an angle of 60° and some of which showed as decided ellipses. There was really no definite point at which what might be called distortion began or ceased. As soon as the centre of a flat plate was left a representation was obtained which was not true unless it was looked at from a particular point, and the greater the distance from the centre of the field the more conspicuous did the distortion become. In a very wide-angle photograph of a group, where the photographer could not help himself, the side figures would appear very much distorted by being broadened when looked at opposite each figure instead of from opposite the centre of the picture.

Mr. T. Bolas, referring to the subject of wide-angle lenses, said it was often stated in books that vision could only include a very narrow angle, he thought about 60°; his eye, at any rate, could see with fair definition over 120°, and it was proved in this way: Set up three lights, one axially, and the other two in such positions as to subtend a given angle to the eye, say 120°; look at the middle light steadily, and then extinguish all the lights or look away; if then one sees the "ghosts," or retinal images of all three, the eye must have included that angle when

the middle light was looked at; naturally, the two outer lights should be rather more intense than the middle one. Other experiments of a similar character might be mentioned.

Mr. H. W. Bennett thought that, in using a level to determine the extent to which the front had been raised, Mr. Baugh was going a rather round-about way to find out something that should be visible from the picture itself. In an architectural photograph, taken while the swing back was kept upright, the extent to which the rising front was used would always be indicated by the distance below the centre of the picture that the perspective lines became perfectly horizontal. In landscape work, too, the distance of the horizon below the centre was the amount that the rising front had been raised above the centre. With regard to the use of wide-angle lenses, although there was a general objection to the inclusion of a wider angle than was absolutely necessary, there were, as Mr. Debenham had said, many subjects that could only be taken with a wide-angle lens and where the circumstances were such that the composition would be thoroughly bad if a narrow-angle were used; and it appeared to him that the general result of the picture should be considered rather than any arbitrary rule as to the angle to be included. In connexion with distortion there was one point which was sometimes overlooked. In many wide-angle pictures it was necessary to use the rising front very considerably, so that from the centre of the lens to the top corners of the subject would include an angle very much greater than that from the centre of the lens to the bottom corners of the subject, sometimes as much as two or three times greater. The lens might be raised to such an extent that an angle of 45° would be included from the centre of the lens to the top corner of the picture, while that to the bottom corner would be only 15°, rendering it necessary to employ a lens capable of covering 90°, though only an angle of 60° were utilised. He had seen many photographs that he knew to have been taken under such circumstances, and they looked perfectly natural, although, if such an extremely wide angle—45° from the centre—introduced so much distortion, it should have been apparent. It seemed rather undesirable to fix arbitrary rules with regard to angle of view, because the picture, as a whole, and its effect as a picture, should be the first consideration, especially now that such excellent wide-angle lenses were obtainable.

The Rev. F. C. Lambert thought there was a good deal of truth in Mr. Baugh's remarks upon the subject of the hanging of pictures, to the effect that for a picture to be seen at its best it should be hung in a position bearing a certain relation with regard to the eye of the observer. Painters were agreed upon this point, although they did not carry the theory into practice at the exhibitions of their work. For example, one saw various attempts to represent what was called a downhill effect, an effect which was certainly very difficult to represent adequately, owing in part to the impossibility of getting the picture below the level of the eye so as to correspond with the position of the observer in nature. It was a remarkable physiological fact that the position of the head undoubtedly had an effect upon the appearance of a picture. He once saw a photograph which had been taken looking down into a well. When it was hanging on the wall it looked absurd—no one could even guess what it represented, but when it was placed on the floor and looked down upon—as one would look down a well—it had a strikingly realistic effect. There was no doubt whatever that the position of the head had a wonderful effect in enabling one to realise the altitude or depression of a view. With regard to wide-angle lenses, he agreed with Mr. Debenham that it was undesirable to endeavour to fix upon any particular angle, and that no arbitrary line could be drawn as to what angle was or was not visible. If we were to take the verdict of physiologists who had studied the question, the matter resolved itself to this, that the amount of sharp picture that could be seen with the normal eye, with the head in a fixed position, was about one degree, that being the extent embraced by the middle of the *fovea centralis*, and directly that was passed there was a gradual falling off. The fact alluded to by Mr. Bolas, that one could see lights falling on the periphery of the retina, merely showed that there were nerves in that position and not that the lights were distinctly "seen," in the ordinary sense of the word. The question as to how far one could see right and left was very interesting, but he thought that, like many other points in photography, it was a matter of compromise. Pictures could not be hung in strict accordance with any theory, but it was certainly desirable that, where it was possible, pictures taken with the lens depressed should be hung fairly low down, and that those which represented high-angle views should be hung high on the walls.

The President pointed out that there were three kinds of perspective—spherical, cylindrical, and plane perspective. In each the station point was of extreme moment, and, if it were not for the absence of an indica-

tion of the station point, photographs could always be made to appear correct. With spherical perspective everything would look right from the centre of the sphere; with cylindrical perspective, by standing in the centre at the radius, for, as the eye turned, everything would look correct; but in ordinary plane perspective the cylinder was projected upon a plane called a tangent scale, as was seen in metro-photography. Five or ten degrees of angle of subject near the centre occupied less space than a similar angular measurement near the edge; but, if the eye were at the station point, every point in the picture would subtend the same angle. There was, therefore, theoretically, no objection whatever to an extremely wide angle, provided the perspective was observed from the true station point. With regard to exhibitions, it might, of course, be possible for those who are very particular in the matter to indicate the station point on the back of their pictures. There was no doubt that wide-angle pictures taken by lenses of short focal length were seldom seen agreeably, and, although the effect of enlargement would obviate this to some extent, the correct station point must still be maintained in order to secure accuracy in representation. In certain schools of art the pupils were not allowed to learn perspective, but were told to paint the subject as they saw it, and there was a good deal to be said for this principle. Photographers' work, however, was subject to measurement; they use a lens which is a mathematical drawing instrument, and they must abide by the drawing which it gave. With regard to the measurement of lens apertures, some thirty years ago the general method of finding the working aperture was to use a ferrotype plate in the manner mentioned by Mr. Baugh, and to cover with milk the anterior surface of the front lens, and measure the illuminated disc. Diaphragm apertures were at one time referred to in a very slipshod way; the President's late father arranged stops bearing a certain relation one to another. Later, when the question of a unit of intensity was discussed, an aperture of  $f-4$  was suggested by the P.S.G.B. Committee as the best, because it corresponded with the aperture of the rapid portrait lens in general use at the time. He thought the time had possibly arrived when an alteration might be made in the Society's standards, which were very little used, for everybody at the present time understood what was meant by  $f-1$ ,  $f-2$ ,  $f-6$ ,  $f-32$ , &c., but the meaning of any set of numbers would have to be worked out.

Mr. John A. Hodges alluded to the statement that the use of a small aperture tended to produce greater roundness in the picture, and said that he had always been of opinion—and he thought he had proved—that "roundness" depended more upon the lighting of the subject than upon the aperture of the lens. With regard to the use of wide-angle lenses, he agreed that the question should depend upon what the photographer wanted to do with his lens at the time of using it; the subject should be considered from the pictorial point of view, and the photographer, having selected his picture and determined what he wished to include upon the plate, should select the particular lens that would give the desired result. He was referring more especially to landscape work, in which it was sometimes necessary to use a wide-angle lens, and he had no hesitation in saying that it would be very difficult indeed for any one to form an opinion as to the focal length of the lens with which such photographs were taken. He had recently been taking some negatives of the Lynn Valley, a confined situation where the use of a wide-angle lens was absolutely necessary in order to convey an adequate impression of the character of the scenery, and he did not think any arbitrary rule should be laid down such as Mr. Baugh had suggested.

Mr. Baugh, in replying, said he considered that the use of the Abney level, for registering the angle from the horizontal at which a picture was taken, was much simpler and more satisfactory than measuring the extent to which the lens was raised, as suggested by Mr. Debenham. The latter method would involve calculation which was not necessary with the Abney level. For topographical work wide-angle views were necessary and useful, but, from the pictorial point of view, unless they were observed from the right station point they were inaccurate and very ugly. He believed that, as Mr. Bolas had said, a very wide angle could be seen, but only a very small angle could be seen sharply and comfortably. In his opinion it would be much more difficult and less certain to measure the angle on the print by the horizon, as suggested by Mr. Bennett, than to use the level, which was simplicity itself. With regard to composition, wide-angle lenses must certainly be sometimes used in architectural work, but then the print must be observed in the proper way, and the whole object of his paper had been to point out that a photograph could not be seen correctly unless it was viewed from the right point. Of course, no arbitrary rule could be laid down as to the employment of wide-angle lenses, and he had not suggested such a thing. In the Dresden Gallery some pictures were placed in special rooms in such a manner that the majority of the visitors should see them from the proper stand-point, and he advocated the adoption of a similar plan at photographic exhibitions.

#### ARTIFICIAL DAYLIGHT.

The following is an abstract of a very interesting and suggestive paper, read before the British Association by Messrs. Arthur Dafton and W. M. Gardner:—

It is a matter of common experience that many colours alter in appearance when seen by artificial light. The extent to which colours may vary under different illumination is, perhaps, not commonly known, but is well illustrated by the range of dyed cloths exhibited. Amongst other patterns, one which is green by daylight becomes red-brown by gaslight; a violet changes to purple, a grey to heliotrope, a shade of tan to a brick-red. Particularly striking is a pattern woven from specially dyed yarns, which appears a uniform green colour by daylight, but which is figured by gaslight. Seen by the light of the electric arc, the patterns show similar, but less marked, changes.

It may be of interest to indicate briefly how such peculiar changes of colour arise. The colour of a body depends, in the first place, on the nature of the incident light. In monochromatic red light a red appears much the same as in daylight, but a yellow changes to red, a green is almost black, while blues and violets become red.

Gaslight shows a continuous spectrum from red to violet, but, compared to daylight, is of a strong orange colour, due to an excess of rays in the red, orange, and yellow. It does not, however, necessarily result that all colours appear redder by gaslight. It is, indeed, well known that the majority of colours change little by gaslight. This is due to the adaptability of the eye. If the light becomes redder, the eye becomes less sensitive to red; if the light is deficient in green, the eyes become more sensitive to green. Persons working by gaslight soon cease to notice its intense orange colour. It results that a grey produced by mixture of black and white appears grey under any illumination, and simple colours, such as reds, oranges, and some greens, giving light confined practically to one part of the spectrum, undergo little change.

Generally, however, the colour of a body is due to a mixture of light from different parts of the spectrum. All violet colours are transparent, not only for violet but also for blue and red light; all blues transmit not only blue, violet, and green light, but also more or less red. Consequently, whenever a blue or violet is used in the production of what is called by artists a "tertiary" colour, the general result is a colour having bright bands in different parts of the spectrum. A mixture of red, blue, and yellow, to produce a neutral grey, will show bright bands in the red and green—complementary colours, resulting in a proportion of white light. According to the exact position and intensity of these bands the grey will become redder or greener, or may even remain unchanged by gaslight.

Generally colours become redder under artificial light. This is due not merely to the redder character of artificial lights as compared with daylight, but to the peculiar transparency of colouring matters for red light. Among reds and yellows we have many theoretically perfect colouring matters, a perfect yellow being one having sharp absorption in the violet and blue, and perfect transparency for green, yellow, orange, and red rays. A perfect blue would be transparent for violet, blue, and green, and opaque for the rest of the spectrum. Apparently such a blue can only be obtained by means of cupric salts. All other blue dyes and pigments we have examined agree in being more or less transparent for red light. Even greens transmit some red. This peculiar transparency of colours for red light is of primary importance in colour-matching. All dyers know how persistent is the tendency to the development of red in the production of compound shades.

The need of an artificial light which should so closely resemble daylight as to show colours in their true relationship has long been felt by workers in colour. At present the electric arc light is largely used for colour work, but, as we have seen, it is far from satisfactory.

The peculiar character of daylight is due essentially to the modification produced by the atmosphere in the light from the sun. Light from a north sky as usually adopted for colour work is deficient in red, orange, and yellow rays, and consequently the light from a clear north sky is intensely blue.

Starting with the electric arc light as being nearest daylight in character, the authors attempted to imitate by direct absorption the effect produced by scattering in the atmosphere.

The light of an arc lamp consists of two distinct parts:—(1) The light from the glowing carbons; (2) the light of the arc itself, characterised by its richness in violet rays. In lamps of the enclosed arc type the length of arc is increased, and consequently such lamps give a light richer in violet rays. Although arc lights vary somewhat in the proportion of violet light, they all agree in being richer than daylight in the amount of red, orange, and yellow rays, compared with the amount of green and blue. Owing to the peculiar transparency of colours to red light already

noticed, it is of primary importance that the proportion of red light should be carefully adjusted. Small variations in the amount of violet light are of minor importance, owing to the eye being less sensitive to such rays, and also because in mixing colours there is not the same tendency to develop a band of violet as we have seen occurs in the red, since yellow colours generally have complete absorption in the violet.

The required absorption of the less refrangible rays can be effected by means of blue cupric salts. A solution of copper sulphate shows strong absorption at the extreme red of the spectrum, the absorption extending with diminishing intensity into the green.

For practical purposes the light from the arc is modified by passage through pale blue glass coloured by means of copper. This coloured glass may conveniently take the form of a globe replacing the ordinary globe of the arc light.

#### THE REGISTRATION OF PHOTOGRAPHS—NOTICE TO OUR READERS.

At the head of our weekly Answers to Correspondents it may very often be noticed that a list is given of photographs registered. There are one or two misconceptions prevalent with regard to this matter which we take this opportunity of removing. In the first place the announcements relate only to photographs which we ourselves have registered for the convenience of our readers. Secondly, they have no reference whatever to or connexion with the official register at Stationers' Hall. Thirdly, they are merely records of registration that we have effected, and they have no legal significance at all, being of the nature of informal receipts only.

It has occurred to us that our readers at large may be usefully reminded that, for their convenience in the matter and especially that of photographers living at a distance from London, our publishers undertake the registration at Stationers' Hall of copyright photographs. For the guidance of those unfamiliar with the necessary procedure, we here state what is required in order to effect registration through THE BRITISH JOURNAL OF PHOTOGRAPHY.

1. Send us two copies of the photograph to be registered, with a postal order for one shilling and sevenpence.
2. On receipt of these our publishers will forward the photographer a registration form, which he must fill up and return to them.
3. Address all communications on the subject to Messrs. Henry Greenwood & Co., 24 Wellington-street, Strand, London. The fee of one shilling and sevenpence covers the cost of registration (1s.), form (1d.), postage and expenses.

#### THE "BRITISH JOURNAL" DEPOSIT SYSTEM.

It has been our custom for many years past to act as intermediaries between advertisers of photographic apparatus, &c., in the miscellaneous columns of our outer pages, and would-be purchasers of those goods. The latter deposit with us cheques to value, and if a sale is effected the money is forwarded to the vendor, or, in the event of a non-sale, it is returned to the sender. The conveniences of this system are obvious. Advertisers desirous of disposing of goods can send them on approval to inquirers in the assurance that the latter are acting *bonâ fide* in the matter; while, on the other hand, the would-be purchaser need not part with his money until he is satisfied with his bargain.

We draw attention to the fact that we undertake to act as depositories in these transactions by way of replying to many inquiries that have recently reached us on the subject. Numbers of readers and advertisers appear to be under the impression that we do not hold money on deposit. Besides, cases have been brought to our notice in which goods and money have been parted with, to the subsequent dissatisfaction of those concerned.

We therefore wish it to be known that, for the convenience of those who utilise our miscellaneous advertisement columns for the disposal or purchase of photographic apparatus, we undertake to hold sums of money on deposit. The following simple rules must be observed:—

1. A would-be purchaser must send us a cheque, P.O.O., or P.O. to the value of the amount asked by the advertiser, plus one shilling, our charge for expenses.
2. We will advise the vendor of the receipt of the money.
3. On notification from the would-be purchaser that he approves of his bargain, we will forward the money to the vendor. In the contrary event, the money will be returned, so soon as we are advised that the vendor has received his goods back.
4. It must be distinctly understood that our participation in the transactions is limited to the receipt and despatch of deposits.
5. All communications relating to THE BRITISH JOURNAL deposit system must be addressed, and all cheques, P.O.O.'s, and P.O.'s must be made payable, to Henry Greenwood & Co., 24, Wellington-street, Strand, London.

#### THE ECONOMY OF PHOTOGRAPHIC LABOUR.

COMMERCIAL photography being a manufacturing business in which the raw material is converted into finished articles ready for sale, a large part of its working outlay must go to skilled labour, wages thus forming the main expense in the cost price of photographs. To be successful as a professional photographer, it is therefore necessary to understand the economy of labour, in order to employ it to the best advantage, and to put it to the most profitable uses. True as this is, it is still a fact that few photographers really grasp the labour question, and, as a consequence, the majority of businesses neither yield the highest possible profit to their owners nor the maximum wage to the assistants. The employer still treats his assistant as a servant, a chattel, expecting from him a number of personal services unrelated to his work. In contrast with this, the modern factory-owner regards his worker as a wheel in a machine, doing the allotted part, and no more nor less, personal services under this system having no economic value to the employer, but rather lessening than adding to the worth of an *employé*. By retaining the notion of the assistant as a servant, the photographer refuses to avail himself of those improvements which, during the present century, have so largely increased the productiveness of labour, placing the manufacture of commodities upon a firm economic foundation.

The photographer, again, still carries on his business on the lines of a cottage industry, which is inferior to that known as the factory system. Under the former the workers were isolated, manufacturing their articles from start to finish unaided by machinery; with the latter, the workers are concentrated in large buildings, the principle of the subdivision of labour is strictly carried out, and the newest and most complex machinery utilised. The advocates of the factory system, while quick to grasp the value of the subdivision of labour, the concentration of the workers, and the worth of good appliances, overlooked the health and well-being of those in their employ as a factor in the economy of labour. Including this last, the economics of labour fall into the following leading sections:—

- (a.) The subdivision of labour.
- (b.) The organization of the workers.
- (c.) The economy of tools and appliances.
- (d.) The well-being of *employés*.

In the rudimentary stage of manufacture the mechanic undertakes to commence and finish an article throughout; hence, in the early days of photography, the production of plates, sensitive papers, &c., in addition to the making of portraits, was carried on by the individual worker. As any industry progresses, this primitive method of production becomes unsuited to the demands of the case, and the business is subdivided into various sections. A special class arises, who deal first with the raw material, and we have the plate-maker and the producer of sensitive papers; after these, many skilled men as operators, retouchers, enlargers, and printers, each making a speciality of operations previously done by the single worker. The foremost advantage of this subdivision is that the man who confines his attention to a single operation becomes, by habitude and practice, so expert, highly skilled, and adept that his daily output is largely increased. Practically, there is no limit to this process; and, the greater extent to which it can be carried, the more productive does labour become. In photography the subdivision has not yet been taken far, though a few of the larger firms have gone a considerable length in this direction. For instance, in one case the printing is thus split up: paper-cutter, printer plain, printer vignettes, boy to fill up printing frames, boy to carry them in and out of printing-room, washer before toning, toner, fixer and washer after toning, mounter, spotter, burnisher. Here we find eleven separate assistants confined to a single duty throughout the day, and engaged in operations usually conducted by an unaided printer.

By this simple device an undoubted economy follows, the amount of completed work being larger, and more expeditiously produced than if eleven printers were individually occupied with the whole course of printing operations. Beyond this gain arising solely from the expertness of the specialist, a further economy results where each worker continues daily in a similar task, for the time lost by the worker doing various consecutive processes, in passing from one to the other, or in changing from one set of tools or appliances to another, is saved under a subdivision of labour. It follows for these reasons that a multiplicity of duties, or a multiplicity of processes, conducted by the same man is economically not so advantageous as confining his attention to one process or a simple range of duties. This principle is one of the soundest of modern economics, and from its importance it would not be without profit to examine it more closely, and to find how far photographic manufacture is guided in agreement with its demands.

In so far as a subdivision of labour has been adapted to photography, apart from the manufacture of material where labour is much more specialised, we have only to consider, for the majority of workshops and studios, operator, retoucher, and printer. The average photographic business being comparatively small, it is scarcely possible to divide the assistants into more sections, except in a few instances of big firms where we have out and indoor operators, developers, retouchers, black-and-white workers, carbon, platinum, and silver printers, mounters, and spotters, each distinct. This being so, it will be preferable to consider the

larger class of employer, merely noting that a wider subdivision is possible, and in all cases desirable when the extent of business allows.

Coming at once to the question of multiplicity of duties, the following summary indicates without exaggeration what is expected from operator, retoucher, and printer, respectively, in the general photographic house of trade:—

The operator uses several brands of plates with various developers— isochromatic and backed plates, often wet-collodion plates for making enlarged negatives, bromide papers, bromide opals, lantern plates. He must also be competent in studio work, copying pictures, landscape, groups, interiors, and machinery. In addition he is supposed to be able to retouch, to do black-and-white work, and to supervise the retouching, printing, and finishing of the establishment.

The retoucher, besides working on negatives with the pencil, must also be an expert with the brush, and colour on platinotypes, carbons in several colours, chiefly red chalk, sepia, and brown; carbons on opal and ivory; bromide paper and opals in crayons; and, if called upon, be ready to spot and sometimes colour, albumen and gelatino-chloride prints.

The printer should possess a practical knowledge of the following: Albumen, collodio-chloride, gelatino-chloride, carbon, single and double transfer on opal and ivory, carbon negatives and transparencies, platinum, sepia platinum, collodio-chloride platinum toned. In some cases he must know bromide papers and the other methods of making prints by development.

From the above summary, which is drawn from actual observation, it is manifest that the use of a multiplicity of processes is carried to the extreme in present-day photography, and that operator, retoucher, and printer are occupied in a diversity of manipulations involving considerable waste of time in passing from one process to another.

To examine this more closely, take the case of the printer. It is no uncommon thing for him to undertake daily five distinct processes single-handed, or with only a lad to help, namely, albumen, P.O.P., collodio-chloride, platinum, and carbon. This implies five distinct papers, each kept in its wrapper, each to be undone every time it is wanted, re-wrapped, and put away again when the printing frames are filled, platinum and carbon paper in light-tight and air-tight tubes. At the lowest estimate ten chemicals are needed—gold chloride, acetate soda, sulphocyanide of potassium, hyposulphite soda, sodium chloride, oxalate potash, hydrochloric acid, carbonate soda, bichromate potash, alum—each requiring to be weighed, mixed, and kept in measured solutions and baths ready for use. To manage all these processes, twelve dishes, including expensive enamelled iron and porcelain, are a necessity, and fifteen, or three for each, would not be excessive for clean manipulation.

Such being the material, chemicals, and appliances that pass through the hands of a printer, it is evident that a large proportion of his working hours is lost in the mere preparation for printing, changing from one paper to another, and in moving the many solutions, papers, chemicals, &c., under his care from place to place. Thus handicapped, the daily output of finished prints, even with the most energetic printers, must be considerably reduced, and cannot be sufficient in quantity to balance the waste of time lost in doing unproductive labour. The same holds good of the output of operator and retoucher, because the value of their services can only be judged by output, and not by the length of the hours occupied.

Beyond the loss through the time that is unproductive *i.e.*, when the employé is preparing, or changing from one set of duties to another, we must also consider that caused by the deterioration of chemicals, and stock, breakages, wear of appliances, and waste of material, all these being proportionately greater, the larger the number of chemicals employed, the appliances handled, and processes in use.

From this short review of the conditions of photographic manufacture it must be obvious that the present-day photographer is utilising his labour in a manner opposed to the first principles of sound economics, and the wonder is, conducted on these lines, that commercial photography pays even its working expenses. To carry on a multiplicity of processes with a limited staff, is inconsistent with the profitable conduct of industry, and those who can recall the paying days of trade will know that it was a period of one process, namely, albumen printing. This allowed the worker to reach a very high point of efficiency, and consequently the employer received good value in return for the wages paid. Nowadays, in striving to work all processes, the employer cannot possibly engage efficient labour, and wages being so high a proportion in cost of production a business soon feels the effects of such bad economy.

With the remaining three heads, the organization of labour, economy of apparatus, and the health of workers, space will not allow me to deal with in the present article, and they must stand over.

JOHN A. RANDALL.

THE DENAYROUZE LAMP.

[Patent No. 22,098 of 1899.]

MANY inquiries having been addressed to us with reference to this lamp, we subjoin the description given in the Patent Specification of M. Denayrouze:—

“Minute observation of the phenomena have enabled me to introduce a

very important simplification in the construction and operation of my previous patented lamps.

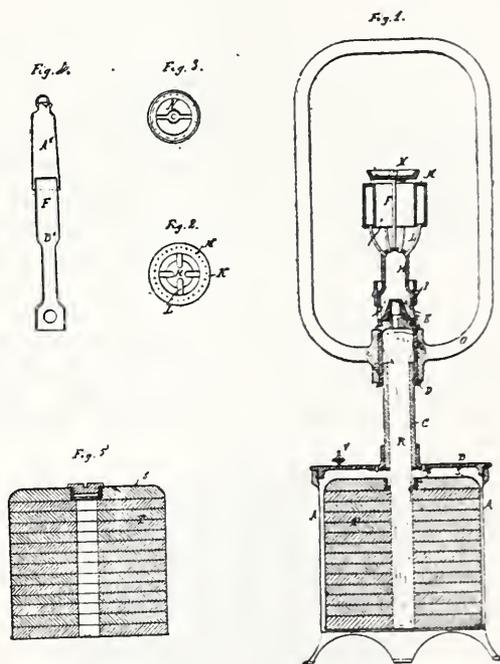

“The following is that in which the new system that I have devised consists. The waste heat of a flame is much more than is necessary to gasify the small quantity of hydrocarbon required to sustain the production of the light (whether with incandescence of rare earths or with incandescence of the carbon itself). In my former lamps and similar apparatus the excess of this heat, collected without means of quite completely regulating the action, rendered the apparatus delicate, and injured their lasting qualities as well as the absolute certainty of their action.

“In the arrangement that I am about to describe I have quite tamed, so to speak, the action of these waste heats:—

“1st. By taking only the quantity necessary and sufficient for the regular feed of the lamp:—

“2nd. By directing the action of this heat and concentrating it on the only part of the apparatus where it may have a useful and even decisive effect, without allowing it to gain the parts of the lamp where its action might in time become injurious and even dangerous.

“The annexed drawing represents my system in sectional elevation (fig. 1). The liquid hydrocarbon (preferably chosen among the most homogeneous products of distillation of tar) is contained in a reservoir *s*, furnished internally with felt *r* or spongy layers of any kind. Into this reservoir, which is itself enclosed in the body *A* of the lamp, under the

cover *B*, penetrates a wick *r* supported by a stiff cross pin *p*. The wick is of cotton or other material favourable to ascent of the liquid by capillary action.

“Above the reservoir *A B* lodged in a support is a hollow cylinder *c* of porcelain or other non-conducting material. This piece of insulating material carries on the other hand the metal gasifying chamber *D* closed by a stopper *E*. It may be readily understood that the waste heat of the flame partly collected and conducted by the frame *O* is felt at the chamber *D*, but cannot lose and extend itself lower, owing to the insulation effected by the cylinder *c*.

“In obedience to the capillary action, the hydrocarbon ascends by the wick *r*. In *D* it receives the action of the heat and rapidly emits vapours, this heat being concentrated on the very points where it can be useful, that is to say, where the liquid is rapidly gasified. Thus the heat is not lost on the mass of the lamp body. It acts with perfect regularity and regulates itself with a precision quite mathematical, since its passage can be regulated with the most extreme precision by determining exactly the diameter of the conducting piece which surrounds the burner. Thus there is brought to the gasifying chamber the supply of heat exactly necessary to make the hydrocarbon emit the quantity of vapour which, mixed with air ascending the passage *F*, burns at *x* (see plan, fig. 2) at the top of the burner *H L K* whence escape the separate elementary flames burning white without mantle under a deflector *x* shown separately in fig. 3. This burner is provided with a regulating sleeve *i* for admission of air. *i* could cause the mixture to burn under a mantle *A<sup>1</sup>* with a burner *B<sup>1</sup>* (fig. 4).

“The capillary action supplies the wick with liquid, the heat supplies the burner with vapour, all in quantity and at pressure which can be regulated with the greatest precision.

“Thus, whether the burner *A B* or the burner *A<sup>1</sup> B<sup>1</sup>* be put on, incandescence can be produced with this lamp with or without a mantle of rare earths.

"Extinction is simply effected by opening the cock v, allowing the vapour to escape instead of passing to the flame. This arrangement secures simplicity and economy. The use of the reservoirs which can be replaced (shown separately in fig. 5) gives absolute security. The choice of the volatile substance gives the brilliancy and purity of the light."

## Our Editorial Table.

### MOTTO MOUNTS FOR CHRISTMAS AND NEW-YEAR'S CARDS.

Sold by W. Tylar, 41, High-street, Aston, Birmingham.

MR. TYLAR is utilising an idea which should be popular with those persons who exchange photographic Christmas and New-year's Cards with their friends. He is issuing a series of embossed folding mounts plain and tinted, and varied in design, a clear space of  $2\frac{3}{4} \times 1\frac{3}{4}$  inches on the front of the first leaf being left for the purpose of bearing the photograph. On page three a motto or sentiment, selected from the works of standard authors, is printed. A box of these little mounts costs one shilling and sixpence.

### THE PRIMUS LANTERNIST'S POCKET-BOOK FOR 1900-1901.

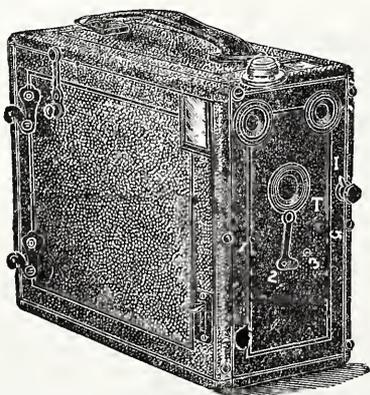

Published by W. Butcher & Son, Blackheath, S.E.

NEATLY bound in green cloth, with diary and memorandum spaces, and containing a great deal of information likely to assist the lantern operator in his work, Messrs. Butcher's Annual Pocket-book, which is edited by Mr. W. F. Butcher, again greets us. The publishers state, that owing to the increased cost of production, they find it is necessary to make a charge of 6d. for the book, and on receipt of this amount they will be pleased to forward it to any applicant *post free*. The Pocket-book is a cheap six-pennyworth.

### THE APEK HAND CAMERA.

Sold by Wilfred Emery, 3, Soho-street, and Anson-parade, Cricklewood, N.W.

FOR the low price of a guinea Mr. Wilfred Emery is putting on the market a form of magazine hand camera which should find many purchasers. It carries twelve plates in sheaths, has an achromatic single

lens, a time and instantaneous ever-set shutter, three stops, two brilliant finders, and a spirit level. The body is covered with leather, and the method of changing, which is by means of a lever at the side of the camera, is simple and reliable. We have carefully examined the instrument, which we can certify to be well worth the money.

## Studio Gossip.

MESSRS. LAMBERT WESTON & SON had the honour of a sitting from H.R.H. the Princess Stéphanie of Austria and her husband, Count de Longay, during their recent visit to Folkestone.

THE first illustrated post-card was issued in Basle in 1865. The Swiss, in fact, were the first to hit upon the idea, but it was speedily taken up in Germany, where the trade has assumed gigantic proportions.

DUCKS IN A PHOTOGRAPHIC STUDIO.—At the Haywards Heath Petty Sessions, Mrs. Coles, of Sussex-terrace, Burgess Hill, was summoned at the instance of Edwin Brown, Inspector of Nuisances to the Burgess Hill Urban Council, who asked that an order be made on her to abate a nuisance. The defendant, who was very deaf, sat between the clerk and a solicitor, so that she could hear the evidence. Edwin Brown stated that, in consequence of complaints, he obtained an order from the Justices to inspect the defendant's house. He had great difficulty in obtaining entry. He found the house all right, but in a building built for the purpose of a photographic studio he

found sixteen ducks, which had apparently been there several months. The stench was awful, and the floor quite rotten with manure. The glass roof caused the stench to be greater. The defendant, who was the owner of the house, kept the ducks as a hobby. Mrs. Copeland, of 2, Sussex-terrace, Burgess Hill, said she had complained about the smell. Very often they could not use their garden or their dining-room, owing to the offensive smell that came from the photographic studio. Defendant said Mrs. Copeland had only complained "that the little ducks squeaked, and woke up her little girl." She contended that a false charge had been made, but she would undertake to have the ducks removed. The magistrates made an order for the ducks to be removed within forty-eight hours, and defendant was also ordered to pay the costs, amounting to 1*l.* 18*s.* 6*d.*, or in default seven days. Defendant said she would not pay the money until she had consulted her solicitor.

PHOTOGRAPHING AN ACTRESS.—We abridge from an American contemporary the following entertaining account of an actress's experiences at her photographers. "We surely manage these things better in London?" "The artist regarded me with the knowing air of one to whom human nature is an open book, and said I was not very fat, was I? and instantly followed that train of thought by the surmise that I would probably wish to be taken in evening dress. I said that such was my desire, and in an evil moment was moved to add that I wanted the photograph for professional purposes, at which a marked change came over him. He glowed with pleasure, and ordered me to get ready, and we heard him, in the interval, move screens about with the cool and sure precision of one who whets a steady knife for the fray. When we reappeared, he met us with a quiet, masterful smile which seemed to say, 'All is now prepared;' and, looking me over from head to foot, he at once fell to. Our intimation to him of the ultimate end of the picture seemed to call into being every wily art of which he was master; but his method of procedure seemed to us, I must confess, a strange one! I was led to a large chair and ordered to go through a series of facial gymnastics, somewhat after this wise:—'Chin back a little, eyes to the stove pipe, a slight forward movement of the body and a blank expression, please' (heroic wriggles on my part, attended by failure alone, judging from the sterner front of the photographer), 'a little more attention to detail and you will get the pose; now, I should like you to replace the blank expression with a cheerful smile; no teeth in the smile, please. Ah, if the body shakes I cannot effect a picture in any case! Now, I should like a more conventional smile, merging less broadly to a laugh; as, for instance, a smile of recognition to a friend. Yes; better, but a little strained, perhaps. Now let me see a slight brightening of the left eye—a little more sparkle, in fact. Ah, now we have it! a pity to miss that expression—but I shall have to put on the necessary shadows.' The 'necessary shadows' evolved themselves into a series of little dabs laid upon my cheek bones and about my eyes with a thick, moist, black pencil, which seemed to be filled with some sort of stove polish, awful to feel. Thick coats of powder being laid on after this, I felt that I was now 'shadowed,' and that the man had probably done his worst; but he stood back and surveyed the prospect with dissatisfaction, knit his brows, and was, a moment later, inspired to remove the powder and anoint my nose heavily with oil, which he rubbed on with a free hand. This done, and my discomfort being quite complete, he placed my head in what he called a 'rest,' he tilted my chin toward the ceiling, and the facial gymnastics began again in earnest. I could feel the heavy condiments upon my face, I was dying to see what they looked like, and I knew I was going to sneeze! The 'rest' gripped my head like a vice. 'Now, I shall need the assistance of Mr. Johnston,' he said; and there arose from under a shawled canopy, in the corner of the room, the form of a strange young man, hitherto I suppose secreted there, who came promptly and held over my unhappy head a scoopy net, evidently intended at one time for fishing. And from all this agony there came at last, my dearest dears, a picture! A beautiful, etching like, transparent picture of a round-cheeked maiden fair to see, with large, limpid eyes and a happy look on her face! As we gaze upon it, I wonder if it can really be that that little stout smile of pure content was made only of vaseline and blackening and powder? Was really wrung from my tortured features by the admonitions of Smythe, was evolved from these faltering lips even while I cowered before the awful eye of the discerning camera?"

## News and Notes.

ROYAL PHOTOGRAPHIC SOCIETY.—At the Technical Meeting on Tuesday, October 2, at eight p.m., at the New Gallery, 121, Regent-street, W., the apparatus on view in the Exhibition will be described.

SOUTHSEA AMATEUR PHOTOGRAPHIC SOCIETY.—Mr. F. J. Mortimer having resigned the secretaryship of this Society, all communications should in future be addressed to Mr. G. Wood, 10, Pelham-road, Southsea; or Frank O. Field, 40, High-street, Gosport.

SEVERE ON THE PRINTER.—The following notice appears in an American photographic magazine for September: We beg to apologise for the abominable work of our printer as shown in this month's issue. This is especially noticeable in the half-tones, which are mere blotches, although made from good plates. We promise you it will not occur again.

LONDON AND PROVINCIAL PHOTOGRAPHIC ASSOCIATION.—To-night there will be a demonstration of the Carbona paper by Mr. Nightingale, of Messrs. Griffin & Son. Next Thursday, October 4, a lantern lecture by Mr. Alexander Henderson on "Bordighera." Visitors are always welcome at the White Swan, Tudor-street, E.C., the meeting commencing at eight p.m.

HELLIS' ROWING CLUB (PHOTOGRAPHERS).—This Club decided their annual pair-oared race on Saturday last, from Millwall Pier to Greenwich. It resulted as follows: G. Brown (bow), O. Oxford (stroke), F. Archard (cox.).

1st; R. Day (bow), G. Horrex (stroke), W. Soper (cox.), 2nd; H. Peck (bow), E. Freak (stroke), A. Campbell (cox.), 3rd. T. Cleaveland (bow), S. Shakespeare (stroke), S. Hayward (cox.), the winners who led from the start, won by three lengths, second and third being divided by scarcely a length. Starter and Umpire, J. Williams. Judges, Mr. F. Milner and Mr. S. Lydford. In the evening all the members assembled at their Headquarters, Guildford Arms, Guildford-road, Greenwich, where a most pleasant and enjoyable smoking concert was held, after which the prizes were distributed. The meeting was brought to a close by a hearty vote of thanks to Mr. W. Hellis, Mr. W. Morgan, and Mr. F. Milner for their generous support.

**MORE DISAPPEARING LONDON.**—One more well-known building in the City will soon be a thing of the past. The scholars of Christ's Hospital—the Blue Coat School—in Newgate-street, will shortly be removed to the new school at Horsham. Already some portions of the more historic parts of the building are being taken down—for example, the picturesque old façade on the southern entrance in Christ Church-passage. The parts of this fabric are being carefully packed up, and will be re-erected at Horsham, but they are lost to the City for ever. The main building will not be ready for disposal for some time yet, therefore photographers still have ample time for securing mementoes of the building in which thousands of the citizens, many of whom afterwards rose to fame, received their education. Christ's Hospital, like Newgate and the Old Bailey, has no marked architectural features, but photographs of all of them will be valuable in future generations. As we have often said before, the securing of photographs of historic buildings is too often delayed until they are in the hands of the "housebreaker," and surrounded by hoardings, scaffolding, and the like, which make a good picture impossible.

**THE CARELESS USE OF AMMONIA.**—How many serious consequences have resulted from the careless use of ammonia, the *Todmorden News* states, it would be difficult to calculate. "In the first six months of this year many cases of poisoning, and the majority fatal, were recorded. In the year 1898, eleven persons died from the same cause. One of the chief sources of the mischief arises from the unsuitability of the vessel in which it is kept. Any kind of bottle appears to be good enough to put it in. Ginger-beer bottles are most commonly used, and times and times again these have been the sole cause of people being poisoned. The latest case reported is that of a mother who placed a bottle of this description containing ammonia on the mantelpiece, after using a portion for cleaning the bedroom floor; one of the children came in and drank of the liquid, resulting in death. Perhaps it may not have struck people who use these bottles that they are committing an act of dishonesty. Such bottles do not belong to them, but to the maker of the ginger beer, &c., and by using them they are robbing the owners of their property. Chemists and other sellers of ammonia might do a good deal to do away with the use of such bottles by refusing to put the liquid into them; but, unless there is combined action, the man who scrupulously refuses to supply ammonia in 'pop' and other like bottles, suffers, because the would-be purchaser rushes off to the more unscrupulous dealer."

**THE ACTION OF WATER UPON GLASS.**—*The Journal of Applied Microscopy* quotes from the experiences of an observer in India, who states that lenses of optical instruments are liable to serious injury from atmospheric influences. Attention was directed to this phenomenon by the observation that domestic glassware, when allowed to stand for some time containing pure water, was more or less dissolved and eaten into. It was afterwards noticed that the glass discs of a Newton's Rings apparatus were attacked and spoiled by the same action. In another case the inner surface of the convex lens in the object combination of a three-and-a-half-inch telescope was badly corroded. From the last case it would appear that some kinds of glass are more readily attacked than others, for the flint glass of the other lens of the combination was apparently uninjured. The writer entertains no doubt that the corrosion in the cases cited above was due to moisture which collected between the glass surfaces. These observations, adds our contemporary, may be of use to optical-instrument makers, especially as it appears that only particular kinds of glass are attacked in this way; for it may be possible to avoid glass of that composition, or the edges of combined lenses may be covered with a coating of cement or varnish, so as to prevent moisture getting in between them. This action is well known, at least, to American instrument-makers, who avoid the use of glass that is subject to injury by atmospheric changes.

The syllabus of the Leeds Photographic Society has now been issued to the members for the various meetings to be held during the session 1900-1901. Commencing on September 25, Mr. E. W. Cullriss opened the season with "Cave-hunting in Yorkshire," and at the following meeting Mr. John H. Gash, a well-known north country worker, is down for "Carbon Printing with Control in Development," a subject which he is more than capable of treating exhaustively. Next on the list is Mr. J. W. Wade, with "An Alpine Borderland," and succeeding him Mr. H. C. Sorby, LL.D., F.R.S., will lecture on "Photographs of Marine Animals." Subsequently, Mr. Percy Sheard is down with "Cairo to the First Cataract," and later Mr. Percy Lund (Editor of the *Practical Photographer*) talks about "Nature Poets and Nature Pictures," and at the end of the year Mr. Godfrey Bingley will give an exhibition of new lantern slides, "Shakespeare's Country, Northumberland, Yorkshire," &c. The new year opens with the Annual General Meeting on January 9, and a fortnight later a *conversazione* and exhibition of members' work will be held. Mr. Horsley Hinton follows with an illustrated lecture on "Some Every-day Aspects of Pictorial Photography," and in turn Mr. Tempest Anderson, M.D., B.Sc., F.G.S., will give an illustrated account of "The Grand Cañon of the Colorado." The Annual Lantern Exhibition is to be held on March 12 next, and on April 12 there is also a show of the Yorkshire Photographic Union's lantern slides, and on April 23 a "Demonstration of Dry-plate Development," which gives place to "A Few Manx Photographs," by Mr. J. W. Addyman, B.A., and the concluding lecture of the session is down to Mr. Charles B. Howdill, A.R.I.B.A., with "The Photography of Colour." The list is an exceptionally strong one, extending well into another year, and much good work will, no doubt, be done, as the Society is the fortunate possessor of a lecture-hall which few photographic clubs can lay claim to. We wish them a very prosperous session.

## Commercial Intelligence.

**WASTE GLASS.**—It is stated that a recent discovery is likely to solve a serious problem for the plate-glass manufacturers of St. Helens. The problem is that of how to dispose of the rapidly increasing waste heaps, and the solution is that of using the waste for bricks. At Messrs. Pilkington Bros., Ltd., there is a waste heap containing a million and a half tons of spent sand, which is being added to at the rate of 1200 tons weekly. These heaps are neither pretty nor useful; in fact, they have been looked upon as ugly, but inevitable accompaniments of an enormous industry. For years chemists and scientists have been trying to find a use for these waste heaps, but it is only just now that Dr. Ormandy, a St. Helens man, has, it is said, found a practicable means of making serviceable bricks. A plant has been laid down at Messrs. Pilkington's works, and the manufacture of bricks will soon be in full swing. For some time it will only be possible to deal with the weekly accumulation of 1200 tons. This, to be used in the making of bricks, has to be mixed with an equal quantity of other substances. If the whole lot is used, it will represent an out-turn of some 800,000 bricks every seven days. Obviously it will be some time before the million and a half tons will be tackled. The discovery is kept a strict secret, though other firms are making endeavours to find some means of dealing with their own waste. The waste is composed of 97 per cent. of ground glass and spent sand. In the process of grinding the plates, a quarter of each plate is lost, while the friction of the iron runners causes a waste of fifteen tons of iron per week. The problem now is to extract the iron, which otherwise will be lost in the brick-making. Whether bricks can really be made profitably is doubtful, especially considering the falling market and the recent collapse of so many brick-making companies.

## Patent News.

THE following applications for Patents were made between September 10 and September 15, 1900:—

**EXPOSURE SCALES.**—No. 16,075. "Improvements in Exposure Scales for Photographers." Complete specification. R. J. HAGEY.

**SHUTTER.**—No. 16,137. "A Time and Instantaneous Shutter for Photographic Purposes." H. P. TATTERSALL.

**APPARATUS.**—No. 16,238. "Improvements in Photographic Apparatus." Communicated by A. V. C. Mayall. O. SCHÖLZIG.

**STANDS.**—No. 16,282. "An Improved Apparatus for Supporting Photographic Cameras when in use for taking Photographs." Complete specification. R. W. SHIPWAY.

**SHUTTERS.**—No. 16,072. "Improvements in Photographic Shutters." Communicated by N. A. Cobb. G. C. MARKS.

## Meetings of Societies.

### MEETINGS OF SOCIETIES FOR NEXT WEEK.

October.	Name of Society.	Subject.
1.....	Royal Photographic Society ...	Exhibition Opens to the Public.
2.....	Aintree .....	Demonstration: Bromides and Bromide Toning. F. Anyon.
2.....	Bootle .....	Illustrated Lecture: Scenes in South Africa. Union S.S. Company.
2.....	Royal Photographic Society ...	Technical Meeting: Description of the Apparatus on View in the Exhibition.
3.....	Croydon Camera Club .....	Address by the President.—The Carbon Process of Slide-making. L. G. Kough.
3.....	Redhill and District .....	Demonstration: Thornton Films. Walter D. Welford, F.R.P.S.
4.....	Liverpool Amateur .....	Special Demonstration for Beginners: Treating of Exposure, Development, Printing, and Toning. Fred Anyon.
4.....	London and Provincial .....	Lantern Night: Bordighera, New and Old. A. L. Henderson.
4.....	Woodford .....	Orthochromatic Photography. E. Sanger Shepherd, F.R.P.S.
5.....	Borough Polytechnic .....	Practical Instruction: Cameras, Hand and Stand. Accessories.
6.....	Brentford .....	Excursion: Dorking and District. Leader, F. Turner.
6.....	South London .....	Excursion: Chislehurst. Leader, G. C. Payne.

### LONDON AND PROVINCIAL PHOTOGRAPHIC ASSOCIATION.

SEPTEMBER 20.—Mr. R. Beckett in the chair.

Mr. ARCHER CLARK spoke of the keeping powers of ortol developing solution. Some very old used solution that had become of the colour of stone had been given a month's rest, and decanted off, being then of a sherry colour. He found that an ounce of ortol had developed altogether some two hundred plates, and about a like number of bromide prints. It still worked fairly well.

Mr. A. L. HENDERSON gave a lantern show of his Paris Exhibition pictures. They were all hand-camera photographs, although a few had been time exposures and the camera had been supported on a convenient place for the purpose. Mr. Henderson's zealous use of the camera resulted in a very representative collection of views of the great Exposition. The buildings

housing the exhibits of the various countries were made to form an instructive and comparative series, not, he thought, to the credit of this country. Some of the erections were shown to be very handsome in design and construction, while the general views about the interior and exterior of the Exhibition were something that all present were glad to see upon the screen. Mr. Henderson briefly alluded to some experiments in film-making he had in hand, and to some made twenty years ago in conjunction with the late W. B. Woodbury. He had on the stocks a film which was to be something to be reckoned with in the future, and one that was really non-inflammable. He found that certain films which were said to possess this quality failed to withstand fire.

The Association will shortly hear from Mr. Henderson on the subject of films for photographic use.

**North Middlesex Photographic Society.**—September 17.—In the absence of Mr. Pither, Mr. J. MACINTOSH delivered his lecture on

LIGHT AND SHADE IN COMPOSITION.

Referring to numerous prints and engravings which were on view, he pointed out how the pictorial effect was obtained by the arrangement of the lights and darks. Speaking of altering the gradations in the negative by shading during printing, &c., in order to correspond with a sky having marked differences in illumination, he said that a scene lit by diffused light was the best to experiment upon, as, if the sun was shining, the shadows were difficult to manage.

FORTHCOMING EXHIBITIONS.

- 1900.
- Sept. 28–Nov. 3 ..... Photographic Salon, Dudley Gallery, Piccadilly. Hon. Secretary, R. W. Craigie, Camera Club, Charing Cross-road, W.C.
- October 1–Nov. 3 ... Royal Photographic Society, New Gallery, Regent-street. The Hon. Secretary, 66, Russell-square, W.C.
- „ 17–20 ..... Rotherham Photographic Society. Hon. Secretary, H. C. Hemmingway, Tooker-road, Rotherham.
- November 7–10 ..... Cripplegate Photographic Society and the Essex and Middlesex Cycling Union, Ltd. The Hon. Secretaries, A. T. Ward, Cripplegate Institute, E.C., and G. F. Sharp, Sach-road, Upper Clapton, N.E.
- „ 12–17 ..... Ashton-under-Lyne.
- „ 21–23 ..... Hackney Photographic Society.
- „ 22–24 ..... Hove Camera Club. Hon. Secretary, C. Berington-Stoner, 24, Holland-road, Hove.
- 1901.
- January 14–19 ..... Blairgowrie and District Photographic Association. The Hon. Secretaries, Blairgowrie, N.B.

Those who desire to send photographs to the above Exhibitions should write for prospectuses to the Hon. Secretaries, whose addresses are given in the second column above. The dates mentioned are those at which the Exhibitions open.

Correspondence.

\* \* \* Correspondents should never write on both sides of the paper. No notice is taken of communications unless the names and addresses of the writers are given.

\* \* \* We do not undertake responsibility for the opinions expressed by our correspondents.

DR. SELLE'S PATENTS.

To the EDITORS.

GENTLEMEN,—Permit me to call attention to the fact that the photo-chromoscopic device patented by Dr. Selle, No. 13,666, 1899 (THE BRITISH JOURNAL OF PHOTOGRAPHY, p. 556), is precisely what I patented in the United States, England, France, and Austria, in 1892. The substitution of paper images for transparencies is not an improvement (quite the reverse), and was suggested many years ago.

Dr. Selle's observations about the production of images in minus colours by inserting single positives in such a device were also anticipated by several publications of my own at different periods. The principle is precisely the same, whether the prints be viewed by transmission or by reflection, and the talk about the latter method being "different," in that it gives images "made up of the complementary tints," is all nonsense. It is most singular, too, that Dr. Selle should class my stereoscopic two-step "Kromskop," having coloured-glass reflectors and folding "Kromograms," with anything belonging to Zinck and Nader [Nacht?].—I am, yours, &c.,

F. E. IVES.  
1324, Chestnut-street, Philadelphia, U.S.A., September 11, 1900.

[Mr. Ives's letter is a further proof of the absurdity of the British

Patent Laws which permit successive "inventors" to protect exactly the same ideas. As we have often pointed out, a very large percentage of modern patents are not worth the paper upon which they are printed on this very account. An opportunity of further inquiring into the validity of Dr. Selle's many claims will present itself when the Company that is being formed to exploit his inventions makes its long-delayed appearance. And upon that matter we shall probably have some pertinent observations and comments to offer.—EDS.]

PHOTOGRAPHY IN CAPETOWN.

To the EDITORS.

GENTLEMEN,—I see in a recent JOURNAL a question asked by E. Thorne with regard to salaries in Capetown. I would be pleased to give him any information if he cares to write me to address as under. There was also a question asked three weeks ago, What chance would two men have travelling the Colony after the war was over doing photographic work? Your advice was, Try it. I have had some considerable experience in both Cape Colony and the Transvaal, and would not think of going out from home upon such a venture. Let them take situations until they look round, as the game is now overdone in the Colony, and a raw Englishman stands very little chance. If you care to look up their query, which is about three weeks old, and give them my address, I, no doubt, could help them.—I am, yours, &c.,

G. D. FRAZIER.

Perkins' Temperance Hotel, Minehead, Somerset.

A COMPLAINT.

To the EDITORS.

GENTLEMEN,—I would advise operators and retouchers not to send specimens of their work to any address unless the real name of the advertiser is given. I may state that, about two months ago, I answered three advertisements, sending, as requested, specimens of my work, and, although I sent stamped address for the return of the photographs, they have not as yet been returned. I am certain no honest photographer would keep them for such a length of time. They may, however, come in handy for some poor soul.—I am, yours, &c.,

OPERATOR.

[A simple plan for preventing the misuse of specimens is for the author of the photographs to boldly write his name and address across them. Specimen thieves unquestionably abound; but there are two sides to this perennial quarrel. And the side not sufficiently insisted upon is that of the operator whose crass carelessness in not identifying, or properly addressing, his specimens renders it impossible for a photographer to return them.—EDS.]

PHOTOGRAPHIC CHRISTMAS CARDS.

To the EDITORS.

GENTLEMEN,—Just previous to last Christmas you mentioned I think, under Our Editorial Table what you described as the "Speaight Christmas Card," and you expressed surprise that photographers generally did not go in more for Christmas-card work. Could you kindly give me a description of the "Speaight Christmas Card," or tell me where I can obtain one?

If it belongs to a firm of that name, they, having used it last year, will probably have something fresh this season, and will not mind a struggling brother professional imitating what you mentioned so favourably.—I am, yours, &c.,

C. W. E.

[To the best of our recollection the production referred to was a double card bearing on its front surface a little photograph and having a double-paged inset of paper upon which there was a suitable inscription and spaces for the names of sender and recipient. It is not necessary for our correspondent to copy Messrs. Speaight. We recommend him to ask some such firm as Messrs. Marion, Messrs. Houghton, or Messrs. Tallowfield, for a specimen box of their photographic cards. Of these an enormous variety is available and "C. W. E." can easily select a design to suit himself and his clients.—EDS.]

STEREOSCOPIC PHOTOGRAPHY.

To the EDITORS.

GENTLEMEN,—May I offer a few remarks respecting Mr. Hand's letter in your issue of last week. In a properly mounted stereoscopic print the two images of a near object are nearer together than those of a more distant object; therefore we turn our eyes inward more to look at the near object than we do to look at the distant one—a state of things which corresponds to nature. If we turn the view upside down in the stereo-

scope, we do not alter the relative planes of the view, because the separation of the similar images is a fixed quantity; but, if we truly transpose the two views we alter the relative distances. The images of remote objects are nearer together than those of near ones; we turn our eyes in for the distant view, and turn them out for near objects; hence pseudoscopy. The same effect is reached by squinting, an action which practically transposes the views. Now, in a negative, these relative positions are in the condition of a transposed print, consequently we must squint at it in order to transpose the view so that the separation of the specific parts of the view may give the effect of nature. But, whether we squint at a print or negative, or regard them directly, turning the print or negative will cause no alteration in the apparent position of objects. That apparent position, near or far, is absolutely fixed by the relative separation of the corresponding images of various details of the view. Those corresponding parts which are close will remain so, whether the conformed view be looked at directly looked through, right or wrong side up. There is no special virtue in a right or left-eye view. Take a positive transparency, put it in the stereoscope wrong side before, the only effect will be to turn the view round, left to right, it will still appear solid. May I add that I often look at my negatives stereoscopically before printing and am able to see prints without a stereoscope. I often amuse myself by looking at a print cross-eyed, in order to obtain pseudoscopic effects, which are sometimes peculiar. I hope I have made it clear that the apparent removal of objects, true or pseudoscopic, is merely a matter of separation of the constituent parts of the views, not a right and left-eye matter.—I am, yours &c., HENRY V. HOPWOOD.  
36 Ferncliff-road, Downs Park-road, Hackney, N.E., September 22, 1900.

### A NEW LIGHT FOR THE STUDIO.

To the EDITORS.

GENTLEMEN,—“R. S.” inquires about the cost of our new light for the studio.

Four lights for four hours cost 2d. Four lights are sufficient for every class of studio work.

The material for charging the apparatus can be bought at any Italian warehouseman's for 1s. per gallon. We do not use coal gas in any form whatsoever. The gas is made instantaneously as and when required. A small water motor attached to any ordinary water tap drives the apparatus; or clockwork electric motor, weights and pulleys can be used. When required for private houses, theatres, clubs, hotels, &c., a ball and tube can be used worked by a lad for any length of time altogether, making a very compact and portable apparatus. The cost of the apparatus will not be more than 10l., more likely under. I enclose you another photograph, taken in four seconds with three burners only, on a Barnet medium plate, stop *f*-11.3.—I am, yours, &c.,

EDW. F. CHAPMAN, *Manager.*  
*The Atmospheric Gas Company.*

5, New Bond-street, Leeds, September 22, 1900.

To the EDITORS.

GENTLEMEN,—Replying to “R. S.,” I am unable to say what the saturator or carburiser is charged with, as I am not in any way connected with the invention. I suppose the contents of the cylinder are included in the patent; but any information would be supplied by the Atmospheric Gas Company, New Bond-street, Leeds. I believe the light was really brought out as an illuminant, but my attention was directed to its extraordinary actinic power, hence my reason for bringing it before the photographic public.—I am, yours, &c., A. A. PEARSON.  
21, New Station-street, Leeds.

### A SOCIETY FOR PHOTOGRAPHIC ASSISTANTS.

To the EDITORS.

GENTLEMEN,—As you have hitherto generously allowed your columns to be opened for the discussion of subjects specially of interest to photographic assistants, perhaps you will allow me space to supplement your reply to your correspondent of last week, who is desirous of knowing the name and address, also your opinion, of the organization which photographic assistants can join.

The name of the Union, to give it its full title, is “The National Amalgamated Union of Shop Assistants, Warehousemen, and Clerks,” and the head office is at 55, Chancery-lane, London.

If your correspondent will refer to THE BRITISH JOURNAL PHOTOGRAPHIC ALMANAC for 1899 he will find an article devoted to the above organization and a table of payments and benefits.

Although the above Union was not formed specially for photographic workers it is prepared to, and does, accept their applications for membership; and, until operators and assistants can pluck up enough courage to form a Union of their own, they cannot do better than join, and participate in the benefits offered by this organization, that is if they are so unfortunate as to need them.

As you rightly add in your reply to your correspondent, it is regrettable

that photographic operators and assistants will not combine for mutual help and support, but I think this question of respectability which is alluded to has a lot to do with it. Is the photographic worker any more respectable than the engineer, railway worker, lawyer, or doctor? and all these have long since recognised the benefits of combination. No, sir; if photographic workers desire to alter their condition and protect their interests, they will have to adopt the same methods that have been used so successfully by workers in other trades and professions; and, to judge from your advertisement and Correspondence columns of recent years, there is some room for improvement in the conditions under which many assistants are working. An attempt to form a Union for photographic assistants was made a few years back by Mr. Randall, but failed from lack of support, the photographic worker evidently considering himself too respectable to join a Trades Union. I should like to know if the same feeling exists as strongly now as then. If Mr. Cameron writes to the address as under, he will be informed of the address of the Glasgow Branch Secretary.—I am, yours, &c.,

A PHOTOGRAPHIC TRADES UNIONIST.

15, Cornwall-terrace, Bradford.

### COLLOTYPE POST-CARDS.

To the EDITORS.

GENTLEMEN,—With reference to enclosed page from this week's JOURNAL and to the replies re ColloTYPE printing, we do not think it at all fair treatment on your part towards those advertising, if, where there are several firms equally capable of doing the work your correspondents enquire about, you should mention by name a particular firm or firms at the expense of others.

We have printed millions of pictorial post-cards from our own and our customers' negatives, and we undertake ColloTYPE printing of every description. We accordingly consider we are not acting at all unreasonably in making the above protest against what we think unfair treatment on your part.—We are, yours, &c., WYNDHAM & COMPANY, LIMITED.  
Mill Hill Park, Acton, London, W. September 22, 1900.

[The passage to which our correspondents take exception is as follows: “We presume our correspondent requires colloTYPE prints. If so, Messrs. Morgan & Kidd, Richmond; The London Stereoscopic Company, Cheapside, and other firms who advertise in this JOURNAL and its ALMANAC, execute such work in enormous quantities, and should be able to quote lowest prices consistent with good printing.” Obviously Messrs. Wyndham are included in the “other firms” referred to; but, in order to convince them that we have no desire to act unfairly towards them, we insert their letter, which is, perhaps, needlessly querulous.—EDS.]

### DR. BARADUC'S EXPERIMENTS.

To the EDITORS.

GENTLEMEN,—I do not remember having seen anything with reference to the enclosed in the JOURNAL. A friend of mine is very much interested in the question, and would be obliged if you could give me any information on the subject, or give any further reference.—I am, yours, &c., ARTHUR ELSDEN.  
The Studio, Mill Bridge, Hertford, September 25, 1900.

“Les docteurs Baraduc, Luys,\* et Lebon, ont réussi à fixer sur la plaque sensible les radiations de la pensée et les vibrations de la volonté. Ces expériences nous les avons poursuivies nous-même pendant des années, et le fait qui s'en dégage, c'est qu'il existe en chaque être humain un centre de radiations invisible, un foyer de lumières qui échappent à la vue, mais peuvent impressionner les plaques photographiques.”—LÉON DENIS, *Christianisme et Spiritisme, Paris, 1898.*

[We fear that we cannot help Mr. Elsdén in the matter. Fugitive paragraphs relating to Dr. Baraduc's experiments are all that we remember to have seen, and they give no more information than the above extract; but we insert the letter in the hope that its publication may bring Mr. Elsdén the references he desires.—EDS.]

### PHOTOGRAPHS REGISTERED:—

- A. Tear, 5, Westgate-street, Ipswich.—Two photographs of Miss Pretty.
- G. A. Dean, 14, High-street, Rugby.—Photograph entitled “In the Stocks.”
- A. J. Ashbolt, 29, High-street, Southampton.—Photograph of E. Chadwick.
- W. Brown, 9, Gilmour-street, Paisley, N.B.—Photograph of Centenary Memorial to R. Pollok, A.M.

## Answers to Correspondents.

\* \* \* All matters intended for the text portion of this JOURNAL, including queries, must be addressed to "THE EDITORS, THE BRITISH JOURNAL OF PHOTOGRAPHY," 24 Wellington-street Strand, London, W.C. Inattention to this ensures delay.

\* \* \* Correspondents are informed that we cannot undertake to answer communications through the post. Questions are not answered unless the names and addresses of the writers are given.

\* \* \* Communications relating to Advertisements and general business affairs should be addressed to Messrs. HENRY GREENWOOD & Co., 24, Wellington-street, Strand, London, W.C.

VACUUM CAPUT; REX; W. THOMPSON; F. J. MARTIN; IN NUBIBUS; ALPHA.—The answers to these and other correspondents are unavoidably held over.

PHOTO-BUTTONS.—R. B. GILPIN writes: "Could you give me the address of a firm that make those photo-buttons? I have looked all over for an advertisement, but fail to find any. I am thinking of getting some done of our candidates."—In reply: Crayon, Limited, 49B, Brecknock-road, London, N.

PHOTOGRAPHING ON WOOD.—BRUM writes: "I should be extremely obliged if you could give me any one good and cheap method of photographing on wood?"—A process of producing photographs on wood blocks is given on p. 326 of the current volume. That may be the "floating-on process" referred to in your previous communication.

MOUNTING PRINTS ON FLEXIBLE SUPPORTS.—CHAIRS writes: "I have been photographing a lot of chairs for a manufacturer. He wants me to mount the prints on some kind of pliable stuff, such as cloth, to be rolled up and carried by travellers. Can you suggest to me a suitable material?"—We can suggest nothing better than linen, such as folding or pocket maps are mounted upon.

THE R.P.S. EXHIBITION.—ALAN CARTWRIGHT writes: "I should deem it a favour if you would inform me where I can obtain the necessary particulars for sending an exhibit to the Royal Photographic Society's autumnal Exhibition."—In reply: Of the Secretary, 66, Russell-square, London, W.C. If our correspondent applies for a form about next July, he will be in time for the Exhibition of 1901. This year's opens on Monday.

RETOUCHER'S KNIFE.—W. WALKER writes: "Will you kindly tell me where I can get a first-class retoucher's knife. Also say if there is a work published on the use of the knife."—Marion & Co., Soho Square. There is no work published on the use of the knife, beyond what is included in the usual instruction in retouching. We should advise you to get a few lessons from a skilful retoucher, who would initiate you in the use of the knife.

COPYRIGHT.—G. BOUCAS writes: "Can you inform me as to my position as stated below? I was asked to make an enlargement of a photograph marked copyright; may I do so? A customer brought me a photograph taken by an amateur, on a plain mount, and ordered copies and enlargements from the same, which I supplied. The amateur in question wants to stop me; can he do so?"—In reply: Assuming that in both cases cited the original photographs are copyright and have been duly registered at Stationers' Hall, you would be liable to an action for infringement. Photographers, trade enlargers, and others do not realise the very grave risks they run in this matter.

COATING FOR A FIXING TANK; TESTING MOUNTS.—PENTLAND asks for: "1. A formula for coating a box I have cut down for a negative fixing tank; the sides are dovetailed, but the bottom is nailed on and the wood is stained with rust, and the negatives might in turn be stained if fixed in tank as it is. 2. A test or tests for the purity of mounts would also oblige."—1. One of the best coatings is hard paraffin wax, melted and run round the vessel. Another good one is a mixture of bitumen and beeswax. The vessel should be made warm before either is applied. If the coating is made impervious, the nails will not matter. 2. Tests for mounts were given on p. 291 of the current volume.

COMPETITION PHOTOGRAPH.—COMPETE writes: "Kindly excuse the colour of the enclosed print of a country post-office now removed. Please say through the JOURNAL if you think it sufficiently interesting to enter into one of the many magazine and other competitions. If so, kindly recommend size (enlarged?) and mounting, or what you think would show it off at its best."—In reply: The print sent shows a pleasing little photograph of an old thatched cottage, which would look well in toned bromide, sepia platinum, or carbon. But we do not think it up to competition form; at any rate, it could not in the most favourable case bring our correspondent more than a few shillings.

PARTNERSHIP AGREEMENT.—ORION writes: "1. Partnership has been dissolved by the outgoing partner signing over all to me for a fixed sum; should that be stamped or not? 2. The agreement has also been handed over signed by two witnesses, it is not stamped; signed December 25th, 1899; is it too late now to be stamped for my own safety; if not, what is about the cost including late fee, and where should it be sent to? I might say the agreement concerns the studio accessories, apparatus, &c., taken over from the late owner of same."—1. Yes, certainly. 2. It is not too late. The fee will be, we think, ten pounds in addition to the cost of the stamp itself, payable at Somerset House.

ELECTRICAL QUERY.—S. COLEY. Your query should be addressed to one or other of the journals devoted to electrical matters. In this column we cannot undertake to reply to queries that in no way, directly or indirectly, relate to photography.

COVERING POWER OF PORTRAIT LENS.—J. ROBERTS. The lens is a portrait lens of less than twelve inches equivalent focus, therefore you must not expect it to take 10×8 groups, even when stopped down to *f*-6. Its being three and a half inches diameter has nothing to do with it. The focal length is the factor, and a portrait combination of the focus stated, even when stopped down to *f*-6, must not be expected to cover a 10×8 plate.

DISCOLOURED PYROGALLIC SOLUTION.—C. WILLEY says: "Hitherto I have used metol as a developer, but it has made my fingers in a very bad state. I have made up some pyro solution ten per cent. by the ordinary formula, but it is of a sherry colour, is it of any good?"—It should not be of that colour if the sulphite was dissolved first and it was of good quality. However, it will, doubtless, work all right, though it may perhaps not keep long; try it.

REMOVING SILVER STAINS FROM LINEN.—G. SHUTER says: "I have got some bad silver stains on some of my cuffs, can you tell me a simple way of getting them out without injuring the fabric?"—Wash the cuffs thoroughly to remove all the starch and dry. Then apply a tolerably strong solution of cyanide of potassium to the stains while they disappear, and then well rinse in water. Of course, you are aware that cyanide of potassium is poison.

CARBON PRINTING TROUBLES.—W. BLAKE says: "Can you help me out of this difficulty with my carbon printing. I get on very well with the single-transfer process. But with the double I fail entirely. My difficulty is this: The picture is developed on the flexible support and dried. Then the double-transfer paper is applied and well squeegeed upon it and again dried. When the two are separated there is as much of the image left upon the flexible support as there is upon the transfer paper?"—The reason, probably, is that you have used too hot water in softening the transfer paper, and so dissolved off the adhesive coating. Use cooler water, or allow a shorter time in the soaking of it.

COPYRIGHT QUESTION.—F. A. V. asks: "If an artist is employed by an architect to paint a fresco for a church, museum, or other public building, and the authorities in charge of such place allow a photographer to make a negative from such fresco without the knowledge and sanction of the architect, or even the artist himself who did the work, has that photographer, if he registers his negatives in the ordinary way, any real claim to copyright in same, the artist being still alive?"—In reply: The artist who painted the fresco would have the copyright in his work, and we surmise the photographer would be infringing it, and would be liable to penalties. But the photographer might have a copyright in his work if he was not infringing any one else's.

A BUSINESS DISPUTE.—H. LESLIE writes: "For the benefit of others in the trade, I wish to inform you that I sent some photographic apparatus five weeks ago to a certain photographer on approval or return. I have written him several times, but can get no reply. By the appearance of his memorandum, I took him to be a respectable tradesman, but by his detaining goods and giving me no reply I am of opinion that his intentions are far from those of an honest man. I know I can sue him, but what I should like to do is to have him arrested for obtaining goods under false pretences. Can I legally do this? I should prefer to take the latter course, as it would be a warning to others like him."—In reply: We do not think you can have the man "arrested," but a solicitor will advise you if a police-court prosecution can be instituted.

YELLOW STAINS ON PRINTS.—NEW BRIGHTON writes: "1. Could you explain the cause of the yellow stain upon the print I enclose, also how to remove the stain? 2. I have been using hydroquinone for some time, but had such difficulty in developing fully my negative, although I gave twice to three times the exposure that others gave, that, on the advice of a friend, I have taken to pyro, the same as recommended for Imperial plates. But this does not satisfy me; I like good contrasts. 3. Can you tell me how to get this, and not such flat prints? 4. Can you tell me why I had to give such a long exposure with hydroquinone as a developer?"—1. Carelessness in the work. The prints have been allowed to stick together while in the fixing bath. There is no way of removing the stains. 2 and 3. There should be no difficulty in getting good contrasts with either developer if the exposure is correct and sufficient time is given for the developer to do its work. 4. No; unless you used very slow plates.

INTENSIFICATION TROUBLES.—INTENSIFIER writes: "I beg to submit a couple of negatives for your inspection. They were, if I remember right, somewhat over-exposed and thin when developed, so I proceeded to intensify with mercury. The following steps were taken: (1) Soaking and alum bath; (2) Washed in running water thirty minutes; (3) Bleached merc. chloride and small quantity of hydrochloric acid; (4) Washing about twenty minutes; (5) Blackened sodium sulphite; (6) Washing. While in the mercury bath they become 'velvety' to the touch, which became worse on transfer to the sulphite, and in the final washing settled down to the reticulated appearance you now see. I tried shrinking by methylated spirit, but with little effect, and, from observations made on No. II, I am inclined to put the effect down to the gelatine going wrong, and casting all its suspended silver, &c., to the surface. Can you suggest any remedy, or tell me what has caused the failure? I cannot find any information in my books of reference."—In reply: Of the many possible causes of the trouble, an excessive quantity of acid seems to us the most likely. We have had films behave in the same manner with acidified mercury solution. Probably the gelatine was from a soft "batch." We can offer no other explanation.

## THE BRITISH JOURNAL PHOTOGRAPHIC ALMANAC FOR 1901.

Edited by THOMAS BEDDING, F.R.P.S.

The ALMANAC for 1901 will appeal to photographers all the world over as a daily reference guide in practical work. The formulæ will be revised where necessary, and the latest departures in theory and practice will be chronicled. The year's advances will be recorded, and wherever practicable new features of an informative nature will be added.

Adhering to an old and much-appreciated custom, we invite short contributions on practical subjects for the pages for the 1901 ALMANAC. Those of our friends intending to co-operate with us in this respect can help us by letting us have their M.S., sketches, &c., at the earliest possible date.

We shall be glad to receive any additions that may be made to the list of telegraphic addresses of the trade, &c.

As usual, a section of the ALMANAC will be devoted to notices of the latest introductions in photographic apparatus, &c. Those firms who wish to take advantage of this feature should communicate with us as early as possible.

The publishers ask us to remind advertisers that many of the advertisement pages of the ALMANAC are already booked, and that, to ensure insertion and good positions, orders and copy should reach them without delay.

† † Will secretaries of societies who have not yet sent us lists of officers for inclusion in the ALMANAC kindly oblige us by doing so at once in order that this section of the book may be proceeded with.

## EX CATHEDRA.

By the courtesy of Mr. E. Cecil Hertslet, Her Majesty's Consul at Havre, we have received a copy of the list of the French Exhibition awards conferred upon British and Colonial exhibitors. The work which is under revision is compiled by the Royal Commission from information published by the French Exhibition authorities, and it is printed by William Clowes and Sons, Limited, of London. The list occupies eighty pages of print, and we are very much obliged to Mr. Hertslet for his consideration in the matter. It is curious that an essentially British publication should reach us via Havre, and not direct from South Kensington; but the ways of British Commissions are always difficult to understand. The home authorities who represented Great Britain at Paris do not appear to have considered it their duty to volunteer any information to the Press with regard to the destination of the British awards. By the way, our statement made in the JOURNAL some weeks ago that actual medals were not handed to successful competitors was disbelieved by some persons not familiar with the modern customs attending the distribution of Universal Exhibition awards. We therefore quote from the compilation before us the following pronouncement on the subject:—"The regulations of the French Administration provide that awards to exhibitors shall take the form of diplomas signed

by the Minister of Commerce and by the Commissaire-General." Obviously, therefore, those who have received gold, silver, and bronze "medal" diplomas must have them prepared at their own expense. One of the most curious awards at Paris was that of the Grand Prix for the collective exhibit of Pictorial Photography. Fifty photographers sent work for this section: and we suppose each one is entitled to feel a proportionate share of exultation at his success. What has become of the diploma, and will each of the fifty receive a photographic reproduction of it? It will be interesting to know where the precious document is stored. We suggest that the names of the fifty be written upon it, so that if another International Exhibition takes place at Paris in 1911 the names of those then considered the most prominent in pictorial photography may be compared with the successful exhibitors of 1900.

\* \* \*

THE Edinburgh Photographic Society's winter syllabus and the October number of its transactions have reached us this week. Between the present time and next May this old-established Society—it dates back to 1861, and thus ranks high up amongst veteran photographic institutions—has settled to work through what appears to be an excellent programme of papers and demonstrations. From the Transactions of the Society we take two extracts illustrative of the public-spiritedness which prevails amongst the members. In June last the President proposed that a telegram should be sent to Her Majesty the Queen congratulating her on the entry of her troops into Pretoria. This was agreed to, and the following is the text of the telegram which was sent: "To Her Majesty the Queen, Balmoral. Edinburgh Photographic Society, at its Fortieth Annual Meeting, humbly desire to express to your Majesty their heartiest congratulations on the triumphal entry of your gallant troops into Pretoria," and the following is the reply which was received from Her Majesty: "Buckingham Palace, 9th June, 1900. The Private Secretary is commanded to express the thanks of the Queen for the kind message of congratulation which you have forwarded to Her Majesty." At a later date the death of the Duke of Saxe-Coburg-Gotha (Duke of Edinburgh) was made the occasion of the transmission by the Society of the following letter of condolence to H.R.H. the Duchess of Saxe-Coburg-Gotha:—"May it please your Royal Highness. At a meeting of Committee of this Society, of which your late husband was the Patron, we were deputed to offer in its name our respectful, sincere, and heartfelt sympathy with you in the severe trial with which you have been so lately afflicted. His Royal Highness, the late Duke of Saxe-Coburg-Gotha, with that graciousness for which he was so well known, became the Patron of this Society on 2nd August, 1881, when he was Duke of Edinburgh—just nineteen years ago just now—an office which he held, with much acceptance to the photographers of Edinburgh, until his untimely death. While therefore mourning the loss of our esteemed Patron, will you allow us to offer your Royal Highness our respectful, sincere, and heartfelt sympathy in the great and irreparable loss which has befallen you?" It was but natural that the Edinburgh Photographic Society should lament the loss of its august Patron; but an even more unique interest must attach to the telegrams evoked by the Fall of Pretoria. No other photographic

society, that we are aware of, was moved to indulge in a similar patriotic outburst.

\* \* \*

WE have been shown by General Tennant a simple method of attaching a yellow screen-holder to a shutter. The latter is of the familiar Thornton Pickard kind, and it is, of course, well known that its external surface surrounding the aperture outside the lens is plane. Upon this surface a light frame of ebonite has been screwed, and, being grooved at the sides, all that is necessary is for the screen to be dropped into position, where it is securely held. The details of the device, which General Tennant tells us may be generally availed of, can, of course, be varied. The idea so far as we know is quite novel, and it is very easily applied to shutters of the type mentioned. A few shillings should defray the cost of fitting such an attachment, the conveniences of which must be plain to practical workers. Considerable discussion has from time to time taken place with regard to the best position the screen should occupy—in front of the lens, between the combinations or at the position behind the lens. In practice, there is perhaps not much to choose between each of these plans. Until now we have not seen a suggestion that the screen should be placed in front of the shutter, and, of course, with many shutters it is not practicable to give it such a position.

\* \* \*

ONE of our contributors, whose experience of photography has been long and varied, sends us some remarks, condemnatory of dark room lamps, which are worth taking into consideration by those firms who make and sell these "necessary evils." He says: "The lighting of the dark room, the laboratory, and work room, very often, of the amateur and professional alike, remains pretty much as of yore. Particularly is one led to a conclusion of this sort by an inspection of the lamps which are placed upon the market for the purpose of providing safe illumination during the development of plates. I really do not think we can feel proud of the assortment provided for our use, it is a meagre assortment, but on the other hand it is easier to find fault than to suggest improvements—one can only attempt to do the latter. There is not one dark room lamp which comes up to an average well-constructed cycle lamp; the latter is a vastly improved accessory; the former has evidently escaped notice. Now, every cyclist knows that a cheap lamp is abominable and vexatious, and withal the most expensive in the end. The same remark applies, and almost to the same extent, to ruby lamps intended for the illumination of the dark room. The ideal dark room," continues our correspondent, "is one (I write strictly from the amateur point of view) which is practically a room, portable or fixed, fitted up within another room in which there is a fireplace, the window provided with a shutter in order to be able on occasions to totally exclude all daylight; if now, the dark chamber is placed close to the window, and itself provided with a window papered with ruby and canary fabric, and this small window adjusted approximately to an aperture similar in size cut in the shutter aforesaid, we have a splendid light for all purposes when working by the light of day, with this important proviso, however, the ruby and canary media to be renewed at least twice a year, and oftener if exposed much to sunlight. In my own case

I have fitted pieces of pine grooving, sold for negative box making, at the top and bottom of window, and am able to slide squares of coloured fabric, attached to old cut out mounts, across the window, enabling me to block out a great deal of superfluous light, or rather, adjust it to one's own individual requirements.

\* \* \*

"MANY lamps" (he continues) "are little better than small portable stoves, and vile-smelling at that. There is no sense in having anything of the sort inside the developing room at all, providing one has a second window somewhat similarly constructed, at any point within 6 ft. or so of the average gas burner. Sufficient light is available for working by, or to fit up a shelf or bracket outside, upon which may be stood pro tem. whatever illuminant is available. If a lamp must be used inside the developing chamber, I should prefer to use, in the absence of an electric lamp, a good cycle lamp, as a well-constructed and designed affair to be depended upon to give a good light, and not to go out at unexpected and critical moments; but in this case it is best to use with it a couple of folds of ruby and canary fabric, at least two feet in length, stood up on one end round the lamp; any fumes arising from bad combustion are thus carried up above the level of one's nose, at any rate. Purity of atmosphere in the dark room is just as important as anywhere else. It is, I believe, a factor in the development of the very sensitive plates now so frequently used almost to the extent we assign to the purity of our chemicals and the cleanliness of our utensils. This purity of atmosphere is, if the sale of lamps be any criterion, not attained by the majority of photographic workers." It must surprise the manufacturers to be told that for dark room purposes an experienced photographer prefers to use a cycle lamp instead of one specially made for the purpose; and if it be true, as he asserts, that while the former has been improved the latter has escaped notice the sooner it is taken in hand the better. From our own experience with a large variety of gas, oil, and candle-lamps, we can quite sympathise with much that our correspondent says.

#### EFFECTUAL WASHING.

In two previous articles we have dealt with the subject of the fixation of silver prints, as relating to their stability. When dealing with the subject we pointed out that unless the prints were perfectly fixed in the first instance, so that the complex hypo-silver salts were got into a perfectly soluble condition, no after washing would eliminate them, however long that might be. Now, it is these salts, if left in the picture, that do the chief mischief; a mere trace of hypo-sulphite of soda is comparatively harmless, as experiments made many years ago have shown. At one time, now many years ago, long washing was thought to be necessary to eliminate the hypo, and it was customary, with many, to leave the prints in running water all night, so that they received fourteen or fifteen hours' washing. In some cases they were left in from the Saturday night till the Monday morning. This prolonged washing was, of course, quite unnecessary. But as the prints then made were of a very robust character, they suffered no harm, and, therefore, conscientious photographers preferred to err

on the side of overdoing it rather than underdoing it. Present-day pictures would be materially deteriorated in appearance by anything like that treatment, and it would be of no real advantage if they would not be injured.

Some time ago Messrs. Haddon and Grundy demonstrated that the hypo-salts could be entirely got rid of by washing for an hour or so, if the work were properly done. Since then a reaction has set in, and the other extreme has been gone to, and, in many cases, the washing, as a result, is incomplete; not, however, that the time has been too short, but because the method followed has been not what was required. The directions issued by the makers of some papers encourage too little washing to ensure stability—that is in the conditions it is usually done. Some of these directions say wash for half-an-hour in running water, others an hour or an hour-and-a-half. Now, many inexperienced amateurs simply rely upon these instructions, and put the dish, or maybe a washing machine, containing perhaps two or three dozen prints, under the tap, and let it dribble for the stated time, and then assume that the pictures will be permanent!

At the present time there are three different kinds of paper in vogue—albumen, collodion, and gelatine. Now, the films bearing the images, in each case, are of a different character. The albumen one is thin, and the albumen is insoluble and has very little affinity for water. The collodion film is still thinner, and has no affinity whatever for water. Gelatine, on the other hand, has a great affinity for water, and holds it tenaciously, and this film on the paper is also thicker than it is on either of the other papers. Let us for the moment take the two latter—collodion and gelatine—as applied to glass, by way of illustration. Collodion negatives are mostly fixed with cyanide of potassium, and, with that, a minute or two under the tap is ample to render the negative permanent. Many, however, are fixed with hypo-sulphite of soda, but, even with that, four or five minutes, or less, is quite sufficient to get rid of all traces of the salts. Not so with gelatine negatives, as with them, as everyone knows, a much longer time is necessary to ensure the elimination of the hypo-salts, even when the negative has been thoroughly fixed. Here we are dealing with the film on an impervious and non-absorbent material—glass.

In the case of prints, there is not only the film, but the paper, an absorbent material both of water and the solution of the hypo-silver salts, to be taken into consideration. These have not only to be eliminated from the films on the paper, but from the baryta coating, with which most of the "P.O.P.'s" are surfaced, as well as from the sizing material by which it is held to the paper. Now, can it be expected that the brief time, sometimes recommended, will effect this, in the conditions the washing is too often done?

In washing a precipitate a chemist is very careful to drain off, as dry as possible, all the water he can before adding fresh, for the washing is simply a matter of dilution. For example, say to begin with, there are forty ounces of solution to be eliminated, and the precipitate is drained off to one ounce. When the vessel is filled up again the water contains but a fortieth part of what it did before, and when the precipitate is again drained off to an ounce, and the vessel is once more filled up, the water contains but a fortieth part of what the previous lot did, and so on with each subsequent change, until the precipitate is thoroughly

washed. In the days when albumen paper was the only one used, prints, as now, sometimes had to be produced in a great hurry, and old photographers have told us that some of the most permanent ones they have made were washed in from ten minutes to a quarter-of-an-hour. The washing was done in this way:—After the prints were thoroughly fixed they were blotted off as closely as possible; they were then put into water and kept in motion for a minute or two, until it had thoroughly permeated the paper. The prints were then closely blotted off as before. Then they were put into water again, or washed under the tap for a few minutes, and once more blotted off, these operations being repeated till it was judged that all hypo had been removed. Here it will be seen that the principle of washing a precipitate was closely followed.

Of course the blotting-off method, even in a case of emergency, could not be adopted with gelatine papers, though it could with collodion ones. Much the same end may, however, be attained with gelatine papers by taking the prints from the water, placing them on a glass plate, and then passing over the back a soft roller squeegee with heavy pressure. We have merely quoted the above to illustrate how prints can be effectually washed in a very short time—and the same principle can be followed in every-day work in this way.

After the prints are fixed let the hypo solution be poured off, and the prints thoroughly drained while adhering to the bottom of the dish. They may then be put into a larger dish, or tray, and that filled up with water, and kept in motion for a few minutes, and the water closely drained off as before; these operations being repeated every five or six minutes. In this way, with a dozen or so changes of water, according to the number of prints and the size of the vessel, the pictures may be considered effectually washed in an hour or so. If the tap be running while the prints are in the water, so much the better. The object in the effectual washing of prints should be to get rid of as much as possible of the previous water before putting them into the next. Continual changes of water, with close draining between each, is far better than any continuous washing contrivances, however convenient they may be.

**Micro-photographic Despatches.**—According to a paragraph that has been going the round of the papers, the reputation of Dagron and his balloon system of pigeon-post messages is to be overshadowed by the most recent invention in connexion with minute photographic despatches, for, on the above authority, we learn that a "Western farmer" is training bees in lieu of pigeons. The bee is taken away from his little hive, a letter, photographed *à la* Dagron gummed to his back; he is turned out just like a pigeon, and home he goes! But if, as we were informed in the days of our childhood, the little busy bee gathers honey all the day from every opening flower, we think he would find even his tiny film a big load to carry, and it would be very awkward if he deposited his satchel of news in the middle of some tempting honey-laden bell. When the system has been completely matured, there will be a fertile source of copy for special correspondents, and in time we may expect to read such correspondents' stories as "The Brave Bee. Successful Encounter with a would-be Commandeerer. Sting against Bayonet: the Enemy Routed. Triumphant Return of the Insect."

**Invisible Light Photographs.**—From photographs by Venus-light to photographs taken by invisible lamp light is a slight step, and the latter feat has been achieved by M. Gustav Le Bon, whose

name has for some time past been familiar from his experiments with what he first, we believe, termed "dark light" or "black light." In a late number of the *Revue Scientifique*, this discoverer describes a remarkable and interesting phase of light, of which, if not already tried, there is no doubt that photographic use will be made. M. Le Bon, writing on various forms of phosphorescence, describes a dark lamp (*lampe noir*) for producing invisible radiations of great wavelength in connexion with the study of phosphorescence. After describing a number of experiments, he refers to the one we speak of. In an absolutely dark room, a dark lamp is placed on a table, this lamp not transmitting any trace of visible light. In front of it M. Le Bon places a statuette covered with sulphide of lime that has been left in darkness for several days, and consequently retains no trace of phosphorescence. After about a couple of minutes the statuette becomes luminous, and appears to emerge from the darkness. It is evident that the statuette in its luminous condition might be photographed, and some pretty and curious photographic experiments performed under the given conditions.

**Healthy Atmospheres.**—Since the advent of dry-plate work the old complaints of unhealthy dark rooms is never heard. The odours of the wet-plate era were strong and evident, but the question arises, Are there not to the dark-room worker emanations and impurities of the air of the room all the more dangerous through not being readily evident to the nasal organs? Some reply to this question may be found in the results of an investigation which, according to the *Manchester Guardian*, Mr. Francis Jones, of the Grammar School of that city, has been making. Briefly, his conclusions are that, if pure air is desired, gas should be avoided, either for heating or lighting. Thirteen parts of carbonic acid per 10,000 is quoted as being the recognised permissible maximum of this impurity. Coal fire and gas in Mr. Jones's experiments brought the proportion up to 27. Gas fire and electric light after a while gave a steady 14 to 15, which, if gas was used for lighting, quickly rose to 32. This was for an ordinary living room. What it would be in a dark room can be easily guessed, and the evil consequences to health surmised. From these data it is clear that all dark-room gas lights should be connected with a flue to carry off the products of combustion; but, with regard to Mr. Jones's deductions from the use of a gas fire, we can only say we should like to know how it was connected with the open air, for it is difficult to imagine how products of combustion could reach the air of a room in a properly ventilated gas fire.

**Starlight Photographic Portraiture.**—Photographs taken by moonlight are no novelty—landscape photographs, that is to say, taken by the light of the moon alone, not the sham "moonlight pictures" taken in broad daylight, the sun shining, the negative under-exposed, and the print over-printed—but photographic portraits taken by moonlight have not yet, so far as we are aware, been produced. Hence our readers would share with us the astonishment produced by reading in the *Daily Mail* that the feat had been performed of taking a portrait by starlight alone, or, at any rate, by the light of a "fixed star," as a planet has long been termed. The following communication from "our own correspondent" recently appeared in that paper: "Professor William K. Brooks, who is the head of the big Astronomical Observatory at "Geneva," New York, has recently extended his experiments to photography, and on Sunday night he succeeded in producing a remarkably clear picture of Mr. J. Fosdick, his assistant, by means of the rays of Venus alone. He selected the darkest hour of the night after the planet had risen and carefully excluded all light except that which came from this single star through the open shutter of the observatory dome. He found the light much stronger than he had anticipated, and will continue his experiments with other planets of less brilliancy." We can only remark that Professor Brooks's plate must have been as rapid as the aperture of his lens was great, unless, indeed, we are to understand that the "remarkably clear picture" was a silhouette only.

## ROYAL PHOTOGRAPHIC SOCIETY'S EXHIBITION.

[FIRST NOTICE.]

THE removal of the Royal Photographic Society's Annual Exhibition to the New Gallery in Regent-street, is a departure of the highest importance and one which must exercise great influence upon the future of British photography. At a stride the Society leaves the last of its old traditions, and finally enters upon a new turn in its career. Far-reaching indeed should be the benefits to photography, as a result of this step. For many years there have been complaints that the Water Colour Society's Gallery in Pall Mall gave insufficient scope for an exhibition which would permit photography to be adequately illustrated in its principal aspects. There were good grounds for these complaints. In a desolate-looking gallery measuring sixty feet by twenty feet, it was not possible either to hang sufficient exhibits from each class, or to allow of that division and subdivision which the necessities of the case required. What was pictorial and what was technical depended to some extent upon the whim of the visitor, who, in the absence of any line of demarcation, was to be forgiven if he placed a photogravure reproduction of an oil painting in the first category, and a platinum architectural interior in the second. The apparatus was huddled in the corner of a room, and the whole range of the scientific applications of photography was crowded into a few feet of wall space, at the tail end of the other exhibits; in fact, no classification at all existed or was attempted.

The pictorial workers had least cause of any to grumble at this state of things, for as a rule they took up seven-eighths of the wall space. Indeed, during the last ten years there has been a wide-spread belief that this branch of work has been far too generously treated at the R.P.S. exhibitions. The "bread and butter side" to quote Lord Crawford's now famous phrase, has been persistently neglected. The trade enlarger, the general professional photographer, the apparatus-maker, and the manufacturer, have practically been denied all opportunity of taking part in the Exhibition. The pendulum of progress has swung so far that it has forced out of the field of competition such men as Lafayette, Winter, Byrne, Van der Weyde, Mendelssohn, Werner, and many other clever workers, whose names at one time figured in the catalogue with unfailing regularity. Instead of the conscientious efforts of these men, the glorified snap-shot of the noisy amateur has been singled out for applause, with the result that there has been a falling off of much of that kind of support which at one time was a feature of the Exhibition. With such marked discouragement as it has received in recent years, how could a continuance of it have been expected?

These are some of the blunders which the Exhibition at the New Gallery will retrieve. The pictorial man has a big gallery all to himself. The "general professionals" are placed in two galleries, almost the equal in area of the deserted salon in Pall Mall East; the scientific photographer retires to the elevated seclusion of an upper balcony or gallery, and the apparatus-makers and manufacturers confront the visitor the moment he passes the turnstile and steps into the hall. This disposition of the exhibits appears to have elicited general approval.

On Saturday last the Private View and *Conversazione* attracted many hundreds of visitors, and at every turn we heard expressions of satisfaction with the comprehensive nature of the Exhibition, its size, and its scheme of arrangement. In the Pictorial Gallery there are 350 exhibits headed "photographs," the scientific, technical, and photo-mechanical exhibits (including a few items of competitive apparatus) number 212; the lantern-slide section numbers twenty-eight exhibits, inclusive of colour photographs and stereoscopic transparencies; and the twenty-four exhibitors in the general professional section show, between them, several hundreds of photographs and enlargements. A list of the exhibits takes up fifty pages of the catalogue, and there must be in all between one and two thousand photographs on the walls. The stall-holders number twelve, and the total of the exhibitors is 200. The five galleries—for so we must term them—present an extremely well-filled appearance, and the whole exhibition is so great and so satisfying, there is such a variety, such a wonderful wealth of splendid photography (not, of course, entirely untainted by bad work) that London photographers who have not had our advantage of visiting the celebrated international exhibitions at Bristol, Glasgow, Newcastle, Leeds, and elsewhere, will be able, for the first time, to realise the pleasurable sensation of passing through a number of galleries devoted to the exhibition of photographs—a sensation not hitherto to be obtained at Pall Mall or elsewhere in London.

The importance of the Exhibition from the point of view of public attendance cannot be over-rated. Pall Mall East, where the photographic Exhibition was formerly held, is traversed by comparatively few people; it leads, as it has been said, from nowhere to the same destina-

tion. Regent-street, which for magnificence and grandeur of position is unrivalled, and all the year round is peopled by streams of *flaneurs*, pleasure-seekers, and exhibition-goers, is also easily accessible from all parts of London, and these two facts should tell largely in favour of the attendance. The season's average of 11,000 at Pall Mall should rise very considerably at Regent-street. But we are not looking at the matter solely from a financial point of view. It stands on a higher platform than this. We think that the more people who visit the New Gallery Exhibition the better for a spread of a knowledge of photography in its best aspects. It is in its capability of educating the public at large up to this knowledge that the future of the Photographic Exhibition at the New Gallery should be so extremely valuable.

And in this connexion the hard case of the Photographic Salon really excites our compassion. Last week, when we wrote about the plastic psychological syntheses at the Egyptian Hall, we had not seen the superb show of photographs at the New Gallery. If we had, our natural tenderness of heart towards all struggling institutions might have disposed us to deal a little more gently with what we are driven to conclude is a doomed Exhibition. Years ago we pointed out that the continuance of the Photographic Salon as a separate Exhibition was out of the question, and, despite Mr. Maskell's defensive advocacy, events have shown we were quite right. It is not conceivable that the Exhibition, going public will continue paying 1s. a head to look at a little show of 239 photographs and other things hung in a small back room when, within a few minutes' walk, there is an Exhibition five times as large in one of the noblest suites of galleries in London. The thing is out of the question. One Exhibition is value for money and the other is not. Notoriously the British public, when it parts with its shillings, likes to get the best quantitative, as well as the best qualitative, return, and as between the Salon and the R.P.S., from the point of view of the Exhibition-goer, the comparison is not favourable to the former. But we do not feel called upon to labour the point. We alone have for years denied the need for two simultaneous London Exhibitions—the plea that one is "supplementary" to the other may be swept aside as the sickly twaddle of imbecility—and now that the R.P.S. has at last definitely occupied the whole available field of exhibition photography in Central London, the unswerving law of supply and demand may be trusted to settle the matter. Our contributor, "Cosmos," may be called upon to publish a certain epitaph sooner than he expected!

## SCIENTIFIC AND TECHNICAL.

The Scientific and Technical Section at the New Gallery compares very favourably with that of the Society's exhibitions in the past. Hitherto the pictorial show has been spoiled by the presence of the few technical exhibits that the Society received for display, and the Technical Section, on the other hand, has been unhappily dwarfed by the superior numbers of the pictorial exhibits. For some years the cry that the technical side of photography has been neglected by the Society has been growing louder, but we can assure our readers that this state of things was quite an unavoidable one. The Old Gallery has long been quite inadequate as a home for the Royal Photographic Society's annual exhibitions, and none knew better than the Society itself. With this in mind, efforts have long been making for a removal to a worthy place, and, in the New Gallery, we think, that place has, for the present at any rate, been found. The exhibits coming under our present notice are gathered together in the balcony of the Central Hall. By no stretch of the imagination can it be held that the section is in any way representative of the present position of the scientific applications or the technical side of photography; but, as a foretaste of what may and should be another year, it is decidedly noteworthy. The feeling that, in the past, they have been discouraged could not be quickly thrown aside by those upon whom one naturally looks for the exemplification of technical photography and its many scientific applications, but we are confident that the first results of the Society's movement to encourage these workers will be reflected next year on a larger, more gratifying, and representative scale.

## PHOTO-MECHANICAL.

Although, strictly speaking, exhibits under this heading form a distinct section of the Exhibition, they will not be found apart, but mixed with the general scientific and technical items. Messrs. Pellissier and Allen have on view a large number of photogravure reproductions of J. M. W. Turner's paintings, including a portrait of the great artist himself. Taken as a whole, they are good enough; some are very good, but the values in some do not appear to us truthfully rendered. The series includes copies of some of Turner's best works, and is an interesting exhibit. We should not proceed further without mention of Messrs. T. & R. Annan & Son's splendid photogravure reproductions of paintings

by Sir Henry Raeburn. There are about a dozen of these in two frames, selected from a series prepared to illustrate a forthcoming book on the works of Sir Henry Raeburn. The first frame (No. 407) deservedly secures the only medal awarded by the Judges in this section. Visitors will notice very quickly the fine display of photogravures made by Mr. Ignatz Herbst and Mr. Theodore Reichs. These gentlemen, in whom will be recognised the leading spirits of the Strand Engraving Company and the Art Photogravure Company, have for long been studying the question of the commercial production of large photogravure plates in competition with the Continental houses who have for so long practically monopolised this branch of reproduction. Here we have about a dozen examples of the work now being done by them in England. The patriotic visitor will be attracted by the pictures of Baden-Powell and Sir George White. The former is copied from a painting by the General's brother, Frank Baden-Powell, and the latter from Langfrier's recent photograph of the Hero of Ladysmith. The four plates of the Seasons, done in colours, have a very effective appearance, and are fair examples of the work of this firm in the direction of large coloured photogravure reproductions. Other prints by the same exhibitors are from F. Thomas Smith's *Come one, come all*, Farquharson's *Lusty Winter*, Browncombe's *Cheerful Spring*, and a picture by S. E. Waller.

The three-colour printing by Messrs. Raithby, Lawrence, & Co., of Leicester, will at once attract attention. The blocks were all made direct from the objects themselves, which comprise Oriental and other carpets, linoleums, and wall papers, &c., and several water-colour paintings, and all the examples speak well for the skill with which the colour printing of this firm is executed.

The Art Reproduction Company show a number of photogravure reproductions of pictures, half-tones, and photochromes, and in No. 439 a half-tone zinc plate such as is used in half-tone printing.

#### COLOUR PHOTOGRAPHY.

The present position of colour photography is very well illustrated. In the South Room are to be found two examples of the Lippmann interference process, contributed by Dr. R. Neuhaus—one of a stuffed parrot, his test subject, and another of the solar spectrum. Both are excellent specimens of the best work as yet produced by the Lippmann process, and are creditable enough to Dr. Neuhaus. In conjunction with these, another exhibit (No. 356) by Dr. Neuhaus should be examined. It shows a photo-micrograph (+4000) of a section through the picture surface of the red spectral zone of a spectrum photograph prepared after Lippmann's interference method, and presents very clearly the laminated condition of the film to which the colour effect is due. Mr. E. Douglas Fawcett, a gentleman who has devoted a lot of attention to the Lippmann process, is also represented. His exhibit is rather a collection of experimental results than a fine example of the capabilities of the interference method of colour photography. It shows, in the first place, a heliochrome, without a prism, indicating the density of the kind of image found most satisfactory. This has a special interest as tending to remove one of the many pitfalls of the process, and it will, no doubt, surprise many that so great a density has been found desirable. Examples of great under-exposure, with its characteristic appearance; fuller, but still inadequate exposure; marked predominance of the blues; and of the entire absence of the blues in an otherwise fairly good picture, are also exhibited. Mr. Fawcett's series terminates with an example of accurate exposure, under a good lighting; and a fine specimen, by Professor Lippmann himself, of Versailles and flower beds, not hitherto seen, we believe, in this country.

Another process here illustrated, and about which more is likely soon to be heard in this country is the McDonough-Joly process of photography in colour. The Colour Photo Company have on view some twenty transparencies by this method, many of which are very fine in their rendering of the original. It may be well to again outline the process. The picture is produced by a single exposure upon a single photographic plate, through the intervention of a screen placed in contact with the plate, and ruled in very fine parallel lines in the three fundamental colours, red green, and violet. The resulting negative is built up of lines corresponding in density with the colours and lights and shades of the original. A glass positive from this negative is then viewed through a second similar screen, properly adjusted, when a coloured representation of the original object is seen. Other processes illustrated are the Sampolo-Brasseur method, of which very meagre particulars are given, and the Sanger-Shepherd process of three stained and superimposed films. Messrs. Sanger Shepherd & Co. have eight very fine slides prepared in this way, and a stereoscopic view by the same method, and in the Central Hall a stand where many other interesting

examples and the special triple dark slide and apparatus required may be examined.

Altogether the exhibits of colour photographs and colour printing are prominent features of the show. That they are popular is shown by the way in which visitors congregate around them. We observe that colour slides by various processes will be shown on each evening that the Exhibition is open, in addition to the ordinary lantern-slide displays, and on three evenings special lectures on colour photography will be given by Mr. Sanger Shepherd.

#### PHOTO-MICROGRAPHY.

Mr. T. E. Freshwater, is again an exhibitor this year, represented by some very fine photo-micrographs of curious insects, ants, parasites, beetles, and mosquitoes, and a frame of photographs of spiders of various sorts. Mr. Freshwater is well known as a serious and painstaking worker in the delineation of this class of subject, and his latest productions amply maintain this reputation. The Royal Microscopical send a welcome exhibit in the shape of a frame of twenty-four photo-micrographs of diatoms, &c., by one who stands amongst the highest workers with the camera and the microscope—Mr. E. M. Nelson. Some of the specimens are quite superb, and all are sure to attract a large share of attention from the interested public. Our old friend, Mr. Andrew Pringle, shows that he has not forgotten his pet hobby, by the contribution of a frame of low-power micrographs of insects, including the homely flea, and late visitor the mosquito. Dr. Gustav Mann, B.Sc., has not, we believe, exhibited here before. His photo-micrographs of the section taken from the rabbit, cat, and monkey, speak well, however, for his skill, in this interesting branch of work, and the particulars he gives of exposure, magnification, and staining should be useful to others. Mr. J. M. Offord's photo-micrographs of pollen of mallow, eggs of butterflies, and moths, &c., are also worthy of notice in this section.

#### ASTRONOMICAL WORK.

The Royal Observatory, Greenwich, has a small but instructive exhibit of lunar, astronomical, and solar eclipse photographs in the form of transparencies. We would draw attention to the enlargement of the corona photograph taken by Mr. Davidson at Ovar in Portugal with the new Unar lens of  $2\frac{1}{2}$  inches aperture and 12 inches focus. The Rev. Walter Sidgreaves, of Stonyhurst Observatory, exhibits photographs of stellar spectra and of parts of the solar spectrum taken by means of the Rowland plane grating. He also has, in the Scientific Section, some magnetograms, thermometric and barometric photographic records, illustrating some more of the many applications to science to which photography has been put. Mr. J. M. Offord sends some fine photographs of portions of the moon taken with a  $12\frac{1}{2}$  inches equatoria reflecting telescope in conjunction with an enlarging lens.

Miss Acland, of Oxford, has a small series of slides showing the eclipse of the sun as seen in May last at Oxford, two of them taken in a hand camera.

#### LANTERN SLIDES.

The lantern slides and stereoscopic transparencies are of much the same quality as in the past. The best work, unfortunately, never seems to be sent in for competition, which is a pity, because there is no dearth of excellent work and workers, and here, at the greatest and most important Exhibition in the world, one should naturally find them.

#### GENERAL SCIENTIFIC EXHIBITS.

Amongst the general exhibits which cannot well be separately classified, may be mentioned some prints shown by Dr. W. J. Russell, F.R.S., illustrating the radio-active properties of the metals radium and polonium, and the action of uranium salts on photographic plates. Some thirty plates are also shown, produced by the agency of hydrogen peroxide in the dark. The exhibits possess considerable interest in themselves, and still more taken in conjunction with Dr. Russell's recently read papers upon the action of various substances upon plates in darkness. Professor C. V. Boys, F.R.S., sends a frame of interesting photographs of flying bullets, a class of work peculiarly his own. Visitors will note the wonderful way in which the photograph has recorded the waves of air thrown out by the rapidly moving bullet in its course. Mr. Thomas Manly, the inventor of ozotype pigment printing, is represented by two frames of examples, and it should be observed that the washed initial print in one case was kept for thirteen months before being pigmented.

The Institution of Civil Engineers contribute a series of four photographs by Mr. Cecil Lightfoot, showing the different stages of the sinking of the *Tai Hoko*, in July 1897, from the first dipping of the ship's bows to the moment when, stern in air, it disappeared. A striking photograph is also shown in No. 455, a common shell fired from an 8 inch howitzer, bursting in an earthwork of loam, at a range of 2000 yards.

Captain F. A. Bligh has succeeded admirably with his two photographs of Ice flowers on St. Moritz Lake, natural size. They are not easy to take; but in these the formation is seen to great advantage. The Rev. John M. Bacon, well known for his ballooning expeditions in search of knowledge and the Leonids, has several enlargements showing the cloud floor and experiences incident to ballooning that will not fail to attract notice. The same may be said of a large collection of prints by Mr. Douglas English, who has got together a number of photographs of snakes, toads, and newts, and so forth, taken in an aquarium. Our attention was specially drawn to a photograph of a roach.

It takes the form of a carbon transparency backed up with aluminium, and the realistic effect imparted to the counterfeit by the sheen of the metal seen through the transparency is very clever.

Mr. Edgar Scamell has been following the growth of a nasturtium by daily exposures upon it from May 21 to August 22, and the selection from the series shown in this section has particular interest to horticulturists. Mr. J. C. Shenstone has also undertaken the task of photographing British wild flowers in a manner suitable for book illustration and educational purposes. Both of these exhibits serve very well to show how a system can be applied to photographic pursuits, and a result interesting and valuable to others obtained.

Our notice would not be doing justice to the Exhibition without allusion to the series of light images on pure silver plates shown by General Waterhouse, and described by him on previous occasions. We are glad to perceive that he is proceeding with the knotty problem he has set himself, and to clear up which he has already done so much. Dr. Norris Wolfenden's contribution of X-ray photographs of marine creatures; Mr. Bridges Lee's survey photographs taken in various parts of the world with his now well-known Photo-theodolite; and the photo sculptures shown by the Selke Photo-sculpt Company, of Berlin, will at once attract attention, as also the instructive series sent by the Kodak Company, showing range of exposure, methods of toning bromide prints, and special treatment of papers.

There is a host of other exhibits well worthy of mention, but considerations of space preclude our dealing with them more minutely.

#### THE STALLS.

The central hall of the New Gallery will be found devoted to stalls, about a dozen in number. The Gallery lends itself with considerable facility to the erection of these stalls, and, although as many as a dozen may be seen, they cannot be said to be obtrusive or wanting in attractiveness.

Messrs. Wellington & Ward have a very dainty corner, designed and executed by Mr. George Walton, who has displayed considerable skill in his arrangements. It is hung with a choice selection of prints on Wellington specialties, and negatives on the Wellington film may also be seen. At night it is specially lighted by a cluster of electric lamps, as are others of the stalls in the building. Next in attractiveness, perhaps, is Griffin & Sons' space, got up under the balcony as a room in a private house with pictures on the walls, and an imaginary street lamp shining through a little window contrived at the back. The scheme of decoration is decidedly good, and here may be seen daily demonstrations of Velox printing and development. Messrs. Goerz devote their space to the display of enlargements from negatives taken with the Goerz-Anschütz folding camera, Goerz double anastigmat lenses, cameras, and binoculars of the Goerz-Trieder construction. Two stereoscopes served also to show the capabilities of the Goerz-Anschütz folding stereoscopic camera.

Messrs. Dallmeyer, Limited, Watson & Son, and Messrs. Ross, Limited, have cases of lenses, cameras, lantern and other apparatus of a particularly interesting nature. The stand occupied by Messrs. R. & J. Beck, Limited, has a large number of things which will well repay examination, prominent, of course, amongst them being Frena cameras and the Beck-Steinheil lenses recently put before the British public. Very neat and effective is the little stand erected by Messrs. Burroughs, Welcome, & Co. for the advertisement of their convenient tabloid form of photographic chemicals. This form has become quite an important one among those supplying the wants of amateurs.

To the Kodak Company, who have a very neatly got-up table stand in the middle of the hall, has been awarded the only medal for apparatus, and this is secured by the new Panoram Kodak. The same firm also shows the Brownie and several new folding cameras, modifications and improvements on old forms.

\* \* Next week in a second notice we shall deal with the General Professional and Pictorial Sections of the Royal Photographic Society's Exhibition.

#### THE PHOTOGRAPHER'S YEAR.

##### OCTOBER.

MANY people must be glad to see October come in. Railway officials, for instance, with time-tables brought back to the normal by the dropping of the tourist portions; lodging-house keepers, who for the past three months have been dining in the kitchen and sleeping in the garret; farmers, with the back of the year's work broken, and its spoil under cover in rickyard and barn. The summer traveller, seaside visitor, bread-eater generally, is also probably not sorry to think of a change. There is nothing so short-lived as satisfaction with the existing order of things, however pleasant and favourable. It would be very tiresome and monotonous if it were always summer, and thoughts of coming winter and its crisper life are agreeable ones. These begin to suggest themselves with October. The clear, blustering freshness of the equinoctial gale blows the smoky cobwebs of the dusky Michaelmas summer out of the brain, and acts as a fine, bracing, all-round tonic.

The photographer of the year who may have overdone it in the past favourable months will find the clear and keen air of an October morning act as a valuable counteractant against the reaction that prompts him to put his camera by for the season. In the earlier portion of the month in particular he will find a good deal remaining well worth photographing, and more markedly characteristic of the month itself than the effort at this in any other. If a photograph were taken of what is regarded as a typical scene of each month, and ranged unlabelled side by side upon a table, that of October would be picked out first as most easily recognisable. In our variable climate the picture of one month might very excusably be confounded with that of the next, as the weather of one has such a faculty for spreading over two. January, for instance, might be taken for February, February for March, and, with a delayed spring, March for April, or even May. Fullness of foliage will make August look like June, much as a wealth of hair, against which "the miller's cart has not brushed against," will knock ten or fifteen years off a man's age. The partially fallen leaves of October, however, proclaim its name and place at once. Yet there are many artistic possibilities at this particular stage of nature's yearly cycle of work. Fuller spaces are opened out when the leaves have partly fallen, and many old-fashioned country houses brought into better view that have been until now too closely shut in by greenery. There are upon the same road that we thought we knew so well a dozen fresh points of view, or, more correctly perhaps, fresh views from old points. At the same time the trees are full enough to keep out the suggestions of bareness that must come later. Fallen leaves upon the road in the foreground, clustered as the wind has swirled them together, with the deep-cut trail of the wheel of a country cart passing through, give wonderful realism to a picture of October.

The objection that most people would have even to a highly artistic picture in this month would be the suggestions of death and decay that present themselves everywhere. Age, up to a certain point, is beautiful and attractive, but that point stops short of the stamp of advancing death. The artistic temperament, necessarily a highly sensitive one, feels this keenly. The artistic point of view, too, being essentially that of the outward appearance of things, cannot find so readily the source of consolation of the scientific one, in regarding more broadly and deeply the decay as a necessary process of larger life. The artist concerns himself with the fallen leaf and the naked bough only, and is unhappy; the botanist knows as well of the bud that has been formed where the leaf broke off, and its possibilities. If artistically miserable, he is scientifically cheered. It is unfortunately not a common combination. Dealing with broad masses and the airy and changeable shapes and bounds of light and shade, the artist cannot pin himself down to study the formation and functions of a bud, nor read the meaning of the reticulation of a leaf.

If this phase of nature prove too disagreeably suggestive to the artistic and emotional photographer, there are many other subjects still out of doors tinged with no unpleasant colouring. The heavier and more pressing portion of farm work being over for the year, the farmer has time to look to his hedges and ditches, and also plenty of spare labour to prepare them for the extra strain of coming wet and wintry weather. A wayside labourer is well worth noticing. He has generally a very interesting mass of information about all things belonging to the country laid up in his head, and is ready enough to part with it—to the right man. To the wrong man, however, he is "a mere clod"—although it might do this would-be patronising individual a great deal of good if he could only know how accurately this "mere clod" sized him up. Country people have far more in them than the town man, who only comes across them occasionally and superficially, thinks. They know

but little, it is true, of matters that he is chiefly concerned with; but, probably, more than he knows of the country, and its life and doings.

To one who can reach to broad interest in, and sympathy with, them, there are very many fine photographic possibilities open. Appreciative interest, for instance, in what the ditcher has just been saying about the past season, the coming winter, the effect of the moon upon the weather, or even the carrying capacity of a ditch, will wonderfully lighten up his face and strengthen his unconscious pose. There is a touch of individuality about him now that would look well in a picture. He is perfectly willing to be taken; the promise of a copy, if successful, makes him more than willing, enthusiastic. How and where could conditions be more favourable? A quiet country road, an interested subject, fully in keeping with its setting, and the human interest. Why, with just a touch of luck, he might figure as a type, and the negative stand enlarging and titling as "The Ditcher!" Then there is the road-mender of October, and the Irishman who comes over at this time of the year to help dig and "hog" potatoes. The still more interesting tramp also, now that there is a touch of frost in the air night and morning, closes in towards the town, and is more accessible. He is well worth attention from a dozen points of view, each one of which would make a photograph of him valuable. Everything that means success in life the tramp is short of. His appearance so unmistakably proclaims this that he who may have been gifted in short measure—or, as he would probably put it, has met with but indifferent luck in life—can always congratulate himself in a pleasant Pharisaic spirit, that he is, at any rate, better off than this man; and, when a man arrives at the stage of realising that he might be worse off, he has crossed over the boundaries, at least, of the region of content and happiness. Or, if so successful a man—as all photographers, amateur and professional, should be—that he cannot very well open up a comparison between himself and one so far down the social scale, the tramp is still an object of high interest. There is a subconscious dash of sympathy with his freer life, possibly owing to a deeplying, instinctive reversion to the mode of life of common, though far-distant, roving ancestors. It is the same instinct that induces English boys to read *Treasure Island* and *Robinson Crusoe*—the grandest old tramp of all—and sends them to sea, and the distant corners of the Empire. As for their elders, does not the blood run more freely and easily when thinking of a bicycle tour, a yachting cruise, or a fortnight under canvas! If these be too far-fetched, our tramp has a marvellous store of information of things that be, hopeless to look for in a book—for he is another marked instance of the truth of the statement, "That he who knows cannot write, and he who can write does not know!" It is but a slight lack of balance of brain molecules, after all, that makes one man a tramp, and another a town mayor. He—the tramp, certainly not the mayor—is not over-anxious, as a rule, to be photographed, partly from a surviving remnant of shame at his possible drop in the social scale, but chiefly because he may have a "history." A little genial breadth of view, a little tact, and a shilling, will go far, however, in gaining the point. We make big efforts to portray "his Worship the Mayor" in his robes; the tramp, in his makeshift clothes, is far more interesting artistically—and very often far more interesting in other directions as well.

Our forefathers called October the "wine month." Why, it is hard to say, for there could never have been wine enough made in England to justify the term as indicating any such very general operation. "Beer month" would be nearer the mark, for the October brew, with the new malt and hop, was, and is, the best and most important of the year. Home brewing is fast disappearing, like a good many home other things; the more's the pity, but in quiet corners it is still possible to come across the home process of beer-making. It is a distinctive and interesting one, and, with some care and careful arranging, possible to photograph. The whole of the kitchen or out-house may be out of the question, for the light in old-fashioned kitchens is not by any means of the best. It will be possible, though, to get the large copper pan set upon the wide, open fire hearth, and the figure of the stirrer of its contents, with a suggestion of characteristic surroundings. Irregular and roughly vignettted, it might "turn out trumps." Farmhouse people have plenty of time to be obliging and courteous, and the camera is not familiar enough to them to be uninteresting. With rather a contempt, often, for the objects the photographer wishes to gain, as being to them so commonplace, they will take great trouble and pains to meet his wishes. The cider press will also now be in action, lending itself even better than the brewing to photography. The fire is absent, fire being, with a lengthened exposure, very awkward to express properly. A difficulty in both cases will be the arranging of figures, to sustain a natural appearance for the probably long exposure, the temptation to look at the camera and see what is going on

being so strong. After all the trouble, both, if not rank failures, may be but modified successes; but there is also a chance of gaining an unqualified success. If so, it will be a far higher prize than the orthodox success in getting the glen, waterfall, or romantic-looking show village squeezed up in the narrow, well-wooded valley. It is more distinctive and unusual, and the difficulties in taking it have been so much greater.

If a worker of a sporting turn of mind would have pictures to fill in his all-round series, this month is as favourable as, if not more so, than the ones at the other end of the winter season's sports, when the light is about the same. Football is well under weigh, and a reasonably clear day will admit of the necessary snap-shot with a rapid plate. The hounds and huntsmen at the covert side will make a better picture than in early spring, from the fact that the trees and country generally, though bare, are not too much so.

At closer range the cobweb covered with rime in the hedge, or, better, considering background perhaps, anchored down to the withering fronds of adjoining ferns, is both exquisitely beautiful in itself, and will lend itself well as a positive on glass to dainty decoration. The same can be said of a tassel of fir cones, a spray of late-ripening hop, and the hardy sedges now standing well and prominently out of the water.

In short, although October, at the first glance, may seem lacking in suitable subjects for the camera, a little closer looking will bring to light an ample supply.

#### THE SITTER'S RECOMMENDATION.

WHAT part do the recommendations of his clients play in the building up and extension of a professional photographer's business? The question is interesting, because rather difficult to answer. Advertisement is said nowadays to spell success, and certainly none better could be had than the personal praising of our work to others by people we have pleased and satisfied. Can the photographer, then, rely on such kindly remembrance as a necessary consequence of the creditable execution of his orders? Every owner of a studio is well used to friendly and unsolicited promises of recommendation from sitters he has had the good fortune to entirely satisfy; but, after the first flush of gratification has died away, how many of them call to mind their benevolent intentions? Only a very slight knowledge of human nature is required to anticipate the reply, that the proportion is small indeed. This statement is made in no unkindly or carping spirit; possibly many excuses may be found, among which, no doubt, bad memory may be included. What photographer is there who will not on occasion speak feelingly and sadly of that quick realisation of the instability of good intentions which is one of the first lessons learnt in the school of experience? A fair damsel, for instance, the pride of a family of some local standing, comes to sit for her portrait, beseechingly asking to be made as good-looking as possible. Her proofs turned out things of beauty. Pleased and delighted, she hints at speedy visits from all her friends and relatives, each similarly charmed and anxious to become possessed of equally good photographs of themselves. But, alas! not one of them comes, nor does the young lady herself ever increase her original order!

Many such a case will easily recur to the professional memory, and does not tend to enhance our faith in the practical value of hastily made promises. To be sure, now and then we come across a specimen of that *rara avis*, the sincerely and lastingly appreciative sitter, whose recommendation brings custom to us. It is not always those who most demonstratively express their satisfaction who are really the best pleased, and sometimes the knight of the camera is agreeably surprised by new sitters mentioning, as having induced them to come, some past client whose commendation was least expected. It has even happened that fresh custom has come by the instrumentality of those who were absolutely angry with their portraits. An amusing example occurred lately. A rising photographer had, by one of those perverse mischances that none may avoid, taken a really execrable portrait of a certain provincial mayor. To call it even a caricature would have been flattery, and the perpetrator had resigned himself to the abandonment of all hope of any orders or patronage from that quarter. To his intense surprise, however, scarcely a week after, appeared the mayor of an adjacent town, saying he had been advised to come there for his portrait by the municipal magnate before mentioned. The result was eminently satisfactory to the photographer, and, meeting later the client of whom he had taken so unflattering a picture, he ventured to thank him for his kind recommendation. His worship grunted: "Oh," said he, "I didn't tell the man to come to you because I liked my pictures, but because I detested him!"

Such occurrences as that just related are, needless to say, sufficiently infrequent to be safely ignored from the standpoint of business utility. As we have seen, even when the sitters are pleased, it by no means follows that they will try to influence others in the photographer's interest. Unquestionably in the past personal recommendations were more frequent, and had far more value in building up a profitable connexion than at present. Nowadays people have more independence, are more in the habit of judging and choosing for themselves, and therefore less likely to take anything at another's valuation. If it appeals to them as good and worth their having, they will straightway patronise it, whether or not it is praised by some one else.

If, then, the photographer has not much to gain by the favourable mention of his clients, can it be said that he has nothing to lose by adverse comments when his work is for any reason unsatisfactory? It is, unfortunately, true that the public are, at the best of times, difficult to please, and that, when discontented, they find no particular difficulty in communicating their grounds for dissatisfaction to a wide circle of friends and acquaintances. A gets a picture of Mrs. A, for instance. Now, the latter is decidedly good-looking, and is well aware of the fact. Her portrait, however, renders her as a decidedly dowdy and unattractive female. Perhaps it was her fault, perhaps the photographer's, be that as it may. The indignant A shows the offending print to sympathetic kindred, and cronies by the dozen, each of whom helps to pass censure on the unlucky artist, probably forming also resolutions never to give him a sitting. It is evident how much real harm may be done to a photographic business in this manner. The taking of one bad picture is, in fact, sufficient to counterbalance the good effect of a score, acting as a powerful anti-advertisement. We all know that failures must be; no man is infallible, and, where there are so many factors of disturbance to be overcome, little wonder that even the photographic Homer sometimes nods. Happy is the portraitist who makes the fewest mistakes!

There are occasions, undeniably, when the cleverest operator living could not produce a satisfactory result to save his life, as, for example, when a more than usually ill-favoured individual has to be taken. It is at such times that the artist wishes fervently that he might venture to adopt the procedure of some of the early lights of the profession, and exercise a right of veto on his sitters. But, no, the uninviting face must be reproduced, with what little alleviation retouching can give, then to be shown round and expatiated upon, more or less to the photographer's detriment.

If it is not always possible to secure an artistically pleasing portrait, it is certainly in our power to see that no badly finished or slipshod work is ever allowed to pass. People are more given to noticing such lapses than might be imagined; indeed, it may almost be said that the public would rather have a second-rate picture well finished than a first-rate one that is not. We may flatter ourselves that our clients will not notice such trivialities as a tiny lump carelessly missed in the mounting, a roughly cut edge or imperfectly square corner, and suchlike little offences against perfect technique, but our hopes are falsely based. They do notice them, and also that other photographers avoid such lapses. So our critics draw their own conclusions, and very probably make haste to communicate the same to others, in a manner hardly conducive to our best interests.

The few recommendations that are given by the sitters are often quite as much the result of their appreciation of courteous treatment as of satisfaction with the work done for them. It is wonderful how politeness and diplomacy pay in the world of business. The public enjoy having their little idiosyncrasies considered, a certain amount of gossiping patiently listened to, or to be discreetly complimented on a pretty dress or fashionable coat, when it can be done without officiousness. Courtesy is easily cultivated, there is nothing hollow or false about the genuine article. Where servility and sugared falsehood fail to impress, true politeness generally brings its reward. Employers, as a rule themselves the most courteous of men, would seem to some extent to be aware of the importance of the manner in which their customers are received by the stress many of them lay on the necessity of obtaining tactful and clever receptionists. In some reception rooms, though happily very few, the sitter is treated with chilling indifference, and led to the studio as a criminal going to execution. It is hardly necessary to say that such treatment is not productive of recommendations, to say nothing of good orders.

It has certainly been the happy fortune of some photographers to have clients whose generous patronage and good words have helped them to establish a successful business. Such cases, however, are very rare, and not to be reckoned among ordinary probabilities. It would appear, then, that a professional reputation principally depends on ability to produce good work. Each picture turned out by a truly capable man is

a finger-post pointing all who see it to his studio. An artist of genuine ability, provided only that he have a certain aptitude for business, need fear no lack of customers if he has no other advertisement than the products of his skill.

A. LOCKETT.

#### EXPERIMENTS CONCERNING NASCENT SILVER AND THE PROCESS OF DEVELOPMENT.

[Translated from the *Archiv für Wissenschaftliche Photographie*.]

THE nascent silver theory assumes that the action of the reducing agent of the developer upon bromide of silver produces a super-saturated solution of silver, and that the metal is precipitated upon the minute particles of silver which may be present. The many tempting advantages of this theory distract attention from certain difficulties, and these have recently been referred to by one of the joint authors of this paper. Substantially the following difficulties must be met:—

1. The impossibility of developing bromide of silver films of variable thickness in similar proportion with a developer free from silver salt, whereas the presence of a silver salt in the solution renders it possible.
2. The impossibility of increasing the opacity of chemical fog to any desired extent with ordinary developers not containing silver salts even if the reaction is far from having reached a state of equilibrium:—

3. The slight lateral extension of development from the exposed to the unexposed portions of a plate, as proved by the experiments made by Eder and Schaum.

4. The impossibility of developing the under-exposed parts of a thickly coated plate through to the glass.

All these difficulties are removed if the theory of super-saturation is enlarged by assuming that reduction and precipitation of silver from a super-saturated solution takes place in proximity to particles of silver bromide predisposed to development by the action of light.

With regard to irradiation due to development, we have not yet any conclusive experiments. The lateral extension may be due to slight halation. The importance of diffusion of light and transparency of film will be shown in a subsequent treatise. No value can yet be attached to Eder's experiment in contradiction of point 4, as particulars of the physical conditions are entirely wanting from which an opinion of their conclusiveness might be formed. (This relates to the amount of absorption of an indefinite quantity of light by a film of indefinite thickness.)

On the other hand, a complete investigation should deal with the proof of those facts, which are regarded as material evidence of the action of nascent silver, and therefore as the principal support of the super-saturation theory. These mostly relate to Abney's experiments concerning the transmitted development of unexposed silver bromide and the interpretations which have been placed upon them.

We started afresh with the Abney experiments, which one of us had already made,\* mostly with negative results, and we repeated them, taking all due precautions. The experiments which Abney described in the treatise published in 1877 appear to have been made exclusively upon collodion plates, which after exposure were half re-coated with collodio-bromide of silver, or collodio-bromo-iodide of silver, and then developed. The important fact of Abney's experiments was that the re-coated half showed intensification after development.

"An ordinary dry plate," is only mentioned once in the treatise, and it is not stated, as was then usually the case, whether a collodion or gelatine plate had been used. Our experiments have been made almost exclusively with gelatine plates, as the subject is of greater interest. Both normally and under-exposed plates were prepared and coated with collodion emulsion before development in accordance with Abney's procedure.

In a large number of cases, in which various developers were used (hydroquinone, ferrous oxalate, and pyrogallol more especially), no intensification was observable upon that part of the plate which had been re-coated after exposure, when the collodion emulsion which was used contained no free silver nitrate, and this was also the case in our previous experiments. On the contrary, even after prolonged development, the re-coated portion always appeared to be thinner. But, if free silver nitrate be present in the collodion emulsion, or if a soluble silver salt be formed by the developer, as, for instance, pyrogallol and ammonia, then, as might be expected, a considerable intensification takes place. In our experiments the silver salt was introduced to the film by pouring over the stained collodio-bromide plate a sensitising solution, which

\* Precht, *Archiv für Wissenschaftliche Photographie*, ii. 3, 1900.

contained a dye as well as silver nitrate. A portion of the solution containing the dye also formed part of the same emulsion used for coating. The quantity of  $\text{AgNO}_3$  in the emulsion and the period of development were varied in twenty-three of the experiments, and both ferrous oxalate and alkaline pyrogallol were used as developers. There was no intensification in any single instance when the silver salt was eliminated by sufficient washing before development. Some contradictory results occurred at first, but were due to insufficient washing before development.

We conclude from these experiments that the intensification which has been observed with plates recoated with collodion emulsion is connected with the presence of free silver salt, and we must infer that, in Abney's experiments, and likewise those made at the Vienna Technica School at the instance of Bredig, and quoted by Eder, small quantities of free silver salt probably influenced the results.

With reference to the experiment made at the instance of Bredig and described by Eder, in which the direct contact of the films of collodion and gelatino-bromide emulsion was prevented by interposition of a thin film of gelatine, it appears to have escaped Bredig's attention completely that a similar experiment was described by Abney, and gave an opposite result from that stated by Eder, for reasons to which we shall refer. Abney coated iodide and bromo-iodide plates with tannin and diluted albumen, and dried them. After exposure each plate was half coated with collodio-bromide, and developed with strong alkaline pyrogallol. The unprotected iodide only showed traces of an image, which, according to Abney, was due to the formation of a sensitive albumen salt (with free silver nitrate).

Doubtless the formation of the image is due to the free salt of silver, and, if this be the case, it must be inferred, in the case of the Vienna experiments, that the free silver salt in the collodion emulsion, to which intensification is probably due, did not have time, in the process of development, to pass through the intervening five per cent. film of gelatine, for, according to Abney's own statement, the free silver must have penetrated the film of albumen. In Abney's experiments intensification was also absent when the intervening film of albumen or gum was very thick.

We think we have thus explained the contradictions, but we must state that, in the work of Abney's to which we have referred, neither gelatino-bromide plates nor collodio-chloro-bromide emulsion are in question, and we must therefore conclude that the original paper was not at Bredig's disposal. We should also mention that the image was sometimes more marked in the exposed film, and at others in the second coating. This depended upon the developer, which was either pyrogallol with ammonia, or caustic potash, and is explained by Abney's observation that silver bromide is soluble in ammonia and insoluble in caustic potash.

Our experiments do not, however, entirely preclude the possibility of the action of nascent silver, for in such case it should not be possible to intensify a negative by coating it with emulsion and developing it. In relation to this we proved the fact that no intensification takes place if a negative be coated with collodio-bromide without any free silver salt, and then developed, without exposure to light, with a solution of such strength as generally used in the collodion process. The experiment may be easily made with Dr. Albert's plain emulsion and hydroquinone developer, but a strip should be removed from the negative before coating it with the emulsion in order to ascertain the presence of chemical fog. If, under similar conditions, the plate be developed with strong alkaline pyrogallol, as, for instance, the usual pyrogallol-soda or pyrogallol-acetone developers, taken in ordinary strength for gelatine plates, it will be seen that considerable intensification actually occur; but in our experiments we also noticed a considerable amount of chemical fog upon that part of the plate from which the gelatine film had been removed.

Upon developing gelatine plates coated with collodion emulsion after exposure we also found in some cases, where a strong solution of alkaline pyrogallol had been used, that intensification corresponding with the amount of chemical fog had occurred, but it was entirely absent upon development with a normal solution of ferrous oxalate, and it could not, therefore, be ascribed to the action of nascent silver. As Abney has expressly drawn attention to the very marked alkaline character of the pyro developer he used, it is possible that his results are partly to be accounted for in this way. Concerning the Vienna experiment, it is also impossible to pronounce an opinion in this respect.

Finally, we wish to add a few remarks concerning experiments with gelatine plates which were coated with a second film of gelatino-bromide emulsion. This can be done without detriment to the first film by reducing the temperature of the emulsion to  $18^\circ\text{C}$ ., and, after pouring it

upon the plate, spreading it by means of a glass rod or broad spatula. The excess is allowed to flow off. We used a normal gelatino-bromide emulsion, similar to that with which the plates were prepared, but diluted with four times the quantity of water. It is then possible to spread it well at  $18^\circ\text{C}$ . Failures attending the use of a more highly tempered gelatine are thus avoided.

An increase of density was observed, with both plates and finished negatives, when treated in this way. If the same precautions be taken as mentioned above, and plain glass plates coated with the second emulsion be simultaneously developed, a guide to the amount of chemical fog is obtained. If the veiled plate be placed upon the normal half of the plate which has been coated a second time, the intensification and gradation of both halves of the plate, upon which the experiment has been made, will be found the same. It is therefore impossible to conclude from these experiments that there has been any contributory action of nascent silver. With developers characterised by little or no tendency to fog, such as ferrous oxalate under  $18^\circ\text{C}$ ., the intensification is slight or absent when the period of development is not too prolonged. At a higher temperature, and with developers prone to fog, such as pyrogallol, para-amidophenol, &c., it is considerable.

Some new and interesting results were obtained in two other series of experiments. Some gelatino-bromide emulsion, which it was just possible to coat at  $27^\circ\text{C}$ ., was used for the preparation of some ordinary plates, and some test exposures were made to verify their reliability. A very thinly coated stereoscopic plate was half recoated with a measured quantity of emulsion, and, when dry, exposed in a stereoscopic camera upon a test object, a target formed of black-and-white concentric circles. The thick and thin halves of the plate, in this manner, were both exposed to exactly the same amount of light. By coating the thin half of the plate after exposure with a similar quantity of emulsion at  $27^\circ$ , and drying it, a plate of the same thickness of film throughout was obtained. This was developed with ferrous oxalate. If the action of nascent silver contributes materially to the effect of development, it might be expected that the half coated with emulsion after exposure should show the same opacity and characteristics as the other normally exposed, thickly coated half. But this was by no means the case. The half which had been coated a second time after exposure was inferior in opacity and contrast to the other half. If the former fact be opposed to the theory of the action of nascent silver, then the want of contrast must also be taken as further confirmation of the same conclusion. We contrived to strip the unexposed film from the exposed film supporting it, and, to our surprise, found that the former exhibited a positive image. In the supplementary film the black circles of the test object were black, and the adjacent numbers also. Instead of there being any nascent silver action, the contrary was the case.

To obviate any rash conclusions, we varied the thickness of the film and the period of exposure in another series of experiments. The plates were coated with a wedge-shaped film of emulsion, and the second film was also of similar form. In this case it was necessary to dilute the normal emulsion for the supplementary film with an equal quantity of water. The thermometer used as a rod in spreading the second film, as previously mentioned, registered a temperature of  $27^\circ$ . Numerous experiments gave results the same as already described. Only in two instances was there any confirmation of the action of nascent silver, and this was indicated by a negative image in the emulsion supported by the thin film which had received the exposure. Both instances showed a coincidence of definite values for thickness of film and period of exposure, and were characterised by marked under-exposure and attenuation of both films. Although this manifestation of the action of nascent silver was quite exceptional in the course of our experiments, it indicates the possibility of transmitting development according to the nascent silver theory, but, in the presence of the opposite result in a large number of other experiments, it cannot be considered of much importance for the explanation of the process of development.

If we summarise the results of these experiments with double-coated gelatine plates, it must be said that the upper, unexposed film usually presents a positive (chemical fog), or no image, when treated with the developer, but that in a few exceptional cases there is a transmitted image, or intensification of the underlying negative, in accordance with the nascent silver theory.

The formation of a positive image in the unexposed supplementary film may be explained by the gelatine acting as a chemical sensitiser (especially when there is a slight increase of temperature) and taking up a part of the bromine liberated by the exposure to light. The presence of bromine with gelatino-bromide of silver renders it less susceptible to development, as it hinders the liberation of further bromine. Such parts of the supple-

mentary film are consequently less affected than those which are situated above the unaltered bromide of silver, and we thus obtain a positive in the supplementary film instead of uniform chemical fog.

So far as we are aware, it has never been urged against the nascent-silver theory by former writers, that very clean images may be produced when bromide emulsion is developed upon a substratum of silver foil. Bühler, of Schriesheim, has recently introduced as a commercial article a bromide paper with a metallic support for the emulsion (this is not silver, but an alloy of aluminium). The metallic substratum does not in the least affect the purity of the unexposed portions of the film.

Eder cites a more recent experiment of Abney's, in which an under-exposed gelatino-bromide plate was partly coated with chloro-bromide emulsion after exposure, and when submitted to alkaline development appeared as though normally exposed at those parts. The image was found to be largely in the unexposed, supplementary film. As Eder does not mention whether this experiment has been published and where, we have only been able to repeat it according to the particulars given. We have not been successful in the manner described, but, on the contrary, the results were much more in accordance with the experiments we have already mentioned.

We are of opinion that the action of nascent silver cannot be regarded as of importance in the process of development until new and stronger evidence is offered. We would rather look upon the occasional experiments of Abney, Herzog, and Luther as preliminary, in so far as they may be in favour of the action of nascent silver.

In the work to which we have referred, Abney expresses the opinion that "the atom of reduced silver at once unites with the adjacent molecule of silver forming sub-bromide, which is reduced to the metallic state, that these two silver atoms unite with other molecules of silver bromide, and so on, and that the image is thus gradually built up." This theory has recently been expounded by Liesegang, but, apart from purely chemical considerations, it is open to the objection, that it presupposes the presence of silver or silver sub-bromide in the exposed silver bromide.

If we adopt the theory expressed at the beginning of this paper, which we will now further amplify, we avoid not only these difficulties, but the hypotheses which are shown to be unnecessary by the facts we have observed. We assume, for reasons which have often been given, that the developer reduces more silver bromide than is directly changed by the action of light, but we affirm that only those particles of silver bromide are very materially reduced which have suffered change by exposure. The nature and extent of this change should be looked upon as unimportant, and, in order to understand the process of development, it is unnecessary to adopt any hypothesis concerning the nature of the latent image, and this should be regarded as a considerable advantage. In more precise language we may say: The speed of the reaction of bromide of

silver + developer  $\rightleftharpoons$  silver + [developer + bromine] is accelerated catalytically at the exposed parts in proportion to the effective energy of the light, and this in proportion to the concentration of the catalytic agent. Only upon such a supposition is it possible to understand that the law of Bunsen and Roscoe, for direct conversion by light, is also true as a whole for developed gelatino-bromide of silver. This point, which is of the utmost importance, has not been taken into account in any theory up to the present, although a large part of the scientific and practical application of photography directly depends at least upon the approximate validity of the law.

We think it important once more to emphasise the fact, that our theory is independent of the substance of the latent image, and that it consequently leaves room for due consideration of the possible part the gelatine may play in the formation of the same, a factor which has hitherto been undervalued and disregarded.

J. PRECHT and W. STRECKER,

Photographic Laboratory of the University Archaeological Institute.  
Heidelberg, June, 1900.

### THE PERISHABILITY OF PAPER.

THE following notes on this important subject, which is of direct interest to photographers, are quoted by a contemporary from a Canadian official report:—

"It is important to recognise the fact that a great revolution has taken place in the manufacture of paper, and that a very large proportion of the books and documents of the present day are doomed to crumble away on the shelves of the archives and libraries established and endowed to preserve them. It is not, perhaps, to be regretted that the vast mass of

cheap books and periodicals will be resolved into dust under the influence of light and air alone, without the aid of any human agency, but it is to be regretted that literary works of value, and even documents of great importance, are still written and printed upon materials whose perishable nature is not taken into account.

"The durability of ancient books is very remarkable. The productions of the very earliest presses have come down to us as bright and clear and solid as when they were first printed. The paper is tougher, and the ink as black as in the works of the present day. The books which Columbus read may now be read as easily as when they were first printed, and the notes he made on their margins are as legible as when he wrote them. The entries in the Customs House Records of the reward paid for discovering America are still black, but, upon the receipt for the amount paid in the Alabama award, some of the endorsements have turned brown and are fading away.

"The perishable character of recently printed books is due mainly to two causes: the use of wood pulp not thoroughly prepared, and the introduction of heavily clayed glossy papers necessary for printing photographic process blocks of low relief. The defective material in these last papers is covered up by the clay with which the interstices are filled and the surface covered. The weight of the paper is increased by the heavy loading, but a fold across the corner of a sheet will show that its brittleness is increased in proportion.

"The danger of using paper made from wood for important documents was soon observed in Germany, where such paper came first into use, and, because of its cheapness, was very generally employed.

"The Prussian Government took up the matter and made very stringent laws upon the subject. It established standards of quality and enacted that all papers for permanent documents should be submitted to official tests. The issues of the German publishers for a number of years (until, in fact, quite recently when these conditions came to be appreciated) show abundant evidence in their brown margins and brittle edges of the perishable nature of the paper used.

"It is not, however, to be assumed that paper made with the admixture of wood pulp is to be condemned if the resinous matter is eliminated and only the wood cellulose remains. It is not likely that we shall ever again use paper so durable as that used when printing was first invented. The papers of those days were made of linen, cotton, and hemp fibres, and these materials are as enduring now as ever, but modern taste insists on their being bleached to a high degree of whiteness."

### CARBONA PAPER.

At the meeting of the London and Provincial Photographic Association on September 27 a short discussion took place *re* the coagulation of silicate of soda and dextrine. Mr. Henderson, having made several experiments, came to the conclusion that these two will not coagulate, Mr. Wilkinson having quite an opposite opinion.

Mr. Nightingale then gave a demonstration of carbona paper. He said: The printing-out paper which has recently been introduced by Messrs. Griffin will doubtless claim attention on account of the ease and certainty with which the varying grades of warm tones may be produced by brief immersion in a gold toning bath. The risk of over-toning is practically *nil*, since prints remaining in the toning bath longer than is necessary for purple tones do not assume the unpleasant bluish appearance of the orthodox "over-toned" print. From purple, the image becomes purple-black, until, finally, a stage is reached at which the print, when dry, will be quite black and white, almost resembling the results obtainable on Velox and bromide papers.

By the use of a platinum bath acidified with either phosphoric or nitric acid, prints similar to those on collodio-chloride paper are obtained. Ordinary combined toning and fixing bath yield warm browns only.

Referring again to gold toning, the proportion of gold in the bath available for warm tones is one grain to twelve fluid ounces. For sepia to black tones a stronger bath is employed, eight fluid ounces of water only being used. Toning with either bath is very rapid, immersion for two minutes yielding black tones, whilst sufficient action results in about fifteen seconds to produce red-browns.

It may be urged that rapid toning means a tendency to uneven tones on the finished prints. With ordinary care, this is certainly not so, and an innovation which reduces, even to a slight extent, the time occupied in any part of a photographic process is sure to be welcomed by both amateur and professional.

In employing the platinum bath prints should be toned separately, since the action of this bath on Carbona paper is very rapid.

When placed in the fixing bath a solution of hypo of two ounces to the pint, the print assumes a considerably colder colour, a fact for which due allowance must be made. As an instance, for warm browns the print

must be removed from the toning bath while still a brown red; in fact, the alteration in colour is scarcely perceptible until fixing is commenced. In such a case it is therefore preferable to time each print, allowing from fifteen to twenty seconds in the toning bath. After toning, the print must be well washed and fixed for about five minutes. Washing is complete in from half to three quarters of an hour in running water.

It may be of interest to mention that prints of a most satisfactory blue tone may be obtained by direct toning. The results are unlike those afforded by the ferro-prussiate process, since the blue is decidedly deeper and more pleasing. By comparison with the matt papers of commerce, Carbona yields a wider range of tones, prints at least as quickly, tones very rapidly, and may be roughly handled without risk of damage, since the film is specially toughened.

**BUTLER'S IMPROVEMENTS IN PHOTOGRAPHIC CAMERAS FOR PRODUCING AND VIEWING IMAGES IN NATURAL COLOURS.**

[Patent No. 9936 of 1900.]

The invention comprises a system of dividing the spectrum into four ordinate colours, two of which combine in their proper proportion, and act on the retina of one eye to produce all the colours of half the spectrum, and the other two ordinate colours combine in their proper proportion and act on the retina of the other eye, to produce all the colours of the other half of the spectrum, so that the impression produced is that of a complete view in all its natural colours.

It consists of a camera fitted with stereoscopic lenses, and a sliding arrangement inside with suitable means of holding a transparent reflector at an angle of forty-five degrees with the base of the camera.

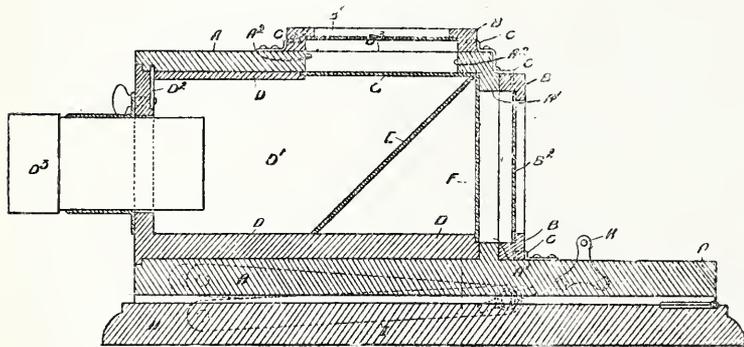

FIG. 1.

This may be coloured or not, but four suitably coloured screens must be fitted to the camera for viewing the pictures, so that each one of the four images on the two plates differs from each of the others as much as possible. The colour spectrum being divided into four parts, say one is red, the others must be yellowish-green, greenish-blue and violet. The ordinates may be selected from any other part of the spectrum, but a true quarto division is necessary to ensure balance and truth in the result. Each of the colour screens may consist of one, two, or more elements.

Coloured screens may be placed before the lenses, or behind, or both. The image through the lens is filtered of half, say, the warm rays. Part of the filtered rays then pass through the transparent reflector, and are again filtered before reaching the sensitive plate, placed perpendicularly

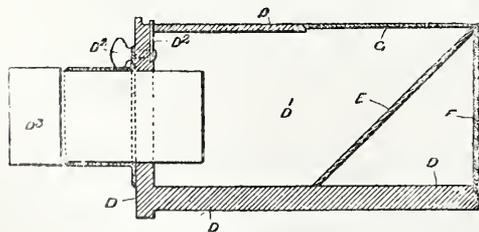

FIG. 2.

or otherwise in a dark slide, and part are reflected upwards, again filtered and focussed on a sensitive plate placed horizontally or otherwise in a dark slide.

The image through the other lens is filtered, part transmitted and part reflected, and focussed on the other half of the two sensitive plates in like manner.

The four images are taken simultaneously at one exposure. The local density of each image differs according to the strength of colour repre-

sented. Transparencies are subsequently prepared from the negative for viewing the picture.

A quarto division of the spectrum is used in the instrument for taking as well as for viewing the pictures, and another casing, or, as described, the same casing may be used for both taking and viewing by having a double set of mounted colour screens, one to slide into the camera for taking and the other for viewing, both on the quarto division principle,

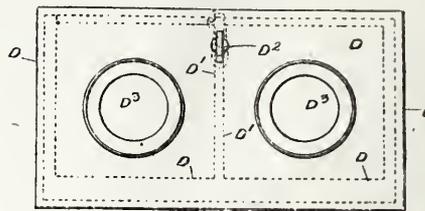

FIG. 3.

the set for taking the pictures being modified to suit the different actinic power of the several parts of the spectrum, and having suitable lenses and transparency plate-holders substituted for dark slides.

Fig. 1 is a vertical section of a stereoscopic colour camera constructed in accordance with my invention and designed also to be used as a stereoscope by the withdrawal of the inner portion, which is provided with lenses and constitutes the camera proper, and the substitution of a similarly constructed portion having stereoscopic lenses; or the camera and stereoscope may form two separate instruments, as hereinafter described. Fig. 2 is a vertical section and fig. 3 an end elevation of the camera proper, shown separate from the outer casing, which latter is designed to form an outer casing, as also to hold the sensitive plates, or the transparencies taken from these, according as the instrument is being used as a camera or stereoscope. Fig. 4 is a vertical section, and fig. 5 is a plan of the instrument showing the same in use as a stereoscope, a stereoscopic inner portion being substituted for the camera proper, and

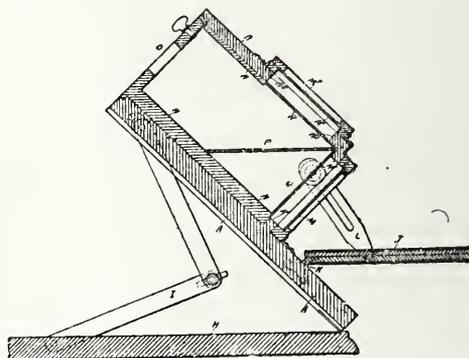

FIG. 4.

figs. 6 and 7 show in longitudinal vertical section and end view respectively the stereoscopic inner portion separate from the casing.

Referring to figs. 1, 2, and 3, the instrument (which is shown at fig. 1 in use as a camera) consists of a box-like casing A having orifices A¹, A², over which slides B, B¹, carrying sensitive plates B², B³, are fitted, these slides being retained in position on the casing A by guide strips C or otherwise. Within this casing A a removable camera D is fitted and secured by a catch D² or other device to said casing, the camera D being divided longitudinally by a web D¹ and furnished with lenses D²

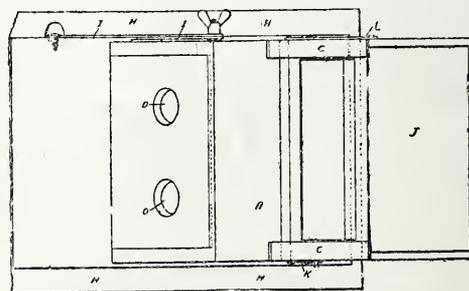

FIG. 5.

Coloured screens may be placed either before or behind the lenses D² or both before and behind, and near the end remote from the lenses D² a transparent reflector E is placed at an angle of forty-five degrees to the bottom of the camera body, this reflector being either of clear or coloured glass.

At points horizontally behind and vertically above the reflector E,

coloured screens *F* and *G* are fitted, either in orifices in the camera *D* or in the orifices *A*<sup>1</sup>, *A*<sup>2</sup> (already referred to), in the outer casing *A*, the screens *F*, *G*, being arranged in pairs, one of each pair being opposite a lens immediately in front of and under the sensitive plates *B*<sup>2</sup>, *B*<sup>3</sup>, respectively, and being arranged to receive either transmitted or reflected light from the reflector.

The image passing through either lens is, by means of the coloured screens, in front of, or behind, or both in front of and behind one of the lenses *D*<sup>3</sup> filtered of half, say, the warm rays of the object, part of the filtered rays then passing through the transparent reflector *E*, and part being reflected upwards. The transmitted rays before reaching the sensitive plate *B*<sup>2</sup> on which they are to be focussed, are again filtered by that portion of the coloured screen *F* opposite this lens, this portion of the coloured screen representing one-fourth of the spectrum colours. That part of the rays passing through this lens and reflected upwards by the reflector *E*, before being focussed upon the sensitive plate *B*<sup>3</sup> is again filtered by means of that portion of the screen corresponding to the portion of the screen *F* above referred to, this

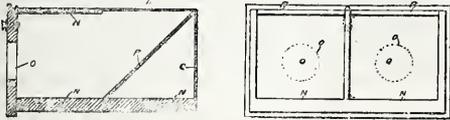

FIG. 6.

portion of the screen *G* also representing one-fourth of the spectrum colours, and being the complementary colours to those of the screen *F*. The image passing through the other lens *D*<sup>3</sup> is filtered, transmitted, reflected and again filtered in exactly the same manner as already described, at the same time, so that four images are taken simultaneously at one exposure, on separate portions of a pair of plates, from which transparencies are subsequently prepared for viewing the picture.

Referring to figs. 4, 5, 6 and 7, for the purpose of using the instrument as a stereoscope, the casing *A* is preferably hinged to a sole *H* and is arranged to be secured at any angle to the latter, as shown at figs. 4 and 5, by means of jointed arms *I*. A mirror or reflector *J* is also provided and is pivoted in bearings *K* secured upon the casing *A*, this reflector *J* being adjustable by means of the slotted arm *L* to reflect the light at the desired angle. An inner box *N* (shown separate at figs. 6 and 7) having stereoscopic lenses in orifices *O*, but otherwise constructed exactly as the camera *D* with reflector *E*, and coloured screens *Q*, *R*, is fitted within the casing *A* and the transparencies *M*, *M*<sup>1</sup>, taken from the negatives *B*<sup>2</sup>, *B*<sup>3</sup>, are substituted for these negatives in the retaining strips *C* when the instrument is used for this purpose.

The casing *A* may be made entirely separate from the sole *H* or be removably hinged thereto if desired.

## Our Editorial Table.

“JAHRBUCH FÜR PHOTOGRAPHIE UND REPRODUKTIONSTECHNIK.”

Wilhelm Knapp, Halle a/S.

WE have recently received Dr. J. M. Eder's valuable summary of the progress of photography in its various branches during the past year. In point of interest and likewise for careful selection of material recording new facts and technical improvements, the *Jahrbuch* for 1900 rivals any previous issue of the work. In this respect alone the volume renders an inestimable service, for which it merits the support of all who take more than a passing interest in photography. But, apart from the record of progress for the year, the volume contains a series of important contributions by leading writers upon photography, amongst whom may be mentioned, Messieurs Lumière and Seyewitz, J. Gaedicke, George Fritz, Professor E. Valenta, Dr. C. Grebe, Professor R. Abegg, Dr. Moritz von Röhr, Dr. R. E. Liesegang, Dr. R. Neuhaus, Dr. Kaempfer, L. Schrank, and Professor F. Schiffrer. The illustrations at the end of the volume form a very interesting guide to the prevailing methods of photographic reproduction, and comprise some remarkable three-colour prints.

## Studio Gossip.

THE AEROGRAPH—Mr. F. A. Verring sends the following note on this subject to the *English Mechanic*:—“Briefly stated, the ‘Aerograph,’ which used to be called the ‘fountain air brush,’ is an instrument of the appearance of an extra large-sized stilo pen. The pointed end is of plated metal, the top of which is cut away, and forms an open chamber in which liquid colour is placed. Working through this chamber, and above it, is a finger button attached to lever, which has two motions—an upward one, to open the air

valve underneath, to which is attached a small rubber tube from a compressed-air receptacle; and, secondly, a lateral movement which allows the operator to withdraw a silver needle running through the colour reservoir, and whose point fits into an opening in the nozzle of instrument, acting as a valve. Over this nozzle, and right at the point of instrument, is a small air chamber. As the finger button is pressed downwards, the air rushes into this chamber and out at the point of instrument. On pulling back the lever at the same time as pressing it, a very fine spray of colour is drawn into the air chamber by suction, and is projected through the point of the instrument in a very fine spray in the escaping current of air, the density of spray being regulated by the needle valve before described. The instrument is a valuable one in the hands of an artist. With it he can do his work more quickly, and obtain far better results. The liquid colour is sprayed on the paper or canvas: the manipulating of the two valves operated by the finger, together with the varying distances from his work the operator uses his instrument, allows him to obtain a fine finish, and the softest gradations between light and shadow, and a transparency in his shadows, which is only obtained without the aid of this instrument by much care, time, and skill. The compressed air for the supply of the Aerograph or any kind of air brush is obtained from a specially constructed pump, which is generally supplied by the makers; but in large studios, where a number of Aerographs and other air brushes are used, a supply of compressed air is produced by specially constructed pumps, and stored in reservoirs at a pressure suitable for correct working of the instrument (from 16 lbs. to 18 lbs. per square inch). There are a great many artists in this country who much prefer an older air brush which is made in Rockford (Ill., U.S.A.). This ‘brush’ is scarcely so quick in use as the ‘Aerograph;’ but, in the opinion of a number of workers, it is more satisfactory for producing the finest quality of work. The Aerograph is now being manufactured in England, and is sold, together with foot pump and pressure gauge, for 7*l.* 7*s.* The ‘Rockford’ is about the same price.”

## News and Notes.

THE Waterloo and Blundellsands Photographic Society's Second Annual Exhibition of photographs, lantern slides, paintings, drawings, and designs, will be held in the Club Rooms, 65, St. John's-road, Waterloo, from Monday, November 19, to Saturday, 24, inclusive. Entry forms and all particulars may be obtained from Mr. Wm. G. Eyre, Hon. Exhibition Secretary, 2, Mersey-road, Blundellsands.

EXHIBITION OF AMERICAN PHOTOGRAPHS—An Exhibition of American photographs, comprising the work of all the leading pictorial photographers in the United States, will be opened on October 10, at the rooms of the Royal Photographic Society, 66, Russell-square, at eight p.m., when Mr. F. Holland Day will deliver an address. Admission, upon presentation of visiting card, also daily, between the hours of 10 a.m. and 4 p.m.

THE COLOR-PHOTO CO., of Birkbeck Bank-chambers, write: We regret that owing to light difficulties the proper means of showing our pictures at the Royal Photographic Society's Exhibition have not yet been satisfactorily solved, but we have reason to think that within the next few days the pictures will be shown in a way which will allow of their being judged on their merits. We shall be pleased to inform you when they have been so arranged.

“THE Alwick and District Camera Club has recently been formed,” says *Hurman's Photographic Chat*, “and promises to be an unqualified success. Mr. George Reavell is the Honorary Secretary, and under his energetic guidance, assisted by a committee of well-known amateur photographers, a capital programme of summer excursions was arranged. Enjoyable half-holiday excursions were made to Eglingham and Rothbury, others to Dunstable, Bamfording, Howick, Edlingham, Warkworth, and places whose scenic charms are enhanced by their great historic interest.”

ASHTON-UNDER-LYNE PHOTOGRAPHIC SOCIETY.—In consequence of the Triennial Exhibition in November, there will be no meetings for demonstrations, &c., during this month. Members are, however, requested to do all in their power to make the Exhibition as successful as in the past. It is also hoped that all members will endeavour to send some of their own work, either framed pictures, unframed pictures, lantern slides, or transparencies, so that we can have a good display of members' work. The Exhibition will be opened at 6 p.m. on Monday, November 12, and continue open during the rest of the week. Illustrated lectures will be given each evening after the opening night, and a musical programme rendered by an efficient Band.

AN OPEN EXHIBITION IN LONDON.—The Seventh Annual Photographic Exhibition of the Cripplegate Photographic Society and Essex and Middlesex Cycling Union, will be held at the Cripplegate Institute from November 7 to 10 next. Twenty-five gold, gold centre, and silver medals are offered for competition amongst photographers. Open Champion Classes have been arranged for (A) Pictures and (B) Lantern Slides, whilst the Ordinary Classes are (C) Portraiture, (D) Landscapes, (E) Architecture, (F) Beginners' Class, (G) Hand Camera and Cycling Subjects, and (H) Lantern Slides. Full particulars and entry form will be gladly sent on application by G. F. Sharp, 31, Sach-road, Upper Clapton, London, N.E., or A. T. Ward, Cripplegate Institute, Golden-lane, E.C.

PHOTOGRAPHY AT THE THORNTON HEATH POLYTECHNIC.—The Committee of this Institute call attention to a series of lectures which will be held on Thursday evenings from October 18, 1900, at 7.30, at the Thornton Heath Polytechnic. The Committee have secured the services of Mr. J. H. Gear, F.R.P.S., Honours Medallist, City and Guilds, Lecturer on Photography at the Regent-street Polytechnic and the Cripplegate Institute. The lectures will embrace the course laid down by the City and Guilds of London Institute.

including both practical and theoretical work, and are intended to enable students to obtain the certificate of that body. The course will consist of twenty-four lectures, and the fee, which includes use of apparatus, chemicals, and dark room, will be 7s. 6d. per student. The Secretary will be in attendance at the Polytechnic to receive entries every evening from September 17.

THE Sefton Park Photographic Society's Second Annual Exhibition will be held at the High Schools, Arundel-avenue, on Tuesday, Wednesday, Thursday, Friday, and Saturday, October 30 to November 3, 1900. The Judges are Messrs. F. Anyon, Paul Lange, George E. Thompson. The following are the Open Classes:—K, Landscape and Seascape, silver and bronze, 4 prints allowed in each set; L, Portraiture and Figure Studies, bronze, 4; M, Architecture, silver and bronze, 4; N, Hand-camera Work (camera must have been held in the hand during exposure), silver and bronze, 6; O, Lantern Slides, silver and bronze, 4; P, Champion Class. One print, any size, Landscape, Seascape, or Architecture. Open to prints which have gained an award at any Exhibition, silver and bronze, 4. In Classes N and O, complete sets must be sent in. Entry forms and fees only to be sent to Mr. George Birtwhistle, 7, Gainsborough-road, Sefton Park, Liverpool.

## Commercial Intelligence.

Mr. ALFRED WATKINS informs us that he has purchased from Messrs. Field, of Birmingham, their connexion with the Watkins exposure meter, and that he proposes conducting the business at Hereford from November 1, under the style of the Watkins Meter Company.

DRY-PLATE MAKING IN AUSTRALIA.—The following notice from Messrs. Baker & Rouse appears in the *Australasian Photographic Review* for August: "We take this opportunity to inform the trade throughout Australia that our Mr. Baker (now in England) has purchased a complete and up-to-date plant with the very latest appliances for the manufacture of dry plates in the Colonies. It is needless to say that every effort on the part of the firm will be made to turn out a high quality of plates. In the past we learned the great advantage it has been to procure fresh dry plates from the manufactory. We are safe in saying, when Mr. Baker was making plates some years ago they were acknowledged to be equal in every respect, if not superior, to any of the dry plates brought into the Colonial market, even to those of the present day. We can honestly say there are many leading photographers in Australia who can bear out this statement, for, when the Baker's specially rapid dry plate was enjoying its fame, there was no quicker, or clearer, or better gelatine plate to be met with in the Colonies. It will be our aim to give the Australian trade an equally fast and reliable plate at the moderate prices obtained to-day."

## Meetings of Societies.

### MEETINGS OF SOCIETIES FOR NEXT WEEK.

October.	Name of Society.	Subject.

12.....	Oroydon Microscopical .....	Prize Slides.

### ROYAL PHOTOGRAPHIC SOCIETY.

OCTOBER 2,—Technical Meeting,—Mr. Chapman Jones, F.I.C., F.C.S. (Vice-President), in the chair.

#### APPARATUS AT THE EXHIBITION.

In accordance with the usual custom, the first meeting after the opening of the annual Exhibition, and of the winter session, was devoted to the demonstration and examination of the novelties in apparatus exhibited, most of which have already been fully described in previous issues of THE BRITISH JOURNAL OF PHOTOGRAPHY.

KODAK, LIMITED, exhibited the Panoram Kodak (for which the Society's medal has been awarded), the No. 3 Pocket Kodak, the Brownie, the No. 4 Cartridge, and the No. 1A Folding Pocket Kodak, and also a film-cutting board for facilitating cutting off exposed films for development, a contrivance which will be found very useful by all users of rollable films.

MESSRS. DALLMEYER, LIMITED, showed an improved form of the Naturalist's tele-photo hand camera. The instrument as originally constructed met with a considerable amount of success, but was found to possess certain disadvantages which were now obviated. The new camera, instead of being a rigid box only suitable for lenses of a particular focal length, had a collapsible bellows body and a focussing arrangement, by means of which images of different sizes could be obtained. A specially constructed eyepiece, with a field including a circle of two inches in the middle of the quarter-plate image, had been substituted for the telescope by which the focus was originally ascertained. The camera shown was adapted for use with a tele-photo lens giving a magnification of about two diameters, or with positive lenses of any focal length down to about six inches.

Mr. SANGER SHEPHERD said that, from correspondence which he had had with many workers in three-colour and orthochromatic photography, there appeared to be considerable difficulty in finding the best place for fitting light filters, and in fitting the light filters. Practically, as long as the colour screen was placed between the sensitive plate and the object photographed, the exact position was not of much consequence; personally, he preferred to have it in front of the lens, because one could then always see whether a light filter was in position or not. He showed several pieces of apparatus for holding the screen, some as simple frames and others in the form of lens caps, &c., and for enabling the filters and plates to be changed rapidly and simultaneously.

MESSRS. R. & J. BECK, LIMITED, exhibited the new folding No. 8 Frena camera, fitted with the Beck-Steinheil lens, with an aperture of f/6.3, and the aluminium "Wafer" shutter, which has already been noticed in these columns.

MESSRS. W. WATSON & SONS showed a printing frame, designed by Dr. Barton, for printing from any portion of a half-plate negative for stereoscopic work. They also described a new feature in their binocular stereoscopic camera, with which the pictures are taken from the side and not from the end of the apparatus; there had hitherto been some difficulty in ascertaining whether the camera was level, but this had now been obviated by means of a level reflected on to a mirror and into the eyepiece.

THE LONDON STEREOSCOPIC AND PHOTOGRAPHIC COMPANY showed the "Royal" Stereoscopic Hand Camera, taking either twelve stereoscopic pairs, or twenty-four single pictures, the size of each being 2 3/4 inches by 2 1/2 inches; Kodak and Frena cameras, with Goerz and Steinheil lenses; the Goerz Photo-stereo-binocular, combining an opera-glass magnifying two and a half times, a field-glass magnifying three and a half times, and a photographic camera for twenty-four single or twelve stereoscopic views, on plates measuring 1 1/4 by 2 1/2 inches, and other examples of their well-known instruments.

### COMING EVENTS.

AN Ordinary Meeting will be held at the New Gallery, Regent-street, on Tuesday, October 9, at 8 p.m., when the President will deliver his Annual Address and present the medals awarded at the Exhibition. On Wednesday, October 10, at 66, Russell-square, at 8 p.m., Mr. F. Holland Day will open, with an address, an Exhibition of American Photographs. The collection will remain on view, during ordinary hours, until early in November.

Liverpool Amateur Photographic Society.—September 27. Mr. J. H. Welch (President) occupied the chair.—Eight new Members were elected. Mr. WELCH, on behalf of the members, presented Mr. F. A. Schierwater, the Hon. Secretary, on the occasion of his marriage, with a handsome solid oak cabinet sideboard and silver rose bowl. He spoke in glowing terms of the admirable services the recipient had rendered to the Society during the seven years he had undertaken the duties of Hon. Secretary. Mr. SCHIERWATER suitably replied. The lecture set down for the evening was by Mr. FRED CLIBBORN, on

### THE LOIRE AND THE ROYAL CHATEAUX OF TOURAINE.

Mr. Clibborn handled his subject in a very masterly and at the same time amusing manner, and the interest of the audience was well maintained throughout. The lantern illustrations were of a very high-class character, and did much to enhance the pleasure of the evening.

### FORTHCOMING EXHIBITIONS.

1900.	
October 5–Nov. 3 ...	Photographic Salon, Dudley Gallery, Piccadilly. Hon. Secretary, R. W. Craigie, Camera Club, Charing Cross-road, W.C.
„ 5–Nov. 3 ...	Royal Photographic Society, New Gallery, Regent-street. The Hon. Secretary, 66, Russell-square W.C.
„ 17–20 .....	Rotherham Photographic Society. Hon. Secretary, H. C. Hemmingway, Tooker-road, Rotherham.
November 7–10 .....	Cripplegate Photographic Society and the Essex and Middlesex Cycling Union, Ltd. The Hon. Secretaries, A. T. Ward, Cripplegate Institute, E.C., and G. F. Sharp, Sach-road, Upper Clapton, N.E.
„ 12–17 .....	Ashton-under-Lyne.
„ 21–23 .....	Hackney Photographic Society.
„ 22–24 .....	Hove Camera Club. Hon. Secretary, C. Berrington-Stoner, 24, Holland-road, Hove.

1901.  
January 14-19 ..... Blairgowrie and District Photographic Association.  
The Hon. Secretaries, Blairgowrie, N.B.

Those who desire to send photographs to the above Exhibitions should write for prospectuses to the Hon. Secretaries, whose addresses are given in the second column above. The dates mentioned are those which the Exhibitions open.

## Patent News.

The following applications for Patents were made between September 17 and September 22, 1900:—

PRINTING FRAMES.—No. 16,689. "Improvements in Photographic Printing Frames." L. HOLLAND.

FILM-CARRIERS.—No. 16,758. "Improvements in, and relating to, the Carrying and Exposing in the Camera of Photographic Sensitive Films." J. FLECK.

CAMERAS.—No. 16,802. "Improvements in Multiplying Cameras." Complete specification. J. SCHAUB.

ARTIFICIAL LIGHT.—No. 16,804. "Improvements in Apparatus for the Photographic Copying of Drawings and the like with Artificial Light." J. L. DAVIES.

MEASURING NEGATIVES.—No. 16,813. "Improvements in Apparatus for Ascertaining the Colour and Density of Photographic Negatives." J. W. DAWSON.

CAMP PHOTOGRAPHY.—No. 16,919. "Improvements in Stamp Photography." Complete specification. H. LANDAUER and E. HACKH.

## Correspondence.

\* Correspondents should never write on both sides of the paper. No notice is taken of communications unless the names and addresses of the writers are given.

\* We do not undertake responsibility for the opinions expressed by our correspondents.

### THE TRADERS IN POISONS OR POISONOUS COMPOUNDS FOR TECHNICAL PURPOSES PROTECTION SOCIETY.

To the EDITORS.

#### THE SALE OF POISONS AND THE GENERAL ELECTION.

GENTLEMEN,—The following is a question which my Society is forwarding to be answered by each candidate at the coming General Election.

"Are you prepared to support a Bill in Parliament making it legal that chemical compounds (although containing poisons), which are not for medicinal use nor intended for the preparation of medicine, may be obtained by traders such as agricultural agents, seedsmen, nurserymen, iron dealers, iron and hardware dealers, and other tradesmen (including pharmacists) for any trade or technical purpose, in original sealed packages as received from the wholesale dealer or manufacturer?"

I trust that your readers who are interested in the subject will use their best endeavours to also bring the question to the front.—I am, yours, &c.,

T. G. DOBBS.

5, Clements-inn, Strand, London, W.C., September 26, 1900.

### PICTORIAL PHOTOGRAPHY.

To the EDITORS.

GENTLEMEN,—There is an old saying, "When doctors differ, who shall decide?" One cannot be long interested in the photographic world before becoming acquainted with the fact that there are what might be described as photographic schools, particularly in the region of what is known as pictorial photography. There is certainly a good deal of inconsistency as to what constitutes a pictorial photograph, also as to the methods which may be legitimately pursued in the production of a pictorial photograph. You, at any rate, have never hesitated to express your opinion concerning some of the photographs which claim to possess artistic qualities, and some of your remarks on the works at the Salon are emphatic enough, in all conscience.

There comes a time in the affairs of many indiscriminate snap-shooters when they possess a desire to pursue photography somewhat more seriously than has been their wont; but, as I have remarked, there

appear to be great differences of opinion as to what constitutes a serious photographic production, so that they may well ask, "When doctors differ, who shall decide?"—I am, yours, &c.,  
J. A. REID.  
Cutcliffe-grove, Bedford, October 1, 1900.

### COMPRESSED PYRO.

To the EDITORS.

GENTLEMEN,—We forward for you to try a sample of Messrs. Johnson & Sons new pyro preparation. It is a *very pure pyro* put up in a delightfully portable form; half a pound of it could easily be carried in one's pocket, yet it dissolves as quickly as the bulky flocculent crystals, and is in no way injured by the process of compression. Trusting to have a favourable report,—I am, yours, &c.,

G. WATMOUGH WEBSTER,  
Managing Director Sepac Company.

33, Bridge-street-row, Chester, October 2, 1900.

[The sample of pyro sent is in compressed form, and it packs into a card box  $2\frac{3}{4}$  inches in diameter, and half an inch deep. In use the pyro does not appear to be affected by the compression; it easily flakes off in the cake, is freely soluble, while its reducing properties in development are all that can be required. No more convenient way of sending out "our old friend pyro" could have been hit on. EDS.]

### INTENSIFICATION TROUBLES.

To the EDITORS.

GENTLEMEN,—It is many years since I had a case similar to that referred to under the above heading (THE BRITISH JOURNAL OF PHOTOGRAPHY, p. 624) in the days when dry plates were not to be depended on. I forget the conditions prevailing at the time, and I have no doubt the reticulated film was allowed to disappear down the sink; but, were such a case to crop up now, I think I should make an attempt to entirely "remove the film," using an acid solution (1 part acid hydrochlor to 7 parts of water), which I have invariably found effective, then to soak and wash the film and intensify *de novo*. Probably this suggestion is too late for the case referred to by your correspondent, as, if such a negative be allowed to dry, I imagine the reticulations would show on removal as slightly (but fatally) denser markings.—I am, yours, &c.,  
October 2, 1900.  
J. PIKE.

## Answers to Correspondents.

\*\* All matters intended for the text portion of this JOURNAL, including queries, must be addressed to "THE EDITORS, THE BRITISH JOURNAL OF PHOTOGRAPHY," 24 Wellington-street Strand, London, W.C. Inattention to this ensures delay.

\*\* Correspondents are informed that we cannot undertake to answer communications through the post. Questions are not answered unless the names and addresses of the writers are given.

\*\* Communications relating to Advertisements and general business affairs should be addressed to Messrs. HENRY GREENWOOD & Co., 24, Wellington-street, Strand, London, W.C.

### PHOTOGRAPHS REGISTERED:—

- G. Denney, 21, Sidwell-street, Exeter.—Photograph of Sir Edgar Vincent, K.C.B.
- W. Morrison, 11, St. James-street, Nottingham.—Photograph of Lord Henry Bentinck.
- A. C. Price, Royal Victoria Studio, St. Leonards-on-Sea.—Two photographs of child lying on cushion.
- J. Tyson, 10, Alwyn-road, Fallowfield, Manchester.—Six photographs of the G.P.O. fire, Manchester.
- W. H. Warburton, Harris Promenade, Douglas, Isle of Man.—Three photographs of Madame Lucile Hill. Five photographs of D. S. S. Moore.
- W. Harrison, Holly Bank, Ouchau, Isle of Man.—Photograph of the Hall at Bishop Court, Isle of Man. Photograph of Bishop Sodor in his Study at Bishop Court.
- A. J. Ashbolt, 29, High-street, Southampton.—Photograph of group of the Southampton Club football players. Photograph of A. Molyneux. Photograph of Mr. Blackburn. Photograph of B. Sharp.

W. THOMPSON.—For street stereoscopic work we should prefer lenses of five inches focus.

A. GREENWOOD.—The oxymagnesium light of the Platinotype Company would, no doubt, suit your requirements. We recommend you to write the Company for particulars.

FORMULA WANTED.—ALPHA writes for a good formula for a combined toning and fixing solution.—Formulae for combined toning and fixing bath, are given on pages 1073 and 1074 of the ALMANAC for the current years and they are good ones.

**THE THORNTON POSITIVE FILM.**—J. H. Baker writes: "Can you tell me where to get J. E. Thornton and C. F. S. Rothwell's patent photographic film for producing positives direct on the camera from, or give me the address of the gentleman mentioned."—In reply: Address the Thornton Film Company, Altrincham, Cheshire.

**BOOKS ON STUDIO CONSTRUCTION.**—G. S. asks for names of the best books published on Studio Construction and lighting and posing.—In reply: Mr. H. P. Robinson's *Studio and What to do in it*, published by Sampson Low & Co., Fetter-lane; and *Studio Construction*, by Mr. Bolas, published by Marion & Co., Soho-square, W.

**PARTNERSHIP AGREEMENT.**—W. W. says: "I am about entering into a partnership with my brother-in-law, in the purchase of a photographic business. The agreements are drawn out by ourselves. Can you tell me if it is necessary that they should be stamped? and, if so, should both be stamped?"—Yes, they should both be stamped or they will not be valid.

**THINNING COLLODION.**—S. WALTERS.—The enamel collodion that has got thick by keeping may be thinned with equal parts of ether and alcohol; but, as the ether has probably evaporated in a greater proportion than the alcohol, it will be better to use, say, six parts of ether to four of alcohol. Methylated alcohol will do provided its specific gravity does not exceed .820.

**THICK BROMIDE CARDS.**—H. J. J. writes: "Could you give me the address of a firm where I could obtain thick bromide card? I should like it about as thick as an ordinary cabinet mount."—Messrs. Griffin & Sons supply a very thick bromide paper or card. Some other firms do the same, but whether any as thick as that mentioned is made we do not know. If it were, we should imagine it would be somewhat difficult to manipulate.

**SHUTTERS.**—SHUTTER asks: "What kind of shutter do you regard as the best for all-round work, and why? What are the advantages or otherwise of fixing the shutter (a) before, (b) behind, and (c) between the combinations?"—All the shutters now on the market are good. Perhaps the form more generally used is the "roller blind." a, b, c: Advantages are claimed for each position, but in actual practice there is very little difference in the results obtained.

**THE PHOTOGRAPHIC ERA.**—LENS writes: "Could you oblige me with the name and publishers of the *Photographic Era*, mentioned in your issue of September 21, on p. 603, in the "Making of the Lens," and the date of same from which the quotation is made, as I cannot obtain it from Smith & Son?"—The *Photographic Era* is published at Boston, U.S.A. The September number, from which our quotation was taken, may, no doubt, be obtained by order of Messrs. Dawbarn & Ward, 6, Farringdon-avenue, E.C.

**AGREEMENT FOR THE SEASON.**—OPERATOR writes: "I made an agreement with Messrs. — for the season, no definite time was mentioned. I have just received notice that I shall not be required after the end of this month. I commenced on August 1. Ought I not to go on till the end of October. What is considered the season?"—"The season" is a very indefinite term and may mean anything. In making such agreements a definite time should be stated. At some places "the season" is very short, at others it is longer. As you are only a weekly servant, we expect you will have to take the week's notice.

**EMPLOYMENT IN AMERICA.**—H. B. T. asks: "1. Is there any weekly published in America like your BRITISH JOURNAL OF PHOTOGRAPHY obtainable in England, and where? 2. Is there any chance of earning a good living at photography in America? 3. If so, can you advise how to get a situation? 4. About what salary do they earn?"—In reply: 1. Perhaps *Wilson's Photographic Magazine*, obtainable, on order, from Messrs. Dawbarn & Ward, Farringdon-avenue, might suit your purpose. 2, 3, and 4. Upon these matters we can give no first-hand information; but we should say all would depend upon your ability and experience.

**PHOTOGRAPHING BRIGHT OBJECTS.**—C. STUART writes: "I have some silver cups, vases, &c., to photograph. Would you please inform me what is best to be done to them previous to photographing, what preparation is put on to prevent glare or halation?"—There are different ways of dulling the surface of the metal. One is to dab it over with a ball of common glazier's putty. Another is to have the studio warm, and then introduce into the vessels a lump of ice. That will cause the moisture in the room to condense on the metal, and thus dull its surface. Both methods are good. The plates should be backed to prevent halation.

**URANIUM TONING.**—ENLARGER writes: "Can you oblige me with a uranium toning bath for bromide prints and opals? Will the uranium salts deteriorate if kept in a ten per cent. solution, and can any alteration in tone in mixing different quantities of ferricyanide and uranium be obtained, as the tone I require is a rich brown—as near a carbon as possible—and not the usual rank sepia tint?"—Two short articles on uranium toning are given on pp. 962 and 963. In these you will find directions for obtaining a great variety of colours. We prefer to use the solutions tolerably fresh; they will not, however, keep at their best for a long time.

**LENS FOG.**—C. GODFREY writes: "Will you kindly tell me the cause of fog in centre of enclosed picture? Two other negatives taken at the same time are similar. The sun was shining slightly at the time of exposure, but I shaded the lens by standing the right side of it. The lens is a single one, the iris diaphragm is slightly bright with wear, a small aperture was used."—The fog is caused by a flare spot from the lens, and probably enhanced by the bright edges of the diaphragm. Altering the position of the stop will often avoid it. Place the stop a little further from, or nearer to, the lens and see the effect. Also blacken the diaphragm afresh.

**RAPID DEVELOPMENT.**—C. HAMLIN. If you can make a developer that will bring out the image, with full density, in twenty seconds, where is the advantage of it in practice? With such an energetic developer it is so easy to go wrong, for with a second or two, more or less, too little or too much, density may be obtained, and what might otherwise have been a good negative spoilt.

**TWENTY-FOUR PHOTOGRAPHS ON A PLATE.**—L. MARTIN writes: "Can you inform me where I can purchase printing frame for about twenty-four small photographs on half-plate bromide paper? I have tried several firms, and they recommend the Gem or Victoria Camera, but I have seen them printed from one head or figure."—In reply: Perhaps Klay's multiplying plate-holder may meet our correspondent's requirements. Write for particulars to the agent, Mr. G. Jobson, Adin Villas, Boston-road, Horncastle.

**CYANOTYPE LANTERN SLIDES.**—IN NUBIBUS asks: "Can you give me a formula for the production of ferro-prussiate or cyanotype lantern slides? Can ordinary lantern slides be treated to produce the result, or must they be independently coated with a special emulsion? In the latter case, can they be procured through any trade channel?"—Ferro-prussiate lantern plates are not articles of commerce, and we know of no method of getting the same results on ordinary lantern plates. Blue slides can be produced by the carbon process, using a blue tissue. Several pages in the ALMANAC are devoted to the ferro-prussiate process; possibly from them you will be able to prepare plates for yourself.

**MYSTERIOUS CASES OF FOG.**—REX asks: "Can you please help me to find out the cause of apparent fog on the waste negative enclosed herewith? These marks have been annoying me ever since my commencement in business, but they do not always appear to the same extent, and sometimes not at all. I thought it must be from reflected light, so I had two rods fitted to the camera, thereby enabling me to draw the cloth more over and shade the lens, but this did not avail. There is nothing inside the camera that would be likely to reflect, everything being quite black."—The "fog" appears to be a secondary image produced by a minute hole in the camera, either in the front or in the bellows, which has acted as a "pin hole camera." In the negative sent, a figure in light hat can be traced.

**CONVERSION OF FORMULE.**—VACUUM CAPUT writes: "Not understanding the following, will you please give it me in English weight and measure? I.—Pyrocatechin, 7 grammes; hydrate of potash, 6 grammes; crystallised sulphite soda, 30 grammes; water, 75 grammes. II.—Concentrated developer, 10 c.c.; soda-fixing solution, 1 to 5\*, 20 c.c.; water, 20 c.c. See soda-fixing solution marked thus \*, please explain this; what is 1 to 5, and should the solution be 3 ounces of hypo to the pint? From p. 861 of BRITISH JOURNAL ALMANAC."—If you turn to pp. 548-60, also pp. 990-91 of the ALMANAC, from which you got the formula, you will find tables of the metric system and the equivalents in the English system. By 1 to 5, one part of hyposulphite of soda to five parts of water is meant—equal to 4 ounces to the pint.

**CARBON PRINTING.**—G. & J. HALL write: "We have been doing a little carbon printing of late, and in every case we have been troubled with a slight veil or fog over the prints which will not develop away. The sensitising and drying is done in the dark room, and we are very careful in every way. Could you suggest a cause or remedy?"—The tissue is tinted, that is, it has a slight insoluble layer on its surface. This may be caused in different ways. Too slow drying may cause it; exposure to the fumes of burning gas will also produce it. As a rule, an ordinary dark room is not a good place wherein to dry sensitised carbon tissue. We should advise you, after sensitising the tissue, to squeeze it on to a ferrotype or glass plate, and allow it to dry on that. The surface will then be protected against any noxious fumes.

**STUDIO-BUILDING.**—NEW STUDIO writes: "I am about to build a new studio. The only available "square" space is about 20 x 13 feet, but I can have an extension of about 12 x 6 feet or so wide for long focus when taking groups. The only available light is about E.N.E. I intend making the studio on H. P. Robinson's plan, as sketch, not made to scale, the glass to run the whole twenty feet length of studio proper (or eighteen feet of it). With regard to the glass, my pocket tells me I must economise. I am told that glass plates about 14 x 12 inches to cover the area of 180 feet will come very much cheaper than larger sheets sufficient to cover the same area. My idea, as a former studio worker, is to have the sheets at least 16 x 30 inches, in order to prevent so much overlapping and so many bars of wood to reduce the light. My brother, who is helping me with the needful towards the erection, thinks that the smaller sheets will answer just as well. I may say here that he knows absolutely nothing about photography. What I want you, with your usual kindness, to decide for our satisfaction is whether the smaller panes would be practicable or not. Mr. Robinson does not give any idea at all as to the size of each pane of glass. I shall so arrange matters that I can use both ends of the studio proper, a bust or three-quarter cabinet, &c., but for, say, full figure or group can only use the S.S.E. end, as the narrow extension before mentioned will be at the opposite end. Kindly give me a few hints regarding the colour of blinds and the width of same for the given light and form of studio. I think white or cream, with supplementary dark blinds, at each end at least, all to run to the ridge by means of spring rollers."—The larger size glass will be decidedly preferable, as there will be fewer laps to let in water and dust. 14 x 12 is certainly small for glazing a studio with, and, with that size more sash bars will be necessary than with the larger size. We should prefer the blinds to be light green or dark blue, then, with that aspect one set of blinds will suffice, except, perhaps, a darker one at either end. About four blinds for the roof will answer.

As usual, a section of the ALMANAC will be devoted to notices of the latest introductions in photographic apparatus, &c. Those firms who wish to take advantage of this feature should communicate with us at once.

\* \* \* The publishers ask us to remind advertisers that most of the advertisement pages of the ALMANAC are already booked, and that, to ensure insertion and good positions, orders and copy should reach them immediately.

\* \* \* Will secretaries of societies who have not yet sent us lists of officers for inclusion in the ALMANAC kindly oblige us by doing so by return in order that this section of the book may be proceeded with.

## EX CATHEDRÀ.

An excellent suggestion for promoting the use of the metric system amongst photographers reaches us from an esteemed correspondent. He writes:—"I would suggest that the teachers of photography should be especially appealed to. There are several large schools for teaching where much might be done to encourage the use of metric units, laying especial weight on their definiteness in comparison with the doubts often raised by the present system. Take the ounce. Photographers often mean the ounce of 480 grains: now one by which no dealings are legal save in precious metals. Then the drachm is in weight 30 grains: in measure 60 minims [an ounce weight is legally 16 drachms, whereas an ounce measure is only 8], and (I speak from experience) there is often a doubt as to what is meant. The question, of course, is not whether the speaker or writer knows his own meaning, but what he conveys to others. Even if the pupils of a school are without doubt as to the meaning there, they are liable to mistake when working on their own account, and reading as, of course, they should do in order to keep up with increases of knowledge." The photographic classes at the various polytechnics in London, to the number of some eight or ten, have just commenced their course of winter work, and thus the suggestion of our correspondent comes in excellent time for its adoption by the various teachers.

## THE BRITISH JOURNAL PHOTOGRAPHIC ALMANAC FOR 1901.

Edited by THOMAS BEDDING, F.R.P.S.

The ALMANAC for 1901 will appeal to photographers all the world over as a daily reference guide in practical work. The formulæ will be revised where necessary, and the latest departures in theory and practice will be chronicled. The year's advances will be recorded, and wherever practicable new features of an informative nature will be added.

Adhering to an old and much-appreciated custom, we invite short contributions on practical subjects for the pages for the 1901 ALMANAC. Those of our friends intending to co-operate with us in this respect can help us by letting us have their M.S., sketches, &c., in the course of this month.

We shall be glad to receive any additions that may be made to the list of telegraphic addresses of the trade, &c.

At this time of year we receive from the secretaries of photographic societies many lists of winter fixtures. There are some peculiarities about these compilations that call for one or two observations. In the first place it is only too apparent that the benign virtue of self-reliance is not cultivated by photographic societies so much as it might be. It is to outside help that the majority of them look for assistance in filling their evening bills. Of the many fixture-cards that have lately passed under our observation not more than two or three exclusively bear the names of members as readers of papers. Trade demonstrators are "starred" with the greatest frequency on those cards. Then, in London, the forty odd societies of the great city and its suburbs make the greatest possible use of a handful of clever amateur photographers who have become specialistic in some particular branch of work. The man who attacks an uncommon or novel aspect of photography, and in a moment of unreflective enthusiasm reads a paper descriptive of what he has done before some society is swiftly pounced upon by the rapacious secretaries of other organisations, who make his life a burden with requests to favour them with repetitions of his lecture or paper. But, in addition to trade demonstrators and prominent photographers society secretaries have an unpleasant habit of levying toll upon another class of people. Those persistent and misguided gentlemen appear to think that a modern photographic journalist should occupy his few leisure evenings in travelling to more or less remote places and delivering discourses on photography to small audiences of languid amateurs, who must be satiated with the printed literature of photography.

\* \* \*

It has always been a mystery to us why the members of the photographic press—as busy a band of workers as you may find in the field of London journalism—should be taxed and importuned in this manner. For ourselves, if we gave way to half the requests to read papers that constantly reach us our free evenings between October and June would be rarities. Home would become a thing in name only. In the course of a quarter of a century's association with journalism of various kinds, we have not come across any cases parallel to this. The conductors of journals appealing to particular classes, with the exception of photography, are not badgered in this manner, or at any rate to nothing like the same extent. Fancy the Editors of "The Lancet," or "The Gardeners' Chronicle," or "The Engineer," being persistently dunned by the secretaries of medical, horticultural, or engineering societies to live laborious nights in lecturing to small organisations on their "favourite hobbies." However, our point in all this is that self-help should be a cardinal feature in photographic society work. Outside assistance can only be relied on for a comparatively short time, and, when withdrawn, experience has over and over again shown that a resourceless society which has failed to develop the abilities and knowledge of its own members sinks slowly but surely into oblivion.

\* \* \*

As we lift the pen from writing the previous paragraph we see at our side a post-card, sent us by a friend, which is circulated amongst the members of the Toronto Camera Club. Under the October list of fixtures the "Secretary-Treasurer"

prints the following series of bright, little hints to his members:

P. S. The above bill of fare, rich, varied, &c though it is, may probably be augmented by a dish of brain food of a new brand. The date can not yet be determined, therefore members should make a point of attending regularly and not miss any extra items. The Committee is most pleased to heliograph that it has other things up its executive sleeve besides its executive arm.

P. P. S. The demonstrations above announced, and which are for the benefit of our less experienced members, will, it is hoped, prove popular. Those who have not yet made slides will be encouraged to get their skates on and break the ice.

NEW MEMBERS. All applications for membership should be forwarded at once to the Secretary. The vacancies will be very few. To avoid the crowd, come early and bring the exact amount with application.

GETTING A BIG BOY NOW. Our Tenth Annual Exhibition will be held December 11th to 15th, 1900. To encourage our members to exhibit, please note that this will be a purely photographic exhibition, as heretofore. The rumour of peanut stands and side shows is entirely without foundation.

AUTUMNAL RAIN. A heavy down-pour of "fives" is expected by the Secretary-Treasurer early this month.

The author of these perky reminders is evidently a very "live" official indeed, laudably anxious to keep his members together, and not afraid to select slightly unconventional methods of arousing and sustaining their interest in the affairs of the Club. If some of the lethargic secretaries of English societies infused a little more go into their administrative methods we should perhaps hear fewer complaints of poorly attended meetings and the decay of enthusiasm for photography, which so surely follows the withdrawal of incentives to continue its practice.

\* \* \*

Dr. Kime, in "The Scientific American," of September 29 describes and illustrates some decidedly attractive and, so far as we are aware, novel experiments in testing the penetrative quality of light by means of photography. He remarks that he has been able to demonstrate that the actinic rays of the sun, when sufficiently concentrated, may be made to pass through the thorax of an adult, from front to back with sufficient intensity to reproduce a picture upon an ordinary photographic dry plate. The doctor describes the method of procedure as follows: The person on whom the experiments were to be made was taken into the photographer's dark room and the plates were applied with great care, that all rays of light save those that traversed the thorax might be excluded. The direct rays of the sun falling upon the reflector through the skylight are focussed upon the chest of the person upon whose back has been placed the sensitised plate on which the picture is to be taken. A transparency on glass of a valley in the Klondike was used as the original from which the picture was to be made. This was fastened to the sensitised plate, and the two were placed on the back between the scapulæ of a man weighing 150 pounds, the transparency being placed next to the body with the new plate immediately behind it. Over these were placed black paper, black cotton wadding, several large black cloths, and over this his coat was drawn and all were securely fastened by means of long black bandages. He was the

taken to the light room, and the reflector was turned upon the best for fifteen minutes. After exposure he was again taken to the dark room and the plates were removed, and the illustration [a small view is reproduced in our contemporary] was developed on the photographic plate. In producing the picture all sources of error were carefully excluded, and the operation was repeated many times on various persons, and always with like results.

\* \* \*

ANTICIPATING any suggestion that some agency other than transmitted sunlight might have influenced the sensitive plate, Dr. Kime adds that in order to further test the reliability of the procedure, and to insure that the picture was not produced by contact of the transparency with the plate, aided by the body heat or by some undetermined influence other than the light transmitted through the body, plates were arranged in the same manner and for like periods of time, without attempting to pass the light through the body, and no picture developed on the plate. The conclusions of the experimentalist are that the photographs establish the fact that the actinic rays of the sun, when sufficiently concentrated, may be made to pass entirely through the body of a full-grown man. He points out that the rays of light pass through the integument with considerable difficulty, more readily through muscular tissue, and much more readily through bone. In producing a picture through one cheek the light passes through but a single thickness of the skin, and the picture is reproduced almost instantly. Finally, Dr. Kime says that the reflector used in making the experiments was a compound circular mirror, 30 inches in diameter, and is overlaid with blue glass. It is so constructed that all the light which falls upon it is focused upon a spot 6 inches in diameter at a distance of 8 feet in front of it. In concluding his account of the experiments, Dr. Kime points out that light has been applied to the treatment of diseases of the skin, but it has not been supposed that it would penetrate to any distance into the body. It should not be a difficult thing to repeat Dr. Kime's experiments. If they are verified—the weakness of the sunlight at this time of year would necessarily entail very long exposures—a curious addition to the numerous phenomena of light transference and transmission will have been made.

BLUE PRINTERS' APPLIANCES.

THE photographic reproduction of drawings and tracings, albeit by processes which are as old almost as photography itself, is a department with which professional and amateur alike are very slightly acquainted. Nevertheless, it is of considerable industrial importance, and a by no means insignificant number of hands are employed mostly in large engineering works in working these "blue-line" and "black-line" processes. In this country the existence of an independent blue printing establishment, to draw its custom from local engineers, architects, clerks of works, surveyors, and estate agents, and others requiring plans of any kind multiplied on a limited scale, does not appear to have occurred to any of the photographic craft, although on the Continent the sign "Licht-pans Anstalt" is frequently to be observed in large manufacturing towns—the outward and visible sign that within one may obtain heliographic prints at short notice. We drew our readers' attention to the pos-

sible business in this direction some months ago, but we have not heard of any one setting up.

However, this may be, we take it that blue printers, wherever they may be, are numbered amongst our readers, and will therefore be interested in one or two of the later developments in the craft which have come under our notice. The first is of special interest to those in charge of a blue print house in a large factory in which the difficulty of obtaining a suitable and sufficient printing area is often keenly felt, par-

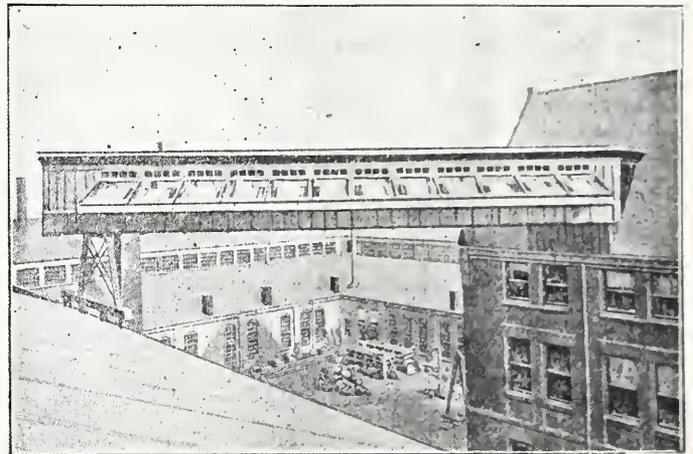

FIG. 1.—South side of Blue Print Gallery.

ticularly in premises within the metropolitan district. As showing how such difficulties can be overcome, we give below a description of a blue printing establishment erected by the Brown Hoisting and Conveying Machine Co., Cleveland, Ohio, for which we are indebted to "The American Machinist." The half-tones which illustrate our remarks are copied from the half-tone reproductions of the photographs of the originals. The rectangular lines of the factory ran at almost exactly 45° to the cardinal points of the

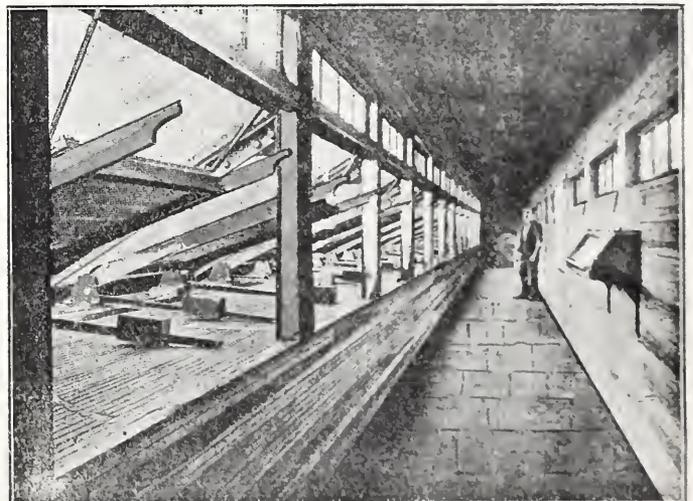

FIG. 2.—Blue Print Gallery (inside).

compass, so that a direct southern aspect from any of the windows was impossible. A gallery, as shown in fig. 1, was therefore constructed from a corner of the block in which the drawing office was situated to the roof of an opposite shop. This gallery runs due east and west, and accommodates 12 printing frames, each taking a sheet of paper 36 by 24 inches.

"The slanting roof of the gallery (see fig. 2) is composed of sheets of plate glass much larger than the printing frames,

and covering the entire spaces between the oblique steel angle beams. This affords a perfect protection from rain, and allows the printing to be carried on in all weathers. The spaces between the large printing frames are used for small tracings, and about fifty 9 by 12 prints can be printed here.

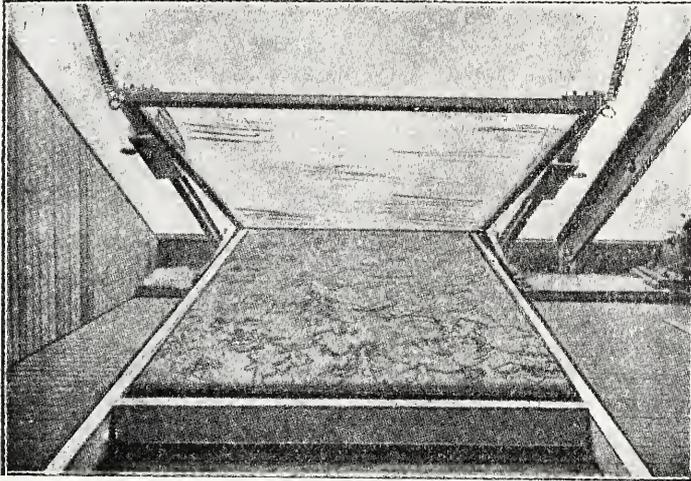

FIG. 3.—One of the Printing Frames.

No frames are used for these, merely a pad of blotting-paper, and then a plate of glass over the tracing, the weight of the glass being sufficient to hold the tracing.

"The arrangement of the large frames will be understood from figs. 2 and 3. The wooden frames are balanced in any

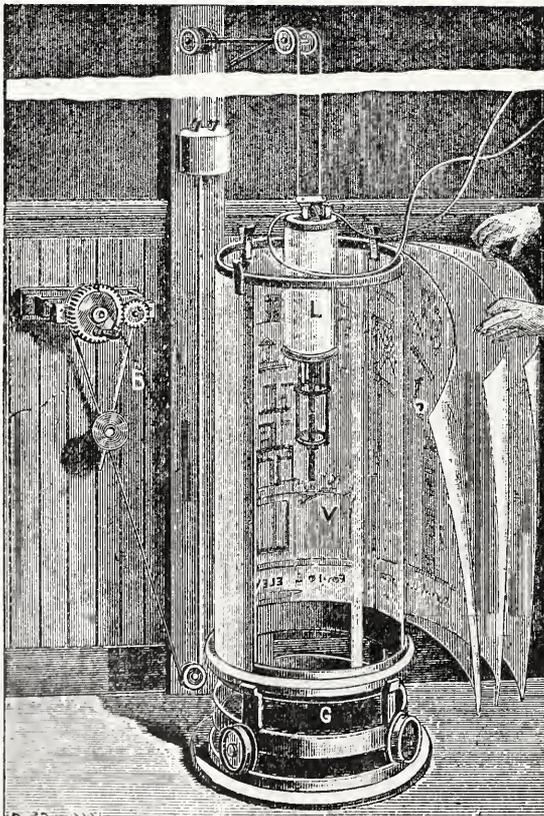

FIG. 4.—Apparatus for Printing Working Drawings. From a Drawing in *La Nature*.

position by a system of levers and counterweights. These as well as the iron frames for the glass, are hinged at the outer end, and at the inner end there are springs which relieve the glass from shocks, stop the frames at a certain point, and allow the wooden frame to drop away and relieve the tracing.

The tracing and blue-print paper are laid upon the carpe padded surface, and the wooden frame is then raised until the glass and the iron frame are reached. The two frames are now nearly parallel, and as the motion is continued the entire weight of the glass and its iron frame is thrown upon the tracing. In good light the twelve frames will turn out a print each every minute."

The second appliance we describe is for printing large tracings by artificial light. The arrangement, we learn, is of English manufacture, and is patented, though from the reports we see is received with greater favour on the Continent than here.

The apparatus (fig. 4) consists of two semi-circular sheets of thick glass mounted in a cylindrical frame, which rest upon a base (G in figure) with which it can rotate by means of the three small wheels attached to the latter. The tracing to be reproduced is first placed round the outside of the glass surface, the sensitive paper laid over it, and the two drawn into contact by a cloth wrapping, which is placed on and fastened with buckles. An arc lamp is now suspended over the interior. It is connected with a simple mechanism whereby it acts as the motive power for slowly rotating the cylinder as it descends. Everything being in readiness for the exposure, a pendulum is released, and the lamp commences its downward journey, the motion of the print around it securing an even illumination. The speed of the lamp can be adjusted to suit tracings of different opacity or paper differing in sensitiveness. With a lamp of 10 amperes and 120 volts, forty prints (30 by 40) can, it is stated, be made per hour.

**Acetylene Purification.**—This topic, which has often claimed our attention, has too practical a bearing to be lost sight of, and the method adopted by the Hungarian street railway seems to meet almost all requirements. Formerly at acetylene supply works chloride of lime was the agent employed; but there is now used with this material sodium plumbate containing an excess of alkali. It is stated that, when the chloride alone is used, there is danger of explosion through liberation of chlorine. A purifier charged with the new mixture was opened after ten hours' working. When the upper grating covered with lime was removed, spontaneous combustion ensued, and a long flame rose from the apparatus but no explosion occurred. The conclusion was drawn from these results that the new mixture might be looked upon as free from danger.

**Algin.**—This is a gelatine-like substance of which we shall probably hear more, and which may be found useful for many purposes in photography. It is made from seaweed which is steeped for a day in a solution of carbonate of soda, the product being a mass with extraordinary viscosity—fourteen times that of starch, and thirty-seven times that of gum. This mass is cellulose, with a large amount of the gelatinous constituent, which has received the name of algin, and can be stored for a length of time without change. The pressed-out gelatinous mass is made into cakes resembling cheese, and can be used for a great variety of purposes. The cellulose left behind after pressing out the algin is also a valuable product, and is capable of being turned and shaped like celluloid, and of receiving a high polish. It also makes an excellent paper—tough, transparent, and fibreless. These qualities should mark it out as a very desirable, if not, indeed, already chosen, substitute for celluloid for films, and, the source being almost inexhaustible, it would have the merit of probable stability of cost, unlike cellulose, the price of which, through the rise in camphor, is greatly increased over that of a few years ago.

**The Coagulation of Albumen.**—Many years, perhaps a quarter of a century ago, the literature of albumen was very copious

but of late years gelatine has taken its place. Here we have another example to add to the perpetually expanding list of decay of English in favour of foreign manufactures. It is within the memory of the older generation of photographers that the best albumenised paper in the world was made in England—there were several eminent makers; any from abroad was foul-smelling and inferior. What is the present position of the trade? Virtually it all is “made in Germany.” There are other highly prosperous photographic trades for which this country is pre-eminent for excellence; yet already a start has been made in Germany to supplant them. So far the opposition is negligible and our trade is not touched; but, if the English manufacturers think that the foreign makers will rest, they will make a woful mistake. They can do as they please now; but we advise them to take warning by the trade referred to above, to the state of the coal-tar dye trade, to the mount manufacture trade, to the paper trade, to the pyrogallic acid trade, &c., in all of which once this country was pre-eminent. We have rather digressed from our purpose which was to refer to a paper by J. Bretland Farrar, recently read at the Royal Society upon the effect of heat on various forms of albumen. It would appear that even for the same type of albumen the coagulation temperature is not constant. A sample from fresh-laid hen eggs became opalescent at 60° and insoluble at 64°, while with another sample the figures were 65.5° and 68°. In the new experiments dry albumen was used: it was dissolved in water, which it did readily, and gave 60° and 62–63°. Heated before solution for two or three hours it became coagulated at 80°; but if any contained moisture be driven off at a gentle heat to 52 to 55° it could be heated to 102–110° without undergoing any change. It can be readily understood from these data how easy it is for the albumen used upon paper to vary in its conditions of coagulability, the manner of which and the time needed for it being potent factors in the production of good tones.

**Low Prices for Stereoscopic Prints.**—A correspondent writes us that he was sufficiently interested in our last ALMANAC article to take up stereoscopic photography. He had a special camera made to order, and secured about ninety views in a picturesque part of the country, which he thinks are as good as any he has seen. Some of the slides have been sent us, and they are somewhat pleasing. But our correspondent was disappointed with the results of his attempt to sell his prints to a publishing house. He asked four shillings per dozen, and could only obtain half that price. Naturally he is somewhat disheartened at his first endeavours to make money out of stereoscopic photography. Two shillings a dozen for stereoscopic prints is a ridiculously small price, but it must be remembered that a publisher buys prints to sell again. Our correspondent, who spent 30*l.* on his apparatus, says: “I trust you will pardon me writing, my only excuse being to give you some idea of my experience in stereo work, and the poor look-out for any one who might possibly take it up as a means of earning their bread and cheese; there seems no public interest in it whatever, and no inducement to turn out decent work.” We are sorry at our correspondent’s failure; but we have never glossed over the undoubted fact that in these days, for money to be made out of stereoscopic photography, it must be undertaken on a very large scale. The mere selling of prints from a few negatives offers few chances of financial success rewarding one’s efforts.

NOTE ON THE LIPPMANN PROCESS.

WORKERS in this process, especially in cases where mixed colours are dealt with, will do well to note Professor Lippmann’s recent advance in the matter of isochromatising his plates, an advance not mentioned at all in the latest British handbook (Marion’s) which touches on the practice of his fascinating method.

This advance consists in replacing the usual dyes (cyanine, quinoline red, &c.) with a solution of *crystallised* methyl violet (one per cent.) in pure alcohol. A plate, to all intents and purposes panchromatic, results, and reds, greens, and yellows appear with striking fidelity and brilliancy along with the blues in the finished helio-

chrome. In a recent number of the JOURNAL an account was given of Dr. Luppó Cramer’s experiments, and the opinion expressed that, in the case of the fine-grain (it is *not* grainless) Lippmann plate, the range of sensitiveness runs further towards the red end of the spectrum than in the case of ordinary plates sensitised with the like dyes. This holds true of plates dyed with methyl violet, which does not seem to sensitise beyond the orange in the case of ordinary emulsions, but, nevertheless, suffices for the registration of rich and deep red in the Lippmann procedure. Two and a half c. c. of the solution to 100 c. c. of emulsion is the quantity that Professor Lippmann favours. His recent results are far the finest.

To turn to another quarter, there is a very curious modification of the usual procedure to be noted. Personally I never succeeded to any satisfactory extent until I hit upon it, the colours being usually too feeble to be of any value. On one occasion, having developed a plate to no purpose, and having vainly tried to coax out colours by mercury intensification, I resorted to a trial of a formula for “development after fixing,” which I noted in an old BRITISH JOURNAL PHOTOGRAPHIC ALMANAC, and which was devised by Dr. Neuhaus some years back with a view to “developing” ordinary plates which had been *previously fixed*.

This subtle intensifier, to give it its proper name, proved exactly the remedy required. It gave me a heliochrome with bright and accurate colours, the visual density of the deposit being very great. Since hitting on this modification of practice, I never do otherwise than *develop very partially*, obtaining all else, including colours, with the intensifier. Sometimes the colours are wholly absent previous to resort to this intensifying device.

This formula, which I found ready to hand, and merely applied to a novel department of experiment, runs thus:—

Sulphocyanide of ammonia.....	24	grammes.
Sulphite of soda .....	24	”
Hypo-sulphite of soda .....	5	”
Nitrate of silver .....	1	”
Bromide of potash.....	½	gramme.
Water.....	100	grammes.

works pretty quickly. Usually the best results are obtained when the negative looks ruby-coloured by transmitted light, and green on a putty ground by reflected light. The deposit is very fine.

Possibly the Wellington (or Sterry) intensifier would give equally good results, but I have not tried it. The absolute uselessness of ordinary intensifiers in many cases of thin-filmed plates is so marked that I cannot but urge workers to try this modified procedure, which will elicit detail before invisible, and along with this detail the bright colours which are reflected from interference layers, mere traces of which have been filled in by fresh and fine deposits. The silver intensifier has to be mixed with another solution before use. I generally use about 7 parts of the intensifier to 40 or 50 parts of a metol-sulphite (no alkali) solution which is better than the rodinal mentioned in the original formula—being quicker and giving a richer image.

A heliochrome can be “developed” wholly “after fixing,” but in my experience a *prior partial* ordinary development with weak ortol or glycin is better; the exposure required is also much shorter.

E. DOUGLAS FAWCETT.

P.S.—To five or six parts of the intensifier add thirty to forty parts of a metol-sulphite (better than rodinal) solution immediately before use. No special alkali is required in the solution. Rodinal, as originally recommended, is convenient, but works more slowly, gives less density, and is apt to cause frilling.

ROYAL PHOTOGRAPHIC SOCIETY’S EXHIBITION.

[SECOND NOTICE.]

PROFESSIONAL AND TRADE PHOTOGRAPHY.

WE have already commented upon the fact that for some years past there has been a notable absence from the Society’s Exhibitions of portrait work by professional photographers, although at one time such work formed a large proportion and an important portion of the exhibits. We believe that in recent years very little, indeed, of such work has been sent in, for, naturally, when professional photographers,

whose interest in photography is primarily to make money out of it, found that their efforts to make an imposing show of their productions were thwarted by the action of the Selection Committee, and the expense they had been put to was wasted, they ceased to attempt this perfectly legitimate method of advertising. We have from time to time expressed our regret that the business side of photography has not received more sympathetic treatment, but, at the same time, we have loyally accepted the decisions of those appointed by the Society to organise its exhibitions in a matter upon which they are necessarily in a position to form a more correct judgment.

However, the difficulty has now been solved in a manner which should be satisfactory to all concerned. These professional or trade photographers who have been far-seeing enough to secure space upon the walls of the present Exhibition have been at liberty to hang what pictures they pleased, and to hang them in what manner they pleased. They have made a very imposing show, and not the least popular part of the exhibition will be two galleries devoted to this section.

As we have indicated, each exhibitor has been left to satisfy his own taste in the display of his exhibits, and in most cases no exception could be taken to the way in which this liberty has been exercised. There are a few cases, however, in which the desire to achieve importance has resulted in prominence of a very undesirable kind from every one's point of view. Every exhibitor gains by the exhibition presenting a harmonious whole. A jarring note which upsets the harmony will certainly secure attention—and also resentment.

Before passing to the work of the exhibitors in this section, we cannot help noticing the absence from the list of many names we should have expected to find there. The space, of course, is limited, and everybody could not be there, but it certainly seems as if some of the younger firms of photographers have shown more enterprise than many of the firms which are universally accepted as representative of photography in England.

In the South Room R. W. Speaight, of Regent-street, shows a good selection of studies of children, a branch of photography which he has made the staple of his business. He has lined his portion of the wall with a light toned canvas, with a stencilled border, and, except that the canvas is hardly sufficiently covered with frames, the effect is fairly good. The exhibit is, however, an example of the disadvantages of decorating a portion of a wall without reference to any general scheme. It happens, fortunately in this case, that much harm has not been done, for the wall is not a very prominent one, and is already broken by the entrance door.

The exhibit of R. Fellows Willson, of New Bond-street, will meet with general praise. The opponents of the modern school of diffusion and rough paper will be able, with complete justification, to point to the exquisite examples of portraiture here shown as proofs that perfect definition and extreme finish are not inconsistent with artistic effect. The work is some of the finest of its kind that we have seen, and that this method of treatment is successful only in small sizes is disproved by examples of quite considerable size, which may be prints from direct negatives or enlargements. Some one in our hearing described the work as "the idealisation of the usual thing," but the expression was not quite a happy one. The work may be what the usual thing might be like; but it is quite an unusual combination of perfect photography and perfect taste.

Mr. W. Crooke, of Edinburgh, occupies a complete wall facing the entrance, and his display may be taken as a model worthy of study by those who may have occasion to make a show of a similar kind. He divides his wall into three panels, the centre one covered with figured tapestry, and the side ones covered with a plain fabric of deep red. The effect of the whole is rich and imposing, and at the same time there is nothing to disturb due enjoyment of the pictures themselves. The decorative design is extremely refined. Many of the pictures are familiar to those who visit exhibitions, and have received a due meed of admiration. They seem to us to lose nothing by being shown in competition with one another. Perhaps even this is a gain, for an opportunity is afforded of studying the characteristic style of the worker. The individuality is so marked that almost in every case the hand of the author is at once apparent, but there is no lack of variety either in subject or treatment. Some of the smaller portraits are quite as commendable as the more important and better known works.

Miss Catherine Edmonds, of Westbourne-grove, W., has a dainty little panel. Many of the portraits are admirable examples of studio work, graceful in pose throughout, as well as good photographically. One or two of the frames, however, could well have been spared, both because they are not up to the general standard of excellence, and because the arrangement would have benefited by a little more space.

Furley Lewis, of Kensington, has some worthy work. The pictures

are rather unequal in quality, and the arrangement of them leaves something to be desired.

Continuing to deal with professional exhibitors, in the North Room H. W. R. Child, of Bloomsbury-square, includes in his exhibit portraiture and reproductions of pictures. The latter are very good indeed. There is also good work among the portraits, but Mr. Child has been singularly unfortunate in his decorations. The somewhat vivid green drapery he has chosen is quite out of keeping with the general arrangement of the room. He has certainly made his portion of the wall conspicuous, but it is in a way that cannot be commended.

The work of John H. Avery is so well known to visitors to the Society's exhibitions and others that we need only mention that his firm's (J. H. Avery and Co.) exhibit contains a selection of architectural, landscape, and technical photographs of the high standard we should expect.

The exhibit of T. C. Turner, of Hull and Islington, N., will extend his good reputation. If we may put it that way, it is an ideal show case. There is so great a variety of style, treatment, method of printing, &c., that the most fastidious visitor to a photographer's studio can hardly fail to find something to his taste, or to become impressed with the ability of the photographer. Much of the work is admirable from every point of view.

As far as space is concerned, the next important part of the section is devoted to photographers who work for the trade, but before passing to these we must refer to the exhibit of the London Stereoscopic Co., whose business includes both trade work and general photography. They occupy the whole of the end of the North Gallery, certainly the most important position in the rooms devoted to the section, and therein was the opportunity to make the most imposing show of all. This opportunity they cannot conscientiously be said to have made the best of. They have chosen to cover the wall from floor to ceiling, or as near as they could get thereto, with a heterogeneous collection of portraits, architectural photographs, photographs of machinery, collotypes made for illustrating catalogues, and other examples of their work, as closely as they could be hung. We would suggest that at future exhibitions the company should be content with a smaller display in which the commercial specimens are subordinated to the artistic. On this vast wall there is some first-rate photography of all kinds, but visitors would doubtless be content with far less of it, judiciously weeded out and hung with a closer regard for the exigencies of the case.

Thomas Illingworth and Co. have a well-arranged panel, principally of enlargements from negatives by well-known photographers. Their piece de resistance is a portrait of the Queen of more than life-size. Their part in its production, as indeed in all the work shown, has been well performed, and if it is not quite the best example of photography that might have been chosen upon which to show their skill, we, as loyalists, can appreciate their choice of subject. The two frames of miniatures deserve examination.

The Autotype Company divide their exhibit into technical work and fine art reproductions. The former are enlargements, in carbon, of course, from negatives from nature, and the latter are from paintings. The exhibit forms quite an exhibition in itself, and need we say more in praise than that they are autotypes.

Messrs. Elliott and Son, of Barnet, have relied upon the skill of George Walton for their decorations. They show a good assortment of enlargements and direct prints in carbon produced from tissue of their own manufacture. In variety of tint and general beauty of result their carbon work evidently approaches perfection. The enlargement in sepia-carbon from a negative by H. Walter Barnett, which forms their centre piece, certainly could not be excelled.

The Kodak Company make a strong bid for popularity. Their exhibit consists principally of a series of enlargements of South African war subjects, produced on royal bromide paper toned. A very interesting series indeed, and well illustrating what the Kodak is capable of. Their wall is very tastefully arranged and decorated, but it is a little monotonous. The toned bromides, though not wanting in sufficient contrast when looked at individually, appear somewhat weak when viewed collectively, separated only by a framing which approximately matches their own half-tones.

Morgan and Kidd show trade and commercial photographs, including half-tone work and collotypes, and enlargements, up to their usual standard. A large portrait of General Lord Roberts, painted in oil, in the most brilliant of scarlet uniforms, strikes a very decisive note among its surroundings.

The Selke Photosculpt Co., of Berlin, show examples of sculptures produced by photographic agency. They will be examined with interest as an unusual, if not entirely novel, application of photography. The method or methods of their production have already been published.

v. 319

## PICTORIAL PHOTOGRAPHY.

The most important gallery of the suite is devoted entirely to pictorial photography, which, for the first time, is displayed apart from the competing attractions of apparatus, &c. In size the room is approximately the same as that at Pall Mall. The number of frames hung is very nearly the same as at last year's exhibition. The Hanging Committee have not attempted any scheme of decoration, but the low warm tone of the walls is far from unsuitable for the purpose in view. The general effect is restful and pleasing, though perhaps a little sombre. A word of praise is due to those responsible for the arrangement of the pictures, especially considering that much of the experience gained at past exhibitions was unavailable. With workmen accustomed to their methods, a different system of fastening the frames to the walls and other difficulties incident to the change, their task has not been a light one.

The selection appears to have been performed with even more than the customary care, and leaves little ground for complaint of any kind, except, of course, from those unhappy individuals whose wails are heard after every exhibition. Certainly there can be no complaint of want of catholicity. Probably no collection of photographs has yet been exhibited containing so much variety in everything that can be varied in a photograph as that at present on view. This is as it should be at the annual exhibition of the leading Society in the kingdom.

The judges have awarded only two medals, and the awards will be received with neither more nor less than the usual amount of criticism. One of the medals is given to W. T. Greatbatch for a print in carbon of a warm brown tint called "The Orchard." It is admirable in the correct rendering of tones, in atmosphere, and in conveying a sense of the joyousness of summer, but many will take exception to the composition. The principal object is a crooked tree trunk, cut off by the top of the picture just where the branches are commencing to spring from it. Its lines are almost precisely repeated in a smaller tree trunk in the middle distance. Whether the lines are offensive or not is a matter of personal feeling. The other medal is awarded to Percy Lewis for "Venice," and this and Mr. Lewis' other exhibit, "A Venetian Waterway," are, we think, the most satisfactory renderings by photography of Venetian scenes we have met with. The portraiture has not been kept together as has been the custom in recent exhibitions, and our impression is that there is rather less than usual of what may be strictly termed portraiture, and, truth to tell, it is, generally, less important in size, and the larger work does not rouse us to much enthusiasm. H. Walter Barnett sends two portraits, one of which greatly pleases us. F. Hollyer, in his portrait of Snowden Ward, has not succeeded in preserving his usual distinction of style. This very nearly approaches the commonplace. A portrait by R. Porteous, of Melbourne, Australia, is particularly interesting as an example of what our brethren in the Colonies are capable of. It is a piece of really sound work. "A Portrait of a Lady" by A. Cochrane, has some good points, but it seems a direct imitation of rather than an inspiration from the work of the early British school of portrait painting, &c. "John Leighton, F.S.A.," by Rev. F. C. Lambert, is totally deficient in the qualities we should expect to find in the work of one who has been so long looked upon as an exponent of pictorial photography. But if the more ambitious work is so tame, there is much among that of smaller size to win admiration. Arthur Hewitt, of New Jersey, U.S.A., sends several portraits and figure studies, and among them are several worthy of notice; though not perhaps the most striking among them, "An Oxonian," pleases us as well as any. The simplicity and even severity of the treatment are so well in keeping with the character of the subject that we can conceive nothing better of its kind. The work of R. Fellows Wilson we have already referred to in dealing with the professional exhibits. It is a testimony to its quality that the two exhibits among the professedly pictorial work lose nothing of their claims to admiration. Miss M. Weil is represented by some half-dozen pictures, some of which may be classed as portraits, in one case as half a portrait, and about this we maintain a respectful silence. The idea is either sublime or ridiculous. "Eleanor" is perhaps the quaintest thing in the exhibition. The seated figure of a little girl in a room, with a large book in her lap. The pose and point of view seem designed to illustrate everything that the instruction books tell us not to do. It is quite a triumph in its way. All Miss Weil's work is interesting. Among her figure studies, "The Song of the Lark" and "Across the Fields" will probably be the favourites. "A School-boy," by C. Sweet and "A Portrait Study" by F. A. Bolton deserve looking at as examples of the successful treatment of that not very easy subject to deal with pictorially, the boy.

Among the figure subjects, "The Madonna and Child," by R. Eickemeyer, is notable rather for the boldness of the attempt than for the

completeness of its success. The wisdom of attempting such subjects is questionable. W. M. Warneuke, who sends but one frame, departs from his usual style. His "Golden Age" represents a child bathed in sunlight on the rustic steps of a garden. The figure is so happily rendered that one can not help regretting that there was not a greater subordination of its surroundings. It narrowly misses being fine. J. H. Gash has a fine thing in "Riveters," a homely enough subject; two mechanics at work on a ship's side. The subject is very skilfully handled. "A Warm Job," by the same artist, is not nearly so good, and it loses by being so thoroughly reminiscent of F. Marsh's "Gas Stokers," without being so successful. J. A. Sinclair's "Scavengers" is a picture that will impress itself on every visitor's mind, it is so strong and bold. Two scavengers, not the Metropolitan variety, but apparently of Spanish or Italian growth and environment, marching along with brooms over their shoulders, strongly outlined against a white wall. The sense of sunlight is perfect. There are at least two pictures in the exhibition which remind us of the bygone days when Diston and Hubbard were leading lights in the photographic world. "The Miser," by H. E. Brightman, is a very good specimen of work of the kind. It is so well got up that one is almost convinced of its truth. "The Spinner," by F. A. Bolton, is more natural, and is fairly successful. "A Question of Cost," by T. Lee Lyms and "In the Smithy," by J. A. Armitage, are both worthy of more than passing notice. Two pictures designed to illustrate the book, "Trelawney," should be carefully studied by those who are interested in the possibility of applying photography in this direction. They are by C. Y. Abbott.

Quite a feature of the exhibition is the figure work sent in by American photographers. But a few years ago all but a few prints from those sent from across the Atlantic had to be rejected on account of their entire want of pictorial qualities. A few workers, such as Miss Weil and R. Eickemeyer, were well known to and esteemed by us, but the bulk of the work sent was of that cold, hard, uncompromising kind which had long since ceased to be attractive here. Now all this is changed. The United States are represented by close on fifty pictures by about a dozen contributors. The American work, speaking generally of it, is the most daring in the exhibition. Old conventions, not only with regard to treatment, but with regard to mounting and other matters, have been thrown to the winds. Some of the work has little but its eccentricity to recommend it, but, in all but the extreme cases, there is a thread of fancy running through it which will make itself apparent to all who choose to look for it with sympathetic eyes. To unsympathetic eyes the kind is excusable. The work of E. J. Steicken, F. Eugene, T. C. Abbott, and Dr. Detelefsen and some others will create surprise amongst those whose ideas of photography have formed from what has been exhibited at the Society's exhibitions in former years, and opinions about it are not likely to be unanimous. It must not be thought, however, that all the American photography shown here is of the extravagant type. A fair proportion of it would be acceptable anywhere.

Architecture subjects do not seem so plentiful as usual, perhaps it is because no attempt has been made to keep them together, and the fashion of the day seems to be for effects of light and shade in carefully chosen corners rather than for open effects in choirs, transepts, and naves. H. W. Bennett maintains his reputation. His half-dozen contributions are all so good that it is a pity to try to make a selection. W. T. Greatbatch sends some very pleasing work. C. Barrow Keene has as his one contribution a very satisfactory number entitled "A Cottage Stairway." We paused over work by H. J. Yates, R. R. Rawkins, and certainly the best exterior in the exhibition is "The Temple of the Caryatides," by John Bushby.

Pictures that would be unclassified under the simple grouping of landscapes, figures, and architecture seem singularly few this year. Three pictures of dogs by P. Von Schoeller deserve especial mention for the originality of the treatment, and these with "Rest," by W. Reid, a study of horses, are about all the animal pictures in which the animal interest is not subsidiary to the landscape. We might mention here, though, of course, it is not strictly a landscape, the fine snow scene by Mrs. Le Blond, better known to the photographic world as Mrs. Main, and also a very charming little picture, "The Burning of the Saale," by E. Kingsland.

We now turn to the landscapes, to-day as of yore the strongest feature of the exhibition. We have already referred to Mr. Greatbatch's medalled picture. Scarcely less meritorious is his "Summer Reflections." It is a little less uncommon subject, but still it is a worthy fellow. C. Job has never produced anything better than his two works here. They even deserve extravagant praise. The three landscapes of F. A. Bolton impress us almost as favourably. W. Thomas does not

seem quite in his usual form. "The Old Mill" is bold, and as a subject well chosen, but it is distinctly wanting in atmospheric perspective. A. Keighley's work is disappointing throughout; he has adopted a very low tone, to which no exception could be made, but in obtaining his low tone he has lost his truth of gradation. J. B. B. Wellington has a fairly good picture in "Stanmore Common," but it is not the best work he has accomplished. J. Page Croft has several pictures in his usual style. We prefer "Sentinels" of his work. J. A. Sinclair keeps to his preference for illustrating foreign countries. Spain is here his fancy. "The Water-carrier" is a clever effect of sunshine, and as interesting as an illustration of a phase of life as it is pictorially. He has not been so successful with his other attempts. J. C. Mummery sends three pictures. We prefer "Leigh Ray," in which he has used the gum bichromate process to the best advantage in obtaining an effect of atmosphere which is incompatible, or at least, very difficult with most photographic printing processes. "Pagglesham Pool" is hardly less pleasing. C. F. Inston has perhaps attempted a greater variety of subjects than usual, but his most successful work is still by the sea. "Whence and Whither" is remarkable as a picture of the open sea, with no object of interest other than the waves themselves, which might be employed to illustrate composition. Hardly less satisfactory is "Clearing Up," notable for its luminosity and for the truthful effect of the clearness of atmosphere one often finds after a summer shower.

Three works are exhibited by the hands of the late W. J. Warren. They will increase our regret at the loss of so promising a worker. The principal is "Whitby," which we fancy is an elaboration of a smaller picture of the same subject. Dr. Llewellyn Morgan also shows among others some characteristic views of the same place. Our old friend, H. P. Robinson, F.R.P.S., though not occupying the post of honour in the New Gallery, amply demonstrates that his ill-health, which we deplore, though it may have rendered him less active, has not affected his skill. He is represented by two pictures which every one would recognise as his work. We must conclude our notice with a regret that we cannot deal with the numerous good things which we have marked in our catalogue.

#### TIMING ENLARGEMENTS BY THE RUMFORD PHOTOMETER.

SINCE every enlargement from a given negative requires a different exposure from that of a larger or a smaller one produced by the same illuminant under the same conditions, it is a convenience to be able to determine the exposure of each by reference to a constant. A constant adopted here is the time and distance from a candle required for the correct exposure of a contact print from the negative that is being dealt with. In other words, if we know the time required for a contact print at a certain distance from a repeatable light, we can easily determine the approximate exposure required for an enlargement of any extent.

The method to be described depends on the truth of a proposition that is by no means self-evident, but that is capable of proof, viz., that an enlargement and a contact print from the same negative require equal exposures when the illuminating power of the light and its distance from the bromide paper are fixed, the rays of light in both cases passing through the condenser and objective. When the lantern, that is to say, is set up and an enlarged image of the negative is cast on the bromide paper, exactly the same exposure will be required for that enlargement as for a contact print made by removing the negative from the lantern and placing it in contact with the bromide paper.

At first sight one might argue that, since all the light passes through the negative to form the enlargement and only a small portion to form the contact print, the time of exposure must be different for each, and that, in order to get equal times for each, all the light would have to be concentrated on the negative when the contact print is being made. But this argument is fallacious, as the following reasoning will show.

Suppose a perfectly transparent spot in the negative. When the negative is in the carrier of the lantern a certain quantity of light passes through the spot, grows weaker and weaker by the law of inverse squares, and finally reaches the bromide paper, upon which it impinges with a certain intensity and area. It gives an enlarged image of the spot, and a definite exposure is required.

Now, if the negative be removed from the carrier and pressed against the bromide paper the exposure for that transparent spot will, without doubt, be exactly the same, because the spot, in virtue of its transparency, has in no way affected the intensity of the light falling on the bromide paper. It has merely limited its area.

Absolutely opaque spots—assuming the possibility of such—may be left out of account, since no light whatsoever passes through them; and we now come to the most troublesome question of all, that of half-tones.

A little thinking might incline us to believe that the half-tones will not take equal times for contact print and for enlargement under the conditions specified, and that in consequence the scale of gradation of the enlargement will differ vastly from that of the contact print, but a little more thinking will convince us that exactly the same holds good for a half-tone as for a transparent spot. For a half-tone passing a certain quantity of light may be regarded as equivalent to a transparent spot passing a less quantity of light, since a half-tone which transmits a definite fraction of the light passing through it will transmit that fraction whether its position be near to or remote from the source of light.

Having settled the preliminaries, we may now describe the method. A concrete illustration will afford the simplest means of doing so.

Let us imagine that we are going to enlarge from a given negative. We know, or we find, that a contact print from it requires ten seconds at one foot from a candle. The lantern is set up, the negative is inserted, focussed, and arranged. The negative is then removed from the lantern, and the intensity of the illumination of the screen is determined in terms of the candle by means of a Rumford shadow photometer as follows: Two shadows of a rod are thrown on the screen by the lantern on the one hand, and the candle on the other. The candle is moved to and from the screen till the shadows of the rod are of equal intensity, till, that is to say, the shadows are equally illuminated by the lantern and the candle. The distance of the candle from the screen is then noted. We now know that the light falling on the screen from the lantern is equal to the light from the candle at the distance determined, and a simple calculation gives us the exposure required. Three feet, let us say, is the distance of the candle from the screen. We know that a contact print required ten seconds at one foot from the candle, and we know that the time of exposure varies inversely as the candle, whereupon we know that the time of exposure at three feet from the candle will be nine seconds—which is the exposure required for the enlargement.

This may seem troublesome. In reality it is simplicity itself, and a greater saver of time that is sometimes wasted in exposing and developing trial strips of paper. It is not necessary to make a trial contact print by candle-light if the time and distance for a contact print with any other repeatable light such as a gas flame are known. In such a case it suffices to translate the gas flame into candle power by the use of the Rumford or other photometer, and to calculate the exposure required with the candle. Thus, ten seconds at a foot from a gas flame or five candle-power become fifty seconds at a foot from a candle. The rest of the procedure is the same. It will be found that, unless the light used as a constant approaches in actinic value the lantern illuminant, some allowance must be made for the discrepancy. Hence only an approximately correct exposure may be looked for in a first trial. But by experiment the ratio of the actinic values of the two lights may be determined once for all in the form of a fraction, and allowance made in the future.

J. CAMPBELL SMITH, M.A.

#### BUSINESS METHODS AS APPLIED IN PHOTOGRAPHY.

[A paper read before the New England Convention at Boston, September 13].

THERE is a common notion among photographers that business methods mean an elaborate system of red tape—book-keeping, ticketing and checking the customer, his order, and every detail of the day's work. Now, while it is desirable that the photographer should keep his books in good shape, and have an intelligent control of his establishment and its working, the business methods which I propose to discuss do not concern these details particularly. What we are after this morning are those schemes, plans or methods by which successful photographers create business, and make it grow from day to day.

The whole question of business methods was very aptly put to me a few days ago by Pirie MacDonald. He said: "Tell the boys that they must make business; that if they are content to take what comes to them they will end their days in the poorhouse." The man who grasps this idea has taken the first step towards better days. There has been altogether too much waiting for business in professional photography. The day has gone past when a man can hope by good work alone to draw people into his studio. The successes of recent years have been won by men who could think out and put in operation schemes by which business was brought to the studio. Here, then, we have the field for method in photography as a business. It covers the getting

of business, and then the successful management of business when obtained.

Mr. MacDonald has been very busy all summer. His methods (if we knew them) would give us some very interesting data; but he did not tell me anything of them. The fact of the matter is, of course, that it is impossible to set forth any business methods of universal application. What is appropriate or successful in Chicago may have no application in Boston. Methods which would be profitable in New York might be unproductive in Savannah or Kalamazoo. In short, it is obvious that the method must be evolved by the man, to fit the special requirements of his locality or the needs of the moment, or the clientele he has in view.

How shall a photographer turn himself out of his rut and begin to infuse modern methods into the conduct of his business? First of all by realising the factors which are of most importance in business to-day; his personality; his methods of publicity; the character of his work; and his place of business. These must all play their part both in creating and retaining business. Here we have points sufficient for our talk; let us try to cover them.

#### THE PHOTOGRAPHER'S PERSONALITY.

There can be no doubt about the great influence of a man's personality in his business. Photographers have been very much at fault here. They keep themselves too far behind in the social and business life of their cities. They confine themselves too closely to the mere following of their speciality, and their horizon is too often bounded by things which pertain to "cabinets" at so much per dozen. The successful photographer, or the photographer who would be successful, should take a wide and lively interest in the affairs of his town, or of a good "set" in that town. This is necessary in order that he may know intimately "who is who," what is about to happen, and what chances there are day by day to improve his position in the community, to turn events to good business advantage.

There is a great deal in the point of view from which you conduct your business, the point of view, that is, which you take before your neighbours. It is not at all difficult when one is residing in any locality for a year or two to "size up" the more prominent people in that locality, to tell fairly correctly where they stand, and the estimate they put upon themselves. And you may be very sure that the world will take you pretty much at the estimate which you put upon yourself. If your establishment is obviously behind the times, lacking in attractiveness or good taste, your business stationery crude and out of date, and you are seen to take no part in the public life about you, it is only natural that your townspeople will take you at your own estimate and conclude that you are a "back number." If we could run over a list of the most successful photographers in the United States, and see them as they are at home, we would find them all men vitally interested in the life and progress of their towns, wide awake to every possible advantage which this or that turn of events may bring about, scrupulously careful about their personal appearance, and of their standing in the community. Careful, also, about the appearance of their places of business. In fact, you will find them known among their fellow-citizens as men of intelligent enterprise and public spirit.

#### THE PLACE OF BUSINESS.

Let us now take up the detail of the place of business. It is most important that your public rooms should be not only clean and attractive, but also easily accessible and properly placed before the public eye. There is, of course, no excuse whatever for dirt or uncleanness in the photographer's establishment, but photographers do not always realise how unattractive their places are. They grow accustomed to the accumulation of rubbish, properties, and discarded specimens which naturally gravitates about a studio. It does not seem to occur to them to look at their places from the point of view of my lady, who is careful about her dresses, and who has no pleasure in visiting the average studio because it is "such a dusty, dirty place." It would be well for photographers to regard their public rooms from the point of view of the physician (I won't say dentist), or the picture gallery. Let us have rooms which are evidently designed to give the visitor a good impression of the profession to which they are devoted; which will give the visitor the impression that the photographer follows an art rather than a mechanical trade.

This brings us to the important matter of display. Perhaps I am wrong, but I think that photographers over-reach themselves in this detail of display. Wherever one meets the photographer's place of business, the conglomerate collection of specimens of his work at every turn, in all sizes, colours, and degrees of freshness, gives one a very "cheap" idea of photography—the idea of the machine rather than of an

art. There is room for better methods here, of which, however, I have little time to speak. A small but choice display, changed every day or every week, will give the public a much higher idea of your profession, and the risk of showing poor or mediocre work will be largely avoided. Let me suggest to you that it would be well to make your displays not only smaller, and more carefully selected, but also more educational. Thus there can be little doubt but that the public would be interested in a series of little exhibitions giving, one after the other, a display of the advantages of carbon, platinotype, sepia-prints, aristoplato, and plain, glossy prints in portraiture. A small descriptive card accompanying each display would, of course, add to the interest of the exhibit. Special displays of this kind, grouped around novel or practical ideas, will doubtless suggest themselves to you. For certain classes of trade a card, embellished with a photograph, of course, inserted in the street cars, would be a profitable method of display. Small exhibits in the public places of your towns also suggest themselves as likely to help in creating new business. It would be possible to talk all morning, or a week, about this one detail of the photographer's display, but I leave it to you, only emphasising the desirability of making your display produce a better impression than can result from the average exhibit of the average gallery.

#### PUBLICITY.

After display comes the question of methods of publicity. Here, again, the photographer is lamentably behind his times. Take the very simple matter of the photographer's stationery. Every communication you send to your customer is as important in a business way as a personal visit. When you write a letter to your customer you should be as careful about the appearance of that letter as you would be about your own personal appearance if you were to meet your customer. Glancing back over the business letters received from professional photographers of every class during the past ten or eleven years, an experience covering many thousands of letters, I cannot recall more than a dozen instances where the printed matter was worthy either of the photographer or of his profession. Your letter heads, envelopes, announcements, and price lists should reflect your individuality and taste equally with your portraiture. Many photographers excuse themselves in this matter by saying that they have not the gift of putting such things in shape. Nowadays, however, when every town has its artistic printer or its advertising expert this detail of appropriate business stationery should not present any great difficulty. The same thing applies to the "booklet"—the little book which photographers issue to advertise their studio and capabilities, and acquaint possible customers with little details which need attention in preparing for a sitting. It is astonishing that this method of publicity has not been more generally used. No profession lends itself so completely to the preparation and use of a dainty advertising booklet as that of the photographer. Thus, let us suppose that you have prepared for you a little booklet such as I have indicated. By leaving two or three pages blank, and mounting thereon for one effort a sepia print, for another effort a carbon miniature, and for another effort a platinum vignette, you have good material for three profitable excursions among the best people of your locality. And you may be sure that a little booklet, carefully written and printed, and illustrated this way, will not be thrown aside. Several papers dealing with the preparation of such a booklet have been published in the journals of late, and I would advise you to look up these papers and lose no time in putting into circulation a booklet adapted for the trade you are seeking. If you cannot prepare a booklet for yourself, you will do well to get hold of someone skilled in the preparation of advertising matter, and pay him whatever is reasonable for the work.

About methods of handling customers I can only give you a word or two. There should be more elasticity in dealing with your people than perhaps many of you have been accustomed to. Thus, the old-fashioned notions of prohibitory notices regarding the return of proofs, penalties on resittings, too much insistence about prepayment, &c., all these things are out of date, and have long been discarded in progressive studios. If you will look at these things from the point of view of the customer, you will see that they are against, rather than for, the growth of the business—clumsy methods of attaining certain ends which can just as surely be secured in more pleasant ways. A clever receptionist can make sure of payment, get all the proofs returned, and manage the detail of resittings without these clumsy methods of the old time.

#### THE RECEPTIONIST.

Let me not forget the receptionist—generally, and preferably, a woman of refined and gentle manners, well informed and specially gifted in handling people of varied dispositions. A woman especially who knows how to handle other women, and who can make herself beloved by the

children who may visit the studio. A woman also, who in a thoroughly suave and dignified way knows just how to handle the young man of the period, so that the photographer may be glad to have his business. What a power the receptionist is when properly chosen and trained. It is not too much to say that she can both make and destroy a business, if she has the amount of discretionary power given to her in some galleries. Let me put my finger here upon the mistake made in many galleries when choosing a receptionist. A photographer often values his receptionist according to her power of persuading more business than the customer intended in coming to the studio. The skill to do this is indeed worth a good deal, but the knowledge when and when not to use that skill is altogether more valuable. This "working" of the customer should be done with the greatest discrimination. People quickly jump to the fact that they are being "worked," and if it is overdone they will avoid the studio where such practice obtains.

Let me relate to you how this practice of "working" the customer is followed in one of the largest studios of the West. The receptionist of that studio has a card index containing the names of all the most prominent people of the city, their financial standing, and their circumstances. When a customer comes to this studio, the receptionist skillfully holds him or her in conversation until an assistant has given her the card containing the record already mentioned. According to the information given by the card the customer is thereafter systematically "worked" both at the desk and in the studio. It is unnecessary for me to detail how this "working" is done, but the system is worthy of a word or two. In so far as this and similar methods are useful in aiding the photographer or his assistants to handle his customers to advantage, they are praiseworthy. But, where they are "worked" without the most careful discrimination, they will, I believe, speedily degenerate into blackmail and end in ruin. Especially is this likely to happen in a studio where commissions are given to the employees for all work which they may influence or secure over and beyond that which brought the customer to the studio.

The use of the card index system, by the way, occupies a special place among business methods of to-day. I have not time here to go into it, but I would urge upon you the advisability of looking into and getting a good grasp of the advantages of this system, both in labour saving and in "following up" lists of customers and similar uses.

#### MODERN *versus* OLD-FASHIONED METHODS.

Now, let us take an actual instance illustrating many of the points I have mentioned, and contrast modern with old-fashioned methods. Some time ago I had a visit from a friend who has for some years resided in a flourishing western city. As an amateur he had made a speciality of portraiture, and naturally his ideas gradually turned towards the making of portraits in a professional way. His moves were most interesting. His position in his town had given him an intimate acquaintance with the best known men in the business and social life of the place. To complete this acquaintance for business purposes, he cultivated a little group of women journalists who had charge of the "society reporting" for the local papers, and won their interest and help. When he was ready for business they could tell him just who was at the top in current events, could furnish him with lists of desirable patrons, and inform him beforehand of social affairs which he might possibly be able to turn to business advantage. He saw that the local professionals (being asleep) had clung to their down-town studios; were neglectful of modern ideas; and that their places of business were inaccessible, guiltless of elevators or similar conveniences. He perceived, too, that their point of view was too "cheap" for the best people of that town, and that consequently much of the most desirable work was going to a near-by city. What did he do? Selecting a corner lot in the residence section, away from the dust and bustle of the town, he built himself an artistic studio; kept his rooms all on the ground floor; made sure of a spacious skylight, and public rooms with ample room for display; got an expert to prepare a campaign of advertising or publicity to cover the first year; inaugurated, to accompany this campaign, exhibitions of work at the studio; placed, month after month, by means of his society lists, attractive announcements of his studio with specimens of his work, among the desirable people of his locality; would make nothing but platinum and carbon portraits, and fixed his prices at \$10 and \$15 for a dozen cabinets. What happened? He succeeded from the start, and to-day is building the best business in his town, while the old-style professionals are grubbing along, complaining more profusely than ever.

Some days ago the business methods employed by Strauss, of St. Louis, were under discussion. One who knew Mr. Strauss and his methods intimately said: "He has a beautiful place, a staff of clever assistants, and he does beautiful work; but it is my opinion that the

biggest feature of his establishment, the thing which impresses people most when they visit the studio, is the wonderful courtesy which is extended to all visitors, whether they come for business, curiosity, or pleasure. You know, of course, that the Strauss Studio is one of the show places of the town, and that people have got into the habit of taking their friends to see the studio as a local institution. Mr. Strauss has three assistants entirely devoted to the work of showing visitors about his beautiful rooms, making his customers comfortable during their stay there, &c. Then his "convenience department" has been a big feature. There are no banks or express offices within a mile or so of the studio. Seeing this, Mr. Strauss created a department where the people of his locality could obtain small change, or have their checks cashed, or leave parcels for collection by the various express companies, without the bother of sending into the city. These conveniences, and everything else about the gallery, are held open to the public, and the popularity which Strauss has gained in St. Louis has been won quite as much by his generous hospitality and courtesy as by his portraiture." This, of course, refers to the gallery which was burned down some months ago. I merely relate the conversation to you so that you may have the suggestion which it offers.

In this way we could go on from sunrise to sunset, discussing the thousand and one points at which modern methods or intelligent enterprise along definite lines might be advantageously applied in professional photography. I have, however, wearied you sufficiently for one sitting, and therefore make an end, with my thanks for your patience and attention.

JOHN A. TENNANT.

#### A CONTRIBUTION TO THE THEORY OF PHOTOGRAPHIC DEVELOPMENT.

[Translated from the *Archiv für Wissenschaftliche Photographie*.]

INVESTIGATORS of this subject seem latterly to agree that the greater part of the silver forming the negative is not attributable to the direct action of light. This view receives considerable support from the fact that a plate, which has been exposed and fixed, contains scarcely any silver, and cannot be developed with a developer which does not contain a silver salt. From my former experiments it is highly probable that a plate, fixed immediately after exposure, contains no metallic silver whatever, and that there is merely an extremely attenuated image formed of sulphide of silver, which cannot be destroyed even by prolonged action of concentrated nitric acid, and upon which a silver image may be formed, and repeated at will, by deposition from a super-saturated solution of silver. This was the first complete explanation of the development of a fixed plate.

We have now to consider the mechanism of the deposition of silver upon the particles of exposed silver bromide in development, which, from the experience we know, are more easily reduced. The opinion was accepted for a considerable time, upon the authority of Lermontoff and Eder that processes of electrolysis took place between the silver, developer, and silver bromide, by means of which larger quantities of silver were deposited upon the image. This theory was ultimately abandoned, when it was shown that Eder's experiment, its principal support, was inexact and incorrectly interpreted. It was replaced by the opinion, that the developer took up reduced silver from the unexposed silver bromide, and that this solution becoming super-saturated, even at a low degree of concentration, deposited, in its meta-stable state, the metallic silver upon the very minute particles (formed from sub-haloid) already there. This opinion lends itself readily to experience. The differences in the external condition of exposed and unexposed particles of silver bromide are also sufficient to account for the precipitation. This theory, which is adopted by Ostwald, Abegg, Schaum, Luther, and others, easily accounts for the difference which formerly appeared to exist between physical and chemical development. On the other hand, it suffers from the disadvantage that it cannot be confirmed by direct experiment, for if no silver is found in solution in the developer, it may be answered that the quantity is of necessity extremely small and only momentarily there. In addition to this there is also the fact that a certain quantity of bromine taken up by the developer, which progressively counteracts its assumed capacity to hold silver in solution. This does not agree entirely with Abegg's application of the law of volumetric action to the process of development, which is not unexceptionable in its hypotheses and inferences, but nevertheless it agrees best with general experience, for the deposition of silver attains a maximum in a relatively short time, and then progresses slowly.

On the other hand, the super-saturation theory has the advantage of being independent of any assumptions concerning the nature of the

latent image. Any superficial change brought about by the action of light suffices, whether it be of chemical nature or not. It must, however, extend to the surface of the individual particles of silver bromide, since the surface of the plate does not suffer any possible change, as I have previously shown.

Concerning the existence of the sub-haloid, it may be useful to mention that I do not think its existence proved, despite beautiful experiments made by Luther. Many other compounds may be the cause of similar potential advances in the curves, provided that the relation between haloid and silver remain the same. The hypothetical compound,  $Ag_2O.2AgCl$ , may be taken as an instance. Upon chemical grounds, its existence seems quite as probable as that of sub-haloid. As the deposition of the silver must occur at the surface separating the two phases of which the system, silver and silver solution, is composed, or, in other words, at the surface of the particles of silver bromide changed by light, which have in a very short time been covered with a film of silver, it might be expected that the deposition of the silver would first occur upon those particles which had undergone most change, and that in consequence of the larger surface progress would be more rapid. This would give rise to coarser grain at the parts where exposure had been greatest. But microscopic examination contradicts this conclusion. We find a greater number, instead of larger-sized particles at those parts, where exposure has been most. The super-saturation theory avoids this difficulty by the wider supposition that increase in the size of the particles is small in comparison with the direct action of light predisposing to development, which penetrates the film to the depth at which light absorption by the particles of silver bromide attains a minimum. However great the amount of work done by light may be, we can entirely disregard the question whether the change be chemical or physical. In this respect it is well to impose careful limitations. It is, however, important to assume that only those particles are reduced, or bring about deposition of silver from the super-saturated solution, which have received a certain amount of exposure at least equal to the inertia (Schwellenwerth) of the plate.

I consider this supposition indispensable to any possible theory of development. Without it, chemical fog must be formed directly development begins, and it would be possible to develop to any degree of density a plate which had been under-exposed, or not exposed at all. This is not true in either instance. Moreover, it would be possible to develop to any degree of density an unexposed silver bromide emulsion to which metallic silver had been added. Experiments in this direction have been made by Abegg and Herzog, and likewise by Schaum, but in both cases with no results, and the more rapid tendency to fog, which was actually observed in the former case, may have been due to other causes (traces of free silver salt, difference of permeability, &c.).

If the above supposition be granted, the super-saturation theory gives an almost unconstrained explanation of the small lateral extension of development where sharp contrasts occur (irradiation in development). (When experiments of the kind are made the utmost caution should be observed, if mistakes due to the optical properties of a cloudy medium and diffusion of light are to be avoided.) Another objection is likewise obviated, which would be fatal to the super-saturation theory. I formerly described an experiment in which the silver image on an unfixed collodion plate was destroyed by submitting it to the action of nitric acid, so that only a positive formed of silver bromide remained. Such an image cannot be reduced to silver by prolonged action of a hydroquinone developer (more than half an hour was tried). On the other hand, a metal developer, containing a silver salt, at once deposited silver upon the image in such a manner that a normal silver positive was obtained. The deposition in this case, however, is proportional to the extent of surface implicated in the two phases, that is to say in proportion to the surface of the particles of silver bromide, the number of which may be determined for the various thicknesses of film, on account of their approximately equal size. The development with an ordinary hydroquinone developer only occurs after the plate has been exposed to light, which proves the necessity of the enlarged hypothesis, if the super-saturation theory, which is otherwise in harmony with the facts, is to be maintained.

In conclusion, those experiments remain to be discussed, which are regarded as the essential and conclusive basis of the nascent silver theory of development. These refer more particularly to Abney's work, which is so frequently quoted. As fresh experiments are necessary to the treatment of this question, we refer to our paper upon this subject.\*

Heidelberg, June, 1900.

J. PRECHT.

COPYRIGHT PORTRAITS.

It is obvious that what would be regarded as "a valuable consideration" in respect of the copyright portrait of one person, might not be so considered in the case of another. The commercial value of copyright portraits must, of necessity, vary greatly. It will vary with the course of events, for one thing. We have many instances of this in respect of the photographs of military men. At one time they may be practically unknown to the average person. In a short time, through some notable military achievement, their names may be on everybody's lips, and the commercial value of their portraits will consequently increase enormously. Most photographers, doubtless, would be pleased to give military officers about to proceed on active service free sittings as a commercial speculation, and, in the case of a general off to the front, most photographers would probably be pleased to offer a handsome cheque as "a valuable consideration" for permission to take their portraits for copyright purposes, to be used for publication purposes if desired.

The commercial history of these diminutive buttons imprinted with photographic reproductions of popular generals, which have recently been selling in such large quantities, would provide interesting, and, very probably, somewhat surprising, reading.

The average photographer has probably few sitters whose portraits would be valuable for copyright purposes. Of course, as has been recently remarked, one can never tell. A person unknown to fame to-day may be famous to-morrow. But the ordinary photographer cannot conduct his business in speculative lines, and with him "a bird in the hand is worth two in the bush," in most cases.

When a person reaches that interesting stage when he can be described as being "in the public eye," or "somebody" as one of the illustrated journals has it, it would seem that there are only a few firms which are capable of doing photographic justice to his features. So much the better for the favoured few, it will perhaps be said. At the same time, this seems rather hard on the local photographers, many of whom are very capable workers. It would rather seem that a person can not be a celebrity unless he has been photographed by certain eminent firms.

Members of the Royal family, happily for a few photographers within the charmed circle, spend a considerable fair portion of their lives posing before the camera, and in some instances the photographers who have the privilege of photographing Her Majesty make arrangements—no doubt very satisfactory arrangements—whereby the photograph is exclusively published in one journal. This is, no doubt, smart journalism and perfectly legitimate. At the same time, some old-fashioned folk might consider that such procedure is not quite the thing.

The sale of photographs of Royalty is quite a lucrative business in itself, and no less than 80,000 copies of the photograph of the Princess of Wales attired in the robes of a doctor of music were sold, and the well-known "four generations" photograph was almost equally popular.

With all respect to the eminent firms which have the privilege of photographing royal personages and notabilities, it would be absurd to assume that of the many hundreds of professional photographers, only some half-dozen are capable of performing such work.

Although the matter really only concerns the sitter and the photographers concerned, it would be interesting to know what the "valuable consideration" is in such cases.

Our Editorial Table.

"THE B.P. COMBINATION KEY."

Manufactured and sold by the Scotch and Irish Oxygen Co., Polmadie, Glasgow.

AMONG the new productions in connection with lantern accessories for the coming season, there falls to be noted a very ingenious tool which the Scotch and Irish Oxygen Co., Ltd., are about to place on the market. Most lantern operators who have to travel over wide areas, and are compelled to draw their gas supplies from different compressing companies, are alive to the fact that the gland nuts and other fittings of the various companies are not the same in size throughout, and it is to meet this difficulty that the Scotch and Irish Oxygen Company have devised their B.P. Combination Key.

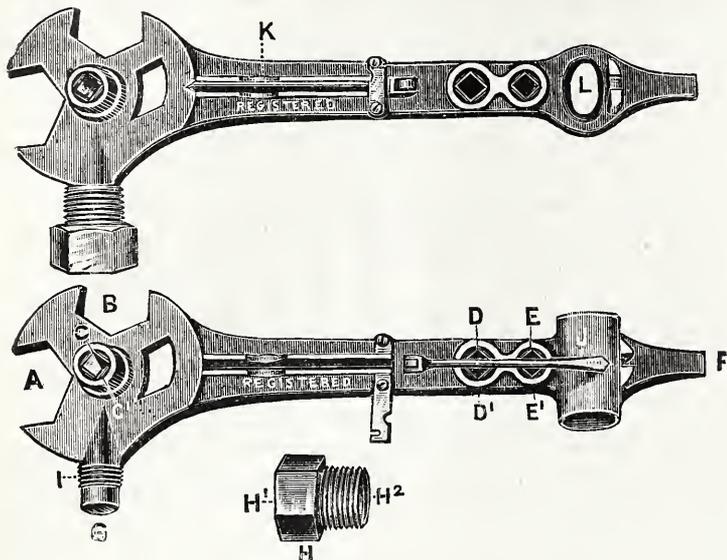

By means of this cleverly-conceived tool an operator can manipulate the fittings of any of the different company's cylinders. There is no doubt this handy tool will meet a want that has existed for a long time, and every lanternist ought to possess one. The following description will enable our readers to form an opinion of the capabilities of this key, which may be said to be universal.

The "B.P. Combination Key" is in stamped steel, case-hardened throughout; the reversible union or coupling is made in gun-metal.

- A To suit Manchester Oxygen Co.'s and other gland nuts.
- B To suit Brin's, Birmingham, and Scotch and Irish Oxygen Company's and other gland nuts, also to take reversible union H.
- C To suit Manchester, Birmingham, and Scotch and Irish Oxygen Company's, &c., spindles 5-16 in. square.

\* THE BRITISH JOURNAL OF PHOTOGRAPHY, vol. xlvii., No. 2109, p. 633, October 5, 1900.

- C<sup>1</sup> To suit Brin's Oxygen Co.'s, &c., spindles 9-32 in. square, also the advantage of taking 5-16 in. spindle when it becomes slightly worn or rounded on the corners.
- D<sup>1</sup> To suit ½ in. full spindles employed by some gas compressing companies for oxygen and nitrous oxide for dentists, &c.
- D<sup>1</sup> To suit ½ in. bare spindles employed by some gas compressing companies for oxygen and nitrous oxides for dentists, &c.
- E To suit odd or bastard size spindles.
- E<sup>1</sup> To suit odd or bastard size spindles.

It will be noticed that above six different size spindles are provided for, which, we think, is likely to equal everything the operator may require.

- F Screwdriver.
- G Hammer-head
- H Gun-metal reversible union to suit gauge, regulator, or slow valve; the end H<sup>1</sup> is screwed to fit Scotch and Irish Oxygen Co.'s or other externally screwed oxygen valves, and H<sup>2</sup> fits the bull-nose or internally screwed oxygen valves of Brin's, Birmingham, and Manchester Oxygen Co.'s, and others.
- I It will be noticed is screwed (⅜ in. gas thread—same as tails of gauges, regulators, slow valves, &c., &c.), to carry the reversible union H.
- J Lime tongs.
- K Lime cleaner; the pin is stiffly hinged and brought to right angles with the lever of key when used to clean out the hole in lime.
- L Wing nut, &c., lever.

## Studio Gossip.

**SUNDAY PHOTOGRAPHY IN LONDON.**—The Sunday street photographer (says the "Daily Chronicle") has been doing good business during the recent fine weather. His clients are chiefly maid-servants out for the afternoon and working men and their families, who are taking their week-end holiday. The "artist's" apparatus is of the most primitive description, and his "pictures" are just such as please an untutored fancy. They are of the tin-type order, and the modest charge is their chief recommendation. The posing of a group, all in Sunday best, at a suburban street corner is a quaint sight. The vagrant photographer knows his audience thoroughly, and his style of adjuring them to look their best, so that he may do justice to them, is a study in itself.

**THE POLYTECHNIC.**—The winter prospectus of that well-known photographic-teaching institution, the Polytechnic, 309, Regent-street, W., has been issued. From this we learn that the opening night and social re-union will be held on Tuesday evening, October 16, in the large hall at that address. The following is the programme:—7.30 p.m., conversation; 8 p.m., exhibition of animated photographs of the latest war pictures, entitled "A Free Trip to South Africa"; 8.40 p.m., the work of the ensuing session, Mr. Howard Farmer; 9 p.m., conversation. All the teachers will be present, and at either 7.30 or 9 p.m. will be glad to meet old or intending students, and to give visitors information concerning the work of the school or classes. Instrumental music by the Polytechnic Orchestra. Admission will be free to artists, photographers, publishers, engravers, and lithographers, and those interested in these trades. The prospectus justly points out that in the area of Greater London the Photographic School of the Polytechnic holds the honourable record that a far greater proportion of those engaged in the various sections of the trade are present or past students of the school than is the case with any other industry and its corresponding school. At

the Polytechnic classes in most branches of photography are conducted by competent teachers. We recommend those of our readers who desire to take up the study of photography at this centrally-situated institution to apply at the address given for a copy of the prospectus.

## News and Notes.

THE annual dinner of the Hackney Photographic Society will be held at the London Tavern, Fenchurch-street, E.C., on Tuesday, October 23.

**SHEFFIELD PHOTOGRAPHIC SOCIETY.**—At the annual meeting of this Society, held last week, Mr. H. Muxlow, of 13B, Steade-road, Sheffield, was elected secretary, vice Mr. G. W. Blackwell, who has retired.

**THE YORKSHIRE PHOTOGRAPHIC UNION.**—We are informed that the Cleveland Camera Club and the Huddersfield Photographic Society have joined the Yorkshire Photographic Union, which now embraces twenty-one Societies. The Union has our best wishes for its continued success.

ON Wednesday, October 3, Mr. Nightingale, in the course of a demonstration before the Walton (Liverpool) Society, proceeded to develop an exposure made by one of the members on an Ilford Chromatic Plate, two years old. A negative of excellent printing quality, without fog, resulted.

**THE PHOTOGRAPHIC COPYRIGHT UNION.**—The annual general meeting of the Photographic Copyright Union will be held on Wednesday evening next, October 17, at the Cafe Royal, Regent-street, W., at eight o'clock. Important reports with reference to the proposed new Copyright Bill and the work of the Union will be presented.

**GLUE OR GUM.**—It is sometimes needed to differentiate these substances in some photographic preparations, and for this purpose a simple method has been discovered by Herr Hugo Borntrager. The substance is heated with 50 per cent. of hydrofluoric acid. If glue or gelatine be present the odour of butyric acid is at once perceived.

**BOROUGH POLYTECHNIC PHOTOGRAPHIC SOCIETY.**—At the annual general meeting of this Society the following officers were elected for the ensuing year:—Chairman, Mr. F. W. Bannister; vice-chairman, Mr. R. R. Rawkins; hon. treasurer, Mr. E. G. Hawgood; hon. lanternist, Mr. J. E. Hoar; hon. assistant secretary, Mr. H. A. Norman; hon. secretary, Mr. P. C. Cornford, 103, Borough-road, S.E. The Loan Collection of Members' Slides were shown on the opening night of the winter session, prior to the set being sent round for exhibition at other Societies' meetings throughout the country. The hon. secretary informs us that he has still a few open dates for these slides, which he will be glad to book on application.

THE photograph plays a great part in a work of which Messrs. Hutchinson will publish the first part on Monday. It is a popular account of the living races of mankind (says a contemporary), and is edited by Mr. H. N. Hutchinson, with the assistance of Dr. Gregory, Mr. Lydekker, and other specialists. Portraits for it have been collected from all parts of the world; in simple fact, they have been gathered from China to Peru. Taking the case of the Samoans, there is even a picture of Robert Louis Stevenson's cook, a handsome fellow, who was no doubt a warrior in his spare hours. Our art authorities rather complain that the photograph is being overdone in illustrations. Here, however, is a case where it has a value not to be secured by other means.

MR. GEORGE RUMKER, of the Hamburg Observatory, has been conducting some interesting experiments with a view to measuring the length of a flash of lightning. During a thunderstorm, a few weeks ago, he had set up his camera, and succeeded in recording upon his photographic plate a flash of lightning, which struck a tower about 550 yards distant from his camera. From the distance he was from the tower, and the focal distance of the camera objective, Mr. Rumker succeeded in calculating the breadth of the flash, which was one-fifth of an inch. On each side of the main flash of lightning are seen many ramifications, which Mr. Rumker attributes to the strong gale that was raging at the time; but they have imparted to the discharge the curious effect of a ribbon torn to shreds.

THE Hove Camera Club's Fifth Annual Exhibition will be held at the Town Hall, Hove, on Thursday, Friday, and Saturday, November 22, 23, and 24, 1900. The judges will be Messrs. Charles Job, E. E. Manwaring, and W. Bond. The open classes are as follows:—(a) Landscape and marine, silver medal presented by the Mayor (Alderman J. Colman); (b) figure and portraiture, silver medal presented by A. R. Sargeant, Esq.; (c) architecture; (d) any other subject than the above, bronze medal presented by Charles Job, Esq.; (e) lantern slides (any subject) in sets of four; (f) a set or sets of four pictures by exhibitors who have never gained an award in photography, silver medal presented by Mrs. A. O. Jennings. In each of the above classes silver and bronze medals and certificates will be given. Entry forms and further particulars can be obtained from the hon. secretary, Mr. C. Berrington Stoner, 24, Holland-road, Hove.

A NOVEL USE FOR THE X-RAYS.—A contemporary states that the X-rays have been subjected to a novel purpose in Calcutta. A thief was supposed to have stolen a diamond worth 10,000 rupees, and to have effectually secreted it on his person by swallowing it. Expert thieves in India temporarily secrete small valuables of this description in the throat. It is called "pouching," and the thieves undergo special training in order to render them proficient in the art. The plan is very simple: A small piece of lead is attached to a thread, and this the neophyte

swallows; then by the action of his tongue he guides the lead to the orifice of the sac in the throat. The pupil is prevented from completely swallowing the lead by the piece of thread which the teacher holds. When the man has become skilful in this act of swallowing, the leaden pellet is coated with lime, which has the effect of enlarging the sac so that it becomes capable of retaining large articles. In the case of Calcutta the Rontgen rays revealed the presence of some obstacle in the throat, but its precise identity could not be gathered.

**THE IMPORTANCE OF COMMON SENSE.**—The address introductory to the autumn session of the Royal College of Science, which preceded the distribution of prizes last week, was given by Professor C. Le Neve Foster, D.Sc., in the lecture theatre of the Victoria and Albert Museum. He took as his subject "The Value of Common Sense." The common-sense man, he said, was not tied down by theory; he did not feel bound to follow the methods handed down by his forefathers; he was always on the look-out for improvements. Students should value their present opportunities for acquiring knowledge, which, if neglected, might never recur. What the scientist did to-day the manufacturer did to-morrow, and the experiments made in the laboratory soon became regular processes of manufacture. Though he had chanted the praises of common sense, he concluded, there was something nobler than the acquisition of knowledge merely with a view to making money. There was the suppression of the love of self, and the cultivation of the love of one's neighbour, which should develop into love of one's country.

**A LADIES' PHOTOGRAPHIC COMPETITION.**—From a preliminary circular that has been sent us we learn that a grand exhibition of needlecraft, wood-carving, photographs, etc. (under the auspices of the Worcester Diocesan Girls' Friendly Society), will be held at Stratford-on-Avon in May or June, 1901. Prizes will be offered for exhibits in twenty-four classes, of which the following three will be of especial interest to lady photographers:—T. Photographs: (1) Marine views and landscapes, 10s., 5s.; (2) interiors and architecture, 10s., 5s.; (3) portraits and figure studies, 10s., 5s. U. Snapshots: (1) General work, 7s. 6d., 4s.; (2) moving objects, 7s. 6d., 4s. V. Transparencies and Lantern Slides, 5s., 3s. W. Set of three Photographs illustrating Shakespeare, Tennyson or Browning, 10s., 5s. The following are the principal rules for exhibitors:—Exhibits for competition must be the sole work of the exhibitor, and must have been executed since January, 1900. An entry fee of 1s. will be charged for each article sent in. Class T is confined to work done with a stand camera, no limit as to size. Preference will be given to prints with a matt surface. Class U is for hand camera work only, but Classes V and W are not restricted in any way. Photographs in Classes T and U must be mounted separately, and all photograph exhibits must be ready for hanging, but need not be framed. The hon. secretary of the exhibition is Mrs. Arbuthnot, The Vicarage, Stratford-on-Avon.

## Commercial Intelligence.

Secco Films (British and Colonial), Ltd., 39, Lombard-street, E.C., have arranged for their demonstrator to give a series of lectures to the members of the principal Photographic Societies and Camera Clubs, and request that Secretaries will furnish a list of vacant dates to the Manager of the Company.

Messrs. G. W. Wilson and Co., Ltd., of Aberdeen, are issuing a series of lantern slides illustrating the Life of Admiral Lord Nelson. Many of the slides are from photographs taken specially for this set of authentic portraits, scenes, incidents in Nelson's career, relics, &c. Eleven of the slides depict the beautiful Lady Hamilton, Nelson's "friend," which should add some piquancy to the lecture.

The Warwick Trading Company, Ltd., of 4 and 5, Warwick-court, High Holborn, W.C., whose motto is "Progress, push, and promptness," send us a copy of their latest catalogue. This is a book of 160 pages, about forty of which are devoted to illustrated descriptions of the Company's specialities in apparatus, and the other 120 to a list of films, which are specified in amazing variety. The catalogue, which is a tribute to the wonderful success of the Company, should be in the hands of all interested in cinematography.

## Patent News.

THE following applications for Patents were made between September 24 and September 29, 1900:—

**PHOTO-COPYING MACHINES.**—No. 16,957. "Improvements in Photo-copying Machines." H. O. FOERSTERLING.

**COPYING MACHINE.**—No. 16,958. "Photographic Copying Machine." H. O. FOERSTERLING.

**CAMERAS.**—No. 17,044. "Improvements in Cameras." Complete specification. P. N. ANGSTEN.

**DISHES.**—No. 17,205. "Improvements in Developing Trays or Dishes for Photographic Films." B. M. ROGERS.

**LENSES.**—No. 17,313. "Improvements in the Manufacture of Lenses." W. E. BARRAS.

## Meetings of Societies.

### MEETINGS OF SOCIETIES FOR NEXT WEEK.

October.	Name of Society.	Subject.
16.....	Aintree .....	A Pictorial Exhibition. F. Anyon.
16.....	Birmingham Photo. Society ...	Demonstration: <i>Some Novelties in Velox and the New Developer Kachin.</i> D. A. Nightingale.
16.....	Bootle .....	Demonstration: <i>Platona.</i> J. M. Dul-lehan.
17.....	Borough Polytechnic .....	Lantern Night.
17.....	Croydon Camera Club .....	Lantern-slide Making on the Gelatine Plate. Benjamin E. Edwards.
17.....	Photographic Club .....	<i>Some Difficulties in Carbon Printing.</i> E. W. Foxlee.
17.....	Redhill and District .....	Demonstration: <i>Cristoid Films.</i> Sandell Company, Limited.
17.....	Woodford .....	Annual General Meeting.
18.....	Liverpool Amateur .....	Demonstration: <i>Retouching.</i> F. A. Cooper.
18.....	London and Provincial .....	Demonstration: <i>Ozotype.</i> T. Marly.
19.....	Bognor .....	Monthly Competition: <i>Landscapes.</i>
19.....	Borough Polytechnic .....	Instruction Evening: <i>Developers, their Use and Abuse.</i>
19.....	Croydon Microscopical .....	Photographic Chat.
20.....	Croydon Camera Club .....	Visit to the Royal Photographic Society's Exhibition. Leader, W. H. Rogers.

### ROYAL PHOTOGRAPHIC SOCIETY.

OCTOBER 9, Ordinary Meeting, Mr. T. R. Dallmeyer, F.R.A.S. (President), in the chair.

#### NEW MEMBERS.

Nine new members were elected, and about twenty-five candidates for membership were nominated. It was announced that the Farnham and District Photographic Society and the Amateur Photographic Association of Tunbridge Wells had been admitted to affiliation.

#### THE PRESIDENT ON THE EXHIBITION.

The President, before proceeding to present the medals awarded by the Judges at the Exhibition, said he wished to say a few words upon the subject of the Exhibition itself, which he regarded as the most successful annual display which had ever been held by the Society. The New Gallery afforded opportunities for such a classification of exhibits as was not possible at Pall Mall, and enabled the Society not only to give prominence to pictorial photography, but also to its many scientific applications. In 1898 the Earl of Crawford, their President, emphasised the importance of the commercial aspect of professional photography, and pointed out that it was the duty of the Society to aid and to foster it. Major-General Waterhouse, who at that time occupied the position of Hon. Secretary, in his characteristically unostentatious manner, at once set to work to find premises in which the scope of the Exhibition might be enlarged, so that its aims and objects might be more perfectly fulfilled, and it was to him that the Society was mainly indebted for the facilities afforded by the location of the Exhibition at the New Gallery. The present collection was notable as a landmark in the evolution of pictorial photography, not only in respect of the small number of medals awarded, but also with regard to the very high average of the exhibits and the absence of really poor work. There had been generally a great levelling up in all classes of the work, and the original impetus given by the leaders of new departures in pictorial photography had apparently well-nigh fulfilled its purpose. After looking round this section of the Exhibition one was struck by the fact that a good deal of it was reminiscent, but that on the whole a very high level had been attained. Notable advance in pictorial photography was at the present time a difficult goal to gain, and it must be confessed that no such advance had been made in 1900. The President thought the day had come when it might be considered a great honour to be hung in the Exhibition at all, and a very great honour indeed to obtain the Society's medal, a remark which was justified by the fact that the pictorial section comprised some 350 exhibits, while nearly a thousand frames were rejected. It was gratifying to find that professional photographers had so readily availed themselves of the opportunity which had been afforded them, and had contributed a magnificent display, and it was to be hoped that on future occasions more professional work would be submitted for acceptance in the pictorial section. The scientific, technical, and photo-mechanical exhibits numbered over 200, and were certainly of a deeply interesting and instructive nature. He hoped that in years to come this section would be still more comprehensive. Photography was pre-eminently the handmaid or the pioneer process of investigation in every branch of science, and it was fitting that the work carried on in wider scientific fields should find its representation in the Exhibition of the Society whose main object was the advancement of photography itself. The awards in the competitive technical section were of singular interest in connection with the popularisation of photography. The subject of the dissemination of faithful photographic reproductions of rare and beautiful objects was dealt with in the late President's address, in the course of which he expressed the hope that before long the Government would set up an establishment, primarily devoted to photography, for the service of the national museums. Photogravure was not a new method of reproduction, but the award in that section was evidence of the fact that the Society was on the alert to recognise distinguished merit in photo-mechanical processes. Referring to the award of a medal to Kodak, Ltd., for the Panoram Kodak, the President said it was a source of particular pleasure to him that such an ingenious piece of mechanism had been so successful, for he felt that Mr. George Eastman had done

more than any other man in this generation to popularise photographic practice. The Panoram Kodak recorded the image in cylindrical perspective. From a scientific point of view, such a picture should not be viewed upon a plane surface; but the sensuous impressions conveyed by the instrument were more pleasing than photographs taken by a lens of the same focal length and including the same angle. This arose primarily from the fact that small photographs were almost invariably viewed beyond the station-point, and in that case it was to be expected that the Panoram pictures would be more pleasing. At former Annual Exhibitions the apparatus section was restricted to improvements of a distinctly novel character, but the facilities afforded for a more comprehensive show on the present occasion were, he was sure, highly appreciated both by the manufacturers and by the public.

The President, at the conclusion of his remarks, handed to Mr. George Davison the medal awarded to Kodak, Ltd., for the Panoram Kodak. In the pictorial section medals were awarded to Mr. Percy Lewis, for his picture "Venice," and to Mr. W. T. Greatbach, for "The Orchard"; and in the technical section to Messrs. T. and R. Annan and Sons, for photogravure reproductions of paintings by Sir Henry Raeburn; but these exhibitors were not in attendance.

#### THE PRESIDENT'S ANNUAL ADDRESS.

The President next proceeded to deliver his annual address. The present status of photography as a science, in common with all other sciences, had, he said, been brought about by the classification of facts, their sequence and significance; and as photography is scarcely a century old, one was able to trace with considerable accuracy both the chemical and optical progress of the science from the earliest qualitative experiments to the present qualitative scientific process. The close of the century was a particularly appropriate period at which to review this progress, but in the short time which could be devoted to an address it was impossible to do justice to a subject so vast, or even to any particular branch of it. He proposed, therefore, to give a brief account of the evolution of modern lenses, but the inter-connection of chemical and optical work at the commencement of the century was so peculiarly interesting that he would include a few references to emphasise their early interdependence. Chemical changes due to the action of light had been known for upwards of 2000 years, and were referred to by Aristotle about 350 B.C., and by Vitruvius about 75 B.C. The first public exhibition of photographs took place at the Royal Institution in 1802, when Wedgewood showed photographs on paper and white leather, either unfixed or only partially fixed. The researches of Wollaston, Niepce, and Chevalier were referred to, bringing the subject down to the epoch-making investigations of Petzval, who in 1840 described how he had removed the correction of photographic lenses from the plane of experiment, or trial, and error, to a definite mathematical and scientific basis. From this point the President proceeded to trace the evolution of modern landscape, portrait, triple, doublet, and telephotographic lenses, dealing very comprehensively with the advances made in each type, and describing in chronological order the work of Petzval, Voigtlander, Grubb, Goddard, J. H. Dallmeyer, Rudolph, Andrew Ross, Steinheil, Schroeder, Aldis, Dennis Taylor, Morrison, Davidson, Von Hoegh, Von Rohr, Kaempfer, Miethe, himself, and others. For his address, which will form a very valuable addition to the history of photography, the cordial thanks of the Society were given to the President, upon the motion of Mr. Chapman Jones, seconded by Sir H. T. Wood.

#### COMING EVENTS.

At the Technical Meeting to be held at the New Gallery on October 23, Mr. Thomas Manly will give a demonstration of the Ozotype Printing Process. On November 6, at No. 66, Russell-square, Mrs. Aubrey Le Blond (formerly Mrs. Main) will open the winter series of Lantern Evenings with a lecture on "Cities and Sights of Spain." At the Ordinary Meeting, on November 13, Mr. E. Walter Maunders will read a paper on "Photography of the Eclipse of May 28, 1900." The Traill Taylor Memorial Lecture will be delivered on November 16, at 66, Russell-square, by Mr. F. E. Ives.

#### LONDON AND PROVINCIAL PHOTOGRAPHIC ASSOCIATION.

OCTOBER 4, Mr. A. Mackie in the chair.

The Hon. Secretary, Mr. W. D. Welford announced that as he would be away on several subsequent Thursdays, Mr. T. E. Freshwater had kindly consented to be Acting Hon. Secretary at the meetings, at which Mr. Welford would be absent.

Mr. Freshwater showed two 4-plate negatives on Thornton film, one of which had come away from its support in the washing, and had stretched perfectly to 5 by 4.

Mr. E. Featherstone showed two prints on the new Matt Carbona paper, one being toned to a blue-black and the other to a warm sepia, the toning bath employed being:—

Phosphate soda ... ..	15 grains.
Gold chloride ... ..	½ grain.
Water ... ..	14 oz.

Mr. A. L. Henderson gave a lecture on "Bordighera, New and Old," illustrated by a number of very excellent slides.

#### PHOTOGRAPHIC CLUB.

OCTOBER 3, Mr. E. W. Foxlee in the chair.

The exhibits of the Selke Photo-Sculpt Co. at the New Gallery were the subject of some discussion. They take the form of bas-reliefs in plaster or metal, the moulds for which are produced by photographic means. It was stated that a cinematograph camera was used, and some forty or fifty exposures made upon the sitter's face, lighting being varied in a special manner during such exposure. Enlargements are then made

from the negatives, and from these are cut out certain parts, which, all mounted in order one upon another, yield a model of the sitter's face, from which in turn, after retouching, finished moulds can be produced.

The Chairman referred to a method of making bas-reliefs by an old swelled gelatine process, but the difficulty was to get sufficient relief in this way to make it show at all. There was also a German method by which a swelled gelatine mould was made, and from that a plaster cast. This cast is dug out wherever greater depth is required, and then a wax mould taken. This is served in the same way, and eventually a finished mould is secured.
