A meeting of the Floral Committee was held at one p.m., when a considerable quantity of material was brought before the committee for consideration. One First-class Certificate only was granted, and three other varieties were commended. For particulars of these see a subsequent issue. Mr. H. J. Jones, of Lewisham; Mr. W. Wells, of Earlswood; Mr. W. J. Godfrey, of Exmouth; all exhibited. It transpired at this meeting that the variety shown at the last meeting (November 29th) by Mr. G. Beckett, of Elstree, and which received a First-class Certificate on that date is exactly the same thing as Denis Smith Rylands, sent out by Mr. H. J. Jones. Owing to the confusion arising from the number attached to the plant when sent to Mr. Beckett it was exhibited in perfect good faith as *Violacea*. A motion was passed whereby Mr. Beckett was permitted to change the name of the variety to Denis Smith Rylands.

HELENSLEA, BROUGHTY FERRY.

TOWARDS the close of a misty and wet November day we paid a visit of inspection to Helenslea, Broughty Ferry, the residence of Mrs. Stephens. It lies high, but is fairly sheltered by trees. At this season of the year Chrysanthemums are the leading feature of the glass houses. The gardener, Mr. A. McDonald, is a great enthusiast amongst this useful race of plants, and is, moreover, a successful grower and exhibitor. He is about to leave this establishment, as we mentioned last week, having obtained an appointment in England, from whence he threatens to return with his boxes of Chrysanthemum blooms to compete for the best prizes in the north, like many another Scot.

While inspecting his collection at Helenslea, we noted fine blooms of Mrs. G. W. Palmer, a bronzy sport from Mrs. C. Harman Payne. Croda is a seedling from E. Molyneux crossed with G. C. Schwabe, of a bronzy-chestnut, with an old gold reverse. Mme. Ad. Chatin succeeds well whether the bud is on hard or soft wood. Louise is of a beautiful and clear pink in this northern latitude. Lord Brooke also assumes a rich bronzy-crimson on the back of the florets. The colour of President Borrel is also grand. Sir E. T. Smith is variable and may be an incurved or reflexed Japanese variety of a rich yellow. William Bolia develops handsome blooms of a rich carmine-crimson. The pure white flowers of Mdle. Thérèse Rey, attain a huge size here, as good as any produced in Scotland. M. Chénon de Léché also attains a fine size and colour from the terminal bud; though when treated in this way it is also very late. Hammond Spenser is a compact, silvery-lilac, Japanese variety.

Charles Davis, in bush form, produces flowers that are almost wholly yellow. By way of contrast to this we may mention E. Molyneux, the blooms of which are of a brilliant crimson and altogether fine. Mr. McDonald says that for this part of Scotland the plants should be pinched on the 7th March, and the second crown bud taken to develop into fine form in November. That is the secret of his success with this difficult variety, and the method has never failed him. Most of the plants grown at Helenslea for big blooms are in 8 in. pots.

One of the Peach houses, like the vineries, is utilised for the housing of Chrysanthemums during the season. For some days previous to the Dundee Show this house was shaded to retard the blooms, for the greater portion of the best blooms were located in it. When the florets of Mutual Friend were spread out, the blooms measured 16 in. across; and in the natural position about 3½ in. to 4 in. in depth. Mrs. C. H. Payne was rather light in colour; but Louise,

Mrs. E. S. Trafford, and Calvat's Boule d'Or, were grand, the latter being fawn and old-gold. The ordinary Boule d'Or strongly resembled a wisp of shavings and was fine of its kind. Grand blooms were also carried by G. C. Schwabe, Souvenir d'Une Petite Amie, M. Georges Biron, Sunflower, Pride of Madford, Emily Silsbury, and Edith Tabor, all of which would have done the grower credit at any show. The pure white Mdle. Marie Hoste was 6 in. deep. The bright glossy yellow of the broad florets of Maggie Blenkiron was also very handsome.

In this house we came across M. Chénon de Léché with huge blooms taken on the second crown bud, after the plants had been pinched on the 7th March. The plants were dwarf, but the blooms were pale and quite yellow in the centre. The terminal blooms already mentioned had the advantage in colour, though not in size. The blooms of Niveus, Mrs. W. H. Lees, Thos. Wilkins, Richard Dean, and Phoebus, were all in first-class condition notwithstanding the mild and moist weather which has prevailed during the past autumn along the valley of the Tay.

By this time the light was rapidly failing us, and we had to pass through the other houses quickly, including the greenhouse and stove. The latter is largely occupied with plants for table decoration, including Palms, Crotons, Dracaenas, etc. At the back of the range is a glass partition, so that a cool compartment facing the north runs along the whole length of the back wall. Ferns and similar subjects are accommodated here, and make wonderful growth during the summer months. The grand specimens of *Adiantum concinnum latum* bear ample testimony to this. The deposit of moisture upon the plants during the winter months, however, discounts the value of this compartment at the dull season for plant growing. The shelter that it affords the glass facing south is in favour of the arrangement, so that advantage and disadvantage are fairly balanced.

In a Peach house where the trees are relatively young, some vigorous plants of the Marechal Niel Rose may be seen. In their season they bloom as freely as they grow. On the staging near the front glass a fine batch of *Cinerarias* in an advanced condition will give a good account of themselves presently. Darkness put a stop to further inspection; but we had seen enough to convince us that Mr. McDonald is an enthusiastic and successful gardener. Hard by the gate the engine was hard at work labouring to acquit itself of the task of lighting the establishment by means of the electric light.

GARDENING MISCELLANY.

SEEDLING CHRYSANTHEMUMS.

A BOX of blooms of single seedling Chrysanthemums was forwarded to us at the beginning of the month by Mr. James Bryson, 173, Princes Street, East Helensburgh, N.B. Only one of the varieties was named, but this was distinctly the best of the batch. Golden Hair, as it is called, is an exceedingly bright form, with two rows of ray florets. The colour is rich golden-yellow, with a suffusion of chestnut-red upon the reverse. The florets are quilled for a great portion of their length, but the tips expand quite fully, and consequently are nearly flat. The foliage is distinct, and the constitution appears to be good, and if this is so, Golden Hair will be a most useful variety. The next in point of Merit was one labelled No. 8. This resembles Mary Anderson in colour, but there are two rows of florets, and the bloom has not so regular an outline. The variety appears to be very floriferous and showy. No. 10 is worth noticing by reason of its colours, which consist of a ground colour of white, striped, and suffused with bright rose. The form, however, is bad, since it is a sort of halfway between a single and a Japanese variety. No. 19 is too much like the well-known Scarlet Gem to be considered distinct. In Nos. 2 and 4 the form is bad, but the colours are good, viz., rich chestnut-orange and bright rose respectively. The air of Helensburgh is evidently well adapted for the high development of colour in Chrysanthemums.

CACTUS DAHLIA CANNEL'S GEM.

NAMES are not always happily chosen, but Mr. Cannell must allow us to congratulate him in hitting upon a most appropriate name for this. It is a de-

parture in some respects from the general run of the section of Dahlias to which it belongs, for it may almost be called a pompon Cactus Dahlia. The habit of the plant is dwarf and bushy. The plant is most floriferous, the flowers are well displayed on stiff footstalks, and it has all the essentials to make it a first-class bedding variety, for which purpose, I think, in the near future it will be extensively used, and make a pleasing change. The colour of the flowers is a shade of scarlet, possibly best described as terra cotta.—*W. B. G.*

EXHIBITING MICHAELMAS DAISIES.

MICHAELMAS Daisies look well no matter how they are placed, but there is no doubt that they do not appear to the best advantage when shown in bunches of cut sprays, since the distinctness of habit is merged in a communal appearance that detracts considerably from the interest that should attach to them. Messrs. Jas. Veitch & Sons, Limited, of Chelsea have evidently recognised this, for the Asters shown by them at the Westminster Drill Hall on the 12th ult., were represented by plants lifted from the open ground, and placed in pots. The results were eminently satisfactory, sufficiently so, we should surmise, to repay the extra trouble and labour. The group too was splendidly set up and reflected great credit upon those in charge.

ONIONS GRANSTON'S EXCELSIOR.

THE propriety of growing the best varieties of all things procurable is well exemplified by growing a breadth of this and some old established kind (Brown Globe for instance) side by side with it under the same cultural conditions. I have recently had more than double the weight of the Excelsior from the same space of ground as off the Brown Globe, the difference being attributable only to the variety.—*W. B. G.*

APONOGETON DISTACHYON.

DESPITE its awful name, the Cape Pond Weed is one of our finest although probably our least known hardy aquatics. For growing in tanks or pieces of ornamental water there is nothing to surpass it. Although it grows freely enough, it never becomes a real weed as do some other aquatics once they have established themselves. The lovely Hawthorn-like perfume of the curiously shaped flowers has earned for the plant the not inapt name of the Hawthorn Lily. When establishing it in ornamental water it should be placed first of all in a pot or basket of sufficient size to contain it comfortably. From 18 in. to 2 ft. of water will be found to suit it admirably. It will do in shallower waters, but then its existence will be endangered during severe winters.

EARWIGS AND CHRYSANTHEMUMS.

LAST season I called attention to our almost entire immunity from the attacks of these pests on our Chrysanthemums, attributable, I think, to the spreading of lawn mowings among the plants. I have the same happy state of things to report again, and where the earwigs exist in plenty I would be glad to know if any of your readers took the hint and acted upon it, and with what result.—*W. B. G.*

OBITUARY.

MR. JAMES BATEMAN.

To the younger generation of gardeners Mr. James Bateman is but a name they occasionally meet with in *Sophrocattleya batemaniana* and less often in *Batemannia Colleyi*, which have been named in honour of the great Orchidist, and have their respective histories. To an older generation he was well known as an enthusiastic horticulturist and botanist, doing yeoman service to both branches of the subject which deals with plant life. He died at Spring Bank, his residence in Victoria Road, Worthing, on the 27th ult.

He graduated at Magdalen College, Oxford, close by the Botanic Gardens there, and probably contracted a taste for plants or had it intensified from what he saw there. In any case the fascinating family of Orchids claimed his attention while yet an undergraduate, causing him on one occasion to be severely reprimanded and otherwise punished for allowing himself to be detained beyond the proper time for presenting himself at College, lingering as he did over his lovely *Renanthera coccinea*.

Our recollections of him date back to the Orchid

Conference, held under the auspices of the Royal Horticultural Society at South Kensington, when he publicly and formally renounced his old hatred of hybrid Orchids upon seeing some of the triumphs of the art tabled by Messrs. James Veitch & Sons. By reason of his frank renunciation of this old stumbling block, it was promised that the first good hybrid which should turn up would be named after him. No more fitting compliment could follow this episode than the dedicating of *Sophrocattleya batemanniana*, a bigeneric hybrid, in honour of the veteran Orchidologist.

Orchids were the ruling passion of Mr. Bateman's life, but they had to share his love in company with other exotics, particularly tropical fruits, of which he was an enthusiastic and successful cultivator. His wide knowledge in this respect he freely imparted to the fellows of the Royal Horticultural Society at the meetings. His garden at Knypersley became famous as a repository for a multitude of uncommon pets of this description. He had the good fortune to marry a lady who was also a plant lover of great enthusiasm; but unlike her husband she espoused the cause of hardy plants, and the famous gardens of Biddulph Grange were the result. Both of these gardens were in the north of Staffordshire, not far from the eastern border of Cheshire. Latterly, he quitted that neighbourhood on account of his wife's health, and settled at South Kensington, though not residing constantly there.

His magnum opus was undoubtedly the *Orchidaceae of Mexico and Guatemala*, a huge work, giving life-size coloured plates of Orchids, and which may be seen in the Herbarium, Kew, as well as in the Lindley Library at 117, Victoria Street. He employed more than one collector, but Mr. G. Ure Skinner rendered him the greatest amount of aid by sending home specimens which appeared later on in the form of magnificent coloured plates in Mr. Bateman's great work, extending over the years from 1837 to 1841. Besides the grand paintings and the purely botanical work here recorded, there are many quaint and fanciful quotations and illustrated conceits, a sample of each of which we here quote:—

"Nature breeds
Perverse, all monstrous, all prodigious things,
Abominable, unutterable, and worse
Than fables yet have feigned, or fear conceived,
Gorgons, and hydras, and chimaeras dire."

Milton.

Under an illustration of a bunch of quaint flowers is the following:—"The hag came forth, broom and all, from the flower of *Cypripedium insigne*, her attendant spirits are composed of *Brassia lanceana*, *Angraecum caudatum*, *Oncidium Papilio*, etc. etc.; two specimens of *Cynoches* sail majestically on the globe below (on the right of which crawls *Megaclinium falcatum*. In the centre stands a desponding *Monacanthus*, on the left a pair of *Masdevallias* are dancing a minuet), while sundry *Epidendra*, not unlike the walking leaves of Australia, complete the group."

QUESTIONS AND ANSWERS

"Will our friends who send us newspapers be so good as to mark the paragraphs or articles they wish us to see. We shall be greatly obliged by their so doing."

[Correspondents, please note that we cannot undertake to name florists' flowers such as Carnations, Pelargoniums, Chrysanthemums, Roses, nor such as are mere garden varieties, differing only in the colour of the flower. Florists' flowers, as a rule, can only be named by those who grow collections of them.]

Spotted Masdevallias.—*Annoyer*: Though essentially cool-house Orchids, they cannot withstand low temperatures and a saturated atmosphere with impunity under glass, even though they may do so in their native wilds, where the conditions are vastly different. At this season of the year the outside atmosphere is saturated almost constantly, so that when a low temperature prevails in your cool-house moisture is deposited upon the leaves, and hangs upon them, it may be for days. This constant moisture is prejudicial to the foliage, and likewise encourages the growth of a fungus, which lives in and destroys the tissue of the leaves forming the too familiar black spots. To counteract this you should give sufficient ventilation during the day to expel the superfluous moisture at least once every twenty-four hours during the moist weather of autumn and early winter. A little heat in the pipes should be given, if necessary, to cause sufficient circulation to carry off the vapour. Care should be taken not to carry this means to an extreme at any time. Next season begin early, according to the state of the outside atmosphere.

Carnation Leaves Spotted.—*T. Carter*: The colourless and yellowish spots are often said to be the effects of an attack from bacteria; but this has scarcely, if at all, been proved to the satisfaction of scientific men. Possibly more than one cause has been at work. During the summer months the plants are liable to attacks from aphides and thrips which secrete themselves about the young leaves and other tender parts of the plants, which they puncture in order to abstract the sap. When such leaves expand they cannot but appear crippled if they have been much infested during their early stages. Many other plants get injured in the same way, whether under glass or out of doors. This does not always imply neglect on the part of the cultivator, for these pests are so numerous in certain dry seasons that no cultivator can successfully cope with them. Sometimes the damage is done before one would suspect the presence of the enemy. Possibly a washing now and again by means of the syringe, and using a solution of soft soap or Gishurst's Compound along with a little tobacco juice in the growing season would act as a preventive. Keep the plants cool, dry and airy in winter to guard against other evils of a fungoid nature.

Coloured Mahonia leaves.—*Admirer*: Nothing, as far as ever we have heard or seen, is done to cause the leaves of the Mahonia to assume their well-known red hue in winter. They naturally assume this colour on the approach of cold weather in autumn and early winter. We do not suppose that the foliage would colour up well if too much sheltered or shaded. As far as we have observed, the leaves colour best when well exposed to light and air. Poor soil might assist the intensity of the red; but under such conditions you would not get that liberal growth which would be developed in fairly good soil. Plant your bushes away from houses, walls and trees.

Propagating Chimonanthus.—*A.T.*: Considerable difficulty attaches to the propagation of this plant; but you might try layering in loam, with a small quantity of peat. Make a cut in the twigs or shoots to be layered, in the same way as is done with Carnations, and make sure that the cut is kept open by means of a hooked peg inserted in the soil just at the point where the cut has been made. Do this now or in spring, and examine in late autumn, after the season's growth has been completed. Seeds constitute a sure method of raising young plants, provided you can procure some.

Names of Plants.—*G. Watts*: 1, *Pteris tremula* Smithii; 2, *Asplenium Bellangeri*; 3, *Asplenium flaccidum*; 4, *Selaginella Martensii*; 5, *Pyrus baccata* (quite usual to hang on the trees, even till spring if the birds do not attack them).—*H. J.* 1, *Maxillaria punctata*; 2, *Laelia anceps*; 3, *Dendrobium Dearei*; 4, *Cypripedium insigne* Chantini.—*A. T.* 1, *Chimonanthus fragrans grandiflora*; 2, *Jasminum nudiflorum*; 3, *Viburnum Tinus*; 4, *Cotoneaster Rhamnoides*; 5, *Magnolia glauca*; 6, *Hippophae rhamnoides*; 7, *Retinospora squarrosa*.—*J. West*. 1, *Ugenia Ugni*; 2, *Peristrophe speciosa*; 3, *Phyllanthus glaucescens*.

Freesias.—Would any of your readers in the North-west of Scotland, where we have a heavy rainfall, give their experience with the cultivation of the Freesia? Can they get the old bulbs to flower year after year? And if so, how do they treat them?—*Flora*.

Method of Preserving Fern Fronds.—*Enquirer*: Messrs. D. & W. Buchanan, Forth Vineyards, Kippen, Stirling, claim that they have discovered a method of preserving Fern Fronds in their natural form without pressing and flattening them in the usual way adopted for the drying of them. We understand, however, that they last only for about fourteen days or less. The firm has patented or protected their discovery, and may not care to disclose it. You could consult with them, if you care to.

Fruits to Name.—*A. E.*: 1, Bess Pool; 2, Court Pendu Plat (this latter is somewhat doubtful, not being altogether characteristic).

TRADE CATALOGUE RECEIVED.

C. PLATZ & SON, Erfurt, Germany.—Trade Seed List, containing a choice Collection of Flower, Tree, and Vegetable Seeds.

"Science is Attractive" says an American humorist, "because it gives so large a return of theory for so small an investment of fact." I take it for granted he has tried it and so must know.—*Snags*.

The Crown Oak Forests are gradually getting smaller owing to the fact that the timber is not now required for ship building. The commissioner thinks it desirable to grow other trees for which a market can be found.

A Special Offer to Readers of THE GARDENING WORLD 25/- BOOK for 8/-

NO HOME SHOULD BE WITHOUT ONE.

Ogilvie's Encyclopædia OF USEFUL INFORMATION AND WORLD'S ATLAS.

No Single Book ever before contained such a Wealth of Knowledge.

By Special Arrangement with the Publishers of the "Encyclopædia of Useful Information and Atlas of the World," we are enabled to offer to the Public a Magnificent 25s. Volume for 16 of the coupons, which will appear weekly, together with 6d. each, accepted in Weekly Instalments, or the Coupons may be held until the whole period has elapsed and brought or sent to the Office with 8s., and 6d. towards carriage.

A COMPLETE ILLUSTRATED LIBRARY IN ITSELF.

A universal assistant and treasure-house of information on every conceivable subject, from the household to the manufactory. In short, gives information about everything, is absolutely indispensable to everyone in all walks of life; the contents being so separated, indexed, and arranged that they can be turned to at once. It is

THE BEST { BOOK OF } EVER
 { INFORMATION } ISSUED.
Size of Encyclopædia: 9 by 11½ inches. 656 Pages.

It contains

MANY MAGNIFICENTLY ENGRAVED COLOURED MAPS,

and a description of every country under the sun, besides much other matter relative to the Home, the Farm, the Factory, a Dictionary of Statistics—many Useful Tables, Poetical Selections, Synonyms, Famous Bridges and Ships, How to Calculate, How to Cook, How to Get Rich, How to Cure all Diseases, How to Succeed in Business, Table of Weights and Measures, and

HUNDREDS OF OTHER TOPICS OF GREAT VALUE TO EVERY PERSON

who desires to be up to the times. To see the Book is to want it. To Members of Mutual Improvement Societies it will prove of inestimable value.

The articles are written by men whose lives have been devoted to the subjects treated, are short and concise, but contain full information up to date. It is to be consulted on every subject that arises in everyday life, by old and young alike. It contains a complete Illustrated Atlas of the World.

IN THESE DAYS OF COMPETITION

it is imperative that a Gardener should be a well-informed individual. Here is an Encyclopædia containing an immense amount of knowledge that will be of the greatest service to him.

YOUNG GARDENERS,

do you wish to be successful? Then remember that to possess knowledge is the surest way to achieve success.

It is elegantly bound in Morocco Cloth, with beautifully designed Gilt Side-stamp and Red Edges, making at once the most handsome and durable as well as THE MOST USEFUL BOOK EVER MADE or sold for 25s.

111297.

"Gardening is the purest of human pleasures, and the greatest refreshment to the spirit of man."—BACON.

The Gardening World.

Edited by J. FRASEP, F.L.S.

SATURDAY, DECEMBER 18th, 1897.

FORCING STRAWBERRIES AT CORNELL UNIVERSITY.—The professors at the Agricultural Experiment Station, Ithaca, New York, have been trying their hands at the work of the professional, or at least have been superintending and directing operations. With Professor L. H. Bailey, the writer of numerous useful and interesting books, we are familiar; but his colleague in this case (Mr. C. E. Hunn) may be a practical gardener. Some interest attaches to their experiments, if only from the fact that the methods of procedure for the forcing of Strawberries in America are very similar to our own, the chief differences being in climate, the varieties of Strawberries used, and in the hints that the scientific mind has to offer after a maiden trial at forcing Strawberries, the general results of which were highly successful. The first complaint or grumble made was concerning climate, and that trait is fully applicable to our home growers, with a great deal more reason or cause, however. From December 1st to February 1st there was not a full day of clear sunshine. In the neighbourhood of London, sunshine during the same period is often reduced to a minimum, and none whatever can be guaranteed for certain.

Three batches of plants were grown at Cornell University, but with the exception of the time for performing the various operations, the treatment was practically very similar in all cases. Plants were procured of the variety Beder Wood, and planted in rich, mellow ground on the 6th May for the purpose of procuring runners. This was admitted to be late, and the planting was followed by a dry season, thus retarding growth. On the 10th July, 2½ in. pots were plunged under the runners intended for the first batch. After being allowed to root for a space of fourteen days, the plants were removed and shifted into 4 in. pots, and the latter transferred to cold frames. This was effected on the 14th July; the next repotting into 5 in. pots on the 8th September; while the final shift into the fruiting pots (6 in.) was

accomplished on the 26th of that month. Sashes were placed over them on the approach of cold weather, but no other protection was furnished till nearly mid-winter, during which time they were allowed to freeze till the soil was perfectly solid. The freezing was not considered in any way essential; but it was assumed that it induced a perfect cessation of growth and therefore rest, which probably added to the vigour and productiveness of the plants. It was expected also that the freezing would kill red spider and other pests. This might apply to the pests in an active state, but we doubt if any impression would be made upon their eggs.

On the 28th of December, the first batch of plants, numbering 450, was taken into a house with a night temperature of 45°; and all the dead leaves were trimmed off. Leaves began to make their appearance on the 6th January, together with some spots of rust, for which they were thoroughly sprayed with ammoniacal carbonate of copper, which arrested the disease. The house was also vapourised with an extract of tobacco to keep insects at bay. By the 1st February the flowers began to open, and on the 9th of the same month the plants were transferred to a house with a night temperature of 65°. They were staged as close as possible to the glass, the house being rather deep and relatively unsuitable for this kind of work. The berries were well coloured by the 6th of March, picking commenced on the 11th, and was continued for about ten days. On being sold in Ithaca they fetched two dollars (8s. 4d.) per quart.

While the plants were coming into bloom the leaves were small and scanty, giving rise to fears whether the foliage would be sufficient to support a full crop of fruit. There was no failure on this score, however, as practical men in this country well know. The pollen was very scanty, especially during sunless and moist weather, but great care was taken to distribute the pollen by artificial means. A soft brush was used to transfer the scanty pollen from the anthers to the stigmas in the centre of the flower. This plan might with great advantage be adopted by all who force Strawberries in Britain. Although the varieties of Strawberries here are usually far better supplied with pollen than in the case of American varieties, yet the much damper atmosphere and the general lack of sunshine are prevailing conditions of our climate that would make the artificial distribution of pollen a paying operation. To insure well-shaped berries, care should be taken that all of the stigmas should be carefully pollinated. As in the case of all other hot-house plants, pollen is always more easily obtainable while the sun is shining and the atmosphere of the house

dry than in dull weather, so that cultivators should act accordingly.

In the case under notice, liquid manure was first applied on the 19th February when the fruits were well set, and twice a week afterwards till the berries were fully developed, that is, full size. The fruit stalks of the variety grown would appear to be uncommonly short, for it was found necessary to do something to keep the berries off the soil to maintain them in a clean condition. The tops of the pots were first covered with sphagnum, but that soon caused damping. Cork dust proved much more satisfactory; but a better plan was hit upon by the use of pieces of fine wire screen which kept the berries clear of the soil and dry at the same time. Forked sticks were sometimes utilised. As a rule the fruit stalks of President, Royal Sovereign, Vicomtesse Hericart de Thury, &c., are long enough to carry the fruits a considerable way over the edges of the pots. The plants of the first batch of Beder Wood carried an average of six uniformly good sized fruits; although the plants set from eight to twelve, about half of them were too small to be of use and were removed. The experimenters think that with larger runners next year and the benefit of last year's experience they could raise the average of large berries to eight on each plant. They also consider it possible to obtain a heavier yield from any given space under glass than in the open air. Eight to twelve pots, occupying two to three square feet of space, would furnish a quart of berries. Even after allowing for walks and other space unavoidably wasted, they reckon that this would furnish fully 400 bushels to the acre. Other points they urge the cultivators to attend are not to allow the plants to become pot-bound till in their fruiting pots; to choose early varieties for early forcing; to devote an entire house to a crop, that is, to one batch; and to grow the plants as close to the glass as possible.

Mr. James Colville, Botanical Gardens, Glasgow, has been appointed head gardener to H. A. Hamilton, Esq., Hampton Hall, Balbriggan, Co. Dublin.—G.

Mr. Peter Matheson, Botanical Gardens, Glasgow, has received the appointment of head gardener to Thomas Reid, Esq., Kilmardenny, near Glasgow. Mr. Matheson is an ardent cultivator of the Chrysanthemum, which he has for many years grown with success.—G.

Mr. W. Elton, Glasgow Botanical Gardens, has been recently appointed as head gardener to Mrs. Reid, Sandyhill House, Settleston. Mr. Elton has been for the last three years the Chrysanthemum grower for the gardens. His skill, enthusiasm, and success in that department is widely known, and requires no praise from us.—G.

Ealing Gardeners' Society.—"How I manage a small Kitchen garden" was the subject that Mr. E. Slade, of Hanwell, an amateur gardener of a vigorous type, set himself to discuss before this society, on the 30th ult. The paper was an excellent compound of theory and practice, of success attained and of difficulties overcome, one of these difficulties—to a busy man—being a want of adequate time to attend to growing crops at the right season. To one who often has to leave home by 7 a.m., and not return till 10 p.m., this drawback it will be admitted, is bad for the garden as well as the gardener. Mr. Slade, however, vigorous though he be, is not devoid of humour, and when he described how all but the very best of garden tools bent or broke before his "push," the meeting realised his ardour and enthusiasm; for "words are women; deeds are men." But much useful and instructive matter was also adduced, which was generously recognised by his professional confederates, who accorded him a very hearty vote of thanks. Mr. C. B. Green presided.

Mr. Leopold Marquard, C.M.G., whose death is reported from the Cape was a prominent figure in the colony where he filled the post of Surveyor General. He spent his life in the Cape Civil Service, but in his spare moments was an enthusiastic collector of Feros. He had grouped together a number of these charming plants in a famous fernery in the garden of his residence, Fern Villa, Orange Street, Cape Town. English visitors were always made specially welcome by Mr. Marquard, who by the way was one of the best chess players in the colony. It is suggested by some of the Cape papers that the collection of Ferns should be acquired by the public.

Death of Mr. James Casey.—We sincerely regret having to announce the death of this well-known and faithful servant of Messrs. Hugh Low & Co., Clapton, with whom he has served for the last thirty-five years. He had been travelling for the firm in the west of England, and caught a severe cold, and being unable to continue his work returned to Upper Clapton, where he died on the 8th inst. His remains were interred on Tuesday last. He was never a strong man, but always stuck manfully to his duty, and his untimely death is regretted by a large circle of friends.

Syndical Chamber of Belgian Horticulturists.—At the ordinary meeting of this society on the 5th inst., Certificates of Merit were awarded to *Oncidium crispum*, and *Cypripedium leeanum giganteum*, both presented by M. le Comte Joseph de Hemptinne; to *Kentia belmoreana*, exhibited by M. Van Wassenhove; and to *Vriesia makoyana*, *Stenorhynchus speciosus maculatus*, *Nepenthes coccinea*, and *Nepenthes atrosanguinea*, all exhibited by M. A. Rigouts. The award to *Vriesia* was given with unanimity; and to the three last-named subjects with acclamation. Certificates for culture and flowering were given to *Ataccia cristata*, shown by M. A. Rigouts; and to *Philica ericoides*, staged by M. E. Bedinghaus, with acclamation. *Cococypselum repens*, shown by M. A. Rigouts, received a Botanical Certificate. A variety of *Cypripedium* shown by M. A. Toeffaert received honourable mention.

Bingley Horticultural Society.—The annual meeting of the members of this society took place in the Excelsior Rooms, Bingley, on the evening of December 1st. The chair was filled by Mr. R. Corner. The balance sheet was presented by the secretary, Mr. F. Bentley, from which it appeared that the receipts for the year totalled £88 11s. 6d., including a balance from last year of £9 13s. 8½d. The expenses were £83 2s. 5½d., thus leaving a balance of £5 9s. 1d. It transpired that there had been a loss on the year's working, but this was due to the fact that the committee had spent more in order to increase the attractions of the show. The balance sheet was passed on the motion of Mr. G. Manfield, seconded by Mr. W. Watts. At the election of officers which ensued, Mr. R. Corner was chosen as chairman, with Mr. W. Watts as vice-chairman, Mr. F. Bentley still continues to discharge the secretarial duties, and Mr. H. Whitaker is the treasurer.

National Chrysanthemum Society.—A meeting of the Floral Committee of this society was held on Monday, December 13th, at the Royal Aquarium. No blooms were submitted. A patent Chrysanthemum pot was submitted by Mr. A. R. Knight, of Ashford, Kent, but it did not find favour with the committee. After a good deal of discussion concerning the fixtures for the meetings of the Floral Committee for next year, it was finally settled that a recommendation should be made to the general committee that the last meetings in December and the last meeting in November should be abandoned. Other recommendations to the general committee were moved and carried: One of the most important of these was one made by Mr. D. B. Crane to the effect "that no variety be certificated as a market variety except a plant be produced to show the habit and freedom of bloom." Mr. W. Mease seconded. Mr. R. Dean proposed, and it was unanimously accepted, "that the Aquarium authorities be asked not to allow the organ to play between 1 and 3 p.m. on committee days." A vote of thanks to Mr. Bevan for presiding, which was moved by Mr. Geo. Gordon, and seconded by Mr. J. H. Witty, brought the gathering to a close.

Trees and the Tides.—A contemporary has discovered a story coming from Italy and reviving an old theory that the sap of living trees ebbs and flows in sympathy with the tides of the ocean. A vine grower in Italy, who is also a chemist, has been experimenting in this direction with his vines, and after fourteen years' experience has come to the conclusion that trees should only be lopped and pruned during the hours of ebb tide. He always acts upon this conclusion, with the result that his fruit trees and Vines have developed splendid foliage and crops, while they are free from the attacks of insects which devastate the trees belonging to other people.

Orchids at the Sale Rooms.—On the 10th inst. a small piece of the true *Lycaste Skinneri alba*, bearing a solitary flower, changed hands for 3½ gs. at the Central Sale Rooms of Messrs. Protheroe & Morris, Cheapside. *Cattleya Schroderae alba* was knocked down at 6½ gs., while *Laelia elegans alba* reached 4 gs. at the fall of the hammer. The two last-named came out of the collection of Mr. P. McArthur, 4, Maida Vale, W. A very handsome variety of *Cattleya Trianaei* was bought for 37s. by Mr. G. E. Day, gardener to H. J. Simonds, Esq., Park Place, Leyton, Essex. It was well worth the money and must form a fine addition to this growing collection. The petals are remarkably broad and crisped at the edges, though pale in colour. The lip has a broad, rounded, much crisped, and rich crimson lamina, constituting the dominating feature of an attractive flower.

Edinburgh Seed Trade.—The assistants held their third annual dinner on the evening of Thursday, 9th inst., in the West End Café, when a company of about one hundred gentlemen sat down, presided over by Mr. W. Mackinnon (Mr. Downie's). After the tables were cleared, an excellent programme was carried through, several professional gentlemen contributing songs in fine style. The employers were strongly represented, and helped in no small measure to make the meeting a great success by taking part in the toast list. The menu and toast list were smartly got up and rather unique in their way, inasmuch as each course to be brought to the table was preceded on the menu card by some appropriate motto. *Sucreries* (sweets) had for their motto "Mysteries of Science," which they generally are. The same plan was followed with the toast list, "The Committee" being described as "A noble band of Martyrs." The curtain to a pleasant evening fell on the singing of "Auld Lang Syne."

Arbroath Chrysanthemum Society.—The annual show of this society was held in the Public Hall, Arbroath on Saturday, the 4th inst. There was a large attendance at the opening ceremony, which was performed with much grace by the Countess of Northesk. Her ladyship was supported on the platform by Mrs. Lindsay Carnegie, Kinblethmont, and Mrs. Grant. The arrangement of the exhibits was on the same lines as in former years, the plants occupied the centre of the hall, and the cut blooms were staged on either side. In the open classes for cut blooms Mr. John Bell, of Forfar asserted his superiority for 24 Japanese. He had amongst a grand lot of flowers exceptionally fine samples of Madame Carnot, Sunflower, Modesto, and Miss Rita Schroeter. Mr. Geo. Black, of Kinblethmont was second. Mr. John Ednie, of Carnoustie House, staged the winning stand of 12 blooms. Mr. J. Ednie was also first for six Japanese. Mr. A. Scott, Roseley, was an easy first for twelve incurves. In the amateurs classes Mr. E. Döhner, Monifieth was very successful. Competition was wonderfully keen in the classes for pot plants. Mr. Geo. Black was awarded premier honours in both sections allotted to plants of Japanese varieties, staging some handsome and well-grown plants. There were some capital collections of fruit staged, the first award going to Mr. A. Scott, with Mr. Geo. Black, and Mr. A. Donaldson as second and third respectively. Amongst the non-competitive exhibits appeared 3 grand stands of cut Chrysanthemums from Mr. Norman Davis, the Vineries, Framfield, Sussex. Messrs. Laird and Sinclair, Nethergate, Dundee had a pretty table of flowering and foliage plants in tasteful array. Messrs. Storrie & Storrie, Castle Street, Dundee, had a large assortment of Palms, Heaths, Ferns, and hardy plants.

"Nord Horticole."—The press of editorial matter and the preparation of the blocks for the December number of our contemporary, *Nord Horticole* have retarded the publication of the number which can now only appear between the 15th and 25th inst.

Death of Mr. Gibson.—We are very sorry to announce the death of Mr. Gibson, an Ayrshire gardener, on Monday morning the 13th inst., at Troon, a little to the north of Ayr, where he was calmly spending the evening of his day after retiring from a long and honourable service. His two sons Mr. James Gibson, of Devonhurst, Chiswick, and Mr. David Gibson of Coombe Cottage, Kingston, arrived on the day of his death just a little too late to see him breathe his last.

Florets of Chrysanthemum Madame Carnot.—The twelve magnificent blooms of this variety shown at the November exhibition of the N. C. S. by Mr. Norman Davis, Framfield, Sussex, created quite a sensation amongst gardeners and all who saw them. Mr. W. Watson, of Kew has been counting the florets in a single head and finds that they reach the astounding number of 1,750. He states that this is eight or nine times the number of florets in a head of the wild type. The bloom with 6 ins. of stalk weighed seven ounces; the longest florets were 7 ins. long. The art of man has truly worked wonders upon the original wilding.

Souvenir of the N.C.S. Autumn Festival.—This is the title of a neat pamphlet of sixteen pages, giving descriptions of all the species and varieties of Conifers and other evergreen subjects utilised in the decoration of the Octagon group of the Ichthemis Guano Co., at the November show of the National Chrysanthemum Society. The plants in question were supplied by Messrs. Laird & Sinclair, Dundee and Monifieth, N.B. Flowering plants, statuary, and electric lighting had to be called in to supplement the general decorations. The leading feature was undoubtedly the Coniferae. A short description of each species and variety employed is given. The frequent use of flowering plants (in the popular sense) in the formation and arrangement of groups comes in time to be somewhat monotonous; while on the other hand, it shows a lack of appreciation of the decorative value of a class of plants that are hardy, easily obtainable, and full of possibilities in the hands of skilful decorators, if such plants are not occasionally utilised. The sight of collections of Conifers first suggested the idea; and the souvenir under notice is simply intended as a reminder of this first attempt to take advantage of their decorative value.

Ealing Gardeners' Society.—Mr. D. Cooper, of Hanger Hill House Gardens, Ealing, was well received by the members of this society on the 7th inst., the subject being some "Notes on Gardening in Paris," which were very interesting and useful as a set-off against our own performances in this country. Mr. Cooper considered the French people were much in advance of us in many respects, which was probably due, in a large measure, to the splendid climate which they enjoyed. Mr. Cooper was fortunately able to visit private as well as public parks and gardens, and the admirable way in which these were managed was not a little gratifying to the visitor. What seemed to impress Mr. Cooper principally was the enormous number of plants, such as Begonias, Cannas, and even stove plants, that are used for effective display in the flower garden. At Baron Alfonse de Rothschild's beautiful Chateau de Ferrieres, for instance, all phases of gardening are carried out with the most brilliant success. The park is one of the finest in Europe, while the gardens and pleasure grounds are so extensive that they require about 200 hands to keep them in order. There are something like sixty glasshouses, and an equally large number of frames. This will give some idea of the size and quality of the estate which Mr. Cooper visited, as well as other matters which we are unable to find room for. On the motion of the Chairman, Mr. C. B. Green, Mr. Cooper received a very hearty vote of thanks. A special exhibition was also held for a "Small group of plants arranged for effect, 5 ft. by 3 ft., to be staged in a semi-circle." The result was very pleasing and artistic, the prizes being awarded to Messrs. C. Long, R. Green, H. Holloway, and G. Woods.

In the Palmhouse at Kew.—Nurse girl: "Look, look, Bobby, don't you see a Rose on that Palm." Bobby (gazing roofwards): "No." Nurse girl: "Can yer smell it then?" Bobby: "No, Jane; my nose aint long enough."

The Scilly Islands.—It is stated that the flower crops from which the Scilly Islanders reap so large a share of their revenue are not so early or promising as they were last year at this time. Last season was a record season, however, and thus any comparison between this year and last is hard upon the present one. Good prices may, perhaps, console the growers for a slight decrease in quantity of productions. Much has been done of late years by the Great Western and North Western Railways to develop the industry. New markets in the north of the kingdom have been opened up by an improved service of fast trains from the shipping ports, and flowers leaving the Scilly Islands in the forenoon of one day are in Aberdeen by the evening of the next day—not at all a bad journey.

The late Mr. David McEwen. — On Wednesday, the 24th ult., there were laid to rest in the family vault at St. Mark's Churchyard, Lakenham, the mortal remains of the late Mr. David McEwen, who for the past twenty-nine years carried on a business as florist and seedsman in Red Lion Street, Norwich. The deceased gentleman first started his business career with the late firm of Mackie & Ewing, and some time afterwards joined Mr. Ewing, seedsman, of Exchange Street, and later on taking over the management. He stayed with that firm for upwards of twenty-two years, gaining the respect of both employer and employed, whilst his qualifications as a business man were shown by the firm's numerous customers. On Mr. McEwen leaving this firm he was the recipient of a handsome testimonial in acknowledgment of the long and honoured services he had rendered. The deceased, who was in his 79th year when he died, was known far and near as an authority on horticultural seeds. His genial countenance as he leaned over his shop counter giving his advice to his numerous customers will be missed, as will also his familiar figure as each morning he indulged in a walk round Chapel-field Gardens. It may be added that letters from all parts of the country are being received from friends and customers, condoling with those who are left behind, and testifying to the esteem in which the departed was held as a citizen and a tradesman.

Fruit-growing at the Cape.—Professor McOwan the government hotanist at the Cape, has written a paper upon this subject, which appears in a recent issue of the *Kew Bulletin*. The *African Critic* comments upon the substance of the essay in most favourable terms, and speaks of it as being couched in vigorous and definite language, and that it amounts to a strong and well-reasoned appeal to English gardeners to go out to the Cape and develop the fruit trade. The Professor indeed pleads earnestly for "some gardening missionary to come over and teach us a gospel of better things," for he is disgusted with the way fruit culture is carried on. The ordinary market is supplied with coarse fruit of very inferior quality, and if you want good fruit it can only be obtained from the farmer as a favour. There are at the present moment, continues Professor McOwan, exceptional openings for enterprise in various branches of culture. The only element required is an increase in the number of intelligent and practised growers. Says he, "We want them from England, from the States, from California, in fact from every place where the skill and experience required has run for years into every day practice. This is the immigration wanted just now at the Cape, to catch at the opportunity of the moment and to turn skilled fruit-growing into gold. There is no question that success awaits the man who knows how to deal with fruit trees, to break his ground up properly, to drain, to prune, to gather, to pack for market up country or for market in Covent Garden, and who has the well-founded contempt for the slovenly style of letting things grow themselves, and taking as a crop what chance sends and insect plagues leave." If all intending settlers in the Colony carefully study and follow Professor McOwan's advice as to preventable scourges, and thoroughly spy out the country before settling down, there is nothing, humanly speaking, to prevent them revolutionising the Cape fruit trade.

The Orange is said to possess three distinct odours, one given off by the flowers, another by the leaves, and the third by the rind.

Mr. J. M. Wood, Durban.—The *African Critic* says that "Durban is the only town in South Africa possessing Botanic Gardens of any size, and to the curator (Mr. J. M. Wood, A.L.S.), Kew Gardens are indebted for many valuable collections. In the latest volume of "Flora Capensis" a cordial reference to this fact is made. Mr. Wood's investigations into the flora of Natal are being prosecuted with much skill and success.

ORCHID NOTES & GLEANINGS.

BY THE EDITOR.

Cypripedium Mrs. Plimmer, *Hyb. Nov.*—The seed parent of this hybrid was *C. nitens*, itself a hybrid, and *C. villosum* Boxallii. As far as we have been able to ascertain this cross has not hitherto been effected. The nearest to it was the crossing of *C. nitens* Sallieri with *C. villosum* aureum. The dorsal sepal of *C. Mrs. Plimmer* is oblong, and apple-green, blotched with violet-black, except at the apex, which is white and marked with a cluster of violet blotches. The upper longitudinal half of the petals is of a shining brown, while the corresponding lower half is pale and finely spotted, showing the influence of *C. villosum* Boxallii, all the rest being due to the potency of *C. nitens*. The light brown lip is like that of the latter very nearly. The hybrid was raised by Mr. P. McArthur, 4, Maida Vale, London, W., and is named in compliment to Mrs. Plimmer, of the Woodlands.

FASHIONABLE FLOWERS IN THE NORTH.

By reason of the increased demand by most proprietors of gardens for cut flowers, cultivators are often driven to expedients as how to supply the demand. The species which have increased most are to be found among Carnations, Roses, and herbaceous plants generally. Many years ago these figured largely in the then prevailing fashion, but the hedding mania ruthlessly thrust them aside.

It would be difficult now to find a garden in Scotland of any pretensions where the species indicated are not well represented. Long borders and gardens specially formed may be seen filled with hundreds and thousands of them. While visiting some of these gardens not long ago, I noted excellent displays of flowers for use, while the adornment of patterns was not neglected. At Balhirmie, Fifeshire, some borders of Carnations were dazzling, and though so many were cut during each week they were scarcely missed. From June to November the display continues, and the great breadth of herbaceous plants gives a continuous supply of choice flowers from spring to winter.

The lines of pits at this attractive place filled with tree Carnations give indication of the demand, which Mr. Henderson, the able gardener, meets with great success. It may be noted that indoor flowers are largely grown. Stove plants, Orchids, and Camellias indicate that skill and good taste are much in evidence. The last-named are planted out, and the healthy growth with abundance of flower-buds, show that these old favourites are not underrated at Balhirmie. To succeed the Chrysanthemums they are still much valued. A grower, for sale, lately told me that Camellias in winter were the most profitable branch of his extensive establishment.

The Carnation mania has spread well throughout Fifeshire, and is still on the increase in the North. In old nurseries they are extensively cultivated, and new ones are rising up in nearly every district. For example, at Redbraes, Messrs. Grieve & Sons are increasing their stock of Carnations at a rapid pace. I recently visited their grounds, and noted the large breadth of Carnations and Pansies, which are specialities.

Many choice varieties have recently been raised from seed. Among the choicest of them are Nellie Cooper, white and pink; Mary A. Grieve, deep salmon; Aurora, scarlet; Nellie, a rose-edged Picotee; Gertie Smith, creamy and white; Miss Leslie, deep pink; Napoleon, bright scarlet; The

Clown, scarlet bizarre; Ceres, cerise; Laurie Wood, apricot; Luciter, bright scarlet; Nero, Maroon; Princess Olga, fine pink; and Malcolm, silvery-pink. But though these are of much excellence, the large stock of older sorts cannot be set at naught. It would almost appear that these beautiful flowers have nearly approached their highest stage of perfection.

The new forms of Pansies at Redbraes are strongly in evidence. For early and late decorative purposes they can hardly be surpassed.—*M. T., Carron, N.B.*

FREESIAS.

THE beautiful and delicately-scented Freesias have been greatly in evidence in the leading gardens in Scotland for some years, and the popularity of them seems to be on the increase, ranking with such favourites as Roman Hyacinths, Lily of the Valley, and Cyclamens. In reply to "Flora," p. 238, I may say that many fail to obtain the best results by unduly forcing the bulbs in their early stages, withholding air, and often keeping them too far from the light. Under these conditions they grow up weakly and the flowers are worthless.

It is better to pot the bulbs early (say in August), when they are expected to flower at Christmas, and little forcing may be necessary. Our plants now (Dec. 11th) are throwing up their flowers. They were potted about the middle of August, placed in a pit near to the glass, kept close till growth commenced, and then air was freely admitted. Watering with care from the first has much to do with successful flowering. Little water is given till the roots are active, and then an abundance is supplied. Stagnant moisture is bad for roots and foliage. When the flowers are forming, liquid manure is given occasionally, but not strong. We drain the pots moderately, placing a little moss over the crocks, over which is sprinkled a pinch of soot. This prevents worms from injuring the drainage, and the roots run freely in it. Turfy loam, leaf mould, a sprinkling of sand, and some bone-meal suit Freesias admirably. A 5 in pot, with six or seven bulbs planted regularly over the surface, with the crowns just above the soil, is the general method of planting. Some place each bulb in a little sand. If the soil is heavy and close, this is an advantage.

Three successions, for flowering from January till spring, are necessary, and planting for the latest may be done in October. I have never had bulbs which I have saved by ripening them do so well as those which have been imported.—*M. T., Carron, N.B.*

PEOPLE WE HAVE MET.

MR. J. FRASER SMITH.

THE subject of the accompanying portrait is a native of Aberdeenshire, having been brought up on Deeside. Mr. J. Fraser Smith commenced his gardening career in 1864 at Crathes Castle, the seat of Sir Thomas Burnett, Bart, under the then gardener, Mr. Littlejohn, who succeeded the father of Mr. A. F. Barron, of Chiswick. Mr. Barron's father, it may be remarked, did much to establish the renown of this famous old place, where many a notable gardener commenced his career, including Mr. A. F. Barron himself, Mr. J. Smith, of Mentmore and Mr. J. Fraser Smith.

After serving his apprenticeship at Crathes Castle, the subject of this sketch went to Oxenford Castle, Midlothian, the seat of the Earl of Stair, under the late Mr. Anderson, who was an excellent gardener to instil a knowledge of the profession into the minds of his pupils, and a first-class hardy fruit grower to boot. Here Mr. Fraser Smith stayed for a couple of years, after which he went to that veteran in horticulture, Mr. Lunt, of Ardgowan, Renfrewshire, on the Firth of Clyde, where, in the inside fruit department, he had a grand opportunity of seeing fruit well done under glass.

Having a desire to get further south he got a recommendation to Messrs. J. Veitch & Sons, Chelsea, from whence, after a short time, he was sent as plant foreman to Abernant, South Wales, in the palmy days of that establishment. Returning to Messrs. J. Veitch & Sons, he was next sent as foreman to Shoreham Place, Kent, which at that time was famed for its collection of Orchids. Ever since then Mr. Fraser Smith has always had a great fancy for that class of plants.

His next move was to the Alexandra Park, Muswell Hill, London, at a time when the Palace was being rebuilt after the great fire, and the park laid out by Mr. McKenzie. Here he had every scope for seeing a great variety of landscape work carried out; while at the same time he had even greater facilities for adding to his knowledge in the

MR. J. FRASER SMITH.

glass department. He had charge of the conservatory at the place while the large Palms were being planted. From the Alexandra Palace he journeyed to the far north to lay out and remodel the grounds of Colonel Lumsden, Pitcaple Castle, Aberdeenshire, just where the waters of the classic Gady Burn and the Ury unite before running on to the River Don. He stayed at Pitcaple Castle for three years, at the end of which time he was offered an appointment as head gardener to the Earl of Crawford and Balcarres, Dunecht, Aberdeenshire, from whence the sound of the time gun used to travel for many miles in every direction, informing us and many another gardener of the correct Greenwich time.

While at Dunecht, Mr. Fraser Smith had the privilege of exhibiting, and was a familiar figure at the shows of the Royal Horticultural Society of Aberdeen, where he was much respected and esteemed by a wide circle of friends, who enjoyed his fellowship and courtesy. Here we first made his acquaintance in the Jubilee year, breaking the ice of acquaintanceship over some well-grown and flowered specimens of his favourite Orchids. He presided over the welfare of the gardens at Dunecht for a period of eleven years, until the heart of the place was broken, so to speak, over that scandalous affair, the miserable "Dunecht Mystery."

Since then, however, he has been fortunate in obtaining the appointment as gardener to the Countess Dowager of Seafield, Cullen House, Cullen, N.B., which position he has now held for nine years, to the great satisfaction of all concerned. The Countess Dowager of Seafield is a kind-hearted and most considerate employer; and has a great love for her gardens and plants, especially Orchids. In her gardener she has a man who fully understands every detail of culture in this northern latitude, and she is perfectly cognisant of the fact.

Cullen House is almost on the verge of the northern coast of Banffshire, and within the genial influence of the Moray Firth, so that plants and fruits in the gardens do remarkably well. Peaches, and even Figs ripen on the open walls.

We had the pleasure of again meeting Mr. J. Fraser Smith at the Chrysanthemum show of the Scottish Horticultural Association, Edinburgh; where he acted in the capacity of judge. The same thing occurred at Dundee and Aberdeen during the succeeding week, where similar attractions made the rendezvous identical. Although no longer an exhibitor, the subject of the most recent addition to our portrait gallery continues to assist horticultural

societies in various ways, his services and genial presence being much in request.

PLANTS RECENTLY CERTIFICATED.

At the meeting of the Floral Committee of the N.C.S. at the Aquarium on the 7th inst., the following awards were made.

MISS PHYLLIS FOWLER.—A fine, new, yellow incurved form of great size with large and massive flowers. In build and style it resembles C. H. Curtis, F.C.C. Mr. T. Robinson, gardener to Watkins Laurence, Esq., Elmsfield House, Hollingbourne.

MRS. M. SIMPSON.—A large white Japanese variety which is not unlike Niveus in general appearance, but with narrower florets, and later. Commended, Mr. N. Molyneux, gardener to J. C. Garnier, Esq., Rooksbury Park, Fareham, Hants.

RED L. CANNING.—This is not as the name would suggest, a sport from the well known late white Japanese, L. Canning, but is a seedling. It was commended on this occasion as a market variety. The plant is apparently very floriferous and about 3 ft. in height. The flowers exhibit a bright shade of chestnut-red, and should prove useful for late cutting. Mr. A. Felgate, the Gardens, Burhill, Walton-on-Thames.

SUTTON'S AMATEUR'S GUIDE FOR 1898.

IN the celebration of Her Majesty's Diamond Jubilee horticulture was prominently represented, and of this we are reminded by a remarkable picture which appears in Sutton's Amateur's Guide for the coming season. The magnificent Temple Show held by the Royal Horticultural Society in May last was visited by several members of the Royal Family. The picture of this event by a well-known artist, has been secured by Messrs. Sutton, and a splendid reproduction is now issued with their Annual for 1898.

At the special show and conference arranged by the Royal Horticultural Society at the Crystal Palace in honour of Her Majesty's Reign, Mr. Arthur W. Sutton delivered a lecture on the "Progress of Vegetable Cultivation during the Victorian Era." We are glad to observe that the great Reading firm offer to place a copy of that lecture at the disposal of their customers who may express a wish to receive it.

The improvements achieved in two most important departments of horticulture have been continuously illustrated in successive annual issues of Sutton's Amateur's Guide. The types of vegetables originated and distributed by the Sutton's are not only distinguished by the primary requisite of high utility as food for man, but they also possess in a marked degree the qualities which ensure success on the exhibition stage.

Equally striking has been the development in flowers raised from seeds, and of this fact abundant evidence will be found in the singularly beautiful illustrations which adorn the pages of the new edition of Sutton's Guide in Horticulture. As usual, the work is full of information adapted to meet the requirements of amateurs and to serve as reminders to those who are masters in the profession of gardening.

The illustrations have chiefly been prepared from photographs, and not only maintain their high character of former years for clearly defined outline and life-like representation, but far surpass those that took us by surprise a few years ago, when the result of an accident forced the Messrs. Sutton to adopt them as a makeshift for the coloured plates of previous years. The power of photography to illustrate the products of the garden came suddenly as an eye-opener. The days of the chromolith for the representation of either flowers or vegetables are to all intents numbered both in this country and in America. In the present instance we scarcely know whether most to admire the photographic reproductions of flowers or vegetables, both classes of garden products being most excellently represented and true to nature.

Numerous varieties of Sutton's garden Peas are shown, including novelties for 1898. The same may be said of Potatoes, amongst which we note a full-page illustration of Sutton's Ideal, the promis-

ing and handsome looking Potato we recorded at the November show of the National Chrysanthemum Society. Such lumpy and solid things as Carrots, Beet, Cauliflower, Onions, even a field of Onions, Cabbages, Lettuce, Tomatos, &c., come out with a clearness of light and shade that speaks volumes for the progress of the art of photography within the last decade.

Excepting in the matter of colour, the double tuberous-rooted Begonia represented on p. 105, is as natural as life. No less excellent are Sutton's Calceolarias, Cinerarias, Cyclamen, Hollyhocks, Primulas, and various other popular and useful flowers.

CHRYSANTHEMUM SHOWS.

SEEING the shows are over and the excitement is on the wane for another year, we might well ask ourselves what are the lessons we have learned from them.

About the first is how much better large blooms of the Chrysanthemum look, exhibited in vases than on boards. With nine or a dozen blooms in a large vase as exhibited by some of our large trade growers, there is no comparison between it (for effect) and a dozen arranged on a board in the orthodox fashion.

Three in a vase (the number often asked for in the schedules for competition) have a meagre appearance, and the vases usually supplied are too small, giving the exhibits in this section a painfully top-heavy appearance. To increase, however, the size of the vase would accentuate the meagre appearance of the three blooms; but if nine or a dozen were asked for, larger vases could be used and the effect would be much better. The exhibitors should only be asked to fill one or two vases, so that they would not have to provide more blooms than formerly; and that each vase should contain only one variety as at present. This, of itself, is a great advance on the plum-pudding appearance of the boards with their dots of colour here and there. If this form of competition was adopted competitors would not require to grow so many varieties, which would help to reduce the far too numerous varieties that are in cultivation—particularly those with weak peduncles, which are of little use for decorative work.

Another lesson which is rapidly being learned by growers within the smoke radius of large cities is that their flowers have neither the brilliancy of colour, nor the size, of those grown in the pure air and bright sunshine of the country. This is most marked when the plants are grown to produce the largest flowers possible; but grown in an ordinary way for conservatory decoration, or cut flowers, it is not so marked; in fact grown in this way it makes a good city plant, and no other could take its place.

Seeing that the production of large blooms is not so easy in the city as in the country, growers in the city would meet their opponents from the country on a fairer field if they would confine their attention to the growing of plants as specimens, or for artistic grouping, or cut flowers (not disbudded). Another fact the most casual observer must have noticed, that size is the main consideration in judging Chrysanthemum blooms. It might be urged that they must be true to type in form and colour, but that does not, and cannot receive much attention in the Japanese section. It contains so many varieties, each differing more or less from its neighbour in form or colour, or both, that it is impossible for one man to carry them all in his mind, and have them ready at a moment's notice when he is called upon to give a decision at a public exhibition. So he falls back on the easy and popular rule of giving the prize to the largest blooms; and growers knowing this try to put as much cloth into them as possible.

For example, take the well known variety G. C. Schwabe, which is just at its prettiest before the florets begin to reflex; but because the reflexing of the florets makes it look a little bigger, if Nature has not done it herself, it is done for her artificially. Mr. Davis in his splendid exhibit at Dundee, showed G. C. Schwabe with all the petals incurved, and it looked ever so much better than with one-half incurved and the other half reflexed. This is an instance of the destruction of beauty for the sake of size, and beauty is sacrificed in every case if size is to be obtained.

Another fact worthy of note is that the public takes more interest in artistic groups of plants or

cut flowers than in the big leafless bruisers on the green boards. This is not to be wondered at, as flowers half the size are usually prettier, and the public cannot be expected to take the same interest in the race for size that goes on amongst those smitten with the 'Mum fever.—'Mum.

LEAVES FROM MY NOTE BOOK.

MONTBRETIAS.

THIS really charming and most desirable class of hardy plants is being much sought after, both for hardy flower competitions and more especially for decorative purposes, for which they have few equals, lasting as they do a long time both in a growing and cut state. Many fine varieties are now finding their way into gardens, where for many years old M. Pottsii and M. crocosmiaeflora long held the sway. The following are of recent introduction, and are all good:—Aurea Imperialis, orange-scarlet, grand spikes; Eciantant, fiery-scarlet, with yellow throat; Etincelant, clear scarlet, with sulphur throat; Etoile d'Or, yellow self; Lustre, orange-yellow throat, slightly maculated; Morgenlicht, golden-yellow, very large; Transcendent, orange-vermillion, with large yellow throat; and Turban, golden-yellow, with maculated throat. The latter is the largest of all I have yet seen. I measured a bloom and found it three inches across; it is also of good form and robust.

Vulcan is yellow maculated purple, and is also a very fine variety. Crocosmiaeflora fl. pl. and Pottsii fl. pl. are the only double sorts I know; in fact, I think they are the only two doubles yet in commerce. Both are well worthy of a place in every garden, and no collection of Montbretia can be considered complete without them.—Coilla.

A REMARKABLE WEEPING ASH TREE.

STROLLING with a friend on the night of the 20th October through the rural hamlet of Aberford, a few miles north of Leeds, I was buttonholed by my companion remarking "There is a tree"—pointing over the way—"I wish you could see it before you take leave of us to-morrow. Probably there is not another like it in Yorkshire." The opportunity was too good to be missed. I decided, if possible, on the morrow to see it.

Fortunately the trap where I was staying was going to Garforth, and I was dropped *en route* at Bridge House, the residence of George Whitehouse, Esq., in whose limited grounds the tree is. I must say that in no way has my friend's report been exaggerated; for it is an object well worth the trouble of seeing by any arboriculturist and admirer of peculiar and artificial productions. I am not aware of any similar tree, nor have read of any one describing it. If so, let us have them please, in THE GARDENING WORLD. We often see the branches of weepers propped up and trained outwards, consequently covering a large area of ground Banyan-fashion.

Immediately the visitor arrives in front of the house, two archways of greenery, 8 ft. in height, at a distance of several yards apart, confront him. Entering the one on the left, a 4 ft. path winds its sweeping way, under the covered canopy for upward of thirty yards, leading into the grounds and a small greenhouse beyond.

Retracing our steps under crossarchways we came into the other principal walk, which is about twenty-eight yards, and returns us to the front again.

The tree, I was informed, is about sixty years old, and is in vigorous health; but latterly appears to have been neglected, or the sylvan shades might have been considerably extended.

Standing midway in an oblong plot, the trunk is over 6 ft. in girth, and about 8 ft. high up to the union with the graft. Its four branches average over 3 ft. each in girth, and are trained on the apex of the arches, two each diverging in opposite directions, north and south. All spaces are kept clear between the arches so as to give plenty of light and air. The side laterals from the main branches, as a matter of course, fall clear and gracefully to the ground, and are both regular and dense throughout. Thus has it been in the power of the proprietor and cultivator to modify the tree to their own liking, and the process has been both interesting and a decided success.—*B. Lockwood, Lindley, October 28th.*

FRUIT UNDER GLASS.

THIS is a busy time of the year in the fruit houses for there is the pruning, clearing up, and cleaning of the trees preparatory to another season's growth. Not infrequently, too, the work is much hindered by the houses being choked up with plants of various kinds, these having to be shifted about from one house to another as the work of cleaning goes on.

VINES—The fine October worked wonders with the wood, for in most cases well ripened growths are the rule, and badly ripened ones the exception. There is nothing to gain by waiting, and, therefore, the pruning should be at once seen to. In most establishments where mealy bug is a big pest it is the custom to remove a good deal of the loose bark from the canes with a view to getting rid of the bug at the same time. If carefully done so as not to expose the delicate inner bark, this stripping does not hurt the Vines to any appreciable degree, although there is no doubt that it can be overdone. The houses will need to be well washed, after which the eyes in the iron supports through which the wires pass, and other nooks and crannies in the house should be brushed over with neat petroleum, so as to effect the complete dislodgement of the bug. The canes themselves should be washed twice or thrice with a fairly strong solution of Gishurst Compound, than which nothing is more effective as a cleanser. To complete the work the canes may be painted with a mixture composed of clay, dried and ground to a fine powder, and Gishurst Compound, mixed with warm water until it is of the consistency of thick paint. The canes when dry may then be loosely looped up to the wires for the present. It will be of no use to tie them up properly, as when forcing commences they will have to be bent down to insure equable breaking all along the cane.

After this, the borders must receive attention. The top layer of loose soil may be carefully scraped off, taking care, meanwhile, not to injure any of the roots that may be near the surface. A dressing some 2 in. or 3 in. deep of good loam may then be introduced and spread evenly over. Keep the house as cool as possible until the time has arrived to start it into growth.

RENEWING OLD VINES.—Where the canes have become old and well-nigh worn out, so that the size of the berries and general quality of the fruit has reached a low point, the problem presents itself of how to turn these old vines into young vigorous ones. Of course, the direct method is to root the old ones out, remake the border, if it appear to be necessary, and plant again. In some cases, however, a half-way course may be adopted with excellent results. This is to head the old canes back, and allow them to break away and make fresh canes. The old canes should be cut off to within 3 ft. of the ground, and a strong shoot taken up from, say a foot or 18 in. below this point. Having the advantage of being attached to an extensive root system, the young shoots make great headway, and almost invariably develop into strong, stout canes that may be fruited the second year.

OUTSIDE BORDERS FOR VINES.—In cases where houses that are to be started early, have outside borders, it will be advisable to protect them from deluges of cold rain or heavy downfalls of snow. A good covering of stable litter may be given, and some boards, sheets of galvanised iron, or other material calculated to throw off the rain laid over. The earliest houses should, if possible, have the borders under cover.

FIGS.—See to the pruning and cleaning of these as soon as possible, for nothing is to be gained by keeping Figs back for too long. In pruning, remove the weakest and most ill-ripened shoots, leaving those that have plump and well-matured points. Spread these evenly over the area covered by the tree, so that next season the whole of the wall may be evenly covered with foliage. The cleaning of Fig trees is sometimes a lengthy job, owing to the tenacity with which scale sticks. A good washing with Gishurst Compound, and a painting with the same composition employed for the Vines will, however, soon put matters right. In tying, see that the ties are not made too tight, for the younger branches will swell considerably next year, and if plenty of room is not allowed for this, they are apt to be strangled.—*A. S. G.*

HINTS FOR AMATEURS.

THE GREENHOUSE.

Malmalson Carnations.—Where the young layers were lifted and potted off singly into sixty-size pots about the middle of September they will not need to be disturbed again through the winter. For the present, therefore, they should be kept quiet. No great amount of growth will be made, but an endeavour should be made to keep the colour in the foliage that they already possess. Young plants of this kind will stand a good deal more than older ones which have been enfeebled by flowering, and are feeling the after effects of the heavy feeding given to make them produce good flowers. Stand the plants all together—they may be placed nearly pot thick—and look after them very carefully for water. Very little water will be required, but watch should always be kept to see that none is allowed to fall and remain in the axils of the leaves, which are like so many little cups for retaining moisture. If moss grows on the surface of the soil in the pots it should be picked off, and the surface soil loosened slightly at the same time. This is well worth doing if only for the look of the thing, but it has a greater advantage in that it helps to prevent stagnation of the soil in the pots, and thus keeps the roots in a sweeter, and more healthy condition.

Ericas.—While they are not exactly difficult to grow, the pretty Cape Heaths will not stand a great deal of knocking about. The beauty of such forms *E. hyemalis*, *E. h. alba*, *E. Cavendishii*, *E. gracilis*, and *E. wilmoreana*, is however, a very strong inducement to the amateur to make an attempt at growing them. The chief point in dealing with Heaths is to know when to give water. Once let such fine rooted plants as they are get dry, and they might almost as well be thrown away at once, for they very seldom recover from the shock. Even through the winter months therefore they must never be allowed to get dry. The common practice of tapping the pots, so extensively used to find out whether in the case of other plants they need water or not, will not answer for Ericas, for by the time that the pots emit a hollow sound under the rapping the balls of the plants are dust dry. The only reliable plan is to "weigh" the pots in the hands, when a little practice will soon enable the operator to tell whether water is required or not.

Ericas are very susceptible to the ill effects of cold draughts, which cause mildew. They should, therefore not be placed close to the door or any ventilator that is constantly being opened.

Epacris are charming plants for the amateur. They are fairly easy to grow, and invariably give an excellent return in bloom for the labour expended on them. A warm greenhouse is the best place for them, but if they are properly looked after they will do very well in a house containing such a mixed lot of plants as we are considering.

Basket Plants.—Not only is it a great set off to a house to have a few plants suspended in baskets from various parts of the roof, but the room on the stages thus set at liberty is of great importance. The heaviest plants should be suspended from the centre of the house, or from the strongest supports only, whilst the lighter rafters will be large enough to support the smaller plants. Of the heavy plants we may mention such subjects as *Asplenium bulbiferum*, and its varieties, and *A. fabianum*, which do exceedingly well when treated in this way, provided they are supplied with enough moisture, and moreover, look exceedingly graceful.

Sibthorpia europaea variegata.—This pretty little plant is a great favourite with many, but we usually find it looking rather miserable between the beginning of November, and the beginning of March. The points of the shoots damp off, and the mischief does not end here, for the damp finds its way among the foliage, and the result is that by spring the plants present a very sorry and forlorn appearance. All this may to a great extent be avoided, and the appearance of the house improved at the same time by suspending the pots from the roof. They then escape the damp, and look as fresh and trim at the end of the winter as at the beginning.

Hyacinths.—By this time all the Hyacinths which were potted up during the autumn, and were plunged out-of-doors in the usual way have made a fair

amount of roots, and should now be removed under shelter. A little freezing would not hurt the bulbs themselves, otherwise those planted in the open ground would come badly off, but the bulbs in the pots have reached a more advanced stage than their relatives outside. It will be well, therefore, to put them in a place where they can be easily got at when required. If no other place offers they may be dotted about among the other plants in the greenhouse—there is generally room for a row of them between the back row of large plants, and the side lights of the house. Any vacant shelf space that there may be may also be filled with them, but this should only be when other more delicate things have been properly attended to.

Under the Stage.—This forms a snug retreat for all sorts of plants that are in a state of more or less complete rest, and is in fact a storehouse in itself. We have been amused more than once by a peep at this part of an amateur's greenhouse. The collection of occupants is usually very extensive, for in addition to the various subjects that may legitimately find a place there, many people seem to consider it as a most suitable place for stowing away dead or dying plants which the trump of spring will never wake into life again. Gloxinias and tuberous Begonias may be placed here with perfect safety. Lay the pots on their sides in such a fashion that the water running from the plants on the stage overhead may not wet the soil.

Cannas.—Besides those plants which are grown in pots the Canna has come to be recognised as a legitimate and useful subject wherewith to adorn the flower garden during summer. The rootstocks require to be lifted from the open and stored away for the winter, and here again the usefulness of the understage space in the greenhouse is further manifested. Lay the rootstocks in shallow boxes, with a label bearing the name firmly attached to each—that is if the plants have names—and cover them over lightly with sand or cocoanut fibre refuse, the latter being preferable. The boxes should be covered with a few boards or slates to keep the water out, otherwise the rootstocks will be liable to rot.

Chinese Primulas.—If there is a warm corner of the house these should have it, but they must also receive plenty of light. We often see the plants distributed in rows down each side of the house. The plants do not then get a proper chance, and, besides, the effect they produce is somewhat stiff and formal. It is a far better plan to make a group of the plants in a corner of the house, for the effect is better, and proper attention may then more easily be given them.

Winter-Flowering Zonal Pelargoniums are at this season surpassingly useful. Good plants which were looked after well for disbudding and stopping in the summer and early part of the autumn are now full of flower where the buds were allowed to come on from about the beginning of October. There is consequently a good deal of strain upon the plants, and they must be treated liberally with stimulants to keep them going. We have found Clay's Fertiliser a most useful and safe manure, but prefer dissolving it in the water rather than to apply it in the powder form. Notes should be made as to the varieties that do best in the special locality. Generally speaking, the single-flowered sorts are rather safer investments than the doubles for winter work since the flowers do not damp off so readily, but there some exceptions to this rule, and experience is the only way to find them out. As soon as decaying petals are observed they should be picked out, for the beauty of the flower may often be thus preserved for sometime.

Cyclamen.—In a house of a temperature such as we have been discussing a warm corner should be given to the Cyclamen. Even then the heat will not be sufficient to develop the beauty of the plants to the full, since to do that they require a temperature of from 5° to 10° higher. However, if the plants have been seen to properly during the summer they will do fairly well in a mixed greenhouse. Shield them carefully from draughts, which, above all, have a tendency to stunt and spoil the flowers. As with the Cinerarias and Primulas, it will be wise to group the plants together. If the stage is a trellis of woodwork it will be well to cover it with slates, thin boards, or something of the kind, to enable a layer of ashes to be put on. This simple precaution is often of immense service, and neglect of it, not infrequently,

the cause of comparative failure, for Cyclamens do not like to be stood on a bare, dry, wooden rack.—*Rex.*

Correspondence.

Questions asked by amateurs on any subject pertaining to gardens or gardening will be answered on this page. Anyone may give additional or more explanatory answers to questions that have already appeared. Those who desire their communications to appear on this page should write "Amateurs' Page" on the top of their letters.

Chrysanthemums.—I have some Chrysanthemums which have been nipped with the frost. Would it injure them at all to cut them down and repot the roots, as I want to make room for other plants in the greenhouse?—*H. B.*

Cut your plants down at once, and pot up the roots if necessary, it will not harm them in the slightest. If the plants are already in pots, however, no repotting will be wanted.

Old Chrysanthemums.—*J. H.*: If you want the pots that the Chrysanthemums are now in, you may turn the plants out of them at once. This may be done without disturbing the balls. Place the latter close together and lay a little old soil round them just enough to cover the roots. You will then get cuttings in plenty, for the plants will throw up the young shoots just as freely as if they had been left in the pots.

Pruning a Passiflora.—*C. F.* has a large plant of *Passiflora caerulea* in a cool house, and wants to know what pruning it will require.

If the plant is a young one, the stoutest and best branches should be left to increase the spread, but all the small side growths should be spurred back. Next year, young growths will break away from the bases of these spurs, and will soon cover the wall thickly. The young branches may, for the present, be left at about two-thirds their length, cutting off the small and more unripe portions. These simple rules should be followed without difficulty.

Peach-tree Gumming.—*C. Chartres*: From the description you give of the tree it is in a hopeless condition. You might cut out the affected branches, but you would not then be able to get a decently shaped tree, even supposing the knife got rid of the gumming. You will do better to root the old tree out; remake the border if necessary, and plant another tree.

Figs.—Figs can be grown out of doors successfully in the southern counties, *F. E. Faulkner*, and the fruit ripens fairly well in favourable summers. Now and again a very severe winter will kill a lot of the wood. This was the case in the winter of 1890-91, but such winters are happily few and far between with us. Even when most of the branches are killed with frost, fresh growths are thrown up from the roots during the succeeding summer.

Pteris cretica nobilis is the name of the Fern you send, *Cardross*. It will do well in a warm greenhouse.

Making a Rose Border.—*S. Langholt*: Please consult the answer to *Reader* on p. 200 of the issue of THE GARDENING WORLD for November 27th. You will there obtain the information you require.

Clerodendron fallax.—*Y.*: The reason of the flowers and leaves dropping from the plants is that the temperature of your house is too low. The fruits will ripen if you remove the plants at once to a warm house or pit. Meanwhile, keep the plants a good deal drier at the root than you have been doing.

Berried Plants for Christmas.—*Noel*: There is quite a number of berried plants available for Christmas. In addition to the hardy Holly we may mention such subjects as *Pernettya mucronata* and its various varieties, and *Skimmia japonica*. Pot plants of the Evergreen Thorn, *Crataegus Pyracantha*, are also very useful for decorative purposes. The berried Solanums, *S. Capsicastrum*, and *S. Pseudo-Capsicum* are likewise very handsome. The stove plants *Ardisia crenulata* and *A. c. alba* are other effective, berried subjects, and in a group, such as you propose erecting, would be very useful. They should not be subjected to frost, however. There should be no danger of this

in a ball room, as the heat will remain in the room a long time after the proceedings have terminated.

Gloriosa superba is a stove plant, *J. Deene*, and your house would be far too cool for it. Try something else.

have been put upon the market, including a strain with flowers of enormous size, produced on plants of strong and rampant growth. We think that size is overdone, inasmuch as the number of flowers is reduced in proportion to the size of them. *Petunia hybrida* Snowball (see illustration) is altogether

ground strain has now been put into commerce, and it is claimed for them that 70 per cent. come true to colour from seed.

A large flowered, true Forget-me-not is that named *Myosotis palustris grandiflora* Nixenaugé. A translation of the latter name would be rather cumbersome as it means Water-nymph's-eye. The flowers are as large as those of *M. dissitiflora* Perfection, but more continuously produced all through the summer.

Pansy President Carnot is a large variety of the Olier type, having a large blotch on each of the five petals. In this case the blotches are dark violet, and cover the petals with the exception of a broad pure white border.

A coloured illustration of *Salpiglossis variabilis* superbissima, *Myosotis alpestris stricta* coelestina, Pansy Fairy Queen, and other varieties accompanied the list of novelties, all of which have been raised by Mr. F. C. Heinemann.

PETUNIA HYBRIDA SNOWBALL.

MYOSOTIS ALPESTRIS STRICTA COELESTINA.

different in character, being of dwarf and compact habit, producing a profusion of satiny-white flowers of moderate size. Mr. Heinemann assures us that it comes true from seed, and may be used for bedding purposes or pot culture. Like all other garden Petunias it is well adapted for resisting drought, and, therefore, likely to prove valuable in this country during droughty seasons.

French Marigolds are liable to produce coarse, rampant growth during wet seasons, and in northern districts where the climate is always cooler and moister than in the southern counties of Britain. Dry seasons keep them more within due bounds. There are, however, several dwarf varieties that never get rampant even in wet summers. Legion of Honour is one of them, and already well known and appreciated in this country, being about a foot high, and coming very true from seed, as we have frequently noted in the parks and gardens of this country. *Tagetes patula nana* Gold Ring (see figure) also belongs to the same species as the French Marigold in its various forms, and is described as possessing the same dwarf habit and free-flowering character as Legion of Honour, to which, therefore, it should prove a suitable companion. Like the last-named, it is single, and possesses broad, overlapping ray florets of a rich velvety-brown, edged or laced with a golden line or ring round the margin. It is as constant from seed as Legion of Honour.

The garden race of *Salpiglossis* has attained well merited repute amongst gardeners and lovers of flowers generally during the last few years, on account of their profuse and continuous flowering character, their great variety of gorgeous colours and their faculty for resisting drought. Mr. Heinemann offers a new type producing a bouquet of very large flowers on the top of a solitary and very stout stem. The flowers have a short tube; and widely expanded lamina, veined with reddish-gold on a yellow ground.

Viola tricolor maxima Fairy Queen, belongs to the same race as that type known in this country by the name of Peacock. The flowers of Fairy Queen (*Feenkönigin* in German) are of large size, nearly uniform sky-blue shaded with violet and margined with a pure white band round every petal.

Annual Viscarias in various colours have been inmates of our gardens for many years past. A new variety is announced having flowers of a blood-brown colour, and named *Viscaria oculata* brunea.

Marguerite Carnations still meet with a great amount of favour on account of their continuous flowering habit and beautiful colours. A yellow

TAGETES PATULA NANA GOLD RING.

EUPHORBIA POINSETTIA.

POINSETTIA PULCHERRIMA.

THOSE of us who live within the radius of the fog demon—whose oft recurring visitations leave behind most disastrous results amongst flowering plants—doubly appreciate anything capable of withstanding this autumn and winter scourge. Amongst decorative plants able to resist the ill effects of the fogs prominently stands the *Poinsettia pulcherrima*. Those who saw the splendid group of plants exhibited by Messrs. Cripps & Son, showing evidence of highest culture, being dwarf plants, well furnished with foliage, and terminating in handsome, well-developed bracts, intense in colour, and all in small pots, could not fail to admire such a serviceable and creditable exhibit.

It is evident there are several varieties of this *Poinsettia* in cultivation as they differ considerably in character. Amongst a batch I have grown this year are several with bracts of a distinctly pink or rose vermillion colour, and have several of the bracts green or nearly so, intermixed with the rest. My attention was called in summer time to the difference in the foliage, which, in the scarlet-vermillion variety is broader and of a lighter green than the other. Williams in his "Stove and Greenhouse Plants," mentions six varieties. *P. ignescens* and *P. mirabilis*, he says, are garden hybrids; the latter, he says, has an exquisite soft rose shade. *P. pulcherrima*, *P. pulcherrima alba*, *P. pulcherrima plenissima*, and *P. variabilis* make up the six. I was informed by one, well known as a cultivator and exhibitor, that the variety exhibited by Messrs. Cripps & Son, was an early flowering variety, and was sent out some years ago by Mr. Bull, of King's Road, who raised several seedlings.

MR. HEINEMANN'S NOVELTIES.

WELL-KNOWN flowers of good quality will always find a place in the garden, no matter what their age may be. The reason for this is simply that they can be relied upon to produce any desired effect. On the contrary there will always be a desire for novelties amongst flowers, on account of the interest and charm to the grower and all concerned when a really fresh acquaintance turns up to greet the eye of the beholder. The more unusual forms, and the least expected, coupled with real beauty, will always command the greatest number of admirers.

From a considerable number of novelties raised, and being put into commerce by Mr. F. C. Heinemann, Erfurt, Germany, we select several of the more striking for comment. The accompanying illustrations of three of them have been placed at our disposal by Mr. Heinemann. As far as habit is concerned we give the palm to *Myosotis alpestris stricta* coelestina (see figure) for decided novelty. The compact and columnar form of the plant, like an Irish or Swedish Juniper in habit, is very singular. All the branches are upright, so that the top of the plant is scarcely wider than the base. For this reason it should prove a useful subject in pots for market purposes, being strikingly distinct from any form of *Lobelia* we have ever seen. The flowers are blue and freely produced, over the greater portion of the exposed surface of the plant. It should also prove a distinct novelty for flower-beds of certain patterns, or for edgings to others. The flowers are also bright blue as in the typical form of the species, although, strange to say, a pink variety (*M. a. stricta* rosea) was the first to appear, being put into commerce last year.

Of late years a great number of varieties of *Petunia*

I have before me a coloured illustration of this Poinsettia in the Floricultural Magazine, Vol. 1, March, 1837, taken from a plant (one of the first to flower in this country) grown in the gardens of Wentworth House, noted at that time for its collection of new and rare plants. The plant in question it is stated was five feet high, and judging by the illustration this plant has been much improved by cultivation. It was introduced by Mr. J. McNab, in 1834, from Philadelphia, to which place it was sent from Mexico, where it was discovered by Mr. Poinsette in 1828.—A. P.

N.C.S. AND THE ROYAL AQUARIUM.

Audi alteram partem.

In all walks of life the grumbler plays an important part, and the world of horticulture is by no means exempt from the ventilation of his grievances; in fact they regularly recur in an acute stage at certain seasons of the year.

We are just now passing through one of these periods, and it is distinctly amusing, if not actually edifying, to observe with what eagerness a particular "bone" is being picked in certain quarters.

"We have no suitable place in London to hold a show in" is an old growl that comes up every November as fresh as paint. "The Crystal Palace is impossible," say the critics—want of centrality we suppose; the Royal Aquarium is, of course, everything that is had; want of space is the cry for another place; and thus the eligible centres are disposed of one by one, until the plaint is proved—in the eyes of those who make it.

The Royal Aquarium has been again the scene of the shows of the N.C.S., just as it has been for twenty years past. During that time the Aquarium authorities have certainly done all that has lain in their power to meet the requirements and wishes of the N.C.S., with the result that the society has prospered, and is now a very vital and important item amongst our big horticultural institutions. "The Aquarium people have grown rich over the connection," say the grumblers. Surely that is not apart from the fitness of things—some advantage should accrue to both sides of the compact. The donations of the Aquarium directors to the prize fund have been conducted on fairly liberal lines, and in return they have only had to depend upon the takings at the doors, which, to say the least of them, must be variable and uncertain.

No one would contend that the Aquarium is an ideal place for a show, but if we take all things into consideration we must admit that it has great advantages. First of all there is plenty of space for the exhibits, and, scarcely less important, there is an abundance of auxiliary space for the housing of the numerous and bulky adjuncts to such a show. Its centrality is scarcely less observable, and its suitability in this respect has really never been gainsaid.

The light has not been always what it should be, and in one of the galleries during the November show it was undoubtedly had. This, however, was not due to the fact that the building is normally insufficiently lighted, for the very reverse of this is the case. By an unfortunate coincidence the electric light apparatus went wrong on the date in question, as such apparatuses have a knack of doing, and the Chrysanthemums were the sufferers. Unfortunate! of course, but still an accident. Anyway, the light in the darkest part of the Aquarium was not so bad as the light, or rather the lack of it, at the National Rose Society's Show at the Crystal Palace in July last.

The surroundings! ah! now we come to the crucial point; the surroundings are unsuitable, we are told. But, *Chacun a son goût*, and it may be that the side shows, including the music, provided at the Royal Aquarium, are not so universally detested as some would have us believe. If we look at any of the great shows held throughout the kingdom we shall find that it has been found by experience that music must be provided to assist in drawing the public, else why does the Scottish Horticultural Association pay such a stiff price for a band. Even the Royal Horticultural Society must have a hand at the Temple Show. But that is different, we are told; it may be, certainly, but it is a difference in degree and not in kind. Other societies find even the music insufficient, and in addition provide for sports,

balloon ascents, and dancing. Surely the difference, if any, is fast vanishing when we come to this.

From a financial point of view it is very questionable if horticultural shows in London could be made to pay consistently if no side shows were provided. In the provinces we have only to look at Newcastle and Chester to see examples of balances appearing on the wrong side of the sheet, even when side shows have been provided. In the case of the N.C.S. the society relies upon the Aquarium to furnish them, and thus has the benefit of their "drawing" powers upon the people, but not the disadvantage of feeling their "drawing" powers on the funds of the society. The general concourse of people is as orderly at the Aquarium as in any public hall, and one need not see evil unless one goes out of the way to see it, under which circumstances a "Peeping Tom" may generally be obliged in any part of the world.

Some exception has been taken to the way in which the various exhibits were cut up and scattered all over the hall and galleries at the November show; indeed, this particular string has been played on for all it is worth, and a good deal more beside. When the critics have recourse to such an objection as this it only goes to show how weak their case really is. Those who remember the crowded state of the building during that show, and the difficulty of locomotion, will admit the necessity of giving people room to move, and how could this be done except by cutting up the exhibits, and distributing them over the available area? Certainly, had they been closer together it would have been absolutely impossible to move about.

All who have the welfare of horticulture at heart would be glad to see a special hall for shows built in a suitable locality, but in the meantime, and before such a desirable consummation of our hopes appears, we must admit that the N.C.S. is not after all so badly herthed at the Royal Aquarium.—A. S. Galt.

LIVERPOOL HORTICULTURAL ASSOCIATION.

A highly interesting gathering of this society was held on Saturday evening last, in the Free Library, Liverpool, Mr. Thomas White presiding over a good attendance of members, when Mr. P. Weathers curator of the Botanical Gardens, Manchester, gave a highly interesting review of "The progress and popularity of Orchid growing." Many of the oldest and best-known kinds, that are at present found in most collections, were first considered; and where special needs of culture were required these were briefly given. This was followed by some interesting details of the early organised importation, the R. H. S. receiving some commendation for their initial work, then followed the names and work of private and trade importers who have made themselves famous in the Orchid world by their forethought and enterprise. In connection with this detail many of the latter day gems were recognised, and honour done to those who at great risk had placed them before the public of Europe. This matter led up to the excitement and fascination that gained the attention of the amateur and professional, and was followed by mention of the popular prices at which they can be obtained, as well as the fabulous prices that the unique kinds command.

Hybridising was a subject that was treated at considerable length by the lecturer. Some interesting details of the early work were given, by the names of raisers well-known in the Orchid world, and of the many beautiful varieties that had been obtained, and now that seedlings from hybrids could be raised we have no need to fear that the introduction of new varieties would stop, as they could be obtained from seed. The review of Orchid literature was somewhat startling, for as Mr. Weathers remarked we had sufficient to form a good library.

In addition to an excellent paper, Mr. Weathers had a large assortment of excellent illustrations that were of considerable interest, especially those that had been more recently introduced. A very interesting discussion followed, which consisted more of cultural details in which several of the most noted of Liverpool growers took part.

A cordial vote of thanks was accorded to Mr. Weathers for his interesting and excellent paper. Mr. T. Carling showed a small-leaved seedling Elder, prettily marked with pea-green blotches on a white ground, which was much admired.

NATIONAL ROSE SOCIETY.

THE annual general meeting of this society was held at the Hotel Windsor, on Thursday, December 9th. C. E. Shea, Esq., presided.

After the notices convening the meeting, and the minutes of the last general meeting had been read and passed, and Mr. Geo. Gordon and Mr. W. J. Jefferies appointed as scrutineers of the ballot for the ensuing nomination of officers and committee, the report and balance sheet for the year 1897 were presented by Mr. Mawley, one of the hon. secretaries.

The report dealt with the effect produced by the Diamond Jubilee upon the National Rose Society, in common with other institutions from a financial point of view. It also caused the date of the Portsmouth show to be altered to June 18th, the earliest date on which a provincial show has ever been held by the society. The northern show took place at Norwich, where the arrangements were, on the whole, excellent.

The arrangements for 1898 provide for a show to be held at Bath, on June 23rd, for the southern part of the country, whilst the northern exhibition is to go to Halifax, under the auspices of the Salterhebble and District Rose Society, on July 14th. The Metropolitan show will be held at the Crystal Palace, on July 2nd. A Rose conference will take place at each of the exhibitions, some subject of interest being discussed at each.

The report further dealt with the privileges enjoyed by members of the society, and in conclusion expressed the thanks of the executive to secretaries of local societies, especially holding to praise Mr. H. P. Landon; also to the donors of special prizes.

The balance sheet showed a totality of receipts amounting to £804 12s. 2d., with an expenditure of £764 13s. 7d., thus leaving a sum of £39 18s. 7d.

After he had finished the reading of the balance sheet, Mr. Mawley explained that in reality the balance amounted to £64 18s. 7d., owing to the fact that £10 had been paid in for special prizes during November, and that there was a difference of £15 in the printing expenses that could be accounted for.

The formal adoption of the report and balance sheet was moved by the chairman, who delivered a very practical and pertinent address. After alluding to the fact that another milestone in the history of the society had been passed, he said that Mr. Mawley's explanation of the apparently unfavourable balance remaining in hand was very satisfactory, and had removed many of their fears. The past year had been rather a chequered one, for while the show at Portsmouth was a had one; that at the Crystal Palace had been the most successful that the society had ever had. Looking around upon the number of lovers and cultivators of the Rose that he saw there he had no fears for the future of the flower. Mr. G. Bunyard seconded, and the motion was duly carried.

A note of thanks to the officers of the society was then brought forward. It was seconded by Mr. A. Munt, and carried unanimously. The Rev. H. Honeywood D'Omhain replied.

The Rev. H. A. Berners proposed, and Mr. O. G. Orpen seconded that Bye-law 5 be altered to read: "A special general meeting," instead of "the special general meeting." This was carried without opposition.

The Rev. A. Foster-Meliar proposed, and Mr. C. Cant seconded that Bye-law 7 be altered to read: "The functions of that sub-committee shall endure until the next Annual general meeting," the word *annual* having previously been left out. There was no dissent to this alteration.

Mr. H. P. Landon proposed that Regulation 8 should read: All Roses must be exhibited as cut from the plants. Artificial aid of any kind is strictly prohibited with the exception of wires or other supports which are only to be used to keep the blooms erect. *A bloom left tied will not receive any point from the judges*, dressing Roses so as to alter their character is prohibited, *a bloom so dressed will not receive a point from the judges*. The insertion of any additional foliage *will disqualify the stand*. The italics denote the alterations and additions.

There was a good deal of discussion over this regulation, but it was seconded by Mr. Orpen and finally adopted. A new regulation to read: "Exhibition stands should be of the regulation size, viz., 4 in. high in front and 18 in. wide, and to be set out with moss or other suitable material. They should

also be of uniform length, viz., for twenty-four blooms not less than 3 ft. or more than 3 ft. 6 in.; for twelve blooms not less than 1 ft. 6 in., or more than 2 ft.; and for six or nine blooms not less than 1 ft., and not more than 1 ft. 6 in." was proposed by Mr. George Paul, and seconded by Dr. Shackleton. It was finally adopted after a great deal of discussion in which many prominent members took part.

Mr. Geo. Gordon then reported that the list of the officers and committee men for the ensuing year had been accepted unanimously.

The list is as follows:—President, the Very Rev. the Dean of Rochester, D.D.; Vice-presidents—Messrs. R. N. G. Baker, Geo. Gordon, C. J. Grahame, T. B. Haywood, E. B. Lindsell, H. V. Machin, J. D. Pawle, C. E. Shea, M. T. Masters, M.D., The Mayor of Halifax, Rev. J. H. Pemberton, Rev. A. Foster-Melliard, Rev. W. Wilks, and others. Committee—Messrs. H. Appleby, J. Bateman, W. Boyes, G. Bunyard, J. Burrell, C. E. Cant, F. Cant, W. Cocker, G. W. Cook, W. F. Cooling, F. Dennison, A. Dickson, A. C. Gifford, T. W. Girdlestone, W. J. Grant, R. Harkness, W. J. Jefferies, Conway Jones, J. H. Laing, H. P. Landon, Rivers H. Langton, J. R. Mallock, G. Mount, A. Munt, O. G. Orpen, A. W. Paul, G. Paul, A. E. Prince, W. D. Prior, T. F. Rivers, E. Sanford, A. Slaughter, J. T. Strange, A. Turner, R. E. West, H. Shackleton, M.D., Col. J. H. Pitt, Captain J. Ramsay, and the Rev. H. A. Berners.

In considering the fixtures for 1899 Mr. J. Bateman proposed and Rev. A. Foster-Melliard seconded that the Southern Provincial Show be held at Colchester, which motion was carried after a great deal of discussion.

Mr. W. J. Grant stated that he was authorised to invite the society to Helensburgh, N.B., in 1899, and assured them a warm welcome, and compliance with their rules and regulations. The Rev. J. H. Pemberton spoke strongly in favour of going to Helensburgh, and it was ultimately decided to leave the decision in the hands of the committee. The Rev. D'Ombraïn and Mr. Mawley spoke of having had some communications with Mr. P. Weathers with regard to the show being held at Manchester, but they had heard nothing more of it for the last two months.

A vote of thanks to the chairman for presiding, made on a motion by the Rev. A. Foster-Melliard brought the meeting to a close.

BUCCLEUCH NURSERIES, HAWICK.

THE visitor to the establishment of Mr. John Forbes, Buccleuch Nurseries, Hawick, N.B., during the summer or autumn months can see at a glance that florists' flowers, in the widest sense, that is, popular flowers generally, are the leading feature of the outdoor department. Hawick, to the visitor for the first time, is most romantically situated in a valley, or almost a ravine amongst the green, grass clad mountains of Roxburghshire, where the River Teviot is joined by the Slitrig, the latter, indeed, flowing through the nursery. The grounds extend up one side of the valley, but are yet below the level of the railway which serves the town. The soil is very fertile, or has been made so, in the bottom of the valley; but even on the steep and stony slopes Carnations, Pansies, and Violas flower profusely till very late in the season. Some months ago we gave a general survey of the place, and we now give a few details concerning the popular flowers we were at that time obliged to omit.

PENTSTEMONS.

A large area was planted with Pentstemons, which were in prime condition in the first week of September, and so conspicuous as to draw our attention at the first glance into the nursery. The plants varied from 18 in. to 30 in. high, according to the nature of the variety, and carried branching, massive spikes of flowers that would have been a credit to any garden or soil. The collection is rich in named varieties, and a large breadth of seedlings was also in perfection, many of the varieties being selected for naming. Size and distinctness of colour were the feature of the named varieties, whether old or new; but we can only give a brief selection of those we saw in flower.

Amongst the newly named varieties, Mrs. Norman had large and open rosy-pink flowers. Those of Mrs. Melville were rosy-scarlet with a white throat,

making a beautiful contrast. Strikingly distinct was the violet-purple of Mrs. Hope. The large flowers of Loredan Larchey were of a beautiful dark rose. Other grand flowers were—Donald McBean, purple-crimson; Crafty, rosy-scarlet, with a dark throat; Countess of Ravensworth, very dark purple; Atlantis, purple-crimson, with a white tube; and James Robertson, pure white, tinted with rose at the edges, making a large, open and chaste flower. Twenty-eight new varieties are offered for the present year.

The general collection includes a large number of handsome sorts, many of them being the sorts offered for 1896. The best Continental varieties are also included. The huge flowers of Emile Deschanel are carmine, painted with blood-red and rose. Charles Robin has carmine-rose flowers, distinguished by a transverse, white band. Renommée is a striking variety of a dark crimson, contrasting with a white throat, and of magnificent proportions. There has been a great demand for Jean Mace, on account of the size and beauty of the bright scarlet flowers. Those of William Totty are also of pronounced size, and scarlet, pencilled with dark lines on a white throat; J. W. Moorman is rose-purple, and heavily blotched in the throat; J. Fraser (1896) is rosy-scarlet and finely blotched; and William Browne is bright scarlet, large and open.

PHLOXES.

The collection of these showy and hardy subjects is very extensive, and in the open ground vary from 1½ to 3½ ft. in height, according to the vigour of the sorts. Several pure white varieties are dwarf, branching and most floriferous.

A collection of new and old varieties was being tested in pots to determine their value. Le Mahdi is dark violet-blue, suffused with purple. Albatre is pure white, with compact panicles of large flowers; Etoile, rosy-lilac and white, with a starry eye; Lord Raleigh, dark violet; Embarrasment, salmon-scarlet, with a purple eye and very choice; Wm. Robinson, rosy-salmon, with a violet centre; Beranger, rosy-white, suffused with gray and very choice; Liberté, rosy-salmon, with a carmine eye; and Cyrano, carmine, suffused with blue. Eugene Danzanvillier was honoured with an Award of Merit from the R.H.S. last summer, and has rosy-lilac flowers, with a white eye. Torpilleur is of a beautiful bright magenta, and of large size. Evénement, a bright salmon-scarlet, has also been honoured with an Award of Merit. Other choice and beautiful sorts are Cameron, pure white, with the exception of a deep mauve centre; Huxley, white, and girt with a bright lilac edge; Aurore, salmon, with a violet eye; Wm. Ramsay, of a beautiful violet; and Argon, rose, very faintly suffused with scarlet, being a new shade of colour. No good garden can afford to neglect this beautiful class of flowers, so infinitely varied in colour, size, and habit; while many of the varieties are deliciously fragrant, especially during the cool hours of the evening.

CARNATIONS.

These are mostly grown in the open air, but the tree varieties were under glass, including the well-known Yuletide, a scarlet sort of free flowering character and great value, to which nine certificates have been awarded by as many societies. A soft rose-sport has originated from it. A large batch of plants was layered in pots on the occasion of our visit, and the pots plunged in a frame from which the sashes were removed. A batch in 60, 48, and 32-size pots occupied another house, while being grown on for flowering. Buccleuch Clove is a deliciously fragrant border variety, heavily pencilled with rosy-scarlet on a white ground. The plants were in pots, but others were planted in the open along with the general collection.

Named varieties and seedlings in great quantity were flowering most profusely on the steep hill sides, where they were planted in long beds across the slope. We can only mention a few of the choicer things then flowering and furnishing any quantity of cut bloom. Queen Anne is a rich rose variety; Queen of Bedders, red, and extremely floriferous; Adonis, scarlet and deep buff, and of dwarf habit; Primrose League, a yellow fancy, heavily pencilled; Old Coin, salmon and red on an old-gold ground; and Lady Sankey, deep yellow, with a heavy crimson edge, rich and particularly free flowering. Raby Castle flowers as well in the open as it does further south. Dark varieties are well represented by the maroon Carl Moor.

Picotees are not neglected at Hawick, so long as they are vigorous and can produce plenty of flowers. A very pretty rose-edged variety was that named Mrs. Forbes, ranging from 18 in. to 24 in. in height. Pretty also is the new variety Boiard, with a bright pink or rose edge. Maggie Forbes, a canary-yellow Picotee, edged with crimson, robust and handsome, is also new for 1897. Brocklin is a beautiful yellow, with a heavy purple edge. Edelweiss is a large white, purple-edged variety of great merit. Stambuloff is a striking variety, the yellow ground being nearly covered with fiery-crimson lines. Beautiful and strange is the mixture of colours represented by Mrs. J. M. Troup, the yellow ground being flaked with red and heliotrope. Mr. Nigel is another yellow ground, edged with crimson.

Buckleuch Clove in the open ground surpassed our expectations for freedom of flowering. Its fragrance also remained the same, although it had been raining all day and practically very cold. We could not but admire the beauty of Countess Cowper, with rosy-carmine flowers, edged with a white band. As a border flower we thought it charming. Very delicate and chaste is the flesh coloured Waterwitch. James Ewart is pencilled with bright scarlet on a pure white ground. Miss Wilmott is rich carmine, and very floriferous. All of the above are free-flowering, producing also an abundance of shoots for layering. The seedlings were carrying armfuls of flowers, showing a great range of beautiful colours.

PANSIES AND VIOLAS.

Show and fancy Pansies and bedding Violas are all grown in considerable quantity. All had flowered splendidly on the steep slopes of the upper part of the nursery. Being at home on the mountains and hillsides in a state of nature, their modern garden representatives were equally happy, though the slopes must assuredly be dry in a droughty summer, which was far from being the case during the past season in the north of England and the south of Scotland. They are planted in brakes across the slopes, allowed to flower the first year and to produce seed the second. After this they are removed, the annual plantations being made on fresh ground.

Amongst the Violas were many fine seedlings a few of which will be grown again. All the best named varieties are grown, including such well known and choice things as Duchess of Fife, Bullion Goldfinch, Ardwell Gem, Ariel, Violetta, The Mearns and Border Maid, yellow with heavy blue margins, all of which were flowering profusely at the time of which we speak. Others were Mrs. Nisbet, coppery brown; Eynsford Gem, yellow; Jackanapes, a yellow sort, with the upper petals of a mahogany colour. Mary Gilbert is larger and darker than Ardwell Gem. Vestal is pure white; and A. J. Rowberry, golden yellow. The newer rayless varieties are also well represented.

HERBACEOUS PLANTS.

This being another feature of the nursery, considerable attention is given to the hardy border flowers now rapidly rising in popularity everywhere. Many of them were still in bloom in September, which in more southern latitudes were past their best or out of season. We can only indicate the general run of things. The collection of varieties of Montbretia is very full and most serviceable for cut flower purposes, being both showy and graceful. Other things in full bloom were Achillea Ptarmica The Pearl, Chrysanthemum maximum, C. m. E. Johnstone, C. latifolium, Linaria purpurea, Monarda didyma, Pentstemon barbatus, Veronica virginica, V. v. japonica, Bocconia cordata, Sidalcea malvaeflora, Papaver alpinum and the well-known Iceland Poppies. Geranium Wallichii is a most interesting trailer for rockwork, with handsome flowers and spotted leaves. Stachys coccinea has large spikes of soft orange-scarlet flowers. Tradescantia is represented by T. virginica violescens fl. pl., T. v. rubra, and T. v. fl. pl., the latter having blue flowers. Amongst Verbascums we noted V. phoeniceum, V. phlomoides, and V. nigrum. Veronica incana and many others well represented their class.

Rockery plants are grown in great variety, including collections of Saxifrage, Thymus, Sedum, Dianthus and various others too numerous to mention here. The cool moist atmosphere of this alpine valley is peculiarly suited for the cultivation of hardy border plants and florists' flowers in endless variety. Amongst the latter, East Lothian Stocks, Pentstemons, Phloxes, Pansies, Violas, Chinese Paeonies, Montbretias, and Hollyhocks deserve special mention.

SMITHFIELD CLUB.

THE fame of this club's big annual show at the Agricultural Hall is certainly not on the wane. Some 27,000 visitors accompanied our reporter on Thursday last in paying it a visit, and the grand displays of huge Sweeds, Mangolds, and other roots were well worth the crushing attendant upon even a cursory inspection.

Messrs. Carter's, Sutton's, Webb's, Harrison's, King's, Jarman's, and Dickson's stands were as usual in good evidence, with specimen Swedes, Onions, Carrots, &c.; whilst Mr. A. Findlay and Messrs. Fidler & Sons exhibited fine Potatos; and Messrs. B. Wells, W. Horne, J. Watkins, and Gaymer had Apples.

Various firms known to our readers had stands for chemical manures. Messrs. Hill & Smith showed samples of their well-known "Porcupine" tree guards and continuous fencing, though they omitted to bring along the man who for so many years has been painting them.

Lawn Mowers were shown by the famous Ipswich firm, Messrs. Ransomes, Sims, and Jefferies, Ltd.

The Surrey Seed Co., and Mr. A. Blatchford, also exhibited roots.

The one novelty noticed was a mildew-resisting Swede called "The Universal," which appears to be an absolutely distinct variety. It has pale green foliage, bright bronzy-purple top, and handsome round roots. The raisers, Messrs W. & J. Brown, claim that it is particularly adapted for early work, and is suitable for sowing in hot and light land that is subject to mildew. We understand that Messrs. Hurst & Son, 152, Houndsditch, will have the wholesale distribution of this Swede.

"MUMMERS" AT DINNER.

THE occasion of the mid-winter exhibition of the National Chrysanthemum Society at Westminster last week, afforded an opportunity for some of our enthusiasts North and West to come along, and see what could be done even in drear December in the way of the golden flower. Nor were they disappointed with their reception. Several distinguished visitors had travelled long distances in order to be present, and the opportunity was made use of as a fitting occasion upon which some reciprocal hospitality might be suitably manifested, in token of the unquestionably cordial reception with which many of our Southern members met at Edinburgh and Dublin in November.

Naturally enough an Englishman's most potent notion of celebrating an event of this sort, particularly when the function is to characterise his own native reputation for hospitality, is to entertain his guests at dinner. And dinner it was accordingly. A small private committee, acting on behalf of those who had participated in Scotch and Irish shows, was formed and all the arrangements were entrusted to Messrs. Spiers & Pond, whose manager, Mr. Cheesman, assiduously excelled himself in putting on the tables a most *recherche* repast.

Punctually at 5.30 on Tuesday night Mr. T. W. Sanders, F.R.H.S., Chairman of the National Executive, took the chair, having on his immediate right and left Mr. G. M. Ross, Secretary of the R.H.S. of Ireland; Mr. Robert Laird, Secretary of the Scottish Horticultural Association; Mr. Gardner, of the Brisbane Chrysanthemum Society; and there were also present Mr. R. Dean, V.M.H., and Mr. R. Ballantine, vice-chairmen; Mr. H. J. Jones, H.F.N.C.S.; Mr. E. Molyneux, V.M.H.; Mr. Percy Waterer, Mr. A. E. Stubbs, Mr. J. H. Witty, Mr. W. Mease, Mr. J. Wilkinson, Mr. W. Holmes, Mr. H. Myers, and others. The function was necessarily restricted to one of a semi-private character, but after the tables had been cleared the chairman submitted one or two toasts of an appropriate character.

Following the customary loyal sentiments, Mr. Sanders proposed "Kindred Societies," eulogising the undoubtedly splendid efforts that had been put forth by the societies in the sister cities of Edinburgh, Dublin, and Belfast, in the cause of the Chrysanthemum in 1897. He was personally able to testify to the extremely courteous and hospitable way in which they from the South had been received on their recent visit to Scotland and Ireland—meetings such as these could not fail to encourage the mutual interests of the parent society and those bodies who were acting in a similar capacity outside the metropolis. (Applause.) He welcomed the opportunity

of meeting Mr. Ross and Mr. Laird, and more, he was particularly pleased also, to know they had amongst them Mr. Gardiner, of Brisbane, and in asking each of these three gentlemen to respond to the toast he wished them in the names of his friends and himself a pleasant and profitable visit to London.

The toast was drunk with enthusiasm, and Mr. G. M. Ross, of the Royal Horticultural Society of Ireland, made a happy speech in response, promising that they in Dublin intended to make the best use of the good examples and precepts which were afforded by the National Chrysanthemum Society. He admired their impetus, their energy, and above all their good fellowship. Mr. Ross strongly urged the feasibility of the N.C.S. holding a provincial show each year something on the lines of the National Rose Society; he thought that to allocate some of their prestige and patronage to the larger provincial shows alternately in order of importance could not fail to be productive of lasting good. (Applause)

Mr. Robert Laird, Secretary of the famous Scottish Horticultural Association, rose to return thanks, and was received with enthusiasm. So also was his announcement of the probable surplus which he anticipated his society would this year be able to devote exclusively to charity. They had, he said, as a society, been fortunate in securing for some years past the services of Mr. Molyneux as judge, and they had been able to adopt many of his ideas and much of his advice. He was most pleased indeed to be with them that night, and expressed a wish that they might all meet again in Edinburgh.

Mr. Gardiner, Brisbane, made a most interesting speech, characterising Queensland as a beautiful climate for 'Mum cultivation. He told us, too, of the enthusiasm with which even the children took an interest in their flowers, and from the lowliest to the highest the same interest manifested itself. Their shows and fêtes were well-supported, and he expressed the conviction that the cultivation of these beautiful flowers, in common with the Mother Country, was, he considered, yet one more strand in the bond and tie to dear old England. (Applause, and three cheers for the Colonia's).

Other toasts were "The National Chrysanthemum Society," by Mr. J. Wilkinson, to which Mr. Dean and Mr. Ballantine ably responded; "The Royal Aquarium Company" by the Chair; "The Press," proposed by Mr. Molyneux and replied to by Mr. A. E. Stubbs; and a cordial toast to the genial Chairman brought an enjoyable evening to a close.

GARDENING MISCELLANY.**CORK LITERARY AND SCIENTIFIC SOCIETY.**

A LARGE audience assembled in the hall of the School of Art, Cork, on the 2nd inst., to hear Miss Harriet A. Martin lecture on "Fairy Visions in a Prosaic World." Mr. W. Lane, B.A., presided. In the course of the lecture Miss Martin stated that tree life, like human thought, was ever ebbing and flowing—at one time sinking into the dull monotony of gaunt stem and bared branches; then ever and anon breaking forth into luxuriant growth. The ceaseless tide of life bursts into new foliage under the influence of a summer sun, actively maturing, and rapidly passing into decay—rising and falling in its seasonal course, and singing in its own fashion the story of creation, preservation, and destruction common to all things in nature. In the springtime, continued Miss Martin, the people of Cork know well how the Celandines of Silverspring Lane gleam in golden lines by the dull cold walls; how the Anemones of Fota Woods rise like a foam-tipped sea over the autumn dead leaves; how the Primroses of Hollymount crowd the sunny banks and slopes; while deepening summer skies lure into dazzling shimmering loveliness the Hyacinth sheets of Castle Bernard, and the goldfields of Ardcairn outrival the wealth of Klondike. The formation and protection of the young bud, the shape of the leaves, and their functions provide topics of absorbing interest. Unusual leaf forms, such as may be met with in Nepenthes, Sarracenia, Darlingtonia and Cephalotus, as well as the more local Sundews and Pinguiculas of Irish bog lands also add interest to the many-sided activities bound closely with all studies of tree life. A very hearty vote of thanks to the lecturer terminated the proceedings.

CHRYSANTHEMUM HARLEQUIN.

SPORTS from good and well-recognised varieties of Chrysanthemums or other flowers are generally highly valued as variations upon the original. We do not know how that under notice will be received by the general public, but it is a strange and singular thing, ignoring all rules and precedents which we have hitherto noted amongst Chrysanthemums. Its parent stock is Stressa, a beautiful yellow Japanese variety. The sport is sometimes half yellow, while the other half is bright crimson. At other times only a segment of the head is crimson, sometimes only a few florets, so that it is as fickle and inconstant as it is strange, and well named Harlequin. Sports of this kind frequently appear amongst Dahlias, but not Chrysanthemums. The present one occurred in the collection of Mr. Norman Davls, Framfield, Sussex, who had several blooms of it in his grand group at the Dundee show.

SUNFLOWER GROWING.

ON former occasions we have alluded to the Sunflower as a possibly remunerative crop for British farmers. A contemporary in giving a note upon the culture and uses of this plant says:—that the Sunflower is universally cultivated in fields in southwestern Russia, between the Baltic and the Black Sea. Each part of the plant is turned to some account. Thus a hundred pounds of seeds yield forty pounds of oil. After the expression of the oil the residue is formed into oil cake for cattle. The leaves and green stocks are used as fodder. The fresh flower when it is just expanding is boiled, and eaten as a vegetable, and in this state resembles the Artichoke in flavour. The flowers themselves are much visited by bees for the sake of the honey. Referring again to the seeds, they constitute a valuable poultry food. Ground into flower and formed into pastry and cakes they form food for Plato's "two-legged animal without feathers." Even this does not exhaust the value of the seeds, for when boiled in alum and water they are said to yield a blue colouring matter. The leaves carefully dried make a substitute for Tobacco. The seed cases are made into blotting paper, and the inner part of the stalk into writing paper. The woody portion of the stalk is utilised as fuel, and from the resulting ash potash is obtained. Large plantations of Sunflowers grown in swampy localities are believed to be a protection against fever and ague. Without a doubt, in Russia at least, the Sunflower is a plant of many parts, whatever it may be in this country.

SOCIETIES.**ROYAL HORTICULTURAL.—December 14th.**

THE features of the meeting on Tuesday last were Orchids, Chrysanthemums, Pelargoniums, Cyclamens, Begonia Gloire de Sceaux, Poinsettias, Chinese Primulas, and hardy fruit, chiefly Apples. Considering the period of the year, the display was a very good one indeed.

Messrs. J. Veitch & Sons, Limited, Chelsea, exhibited a collection of Orchids, all of which were hybrids. Very fine were *Laeliocattleya Pallas*, *Cattleya leucoglossa*, *C. Mantinii*, *C. Miranda*, *Cypripedium Adrastus*, *C. Actaeus*, *C. Sallieri*, *C. Niobe*, and others. They were set up with Palms and Maidenhair Ferns.

A magnificent group of *Calanthes* was exhibited by Sir Trevor Lawrence, Bart., (grower, Mr. W. H. White) Burford Lodge, Dorking. The rich carmine-crimson *C. burfordiense*, was shown in quantity, as were also *C. Victoria Regina*, and *C. Veitchi splendens*, all of which bore long and gracefully arching spikes, which were the delight of everybody. He also had plants of *C. Veitchi lactea*, *C. Versicolor*, *C. Bella*, *C. Sanguinaria* (dark blood-red), *C. revertens*, *C. Wylamiana*, *C. Bryan*, *C. Labrosior*, *C. Amabilis*, *C. Porphyrea*, and several others of hybrid origin. The group occupied a considerable amount of table space and well deserved the Silver Gilt Flora Medal awarded it. A cultural commendation was accorded a large piece of the singular looking *Cirrhopetalum Medusae*, and another for a fine pan of *Dendrobium cymbidioides*. *Miltonia Endresii* is a pretty and uncommon species.

Messrs. F. Sander & Co., St. Albans, exhibited a group of *Calanthes* and *Dracaena godseffiana*. Amongst the former were fine pans of *C. Bryan*, *C. Bella*, *C. Florence*, *C. Victoria Regina*, &c. The

Dracaenas were in very fine form, and attracted much attention.

Messrs. Paul & Son, Cheshunt, exhibited ten baskets filled with *Cypripedium*s, including *C. insigne grandiflorum*, *C. harrisianum*, *C. insigne sylhetense*, *C. i. albo-marginatum*, &c., all well flowered.

Messrs. B. S. Williams & Son, Upper Holloway, staged a mixed collection of Orchids, including good specimens of *Calanthe Veitchi alba*, *Lycaste Skinneri*, *Cypripedium Sedeni*, *C. insigne Maulei*, *Oncidium tigrinum*, *O. varicosum*, and various others. They were set up with Palms and Maidenhair Ferns.

Messrs. Hugh Low & Co., Clapton, staged an interesting group of Orchids, including the beautiful *Cypripedium Mino magnificum*, *C. Calypso*, *C. insigne Laura Kimball*, *Cymbidium winnianum*, and various others. The last named is a beautiful hybrid. Very choice was *Lycaste Skinneri armeniaca*, with an apricot lip and petals, and white sepals. A rare and pretty terrestrial species is *Cynorchis Lowii* (Silver Banksian Medal).

Walter C. Walker, Esq. (gardener, Mr. Geo. Cragg), Percy Lodge, Winchmore Hill, exhibited *Laelia albida*, Walker's var., *L. peduncularis*, &c. A grand thing was *Cypripedium insigne*, Wigan's var., exhibited by Sir Frederick Wigan (grower, Mr. W. H. Young), Clare Lawn, East Sheen. He also had *Trichopilia brevis* and *Maxillaria grandiflora*. A very fine variety of *Laelia anceps* was shown by Admiral Sir Henry Fairfax (gardener, Mr. Wm. Yea), Ravenswood, Melrose, N.B. Two fine pieces of *Oncidium Forbesii* were shown by M. S. Cock, Esq. (gardener, Mr. W. Brickell), Tankerville, Kingston Hill. R. W. Richards, Esq., The Priory, Usk, Mon., showed a fine piece of *Laelia pumila praestans*.

Calanthe Harrisii was shown by J. T. Bennett Poë, Esq. (gardener, Mr. Downes), Holmwood, Cheshunt. Walter Cobb, Esq. (gardener, Mr. Howes), Dulcote, Tunbridge Wells, showed *Cypripedium Calypso dulcotense* and *C. J. Howes*, a very handsome variety. Thos. McMeekin, Esq. (gardener, Mr. A. Wright), Falkland Park, South Norwood Hill, exhibited *C. insigne Falkland Park* var., and *C. Mrs. Geo. Botterill*, both very pretty sorts. De Barri Crawshay, Esq. (gardener, Mr. S. Cooke), Rosefield, Sevenoaks, exhibited dark *Laelia anceps*, Mrs. De B. Crawshay, and a richly coloured variety of *L. autumnalis*. The pretty *Laelia Briseis* was tabled by Mr. Jas. Douglas, Edenside, Great Bookham, Surrey. H. Druce, Esq. (gardener, Mr. G. Walker), The Beeches, 43, Circus Road, St. John's Wood, exhibited a fine *Oncidium*, bearing two panicles of bloom.

Near the doorway a semi-circular group of late *Chrysanthemums* in pots were set up by Mr. T. Cubberley, gardener to J. W. Temple, Esq., Leyswood, Tunbridge Wells. *Janette Sheban* and *Princess Blanche* were the varieties shown. The flowers were fresh and of good colour (Silver Flora Medal).

A Silver Banksian Medal went to A. Pears, Esq. (gardener, Mr. Farr, Spring Grove, Isleworth), for a group of handsome plants, *Begonia Gloire de Sceaux* and *Poinsettias*. The latter were put up by themselves in a semi-circular group, with Palms and Bamboos. The *Poinsettias* were an even lot of plants, and carried medium-sized, very bright heads.

Messrs. Wm. Cutbush and Son, Highgate, N., sent a meritorious batch of double Chinese *Primulas*. The rose variety, *Marchioness of Exeter*, and the white *Princess*, were the two varieties on view. In both cases the flowers were large and fine (Silver Banksian Medal).

A Silver Flora Medal went to Mr. H. J. Jones, Ryecroft Nursery, Lewisham, S.E., for a group of cut *Chrysanthemums*. The blooms were fresh and good considering the advanced season. *Simplicity*, Mrs. H. Weeks, *Georgina Pitcher*, Mme. Carnot, and *Golden Gate* were some of the most noticeable varieties.

Messrs. Hugh Low & Co., Bush Hill Park, Enfield, sent a batch of finely-flowered *Cyclamen*. The flowers were large, and of capital substance. A batch of *Carnation Winter Cheer* also came from the firm (Bronze Banksian Medal).

A very showy exhibit of cut blooms of *Zonal Pelargoniums* came from Messrs. H. Cannell & Sons, Swanley, Kent. Upwards of three dozen bunches in as many varieties were displayed in an attractive fashion with a groundwork of *Adiantum*. Mr. P. Routh, Duchess of Marlborough, Herrick, Enid,

Niagara, Crabbe, and Lady Tennyson were some of the finer varieties. A Silver Banksian Medal was awarded.

Messrs. Jas. Veitch & Sons, Ltd., Chelsea, showed samples of the new winter-flowering *Begonias*, *Ensign* and *Winter Cheer*. Mr. J. R. Tranter, Henley-on-Thames, sent three blooms of the new *Chrysanthemum Mrs. J. R. Tranter*, a fine late variety. Mr. James Bryson, Helensburgh, N.B., had blooms of seedling single *Chrysanthemums*.

At a meeting of the Fruit and Vegetable Committee Mr. S. Mortimer, Rowledge, Farnham, Hants, was awarded a Silver Banksian Medal for a dozen boxes of fine Tomatos. The variety was a selected form of *Conqueror*.

Mr. Owen Thomas, The Royal Gardens, Frogmore, sent a box of *Cucumber Frogmore All the Year Round*.

Fifty-six dishes of excellent Apples were sent by Mr. H. Berwick, Sidmouth, Devon. *Sandringham*, *Lady Henniker*, *Perkins*, *Tyler's Kernel*, *Warner's King*, *Annie Elizabeth*, *Newton Wonder*, and *Golden Noble* were some of the most noteworthy varieties (Silver Knightian Medal).

A Silver Banksian Medal went to Mr. J. Day, gardener to the Earl of Galloway, Galloway House, Garliestown, for twenty dishes of Apples. Mr. Day also showed half-a-dozen heavy bulbs of *Ailsa Craig Onion*.

Nineteen dishes of Apples were forthcoming in competition for the Veitch flavour prizes. Mr. Herrin, The Gardens, Dropmore, Maidenhead, was first with *Adam's Pearmain*. Mr. C. Ross, Wellford Castle Gardens, Newbury, was second with *Cockle's Pippin*.

Twelve dishes of Pears were shown. Mr. W. Allan, gardener to Lord Suffield, Gunton Park, Norwich, was first with *President Barabe*. Mr. Geo. Wythes, gardener to Earl Percy, Syon House, Brentford, received the second prize for a dish of *Winter Nelis*.

A collection of different varieties of *Celery* and *Celeriac* supplied by various cultivators excited a good deal of interest. Mr. Bain, gardener to Sir Trevor Lawrence, Burford Lodge, Dorking, had capital samples of *Celeriac Geant de Prague*, and *C. à feuille panachée*. He also obtained a cultural commendation for a fine head of *Couve Tronchuda*. Messrs. Sutton & Sons, Reading, showed samples of their *Solid White Celery*, and Mr. T. Cross, Bury St. Edmunds, sent *Celery Victoria Pink*. Mr. Alfred Outram, 7, Moore Park Road, Fulham, sent *Celery Jubilee Red Plume*. Miss Breton (gardener, Mr. R. Handley), Sandhurst, Berks, showed *Cardoons*.

QUESTIONS AND ANSWERS

* * * Will our friends who send us newspapers be so good as to mark the paragraphs or articles they wish us to see. We shall be greatly obliged by their so doing.

[Correspondents, please note that we cannot undertake to name florists' flowers such as *Carnations*, *Pelargoniums*, *Chrysanthemums*, *Roses*, nor such as are mere garden varieties, differing only in the colour of the flower. Florists' flowers, as a rule, can only be named by those who grow collections of them.]

Fungus on Chrysanthemums.—W. Evans: The *Chrysanthemum* leaves you sent us are attacked with a species of *Puccinia*, possibly *P. tanacetii*. At present it is only in the *Uredo* stage, and by the older botanists would have been named *Uredo*. Now some varieties of *Chrysanthemums* are more liable to be attacked than others, and we should have been pleased if you had given us the name or names of the variety or varieties affected in this way. No doubt you are more concerned about the cure, but the disease is incurable, for the reason that the early growth of the fungus is all inside the leaves, and the spots of dark chestnut-brown, mostly on the under side of the leaves, but sometimes above, are really myriads of oval dark brown spores that have broken through the skin of the leaf ready to be carried hither and thither by the slightest breath of air, and scattered over the leaves of previously healthy plants, to repeat the evil there. It is the first time we have seen this particular form of fungus on *Chrysanthemums*, and we thank you for sending the leaves. In ordinary language this disease is termed rust. Your first proceeding should be to carefully gather all affected leaves and burn them. The affected plants should be kept in a house or pit by themselves, and carefully watched for any further outbreak. If the plants are very bad it might be worth your while destroying them, and getting healthy cuttings from some other source. The necessity for the extreme measure largely depends upon the rapidity with which the fungus spreads. We note that you have been using sulphur. This is good enough for the

ordinary mildew, but it has no effect upon *Puccinia*, because the growth of the fungus is inside the leaves. Spraying with the Bordeaux mixture might be tried at intervals during summer by way of preventing attack, but this means a deal of labour. The mixture to be tried would consist of 3 lbs. of sulphate of copper, 2½ lbs. of lime, and 30 gallons of water, or something similar to those proportions. The sulphate should be dissolved in a portion of the water, and the lime in another. When mixing the two solutions stir all the time, and add sufficient water to make up the regulation quantity.

Angle of Frame.—*Omega*: With the dimensions of the frame you furnish us, the angle of elevation at the highest part of the back would be 10°, and just barely sufficient to throw off rain under fairly favourable conditions.

Distance to plant Apples and Pears apart.—*Omega*: If the Apples are on the *Paradise* and the Pears on the *Quince*, we should presume that they are in pyramid or bush form but you do not state. Now this is all important for a direct answer. If they are as above stated, plant them at 6 ft. apart each way. This will be sufficient for a number of years without wasting the ground, which you can crop for a time with a few rows of *Strawberries* or vegetables. When the trees get too thick, lift every alternate row, and every alternate tree in the rows left. This will leave them all at 12 ft. apart, and the lifted trees may be planted elsewhere. If you desire to plant permanently at once, give the trees 12 ft. each way, and crop the ground with something between the rows.

Angle of elevation for a Fruit House.—*Omega*: The best all round angle of elevation for the roofs of fruit houses, in your part of the country at least, would be 45°. The rays of the sun would strike such a roof perpendicularly twice a year, say on April 6th and September 4th. For some days before and after these dates the divergence of the sun's rays from the perpendicular on your glass would only be very slight. The two dates given would also encompass the greater portion of your growing season, so that you would get the greatest amount of benefit from the sun during that period. For a forcing house you would get greater advantage from a higher angle so as to catch a maximum of the sun's rays in spring, but you speak of the best all-round angle.

Analysis of Soils.—W. J. R.: This would have to be done by a competent analyst. In the more important or populous districts of the country there is generally a qualified analyst in the neighbourhood. If there is one in your district the local chemist would be a very likely man to whom to apply for the desired information. What you want to know is the chemical composition of your soil, and what percentage of the ingredients are soluble or readily soluble.

Freesias.—*Flova*: For a reply to last week's question, see p. 246.

Names of Fruits.—N. Campany: 1, *Golden Reinette*; 2, *Hanwell Souring*.

Names of Plants.—W. C. Marsland: 1, *Croton Laingii*; 2, *Croton variegatum*; 3, *Croton pictum*; 4, *Croton*, not recognised; 5, *Astrantia major*; 6, *Ruscus aculeatus*, or *Butcher's Broom*.—J. M.: 1, *Begonia Rex* var.; 2, *Tropaeolum Ball of Fire*; 3, *Eupatorium riparium*; 4, *Eupatorium odoratum*; 5, *Erica gracilis*; 6, *Adiantum caudatum*.—G. Hyde: 1, *Ilex Aquifolium ferox argentea*; 2, *Prunus lusitanica*; 3, *Choisya ternata*; 4, *Oplismenus Burmanni variegatum*, generally called *Panicum variegatum*.—T. H.: 1, *Laelia autumnalis*; 2, *Oncidium praetextum*; 3, *Odontoglossum Pescatorei*.

NO HOME SHOULD BE WITHOUT ONE.

Ogilvie's Encyclopædia

OF USEFUL INFORMATION AND WORLD'S ATLAS.

No Single Book ever before contained such a Wealth of Knowledge.

By Special Arrangement with the Publishers of the "Encyclopædia of Useful Information and Atlas of the World," we are enabled to offer to the Public a Magnificent 25s. Volume for 16 of the coupons, which will appear weekly, together with 6d. each, accepted in Weekly Instalments, or the Coupons may be held until the whole period has elapsed and brought or sent to the Office with 8s., and 6d. towards carriage.

A COMPLETE ILLUSTRATED LIBRARY IN ITSELF.

A universal assistant and treasure-house of information on every conceivable subject, from the household to the manufactory. In short, gives information about everything, is absolutely indispensable to everyone in all walks of life; the contents being so separated, indexed, and arranged that they can be turned to at once. It is

THE BEST { BOOK OF INFORMATION } EVER ISSUED. Size of Encyclopædia: 9 by 11 1/2 inches. 656 Pages.

It contains

MANY MAGNIFICENTLY ENGRAVED COLOURED MAPS,

and a description of every country under the sun, besides much other matter relative to the Home, the Farm, the Factory, a Dictionary of Statistics—many Useful Tables, Poetical Selections, Synonyms, Famous Bridges and Ships, How to Calculate, How to Cook, How to Get Rich, How to Cure all Diseases, How to Succeed in Business, Table of Weights and Measures, and

HUNDREDS OF OTHER TOPICS OF GREAT VALUE TO EVERY PERSON

who desires to be up to the times. To see the Book is to want it. To Members of Mutual Improvement Societies it will prove of inestimable value.

The articles are written by men whose lives have been devoted to the subjects treated, are short and concise, but contain full information up to date. It is to be consulted on every subject that arises in everyday life, by old and young alike. It contains a complete Illustrated Atlas of the World.

IN THESE DAYS OF COMPETITION

it is imperative that a Gardener should be a well-informed individual. Here is an Encyclopædia containing an immense amount of knowledge that will be of the greatest service to him.

YOUNG GARDENERS,

do you wish to be successful? Then remember that to possess knowledge is the surest way to achieve success.

It is elegantly bound in Morocco Cloth, with beautifully designed Gilt Side-stamp and Red Edges, making at once the most handsome and durable as well as THE MOST USEFUL BOOK EVER MADE or sold for 25s.

181297. COUPON.

Edited by J. FRASER, F.L.S.

SATURDAY, DECEMBER 25th, 1897.

BUDS AND STIPULES.—In continuation of this subject, which the Right Hon. Sir John Lubbock, Bart, M.P., F.R.S. &c., has been studying for some years past, he again read papers on the 18th March, and 17th June last, at meetings of the Linnean Society. The papers now appear in the *Linnean Society's Journal*—Botany, Vol. XXXIII., pp. 202 to 268.

These stipules when present serve for various purposes in the economy of the plants to which they belong. The most usual purpose is to protect the young and tender leaves while yet in the bud stage. They may protect the leaf to which they belong, but more often they cover the next younger leaf or leaves; for in winter they are as large and often several times as large as the leaf to which they belong, while in summer the reverse is the case, even if the stipules survive the expansion of the bud. In the case of the Oak and Beech it may be taken for granted that the only purpose they serve is to protect the leaves during the inclemency of the winter and spring months, seeing that they die and fall in the course of a few days after the expansion of the leaves. The buds, therefore, have to be examined in order to discover a use for the stipules. Though these British trees are so closely allied, the winter buds are remarkably different in size and form. Those of the Beech are long, pointed and relatively narrow, while the buds of the Oak are short and blunt. Yet the leaves in summer assume the reverse of these proportions. The reasons for these differences are not always obvious; but the growth of the Oak buds is arrested at an earlier stage of their development in summer, when the season's growth has been completed. About twelve pairs of stipules covering the buds of the Beech have no leaves accompanying them; whereas the Oak buds have 20 pairs, that is 40 stipules as a rule, before a leaf presents itself in association with them. These facts should demonstrate the utility of stipules for the particular purpose mentioned. Both leaf and flower buds are similarly protected. Whether it would be useless or not to speculate on the differences between the buds of these trees, the fact remains that the young leaves of the Beech and Oak often get destroyed or greatly injured by late frosts in spring after a period

of mild and genial weather induces them to leave their winter covering of stipules. This applies to trees in the north of Scotland as well as in the south of England, but more often, probably, in the latter case on account of the earlier spring and the earlier development of the foliage. It might be argued that the leaves of the Oak are more tender than those of the Beech, and that they require this extra protection in winter; and this is probably the case for they more often get injured.

The poets of by gone times have described the winter buds as the "cradle" of the young leaves, and the scales as the "swaddling clothes," that to them being a sufficiently close description. The poet more nearly touches the gardener's interest when he says that "in one season's chariot rides the glory of the next," the allusion to the leaves and flowers for the following season being wrapped up in the buds of the current year being perfectly correct in all those cases where the trees and shrubs bloom in spring and early summer. This applies to most, if not all, of our fruit trees and bushes. A knowledge of the details of the winter buds of various trees should prove serviceable to gardeners, if it merely quickens their powers of observation in determining which is a flower and which is a leaf bud. That is important whether fruit or ornamental flowering trees are being pruned. A study of the winter buds and their relative safety from any degree of cold we might experience in this country, might also lead to experimenting with valuable fruit trees in spring with the object of retarding the development and unfolding of the winter buds in order to save the blossom from the destructive effects of late spring frosts.

To return to the text of Sir John Lubbock, we find that the allies of our hardy fruit trees, such as Apples, Pears, Plums, and Peaches, all belonging to the Rose family are well provided with stipules, which in conjunction with some portion of the leaves themselves constitute the scales of the winter buds. This is so in the case of the White Beam Tree (*Pyrus Aria*). It is also interesting to note that the scales are firmly glued together in winter and early spring with a viscid gum, calculated to exclude rain from the interior of the buds in which the tender leaves are situated. Incidentally we may mention that leaves and flowers are much less liable to injury from frost provided they are perfectly dry during the occurrence of the latter. Gardeners themselves are well aware of that fact. It may be asked how it happens that stipules, when they serve the purposes of protection, should be hardier than the leaves they cover. The reply is that the outer ones if not actually dead, are very much modified in being thicker, more leathery, less watery, and therefore less liable to injury, all of which is brought about gradually by exposure during late summer, autumn and winter while the temperature is sinking. Very often the outer ones are quite dead before spring; but that is of no consequence so long as the leaves within are safe.

Sometimes the stipules are so modified as to perform the function of leaves, the latter being absent or represented by a short tendril, as in the case of *Lathyrus Aphaca*. The Pea itself has very large stipules which perform the function of leaves to a degree proportionate with their size; while at the same time they serve to protect leaves and flowers in the terminal buds so long as the stem continues to elongate. Some stipules or their representatives develop into tendrils which enable the plant to climb; and others harden into spines of a more or less formidable character, and must thereby assist in preventing the plant or its foliage from

being entirely destroyed by browsing animals. The various forms and modifications of the stipules if only of scientific value are certainly highly interesting, and open a wide field of study for those seeking for information and edification, and for those in quest of a hobby and can command the time to pursue it. Even our native trees, shrubs and herbs have a wide range of facts to disclose, and pleasure to offer the student of Nature. Plants which do not possess stipules have their leaves more or less modified to serve the purpose of protection in our northern climate. The coloured illustrations of unfolding buds and leaves at the end of the text of Sir John's papers show how ornamental many of our trees are in spring and early summer.

Lady Aberdeen has just named a Rose "Lady Dorothea" in memory of a little deceased daughter of her's. It is a sport from Sunset.

Mr. James Wilson has been appointed and has entered upon his duties as head gardener and steward to Sir J. T. Brunner, Bart., M.P., Druids' Cross, Wavertree, Liverpool.

R.H.S. Victoria Medal.—At a meeting of council held on December 14th, it was decided to issue a Diploma to all the recipients of the Victoria Medal of Honour. It was also unanimously resolved:—"That in the event of any recipient violating the conditions on which the Victoria Medal of Honour was bestowed, by using it for advertising or for the promotion of trade interests in any other way, the name of such offender shall be struck off the list."

Mr. H. G. Smyth, horticultural sundriesman by special appointment to Her Majesty the Queen, has now been able to take possession of his new premises, which have been in the course of re-building for many weeks past owing to extensive alterations and the re-construction of a large block of buildings along one side of the street. His new address is Clark's Mews, High Street, Bloomsbury, London, W.C., the new premises being a decided improvement upon the old.

Chrysanthemum Pennsylvania.—The Editor of the *Weekly Florists' Review* considers this variety as one of the two "stars" of the past Chrysanthemum season in America, the other being the white Frank Hardy. Both scored high with the Chrysanthemum Society of America. Other writers have a different opinion, but they may be wrong seeing that they describe it as identical with Philadelphia, whereas the specimens we have seen and described at p. 212 of THE GARDENING WORLD are of a much darker yellow, though the form is the same.

Deplorable gun accident to Mr. Greenway.—We are grieved and pained to hear of a sad accident which has befallen Mr. William R. Greenway, gardener to Sir Lionel Darrel, Bart., Fretherne Court, Stonehouse, Gloucester. Sir Lionel was out with a shooting party on the estate on Friday, the 17th inst., Mr. Greenway being requisitioned to assist, as is frequently the case on private estates in country districts, when a gun carried by one of the party exploded prematurely while the breech was being closed, and the charge lodged in Mr. Greenway's left leg. Happily the local doctor formed one of the party, otherwise the victim of the accident would have bled to death under the circumstances. He was driven to the Gloucester Infirmary, a distance of ten miles, in Sir Lionel's carriage, in company with his grief-stricken wife, the doctor, and the gentleman whose gun exploded. Sad to say it was found necessary to amputate Mr. Greenway's leg above the knee. He is an old Kewite who left Kew Gardens on the 22nd of August, 1885, to take up the position he has since held to the perfect satisfaction of his employer. He has a family of eight young children dependent upon him for their daily bread, and while we sympathise with him and his family, we know for certain that all of our readers who, like us, were contemporaries with him at Kew, will sincerely regret this distressing misfortune to him, for Mr. Greenway was a great favourite with and respected by everybody.

Flowers in Winter.—A correspondent from Ulverston, Lancs., announces that Primroses, Violets, Wallflowers, Lupines, and Polyanthuses are blooming in his garden.

Affirmative or Negative?—The Chester County Carnation Society in America is to discuss the pertinent question at its next meeting: "Is the American Carnation Society of any use under the sun?"

Mr. Rhodes and his Orange Trees.—The *Cape Argus* says that Mr. Rhodes got out a consignment of Orange trees to Bulawayo and gave them away to settlers, because his own farm was not ready to receive them. There were many applicants for the trees offered, and Mr. Rhodes gave them each a number on the condition that they would give one-tenth of the produce to the Memorial Hospital. On being asked whether he could trust the people, he replied "Certainly; I can trust a large percentage of them, and the custom will develop into a habit which will have greater force than any law."

Coiled Wire Stakes.—There appears to be more than one modification of these in use. Some samples were exhibited at the Drill Hall, on the occasion of the last meeting of the Royal Horticultural Society, on the 14th inst., by Mr. A. Outram, 7, Moore Park Road, Fulham, London, S.W. They consisted of moderately stout, galvanised wire, having three complete coils on the top of the part which is intended for being pushed into the ground. These coils vary in width, three different samples being shown, which may be employed for different purposes by those who utilise them for the purpose of saving time in tying. All are intended, however, for light staking. The stems requiring to be supported are twisted into the interior of the coil and the operation is complete.

Renfrewshire Gardeners' Mutual Improvement Society.—The usual fortnightly meeting of this society was held in Yields' Hall, Paisley, on the 8th inst., Mr. Robert Gallacher, Craighends, in the chair. There were two subjects for this evening, the first being a paper on "Draining, Road making, and Levelling," by Mr. James Walker, Hawkhead. Mr. Walker is an acknowledged authority in the district on such matters, and fully upheld his reputation by the able manner in which he handled the subject. The second was a paper by Mr. McKinnon, Kilnside, on "How Plants obtain their Food." He explained his subject clearly in a concise and able manner. Both papers were very much appreciated by those present, several of the members taking part in the discussion which followed. Votes of thanks to those gentlemen and the chairman terminated a most instructive meeting.

Woolton Gardeners' Mutual Improvement Society.—The usual gathering of members of this society took place on the 16th inst. at the Mechanics' Institute, Mr. T. D. Smith presiding over a large audience. The subject was an attractive one for Liverpool gardeners, being on the Chrysanthemum, by Mr. G. Burden, of Claughton, the winner of the Liverpool Horticultural Society's Challenge Vase. The subject was considered solely from an exhibition point of view, commencing with the cuttings, those from the soil being preferred; and in all cases clean pots were essential. Various modes of striking the cuttings were submitted, but the one recommended was to place in a cool house and plunge the pots in leaves. The final potting should be at the end of May or early in June, the compost most suitable being three parts good loam, one of cow manure, one of leaf mould, and a sprinkling of wood ashes and soot. It was advised to pot firmly. The chief points laid down were stopping for the purpose of timing the bud, in some cases from the 6th to the 18th of July being the best. The Queen family, if late, may have the top removed about July 20th. Buds should be secured between August 15th and September 15th. Feeding was important, a change of diet being recommended; and in all cases cleanliness must be strictly adhered to. Greenfly and mildew must be closely watched and dealt with. An interesting discussion followed, chiefly on damping, for which the lecturer recommended ventilation and, if necessary, a little fire heat to dispel the moisture and give an interchange of air. A cordial vote of thanks was tendered the chairman and lecturer for their valuable services.

Dutch Horticultural and Botanical Society.—At a meeting of the Floral Committee of this society on the 27th November, first-class certificates were awarded to Messrs A. P. Bowman & Sons, of Arnhem, for Chrysanthemums Belle de Gordes and Mdle. Lécadie Gentils; and to Mr. W. Van Veen, of Leiden, for Chrysanthemums Lady Esther Smith, Mrs. J. Lewis, and Mme. Gustave Henry. Certificates of Merit were accorded to Mr. J. Van Houten, of Hilversum, for a white sport from Chrysanthemum C. Harman Payne, and to Mr. A. G. M. Richard, of Naarden for *Yucca filamentosa bicolor*. This latter was shown at the meeting of October 9th, 1897.

International Congress on the Protection of Birds.—A congress on this subject was inaugurated at Aix-en-Provence on the 9th of November last, under the auspices of the Ligue Ornithophile Française, and was concluded on the 27th of that month, according to M. L. Lemon, Esq., in a note to the editors of "Knowledge." The sittings were conducted under the presidency of M. Louis Adrien Levat; and the burden of the matter discussed related to the protection of insectivorous birds useful to agriculture. French and Italian agricultural and horticultural societies were represented, as well as the Society for the Protection of Birds and the Selborne Society in Britain. French societies similar to the two last named also sent delegates. The resolutions formulated at the meetings were to be forwarded to the various Governments of Europe through the medium of the French Minister for Foreign Affairs.

Ealing Gardeners' Society.—There was a large attendance of members of this society on the 14th inst., to hear a paper on "The Present-Day Gardener," by Mr. Arthur Pentney, Worton Hall Gardens, Isleworth. Mr. Pentney dealt with his subject in a broad and liberal spirit, giving the modern gardener credit for a good deal of work and influence. A comparison between the past and present gardener was, of course, a necessity in this Jubilee year of grace; the former, however, also came in for a share of praise, not only by the reader, but by several of those who took part in the discussion. Considering the primitive nature of the appliances of the early century gardener, he accomplished some wonderful things. The present-day worker, however, was required to do many more things, and to cope with a larger number and variety of plants than his ancient predecessor. Mr. Pentney received a cordial vote of thanks. He exhibited a very pretty specimen *Begonia Gloire de Lorraine*, which was much admired. Mr. C. B. Green presided.

Royal Horticultural Society of Ireland.—The annual general meeting of this society was held at the Central Hall, 12, Westmoreland Street, Dublin, on the 8th inst., Capt. Lewis Riall, D.L., presiding. The secretary, Mr. G. M. Ross, read the report of the council for the past year, when it transpired that the receipts from the various shows had risen from £373 16s. 6d. to £562 17s. 0d. This prosperous state of matters was largely due to the visit of their Royal Highnesses the Duke and Duchess of York to the autumn show, when a large concourse of visitors attended. There was, however, an increase of the receipts from other shows. Two of the Society's Challenge Cups had been won outright during the year, but they had been replaced, the Rose Cup by Messrs. Alex. Dickson & Sons, Newtownards; and the Chrysanthemum Cup by Lord Ardilaun, the president. The total receipts for the year were £1,023 11s. 5d., and after paying all expenses there was a balance in hand of £99 7s. 8d. The chairman, in moving the adoption of the report, stated that the entries had steadily increased during the last three years, and the receipts were also rising. Mr. F. W. Moore, curator of the Royal Botanic Gardens, Glasnevin, proposed an alteration of the rules, whereby three practical gardeners would be able to serve on the council each year, and this motion was carried. The members of council for 1898 are Lieutenant-Colonel Jervis-White, J.P.; Rev. F. C. Hayes, M.A.; F. W. Moore, Esq., M.R.I.A.; H. Smallman, Esq.; Maziere J. Bady, Esq.; Captain Lewis Riall, D.L.; Shapland M. Tandy, Esq.; and Mr. W. J. Mitchison for the first time; Mr. R. Russell, who was also a candidate, being again defeated.

Compliment to Mr. Hugh Dickson, Belmont.—On Thursday evening, the 16th, Mr. Hugh Dickson, the owner of the well-known Belmont nurseries, was entertained to dinner by a large circle of his friends, and was made the recipient of a beautifully-illuminated address in album form, which set forth the guest's efforts for a long period of years in the promotion of horticulture in Belfast and the North of Ireland. The function took place in Messrs. Thompson & Sons' Restaurant, Donegall Place, Belfast, and was in every respect a great success. Mr. Thomas Shaw, J.P., presided, and a numerous company joined in the well-deserved tribute to the popular guest. Mr. M'Intosh, in responding to the toast of Mr. Dickson's old friends, said that having known Mr. Dickson when living in Newtownards he, in common with the entire community there, regretted when he left the town. He was a most upright, sterling, energetic man, and they had followed his career with the greatest interest, and taken deep pride in all his achievements. During the evening an excellent programme of song was rendered, and the enjoyable proceedings terminated with the singing of "Auld Lang Syne."—*W. F. C.*

with vases of Chrysanthemums, Roses, etc. In the centre of the room a large circular table, on which were placed Grapes and other fruits to regale the company, was most beautifully decorated. A magnificent and elegantly arranged vase of Chrysanthemums occupied the centre, while smaller vases of Tea Roses, Cattleyas, Orchids, etc., with two very elegant baskets of growing Lily of the Valley and Ferns, rendered this table a feast of beauty.

The guests were received by the president and his amiable wife, whose geniality and courtesy to all present added greatly to the success of the gathering. The immediate object of the meeting was to publicly announce the allocation of the surplus funds from the recent Chrysanthemum show which, as our readers are already aware were to be devoted to charitable objects. The success of the exhibition all our readers know from our reports at the time was of a

On the invitation of the president, the treasurer of the Association (Mr. McKenzie) then presented the Lord Provost with a cheque for £100 for the Infirmary Pavilion Scheme; and also handed a cheque for £50 to Mr. Cook, C.A., Treasurer of the Sick Children's Hospital.

The Lord Provost, before referring to the objects of the meeting, congratulated the proprietor of the Hotel on the completion of building, and on the beauty of the rooms. In the recent eminently successful show they had, he said, done three good things; they had stimulated an interest in the cultivation of these beautiful flowers; they had given a vast deal of pleasure to the citizens of Edinburgh; and by handing over these cheques they had placed the city under a debt of gratitude to the society.

On behalf of the Royal Infirmary he thanked them most heartily for that handsome cheque, and

A SOUVENIR OF EDINBURGH SHOW.

THE accompanying group of portraits depicts on the left the president of the Scottish Horticultural Association, whose year of office, now closing, has been endowed with so signal a success beyond all previous records. The handsome sums which the association last week allocated to charitable purposes, owe much of their existence to the personal devotion and assiduity of Mr. Todd, as president, who, by the bye, gives an "At Home" this week at the Society's Official House at which the formal presentation of these sums will be made to the charities selected.

To the right of Mr. Todd in the photo is Mr. A. Williams, the gifted musical director of the Grenadier Guards Band, whose performances at Edinburgh were undoubtedly an important factor in the attendances. Mr. Williams had the gratification of knowing that his efforts have succeeded in fully maintaining the high reputation of the Band, and he is sure of a hearty welcome again at Edinburgh.

To the left of the group is the well-known figure of Mr. H. J. Jones, of Ryecroft fame, who stands in the proud position of being the only winner in the miscellaneous section of the association's Diamond Jubilee Gold Medal—a coveted honour which does him infinite credit.

To the right is Mr. A. E. Stubbs, of the Ichthemic Guano Company, whose tasteful exhibits are invariably a welcome adjunct at all our leading shows.

SCOTTISH HORTICULTURAL ASSOCIATION.

PRESIDENT'S AT HOME.

A HIGHLY successful gathering of this spirited and popular association took place in the Royal British Hotel, Edinburgh, on the evening of Tuesday the 21st inst. The meeting was organised and carried through by Mr. M. Todd, the energetic and popular president of the association, ably assisted by Mr. R. Laird and Mr. J. H. Murray, the hon. and assistant secretaries, and was attended by about 150 ladies and gentlemen. Amongst those who accepted invitations were the Lord Provost of Edinburgh; Bailies Kinloch, Anderson, Hay, Mackenzie, and Sloan, Councillor Cranston, Mr. D. P. Laird, Mr. John Methven, Mr. David Mitchell, Mr. Dunn, Dalkeith Park; Mr. Smith Hopetoun, Mr. R. W. E. Murray, Mr. A. Milne, Mr. A. Mackenzie, Warriston; Mr. D. T. Fish, Mr. Harrow, Botanic Gardens; Mr. Peter Loney, Mr. Macintyre, The Glen; and a large number of horticulturists and their lady friends. The meeting took place in the magnificent new dining saloon of the hotel (one of the most spacious and elegant rooms in Edinburgh), which was most beautifully decorated for the occasion by the president.

Specimen Palms in beautiful pots, on handsome pedestals, were arranged throughout the room, and the mantles, sideboard, etc., were elegantly decorated

Edinburgh and London.

MR. A. E. STUBBS.
MR. A. WILLIAMS.

phenomenal description, whether looked at from the extent of the show, the high quality of the exhibits, or its financial results.

The president intimated that after all the expenses had been paid, the committee have a sum at their disposal for charitable purposes of £250, and it had been resolved to allocate it as follows:—A sum of £100 to the Edinburgh Royal Infirmary; £50 to the Royal Hospital for Sick Children; £50 to the Royal Gardeners' Orphan Fund; and £50 to the Gardeners' Royal Benevolent Institution. In announcing these donations, the president, in a neat and eloquent speech, expressed the great pleasure it gave the committee to be able to dispose of these handsome sums for charitable objects, and they hoped that continued success of these popular exhibitions would result in further sums being available for such beneficent purposes.

he was sure his colleagues would be very gratified when he reported it to them. (Applause.)

Mr. Cook also acknowledged the donation towards the Sick Children's Hospital.

During the evening tea and coffee with other light refreshments with fruit, were liberally served, while a musical programme of great excellence was carried through with much spirit and ability by various talented ladies and gentlemen to whom a hearty vote of thanks was accorded towards the close of the meeting. On the motion of Bailie Hay a most enthusiastic expression of thanks was made to the president and his wife for the manner in which they conceived and carried out the meeting to a successful issue. The whole function was as enjoyable as rare in horticultural annals, and we hope the example set by our Edinburgh friends will be productive of an annual recurrence of such enjoyable meetings.

LEAVES FROM MY NOTE BOOK.

PHLOXES.

AMONGST the newer late Phloxes I noted the under-mentioned varieties as being exceptionally grand, both in size and form. Argon is rather dwarf, with good spikes of delicate rosy-scarlet flowers, quite a distinct colour. Bacchante is a fine dark rosy-crimson, with purple eye, and large Derliche is a dark lilac flower, with a purple centre, large and distinct. Esperance is pale mauve with light centre, and very attractive. Girondin, rosy-carmine, rather lighter in the centre, is a lovely flower of faultless form. Huxley, white, deepening to lilac at the edge, has very large flowers and spikes. Laniboire, rosy-scarlet, with violet centre, is a lovely variety. Lord Raleigh is the nearest approach to a blue I have yet seen; when shaded it is almost so. The flowers individually are of the finest form, and the spikes are tall and branching. Le Mahdi is another dark shade, being violet-blue, slightly tinged bronze. Madame M. Carvilio is a first-rate white dwarf habit. In Pencheur d'Islande we have a salmon-carmine shade with a white eye; it is a distinct and pleasing variety. Tourhillon is a very distinct shade of dark scarlet, with white centre, and has tall handsome spikes. Torpilleur has bright magenta, large and faultlessly formed flowers. William Ramsay, is a dark violet variety, of good form, and is quite distinct.

The above are all varieties of recent introduction, and are worthy of being added to the lists of good sorts, which I have noted from time to time in these columns. No better flower than the Phlox can be grown for an autumn display in our gardens. This is being more and more recognised every year, evidence of which we have around us in all directions. The range of colouring now to be had, and the dwarf habit of many of the varieties for bedding purposes, tend to still further increase the popularity of this handsome autumn flower.—Coila.

THE NATIONAL CHRYSANTHEMUM SOCIETY.

ALL the controversy respecting the N.C.S. and the Royal Aquarium is tending to show what an ill-adapted and unpleasant place it is in which to hold horticultural exhibitions and the disappointing amount of money the directors offer the society compared with what is actually received at the turnstiles. This has been forcibly debated in the *Journal of Horticulture* recently, and is in my opinion most desirable, for the reason that there is at present no other suitable central place; and it seems to me the only remedy for future success is to set about finding a site, and erecting a building, temporary or otherwise, so that the most ardent in horticulture may have full control according to their likes and means.

The scheme for a horticultural hall, which I suggested several years ago, and similar to what is in existence in many cities in America and on the Continent, was most favourably received by the president, council, and also the committee of the Royal Horticultural Society. Thousands of pounds were promised, and this I sincerely hope still stands good. If I am not mistaken one gentleman offered to give £5,000 if a similar sum was subscribed by a certain time; but unfortunately just at that time financial matters in the world were unfavourable, and great depression in business existed. It seems to me that the present should prove to be a most opportune moment for the revival and carrying out of that or a similar scheme.

If a powerful and influential committee were selected from the National Chrysanthemum Society, and if our highly esteemed president, Sir E. Saunders, could be induced to act as spokesman, offering our cordial support to the president and council of the Royal Horticultural Society, the whole matter could be discussed, and the feeling of kindred societies and the public generally be ascertained.

The Rose, Carnation and Picotee, Auricula, Narcissus, and Cacti societies continue to hold their shows at the Drill Hall, and I feel sure the National Chrysanthemum Society would be received with open arms, and without that chartered body wishing in any way to exercise any control over its internal arrangements whatever. I am both willing and anxious to co-operate in assisting to bring something of the kind prominently before the public. Unity is strength, and it seems to me that the united strength

of all the kindred societies now existing in London could be secured, and would pay their proportion towards the interest on borrowed capital, if such a course was deemed necessary. There is no reason why we should not have a home of our own, and not lodgings for ever.

I think we might reasonably count on something like the following income, each society, of course, taking its own gate money:—

| | | |
|---|--------|-----------|
| Royal Horticultural Society .. | £400 | per annum |
| National Chrysanthemum Society | £200 | |
| .. Rose | £100 | |
| .. Dahlia | £100 | |
| Carnation and Picotee | £50 | |
| Auricula | £25 | |
| Cacti | £10 | |
| Letting the hall for horticultural business committee meetings .. | £100 | |
| Letting for other approved purposes | £1,000 | |
| Total | £1,985 | |

This at 4 per cent. gives a borrowing power of nearly £50,000.

If the council would favourably reconsider the suggestion, and all kindred societies would cordially support such or a similar scheme it seems to me we can well picture Phoenix rising boldly out of its own ashes, and British horticulture going on in rapid harmonious strides. It certainly is an undisputed reproach that horticulturists do not possess in the city of London, a building large enough to hold even an ordinary flower show; and in my opinion it is now quite time we did. I ask one and all if the time has not arrived when this hall should be begun.—H. Cannell.

ORCHID NOTES & GLEANINGS.

BY THE EDITOR.

A yellow *Odontoglossum crispum*. *Nov. var.*—A yellow ground variety of the most popular *Odontoglossum* in cultivation has long been a desideratum, and the wish has at last been gratified by a cheerful and bright variety, the body colour of which forcibly recalls the hybrid *O. excellens*. The segments, as far as form is concerned, and particularly the lip, are those of *O. crispum*. The lanceolate sepals and elliptic petals are of a clear and pleasing yellow, the sepals being ornamented with a group of four to five bright chestnut-red spots. The petals are spotless. The lip is of the same colour precisely as the rest of the flower, sharply waved or crisped, and marked with three to five large chestnut-red spots, as well as some smaller specks. The colour is more or less blotched with brown on the back, and tinted with the same hue on the face. The plant is yet only a small piece, but it will be greatly increased in size by the time Mr. J. McBean, of Cooksbridge, Lewes, Sussex, has given it another year's growth. The variety is exceedingly pretty, and now flowering in his collection. Mr. McBean is a noted grower of *Odontoglossums*, fully understanding their cultural treatment.

VEGETABLE CALENDAR.

SEAKALE.—A regular supply of this vegetable will be expected in most establishments after this date, and to meet the demand a good proportion of the roots may be lifted and stored at the base of a wall, covering lightly with leaves or other light material to protect them from drying. All the strongest thong-like roots should be saved for cuttings, and these can be made any time during inclement weather. Any position having the three requisites, warmth, darkness, and moisture, will suit Seakale. A cheap and good method is to dig out a bed 6 ft. wide and a foot in depth, and in this place 2 ft. of fermenting material, covering this with 8 in. of light soil. In this the roots can be planted, and the whole bed covered with a light framework over which a few thicknesses of mats or straw must be placed to exclude the light and retain the warmth. Seakale grown in this way is generally succulent and more satisfactory than when grown in sheds or under stages.

PEAS.—For growing in pots or frames or orchard houses a sowing of some approved dwarf Pea such as Chelsea Gem may now be made in pots or on turves. Small 60-size pots are handy for moving about, and also for transplanting from. Sufficient of these should be filled with a loamy soil, and half a dozen Peas placed in each. A gentle heat may be applied to forward germination, but when once that has taken place a cool position close to the glass must be given to keep them dwarf and stocky, and when well-rooted these may be transferred to larger pots or borders as desired.

FRENCH BEANS.—To have the fullest success with these at this season of the year top and bottom heat is necessary. At the present time we are preparing a bed 100 ft. long by 6 ft. wide down the centre of a low span-roofed house for this crop. A bed of fermenting material, 5 ft. deep, will be formed, and on this 1 foot of light rich soil will be placed for planting in. The Beans, Canadian Wonder and Magnum Bonum, have been sown singly in small 60-pots in a warm house, and out of these pots they will be transferred to the new bed without receiving any check. After planting a temperature of 60° to 65° will be maintained, with a rise of 10° during bright weather. Sowings of Ne Plus Ultra may also be made for growing on in pots in warm positions, to give a few dishes before the beds come into bearing.

SALADING.—This is never more appreciated than during the dull winter season, and the aim should be to keep up a regular supply from this time onwards. To do this, periodical sowings of Mustard and Cress must be made in boxes in intermediate houses. Roots of Chichory, according to the demand, should be placed in warmth and darkness at short intervals, to have it fresh and crisp. Large plants of Endive placed in a little extra warmth during blanching, are much improved, as a quick tender growth is induced. Lettuces growing in frames will require close watching and abundance of ventilation on all favourable occasions. A few roots of Tarragon should also be introduced into gentle heat for supplying a few sprigs when required. A supply of fresh Mint should also receive attention. Boxes filled with roots lifted in September and placed in heat a fortnight ago are now showing abundance of young growth, and will keep up a supply for a long period.—J. R.

The Orchid Grower's Calendar.

LAELIA AUTUMNALIS.—For winter work this is a most beautiful and showy Orchid, producing flowers 4 in. to 5 in. across on scapes 18 in. to 2 ft. in height. The flowers are of a pleasing amethyst colour, and strongly scented.

Its culture is very easy and as they take up but little room it should commend itself to amateurs with limited space. We grow ours in pans and baskets which are suspended from the roof of the Cattleya house. Very little compost is placed about them, as the roots appear to resent being covered up too much. Peat and moss in small quantities is therefore used. The plants are made secure by means of wire, which should be of copper.

LAELIA GOULDIANA.—Without possessing the qualities that nowadays are required in an Orchid to make it go, viz. size, this is nevertheless a very charming plant. By some it is considered a natural hybrid between *L. autumnalis* and *L. albida*, and by others as a species. I am inclined to the former view, as there is a lot in it that reminds us of the smaller forms of *L. autumnalis*.

Then we have the beautiful *L. crawshayana*, which is the only *Laelia* that has any likeness to it; and I am not surprised at specialists having mistaken one for the other, without proper materials at hand for comparison. The pseudobulbs and scapes are quite distinct, taking, as they do, more after *L. albida*. The labellum, too, is blunt or rounded, whilst in *L. gouldiana* it is acuminate. The colour of the two, however, is very similar and it may be that they are reverse crosses of the same parents, *L. autumnalis* and *L. albida*.

ONCIDIUM SPLENDIDUM.—This fine Orchid is just pushing up its stiff erect spikes and as they are very succulent they should be protected from slugs by having a piece of cotton-wool put round them. Should there be any that are refractory and refuse to push the spikes place them in the warmest end

and keep them moderately dry, this will generally have the desired effect. When they have started give them water to help them to develop. Some grow this variety or species very well in the Cattleya house, but I think, where possible, it should have a few more degrees of heat when growing freely.

Suspended in pans in the warmest division it seems to produce the best results. The usual compost, peat and moss, grows it well.

WORK IN THE HOUSES.—Pay particular attention to the giving of air, regulating the temperatures, damping down, &c. Always remember that an excess of either is most harmful; at the same time avoid low temperatures. Anything below the figures given in a previous calendar would be dangerous.—C.

THE FLOWER GARDEN.

DECEMBER has greeted us in rather stormy fashion, and work out of doors has, as a consequence, been very greatly hindered, for with the soil wet and sodden it is impossible to move about upon it much. Leaves and portions of branches, dead or otherwise, strew the ground in all directions, and the broom will have to be plied busily if the lawns and terraces are to be kept in order.

The work of collecting and removing the fallen leaves from outlying portions of the grounds should be prosecuted vigorously, for it is of very little use sweeping and cleaning in the more highly kept portions of the grounds, while the remoter parts are covered with leaves, which every rough wind will carry over the whole place.

ROSES.—On very wet and cold soils it will be advisable to defer any further planting until spring, for the soil will not only work better then, but it will be safer for the plants themselves. Meanwhile, all necessary precautions should be taken to insure the safety of the plants that have been put in already. A good mulching of short, well-decayed stable litter is the first consideration. This may be given to all the Roses with advantage, as well as to the newly planted ones. Standards will need to be properly staked and secured if they are to pass safely through the ordeal of rough winds. A small, neatly twisted band of hay should be so placed as to come between the stake and the stem of the plant, in order to prevent abrasion of the latter.

COVERING TEA ROSES.—Although we have not as yet had enough of winter to do harm to the Teas, it will be necessary in the midland and northern counties to give them protection against cold, and this should be seen to as soon as occasion offers. Dry bracken, and heather are both very suitable covering materials, and as one or the other can be obtained by many gardeners for the trouble of cutting and carrying, the cost is very low.

HELLEBORUS NIGER.—In order to prevent the flowers from becoming splashed by mud during heavy rainfalls, it will be well to cover the Christmas Roses with large bell-glasses or handlights. The square Cauliflower lights come in very handy for this purpose, and if they are not otherwise engaged, may well be thus utilised. Where the plants are growing in the wild gardeo, beneath the partial shade of trees, they may generally be left to take care of themselves, for the fallen leaves protect them from the washing up of the soil.

THE HERBACEOUS BORDER should now be finally put to rights for the winter. All remains of last summer's growth should be cleared away and burned, stakes removed, tied up in bundles and placed in safety, and labels properly inserted opposite their respective plants. After all rubbish is cleared, the border should be forked neatly over.

MOUTAN PAEONIES.—The Tree or Moutan Paeonies when grown in beds by themselves in sheltered parts of the garden are very effective. They require some protection during the winter, and this may be best given in the form of a heavy mulching. Dead snags or portions of branches may be cut off at the same time.

Christmas is now upon us, and quantities of evergreens of all sorts are required for decorating. A look round the shrubberies should be given so as to determine from whence the required material may best be taken. In many cases shrubberies may be improved by a little thinning out or regulation of growth. Where nicely coloured sprays and foliage of Mahonia Aquifolium is in request, it will be as well to take a few plants and cut them close to the ground, for they will throw up again from the stools next year.

BORDER CARNATIONS, which were transferred to their flowering quarters about the middle of October, should be closely watched. Rabbits and sparrows will often mutilate the foliage and practically cripple the plants. Where the plants are in a part of the garden open to the encroachments of rabbits, it may be worth while to enclose the beds with inch mesh wire, whilst an occasional shot will tend to keep off the sparrows. After periods of frost, the plants should be looked over, and any that have been partially lifted out of the ground, pressed back again. A changeful winter, with variations of frost, snow, rain, fog, and cold winds is exceedingly perilous experience for border Carnations.—A. S. G.

Gleanings from the World of Science.

Cyclamen with leafy flower stems.—Some flowers picked from a batch of Cyclamens were sent us by Mr. A. Pentney, The gardens, Worton Hall, Isleworth. The scapes were rather stouter than usual, and surmounted by a solitary bud or open flower, below which two or three leaves seemed to be given off at short intervals from the scape. Examination of the same showed that the petioles of the leaves were amalgamated with the flower scapes. This state of matters had arisen at a very early stage of growth, the leaves and scapes, owing apparently to vigour of growth, being unable to separate in the usual way at the point of origin on the crown of the corm. Whether a strain of plants having this characteristic would possess any decorative value would depend upon the size and quality of the flowers, as well as their numbers on a plant. Seemingly, the flower scapes would be stronger, but it must be remembered that they have the additional weight of the leaves to support, though the latter are considerably smaller than the radical ones.

PLANTS RECENTLY CERTIFICATED.

THE awards mentioned below were made by the Royal Horticultural Society on the 14th inst.

Orchid Committee.

CALANTHE HARRISII.—The flowers of this hybrid are of great size and substance. At a short distance off they appear pure white, but there is a pink tint on the back of the segments. The plant shown by J. T. Bennett Pöe, Esq. (gardener, Mr. Downes), Holme-wood, Cheshunt, was of small size and flowering for the first time, so that when more fully developed it will produce large spikes of magnificent flowers. First-class Certificate.

CYPRIPEDIUM AESON GIGANTEUM. *Nov. hyb. var.*—The upper sepal of this splendid variety is of great size, orbicular, apple-green on the lower portion and richly blotched with brown, while the upper area is pure white. The petals are light brown, and the lip, which has a wide open mouth, is dark brown. The parents of this striking hybrid were *C. insigne* and *C. Drurii*, the latter being the pollen bearer. It is half as big again as *C. Aeson*, if not more. Award of Merit. Messrs. J. Veitch & Sons, Ltd., Chelsea.

LAELIA ANCEPS MRS. DE B. CRAWSHAY. *Nov. var.*—The sepals and petals of this beautiful variety are rich purple with deeper tips. The lip and the side lobes are rich crimson, while the throat is lined with crimson. Award of Merit. De B. Crawshay, Esq. (gardener, Mr. S. Cooke), Rosefield, Sevenoaks.

LAELIA BRISEIS. *Nov. hyb.*—This choice and heartily distinct thing was obtained from *L. cinnaharina* harpophylla crossed with *L. purpurata*. The lanceolate sepals and petals are of a deep apricot, fading almost white with age along the centre. The lip is similar in size and form to that of *L. harpophylla*, but is nearly white, with two or three purple splashes on the lamina. Award of Merit. Mr. James Douglas, Edenside, Great Bockham, Surrey.

TRICHOPILIA BREVIS.—The sepals and petals of this distinct species are revolute at the edges, and deep

chestnut, with yellow tips and fainter bars across them. The lip is suddenly very much expanded above the short tube, and is white with a lemon tube, Award of Merit. Sir. F. Wigan (grower, Mr. W. H. Young), Clare Lawn, East Sheen.

LAELIA PUMILA PRAESTANS.—The sepals and broad, elliptic petals of this variety are lilac-rose. The tube is nearly white externally and yellow internally. The lamina and the side lobes are of an intense crimson-purple. Award of Merit. R. W. Richards, Esq., The Priory, Usk.

LAELIA RUBESCENS.—This dainty little species has suborbicular and compressed pseudo-bulbs from which the flower scapes rise to a height of 1 ft. bearing six or eight lilac flowers, having a crimson blotch in the throat of the lip. The species is also known as *L. peduncularis*, both names being given by Dr. Lindley. Award of Merit. Walter C. Walker, Esq. (gardener, Mr. Geo. Cragg), Percy Lodge, Winchmore Hill; and Sir Trevor Lawrence, Bart. (grower Mr. W. H. White), Burford Lodge, Dorking.

CALANTHE SANGUINARIA.—The flowers of this fine hybrid are blood red, with paler tips to the sepals, and a darker crimson blotch in the throat. Award of Merit. Sir Trevor Lawrence, Bart.

CALANTHE BURFORDIENSE.—In this case the sepals are of an intense rose, while the petals are carmine. The lip possesses a mixture of both these colours, intensified at the base. Award of Merit. Sir Trevor Lawrence, Bart.

C. VEITCHI SPLENDENS.—A large batch of this variety was shown by Sir Trevor Lawrence, Bart., bearing long, arching spikes of rich carmine-rose flowers. Award of Merit.

LAELIA LINDLEYANO ELEGANS. *Nov. hyb.*—The parentage of the hybrid is rather complicated, and might be described as having originated from *Brassiolaelia lindleyana*, crossed with the pollen of *Laeliocattleya elegans*. The sepals and lanceolate petals are acuminate and creamy-white. The tube of the lip is flush, with a lemon blotch on the side lobes; while the lamina is crimson-purple. The broad claw of the lip is unfolded at the sides and recalls the influence of *Brassia*. The clavate stems are 3 in. to 8 in. in length. Award of Merit. Sir Trevor Lawrence, Bart.

MASDEVALLIA CORNICULATA.—The flowers of this species have a tube similar in style to *M. Reichenbachii*, and are orange-red externally, but more inclined to yellow internally. The tails are yellow. Botanical Certificate. Sir Trevor Lawrence, Bart.

CIRRHOPETALUM MEDUSAE.—The flowers of this singular looking Orchid are small individually, but they are produced in dense clusters or heads. They are white, marked with purple spots and furnished with tails about $3\frac{1}{2}$ in. in length. A Botanical Certificate and a Cultural Commendation were awarded to a piece carrying twelve heads, and shown by Sir Trevor Lawrence, Bart.

Floral Committee.

BEGONIA WINTER CHEER.—This is one of the new winter-flowering race of Begonias, and a very fine thing it is with large and often semi-double flowers. It was raised from a tuberous variety crossed with the pollen of *B. socotrana*, between which it is perfectly intermediate. The leaves are cordate-orbicular, with overlapping auricles, but three or more times as large as those of *B. socotrana*. The plant has the habit of the well-known *Adonis*, and bears rosy-carmine flowers in large cymes at the top of the stems which are only about 12 in. high. They often have a rosette of small petals in the centre, and are both showy and durable. Award of Merit. Messrs. J. Veitch & Sons, Ltd.

Fruit and Vegetable Committee.

CELERY SOLID WHITE.—This has been on trial at Chiswick, and was brought up to the Drill Hall for inspection. The leaf stalks are white and of good flavour. The crown of the rootstock, that is, the only real portion of stem is much more largely developed than in ordinary varieties of Celery and being white, solid, of nutty and excellent flavour, it makes good eating; hence the name above given. Award of Merit. Messrs. Sutton & Sons, Reading.

PEAR PRESIDENT BARABE.—The flesh of this late keeping variety is white, very tender, juicy, melting, and of excellent flavour; for it took the first prize for flavour in the usual competition. The fruit is pyriform, and the skin russetty-yellow. It may be classed, therefore, as a good variety for December and Christmas. Award of Merit. Lord Suffield (gardener, Mr. W. Allan), Gunton Park, Norwich.

HINTS FOR AMATEURS.

Christmas Decorations—By the time these notes are in the hands of our readers the joyous revelry of Christmas will already have begun. To all Celtic nations the Yuletide still maintains its importance; and old as well as young look forward to its bewitching influence. Throughout the busy hours that precede Christmas day, as well as on the day itself, many willing nimble fingers are employed in decorating the home with whatever material comes to hand. Nor is this material scanty in either quantity or variety; indeed, given a fair amount of individual taste, and some originality, the Christmas dinner-table may be made to look fully as attractive from a decorative point of view, as a table dressed with mid-summer's choicest flowers, although it may be in a totally different way. Dwelling rooms and corridors, too, in their garb of festal green, with here and there a sparkle of berry or flower, or a flutter of plummy grasses and Palm fronds, may bid defiance to the reign of winter outside, and transfer the thoughts of the occupants from the cold and weariness of the world, as it is to the world of perennial summer where neither cold, nor wet, nor dullness enter.

It is marvellous, indeed, what deft hands, and a little greenery can do to a cheerless room—the effect in such cases is often more happy by reason of its being unstudied. The more elaborate arrangements, of course, call for the exercise of care, and skill, and judgment in determining the relative quantities and positions of the subjects that are employed. There is such a wealth of material available, that there is plenty of room for original conceptions, while those who do not care to plan or construct a scheme for themselves, may follow other ideas with advantage.

The "Mistletoe Bough" must perforce be present somewhere, else it would not be Christmas, but this plant does not lend itself very readily to ordinary decorative purposes. Fashion has decreed that a huge bough of it shall be strung up either in the hall or corridor, and here the young people and the giddy elder ones make merry round it.

It may be of interest to note a few of the available subjects that are most useful at such a season.

Grasses.—There is such a vast difference in the character and general appearance of the grasses that we can only mention a few of the most popular. The palm must be given to the so-called Pampas Grass, *Gynerium argenteum*, and *G. saccharatum*. These can be bought in the market at a comparatively cheap rate, and as they last for a very long time in condition, they are well worth buying, if the amateur is not fortunate enough to possess a good plant from which to cull his own material. Of the smaller grasses *Agrostis nebulosa* appears to be a great favourite. It is light and feathery, and makes up very prettily in small baskets of flowers, foliage, or both combined. Some would-be improvers upon Nature have taken upon themselves to dye this grass in shades of impossible red and purple, and it is to be feared that this perverted taste is not a restricted one. The quaking grasses *Briza minor* and *B. maxima* are pretty and useful.

Clematis Vitalba.—In localities where this charming British plant is to be found in quantity, it is a capital plan to cut long sprays of it when closed with the bunches of feathery stigmas which have given the plant its popular name of "Old Man's Beard." The leaves, of course, die, and may be removed; but the plumes still remain attached. These sprays come in very useful for decorative purposes, and will last in condition until they have become so blackened by the smoke of the city as to render their removal desirable.

Berried Plants.—Naturally enough, the berried plant for Christmas is the Holly, but it often happens that there is a scarcity of well berried Holly, and then something else must be impressed into service. The hops of the wild Rose form a capital substitute, and we have even seen very passable results obtained by fixing a few of the smaller hops to Holly branches, the deception not being apparent when the doctored branches are placed fairly high up.

Crataegus Pyracantha, commonly known as the Evergreen Thorn, and the variety *C. P. Lelandi* are exceedingly useful. The plants berry freely when the Holly refuses to, and sprays thus furnished form no bad substitute for Holly. The ripened and opened

fruits, showing the orange-coloured seeds of *Iris foetidissima* are also highly decorative.

General greenery.—In this direction there is a vast field from which to select what meets the particular needs of the operator. Branches of Conifers of various kinds, Laurels, Bays, Box, and variegated Hollies of various sorts may all be made use of. Long trailing sprays of Ivy taken from exposed situations where the rich colouring of the leaves has been fully developed, form some of the most elegant and effective decorations that can possibly be employed. The same may be said of long strings of *Myrsiphyllum asparagoides*, popularly known as *Smilax*, which is cultivated in such tremendous quantities for the market. The price, too, is reasonable enough, and well within the reach of those possessing only a fairly lined purse. The hothouse *Asparaguses*, *A. plumosus*, and *A. tenuissimus* are comparatively tender plants, but their fronds when cut last for a surprisingly long time, and are far superior to Maidenhair Fern. Other subjects will suggest themselves, those quoted being only a few of the most useful and easily obtained.

Honesty.—This is an old-fashioned garden favourite which is well worthy of any space it may occupy. When the outside portion of the seed pods is peeled off, displaying to view the silvery septum that separates the pods into halves, we have a first-class decorative subject. Cut with long stems *Honesty* comes in well for the filling of large vases, either by itself or in conjunction with other things, whilst smaller pieces may be disposed of with equal advantage in smaller vases, or in baskets, filled with winter foliage and berries.

Berried Plants.—In addition to cut sprays of the various plants mentioned, berried plants in pots tastefully disposed will add much to the general effect. *Skimmia japonica*, *S. oblata*, *Pernettya mucronata* in variety, *Solanum Capsicastrum*, *S. Pseudo-capsicum*, and *Ardisia crenulata* are a few of the most common plants of this description. For a landing on a staircase, or a nook in any of the dwelling rooms it will be easy, given a few plants of any of the above, and some of the Palms that take most kindly to indoor life, to set up a very pretty group that will stand through the Christmas week without the plants taking any harm. The great point is to see that the plants are not subjected to draughts. Plenty of light is also essential, whilst the water supply must be carefully regulated. If these precautions are taken, the plants will stand unhurt. Some of the Palms best adapted for the service are *Kentia belmoreana*, *K. fosteriana*, *K. australis*, *Phoenix canariensis*, and *P. rupicola*. *Areca lutescens* will stand fairly well but must not be tried too far. *Cocos weddelliana* is not at all a success; and if the plants are valued should not be subjected to the ordeal.

The Dinner Table.—In case any of our readers propose to have a table in keeping with the season we may suggest the following arrangement. For a fairly large table two candlesticks may be permitted. These, of course, should be placed in the line of centre. Between them, and lying flat upon the table, also in the line of centre, should be a mirror measuring about 3 ft. in length by 18 in. in width. In the centre of this may stand an epergne filled with foliage of various kinds and berries, with little sprays of *Honesty* inserted here and there, together with pieces of *Iris foetidissima*. Clusters of the black fruits of the Privet (*Ligustrum*) wired to give them the requisite stiffness, also look well. The epergne should be at least a foot higher than the candlesticks, and should have a fairly heavy base. The candlesticks themselves may be wreathed round with long bands of Ivy, while their bases may be encircled with small pieces of Holly. Select a number of small pieces of well-berried Holly, and lay them all round the edge of the central mirror to form a border. Ten small baskets of foliage and berries should be placed round the table, four to be on each side, one at the head, and one at the foot. These, if neatly made, will not take up much room, but will add to the finish of the whole.

Scarlet or red berries should be employed throughout, and these colours with green will be the most conspicuous ones, giving a very pretty and seasonable combination.—*Rex*.

Correspondence.

Questions asked by amateurs on any subject pertaining to gardens or gardening will be answered on this page. Anyone may give additional or more explanatory answers to questions that have already appeared. Those who desire their communications to appear on this page should write "Amateurs' Page" on the top of their letters.

Gooseberry Cuttings—*V.*: Select fairly stout well-ripened tips of shoots from 10 in. to a foot in length. With the point of a sharp knife pick out all the buds for about 6 in. above the base of the cutting. The easiest way of putting in the cuttings is to cut a trench and put them in, allowing from 3 in. to 4 in. between each cutting. Return the soil to the trench, and tread it down firmly. The cuttings may remain in this position until they are rooted. Frost will not harm them, and hence it is not necessary to cover them.

Variegated Kale.—*S. Regan*: The chief use to which variegated Kale is put by the cooks is that of garnishing various dishes, for which the elegant curled leaves are highly suitable. We have never heard that the flavour, when cooked, was inferior to that of the ordinary green curled varieties, although the fact remains that the strain is intended rather as an ornament to various dishes than as a direct adjunct to them.

Fly on Crocuses—I have some Crocuses which I potted up about a couple of months ago, during which time they have been in a cupboard not far from the fire. On taking them out the other day I found that the young growths were smothered with green fly. I was puzzled to account for this, and am so still, for I cannot imagine how the fly got there.—*D.*

Our correspondent's note goes to prove how widely spread are the insect pests that attack our plants. No corner, however remote, seems free from them; and their appearance, as in this case, savours apparently of the marvellous. We should advise *D.* to get rid of the fly as quickly as possible before it infests his establishment still farther. The heat of the cupboard is evidently suitable for the breeding of aphides.

Spiraea confusa—*T. N. Ring*: This plant will force early enough, but do not subject it to too strong heat, or many of the buds will fall, and the flowers that open will be very short lived.

Chrysanthemum Mme. Edmond Roger.—*Sceptic*: We think you are too sceptical. The flower is undoubtedly a green one, although those opening earlier in the season exhibit a paler hue than the later ones. We have seen the variety in a good many places, and under various conditions this season, but in no case would it have been possible to suggest that the blooms had been treated with arsenic to colour them. Arsenic might possibly deepen the colour. Why not try the experiment, and advise us of your results. There would be no lack of interest attaching to such an experience.

Hyacinths Rotting.—*Inquirer*: The outer tunic of the Hyacinth is undoubtedly rotting in the sample you sent us; but the mischief has not penetrated farther, nor will it be likely to until you have flowered the bulb. The evil effects will thus be practically nil. All varieties of Hyacinths are not suited for cultivation in glasses filled with water, and the outer tunics of bulbs of unsuitable varieties will often rot whether they touch the water or no.

Edging for Garden.—*E. N.*: Boards are cheap and nasty; try plain edging tiles in preference. The first cost may be greater, but you will feel more pleased with the results.

Hardy Perennials for Market.—Will you give the names of twelve good hardy perennials for supplying cut flowers for market?—*R. se.*

Anemone japonica alba, *Aquilegias* of sorts, *Coreopsis grandiflora* or *C. lanceolata*, *Campanula persicaefolia alba*, *Gypsophila paniculata*, *Helianthus Miss Mellish*, *Helleborus niger*, *Heuchera sanguinea*, *Iris* of sorts, *Lavandula vera*, *Phlox paniculata*, and double *Pyrethrums* will all be found exceedingly useful. You will observe that we have made no mention of the Michaelmas Daisies, a number of which are very suitable for cutting. The above list may be

almost indefinitely extended. The subjects mentioned are very easy to grow, with, perhaps, the possible exception of *Heuchera sanguinea*.

Apples on the Paradise Stock.—*L. Menzies*: There can be no doubt that in your case Apple trees on the Paradise Stock would be the best. Such trees fruit much earlier than others worked upon the Crab stock; indeed, very small trees often carry heavy crops of fruit. If the soil is shallow the Paradise stock will be better than the Crab on that account. Then again, if your garden is a small one you don't want trees that will reach a large size before they begin to yield any return.

CORONA, BROUGHTY FERRY.

THIS conspicuous suburban residence is beautifully situated on the crown of the ridge overlooking the

dominant feature as far as flowers were concerned. Niveus had assumed the form of an incurve Japanese variety, a feature of its development we also noted elsewhere under certain conditions. Thos. Wilkins takes on a fine golden-yellow. Vivian Morel, Louise, and Stanstead White are also grown to large size here.

This house led us through the Orchids where a fine piece of *Catasetum macrocarpum* was preparing to bloom. A pretty and uncommon plant was *Lycopodium Phlegmaria* with long, drooping stems and lanceolate, leathery leaves covering the pendant shoots on all sides. Next came a fine span-roofed structure well adapted for growing plants. It is kept cool, and at the time of our visit was filled with Chrysanthemums and Carnations in pots. Mr. Machar intends devoting the house to tree Carnations for winter flowering, the house being well adapted for the purpose. The Chrysanthemums in it are

de Lyon always does well in this neighbourhood, developing heavy, well coloured blooms on stout, erect stems. The outer florets of *Simplicity* hang down almost in the same way as *Mme. Carnot*. The bush plants are largely grown for the sake of cut flowers.

Trained to the rafters of the house are large branching plants of *Acacia riceana*, *A. longifolia*, *A. lophantha*, and *Eucalyptus globulus*, the first two of which will presently flower profusely. A large, branching *Opuntia* also finds a place here.

The Banana house contains a number of fine plants which will flower some time in spring. A plant which bloomed in August now carries a large bunch of fruit. *Cypripediums* are also grown in this house, including a grand piece of *Cypripedium insigne*.

There are five acres of garden and pleasure grounds around this suburban mansion. Small

A SNOWY MORN AT CORONA, BROUGHTY FERRY.

valley of the Tay and the bold escarpment of the river on the opposite or Fifeshire side. It belongs to Robert Mudie, Esq., whose garden is under the care of Mr. John Machar, well known about Dundee, owing to his identification with the affairs of the Chrysanthemum Society of that city.

The very prominence or exposed condition of the garden lays it open to the full force of the cold winds which often sweep the valley of the Tay with great violence, and do more damage than all the frost and snow experienced here. The past autumn, however, has been very mild and damp, making it difficult to preserve large blooms of Chrysanthemums in a fresh condition. *Tropaeolum majus*, best known as Nasturtiums, kept flowering freely in the open till the third week in November, after which a frosty night settled them.

In passing through the houses about the end of last month, we noted that Chrysanthemums were the

grown in bush form and include *Source d'Or*, *Elsie*, *Mrs. Geo. Rundle* and others of that class.

The conservatory is a roomy structure attached to the mansion, and at present is chiefly occupied with decorative Chrysanthemums grown in the free or bush form. *Nellie Rainford* has golden flowers; and *Bouquet des Dames*, grown in the same way, has flat and gracefully poised flowers. *Louise*, even in large form, comes pink in this part of the country. *Peter the Great* carries its flowers erect without support. *Source d'Or* is very highly coloured here, and, strange to say, the yellow *Source d'Or* comes of a beautiful soft orange. *Ryecroft Glory*, *Margot*, and *Soeur Melaine* flower very profusely in the bush form. *Red Dragon* is also a most useful decorative subject, with fiery red flowers of moderate size. A few varieties grown to exhibition size had also been located in this house to furnish variety. The blooms of *Pride of Madford* get very much incurved. *Etoile*

fruiting varieties of Apples trees are grown upon the lawn for the sake of their handsome flowers in spring. Cherries are grown for the same purpose. A branching specimen of *Aralia mandschurica*, 10 ft. high, is a singular looking object at the present time, but very interesting. One meets with large beds of hybrid *Rhododendrons* of the best varieties everywhere. They suffered much during the blizzard which occurred two or three years ago; but those that survived have completely recovered, and are well set with buds. Deciduous Azaleas are also favourites, including *A. pontica*. *Ledums* and various other shrubs are also well cared for; and the place must be beautiful in spring and summer, independently of the fine prospect it commands.

In passing through a portion of the kitchen garden we noted that Strawberries are planted, sometimes in August, and sometimes in spring, with the object of getting some portion to escape late frosts and

hurricanes of wind in spring. The wind often makes protection a very difficult matter. Royal Sovereign and Garibaldi are the favourite varieties grown, but particularly the latter.

The electric light is laid on all over the establishment, the electricity being produced by a powerful engine placed under the charge of Mr. Machar.

The accompanying illustration (p. 265), paradoxical as it may seem, represents an ideal Christmas scene, yet in reality an occasional phenomenon of spring at this northern residence. It is in fact a view of the approach to Corona on a snowy and frosty April morning when evergreen trees and bushes were well coated with newly fallen snow and the deciduous ones had a rimy appearance. The gardener who has to put up with this sort of thing would be perfectly happy did it occur at Christmas, but the photograph was taken on the 16th April, when gardeners are to be excused if they seem in a fidget about their fruit trees, bedding plants, and things in general. We ourselves have experienced 4 in. to 6 in. of snow on the 21st of April, but much farther north than Broughty Ferry.

TRINITY ROAD NURSERIES, WANDSWORTH.

FROM the beginning of November until March is usually a busy time with gardeners in establishments where the love for hardy trees is indulged in, for not only is there a good deal to do in the way of regulating the arrangement of shrubberies, but there are also gaps to be filled up, and various improvements and additions to be made. To tell the honest truth we are too much inclined to plant too many of one or two favourite things, regardless of the fact that there are other not less beautiful subjects which have a claim to consideration. It behoves us, therefore, at this time of the year, when we are practically in the middle of the planting season, to consider best how we may add to the variety of the effects produced by our numerous hardy trees and shrubs. There is nothing more likely to interest and instruct a gardener than a peep round one of the nurseries from whence the country draws its annual supplies of ornamental and useful material.

We recently paid a visit to the Trinity Road Nurseries, Wandsworth, where Mr. Robert Neal has for many years carried on with advantage to himself, as well as to the beautifying alike of the stately country mansion, and the villas, streets, and squares of our large towns, a large and flourishing business.

As the metropolis year by year spreads its gigantic shade over what was once the outlying country, and the smoke screen becomes thereby proportionately enlarged, an increasing difficulty is experienced in getting many of the more susceptible plants to flourish as they used to do. This is particularly the case with many of the more tender Coniferae, such as *Cryptomeria elegans*, and *C. japonica*.

To Londoners, then, Mr. Neal's extensive nurseries are like a vast trial ground wherein the smoke-resisting qualities of the various subjects are demonstrated.

CONIFERS.—In all winter effects in the garden Conifers play a very important part, so much so indeed that in some cases they are overdone. Lawson's Cypress (*Cupressus lawsoniana*) is one of the most popular of all evergreens, by reason of its beauty and hardiness, in either town or country. The Cedars are among the handsomest of our trees, although they prefer country air. We were delighted with a grand break of *Cedrus atlantica*. The plants were six or seven years old, and varied in height from five to seven feet. *C. Deodara*, the most graceful of all the Cedars, was also represented by plenty of stock.

The Irish Yew (*Taxus baccata fastigiata*) is a great favourite by reason of its distinct columnar or pyramidal habit, so different from that of the ordinary Yew. Small plants of it are very suitable for window-boxes, or for pot plants in flower beds or ornamental vases during the winter months, and in such positions are characterised by great elegance and beauty.

Whilst speaking of plants suitable for winter decoration of villa gardens we must not forget to mention the Monterey Cypress (*Cupressus macrocarpa*). When the plants are young they are exceedingly graceful in habit, and the red stems show up to great advantage against the bright green of the

foliage. Of course, in its later stages, the plant assumes the proportion of a large tree, and it is of fairly rapid growth. *Cupressus goveniana*, oftentimes met with under the names of *C. californica* and *C. Hartwegii*, is another exceedingly useful subject for winter decoration. In the small state the foliage presents two shades a deeper green than does *C. macrocarpa*.

The Retinosporas, although they cannot be described as good town plants, are wondrously pretty. *R. plumosa* is well named, for it has a feathery habit that is at once distinct and pleasing. The golden variety *R. p. aurea* is another handsome plant in which the young shoots and foliage are of a bright golden hue, becoming green as they pass into the mature stages. It is a great pity that the Retinosporas are not better town plants. With Mr. Neal they do very well during the summer, but the sulphurous fogs of November and December cause them to assume a brown, burnt appearance, which, apart from its unsightliness, well nigh cripples the plants.

MISCELLANEOUS EVERGREENS.—We noticed very many useful and beautiful subjects in this section, which admirably supplements the Conifers for winter effects in the garden. The Handsworth Box, *Buxus handsworthiana*, is one of the handsomest and most useful of all the plain green Boxes, and is sold in its thousands every year.

The genus *Ligustrum*, again, is a heavy contributor. *L. ovalifolium* is well-known as a good hedge plant for town planting, whilst *L. sinense* is almost as great a favourite. We observed a fine break of vigorous, beautiful leaved plants of the latter species. They have been raised from seed by Mr. Neal, and are in capital condition for planting. There is also a moderate demand for *L. lucidum*.

Euonymus japonicus latifolius aureus is in great request; indeed, our guide informed us that they could never get enough of it, and this, despite the fact that from 12,000 to 14,000 cuttings were put in each year, most of which rooted and made plants. *E. radicans*, and its varieties *E. r. sempervirens*, and *E. r. variegata* are handsome plants for rockwork, where their long trailing branches can be seen to advantage. As an edging to carriage drives or other walks in partial shade they also do well, and indeed succeed in places where more tender stuff would not grow.

Aucuba japonica is propagated in its thousands both from seed and layers, and we observed some exceedingly healthy fine plants obtained from last year's layers. After another year has been allowed them to form plenty of roots as well as "tops" they will constitute magnificent material.

We must not forget to mention a fine batch of the Strawberry Tree, *Arbutus Unedo*, which was accommodated in frames. Although hardy in its older stages this plant is found to be rather tender at Wandsworth in the earlier part of its life. Certainly the plants which we saw could not possibly have looked better under any circumstances. As they were all growing in six-inch pots, they were quite ready at any time for removal to any part of the kingdom.

Choisya ternata is a pretty flowering shrub that, while not exactly hardy, will yet succeed very well in the southern counties if given the protection of a wall to which, if desired, it may be trained.

Escallonia floribunda and *E. macrantha* are two other plants that will succeed with a similar amount of shelter. They resist the effects of the smoke very well and are distinct and handsome.

DECIDUOUS TREES AND SHRUBS.—Our walk round the nursery revealed to us magnificent stocks of a wealth of deciduous material. The value of and demand for the London Plane for town planting is still as great as ever. We were informed that upwards of 15,000 cuttings are put in at Wandsworth each year, representing nearly as many plants. These take about ten years before they are of a sufficient size for planting in the streets or squares of the metropolis and its suburbs. Mr. Neal does a great deal in this direction, several of the largest London squares being permanently under his care.

Nothing could be more promising than the various breaks of sturdy Planes in all stages from the cutting up to the fine young tree 10 or 12 ft. in height, bearing a symmetrical and well-balanced head upon a stout and clean stem. Horse Chestnuts, Elms, Maples, and Oaks in variety, including the Scarlet Oak, together with many members of the genera

Prunus, *Crataegus*, and the handsome *Ailantus glandulosa* were represented in great profusion and in first-class condition, all giving evidence of the kind of stuff grown and supplied by Mr. Neal to his numerous customers.

CLIMBERS.—Here, too, there was plenty of variety and all that is wanted to furnish and ornament our walls or other bare places is a judicious selection of the material offered. Roses are grown in quantity, all the best climbing varieties receiving special attention. The same may be said of Clematises, of which no fewer than fifty-six of the finest named forms are catalogued. *C. Jackmannii* would seem to be the general favourite.

Kerria japonica, although not exactly a climber by nature may yet be turned to good account as a wall subject. *Crataegus Pyracantha*, too, must not be lost sight of. *C. P. Lelandi* is distinct from the type by reason of the differently coloured fruits, and by reason that the young plants fruit sooner than do those of the species. Both are valuable plants.

Ampelopsis hederacea, and *A. Veitchii* are both too well known as climbing plants to need further praise. *A. sempervirens*, so called, is a comparative stranger, however, but withal a pretty and useful plant with small green persistent leaves. It will probably be known to some of our readers under its correct name *Vitis striata*.

Ivies are largely grown at the Trinity Road Nurseries, the collection comprising over forty distinct species and varieties. A fine batch of the pretty *Hedera madeiriensis* in pots arrested our attention, for we have never seen this handsome variety in better condition. *H. caenwoodiana*, *H. Helix argentea*, *H. H. donrailensis*, and *H. H. Silver Queen* are some of the finest of the other forms.

FRUIT TREES.—In addition to ornamental trees and shrubs of all kinds, Mr. Neal does a big trade in fruit trees of all descriptions. We were most favourably impressed with the general appearance of these. Large breadths of Apples on the Paradise stock were showing well for fruit even when barely a couple of feet high. Peaches, Nectarines, and Apricots we have never seen in better fettle, the wood being clean and healthy, and the heads having well balanced foundations that only need careful pruning and training for a year or two to develop into splendid trees.

THE QUALIFICATIONS AND DUTIES OF A GARDENER.*

HIS QUALIFICATIONS.

WHAT are these necessary qualifications? That they are numerous all of you will admit, and I shall endeavour to place before you what my views are respecting them. In the first place, I do not think I can do better than take our elementary schools as an example. The little boy when he first goes to school is placed in the lowest class or standard, whichever it may be, and is here taught the first rudiments of education. Unless he should prove a very dull scholar he is, after a year or so, removed into a higher class, and this promotion continues year after year until he has passed the number of standards required by the education department. And so it should be with gardening.

I have always understood gardening to be a profession and to take rank not far behind that of surgeons; for while they are doctors of men, are not we doctors of plants? Yes; and we labour at a disadvantage compared with a physician, as none of our patients have the power of speech, and, therefore, cannot say what ails them.

I say, again, when a youth starts to learn gardening, he should begin at the bottom; and my idea is that this should be in the kitchen garden. I have various applications made to me (and for certain some of you head gardeners have also), by youths wishing to learn our profession; but the majority of them want to start under glass—a very erroneous idea. If they do this, what are the consequences? It is this. They do not care to go back and work in the kitchen garden after being in the houses a year or two, so they know next to nothing about this very important branch.

The youth should make a beginning at weeding and he should have the weeds pointed out to him,

*A paper read by Mr. J. Mayne, gardener to the Hon. Mark Rolle, Bicton, at a meeting of the Devon and Exeter Gardeners' Association, on the 13th October.

especially if he hails from a town; he should also be allowed to assist in the preparation of the ground for planting and the sowing of seeds of the different kinds of vegetables at their various dates. He should also assist with the watering-can, when necessary, and be able to use all the tools requisite for this department as time goes on. He should assist in gathering the fruit when it is ripe, and be shown when it is fit, and how to gather the various kinds. He should carefully watch (even if he is not put to help) the proceedings anent the summer pruning of fruit trees and bushes, as well as that of the winter routine.

I consider he ought to serve at least two years in the kitchen garden, and, if possible, be moved into the flower garden for another twelve or eighteen months, especially if the latter is away from the kitchen garden any distance, and where a regular staff of men is kept for each department. After this insight into kitchen garden work, he will be at home with the spade, fork, hoe, rake, and such like tools. He must be taught how to use the scythe and shears. He will get an insight as to bedding arrangements in early summer, and again in the autumn, as well as the general routine practised in a well-kept garden, where neatness should always be noted.

His next move should be under glass, and his first duty there, for a few months at any rate, should be to work with the foreman or a good journeyman to get an insight as to airing, shading, and watering. As you all know, the last named is of the utmost importance in gardening. A man with no knowledge as to the requirements of a plant in a pot could very soon do a large amount of damage. He should spend one year at least with the plants, and another year or more in the fruit department, when, if he has done between three or four years outside as advocated, I consider he ought to make a change, and if possible get into another county, as we do not know in what part of the country we may get placed in after life, if we are fortunate enough to get a charge. I consider this migrating, if I may so term it, from one county to another, is essential in gardening, as the climatic conditions vary so much that we should be placed at a great disadvantage. If, for comparison's sake, we say that a man has spent all his time in Devonshire, but eventually meets with an appointment somewhere in the north of England, in such a case he must rely upon outsiders to a great extent as to what may be termed hardy, and about what date it may be safe to put out tender hedding plants, etc. Hence the necessity of making our experience as wide as possible in this respect.

I think two years is quite sufficient for a young man to remain in one place after his first post. What he requires is to gain new ideas and fresh experience, because each of us gardeners has our own *modus operandi* as it were, and in after life he will be able to use his own discretion as to which method or practice he should think the most successful.

And here, I may say, that I am not an advocate for apprentices. I think this used to be more customary years ago than now, and the average time, I believe, was from three up to seven years. Now this is a long time to be compelled to keep a youth, especially if after a year or so he should get sick and tired of gardening, as I have known several to be. It is equally as hard for the youth to have to stay. We must have a love for gardening, and be heart and soul in our work before we can hope to be successful. Here, let me give you an instance of how a love for gardening placed a friend of mine, after only seven years' practice, in a responsible position as head-gardener with eight or nine men under him. Up to the time he was twenty-five years of age he worked as a journeyman blacksmith. He got his appointment (there were over one hundred applicants for the post) about nine years ago, and to his credit still holds it. When he was at his trade, if ever I met him, he very soon began to talk about gardening. He was always asking, which did I think was the best Cucumber or the most prolific Pea to grow, and so on. Such a persevering man merited success, I consider.

Well, to return to my subject; while we are probationers we ought in all our spare hours to endeavour to educate ourselves by reading, studying, etc. Happily things are better now than they were, say from twenty to thirty years ago. Night or continuation schools are provided now in most villages, and all young gardeners should avail themselves of

this opportunity whenever it offers, to improve their education in the matter of writing, arithmetic, geometry, and such like. They should also make it a practice to keep a diary by them so as to be able to enter, each day, what work has been done under glass as well as outside, which they may in the future find of great service to them as a book of reference. It not only tends to improve their handwriting, it also instils as it were, practical work into their memory.

We must still follow up this youth from his first place. His next move should be as an improver, and after a year or so as journeyman, then eventually as foreman or second gardener. When he reaches this latter post he should be capable of managing the men and keeping things in general in working order, any day the gardener may be away from home. He should also endeavour to gain as much knowledge as he possibly can about the cultivation of all kinds of plants, flowering and foliage alike, as well as that of fruit, also the propagation of those that may be required in each department. He must carefully notice the various temperatures each house is kept at through the night, as well as that during the day, especially in the case of fruit culture, because the temperature is increased as the crops and season advance. He should be a keen observer and see how Peach, Vine, and Fig trees, and similar fruits are pruned, tied, disbudded, pinched, and, eventually, the crops thinned, where necessary. All these details he should carefully watch, and, as I have said before, chronicle in his diary.

The potting of different species of plants, too, must claim attention as well as the composition of the soils to be used; the staking and tying of plants so as to learn to use no more stakes than are really necessary to keep the plant symmetrical; for too many of them not only injure a plant, when driven down among the tender roots, but they are an eye-sore as well. And if there should be any new glass houses being erected, new boilers or piping put in, all young gardeners should if possible keep an eye on the work. I do not mean that this should be in their employer's time, but in their own dinner hours or after their day's duty is done. This insight may probably, in fact will be sure to, prove of immense service to him in after life.

I have lightly touched upon the subject of watering, but just a few words more, as I consider it of vital importance in gardening. No plant should have water given it unless it is really necessary; and when this is given see that the plant operated on is well soaked. Especially is this the case where much peat may be the staple compost. Take Ericas, for instance. These are most impatient of being sodden, but when water is required they should be gone over and watered twice at least, so as to get the hard ball of soil thoroughly moistened.

Again, when manure water has to be given, or a fertiliser put on plants that may have their pots filled with roots and require assistance, see that it is not used too strong; far better to give it weak, and renew the dose in a day or two than have it too strong and your plant, perhaps, collapse, as indeed I have seen Strawberry plants in pots do when swelling off their fruit, solely on account of the stimulant being too strong. It is a much better plan to err on the side of safety.

Airing or ventilating is another point in gardening that requires careful judgment. It should be put on at intervals, and increased as the sun gains power, not left until a house registers, say, ninety degrees, when with a moderate amount of air it should not have registered more than seventy-five or eighty. To rush in and open top and bottom ventilators at once and so create a draught is most injurious to tender growth, be it plants or fruit. The reducing of the ventilation calls for special mention. Often we get an hour or so of bright sunshine, and then the horizon becomes overcast. Especially is this the case in the early spring months, a most trying time for gardeners, as most of you well know. When this change takes place the amount of air or ventilation should be immediately reduced, or taken off altogether as the case may require, so that the house is not allowed to fall below its usual temperature had there been no sunshine. In fact, the man in charge must ever be on the alert as it were, when the sun keeps popping in and out, as only half-an-hour's neglect in this respect may wreck a whole house of valuable plants or fruit.

Shading, too, requires judgment, and to be put on at the proper time, if it is a movable one, which it

should be wherever practicable, so that the grower may reap the benefit of all the light possible when the day proves cloudy. An hour's sun, about mid-day, say in April or May, would cripple, if not entirely destroy such plants as Calceolarias, Cinerarias, certain stove plants, Orchids, and a host of others that require a certain amount of shade for their well-being. There are no more trying months than March and April for us gardeners, so great care is necessary in this department.

Young gardeners, too, should assist in the embellishment of the mansion with plants and cut flowers, and the decoration of the dinner table. This last-named experience is a very necessary adjunct to the qualifications just given, as most employers consider this an acquisition nowadays, and it is better for us all to be moving with the times, or up-to-date if I may so term it, with this feature of gardening. In some large establishments, a man is kept entirely for this work, and is termed a "decorator"; but I believe these are few and far between.

I had intended to have lightly touched upon hotany, but I find a paper is being prepared for your next meeting on that subject, so will leave it to a better authority. These young gardeners or assistants should be of good address, quick, obliging, and not be above being told or corrected by their chiefs, while ever attentive to their many duties. In fact, they should keep this old injunction ever before them: "Whatsoever thy hand findeth to do, do it with thy might."

These details (and there are many more, no doubt, in my opinion) all assist in laying the foundation, as it were, of a young man wishing to attain to the all-important and responsible position of a gardener, be it head over others or where only one man may be employed. Who is there amongst us that has the love of gardening at heart and has not this ambition? Let me quote one of our great writers—Bacon:—"Gardening is the purest of human pleasures and the greatest refreshment to the spirit of man."

(To be continued.)

MESSRS. HURST & SON AT THE HOLBORN RESTAURANT.

ON Saturday evening last (18th inst.) a dinner was given at the Holborn Restaurant, London, by N. N. Sherwood, Esq., to the staff of Messrs. Hurst and Son, 152, Houndsditch, London. This was the third of the series, the first being given on the 21st December, 1895, to celebrate the majority of Mr. William Sherwood, the eldest son of the host. Last year the function was to celebrate the introduction of his two sons, Mr. William and Mr. Edward Sherwood, to the firm of Messrs. Hurst & Son. Last Saturday there were 119 present at the dinner, 99 of whom were members of the staff, and 20 visitors. The chair was taken by Mr. Sherwood himself, the vice-chair by Mr. H. Aiton, and at four other tables Mr. T. N. Cox, Mr. J. Hodgson, Mr. T. Bray, and Mr. Locke acted as croupiers.

The following list includes the members of the staff present who have been thirteen years and upwards in the service of the firm, the numbers after the names indicating the years they have been with Messrs. Hurst & Son:—Messrs. J. Hodgson 33, T. N. Cox 29, S. Dixon 29, W. W. Polden 28, T. Swift 28, C. Papworth 26, E. Smith 25, R. C. Tucker 24, John Kay 23, N. Lukins 23, Sheldrick 23, Mills 23, Hugh Aiton 22, Riden 22, T. Bray 22, Newby 21, A. B. Crichton 21, W. Cox 21, T. Thake 21, S. N. Sampson 19, A. W. Elphick 17, F. Clarke 17, D. Shearer 16, D. Fairley 16, T. N. Cox, Sen. 16, W. Parker 16, G. T. Bargery 16, J. Meldrum 15, F. Wheeler, Jun. 15, H. Bray 14, V. Cummings 13, A. Laker 13, and T. A. Baldwin 13.

The following visitors were present:—Messrs. R. Gofton Salmond, Geo. J. Ingram (of the Gardeners' Royal Benevolent Institution), D. Pell Smith, W. G. Innes, B. Wynne, James Herbert Veitch, F.L.S. (of Messrs. Veitch & Sons), Fred. Wood, W. Loudon, G. Fagg, John Curran, *City Press*, J. Wright, V.M.H., of the *Journal of Horticulture*, J. Fraser, F.L.S., of the *GARDENING WORLD*, Thos. Mackenzie, M.H.R. of New Zealand, E. Prentis, Geo. Townsend, T. L. Smith, Chas. Carter Page, N. Van Lessen, and A. Dandridge.

A lengthy and excellent toast list and programme was got up, the artistes for the most part being members of the staff of Messrs. Hurst & Son, as on former occasions. After the tables were cleared the

chairman right loyally gave in due succession the toasts of "The Queen" and "The Prince and Princess of Wales and the rest of the Royal Family."

The toast of the evening, "Success to the Firm of Hurst & Son," was proposed by Mr. T. Mackenzie, Member of the House of Representatives of New Zealand, that being equivalent to the House of Commons in Britain. He is the member for Clutha, and only here on a short visit, being on business for an association of co-operative farmers and two other important bodies in New Zealand. He said that though they might not see the name of "Hurst & Son" at every railway station and every other coign of vantage by the way sides and in the fields, yet the people of New Zealand could depend upon the seeds supplied by the firm. They might spend any amount in buying and tilling land, but if seeds were bad their labour would be worse than wasted. Happily they could rely upon this great firm, whose seeds gave complete satisfaction. In all its dealings with the New Zealanders, the firm was courteous, upright and obliging, and Mr. Mackenzie with great vigour and emphasis declared that courtesies to individuals did more to bind the colonies and the mother country together than overtures with greater demonstrations made between public and national bodies.

"The Visitors" was proposed by Mr. T. N. Cox in suitable and courteous terms. Mr. R. Gofton Salmond, secretary to the Worshipful Company of Gardeners, Mr. G. W. Innes and Mr. E. Prentiss, each in turn replied to the toast, speaking in highly complimentary terms of the courtesy they had met with from every member of the staff of the firm with whom they came in contact.

"The Press" was proposed by Mr. A. B. Crichton, who spoke at some length on the excellent services rendered by various periodicals, the Gardening Press in particular. Mr. J. Wright, V.M.H., and Mr. J. Fraser, F.L.S., responded in suitable terms.

The health of "The Chairman" was proposed by Mr. Hugh Aiton, in a suitably worded speech, at once full of great earnestness, and interspersed with bits of genial humour, which was much applauded. Mr. N. N. Sherwood, in replying, said that these annual meetings were very pleasant, but upon reflection he remembered that the time would come when he would no longer be able to meet them, and that was disconcerting. That night, however, he was a proud man. It is now 35 years since he joined the firm, and during that time he had been very successful. He was delighted to have the co-operation and goodwill of the staff, and if they continued to work in the same excellent spirit as they had done in the past, the success of the firm would be greater than ever. He then read over the list of old servants mentioned above, of whom nineteen have been in the service of the house for 21 years and upwards.

Before resuming his seat he proposed "The Representatives, Heads of Departments and General Staff," which was responded to by Messrs. J. Hodgson, W. W. Polden, C. Papworth and R. C. Tucker. Some few members of the staff were absent through illness. "The Cricket Club" was proposed by the Chairman, and responded to by Mr. Stanley N. Sampson, the captain of the club. "The Instrumental and Vocal Entertainers" was proposed by the Chairman and responded to by Mr. Edward Sherwood, who conducted the orchestra. The whole of the music was rendered by members of the staff, with the exception of Mr. John Curran, who played the accompaniments, and Mr. Dandridge, who sang two humorous songs.

JAPANESE MUSHROOMS.

Mr. Robert P. Porter, who has been conducting investigations into the industries of Japan, states that one of the most interesting studies in that country is the growing of Mushrooms in the Shikoku Island, where most of the camphor is produced. This is an important article of export, mostly to China, and during the year 1895, the last year for which the returns are available, the quantity of mushrooms exported from Japan to all countries amounted to 1,780,597 lbs. Of the numerous species of edible Mushrooms, the one called Shitake is the most important, being abundantly exported abroad

and also used for many culinary purposes at home. Logs which are used for cultivating this Mushroom are various species of Oak. The principal districts where this Mushroom is produced are the provinces forming Shikoku, Kiushiu, Wakayama, and Shiozuka prefectures.

Oak trees 25 to 33 years old are felled in the autumn, and incisions made with axes at intervals of 3 or 4 inches, the incisions generally reaching the woody layer. The trees are then cut into logs of 4 to 5 feet in length and left in dark secluded parts of the forest. After the third year, Mushrooms make their appearance in the incised portions. When the growth lessens they are replaced by new logs. The Mushroom grows at each season of the year, winter, spring, summer, and autumn, but the growth in winter and spring is the result of artificial stimulus. The logs are steeped in water for a number of hours, according to the dryness of locality, and then struck with pommels or axes to prepare the beds for facilitating the growth of the Mushrooms. The autumn crop is the most abundant. After being collected, Mushrooms are dried either by the sun or by artificial heat.—*Journal of the Society of Arts.*

HAFTON, HUNTER'S QUAY, N.B.

HUNTER'S QUAY is one of those pleasant spots that strike the visitor as, *par excellence*, the place to live and—die in. That is, of course, assuming the visitor possesses a predisposition to settle down at all, or otherwise feels an interest in the pursuit of studies more or less—but especially more—natural. If the animal world be the source of any satisfaction then he can pass the pleasant time away with rod and line, for Holy Loch—"the charmed loch"—will surely yield its piscatorial fry to those who know the secret of success. If, on the other hand, the cryptogamic forms of life be sought for, then this pastime also should result in gain if *names* mean anything. But names, like fancies, are subject to the vicissitudes of time; and so in this case, for the ancient *Cammesreinach* meant the "bay of Ferns." The Ferns, however, especially the Osmundas, linger only in the minds of the oldest inhabitants. The beautiful shores of Holy Loch, as also of Loch Eck, once the paradise of Filices, have been almost denuded of their cryptogamic charms, by a too progressive British public, or a too business-like tendency on the part of peripatetic Scotch merchants, who will make "siller" if they can.

Opposite Hunter's Quay—which takes its name from the Hunters of Hafton—across the water, the mountains rise to a considerable elevation, and are partly covered with plantations of Spruce and Pine. The views are consequently extremely fine; and this fact alone lends a glory to the stately mansion of Hafton with which few are favoured. The mansion is in the modern Gothic style, and constitutes a fine building; it is surrounded by a good garden and garden and park-like land of an undulating character of about 600 acres.

The culinary department is about 2 acres in extent, and enclosed with high walls, whereon are grown a large assortment of fruit trees, which are in various stages of growth and maturity. These walls also give a habitat to a great quantity of *Asplenium Trichomanes*, besides *Asp. Ruta-muraria* and *Cystopteris fragilis*, which fact alone will afford ample evidence as to the state of things as regards moisture. In the garden, on a rockery, *Polypodium vulgare* var. *cambricum* seems quite at home, while in the park *Hymenophyllum tunbridgense* and *H. Wilsoni* do luxuriate. *Begonias*, *Pelargoniums*, *Adiantums*, *Tomatos*, &c, &c, occupy several ranges, the outside beds and borders being well stocked with green stuff and herbaceous plants.

It is, however, hardly a satisfactory proceeding to be obliged to visit even the best of gardens under the shadow of a waterproof. Nevertheless, it was a labour of love; and the magnificent trees and shrubs which Mr. McLeod, the courteous gardener, pointed out for my benefit, would not, perhaps, have looked so fresh and verdant had conditions been otherwise than humid.

Conifers particularly seem to be in a state of content in this mountainous district, for two fine specimens of the Chili Pine (*Araucaria imbricata*) measured 58 in. and 67 in. respectively in circumference at about 3 ft. from the ground. One of these possesses a spread of branches about 90 ft. in cir-

cumference, while the other covers a circle of about 80 ft. Both were well furnished and fairly symmetrical, hence they were objects of beauty as well as subjects for comment.

Cupressus macrocarpa, *C. lawsoniana*, and *Cedrus Deodara* may be mentioned in particular as ornamental trees of high-class character that thrive here admirably, besides a host of other Conifers. *Azalea indica* also does well, while the Portugal Laurel attains a height of 20 ft. Blue Gums survive most winters, which shows that they are fitted for the west of Scotland as well as the south of England.

The climax of culture and development, however, I think is reached in *Rhododendron ponticum*, which attains not only height and healthy foliage, but enormous dimensions. Two huge clumps—or what appear to be clumps—occupy prominent positions on an undulating lawn, one of which curiosity led me to pace, and as a result I calculate that the circumference of this individual shrub is at least 230 ft. Truly a noble specimen! I could not gather the age of the plant, but Mr. McLeod informed me that the planter was still living in the neighbourhood. Of the planter, then, it can be said that he left that lawn better than he found it, for the man who can do something to benefit his fellow man deserves to have his work recorded.

There are many other notable things in this large and interesting garden which cannot now be noticed, but which it is sufficient to remark exact a good deal of forethought and attention from the gardener who presides over them.—*C. B. G., Acton, W.*

NATIONAL AMATEUR GARDENERS' ASSOCIATION.

THE members of this association and their friends to the number of 180 sat down to their seventh annual dinner in the Venetian Room of the Holtorn Restaurant, London, on the 16 inst. under the presidency of Mr. T. W. Sanders, F.R.H.S. Many brought their wives or daughters, so that ladies were present in large numbers. The menu card was embellished with the photos of Mr. T. W. Sanders (the president), Mr. D. B. Crane (deputy chairman), Mr. Leonard Brown (the energetic hon. sec.), and Mr. H. A. Needs (hon. treasurer). All those gentlemen were present, as well as Mr. Geo. Gordon, Miss Gordon, Mrs. T. W. Sanders, Mrs. Brown, Mr. H. J. Jones (Ryecroft Nursery), Mr. John H. Laing (Laing & Sons), Mrs. J. H. Laing, Mr. Norman Davis (Framfield, Sussex), Mr. Richard Dean (National Chrysanthemum Society), Mr. R. Fife (Dobbie & Co.), Mr. E. T. Cook, Mr. H. W. Percy, Mrs. Percy, Mr. H. T. Wooderson, Mr. A. E. Stubbs (Scottish Horticultural Association), Mr. W. Logan (Barr & Sons), Mr. Charles C. Page (Carter, Page & Co.), Mr. Vasey, Mr. Frank Cant (Colchester), Mr. T. Swales, Mr. J. Fraser, F.L.S., Mr. A. J. Rowberry, Mr. J. S. McDougall, Mr. McDougall, Dr. H. Shackleton (the well-known Rose enthusiast), also Messrs. G. Brown, W. Bradley, G. Gingell, Alder, Jehning, Neal, Lewis, Geo. W. Canford, Foster, Elliott Terry, J. N. Hooker, Stevenson, A. Taylor, J. Bateman, Dolby, J. R. Jackson, E. G. Neisigh, Seelby, G. R. Smith, E. F. Wicks, and many others.

After the usual loyal toasts, the president proposed the "National Amateur Gardeners' Association," and in a well-chosen and thoughtful speech, referred to the remarkable strides the association had made. For instance, three years ago the attractions were much less, but they now had wonderfully diversified trophies and other valuable prizes offered annually, and now they were plainly moving in the right direction. The quarterly journal has added lustre to their laurels, and was a marked addition to their usefulness. Their society was distinguished from all others in the kingdom in offering unique advantages to the amateur gardener. Granted a continuance of the energy and perseverance of the members, of which the present splendid gathering was the outcome, he had no fear of their future. The toast was received with the enthusiasm to which all felt it was justly entitled.

Owing to lack of time the chairman dispensed with the usually perfunctory operation of presenting the awards other than the trophies, the following being a list of the presentations, each recipient being greeted with warm applause:—

Cheal Trophy (£5 5s.), to Mr. J. Bateman, with

109 points for twenty-four dishes of Apples and Pears; the Pye Trophy (£5 5s.), for twelve sprays of Violets to Mr. R. T. Dougall; Barr Trophy (£7 7s.), for Daffodils, to Mr. J. W. Jones, Woking, who also takes the Club Trophy and two Silver Medals; Carter Page Trophy for Chinese Chrysanthemums, to Mr. F. M. Vokes, Southampton. Mr. A. J. Foster, Mrs. Harman, and Mr. A. Lewis received certificates; and Mrs. Norris won the leading aggregate prize for the highest number of points (142) scored during the period from March to December. The Sutton Trophy (£21), the Cannell Trophy, the Fidler Trophy, together with the special prizes offered by Mr. H. J. Jones and Messrs. Carter, Page & Co., all found worthy recipients.

All these prizes were announced by Mr. L. Brown, the hon. secretary, who then delivered an entertaining and humorous speech, proposing the toast of "The Trade and Donors of Trophies and other Prizes," coupling with it the names of Mr. Robert Fife and Mr. Frank Cant, of Colchester. Mr. R. Fife responded with thanks on behalf of his colleagues for the reception with which they had been greeted, and said that the gratification of the receivers of the prizes was equally shared by the givers, and they looked forward to many years of successful working by the N.A.G.A. Mr. F. Cant said that the absence of a Rose Trophy hitherto in the society's schedule would be repaired next year, the announcement being received with great enthusiasm.

Mr. C. T. Green proposed "The Ladies" in an appreciative and humorous manner, and was well received, it being generally realised that a very great éclat had been lent to the proceedings by the presence of so many of the fair sex. Mr. F. G. Swales (assist. hon. gen. secretary) in responding, expressed a sentiment which was unanimously endorsed. "The Press" was proposed by Mr. D. B. Crane (deputy chairman), and responded to by Mr. Geo. Gordon and Mr. A. E. Stubbs. The former proposed "The Chairman" which was received with musical honours. Mr. T. W. Sanders responded assuring them of his earnest and continued interest in the affairs of the association, and thanked them for their support and attendance that night. The plants used in the decoration of the hall were supplied by Messrs. J. Laing & Sons, and the cut flowers by Mr. Norman Davis, and on the motion of the chairman, Mr. J. H. Laing and Mr. Davis addressed the meeting. The speeches generally were short, and a long programme of music rendered the evening highly enjoyable.

CATTLE, FRUIT, AND FLOWERS AT IPSWICH.

THE annual show of the Suffolk Fat Cattle Club and Fruit and Flower Exhibition was held at the Drill Hall, Ipswich, on Monday and Tuesday, December 13th and 14th. The weather being very unfavourable, there were not quite so many visitors as usual.

The Hall or ladies' compartment containing the flowers, fruit, &c., which concerns us most, had undergone a complete transformation, being artistically arranged to represent "Ye Olde Gyppec wicke." In the centre was a representation of the Old Market Cross, which was used as a band-stand upon which the band of the Hon. Artillery Company, under the able conductorship of Mr. E. Walker, bandmaster, performed. A little further down was a solid-looking and imposing structure representing the Old West Gate, guarded on either side by four men in steel armour with drawn swords. At the end of the hall was a representation of "Ye Olde Town Hall." This was utilised for the display of butter, bread, and poultry.

The groups of foliage plants, and flowers were a great attraction, as also were the table decorations. Miss A. Orpen, West Bergholt, secured the first prize, and Miss A. Dudley, The Hermitage, Melton, took second; while Miss Steward, Grayham House, Ipswich, came third. For baskets of flowers, Miss Orpen of West Bergholt came first; and Miss Elliston, Stoke Hall, Ipswich, took second. Mr. C. Clover, Westgate Street, Ipswich, was the winner of the first prize for groups of foliage plants and flowers; Mr. R. C. Notcutt, Ipswich, second; and Mr. H. T. Southgate, Spring Road, Ipswich, took the third. There was quite a display of shoulder bouquets and buttonholes. Miss Orford, Castle Hill, Ipswich,

obtained first prize; Miss Orpen came second; and Miss Elliston third.

Fruit was not strongly represented, much of it being shown not for competition. Mr. F. Cresswell, Stoke Gardens, Ipswich, secured first with six dishes of desert Apples; and Mr. W. L. Fox, Werstal Road, Ipswich, was a good second. In Pears, Mr. F. Cresswell was again to the front.

In the vegetable department there was a strong competition, especially in the collections of six varieties. Mr. F. Prythe, Bromford, took first; and Mr. A. Wagstaff, Werstal Road, Ipswich, secured second. There was a large quantity of Potatoes, Mr. A. Lillstone, of Stowmarket, taking several prizes.

SYON HOUSE.

YEAR by year the indefatigable energy of Mr. Wythes is adding to the beauty and efficiency of the fine old gardens at Syon House. A huge establishment, such as this, has many demands upon its resources, but in addition to the work the supply of these entails, time is found for projecting and executing various improvements.

We found a noticeable instance of this during a recent visit, in the subject of the large conservatory which is such a feature of the place, and in the internal arrangements of which some alterations that cannot fail to be also improvements were being made. As most, if not all, of our readers are fully aware, this huge conservatory describes a crescent with its horns pointing due south. The central block is a rectangular building of great height surmounted by a dome. This is filled with Palms and other plants requiring a stove temperature.

From this centre there runs out at either end a comparatively narrow compartment which is kept cooler and is devoted to greenhouse plants. Until quite recently the wings were fitted with a single path down the centre and stages on each side of it, on which pot plants were stood. Naturally enough, a considerable amount of work was needed to keep these compartments well and suitably furnished at all seasons of the year.

This arrangement has now been done away with, for beds, in which the various subjects may be permanently planted, are in process of construction. Instead of the single central walk, there is a path right round, a roomy bed of soil occupying part of the site formerly taken up by the old path. Narrower beds have been formed next to the perimeter of the house. These will accommodate the climbers with which the roof is to be covered. When completed, this house will present a very much improved appearance, and its value as a winter garden will be much increased.

In the smaller plant houses we found a good deal to interest us. In one was a fine collection of Nepenthes in robust health. The plants were well furnished with pitchers and suspended as they were from the roof, exhibited their distinctive features to the greatest advantage. *N. mixta*, *N. hookeriana*, *N. rafflesiana*, *N. americana*, *N. Curtisii*, *N. C. superba*, *N. Morganiae*, and *N. dicksoniana* helped to make up a representative collection. On the stage beneath the Nepenthes was standing a general collection of warm Orchids. At the end of the house stood a row of fine healthy plants of *Vanda teres*. These were accommodated in 48-sized pots, and we were informed that they had bloomed freely this season.

In a cool house a splendid batch of some sixty well-flowered plants of *Cypripedium insigne* was a great attraction. Here, too, we saw some neat specimens of the pretty *Pinguicula caudata*, the plants carrying a number of the bright rosy flowers.

In other warm houses *Vanilla planifolia* is cultivated largely, and with considerable success by Mr. Wythes. The plants are trained up wires supported by the back wall. They are growing in a box running the whole length of the house, and measuring a foot in depth by 15 in. in width. This is filled with peat and broken crocks, with a few nodules of charcoal here and there. The fruit houses held much that was interesting. The early Peach house containing healthy trees of such varieties as Amsden June, Alexandra, and Hales Early was started on the 25th November, and will yield ripe fruit by about the third week in April. A very noticeable feature about these trees was the careful and wonderfully neat

fashion in which they had been trained, every shoot being in its proper place; indeed, it would be difficult to imagine more perfectly fan-trained specimens than these. We see so much slovenliness with regard to the tying in of fruit trees, that a striking example such as this is all the more noteworthy.

In the large vinery the Grapes were still hanging, such varieties as Lady Downes' Seedling, Trebbiano, Alicante, Gros Maroc, and Barbarossa being represented by some well finished bunches.

The earliest Grapes will be gathered from two-year-old Vines of Mr. Wythes' own raising; in fact, we may say here that all the canes necessary are raised at Syon House from eyes, and are not bought in. This earliest house was started on the 15th of October, Black Hambro' and Foster's Seedling being the varieties.

A good deal of difficulty is experienced in dealing with winter Cucumbers, the fogs proving exceptionally troublesome. Nevertheless, success is attained, and we were much pleased with the appearance of a batch of plants in 12-in. pots that were just beginning to get a hold of the wires. Very little stopping or pinching is done, as it is found that the plants must be encouraged to grow as freely as possible if they are to do well.

The forcing of Strawberries is one of the most important cultures in the establishment, for the demand for forced fruit is very great, and once the supply is started it has to be kept going until the outdoor plants come to the rescue of the forced ones. Upwards of 5,000 Strawberry plants pass through the forcing houses in one season—a gigantic task. Royal Sovereign is now the variety chiefly depended on. Keens' Seedling, and Auguste Nicaise, which have up to the present been forced in quantity, have been discarded this season.

GARDENING MISCELLANY.

ROMAN HYACINTHS.

I do not know if it is the general experience of cultivators of Roman Hyacinths to have them flower freely early in November without subjecting them in some form to forcing? We potted, at three different times, bulbs to keep up a supply of cut flowers till spring, but I notice that those potted about the end of September, and grown in an unheated pit, are throwing up their flowers strongly and abundantly. Those which have been flowering freely are assisted with liquid manure, and will likely throw up a second batch of flowers as a late supply. We never took less pains to get early flowers of these favourites, and never were better supplied. These are grown very extensively in many Scottish gardens. Some pot or pan them by the thousand. Sandy loam, in which a third of the compost is well decayed manure, is very suitable for Roman Hyacinths. To get fine spikes for cutting it is not judicious to plant the bulbs too thickly. They should be kept as near to the glass as possible when they are taken from the covering of ashes or whatever material they are started under.—*M. T., Ca von, N.B.*

ACACIA CELASTRIFOLIA.

THE above name was given to a form of Acacia from Australia by the late Mr. G. Benthams; but the plant has since been considered as a variety only of *A. myrtifolia*, so that it should now read as *A. myrtifolia celastrifolia*. It was introduced from the Swan River in 1842, but at present is not at all common in collections. The leaves are not unlike those of a Myrtle in shape, but in their deep sea-green hue they recall *A. cultriformis*, which is better known in private collections. A coloured figure of it is given in the *Bullettino della R. Società Toscana di Orticultura*, for November, 1897. It has flowered with Sig. Pasquale Motta, of Florence, who recommends it for the precocity, abundant and prolonged flowering of the plant, and its hardness in Italy. In Britain, of course, it would require a greenhouse temperature. The glaucous leaves are ovate, and the small flowers are crowded in small globular heads, which again are arranged in long racemes drooping from the axils of the leaves. They are of a beautiful yellow and pleasantly scented.

OBITUARY.

MR. WILLIAM GREY.

IN this country, Mr. William Grey was best known by his reputation as an Orchid grower on the Corning Farm, Albany, New York. He died at his residence there on the 25th November last.

He was a Scotchman by birth, being born at Greenlaw, Berwickshire, on the 18th February, 1828. He went to the United States in 1851, getting employment for a time with Mr. James Wilson, Lydias Street, Albany. Subsequently he became gardener to Mr. Joel Rathbone, Kenwood; but wishing to try his fortune as a nurseryman in the west country, he moved to Western Iowa, where he found the winters too severe to his liking. Returning to the east, he was appointed gardener to John T. Norton, Esq., Farmington, Connecticut, and stayed there for four years. He afterwards took charge of the collections of Gen. J. F. Rathbone, until his appointment as superintendent of Corning Farm for the late Hon. Erastus Corning.

Here he soon showed that he was in the midst of his real life work. The reputation of the Corning collection of Orchids rapidly rose to great distinction under his management. He raised a large number of very fine hybrids, which have since been finding their way into various collections, both in the Old and New World. Mr. Grey was also a noted entomologist, having a collection of something like 30,000 specimens from various parts of the world. His collection was rich in melanitic and dimorphic forms of insects. He leaves a widow, three sons in the profession, and two daughters to mourn his loss.

QUESTIONS AND ANSWERS

•• Will our friends who send us newspapers be so good as to mark the paragraphs or articles they wish us to see. We shall be greatly obliged by their so doing.

[Correspondents, please note that we cannot undertake to name florists' flowers such as Carnations, Pelargoniums, Chrysanthemums, Roses, nor such as are mere garden varieties, differing only in the colour of the flower. Florists' flowers, as a rule, can only be named by those who grow collections of them.]

Beetles and Plants—*James Thomson*: The so-called beetles you send in four different stages are not beetles at all but cockroaches (*Blatta orientalis*) although the term black beetles is often applied to them. The winged form is the adult male of the insect. The smaller specimens are simply larvae, which are active all through life and never assume either a grub or a pupa stage like true beetles. They keep eating and growing from the earliest to the adult stage of active life, and are one and all more or less destructive. We are surprised, however, that this species should prove destructive to Pinks. Possibly you will find brown specimens in your houses; and if so, they would belong to the American cockroach (*Blatta or Periplaneta americana*), which prove destructive to all kinds of plant life that will afford them nutritive food, which they are able to gnaw. The grub you sent is probably that of a beetle, but it was crushed beyond recognition by the small box rolling about within the larger, together with large loose nails. You do well to destroy both kinds by digging up the soil near the hot water pipes. To destroy the cockroaches get some "phosphorus paste," from your chemist, telling him what the poison is intended for. Put small pieces of this paste on pieces of crock or slate, and lay these about the house in places frequented by the cockroaches, just when leaving off work for the night. Lift the crocks in the morning and place them in a cupboard or other safe place out of harm's way, for the paste is highly poisonous. You need not clear away any dead cockroaches for a day or two, as the live ones eat the dead and share the same fate. You will soon be able to effect a clearance of the pest by continuing the process for a time.

Lectures in Horticulture—*H. H.*: There should be no difficulty in sitting for the examination in your district, provided you can get any one to superintend the examination in your district. You should ascertain in your own neighbourhood whether any schoolmaster, clergyman, or other responsible person would be willing to superintend for two and a half hours or thereabouts in a room while you write out the answers to the questions on the examination papers. Having found some responsible person to do this you should write to the Secretary, Royal Horticultural Society, 117, Victoria Street, Westminster, London, S.W., informing him of your intention, and asking for instructions. You ask whether you would be allowed to prepare for any examination through the post, but we cannot see how this could be done, if that is really what you mean. By pursuing the instructions above given you will get on the right track. You can assist yourself, however, or get any one to help you in extending your knowledge

previous to the examination in May. Your experience will go a long way to assist you in answering the practical questions; and for the theoretical or scientific part you should study "Elementary Botany," by J. W. Oliver, sold by Blackie & Son, Glasgow, for 2s., or "Botany," by H. Edmonds, published by Longmans, Green & Co., London, for something like 2s. 6d. Either of these would enable you to study the morphology and physiology of plant life. They are illustrated.

Strange and lively Earthworms—*Jas. Thomson*: The two specimens you sent us were very much damaged in transit through the post by being packed in a small quantity of dry, loose earth. They were, in fact, dried up and dead. However, judging by their size and shape, as well as the description you give us of their lively movements, we believe they belong to the species *Lumbricus rubescens*, of Friend, first discovered between Idle and Eccleshill, near Bradford, Yorks., in 1895, but since found at several places between Paisley and Sussex. It is usually 3 in. to 4 in. in length, exceedingly active, and usually found along with the Red Worm (*L. rubellus*, Hoffm.). The Rev. Hilderic Friend, M.A., F.L.S., read a paper on the subject at a meeting of the Linnean Society, 5th May, 1892, when he described it as a new species.

Ivy Failing—*Thos. Portnell*: We have carefully examined the specimens you sent us, but fail to find any fungus that would be likely to cause the death of the Ivy. In the old and dried up thick portions we found some traces of a kind of mould, which would be following rather than causing the decay. In some portions of both young and old stems we found bacterial organisms in abundance, but they are likewise the products of decay we imagine. The wood was well formed, and in the younger portions well filled with starch, and the bark with chlorophyll. It is our opinion that the cause of the young shoots and leaves dying is owing to their being dried up through the failure of the thick stems, and their preventing the rise of sap. The cause may have been originally the result of an accident, such as the cutting or injury of the stem in some way. On the other hand it may be that the roots are being starved in a very dry soil, which would have to be investigated on the spot. In any case, the decayed portions may be cut clean out and burnt on the rubbish heap, although we think there is no danger of infection. If you have a young plant or two in pots or otherwise, we should advise you to spread them over the bare place of the wall till they take fresh hold by new growth. Before this, however, you should ascertain the nature of the soil to see if that is at fault, and give some fresh loam. Be sure the soil is not waterlogged, as that would cause the death of the roots, and should be remedied by drainage.

Grub in Stem of Apple Tree—*Milson*: The large and spotted grub in the stem is the caterpillar of the Wood Leopard Moth (*Zeuzera Aesculi*) which occasionally makes its appearance amongst fruit trees both in Surrey and Middlesex. The Goat Moth (*Cossus ligniperda*) is a very much larger creature in the caterpillar stage, different in colour, and usually selects a much thicker branch of the tree, or more often the main stem. Both may be destroyed in the same way by getting a stout piece of copper wire or some other sort that will readily bend in the hole, so as to reach and crush the caterpillars. Another way is to pour or squirt a few drops of chloroform into the hole and close up the entrance by means of clay, so as to keep in the fumes till they have done their work. They have now laid up for the winter; but in future you should keep an eye upon your fruit trees during summer, when frass or gnawed chips of wood are being cast out of the hole in which either of the above moths may be at work. By finding them early you will prevent much mischief, and be better able to get at them with a wire.

Names of Plants—*T. W.*: 1, *Chlorophytum elatum variegatum*; 2, *Agapanthus umbellatus variegatus*; 3, *Selaginella Braunii*; 4, *Selaginella emiliana*.—*Henry Hunt*: 1, *Anthurium warocqueanum*; 2, *Bouvardia Vreelandii*; 3, *Daphne odora*, usually known as *D. indica*, in gardens; 4, *Adiantum hispidulum*; 5, *Metrosideros floribunda*; 6, *Sparmania africana*.—*G. W.*: 1, *Oncidium varicosum*; 2, *Odontoglossum constrictum*; 3, *Laelia anceps*, a fairly dark variety.

A Special Offer to Readers of
THE GARDENING WORLD
25/- BOOK for 8/-

NO HOME SHOULD BE WITHOUT ONE.

Ogilvie's Encyclopædia
OF
USEFUL INFORMATION
AND WORLD'S ATLAS.

No Single Book ever before contained such a Wealth of Knowledge.

By Special Arrangement with the Publishers of the "Encyclopædia of Useful Information and Atlas of the World," we are enabled to offer to the Public a Magnificent 25s. Volume for 16 of the coupons, which will appear weekly, together with 6d. each, accepted in Weekly Instalments, or the Coupons may be held until the whole period has elapsed and brought or sent to the Office with 8s., and 6d. towards carriage.

A COMPLETE ILLUSTRATED LIBRARY IN ITSELF.

A universal assistant and treasure-house of information on every conceivable subject, from the household to the manufactory. In short, gives information about everything, is absolutely indispensable to everyone in all walks of life; the contents being so separated, indexed, and arranged that they can be turned to at once. It is

THE BEST { BOOK OF } EVER
 { INFORMATION } ISSUED.
Size of Encyclopædia: 9 by 11½ inches. 656 Pages.

It contains

MANY MAGNIFICENTLY ENGRAVED
COLOURED MAPS,

and a description of every country under the sun, besides much other matter relative to the Home, the Farm, the Factory, a Dictionary of Statistics—many Useful Tables, Poetical Selections, Synonyms, Famous Bridges and Ships, How to Calculate, How to Cook, How to Get Rich, How to Cure all Diseases, How to Succeed in Business, Table of Weights and Measures, and

HUNDREDS OF OTHER TOPICS OF
GREAT VALUE TO EVERY PERSON

who desires to be up to the times. To see the Book is to want it. To Members of Mutual Improvement Societies it will prove of inestimable value.

The articles are written by men whose lives have been devoted to the subjects treated, are short and concise, but contain full information up to date. It is to be consulted on every subject that arises in everyday life, by old and young alike. It contains a complete Illustrated Atlas of the World.

IN THESE DAYS OF COMPETITION

it is imperative that a Gardener should be a well-informed individual. Here is an Encyclopædia containing an immense amount of knowledge that will be of the greatest service to him.

YOUNG GARDENERS,

do you wish to be successful? Then remember that to possess knowledge is the surest way to achieve success.

It is elegantly bound in Morocco Cloth, with beautifully designed Gilt Side-stamp and Red Edges, making at once the most handsome and durable as well as THE MOST USEFUL BOOK EVER MADE or sold for 25s.

CONTENTS—The Best Seeds and Potatos for Gardsn and Farm; also Descriptive Lists of Carnations, Chrysanthemums, Dahlias, Fuchias, Gladioli, Herbaceous Plants, Pansies, Peiargon ums, Pentstemons, Phioxss, Pinks, Pyrstrhums, Roses, and V olas; with full Cultural Directions for each.

PRESS & OTHER OPINIONS OF THE BOOK.

WEST HUMBERSTONE.—“Your Catalogue and Guide safe to hand. I am very pleased with it, and I am sure every Amateur, in particular, should have one in his possession, as they are worth 100 times their cost.”—T.H.

Leeds Mercury.—“For a useful selection of vegetable and flowers, and a trustworthy guide in the culture of these, it is vastly ahead of ordinary catalogues.”

ABROATH.—“Very many thanks for your valuable Catalogue and Guide. As an Amateur, I find cultural instructions of immense value.”—D.A.

Bell's Weekly Messenger.—“Contains elaborate and complete articles on cultivation for exhibition as well as ordinary purposes. It is thus far more than a mere catalogue—quite an encyclopædia of farm and garden plants.”

YARM.—“Thanks very much for your Catalogue of 1897. In looking through it, I find it is even better than last year's, which I thought could not be surpassed.”—W.C., Gardener to Sir T. Richardson, M.P.

“Gardening is the purest of human pleasures, and the greatest refreshment to the spirit of man.”—BACON.

The Gardening World.

Edited by J. FRASER, F.L.S.

SATURDAY, JANUARY 1st, 1898.

OUR APPLE SUPPLIES.—There is no topic that is more popular at the meetings of societies and mutual improvement associations all over the country than that of fruit culture, but particularly Apples. The agitation which has been going on for several years past has not yet given results that in any way effect the market supplies of fruit, though there ought by this time to be some visible evidence of the produce from the many acres of fruit trees that have been planted since the movement commenced. The operation at best is a slow one, but it is questionable if the proper method of proceeding was adopted when the subject of fruit growing for a home supply was taken up. There can be little doubt that many farmers and other equally inexperienced people turned to fruit growing as a speculation when the agricultural industry generally was in a very depressed condition, with the result that they gave fruit growing a bad name and relinquished it in disgust. The keynote of the whole subject was no doubt struck at a meeting of the Chiswick

Gardeners' Mutual Improvement Association when a paper was read by Mr. Miller on “Profitable Fruit Culture.” In the course of the discussion, Mr. S. T. Wright, the President, remarked that he had been asked whether he knew of and could recommend a good man to undertake the growing of hardy fruit. Notwithstanding his wide experience he was unable to lay his hand on a properly qualified man. Here, then, we have the question in a nutshell. We have plenty of young gardeners who have given lively attention to the cultivation of fruit under glass, though hardy fruit has been neglected by them. Glasshouses have for many years offered great attractions for young men to the neglect of outdoor gardening, including the kitchen garden and hardy fruit; but the latter has suffered by far the greatest amount of neglect. How then can we expect the cultivation of hardy fruit to pay when so few understand the principles of the subject? Here, then, is a hint to the enterprising young men of the period, the future generation of gardeners. From this point of view we have been making a great mistake in urging the increased cultivation of fruit trees with the object of meeting the demand with home supplies, when we should have been encouraging the young men to get a thorough knowledge of fruit culture and to get abreast of the modern requirements to enable him to succeed. A proper selection of varieties to grow for market, the grading and packing of the fruit, and being in touch with good centres for the disposal of the fruit, are things that must constitute part of the experience of a successful fruit grower. Then he must have a good man under him in two or more of the principal departments of the business.

A point in the discussion at the above meeting was that a plantation of fruit would give a profitable return in the course of six years. The president stated that Apple trees on the Paradise stock, and under suitable conditions as to cultivation and proper selection, would give a profitable return in two years. This is certainly very assuring to aspiring cultivators; but few gardeners have had a better or even a similar experience to the author of the statement. The plague to the British cultivator hitherto has been the growing of too many sorts, many of them bad or indifferent, for market, instead of confining his attention to a few, say half a dozen, reliable and good-keeping sorts, with which a continuous supply might be kept up for as long a period as possible, so that the buying public could get acquainted with the quality of the particular varieties in season. Once they can be induced to rely upon the regular and even quality of what they are buying, they are likely to come again for a further supply. By such means a reputation and a business could be built up that would insure a successful future for British-grown fruit.

At present the bulk, if not the whole, of the supplies in the market are of foreign produce, so that the grading which gives the fruits their even and tempting appearance has been due to the skill of the people that sent them here. British grown fruit so long as the supply lasted was in fair form in some cases, while other samples were in the same old mixed order, and anything but tempting in appearance. King of the Pippins Apple grown in Middlesex was being retailed in the shops last November at 4d. a pound, while alongside of them were baskets of the same variety from Worcester at 3d. the pound. The fruits in both cases were of good average size, those from Middlesex being yellow and apparently more thoroughly ripened. On

the other hand the Worcester samples were greener, but heavily flushed with red on the exposed side, and altogether more tempting in appearance. The plea for the difference in price was that the Middlesex Apples were the better in quality. When the skin was pared off the fine looking fruits from Worcester, the flesh was seen to be covered with bruises on all sides, thus discounting any expectations which the skin might have held out. Newtown Pippin Apples from America enjoy a high reputation for quality, so much so that samples of moderate size and disfigured all over with ornamental clusters of the spores of a fungoid disease were selling at 4d. a pound.

At the meeting above mentioned some very fine examples of Apple culture in Ireland were shown by Mr. Gingell, the superintendent of Ravenscourt Park, Hammersmith, London. All the fruits were of large size, and their colour was very striking indeed, particularly in the case of Lane's Prince Albert, Emperor Alexander, The Queen, Bismarck, Peasgood's Nonsuch, and other varieties. The trees had been planted very shallowly on the surface of heavy clay land on account of its inclination to be wet, and the results justified the methods adopted. If fruit such as that could be produced in quantity, not only in various parts of Britain, but also in Ireland, there ought to be no fear for foreign competition. Our home growers, and young gardeners in particular, should be up and doing, and put the situation fully to the test.

The experiment made by the Laurier administration of Canada last season in transmitting Grapes, Peaches, Plums, and Tomatos, by the cold storage system, has been making the United States sit up, so to speak, to see a new and bold competitor against them in our markets. The first shipment of fruit, says *American Gardening*, left the government warehouse at Grimsby, Ontario, on September 7th, in refrigerator cars, on their way to Montreal. From thence they were forwarded in cold storage to Bristol in the steamer "Merrimac." On arrival there the fruit was sent on in refrigerator cars to London. The fruit was found to be a little more matured than was desired, with the exception of some Apples and Pears. This was comparatively a small matter, inasmuch as the Canadians must gain experience at the cost of experiment just as other colonies and peoples have to do. That they did profit by the results of later shipments has been admitted. Amongst other things, however, they discovered that Canadian Tomatos were too large for the British markets. That can easily be remedied, even if they send here for the first stock of seeds. In matters of packing they also had something to learn. Our contemporary on the other side of the Atlantic urges United States growers to maintain uniform grading and honest packing, if they are to hold their own in the markets of the world, for there can be no doubt that the Canadians intend to develop and extend the fruit-growing industry.

Royal Botanic Society and the Public.—At the meeting of the Marylebone Vestry on the 16th ult., a heated discussion took place regarding the new lease to the Royal Botanic Society. The following resolution was proposed, seconded, and carried by a large majority:—"That H. M. Commissioners of Woods and Forests be informed that in the opinion of the vestry increased facilities should be afforded to the public for admission to the Botanic Gardens upon payment for such admission, and that such provision should be a condition precedent to the granting of the new lease to the Royal Botanic Society.

Gladioli with double Flowers.—At a meeting of the National Horticultural Society of France in July last, MM. Dupauloup & Cie exhibited a collection of Gladioli with double flowers, which the *Bulletin d'Arboriculture, de Floriculture, &c.*, thinks will give rise to a new race that cannot fail to interest lovers of this class of flowers.

Notts Chrysanthemum Society.—The annual dinner was spread at the Adjutant White Hotel, Nottingham, on the 17th ult. The chair was ably filled by Mr. D. Whittingham, the president of the society. After the usual loyal toasts had been honoured, Mr. Goodacre proposed "The Society." He spoke of the lead taken by Nottingham in the question of allotments, and was quite sure that the artisans of that town could hold their own against the professional gardeners of many other places. He coupled with the toast the names of the chairman and vice-chairman. After a number of other toasts had been given the secretary laid the balance sheet before the meeting. This showed a balance in hand of £36 14s. 10d., and called forth a remark from the chairman that the society was now in a better condition than it had been at any previous time in its history. At the election of officers, which followed, Mr. E. Hermmel was chosen as secretary, and Mr. T. Hugh as treasurer. The election of president was left in the hands of the committee. It was resolved that the show next year should be held on the second Friday in November, and the general meeting on the first Friday after December 11th.

Reading and District Gardeners' Mutual Improvement Association.—The last fortnightly meeting for the season 1897 of the above association was held on Monday evening in the Abbey Hall (by kind permission of Messrs. Sutton & Sons) and was presided over by the president, Mr. C. B. Stevens. A very large number of members attended to hear a paper entitled "A chat about Chrysanthemums," by Mr. H. J. Jones, of Lewisham, the well-known exhibitor and grower. The paper was given in a very interesting and "racy" manner, and was full of practical hints and illustrations, and was greatly appreciated. The paper was divided into several headings, such as propagation, composts, potting, manuring, watering, insects, housing, exhibiting, &c., and without doubt many were benefited by the wrinkles given. A splendid exhibit of flowers, &c., by the members greatly added to the interest of the meeting. Messrs. Sutton & Sons sent some beautiful specimens of Cyclamen, including Sutton's Salmon Queen, Vulcan, White Butterfly, &c. Mr. Townsend, Sandhurst Lodge Gardens, staged some grand plants of *Primula obconica*; Mr. Bright sent dwarf plants of *W. H. Lincoln Chrysanthemums*, showing the decorative value of plants grown in 3-in. pots; and Mr. Bradley, Tilehurst Nurseries, exhibited cut blooms of Chrysanthemums and a basket of Mushrooms. Mr. Woolford, The Gardens, East Thorpe, also exhibited a splendid specimen of *Begonia Gloire de Lorraine*.

Taunton Horticultural and Floricultural Society.—The annual general meeting of this society was held in the Guild Hall at Taunton on the 14th December. The Mayor (Alderman W. Potter), presided. After the minutes of the last general meeting had been read and confirmed, the secretary presented the report and balance sheet for the year. Like many of the balance sheets of similar societies during the trying Diamond Jubilee year the finances have suffered to some extent. The gate receipts were £50 less, and the expenditure was £27 17s. greater than for the previous year. They commenced the year 1897, after depositing £50 with a balance of £30 19s. 4d., and ended with £13 0s. 5d. The Mayor, in proposing the adoption of the report, reminded those present that they were comparing the accounts with those of a record year. Mr. A. Hammett seconded, and the report was duly adopted. The next show was fixed for August 11th, when Somerset meet Kent on the cricket field at Taunton. The High Sheriff-elect of Somerset, the Hon. E. W. B. Portman, was elected as president. Mr. J. S. Winsor was re-appointed secretary, and Mr. A. Clements was chosen to be treasurer. Mr. T. Penny, of Parklands, and Mr. A. W. Turner, Staplegrove, were added to the list of patrons. Mr. G. Norman and Mr. Albert Goodman were requested to serve on the committee. Votes of thanks were passed to the donors of special prizes, and to those who had assisted the society in other ways.

Mr. Charles Nicholson, formerly of The Lawn Gardens, Warwick, and for the past four years foreman at Rokeby Park Gardens, Barnard Castle, Co. Durham, under Mr. Bowlzer, has been engaged as gardener to Major Chichester Constable, Wycliffe Hall, Winston, Darlington. We heartily wish him every success in his new situation. He entered his duties on the 31st ult., to start with the new year.

The Florists' Club of Philadelphia, U.S.A.—A review of the Chrysanthemums disseminated in the States during 1897 occupied the attention of the Philadelphia florists at a recent meeting. Mr. Robert Thift was appointed to open the discussion, and the officers of the Chrysanthemum Society of America was invited to give an opinion. Mr. Elijah A. Wood, president of this society, read a carefully prepared report, in which he detailed the behaviour of most of the more important introductions. Such varieties as Sunstone, Mrs. Martin, A. Ryerson, and Western King are well known on this side of the Atlantic. Mr. John N. May also gave a similar report of varieties that had done well with him.

Devon and Exeter Gardeners.—Mr. Norman Gill, of Penryn, Cornwall, read an instructive paper on "Insectivorous Plants" before the members of the Devon and Exeter Gardeners' Association on the 22nd ult. The chair was filled by Mr. G. C. Crabbe. The essayist said that it was tolerably well known more than a hundred years ago that some kinds of plants captured and digested insects, yet it was only in recent years, and as a result of the investigations of men like Charles Darwin and Sir J. D. Hooker that the why and the therefore of such movements were apparent. Great Britain, continued Mr. Gill, was comparatively poor in insectivorous plants, twelve species and two sub-species being all that we could muster. These comprised three Sundews, with two sub-species, five Bladderworts, and four Butterworts—all very small bog plants. The Sundew had leaves tipped with crimson hairs, each of which exuded a drop of gummy fluid. The insect became stuck in this fluid, and was digested at leisure by the plant. The movements of other insectivorous plants were next detailed. Almost all of them had but the merest shadow of roots, whilst others had no roots at all. In consequence of their inadequate root capacity the plants had recourse to novel methods for obtaining the necessary nitrogen. Some plants that had once been insect devouring, had outgrown this stage as in the case of *Parnassia palustris*.

The Royal Oxfordshire Horticultural Society held its annual general meeting on the 14th ult. in the Town Hall, Oxford, under the presidency of Mr. George Herbert Morrell, M.P. The report for the year lately passed showed that the committee in presenting the sixty-eighth annual statement regretted a gradually diminishing revenue from subscriptions and other sources, traceable to the removals from the district by death, or otherwise, of supporters, and also the falling off in the visitors' attendance. The shortening of the University term, and the Diamond Jubilee celebrations had also contributed largely to the loss of £43 sustained upon the year's working. The show held at the Worcester College Gardens in June last, fully sustained the reputation of the society's shows, and the same might be said of the second summer show which took place at Headington Hill Hall on the fourth Tuesday in August. The chairman in commenting upon the report and statement of accounts, reminded them that unsuccessful as the year had been from a purely financial point of view, they had yet a balance of £60 or £70 upon which to fall back. The gate-money this year had totalled £68, the lowest figure that had ever been reached, whilst the maximum amount of gate receipts at any time during the last ten or twelve years was £198, and the average £170. He announced that he should be pleased to contribute £10 towards the deficiency. Mr. Wooten formally moved the adoption of the report, in which he was seconded by Mr. Filsell. The motion was duly carried. Owing to Mr. Morrell's retirement from the post of president, it was decided to ask Mr. Aubrey Harcourt, of Nuneham Park, to succeed him. The hon. secretaries, Messrs. John Thomson, and M. Wooten were re-elected on the proposal of Mr. C. Bates, whilst Mr. Greenway was returned as acting secretary.

Source of Mistleto.—The supply of this evergreen, which from a commercial point of view might be described as an annual, has been obtained from the Channel Islands, but more largely from Brittany, St. Malo, Cherbourg, and other parts of France. It was somewhat dearer than usual this season.

Clevedon Chrysanthemum Society.—The committee of this society dined together at Sweet's Restaurant on Saturday evening, December 18th. Mr. H. S. Newnham presided. After an excellent repast, Mr. Wm Jones proposed "Success to the Clevedon Chrysanthemum Society," and coupled with the toast the names of the chairman (Mr. F. Spangle), and the hon. secretary (Mr. J. H. Hart), both of whom responded. Mr. S. Dyer gave the exhibitors, and Messrs. W. Jones and W. Austin replied. Other toasts followed, interspersed with songs, and in this way a very pleasant evening was spent.

Social meeting of Messrs. Dobbie & Co's Employees.—The annual social gathering of Messrs. Dobbie & Co., Rothesay, took place in the New Public Hall of that town on the 23rd ult. The platform was decorated with plants and flowers, while appropriate mottoes adorned the walls. About 200 sat down to table under the presidency of Mr. William Cuthbertson, the senior partner of the firm, who was supported by Mrs. Cuthbertson, Mr. James Dobbie (the founder), Mrs. Dobbie, Mr. Robert Fife, Mr. A. M. Burnie, Mrs. and Miss Burnie, Mr. Andrew Mitchell, Mrs. Mitchell, Rev. Frank Matthews, Ex-Bailie and Mrs. Burness, and Mr. A. G. Christie. The chairman read a telegram from the employees at Orpington wishing success to the social gathering. Being an evening for enjoyment and not for speeches he would not detain them long. The firm with which so many of the audience were connected still enjoyed good health, and he took the opportunity of expressing the gratitude of the firm to those who took such a conscientious interest in their work, the members who did so being neither few nor small. The firm did not as yet see any limit to the development of their business. Quite recently Lord Inverclyde had urged him to develop an American business where there was a large field, as floriculture was not so forward as in Britain. At present they had enough to do with their own country, though they had a satisfactory clientele on the Continent, in America and Australia. He was sure they would be glad to see their hale and hearty friend, Mr. Dobbie, with them. Mr. Fife had also come from Orpington, a distance of 450 miles to be with them again. Of Mr. Mitchell and Mr. Burnie (the other members of the firm) he would say nothing, as they were always with them. On behalf of the staff, Mr. R. Free-land, said that the workers desired to be honourably represented on the programme, and that the continued success of the firm was a source of great gratification to them. Some of his fellow workers had died and others had left for new spheres for their activity. An Agricultural Seeds Section had been added to the business, and this being the first time that Mr. Mitchell, the manager of that department, had come amongst them as a partner of the firm, the employees would offer him a hearty welcome and their warmest congratulations. The business had been founded in 1865 by Mr. Dobbie on half an acre of ground, and looking at the extent of their land now and the number of employees, one could not help being struck with the rapidity of growth of the firm. Mr. Robert Fife said he could hardly realise that it was four years since he had been amongst them, but hoped they were doing their best to guard the reputation of the firm. He had recently been at a banquet in London, where one of the toasts bore strongly upon the firm, and the way in which it was received showed that the firm was well known and appreciated. In describing what they were doing at Orpington he indicated his experiences as to extremes of climate with which their seed growing had to contend. They had been able to maintain the quality of their strains of seed, and that was something. During the evening many popular songs were rendered by ladies and gentlemen. A male voice choir, as well as a choir of young girls and boys, also contributed to the evening's enjoyment. After an amusing dramatic sketch, dancing to the music of Mr. Maitland's band was engaged in till an early hour.

Birmingham Gardeners' Association.—At the fortnightly meeting of this society, which took place at the Athletic Institute, John Bright Street, Birmingham, on December 20th, a paper contributed by Mr. H. Dunkin, late gardener at Warwick Castle, on "The Cultivation of the Strawberry," was read by Mr. J. Hughes. Some interesting statistics of the enormous quantities of Strawberries produced by the Kent fields were given. An instructive discussion followed, in which Messrs. W. Spinks (Solihull), Snead, J. Hughes, W. Jones, and C. R. Bick took part.

Income-Tax Grievances.—The year now drawing to a close has been remarkable for the great increase in the agitation throughout the United Kingdom against the methods adopted by those whose business it is to administer the Income-Tax Acts. While there is no doubt ground for complaint in many districts, we are bound to say that, with very few exceptions, we have at no time had any cause of complaint against the Inland Revenue Officials. The reason why so many fail to obtain relief is that they either will not take the trouble to prepare proper accounts or else they have neglected to keep any accounts of their business transactions. If proper accounts be kept, or even if a proper cash account be presented (which is very simple by using the "Taxpayers' Cash Book"), there is but little difficulty in establishing a claim. Apart altogether from the Income-Tax question, it is most necessary that all persons engaged in business should keep a proper record of the business done. Many persons have drifted into bankruptcy through ignorance of their financial condition, who would have been able to have retrieved their position, had they been aware of it in time. As most of your readers who are engaged in business are now ascertaining the amount of their profits for the past year, will you allow us to remind them that, if such profits show a diminution they may be entitled to the repayment of a considerable portion of the Income-Tax paid in respect of the same, and to point out the importance of making the claim forthwith. Thousands of people pay tax for which they are not liable, more particularly those whose incomes are derived from property and investments where tax is deducted before being paid to the recipients, even when dividends are paid "free of Income-Tax." Claims can in many cases now be made for four years, and the sum repayable might in the case of private incomes alone exceed £42 up to the end of the current financial year, to say nothing of tax allowed in respect of Life Insurance premiums even when the income exceeds £500. We shall be glad to advise any of your readers gratuitously whether they can make a claim, if they send us full particulars of their incomes and a stamped addressed envelope.—*The Income-Tax Adjustment Agency, 12 & 13, Poultry, London, E.C., December 28th, 1897.*

A PIED OR SPRECKLED BLACKBIRD.

It is nearly twenty-five years ago since I observed a similar freak of nature in this bird. I made a note of it at that time in the columns of *The Gardeners' Magazine*, adding by way of a foot-note to Mr. Hibberd, "Be cautious with what cognomen you head the note, for fear of Punch."

I knew not then how to explain the thing, and am still about in the same embarrassing position. Yet the question at issue is typical of the two gentlemen when passing unripe Blackberries, one remarking how ridiculous it was to call them blackberries when they were red. Of course, the other was equal to the occasion by retorting that Blackberries were always red when they were green.

In asking one of the men the other morning whether he had also noticed the speckled blackbird, he blushed red, and, I presume, wondered if the questioner was green too. He has since qualified the statement, having seen it, and is busy prospecting the whereabouts of its roosting place, with a view to its death and transference to the taxidermist. I hope any such chance may be foiled, having a great abhorrence for the extermination of any rare birds.—*B. L.*

P.S.—Since writing the above I notice a white blackbird has also been seen in Kensington Gardens recently. I enclose the cutting:—"On Tuesday, a white blackbird, presumably a male, judging from its size, was seen in Kensington Gardens. It had all the characteristics of an albino, being perfectly white,

with the exception of the eyes, which were of the typical pink hue. Such an oddity is said to be very rare in England, although it is averred to be comparatively common in Northern Europe, especially in the Black Forest."

SELECT LIST OF CACTUS DAHLIAS.

THE undermentioned varieties of Cactus Dahlias have been selected by the National Dahlia Society as being the best and most select for the year 1898. Many have been omitted which find favour with a large section of growers, but those given supply infinite variety in the matter of form and colour. The number of varieties of this section alone in commerce is an indication of the great popularity which Cactus Dahlias have acquired within the last decade:—

ORCHID NOTES & GLEANINGS.

BY THE EDITOR.

Laelia anceps Whiffeni and *L. a. crawshayana*.—On a former occasion we compared these two fine varieties together (*GARDENING WORLD*, Vol. XII. p. 674) when we had not flowers of each to note their peculiar and distinctive characteristics. Now we have seen flowers of both and find them distinct in colour and form, the latter being very decisive under the best of cultural treatment. *L. anceps Whiffeni* has lanceolate, acuminate petals, of a rose colour and darker towards the tips. The lip is intense purple with a very small white disc at the base of the lamina. On the contrary, the petals are ovate, very broad and similar in type to that of *L. a. Dawsoni*. Both they and the sepals are lilac-rose. The side lobes and the lamina of the lip are crimson, with a pale, nearly white disc of considerable size at the base of the crimson. The tube is paler, but lined with rich crimson internally. Both flowers are large, but those of *L. a. crawshayana* are heavy and rounded, with broad blunt petals. We are indebted to De B. Crawshay, Esq., Rosefield, Sevenoaks, for an opportunity of comparing the two varieties above mentioned.

Cypripedium Calypso Falkland Park var.—The parents of this variety were *C. spicerianum* and *C. villosum* Boxalli, the former being the seed bearer. The dorsal sepal is broadly elliptic, but so strongly revolute at the side as to appear obovate, this character being derived from *C. villosum* Boxalli. The basal portion is apple-green, thickly spotted with crimson, the rest being white and finely spotted or mottled with rose, except at the apex and sides; the midrib is claret-purple. The lateral sepals are free, partly reflexed, diverging and whitish-green, with a few spots at the base. The petals are heavily spotted with rich brown on the lower half, and more suffused with that hue on the apical portion. The lip is bright brown, with a yellow margin. The whole flower is of great size, with a glossy lustre as if polished, and very handsome. A large plant in the collection of Thos. McMeekin, Esq., Falkland Park, South Norwood Hill, bearing a number of flowers, has the lateral sepals free almost to the base. Mr. A. Wright, the gardener, is confident that this character will prove permanent. The interior of the lip is more highly and more brightly coloured than the exterior.

PEOPLE WE HAVE MET.

MR. F. W. ASHTON.

THE accompanying portrait of Mr. Francis Widdous Ashton will recall a face that is now familiar to many of our readers, for he is frequently moving about in various parts of the country, and in atten-

MR. F. W. ASHTON.

dance at most of the leading shows where Orchids constitute an important feature.

Mr. Ashton was born at Barnage, near Manchester, in 1860, and was educated at Withington. His school career must have been brief, however, for we find that he commenced to earn his own livelihood at the early age of eleven, this being due to a series of disasters which overtook the family. The gardening profession offered the best inducement to the school lad, and he engaged as an apprentice in the establishment of W. Young, Esq., Highfield, Heaton Mersey. Upon the completion of his apprenticeship he obtained the position of first journeyman at West Bank House, in the same neighbourhood, and now the property of J. Leemann, Esq., of Orchid fame.

After a time Mr. Ashton was transferred in a similar capacity to the establishment of W. R. Leake, Esq., of The Dales, Whitefield, which he shortly left, however, feeling a strong desire to learn the forcing of the better classes of fruit and flowers for market. With this object in view he entered the employment of Mr. Duncalf, of Macclesfield, about the time when Cucumbers in winter were being sold at a guinea apiece, and Strawberries at figures running as high as twenty-eight shillings per pound.

By this time, however, Mr. Ashton had contracted a strong love for Orchids, which has never since forsaken him. The Cucumbers and Strawberries ceased to interest him, and in due course he relinquished his connection with them. Having applied for and obtained an appointment as a student in the Royal Gardens, Kew, he came south and entered upon his new duties in 1880. After serving a year and eight months in the propagating department, he was appointed sub-foreman in the Orchid department.

Here he continued his labours with unabated ardour till May, 1885, when he thought it time to be moving again to fresh fields and pastures new, as behoves all earnest and energetic young men. Long before this, however, he had attended all the courses of lectures given to students in Kew Gardens, and secured all the certificates obtainable for the same. When about to leave, Mr. Ashton was appointed to a foreign post, but before the time for his departure had arrived he resigned, at the same time securing the position of Orchid grower of the trade collection of J. R. Wood, Esq., of Barvins Park, near Potters Bar, Herts. While here, Mr. Ashton met the young lady who now shares his sorrows and joys; and

since he married her he has always considered it one of the most fortunate steps he took.

After a sojourn of three years at Barvins Park, he was appointed foreman in the Orchid department of the Liverpool Horticultural Company, at Garston, which position he held for about three years—until, in fact, he was offered the post of foreman and occasional traveller to Messrs. Charlesworth, Shuttleworth & Co., of Bradford, with whom he stayed several years. At length, however, he found it necessary to leave this northern district on account of his wife's health, which had never been good during his residence there; and he accepted the position of traveller for Messrs. W. L. Lewis & Co., Southgate, N., later on being promoted to the managership of the establishment. In 1893 he was admitted into partnership. Shortly after this period he had the serious misfortune to lose the use of his left eye, owing to a severe attack of influenza, from which he has never fully recovered.

Altogether the subject of this sketch has had a wide and varied experience, but is yet a young man with many years of useful life before him as far as human eyes can discern; and we wish him many years of enjoyment amongst his favourite flowers. He still carries the same unassuming demeanour, and possesses the same genial and courteous disposition as when we first met him in 1880 at Kew. He himself entertains lively and grateful recollections of Kew; for in all his wanderings he has never met with more consideration from anyone than from Mr. W. Watson, of Kew, to whom he has great pleasure in acknowledging that he owes a very large amount of the knowledge that he now possesses. Furthermore, he considers that the advantages of a course at Kew are invaluable as he has proved not only from the education acquired, but by reason of the class of men one meets there. Certainly the more important positions in horticulture throughout the world are mostly held by ex-Kewites.

In the Kew days of which we speak the wages obtainable by the young men were on a much lower scale than at present and many a one found it insufficient to make ends meet. Notwithstanding this, when it got rumoured that Mr. Ashton was about to leave the establishment, the young men took counsel together and organised a subscription list amongst themselves, and collected sufficient with which to procure and present Mr. Ashton with six volumes of useful books, including the "Treasury of Botany," "Treasury of History," "Treasury of Geography," &c., which he has since found very useful. Under the circumstances, this will serve to indicate the estimation in which he was held by his contemporaries.

PRIMULA SINENSIS ALBA PLENA.

THIS is an old but really a most useful plant to cultivate for flowering in the warm greenhouse from early in November to the end of March, and I think it a great pity that it is not more often met with in private establishments, especially where white flowers are in great demand. A well flowered plant in a five or six inch pot well repays the little extra attention that it may be necessary to give it through the summer months. I find it most useful, either as a pot plant for indoor decoration of the mansion, or to cut from for small glasses, as well as for button holes, and, to adopt the old saying, one can cut and come again, if only a dozen plants are grown. What a boon to us gardeners if only a scarlet one could be given, and prove almost continuously in flower, as the one above mentioned. Some gardeners condemn it because the individual flowers are so small compared with the newer, named varieties, but are these varieties so free flowering as the old double white? I trow not. The last named varies a good deal as regard size of flower; some come much larger than others, and the additional name grandiflora is given it by some growers who consider it an improvement on the type; but this is not my opinion. I maintain it is only a matter of culture and find as a rule that those plants having one crown give the finest flowers.

I have a good batch of over one hundred, as I consider it is one of the most useful plants that can be grown by those who can command a temperature not below fifty degrees during the night, with a corresponding rise in the day. If the Editor can find space in his valuable paper, and thinks it would

be instructive, I will give my mode of culture in a future issue. [Please do so, Ed.]—J. Mayne, *Bict n, Devon.*

STRANGE FREAK OF A BLACKBIRD.

ALTHOUGH there are two blackbirds concerned in my story (a cock and a hen), only one of them (the hen) was of much interest. This bird came into my greenhouse in the spring of 1896, and although I was in the house at the time, she seemed to have made up her mind that I had no intention of doing her harm; for she set about examining the interior quite regardless of my presence. One of the Camellia bushes seemed to please her very much as she returned again and again to a particular branch, turning herself and giving a satisfied tuck, tuck, all the time.

About a fortnight after her first visit she laid the foundation stone, or stick, of her nest on the Camellia hush in my presence. The frame-work of the nest was soon finished with strong, dry material of different kinds; she then began to line it with wet muddy, half decayed leaves and fibre of different kinds, sitting well down and turning herself round, beating the inside of the nest with her wings. I happened to be washing flower-pots in the house at this time, and she seemed to be very much interested in what I was doing, coming close up to me and picking up any wet material from amongst the water on the floor. I tried her with a bit of my wet cloth, which she picked up and carried to her nest, coming back for more, till she had the hulk of the washing cloth beaten into her nest.

After she had the nest perfectly formed with wet material she lined it with dry soft grass. After a few days rest four eggs were laid (one per day). Hatching then commenced, and in due time four young blackbirds made their appearance. She was not afraid when visitors came in to see her while she was sitting. The cock did not assist her in any way up to this time, but he started to carry food after the birds were hatched. He was very timid.

The food consisted of the larvae of the Noctuidae family of moths, the larger larvae of the family Tipulidae, the perfect insects and their larvae of the order Coleoptera, the earthworm (*Lumbricus*), the Julidae, Scolopendrae, &c. In fact every creeping thing was picked up except very small animal life and slugs. If gardeners only knew what a quantity of garden pests the blackbird destroys, particularly at nesting time, they would not kill them when caught in their Strawberry nets. The loss of a Strawberry or two is nothing compared to the good they do.

The hen continued to feed the young birds for a few days after they were fledged, then started to build again. The cock continued feeding much longer—till they were full sized. Two nests of birds were brought out in 1896, the first inside the greenhouse, the second outside, the same thing being repeated in 1897.

As soon as the young birds of the last nest were able to look after themselves the mother left them and roosted in the greenhouse alone. She came readily to my call, being always rewarded with some of her tit-bits that I came to know about.

When snow covered the ground and the frost held everything in an icy grip she remained mostly inside the greenhouse. I fed her every day, and she got water from the tank inside the greenhouse, on the side of which she often perched herself, when the water was running into it, accompanying the murmur of the water with a soft low song (for the hen sings). The song sounded like a far away echo of the full bold notes of her mate. No more, however, will I hear her song of gratitude, for an ominous patch of feathers lay near her haunts, and I have not seen her since.—W. K.

THE PLANT HOUSES.

The Stove.

As we are now in the dead of winter and the plants for the most part in a state of comparative rest, nothing should be done to unduly excite them. The night temperature should stand at about 60° Fahr., with a substantial rise during the day, that is if the weather is fine. If we experience very frosty or cold windy weather there will not be very much difference

between night and day temperatures. With the cessation of syringing overhead there will be the more need to attend closely to the damping down of the paths and plant shelves, especially with increased fire heat. There will be very little need to open the top lights for a while yet, as the sun has very little power even when the day is bright, but the bottom ventilators should be opened on all possible occasions. Fresh air will thus be admitted without a cold draught, since the air entering through the bottom ventilators becomes warmed in its passage over the pipes.

Advantage should be taken of the present quiet season to give the house a thorough cleaning out with a view to getting rid of insect pests as far as is humanly possible. All the woodwork, wires, and glass should be washed, the climbers on the roof pruned, cleaned, and returned to their places, and the foliage plants sponged carefully to remove both dirt and insects. The year will thus be started with a clean bill of health, and a moderate amount of labour only will be required to keep things straight afterwards.

BOUGAINVILLEAS.—Throughout the winter months the Bougainvilleas, whether grown in pots or planted out should be kept quite dry at the roots. Plants of *B. glabra*, which is the favourite species in most gardens, may be pruned forthwith. In the case of young plants a few of the strongest growths should be selected as a foundation for the future tree, and the remainder spurred in closely. Weak, or straggling shoots should be cut clean out as they will only be in the way presently. In the case of the larger plants pruning will simply consist in spurring back the last year's growths, just in the same way as Vines. As Bougainvilleas are very subject to mealy bug, the present opportunity for getting rid of the pest should not be lost. The rough bark of the stem and larger branches afford a convenient harbourage for the bug. It will be advisable therefore to give these repeated washings with a fairly strong solution of Gishurst Compound. After this the branches may be painted over with the Glay and Gishurst mixture employed for the Vines.

PLANTING BOUGAINVILLEAS.—Where it is desired to plant Bougainvilleas as cover for the roof the present is a favourable time. It is a somewhat curious fact that pot plants need a warm house to enable them to flower properly, whilst those that are planted out in borders will bloom freely enough in an intermediate house. This should not be lost sight of when making arrangements. When preparing a bed or border for Bougainvilleas the principal point to be borne in mind is that there must be an efficient drainage. During the spring, summer, and early autumn months plenty of water is required, and yet the plants detest anything like stagnant moisture hanging round their roots. On the other hand we have already noted that the plants must be kept dry during the winter. The bed itself should be of a gross depth of about 2 ft. Of this from 6 to 9 ins. at least should be drainage, which should communicate directly with the drain. Over the drainage place a layer of turves, with the grass side downwards. The soil may then follow. This should consist in staple of good loam—say about three parts of it to one of leaf soil, with plenty of coarse river sand.

ALLAMANDAS.—Among the most easily grown and most handsome pillar or roof plants for the stove are the Allamandas. They invariably succeed if properly looked after, whether grown in pots or planted out. Perhaps their most noticeable good quality is that they are not liable to be attacked by any of the insect pests that prey upon our stove plants. Just now the plants are in the middle of their resting period, although a few leaves may remain upon them. No water need therefore be given them yet. An early opportunity of pruning them should be taken. In the majority of instances the plants are kept closely pruned back each year, and the young growths as far as possible strictly trained to wires. Under such circumstances the plants, with their naturally stiff growth, do not appear to the best advantage. A little more freedom may well be allowed, a fine effect being produced by permitting some of the branches to droop at their full length over the plants at the lower levels. The flowers, which are produced at the tips of the growths, are then brought more conspicuously in evidence instead of being crushed up against the glass, as they too

often are. In pruning, after leaving some of the shoots at about two-thirds their length to extend the spread of the plant, cut the other growths hard back into the old wood.

TOP DRESSING THE BORDERS.—Owing to the naturally vigorous growth of Allamandas the size and depth of the borders have to be limited, otherwise the plants would grow too strongly and flower but shyly.

A top dressing of good loam, with which may be mixed a few nodules of charcoal, may be given just before it is desired to start the plants into growth, but no manure of any kind should be given, for the reason stated above.

POT ALLAMANDAS.—Trained plants in pots are highly thought of in some establishments, and they are effective enough when well-grown and bloomed. Like the plants in beds these will have been kept nearly dry at the root for some weeks past. Some time before the middle of the month the plants may be pruned and potted. Use a compost of three parts of fibrous loam to one part of cow manure. Mix with this a few pieces of charcoal, and plenty of coarse river sand. This is a fairly rich soil, but in the comparatively restricted root run in the pots the plants do not get a chance to grow too freely. In potting the soil must be made quite firm by means of the rammer.

CUTTINGS OF ALLAMANDAS will root very freely if given a brisk bottom heat of 70° or 80° Fahr. Select from the prunings the tops of the shoots retaining two or three nodes to each. Put these singly in small pots filled with peat and sand, press the soil very firmly round the base of the cutting, and plunge in a propagating frame, having a bottom heat, such as that mentioned above. The cuttings will have made roots in from three to four weeks time, and will also have pushed out leaves at the apex. In another three or six weeks from the insertion of the cutting, if all has gone well, the small pots will be filled with roots, and a shift onwards will be necessary.

TREE FERNS.—Although in their native habitats the Tree Ferns have a certain resting period, the conditions of life are so altered under glass that it would not be wise to follow nature too slavishly. The plants may require less water at the root than in the summer, but they must not be allowed to get dry. The roots, which are emitted from the stems, must likewise not be starved, otherwise they will perish, and a corresponding check will be sustained by the plant. A certain amount of rest, on the other hand, may be afforded by withholding all manurial stimulants. See that the fire-heat does not render that part of the house where the Ferns are situated too arid. The stages and walks must be damped thoroughly at least three times a day.

NYMPHAEAS.—With these life is in the quiescent stage, and nothing should be done to excite them too soon. The water may now be drawn nearly off, and in another week or ten days may be removed altogether, so as to give an opportunity for the cleaning out of the tank and the repotting of the Lilies. An annual clear out is advisable, not only for the sake of cleanliness, but in order to give new soil to the plants, and to admit of fresh arrangements being made.

Pits and Frames.

CHRYSANTHEMUMS.—One of the most absorbing operations just now is the getting up of stock of Chrysanthemums for the next season. Upon the proper performance of this duty depends in a great measure the amount of success which is to be obtained presently.

With the annual multiplication of varieties, between some of which, it is to be feared, there is very little difference, the task of selection and rejection becomes more than ever important. The lists of varieties are even now almost interminable, and it would indeed be a large establishment that could afford the space for half of them. The particular varieties that are to be grown for another year must depend entirely upon the needs of each several and individual establishment. The object for which the plants are destined is an important factor in the decision, and colour, too, has often to be seriously considered. Anyway, it is well to remember that a bad, or what amounts to the same thing, an unsuitable variety takes up just as much space and attention as a good or suitable one.

SELECTING CUTTINGS.—Too much care cannot be exercised in this part of the business. The best

cuttings are furnished from those cuttings thrown up directly from the root. These should have a clean stem of about 3 ins. in length. The shorter ones, which have to be grubbed up from the ground, are not so good, although far preferable to stem cuttings. Even the latter make good plants occasionally, such as in the case of Stanstead White and Mme. C. Audiguier, but generally speaking they are to be avoided, as they are apt to throw flower buds at an early stage of their life.

STRIKING THE CUTTINGS.—Experience has proved beyond question that the cuttings struck in a cool temperature, that is between 40° and 45° Fahr., make better and more reliable plants than cuttings which are coddled at the outset of their career. The cuttings should be inserted singly in long thumb pots, which have had one crock placed over the bottom hole and have been filled with a compost of equal parts of loam, and leaf soil, with sand. A capital place for the cuttings may be furnished by placing on the stage of a cool greenhouse, and close to the glass, a number of handlights. Into these should be placed enough fine ashes to enable the pots to be plunged to the rims. Shade carefully from the sun, and keep the frame close for the greater part of the time till the cuttings are rooted. Air must be given cautiously at first, and if the cuttings show any signs of flagging the lights must be replaced at once. Water carefully, and keep a close look out for damp. Under such conditions almost every cutting may be relied upon to root.—*A. S. G.*

Gleanings from the World of Science.

THE undermentioned subjects were brought before the Scientific Committee of the Royal Horticultural Society on December 14th.

CYPRIPEDIUM, MONSTROUS.—With reference to the specimen sent to the last meeting by Mr. Veitch, Dr. Masters reports that the lip was wanting, but the dorsal and ventral sepals as well as the lateral petals were normal; both stamens were present, but only two carpels, standing in an antero-posterior position.

TUBEROUS GROWTHS ON VINES.—Mr. S. T. Wright sent some gall-like structures taken from Vines in the large vinery at Chiswick. He observes that "many of the old and young rods are similarly malformed at their base. It does not appear to affect the health and vigour of the rods. In all the malformations grubs or maggots are present; but neither moths nor weevils have been seen in the house." Mr. Michael pronounced the grubs to be coleopterous, but they were not likely to have been the cause. Prof. Church undertook to examine them chemically. There was no apparent structure in them beyond a mass of cellular tissue with a corky exterior surface.

HELLEBORES DISEASED.—Some badly diseased plants were received from Mr. F. W. Burbidge, Botanic Gardens, Dublin. They were submitted to Kew for examination. The report was as follows:—" *Phoma effusa*, Desm., is the name of the fungus attacking the Hellebores. The diseased portions should be removed and burned, as at this season the fungus is producing myriads of spores, which live as saprophytes on humus in the soil for some time before they are capable of acting as parasites. The Hellebore shoots of next year will be infected by these spores. The above alternation from a parasitic to a saprophytic mode of life enables the fungus possessing one form of fruit only, as in the present instance, to tide over the period during which its host plant is not actively growing. Spraying with a solution of potassium sulphide (1 oz. to 3 gallons of water) when the leaves first appear next season would to some extent prevent the chances of inoculation from floating spores."

HOLLY WITH RED AND YELLOW BERRIES.—Mr. Cb. Turner, Slough, sent some sprays, on which he remarks, "They are cut from a large tree which retains its berries for two years. The berries are yellow in the first year, but change to red in the second year." As no seasonal break was distinguishable between the group of yellow and that of the red berries below it on the same stem, some doubt was expressed, and some further information desired. This Mr. Turner has kindly promised to furnish.

HINTS FOR AMATEURS.

THE MISTLETO BOUGH.

"The Mistletoe hung in the castle hall,
The Holly branch shone on the old oak wall."

These words are upon the tongue of every one at the season of Yule, and the sweetly pathetic air to which they are attuned almost haunts the mind, so subtle is its sound, and so sublime the influence of both ballad and tune. But though the tragic death of the baron's daughter at the season when the "Mistletoe hung," and the "Holly branch shone" would be sufficient in itself to form the foundation of many a romance, the historic bough had achieved notoriety ages before the fair and unfortunate lady lived.

Amongst all the numerous chapters on plant lore that have been penned by various writers, none is more interesting than that of the Mistleto. From the earliest record we have it has been wrapped in "mysterie and diablerie," and this has continued even down to our own practical nineteenth century, although in a considerably modified form. The potent spell of the Mistleto at Yule shows no signs of decadence, and neither will it so long as *oscula dulcia* are exchanged by brave lads and fair maidens 'neath the shelter and sanction of its shade.

The mystery attached to the plant probably originated from ignorance as to its origin and life history, and in the human mind ignorance and fear of a subject are very closely allied. It was supposed not to grow from seeds as ordinary plants do, and this in itself was uncanny enough.

Virgil tells its story thus in the Aeneid, lib. VI. line 205:—

"*Quale solet sylvis brumali frigore viscum
Fronde verere nova quod non sua seminat arboris.
Et croceo fetu teretes circumdare truncos.*"

In this way Virgil draws a veil over his ignorance, but we find that in the 18th century in the Delphic classics a commentator who did not lack courage boldly avows the story to be true, saying:—
Non nascitur e semine proprio arboris, at neque ex insiden'um volucrum fimo, ut putavere veteres, sed ex ipso arborum vitali excremento."

Lord Bacon ridiculed the idea that the Mistleto was propagated by the action of birds, and says that the sap which produces the plant is such as "the tree doth exerce, and cannot assimilate," and "Browne," in "Vulgar Errors" endorsed this opinion.

Geralde boldly wrote that "this excrescence hath not any root, neither doth increase himself of his seed, as some have supposed, but it rather cometh of a certain moisture gathered together upon the boughs and joints of the trees through the bark, whereof this vaporious moisture proceeding bringeth forth the "Missletoe."

The belief in the agency of birds in the propagation of the Mistletoe was shared by most of the writers of Shakespeare's day, as the following verse will show:—

"Upon the oake, the plumb tree and the holm,
The stock dove and the blackbird should not come,
Whose mooting on the trees does make to grow,
Rots curing hyphear and the Mistletoe."

Browne.

Of course, we now know that the Mistleto propagates itself by seed in the ordinary way, and also that birds are active agents in the distribution of these seeds.

Whatever the reason or reasons may have been, it is certain that the Mistleto has figured conspicuously in many a curious legend. One of the best known of these is the story of the way in which Baldur the Mighty met his death. Baldur had a very loving and attentive mother, Friga, who put herself to a great deal of trouble to assure for her son immunity from peril. Fire, earth, wind, and water were severally adjured by the mother not to harm her son, but the Mistleto was forgotten. The evil spirit Lok took advantage of this to fashion an arrow out of the forgotten plant. This arrow was handed over to Hoder, the blind deity, who with it slew Baldur. The gods, however, decided to resuscitate Baldur, and as a sort of reparation for the injury done to him dedicated the Mistleto to Friga, who had made such strenuous efforts to preserve him from harm. A condition was attached to this concession, and this

was that the Mistleto must never touch the earth, which was regarded as the empire of Lok. The legend goes on to say that this is the reason why the Mistleto is always suspended from the ceilings of houses when employed in festal decorations.

Apart from this legendary reason, however, it seems very probable that the custom of suspending the Mistleto in our dwellings is a remnant of the ancient Druidical custom of dancing round the tree on which the plant was growing, the habit of seeing it aloft being so strong as to cause those who placed it in their houses after it was cut to suspend it on high.

The mystic bough entered very largely into the religious rites of the Druids, who regarded it as specially sacred when found growing upon the Oak. On such an occasion the Arch Druid cut the plant from its host tree with a golden sickle, taking care to receive it as it fell in the lap of his white robe. A solemn ceremonial and sacrifices were the prelude to the cutting of the Mistleto.

In Holstein the peasants speak of the Mistleto as the "spectre's wand," the holder of a spray being able to discover ghosts, to call them to him, and if he so desires to speak with them.

Numbers of trees are pointed to by legends as having furnished the wood for the cross upon which Christ was crucified, and the Mistleto has been cited as one of them, and that its punishment was that of being reduced from a stately forest tree to a parasite. Culpepper speaks of it as being occasionally called *lignum sanctae crucis*, and that it was held to be efficacious in cases of palsy, consumption, and apoplexy, the cure being effected by hanging it against the body next the skin, and also by taking it internally.

In Sweden Mistleto coming from the Oak is hung in the house all the year round as an insurance against fire and other injuries, and in parts of this country, notably East Anglia, there is a great disinclination to take down the Christmas Mistleto until it is quite dead, for fear of subsequent sickness. Other superstitions connected with the medicinal value of the plant might also be cited did space permit.

One other instance of its occult influence is given in the "Garden of Eden," wherein the legend stated by the author was that "By sitting on a hill late in a evening near a wood in a few nights a fire drake will appear, mark where it lighteth, and there you shall find an Oak with Mistleto, there at the roote whereof is a Mistle-child, whereof many strange things are conceived. *Beati qui non crediderunt.*"

If our ancestors believed half the powers credited to the mystic branch it is no wonder that they regarded it with suspicion and refused to allow it to be used in the decoration of their churches and temples. Even now we vigorously shut it out from our places of worship, although Box, Laurel, and Ivy are admitted freely enough.

Gray, in the lines quoted under made a technical mistake when he said:

"Now with bright Holly all the temples strow,
With Laurel green, and sacred Mistleto."

Mistleto is only once alluded to in Shakespeare's works, and this solitary mention is in "Titus Andronicus," Act II., sc. III.

"The trees, though summer yet, forelorn and lean,
O'ercome with moss, and baleful Mistleto."

We thus see that Shakespeare had no good opinion of the influence of Mistleto upon the trees on which it grew. If he regarded it as a parasite he was justified in calling it "baleful," but perhaps people in those days credited it with other evil qualities.

In the palmy days of Cranborne Chase, where fine herds of deer were kept, the magic plant was employed in a curious way. The season for killing dry does began at Martin's tide (November 2nd), and ended at Candlemas (February 2nd). The keepers tried to procure abortion in the does by placing in the feeding grounds branches of Mistleto. The desired effect was obtained, but the venison suffered in flavour. It is stated that Mistleto will produce the same effect upon dogs, although the practice, if genuine, was probably a piece of woodcraft not generally known.

Among the ancients Pliny considered that the plant was baleful both to the trees on which it grew, and to those people who ate of the berries. The Druids, according to Pliny, called the Mistleto "*suo vocabulo omnia sanitatem*," i.e., *uchel-wydd*, meaning all-heal. The name all-heal in modern English

is not applied to the Mistleto, but to the herb Basil. The equivalent in German is *kraft-wurzel*, and in that language also has no reference to Mistleto.

Anyone who wishes for further information as to Pliny's views of the plant under discussion can obtain it in his Natural History, books, 10, 16, 17, 20, 22, 23, 24, 27, 28, and 32.

With regard to the etymology of the word Mistleto there has been a good deal of discussion at various times, and various views are held by philologists. Dr. Bosworth writes it *Mistel-ta*, and refers it to German, Danish, and Swedish without further explanation. Richardson derives it from Anglo-Saxon, *Mist*, dung, and *ta* or *toe*, i.e., that part of the foot by which the bird is caught by the viscus or bird-lime. The Anglo-Saxon form appears to be *Mistelta* or *Mistiltan*, and the Old Norse equivalent, *Mistiltein*, which literally means dung plant.

Prior, in "Popular Names of British Plants," derives it from Anglo-Saxon *Mistletan*—*Mistl*, meaning unlike, and *tan*, a twig, the whole word signifying that the plant is unlike the tree on which it grows.

Junius spells it *Missel-den*, and Colgrave gives the three forms, *Missell*, *Misseltoe*, and *Misseldine*. In Old German it is *Mistil*, and in Modern High German, Danish, and Swedish it is *Mistel*. The Dutch equivalent is *Mistelboom*.

A bird-lime was formerly made from the glutinous berries, and this fact gave rise to the proverb, "*turdus malum sibi cacat quia ex bacca visci fit gluten quo turdi capiuntur*" The Latin name *Viscum* applied to the genus is another allusion to the glutinous property of the berries.

Wachter, curiously enough has taken the Anglo-Saxon corruption *Mistel-ta* to mean the bird-lime instead of the plant, and says, "*altera digitum pedis significat eam scilicet partem, qua avis tenetur a visco.*" This has given rise to a good deal of discussion, into which it would not be profitable now to plunge.

Meanwhile, shorn from all its erstwhile dread powers, and emancipated from the thrall of superstition, may the Mistleto bough still continue to bring each Yuletide a message of joy and peace to all my readers.—A. S. Galt.

Correspondence.

Questions asked by amateurs on any subject pertaining to gardens or gardening will be answered on this page. Anyone may give additional or more explanatory answers to questions that have already appeared. Those who desire their communications to appear on this page should write "Amateurs' Page" on the top of their letters.

Berried Solanum leaves falling—P. P.: From what you say we are inclined to think that too much water is the cause of the plant's ailment. Keep it a good deal drier, and give no stimulants.

Pruning Wall Roses.—Geo. Saunders: You may, if you wish, prune the Roses now, but we should advise you to wait until spring in the case of the majority of the plants if you can do so without inconveniencing yourself. The plant that has been blown from its fastenings may be pruned, as it would be a waste of time to nail up a lot of shoots that may have to be cut away.

Apricots.—Y.: Branches will often die in large trees without any apparent cause, and it is difficult in such cases to assign a reason. The dead branch should be cut clean out, and the others on either side shifted a little so as to fill up the gap as far as possible.

Brier Cuttings.—Rose: To prepare cuttings of the Brier or Dog Rose take plump, well ripened shoots of the current year's growth. Cut these into pieces about 9 in. long. Leave three buds at the top of the cutting, and pick out the rest with a sharp knife. Insert the cutting 6 in. or 8 in. deep, and make the soil firm around it. Next autumn lift the cuttings, which will then be rooted, and re-plant them in rows about 18 in. apart each way. They must stay in their new quarters until the following July, when they will be ready for budding. It thus takes a year and ten months from the insertion of the cutting to the putting in of the bud. Stocks raised in this way are very suitable for dwarf Roses. For standards and half-standards it will be much better to raise the stocks you want from seed. Collect the hips or fruits from the hedges as soon as possible, and sow the seed in drills. Next year the seedlings must be

transplanted, and the following July they will be fit for budding. It will be seen that the seedlings take about the same time as cuttings to develop into plants, and they produce much better standard or half-standard stocks.

Yellow Madame Carnot.—*Geo. Saunders:* G. J. Warren and the so-called Yellow Madame Carnot are identical. The primrose-yellow or sulphur coloured sport is quite distinct from G. J. Warren. It is named Mrs. W. Mease.

Pruning an Apple Tree.—*S. T. B.:* From the information you give with regard to your Apple tree we should consider it best to shorten the leading shoots to half their present length. Next year two or more shoots may be taken from each, and trained out to form a proper fan shape. You will thus get a good foundation for a shapely tree, and fruitfulness will follow.

Reducing Black Currants.—*S. T. B.:* If the bushes are too large you can easily reduce them by chopping off the outlying portions with a sharp

CHRYSANTHEMUMS AT BLACKBURN CEMETERY.

ABOUT the third week of November a very fine and interesting collection of Chrysanthemums was open to public view at the Blackburn Cemetery. The many charming varieties there displayed reflected very great credit on the head gardener, Mr. Joseph Batty.

Amongst the leading white varieties, were Niveus, Madame Carnot, Miss Elsie Teichmann, Souvenir d'une Petite Amie, and Madame A. de Galbert. Beautiful incurved varieties were Duchess of Fife, and J. Agate. Yellows were supplied by Sunflower, Miss Maggie Blenkiron, the rich yellow incurved Major Bonnaffon, Edith Tabor, the new variety, C. W. Richardson, and Chas. Curtis, also incurved.

Mrs. W. H. Lees was a grand white sort. Amongst the pinks may be mentioned; William Tricker, the incurved Mrs. Clibran, and Rena Dula. We must not forget the primrose-coloured Lady E. Saunders, the bronze coloured Thomas Wilkins and Colonel W. B. Smith, the lovely lilac-coloured Australie, the canary-yellow Australian Gold, also

from the type in seedlings. The modern race of Chrysanthemums has arisen from two species only—*C. indicum*, a small yellow flower that was cultivated in the Physick Gardens at Chelsea in the middle of the last century, but was lost sight of owing to its insignificant appearance; and *C. morifolium* (Mulberry leaved), now known more commonly as *C. sinense*, which was commonly believed to have rose coloured flowers. *C. indicum* is particularly the parent of all the pompon varieties.

Yellow is generally believed to have been the earliest colour after green, and it was seen first in the stamens and pollen of the Conifers, which form a connecting link between the Ferns and the flowering plants. After yellow, come the pinks, the reds, purples, and the attendant shades, and finally blue. The last named colour has not yet been reached in the Chrysanthemum.

Chrysanthemums have from an early date been prone to change the colours of their flowers. An illustration is afforded by the variety known as Changeable Buff, which was introduced to this country in 1824. The normal colour of its flowers was buff, but occasionally it would change to rose,

GROUP OF CHRYSANTHEMUMS AT BLACKBURN.

spade. These divisions may themselves be planted, for if they have a fair amount of roots attached they soon develop into decent bushes.

Young Hollies Dying.—I have a Holly hedge in my garden which, as it has gone rather thin at the bottom, I attempted to repair last spring by planting at the base some young Hollies. These have all died during the course of the year. Is this due to the time of the year at which they were planted? And would it be advisable to put in other young plants to take the places of the dead ones?—*A. M.*

It is not the time of planting that is the secret of the mischief. The young plants have been starved by the older plants taking from them all the moisture of the soil. The summer was very dry, and under such circumstances the young plants with no depth of root run would soon begin to suffer. The autumn rains came too late to save them. In attempting to repair your hedge in the manner suggested you will always have to face the difficulty of the old plants taking nourishment of the soil away from the young ones, but by dint of careful and consistent waterings subsequent to planting, and, perhaps, a more favourable summer, you may succeed next year where you have failed this. At least, the attempt is worth making.

Mons. Chénon de Léché, which is a beautiful rosy-buff-coloured variety, shaded yellow. There were also very fine specimens of "Hairy Wonder," and a great many others which space will not permit to mention. This being the first year it has been open to the public it is really a splendid collection.

The accompanying illustration prepared for us by Mr. John Ianson, 140, Shear Brow, Blackburn, Lancs., gives a view of the collection as it appeared on the above-mentioned date. The pressure of the Chrysanthemum shows on our space prevented us from reproducing the photograph at the time.

SPORTING OF CHRYSANTHEMUMS.

THE Rev. Geo. Henslow lectured to the assembled fellows of the Royal Horticultural Society on the "Sporting of Chrysanthemums" on the 14th ult. Mr. C. E. Pearson occupied the chair.

In his opening remarks the lecturer said that Chrysanthemums appear to produce more sports than any other of our cultivated plants with the exception of Roses. It is not the fashion to call seedlings sports, although we might just as well do so, seeing that Nature also produces many variations

or yellow, and then back to buff again. We find that the distinct forms of the flower known in the present day in the older sorts, and the plants which came to this country from China and Japan were ready for English workers to deal with.

The Rev. G. Henslow then went on to say that he had received a good deal of intimation with regard to Chrysanthemum sports from the various large growers. A hundred had been sent to him, together with the colour of the flower, and the history and parentage of the plant.

Included in this number were thirteen yellows. These in most cases were deeper yellows than the parent plants. The red, too, in the parents had changed to a deeper red in the sports. This was possibly the result of selections, although salts of phosphate of ammonia often had the effect of deepening the colour.

Of red sports from red flowers there were nine; of bronze from red there were thirteen; and of buff from bronze five, but there was not a single instance in the varieties brought under his notice of yellows sporting to red. He inferred from this that if we granted the development of colours in accordance with the recognised idea Nature had performed the change from yellow a long while ago, and did not feel inclined to change back.

Here the Rev. G. Henslow pointed out the difference between the yellow and other colouring matters. The yellow was granular, whereas the other colours are liquid.

Of reds changing to yellow no examples had been furnished him, although there was the Changeable Buff before referred to. They might infer from this that if the other colours, including red, had sprung from yellow, Nature had made the change so long ago that she evidently did not care to change back again.

Of reds changing to white there were ten examples received. All colours can easily take on the albino form, excepting yellow. The variety Madame Desgranges on first opening exhibited a sulphur-yellow hue, but turned white with age, owing to the way in which the yellow granules were spaced out. White seedlings were capable of giving rise to a great variety of colours. Thus the old bronze Ahutilon never changed till a white seedling, Boule de Neige, appears. This was crossed, and thus broken up, and all the other colours resulted from it. The same applied to Chrysanthemums continued the lecturer. The fact about white forms giving rise to many and various colours in the flowers of the progeny was known in the cases of Carnations and Tulips over 200 years ago.

Dealing with the green Chrysanthemum, Professor Henslow said, that not one had been sent for him to examine, and he was consequently unable to say much about it. He could not say without examination whether it was a reversion or not. In analysing Ixias, Professor Church found that the green was due not to chlorophyll, but to a modification of the purple. It was quite possible that the green in the green Chrysanthemum was due to chlorophyll, and in that case it would be a reversion.

Some varieties sported more than others; and in such cases they formed a sporting family as in Queen of England, Empress of India, etc.

The Rev. G. Henslow then proceeded to explain the development of the flower in the hands of the florists, how the short disc florets were converted into ray florets, also the breaking up of the borders of the florets which gave the dragon-mouthed forms. It was stated, however, that sporting generally took the form of change of colour, change of form of the florets being comparatively rare. In some of the very large flowers a multifold head was produced—a sort of "hen-and-chickens" arrangement—but no attempt was made to preserve this form.

In the hairy varieties there were a number of out-growths arising from the surface of the floret. These terminated in points, and constituted the so called hairs. The crestring in Begonias, Daffodils and Cyclamen was an analagous phenomenon, and was probably due to over-nourishment.

The fact of the same sport appearing in several places at once was next commented on. This was not confined to the Chrysanthemum, for the double Petunia was not known to exist until it occurred simultaneously in England, Scotland, and France.

The cause of the variation of colour in sports was a problem of great difficulty. It was possible that it was the result of the dissociation of colours due to the effect of hybridising and crossing of the parents.

The exact cause of sporting is unknown. Some credit of course must be given to the climate and the soil, and various big names were used to explain the phenomenon, but none of them were entirely satisfactory. Although we had no direct control of the plant we could do what we liked with the soil, and thus indirectly effect the economy of the plant. For instance, some growers found that striped Dahlias were best kept clean in poor soil. Mr. Low had expressed an opinion that starving Chrysanthemums had important effects, whilst Mr. Burhidge had said that good cuttings of sports should be grown in poor soil without stopping, but should not be starved.

Practical men were apt to look askance upon the scientist, but they should remember that the latter could only work upon definite observation and information, and the practical men were of all others in the best position to supply the information that the scientist wanted. Practical men, however, often did not appreciate the value of minute observation. Before any explanation could be given of sporting it was necessary to study the circumstances amidst which each sport occurs, the history of the plant, its progress, and development. If this had been done exhaustively he might at that moment have

been holding forth on the origin and the development of sports.

At the close of the lecture Dr. Masters offered a few remarks. He said that "sporting" in the Chrysanthemum in a general way was easy enough to understand. The Chinese and Japanese had cultivated the plants for 2,000 or 3,000 years, during which time they had been crossed and recrossed, intentionally, and unintentionally for many times. This had shaken the stability of the plant so to speak, and a very slight shaking of the colour cells, as in the shaking of a kaleidoscope, would suffice to produce a new arrangement. He believed the theory of the "dissociation of colours" accounted fairly satisfactorily for the phenomenon.

A vote of thanks to the Rev. Henslow brought the meeting to a close.

ZONAL PELARGONIUMS AT SWANLEY.

WHILST some popular flowers seem to have reached the zenith of their beauty and the highest pitch of excellence, the Zonal Pelargonium, year by year, exhibits a still greater improvement, until we begin to wonder where the development is going to stop.

Messrs. H. Cannell & Sons have for many years taken the charming flower under their special protection, and grown it by the thousand; indeed, no matter at what time a visit is paid to the Swanley Nurseries, houses full of Pelargoniums are to be seen, the plants a mass of flower, and the flowers themselves as fine—well, as Swanley Pelargoniums always are.

Such easily-grown and floriferous plants as these never come amiss at any time of the year, but in the dull months their value is enhanced a thousand-fold.

The needs of the ordinary establishment do not require that there shall be some of them in flower the whole of the year round, but by growing a sufficiency of plants a continuity of bloom may easily be obtained from the middle of October till March.

The Swanley collection has nothing to surpass and very few to equal it in any part of the world, for every variety that is worth growing is there, and new ones are constantly being added, for in addition to those raised at Swanley the Messrs. Cannell have a keen eye for meritorious varieties raised elsewhere.

During the past autumn at the various shows throughout the country the Swanley firm has largely exhibited cut blooms of their "Zonals." These exhibits have compelled the admiration of everyone, both from a decorative point of view and for the intrinsic merit of the flowers themselves.

Grand as such exhibits have been, however, one must see the plants at home before it is possible to obtain a true estimate of their value and beauty.

Such a pleasure was afforded us during a recent visit to the Swanley Nurseries, for there were three span-roofed houses, each 100 ft. long, crammed with plants, which were literally blazing with colour. Not only was the number of expanded flowers remarkable, but the size of the trusses was prodigious. The same might be said of the individual pips, which displayed a regular circular outline, and in most cases opened till they lay quite flat.

Almost every hue, except blue and black, was represented, scarlets, crimsons, pinks, and whites being in indescribable profusion, whilst there were many scores of intermediate shades, filling every possible gap between the more pronounced colours. It was only when we came to minutely examine these that we were able to appreciate their subtle tints to the full, for such a sight as was here spread out before us dazzled the eyes when an attempt was made to crowd all the range of colour into one comprehensive view.

The single-flowered varieties were the most conspicuously in evidence, and, arranged as they were in bold masses of one colour, were singularly effective. Amongst the novelties sent out by the firm for 1897 special mention should be made of Mrs. Pole Routh, which is certainly one of the finest forms in existence. The colour is a mottled salmon, shading deeper towards the eye of the pip. The habit of the plant and its general behaviour is all that could be desired. King of Crimsons, sent out at the same time, exhibits a rich, glowing crimson hue, with an enormous truss and pip. Sir Jas. Kitson, another novelty, is

the boldest flower in the whole section of magenta-coloured varieties. The habit is first class. These three varieties at least should be in every garden, where, judging from the way they behave at Swanley, they will be found magnificent subjects for winter work.

Amongst the crimson and scarlet section the following forms were particularly charming:—Souvenir de W. B. Miller, fiery crimson, with a large white eye; Iris, bright purple-rose; Phyllis, salmon-rose; and Kitty, soft cherry-red with a white eye.

Florists are still striving earnestly to obtain a true yellow-flowered form. Aurea Perfecta marks the nearest approach as yet to the desired object. J. H. Arderne is also in this way. There is a distinct shade of yellow in each of these flowers, but it is disguised and hidden by the preponderance of red.

Brittania is a very handsome form with purple flowers. The petals are very large, and overlap each other to a great extent, thus giving the pip a very substantial appearance. Royal Purple, also a standard variety, must not be forgotten. This has been greatly admired wherever it has been shown. The colour is very rich and deep, and altogether this form is a distinct advance on the older King of the Purples.

Duchess of Marlborough is one of the most pleasing of the salmon-flowered section. The flowers are mottled a good deal with white and pink. A. F. Wootten and Oenone are other capital sorts belonging to this colour division.

Of whites we found a goodly selection. Niagara, Virginia, and Snowdrop are three magnificent varieties. Amy Amplett is better known than either of the three, but is distinctly behind them.

Countess of Buckingham, deep rose-pink, is one of the very finest of its class. Pink Domino is as remarkable for its huge trusses of bright pink as for its dwarf, vigorous, and spreading habit.

The double varieties have not been forgotten in the march of progress, although they are not so suitable for winter blooming as the singles, from their greater liability to damp off during foggy weather.

Raspail Improved is well named, for it is an appreciable advance upon the old Raspail in size of both trusses and pip, the other characteristics of habit, constitution, and colour belonging to the older variety having been retained in the newer. Golden Gate is well worth attention, from the fact that the orange-scarlet shade it sets forth is all too scarce in the ranks of "Zonals."

The Double Jacohy is the counterpart of the single form in colour and habit, but the blooms are all very double. This is one of the most useful of the double varieties.

Beauté Poitevine, Eteranthe, M. Alphonse Ricard, Hermine, and Lady Candahar were, in conjunction with other varieties too numerous to mention in detail, in capital condition. Right through the collection, indeed, from the first plant to the last, the same vigour of habit and close jointed sturdy growth assured us that we were looking at plants that not only were naturally first-rate doers, but on whose behalf cultural skill of no mean order and unvarying attention had been bestowed by Messrs. H. Cannell & Sons.

THE QUALIFICATIONS AND DUTIES OF A GARDENER.

HIS DUTIES.

(Concluded from p. 267.)

THE foregoing remarks have treated principally upon the student. I now come to the fully qualified gardener and his duties; and that these duties are onerous none will deny. They are so many and so varied that it is almost difficult which to place in the front; but I think most of you will agree with me that when a man takes his first head place, or a new charge, whichever it may be, his paramount duty should be to find out from his employers what their likes and dislikes are respecting fruit, flowers, and vegetables, as it is not the least good to think you are going to be successful unless you study their requirements in this respect. The next duty and of equal importance is discipline. This is essential whether you are head over two or twenty, whichever the case may be; and here the old adage applies: "example is far better than precept."

To "practice what we preach" should be our motto, and example includes, among many others,

punctuality. This must be enforced, especially where you have a number of men under you. The gardener should be at his post (health permitting) every morning at the specified time, the men are to begin work so as to direct them as to what their labour is to be for the day; and a gardener must be able to lead and not be led. He must also command authority. By this I do not mean that he need be harsh and driving, but to see all the employees under him do their duty. He must look into details and keep a watchful eye over all that is placed under his charge; for he alone is held responsible, and must point out to his assistants, when this or that plant requires to be cleaned or re-potted, and what compost he would like to have used, or Vine disbudded, tied down and stopped.

The same with Peach trees, Figs, Cucumbers, Melons, &c. If he has not the time to do this himself he must be competent to show his young men how to perform it; and the same holds good in the flower and kitchen garden respectively; for if you have a labourer that does not know how to use a tool, or how to put in a plant, it is your duty to give him the lead and put him right.

Of course, a gardener, when he has a large place under his charge, and many men to superintend, has not the time to do much manual labour himself; and here, in my opinion, he is placed at a disadvantage compared with a man holding a single-handed place, because the latter can, at least, see to all his plants, fruit trees, and crops in general, in the way of potting, watering, and so on. He has the satisfaction of knowing that the work has been properly performed; but how often do we find in these smaller places things in general well done? By this assertion I do not wish to cast any or the slightest disparagement on under gardeners. The majority of them, that is, those who are fond of their work, perform their duties to the best of their abilities, but it takes many years before a man is competent to be called a gardener.

Though, as I said just now, having a love for our work is half the battle. The knowledge of gardening is a thing that is never complete in my opinion. There is always room for improvement, and how often is it that our failures eventually lead to success? We profit by those said failures and persevere to overcome them, with the result, generally speaking, of better crops of fruit, finer vegetables, or a better flowered plant, whichever the case may be. It is only by dogged perseverance in the present age, with so much competition, that we can hope to reach the highest standard of excellence in the cultivation of fruit, flowers, and vegetables.

He must also thoroughly understand the art of pruning. I consider the head gardener ought to do all this under glass, at any rate in the fruit department, such being my practice, and I do a good bit outside when time permits. Of course, there are exceptions to the rule, extra large establishments being provided with a foreman for each department, probably men not much under thirty years of age with good experience, capable of being entrusted with this work; but it requires great judgment and should only be undertaken by qualified hands.

Disbudding, too, must claim the gardener's attention, there being a right time as well as a right way to do this; and herein lies the secret of success as to whether you will reap the best crops of fruit that this stage makes possible, or whether by mismanagement you succeed in getting only a badly formed tree, or a mass of unripened shoots.

Thinning the fruit is another duty the head gardener should perform, as this requires care, the Grapes excepted, as it would be impossible for him to do all this himself where several houses are devoted to this fruit. He should give a helping hand so as to be able to point out to his assistants how to thin a bunch of Grapes, which is most tedious work and requires daily attention in the early spring and summer months. The watering of the borders that may contain the roots of fruit trees, or plants must be seen to by the gardener. No hard and fast line can be laid down, as soil, position, and the season must guide him in this to a great extent.

Seed sowing is another item that calls for the qualified gardener's care. Especially is this the case with some of the flower seeds, as some are so minute. For instance, Begonia, Calceolaria, Gloxinia, and such like, if covered with much soil would fail to germinate, so this must be performed by an experienced hand or failure will surely follow.

The packing of fruit and flowers to go by rail, when your employers may happen to be at a distance, often falls to the lot of the gardener, and must claim his attention, as fruit in particular requires to be carefully handled, such as Grapes, Peaches, Strawberries, Figs, and such soft delicate kinds that may have to be despatched. I always do this myself; but my assistants are about and can always see how it is performed, which I hope will be of service to them later on.

Hardening off plants for bedding out and other purposes must rest with the gardener, as no precise date can be fixed as to when it is safe to fully expose them. The weather must guide one in this to a great extent, as also must be the housing of them again in the autumn, as a slight frost may cripple such things as Bouvardias, Callas, and many others that are stood out in the open during the summer months.

I must now pass on to outside work, and will touch upon the flower garden and pleasure grounds. Of course, there is a deal of supervision required here, from April up to the middle of November, when, as a rule, most of the deciduous trees have shed all their leaves. Often in the month of March the mowing machine has to be brought to the fore, and when once this is started there is always a lot of cutting and clipping to be done around trees and shrubs, flower beds, and walks. To keep one's place in good trim this must be done about every ten days up to October, when less often will suffice.

Towards the end of May the putting out of tender bedding plants absorbs a lot of the gardener's time; also the marking out of the beds, where the various kinds have to be planted, and seeing that the same is being properly performed. Later, the pegging down, staking and tying, wherever necessary, and last, though not least, the watering of the same demand almost daily attention. Neither must the weeding and the rolling of the walks be lost sight of; nor must the plants that soon fall a prey to mildew, green fly, caterpillars, and maggots, such as Roses, Verbenas, and many others be overlooked. From early in October the birch brooms must be kept incessantly on the move for six or eight weeks.

This date (October) brings us to the kitchen garden. The gardener must soon see about the raising and storing of most of the root crops; the manuring and eventually the trenching and digging of ground for the various crops of vegetables, and allocating the plots for each kind to be sown or planted in early spring must not be lost sight of, if a succession is to be kept up. The root pruning of fruit trees that may be making rank growth needs attention most autumns. The gathering and storing of Apples and Pears require a lot of time bestowed upon them as each kind becomes fit through the months of August, September, and October; and these require the gardener's personal attention.

None knows better than he the many insects that we have to fight against, among fruit trees in general, from February to September, or rather, all the year round, if we take the green and black fly, red spider, Autumn and Winter Moth, Apple-blossom Weevil, and the Gooseberry Sawfly, each one very destructive in their season, and requiring a deal of perseverance to keep them at bay.

As I said before, it is a decided advantage to a gardener to be able to draw out a plan in the way of beds, paths, or roads, level a piece of ground, and do similar work, whenever called upon to do so.

I must not omit still another duty, and an important one I consider; and this is the gardener's usual walk round with his lamp through all the glass-houses from the end of September to the end of March. My time, to see that the required temperature is somewhere near the mark, is about 9 p.m. each night. This march round sets one's mind at rest before retiring for the night if you find all is right in this department. Not only is this the case, but the young man on duty takes more pains with his work in the way of stoking and regulating his fires, with the knowledge that his chief will be on the alert at his usual hour, and, naturally, his first duty in the morning is to repeat the visit.

In most large places the employer usually finds one or more gardening periodicals each week. These should be passed on to the young men when the gardener has perused them. These papers help to keep the gardener and his assistants in touch with the times and up-to-date gardening, which, as a profession, dates back to the beginning of time, for does not history tell us how Adam, the first living

man, was placed in charge of the Garden of Eden to dress it and keep it? It is doubtful whether Adam possessed those many qualifications just enumerated, and we know for a certainty that he had not one hundredth part of the duties to perform that the present age gardener has. This reminds me of the lady gardeners, as we are told that Eve, the first woman, was also placed with Adam as a help-mate; but I do not think it proved a very great success, as these so-called lady gardeners have not made much headway as yet.

I understand there are one or two at Kew and other places, but I do not think we have much to fear that they will supersede us. I think household duties are more suitable for the fair sex.

I could name a host of other duties that a gardener has to perform; but enough has been said to show that his post is no sinecure. It is certainly a trifle different from what it was in the year 1850, even if we are to judge by that familiar board that is placed at Bicton, and says, "The gardener at a hole looks out, &c., &c.," presuming, of course, that he spent a deal of time there. I do not think the subject that I have spoken upon this evening has been placed prominently enough before our younger members of the craft, to whom we must look to uphold our profession in the next century. I would like to see the county councils take the matter in hand, and arrange a few lectures at convenient centres, so that those young men could attend and reap the advantage of such. I could hope that my well-meant, though imperfect, paper may be a means to that end.—James Mayne.

LESSONS FROM CHRYSANTHEMUM SHOWS.

Now that the "laugh and riot" of the "Chrysanthemum feast" is o'er, it should be profitable for us, as 'Mum points out on p. 247, to reflect calmly on some of the lessons that have come to us amidst the tumult, if so be that we can evolve from them something of practical advantage for the future.

The craze for size seems in no way to have abated. The "big bruisers," as 'Mum calls them, are still striven for with might and main, but there seems a tendency to limit these monsters to their proper sphere—the show board—and more, to insist upon the other phases of Chrysanthemum culture receiving due attention. The idea seems to have gained firm root that it is not sufficient to have, at a Chrysanthemum show, a vast quantity of giant blooms arranged with becoming regularity in seemingly endless lines upon show boards, with an odd group or two of plants dotted here and there to break the monotony.

The break away into having flowers cut with long stems, and arranged in such a way as to give some idea of the natural pose of the flowers upon the plant, was a pleasing and a happy idea, although its application in limiting the blooms to three in a vase, leaves something to be desired. However, it has caught on to a wonderful extent—witness the mammoth prizes offered this autumn by the Scottish Horticultural Association for blooms staged in this way, and also the announcement recently made of the special class for a number of vases of such flowers arranged for next year by the National Chrysanthemum Society.

'Mum is on the right track when he calls for larger vases and more flowers in them. We should then have such noble and imposing exhibits as those which constituted such a conspicuous feature of Mr. Norman Davis' group at the Royal Aquarium in November. Whether other foliage besides that borne by the plants should be permitted in filling these large vases is a matter of detail. For the sake of variety miscellaneous foliage might be permitted in some cases and prohibited in others.

With regard to the "artistic groups of plants or flowers" the public is being surely if somewhat slowly educated up to them, for the haphazard fashion of crowding the plants together in such a manner as to annihilate the individuality of each plant, and leave nothing but a blur of colour no longer is sought after. The public has found that it needs something better.

'Mum also comments very sensibly upon the influence of light and air in developing the colour of the flowers. Growers in the vicinity of London and other large towns and cities are heavily handicapped from the "colour" point of view, and it is

not, therefore, surprising that with very few exceptions those who are not naturally outside of the smoke screen hasten to put themselves there. This is an undeniable proof of the high esteem in which "colour" is held amongst cultivators. Mere size, of course, can be obtained almost if not quite as well in the town as in the country, with the exception of the increased tendency towards damping in the town flower.—G.

THE GOLDEN MONTEREY CYPRESS.

(*CUPRESSUS MACROCARPA LUTEA*.)

THANKS to Messrs. Dickson, of Chester, no brighter or in every way more desirable Conifer has, during the past 25 years at least been brought before the public than the subject of this note. The habit is graceful, the colouring rich and subdued, while the striking difference in tint between the bright cinnamon of the bark and soft golden hue of the deliciously fragrant foliage still further adds to the value of the Cypress for strictly ornamental purposes.

There is an upright, and a spreading form of the Monterey Cypress in cultivation, and evidently this golden variety has been raised from the former, the habit of growth being first sufficiently strict to impart a neat and pleasing outline, the stiffness and formality usually attending fastigate Conifers being quite lost sight of in the lithe, slender, and finely divided branches and branchlets.

In certain golden Conifers the foliage colouring is too glaring and pronounced, and several have fallen into disuse on this account—a fault that can certainly not be found with the present plant, which, though strikingly distinct, is yet of a decidedly rich and subdued tone.

There is nothing patchy about the foliage colouring, the whole being regularly suffused with the warm golden tint for which the plant is so remarkable, this extending not only to the leaves but to the bark of the young wood as well.

Being of good habit, perfectly hardy, and retaining the lower branches intact it makes an excellent pot plant and stands long-continued drought and neglect in a wonderful manner.

The Royal Horticultural Society awarded a First-class Certificate to this Conifer, but a further proof of its popularity is the rapid rate at which it is being propagated in some of the London and suburban tree nurseries.—A. D. Webster.

PRACTICAL GARDENING.

ON Thursday, December 16th, Mr. W. P. Wright delivered his sixth and last lecture of the course to a large and attentive audience at Eynsford. Mr. H. Cannell occupied the chair. The subject of the evening's lecture was "Summer crops of vegetables." Peas and Beans were pointed out as being some of the most important of these. Mr. Wright alluded to the great number of new sorts sent out each year, some of which turned out satisfactorily, and others quite the reverse. He had come to the conclusion that the best plan was to make a selection partly of new and partly of old standard varieties. The dwarf, first early Peas, which needed no sticks, were some of the most useful. The first of these was Chelsea Gem, and the second English Wonder. Daisy was a little later, but a fine Pea. Of exhibition varieties he had found Peerless, Matchless, Duke of Albany, and Alderman very satisfactory, whilst Autocrat was to be specially recommended.

With regard to Beans he advised his audience to grow, in the "runner" section, the old Scarlet for general purposes, whilst for exhibition purposes Prize-winner, Hill's Prize, and Best of All were first-class. Dwarf French Beans would be well represented by such varieties as Canadian Wonder, and Ne Plus Ultra. Taylor's Broad Windsor and Leviathan Longpod were two excellent Broad Beans.

Turning to cultural details the lecturer urged the advisability of giving special attention to the preparation of the soil, for a piece of land well prepared in the spring would give a heavy crop of Peas in the summer, and Turnips in the autumn. Admirable results had been secured by working in a dressing of stable manure a foot below the surface, and sprinkling wood ashes on the surface layer. This plan kept the roots cool and assisted them in combating mildew.

He quoted Dean Hole's remark that the allotment system will always have two opponents—"the idle man who will not garden, and the ignorant man who doesn't know how."

Mr. Wright displayed some excellent lantern views of Peas and Beans to illustrate his remarks.

to a day quite spring-like in the warmth and buoyancy of its atmosphere, the flowers were all looking their best. The following forms were amongst the finest and most interesting;—

C. SATIVUS.—It is from this species that the greater part of the saffron of commerce is collected.

THE GOLDEN MONTEREY CYPRESS.
(*CUPRESSUS MACROCARPA LUTEA*.)

At the conclusion of the lecture Mr. H. Cannell warned his hearers against pinning their faith to cheap seeds, which were unreliable.

One of the most interesting features of the evening was the presentation of Mr. H. M. Pollett's Silver Cup to Mr. William Howard, who has for the space of sixty-six years occupied his allotment, during which time he has proved a successful fruit and vegetable grower. Mr. Cannell presented the cup to Mr. Howard and congratulated him on his long and successful tenure. What an amount of pleasure and profit, physical and mental, said the chairman, must the cultivation of this allotment have given to Mr. Howard in the course of so many years. Mr. Howard in a few words expressed his thanks to Mr. Pollett as the donor of the cup, and to Mr. Cannell for the kind way in which he had presented it.

Mr. Cannell next proceeded to distribute the prizes earned by the allotment-holding competitors for vegetables. The exhibition contained some splendid vegetables from the Eynsford Allotments, of which there are now fully a hundred. Messrs. H. Cannell and Sons, Swanley, sent an excellent collection of vegetables not for competition. The Swanley Cider Company sent samples of Cider.

AUTUMN-FLOWERING CROCUSES.

THE genus *Crocus* is chiefly represented in gardens by the many fine varieties of *C. vernus* and *C. versicolor*, which are so bright and handsome during early spring. Autumn-flowering forms have for some reason or other been much neglected, and it is not often that we see them grown to any extent, with, perhaps, the single exception of *C. speciosus*, the value of which even then is not fully known or appreciated. There are, however, very many pretty things among them, and given a fine autumn some very fine effects may be produced in the garden by their aid. For a number of years Messrs. Barr & Sons have made a speciality of these pretty flowers, and their nurseries at Long Ditton contain a splendid collection, which is ever being added to and developed under the aegis of Mr. J. W. Barr, who loves the flowers with all the fervour of an enthusiast. We spent a very pleasant day among them in October last, upon which occasion, thanks

The flowers are large, violet in colour, and variously marked with lighter purple or violet. The plant is one of great antiquity, and has been cultivated by various peoples for many hundreds of years. Many well marked varieties have originated from this species, some of them having been accorded specific rank.

C. s. CARTWRIGHTIANUS has its flowers smaller and shorter than those of the type. The pistil is longer than the stamens, which are sulphur-yellow in colour. The stigmata are red. The flower is light lilac, charmingly veined with deeper lilac. The plant is a native of Eastern Greece and the Cyclades.

C. s. ELWESII has light purple, stellate flowers of medium size. The structure of the flower and the habit of the plant generally come close to the widely-distributed and well known *C. s. Pallasii*, from which it differs chiefly in the colour and size of the flowers. The plant is found in the neighbourhood of Symrna, at an altitude of from 3,000 to 4,000 ft. above sea level. The Crimea is probably its eastern limit. The *Crocus* is mentioned by Virgil in his *Georgics*, lib. i., cap. xvi.

C. s. PALLASII, as grown at Long Ditton, has stellate, rosy-lilac flowers. In the description of it given by George Maw in his "Monograph of the genus *Crocus*" it is stated to be "smaller in all its parts than *C. s. Elwesii*." It is the most widely distributed form, according to the same author, and varies a good deal in colour, ranging from pale lilac to light purple, according to the locality.

C. s. HAUSKNECKII has been described by Boissier as a distinct species. The corm is smaller than that of the type, and the pistil is shorter relatively to the stamens. It was collected by Hausknecht at an altitude of 5,000 ft. above sea level on Delechani and Sangar, calcareous mountains in Western Persia, and was also found at Kharput in Hindustan, on October 15th, 1865. This latter locality is worthy of notice by reason of the fact that it is the most eastern point at which any form of *C. sativus* has been found.

C. LONGIFLORUS.—From a garden point of view this species is one of the handsomest. The flowers are of medium size, the individual segments being ovate-lanceolate in shape. They vary in colour from rosy-lilac to purple-lilac, and are veined with

deeper purple, and have a yellow throat. The anthers are yellow, and the slightly lobed stigmas crimson-red in hue. This species flowers from October to November, is very hardy, and especially suitable for planting in grass or in suitable parts of the wild garden. Small offsets flower the next year after planting. Saffron is collected in Sicily from wild plants of this species, although the supply of the commodity thus obtained does not affect the market to any appreciable degree.

C. ASTURICUS.—According to "Maw" this is the common species in the north of Spain, where it is distributed over the country, lying between 2° and 7° west longitude. The flowers have a bearded throat, as in *C. vernus*, but in other respects approach closely to *C. nudiflorus*. The segments of the flowers are linear-lanceolate in shape, and the flowers stellate and dwarf in stature. The colour is purple with a white throat. The stigma is much divided, and, like the anthers, yellow.

C. CANCELLATUS is a charming flower, light mauve in colour, shading to white with age. The blooms are prettily striated with rich lilac, and look exceedingly chaste and pretty. This species runs through 29° of longitude, and 8° of latitude, *i.e.*, from northern Palestine to Armenia. The eastern forms have blue flowers with various markings, whilst the western forms are white or pale.

C. SALZMANNI is noteworthy, because it is the only autumn-flowering species common to both Europe and Africa. It is chiefly to be found in the neighbourhood of Tangier, between latitudes 35°, 30', and 36°, 30'N. It has also been discovered in Tetuan and Beni Hosmar, which "Maw" states to be the most south-westerly point at which any Crocuses have been gathered. The flowers are produced in October and November, according to the season. They are very large, the segments being lanceolate in shape. The colour is a pretty shade of light lilac. The plant bears a general resemblance both to *C. Chusii* and to *C. asturicus*, but the leaves attain their full development at the flowering time, and this at once sets it apart from the latter species.

C. SEROTINUS is supposed by some to be the finest of the autumn-flowering Crocuses. The flowers are of medium size, and the segments ovate-lanceolate in shape. The colour is pale lilac, and exceedingly delicate and pretty.

C. CILICIUS LILACINUS.—"Maw" takes this to be a variety of *C. cancellatus*. The flowers are small, light mauve in colour, striated with purple-blue. The base is yellow. The segments are linear and obtusely pointed. The whole plant is very distinct and pretty. The long, feathery, orange-yellow stigmata are not the least charm.

C. HADRIATICUS CHRYSOBELONICUS.—This is not far from *C. sativus*, as evidenced by the character of the stigmas, the colour of the flowers being the chief distinction. The plant is very dwarf, and the flowers being very near the ground are particularly liable to become splashed with mud. The flowers are white, with an orange-yellow blotch at the base. The type is a native of Albania and the Morea, and is distributed over the ground lying between 36½° and 40° North latitude.

C. MEDIUS is one of the very finest of the autumn-flowering Crocuses. The flowers are large and nearly globose in shape. The colour is rich purple, with lines of deeper purple, and a white throat. The anthers are short and yellow, and the stigmata bright coral-red, giving a handsome set off to the whole flower. The plant is hardy and a most robust grower. It is confined to a narrow belt of the Riviera between latitude 45° and 47° north. It has been found in quantity at Mentone in the Holly Wood, on the north-east side of the cemetery. The leaves remain quite dormant until spring, but the flowers are produced in October and November.

C. PULCHELLUS, a native of the shores of the Bosphorus, is well named, for it is a most beautiful form. The white anthers serve to distinguish it readily from *C. speciosus*, which has orange-yellow anthers. The colour of the flowers is light lilac, with a prominent yellow base. The stigmata are very long and feathery.

C. ZONATUS is a small but very pretty flower that produces a very brilliant effect when seen in the mass. The flowers are of medium size, and globular in shape, the individual segments being broad and massive. The colour is a delicate light mauve, with

striations of purple. The conspicuous feature is an orange-yellow central zone of rather irregular outline.

C. VALLICOLA comes near to *C. zonatus*, but lacks the conspicuous zone, which is replaced by a ring of faint yellow spots at the base. The colour of the flower is French-white or mauve, veined strongly with lilac. This is a very rare species, but also an uncommonly pretty one.

GARDENING MISCELLANY.

CHRYSANTHEMUM THE WHITE MRS. FILKINS.

FROM yellow to white is not a common line of sporting amongst Chrysanthemums, nor, perhaps amongst any other class of flowers. A bloom of Chrysanthemum, the White Mrs. Filkins, comes from Messrs. H. Cannell & Sons, Swanley, Kent, which we should understand to be a sport from the yellow or typical variety. In any case only one bloom could be spared owing to the predilection of the ladies who would have this new comer for its graceful and delicate beauty. Now and again we have a grower from the man who loves small flowers in preference to the giants of the show boards, which have lost all modesty, as he says, on account of their inordinate size and lack of beauty. Well here is his opportunity, and that of everybody else concerned. The yellow Mrs. Filkins is now well known, and the white form need no longer be a stranger. We forget whether this belongs to the feathery, fluffy or plummy section, but that is a secondary matter; the heads are light, graceful, pure white, and made up of florets that are deeply cut into five slender fringes, that are nothing, if not fine, in texture, refined and light as a feather. We would compare it to a white variety of the Sweet Sultan, only less lumpy.

THE WINTER CALVILLE BLANC APPLE.

A READER of *L'Agriculture Moderne*, enquires why the Paris market is not better supplied with the fruit, so much appreciated, of the Calville Blanc Apple, that queen of winter Apples, and what are the cultural needs of the tree.

The following are the practical remarks we think good to give our readers on this interesting question:—Never plant the Calville Blanc as standard or half standard trees, this variety, the most delicate of the many kinds of Apples grown requires, on the contrary, small size and good exposure to the east either in espalier or counter-espalier form. In espalier take the vertical cordon with a single branch or the small U or three branched candelabrum. In the first case plant the trees at a distance of 30 centimetres (11.75 inches) from each other; in the second 60 c. (23.5 inches), and in the third 90 c. (35.3 inches). For the Apple tree in counter-espalier the horizontal cordon is generally employed either unilateral or bilateral, which is more common. But we think the small fan should always be preferred; it is easily obtained and guided. Its initial point is a one-year-old scion, cut down when completely rooted to two lateral buds at about a foot from the ground. The two branches which shoot from this cutting are then guided obliquely at an angle of about 45°; they intercross with those of the neighbouring trees and together form very graceful squares. This shape is very productive, consequently to be recommended, especially for the Calville Blanc d'Hiver.

It is besides very wisely employed on a large scale at the Versailles National School of Horticulture, where results are excellent, as also in the principal arboricultural establishments about Paris where its superiority is recognised. In rich clayey soils plant Calville Blanc grafted on the Paradise stock. In poorer soils silicious or calcareous adopt the Doucin stock. For the small fan let the distance between each tree be 27½ ins. on the Paradise, and 39 in. on the Doucin; give this form a height of 39 in. to 47 in.

Here is another piece of advice which certainly is of value. Do you want Calville Blanc winter Apples with wax-coloured skins? If so put each Apple in a paper bag as soon as it is the size of a walnut. The

fruit will grow regularly under this cover, unspotted and marvellously fine in the late autumn. These bags are removed successively beginning after the first fifteen days of September, firstly tearing the bags at the top so as to accustom the fruit to the air. This curious method is not known enough and deserves all possible popularity. Finally, if you want to grow an exquisite Apple in standard form with all the qualities of the Calville Blanc, its form though more elongated, plant the *Lineous Pippin* variety the real name of which, according to M. F. Jamin, of Bourg-la-reine, is *Lincoln Pippin*, and *Belle fleur jaune*, according to M. Baltet, of Troyes, who adds that by its good quality this fruit deserves the name of Calville Relnette. You can always distinguish the Lineous Pippin Apple by the size of the seed cells.—*L'Agriculture Moderne*, Oct. 3rd. 1897.

LAND TRANSFER IN AUSTRALIA.

THE sale of real property in Australia is greatly facilitated by the cheap and expeditious manner in which land is transferred under the Real Property or Torrens' Act, which had made the process as easy as the purchase of a commodity in a retailer's establishment, no matter whether the land transferred consists of only a few square feet or several thousand acres. The system has been adopted by all the Australasian colonies. It came into force in New South Wales as far back as 1862, dealings in real estate before that year having been regulated by the Deeds Registration Act of 1843. The Real Property Act completely revolutionised the procedure in regard to land transfers, and was modelled on the lines of legislation in South Australia adopted at the instance of Sir R. R. Torrens—hence the popular name of "Torrens' Act." The chief features of the Act are the transferring of real property by registration of title instead of deeds; the absolute indefeasibility of the title when registered; and the protection afforded to owners against possessory claims, as a title issued under the Act stands good notwithstanding any length of adverse possession. From the passing of Torrens' Act all lands sold by the Crown were conveyed to the purchasers under its provisions, and the provisions of the old law were restricted to transactions in respect of grants already issued. The area for which grants under the old system had been issued in 1862 was 7,478,794 acres; since then 1,150,115 acres have been brought under the provisions of Torrens' Act, so that the area still under the Deeds Registration Act is 6,328,679 acres. Lands are allowed to be placed under Torrens' Act only when their titles are found to be unchangeable; but thousands of acres are brought under the Act during the course of every year, so that it is merely a question of time when the whole of the lands of the colony will be under a uniform system. The area of Crown lands conveyed and of private lands brought under the Torrens' or Real Property Act during the period it has been in force was 18,489,691 acres, of the estimated value of £40,077,517. Where private lands have been brought within the provisions of the Act all previous deeds have been cancelled. The transfers and conveyances of private lands which take place during ordinary years indicate in some measure the condition of business; but in some years they cannot be relied upon as giving more than an indication of speculation or inflation. During 1888, when the land boom was at its height, land to the value of £11,068,873 changed hands; but thence the amount annually became less until 1895, when it stood at £3,674,837. With the revival of trade and industry in 1896 there was an increase, the figures for that year being £4,221,330, with every prospect of a further increase in 1897. As already mentioned, the Real Property Act provides that on the issue of a certificate the title of the person named on the certificate is indefeasible. Provision is, however, made for error in transfer, by which persons might be deprived of their rightful property, as should the transfer be made to the wrong person the holder of the certificate cannot be dispossessed of his property unless he has acted fraudulently. To indemnify the Government for compensating persons who, through error, may have been deprived of their properties, an assurance fund has been created by a contribution of one halfpenny in the pound on the declared capital value being levied on property first brought under the Act, and upon transmissions of titles of estates

of deceased proprietors. It is an undeniable proof of the value of the Act and the facility of its working that payments from the assurance fund to the 31st December, 1896, in respect of titles improperly granted, amounted to only £3,113. The assurance fund, which forms part of the Trust Fund of the Colonial Treasury, amounted to £151,730 at the close of 1896, and bears interest at rates varying from three to five per cent. The accretions to this fund, that is, interest and collections, average from £8,000 to £9,000 per annum, while the total withdrawals during the whole currency of the Act have not reached £3,000; thus, as there is every likelihood of the amount annually added growing larger as years roll on, the fund bids fair to reach considerable dimensions.

OBITUARY.

MR. JAMES BROWN.

It is with deep regret that we record the death of Mr. James Brown, sixty-five years of age, gardener for over forty years at Abercairney, Perthshire, the splendid domain of Captain Moray, on December 22nd.

Mr. Brown was for many years a keen competitor with vegetables and hardy fruits. At Perth, Dundee, Edinburgh, and Glasgow his skill as a cultivator was strikingly exemplified. Mr. Brown's services as a judge were much in request. By reason of his knowledge and conscientious adjudication he commanded the respect and confidence of exhibitors. His work in the fine gardens under his charge, and devotion to his employer's interests were duly appreciated by the gallant captain, who is descended from generations of forebears distinguished for their integrity and urbanity as employers and proprietors.

Mr. Brown succeeded his father-in-law, the late Mr. James Arnot. Abercairney was the home of the McIntoshes, of Dalkeith, and Drumlanrig Gardens, and one of the most beautiful seats in Scotland.

QUESTIONS AND ANSWERS

* * * Will our friends who send us newspapers be so good as to mark the paragraphs or articles they wish us to see. We shall be greatly obliged by their so doing.

[Correspondents, please note that we cannot undertake to name florists' flowers such as Carnations, Pelargoniums, Chrysanthemums, Roses, nor such as are mere garden varieties, differing only in the colour of the flower. Florists' flowers, as a rule, can only be named by those who grow collections of them.]

Habit and Growth of Maples.—*Notts*: *Acer colchicum* is more correctly named *A. pictum* *ruhrum*. It forms a small tree, 15 ft. to 20 ft. in height and has spreading or ascending branches. The leaves are five-lobed, rather thin in texture and beautifully coloured or tinted with red from spring to autumn, particularly while young growth is being made. We have seen it doing well both in heavy and sandy soil; and if the latter is fairly moist the tree will in time attain a height of 20 ft. or nearly. It grows fairly rapidly after it is well established, making growths of 1 ft. to 2 ft. till it is nearing its full stature. The Snake Barked Maple (*Acer pennsylvanicum*) also known as *A. striatum*, also attains a height of 20 ft. under favourable conditions, but in some cases it forms a spreading top, making a wide head rather than a high one. The leaves are much larger than those of *A. pictum* *ruhrum*, and the bark is covered with wavy, pale or white lines. It grows well enough in sandy soil, provided it is neither too poor nor dry. In its native country of North America it is recorded as growing only 8 ft. to 10 ft. in height, but in this country it varies from 10 ft. to 20 ft.

Professor McOwan on Fruit Culture.—*J. L.*: We think your best plan would be to write to the Secretary of the Emigrants' Information Office, 31, Broadway, Westminster, London, S.W. Professor McOwan, F.L.S., is the director of Gardens and Public Parks, Cape Town, Cape Colony. He might be willing to give you the information you want, but we doubt very much whether it would be his duty to do so.

Catkins of Hazel.—*H. C.*: It is nothing unusual for the male catkins to be on the trees at this period of the year, so that they cannot yet be considered early unless they are actually shedding the pollen. The male catkins are usually well advanced in September, before the fall of the leaves. They keep

increasing in length when the weather is open and otherwise favourable, and the pollen gets matured and shed in January, February, or March, according to the district in which they are growing and the mildness of the season.

Araucaria excelsa.—*A twenty years' subscriber*: We compliment you on the length of time you have been subscribing, and wish you many returns of the year, but you might verify and note down the dates as an aid to memory. You speak of *Araucaria excelsa*, but we think you mean the hardy one, *A. imbricata*. *A. excelsa* requires greenhouse treatment, and grows so rapidly and tall, that even in botanic gardens it becomes necessary to cut off the top, so that cones are seldom, if ever, produced in this country to show whether the trees are male or female. Many Conifers have the sexes on different trees, which are therefore male and female. This is usually the case with the *Araucarias*, but occasionally a tree proves an exception by producing both male and female cones. If you turn to THE GARDENING WORLD for January, 1896, p. 313, you will see an illustration showing male and female cones on the same branch or twig. The tree on which they grew is at Cudham Hall, Kent, where this behaviour has been evinced for the last eight or nine years. This is exceptional for *Araucaria*, as far as observations have yet been made, the trees being generally either male or female.

Annuals for Cut Flowers.—*Elton*: The following are useful and showy annuals that are perfectly hardy and may be sown in the open ground about the end of March or the beginning of April, the figures denoting their usual height:—Sweet Peas, 3 ft. to 5 ft., *Lavatera trimestris* *alba*, *Malope trifida* *grandiflora*, 18 in. to 2 ft., *Convolvulus tricolor*, 12 in., *Clarkia elegans*, 18 in., *Gedelia* *Lady Albemarle* and other varieties, 12 in., *Candytuft* of various colours, 12 in., *Chrysanthemum carinatum*, in variety, 15 in., *Chrysanthemum coronarium*, single and double, 15 in., *Calendula officinalis*, in variety, 12 in., *Coreopsis tinctoria*, 18 in., double annual Larkspurs, 12 in., *Nigella damascena*, 12 in., Iceland and Shirley Poppies, 12 in. to 2 ft., *Scabiosa atropurpurea*, 18 in., and *Nasturtiums* in variety. Sow the *Nasturtiums* in April. Several of the half-hardy annuals might be sown in pans or boxes in March and brought on under glass. Amongst these we might mention China Asters, Ten Weeks Stocks, and East Lothian or Intermediate Stocks. The latter might also be sown in July or August and kept through the winter in pots under glass lights for planting out in spring to bloom about May and June. Wallflower may be sown at different times to furnish a long supply of flowers. If sown early in the year, some would bloom in November if the weather is open. By sowing in May, June, and July you will get a succession. Small plants last best in severe winters. Everlastings are very useful, and amongst them you could sow *Helichrysums*, *Rhodanthe Manglesii* and *Acroclinium roseum*. Sow in the open about the third week of April, or treat them as half hardy annuals in frames. The above will give a great amount of variety.

Names of Plants.—*A. L.*: 1, *Reinwardtia trigyna*; 2, *Acacia riceana*; 3, *Acacia verticillata*; 4, *Coronilla glauca variegata*.—*W. J.*: 1, *Odontoglossum Pescatorei*, a very fine variety; 2, *Laelia anceps Sanderiana*; 3, *Laelia autumnalis*; 4, *Oncidium tigrinum*.—*T. Wesley*: 1, *Jasminum nudiflorum*; 2, *Selaginella Martensi robusta*; 3, *Polypodium rupestre*; 4, *Cryptanthus acaulis zebrina*; 5, *Chlorophytum elatum variegatum*.—*A. James*: 1, *Hamamelis virginica*; 2, *Picea Smithii*; 3, *Juniperus sinensis*; 4, *Cupressus nutkaensis*.

A Special Offer to Readers of THE GARDENING WORLD 25/- BOOK for 8/-

NO HOME SHOULD BE WITHOUT ONE.

Ogilvie's Encyclopædia OF USEFUL INFORMATION AND WORLD'S ATLAS.

No Single Book ever before contained such a Wealth of Knowledge.

By Special Arrangement with the Publishers of the "Encyclopædia of Useful Information and Atlas of the World," we are enabled to offer to the Public a Magnificent 25s. Volume for 16 of the coupons, which will appear weekly, together with 6d. each, accepted in Weekly Instalments, or the Coupons may be held until the whole period has elapsed and brought or sent to the Office with 8s., and 6d. towards carriage.

A COMPLETE ILLUSTRATED LIBRARY IN ITSELF.

A universal assistant and treasure-house of information on every conceivable subject, from the household to the manufactory. In short, gives information about everything, is absolutely indispensable to everyone in all walks of life; the contents being so separated, indexed, and arranged that they can be turned to at once. It is

THE BEST { BOOK OF } EVER
INFORMATION } ISSUED.
Size of Encyclopædia: 9 by 11½ inches. 656 Pages.

It contains

MANY MAGNIFICENTLY ENGRAVED
COLOURED MAPS,

and a description of every country under the sun, besides much other matter relative to the Home, the Farm, the Factory, a Dictionary of Statistics—many Useful Tables, Poetical Selections, Synonyms, Famous Bridges and Ships, How to Calculate, How to Cook, How to Get Rich, How to Cure all Diseases, How to Succeed in Business, Table of Weights and Measures, and

HUNDREDS OF OTHER TOPICS OF
GREAT VALUE TO EVERY PERSON

who desires to be up to the times. To see the Book is to want it. To Members of Mutual Improvement Societies it will prove of inestimable value.

The articles are written by men whose lives have been devoted to the subjects treated, are short and concise, but contain full information up to date. It is to be consulted on every subject that arises in everyday life, by old and young alike. It contains a complete Illustrated Atlas of the World.

IN THESE DAYS OF COMPETITION

it is imperative that a Gardener should be a well-informed individual. Here is an Encyclopædia containing an immense amount of knowledge that will be of the greatest service to him.

YOUNG GARDENERS,

do you wish to be successful? Then remember that to possess knowledge is the surest way to achieve success.

It is elegantly bound in Morocco Cloth, with beautifully designed Gilt Side-stamp and Red Edges, making at once the most handsome and durable as well as THE MOST USEFUL BOOK EVER MADE or sold for 25s.

1198.

(by Parcel Post—it is so large).

CONTENTS—The Best Seeds and Potatos for Garden and Farm; also Descriptive Lists of Carnations, Chrysanthemums, Dahlias, Fuchsias, Gladioli, Herbaceous Plants, Pansies, Pelargoniums, Pentstemons, Phloxes, Pinkes, Pyrethrums, Roses, and Violets; with full Cultural Directions for each.

PRESS & OTHER OPINIONS OF THE BOOK.

WEST HUMBERSTONE.—“Your Catalogue and Guide safe to hand. I am very pleased with it, and I am sure every every Amateur, in particular, should have one in his possession, as they are worth 100 times their cost.”—T.H.

Leeds Mercury.—“For a useful selection of vegetables and flowers, and a trustworthy guide in the culture of these, it is vastly ahead of ordinary catalogues.”

ARBROATH.—“Very many thanks for your valuable Catalogue and Guide. As an Amateur, I find cultural instructions of immense value.”—D.A.

Bell's Weekly Messenger.—“Contains elaborate and complete articles on cultivation for exhibition as well as ordinary purposes. It is thus far more than a mere catalogue—quite an encyclopædia of farm and garden plants.”

YARM.—“Thanks very much for your Catalogue of 1897. In looking through it, I find it is even better than last year's, which I thought could not be surpassed.”—W.C., Gardener to Sir T. Richardson, M.P.

SATURDAY, JANUARY 8th, 1898.

NEXT WEEK'S ENGAGEMENTS.

TUESDAY, January 11th.—Royal Horticultural Society; meeting of committees at 12 o'clock. Sale of Lilies, Rhododendrons, and Roses at 12 o'clock by Messrs. Protheroe & Morris.
WEDNESDAY, January 12th.—Sale of Lilies, Roses, and Begonias at 12 o'clock by Messrs. Protheroe & Morris.
FRIDAY, January 14th.—Sale of imported and established Orchids by Messrs. Protheroe & Morris.

TOWN AND SUBURBAN PLANTING.—Arboreal culture is a favourite theme with many who live in cities and towns; but notwithstanding the natural love for trees they are very frequently badly mismanaged, owing to the treatment they receive at the hands of those who are neither gardeners nor foresters. The men employed by corporate bodies to plant, protect, and prune the trees under their jurisdiction are mostly unskilled labourers without even the experience of a jobbing gardener. We have frequent instances of the disfigurement of town trees, even in cases where there is plenty of room for them to display their natural habit of growth. An instance of this on the south coast came to our notice recently. The same thing happens elsewhere, and a paper on the subject by Mr. John Wilson, Leazes Park, Newcastle,

appears in the *Transactions of the English Arboricultural Society*, Vol. III., p. 329. He says that the judicious planting of trees in towns is admitted to be both a pleasure and a substantial benefit to the inhabitants. Though street planting has not always been attended by successful results, corporations or the powers that be are recommended to select the most favourable and roomy situations for planting before trying the more crowded or congested thoroughfares, which, however, should not be attempted at all where the presence of trees would hamper the traffic and other business of the place. Wherever planting is deemed advisable it should be undertaken with a clear understanding of the worst that can happen when the trees get established. He warns people against Utopian ideas about umbrageous side walks and green canopies where the realisation of such is impossible.

Numerous details are given about the preparation of the sites to receive the trees, the old soil to be taken away and its place taken by fresh material. The soil in old-established streets is generally totally unfit for the growth of young trees, and the pits for them should be 5 ft. in diameter and 3 ft. in depth. This would render the operation a costly one, but the writer hints that this work could most conveniently be undertaken while new streets are being laid out. All this is generally disregarded, however; and we are often surprised that the trees can live after their roots have been cut back to the stumps and laid by the waysides to await planting till such times as holes sufficiently large to admit the mutilated roots have been cut with pick and spade in the consolidated sides of old streets. It must take many years before such trees can support themselves against gales of wind without rigid staking, which becomes all the more necessary owing to the height the specimens are grown before being considered fit for street planting. Mr. Wilson thinks that they are too often treated as posts to be dealt with mechanically, instead of being regarded as living organised bodies, and urges that the rank and file of planters should have some knowledge of “How Trees Grow.”

He is also much concerned about the formality of the planting so generally adopted. As far as streets are concerned it is difficult to see how formality can be avoided if the trees must follow the outlines of the pavement or the houses; but at the same time there seems no reason why the trees employed should be all of one kind. In our opinion the greater variety the better so long as there is space for the trees to assume their respective natural habits; for therein lies half their beauty. Mr. Wilson lays great stress upon this feature. While admitting a certain amount of liberty for the trees, the situation demands that some restraints be placed upon wild nature, and just at this point most of the difficulties in connection with the management of trees arise. Those responsible for the pruning of the trees should have a well balanced judgment and a cultivated taste, so that they may place sufficient restraint upon growth as may be required by the exigencies of the situation, without disfiguring and making them assume unnatural shapes. The periodical hacking to which some trees are subjected is not only outrageous to good taste, but radically wrong. Cutting down the head of a tree till it assumes the appearance of a badly worn broom inverted is simply barbarous; but worse things happen, as when the trees are allowed to grow into shapely proportions till some one invested with a little brief authority suddenly discovers that they want pruning, and orders some ignorant labourer to proceed and give them a thorough hacking.

NEPENTHES.—Great interest continues to be manifested in this family of plants, both from a scientific and a horticultural point of view. The building of a special house for *Nepenthes* at Kew, where the plants can be accorded the special treatment necessary to their welfare, and yet be open to the public, is another case in point. A comprehensive paper on the subject was read by Mr. Harry James Veitch at a meeting of the Royal Horticultural Society, in September last; and this makes its appearance in the part of the *Journal* of the society just now issued. The article in question is copiously illustrated with woodcuts interspersed with the text, some of them full-page or double-page figures. The author pretends to deal with the subject only from a horticultural point of view, but the information tendered, together with the illustrations, places a considerable amount of science at the disposal of students who care to avail themselves of it. Notwithstanding the number of species which have been introduced, and the many hybrids raised artificially, there are yet some remarkable forms with which the British public have not yet become familiar, including *N. Lowii*, *N. edwardsiana*, and *N. Rajah*. The latter, of course, is well-known to those who have been striving to learn the secret of its successful culture; but as that has not yet been mastered the plant has not found its way into many gardens. Nevertheless, *N. madagascariensis*, though the first species discovered, was one of the latest to be introduced, and success may yet attend the cultivation of *N. Rajah*.

The paper under notice embraces the history, geography, introduction of species, artificial hybridisation, and the culture of the subject. To gardeners desirous of mastering the details of cultivation, the same must be of great interest, since the progress of the plant is followed from the seed to the stage at which fertilisation is effected. The illustrations of the seeds and seedlings are extremely interesting, as giving everybody concerned an opportunity of studying and becoming familiar with a baby *Nepenthes* from its earliest stages of growth, including the embryo while still in the seed. Horticulturists rarely follow up the subject with the same attention to details in the early stages of growth. The thirty-six known species are confined to islands in their native habitats, with the exception of *N. khasiana*, and with three or four exceptions they are included within the equatorial zone. The metropolis of the family is Borneo, nearly half of them being confined to that island, while the others are scattered over the adjacent islands between New Caledonia and Madagascar. *N. Pervillei* from the Seychelles, *N. madagascariensis*, and *N. khasiana* are considered outlying stragglers from the main body. The climate of their native habitats shows that high temperatures and plenty of moisture are prevailing conditions, there being occasional showers even in the driest months of the year.

Holly for Christmas decorations comes largely from Sussex and Beds for the London markets.

The Gipsy Moth is comparatively a rare insect in this country, though it is only too abundant and destructive on the Continent and in America. The Gipsy Moth Commission in America was using about half a ton of arsenate of soda daily in waging war against the pest last season.

The cultivation of Coffee as an industry is growing in popularity in the Mackay district of Australia. Not only has the Sugar Cane been grown too frequently on the same land, but the industry itself has not been very prosperous lately. Coffee culture is being advocated as a substitute for the benefit of the farmers.

Royal Horticultural Society.—The first meeting of the Royal Horticultural Society in 1898 will be held as usual in the Drill Hall, James Street, Westminster, on January 11th, 1 to 4 p.m.

A Curious Error.—An American firm which catalogued *Araucaria imbricata* as one of the wonders of the vegetable kingdom lately received a letter from a lady asking for more information about the "vegetable," and particularly how it was to be cooked.

An old Taxodium.—In the Cemetery of Tulle, a small city, situated on the road between Oaxaca and Guatemala, by Tehuantepec, there is a *Taxodium*, which at 5 ft. from the ground has a circumference of forty-four metres, including the sinuosities. Its greatest diameter is twelve metres and its smallest six metres. The height of the tree is fifty metres, and the spread of the branches 100 metres. The estimated age is 2000 years, and Americans aver that it ought to hold the record as the oldest vegetable.

Cypripediums and Odontoglossums.—Hybrid *Cypripediums* are now very numerous, yet there is a good demand for really fine things. At the Sale Rooms of Messrs. Protheroe & Morris on the 31st ult. a piece of *C. nitens superbum*, bearing only two flowers, was secured for 6 gs. An Award of Merit was accorded it a few years ago by the Royal Horticultural Society. A small piece of *Odontoglossum crispum*, consisting of a few pseudobulbs and carrying only four or five flowers, was secured at the same place as the above for 5½ gs. Needless to say it was a good one.

Eastbourne Horticultural Society.—The members of this society sat down to their annual dinner on the 9th ult., at the Queen's Hotel, Eastbourne. Mr. G. Boulton, the president, occupied the chair. After the viands had been properly discussed, Alderman Strange proposed "The Eastbourne Horticultural Society," which he congratulated on its success. Councillor Sharp, and Mr. Pike replied. In reply to the toast of "the president," given by Mr. A. Standen Triggs, Mr. Boulton said that he had been connected with the society from its beginning. He had seen it down, he had seen it rising, until it had attained its present satisfactory condition. He hoped that it would still continue to prosper. Vocal music enlivened the proceedings.

Torquay Gardeners' Association.—At the meeting held on the 17th ult. Mr. J. Wilson, gardener at Belton Lodge, read an instructive paper on "Flowers for Decorative Purposes." He dealt at length with floral combinations for the dinner table, bouquets of all kinds, groups, etc., and described in detail two elaborate dinner-table devices he had recently made. The paper was illustrated by a quantity of flowers, Mr. Wilson himself bringing sprays of *Bougainvillea*, *Poinsettias*, *Camellias*, and *Tea Roses*. Mr. J. French sent a vase of *Chrysanthemums*. Mr. W. B. Smale had a group of *Begonia Gloire de Lorraine*, and *B. haageana*. Mr. F. C. Smale contributed a centre piece for a floral dinner table. The President and Messrs. W. B. Smale, G. Lea, J. French, S. Vallance, and Love took part in a brisk discussion.

Bute Botanical Society.—The monthly meeting of this society was held in the Episcopal Church Hall, Rothesay, on the 21st inst., Mr. Matthews in the chair. The minutes of the previous meeting were read by Mr. John Ballantyne, who is, we may remark, the keenest and best hotanist in the county of Bute. A paper on "Interesting Ways of Plant Fertilisation" was then read by Mr. Wm. Cuthbertson, who confined himself chiefly to pollination. The explanation of his experiments and observations went to prove the advantage of cross over self-fertilisation. Insects, wind, and rain were the chief agencies by which this was effected naturally. By means of well-executed diagrams he showed many of Nature's contrivances to prevent self and secure cross-fertilisation. Mr. S. Jones afterwards read a paper on the "Gardener's Art," which was full of research, and rendered enjoyable by touches of quaint humour and quotations. He described the gardens of various peoples from a remote antiquity down to the present time, illustrating his remarks by pictorial and other figures. The papers were followed by a discussion, during which Mr. Matthews strongly urged the institution of public gardens in every town.

A noble Plant.—One of the grandest specimens of *Anthurium Veitchii* in existence is to be found in the princely establishment of Mr. F. L. Ames, North Easton, Mass., U.S.A. It measures fully fifteen feet in diameter.

Societe Centrale d'Horticulture du Nord.—The double number of *Nord-Horticoles* for December, and only just come to hand, announces that this is not a new society, but a new name for "le Cercle Horticoles du Nord." Young and ardent professionals full of the future as well as distinguished amateurs will maintain and advance the noble reputation of horticulture in the North of France.

Erratum.—At page 277, line 36, from the bottom of the third column, for "on the contrary, the petals are ovate," read, "on the contrary, the petals of *Laelia anceps crawshayana* are ovate, &c." In comparing the two varieties *L. anceps Whiffeni* and *L. a. crawshayana*, it was unfortunate that the latter name was omitted from its proper place, as the description following the line in question refers to it.

A Speckled Blackbird.—Referring to a note in THE GARDENING WORLD of last week about a white Blackbird having been seen in Kensington Gardens, it may interest you to know that there is a speckled one here, which has been noticeable almost daily about the grounds for the last three years. When first seen it had only a small speck on the head, but it is now three parts white, the development having taken place gradually since first noticed. It is a male bird, and is very tame owing, no doubt, to the fact of its receiving greater attention than the others of the same species.—James Gibson, Devonhurst, Chiswick.

Flowers in mid-winter.—With the exception of the cold snap which visited parts of England just before, and broke up on the Sunday after, Christmas, the winter has so far proved a wonderfully mild one, and more than one Christmas dinner table was decorated with flowers, both in and out of season, plucked from the open. In addition to the Christmas Roses, which regularly make their appearance in the winter time, Violets have been blooming very freely. A correspondent writes from Eynsford, in Kent, saying that towards the end of December he picked several blooms of *Gentiana acaulis*. At Sidmouth, in South Devon, the Primroses seem to have forgotten that according to the calendar it is yet winter. As if to be not outdone by Devon, the Golden Valley, Chalford, Gloucestershire, boasts of having gathered Primroses, Clematises, and Gloire de Dijon Roses on Christmas Day.

Gardeners' Royal Benevolent Institution.—A special general meeting of the members of this institution will be held at "Simpson's," 101, Strand, London, on Thursday, January 20th, 1898, at 2.50 p.m., for the purpose of electing two trustees to fill the vacancies caused by the death of Robert Hogg, LL.D., and the resignation of John Lee. The fifty-ninth annual general meeting of the members will also be held at the same place and on the same day at 3 p.m., to receive the report of the committee, and the accounts of the institution (as audited) for 1897; to elect officers for the year 1898, and other affairs; and also for the purpose of placing nineteen pensioners on the funds. We note that ten of these being in distress, and having in every way complied with the rules and regulations, the committee will recommend the ten applicants to be placed on the pension list without the trouble or expense of an election in accordance with Rule III, 5. Only nine vacancies remain, therefore, to be filled from amongst forty-four candidates, over and above the ten already mentioned, the moral of which is self-evident, namely that more help is needed. We are requested to state that the annual friendly supper of the members of this institution and their friends, will take place as usual, at "Simpson's," 101, Strand, on Thursday, January 20th, at 6 p.m., after the annual meeting, when Arthur W. Sutton, Esq., of Reading, will preside. Friends who are desirous of being present are asked to intimate their intention to George J. Ingram, Secretary, 50, Parliament Street, S.W. We also have much pleasure in announcing that his Grace the Duke of Portland has promised to preside at the 60th annual festival dinner of the Gardeners' Royal Benevolent Institution to be held, it is hoped, in June next, but the date is not yet fixed.

The Kew Pelican.—A creature which left the Oasis of Plenty for the Desert of Distress: The Kew Gardens Pelican—killed by someone who ought never to have been trusted with a gun—October 19th, 1897—far, far from home.—*Punch*.

Lilium Harrissii.—This popular Lily is now grown in considerable quantity in Natal, South Africa. The African bulbs have behaved very satisfactorily in this country, and the Bermuda growers will probably find the Cape a serious competitor in the Lillium-growing industry.

The Silver Y Moth (*Plusia Gamma*), according to Miss Ormerod, proved very destructive to Mangold foliage during the past summer, at Kenmare in Ireland. It is very common in Britain, but lives on a great variety of plants, and does not generally seem to be guilty of serious damage to anything in particular.

A White Asparagus Sprengeri.—A Philadelphia correspondent of *The Florists' Exchange* mentions a seedling of this beautiful decorative plant that is so heavily variegated with pure white as to have only a line of green on each of its small leaves. The amount of green is sufficient to enable the plant not only to live, but to grow as vigorously as the type, according to the writer.

Mr. J. Dawe, of Lukesland Gardens, Ivybridge, has just completed a successful course of six lectures which he was engaged to deliver by the Devon County Council. Mr. Dawe dealt with fruit culture, with special reference to cottage gardens. Practical open air demonstrations were given in pruning, grafting, etc. The attendance at the lectures was satisfactory throughout.

Elm Trees in Ross Church, Hereford.—Except in glasshouses trees are very uncommon in houses, so that the two Elm trees in the old church of Ross are great curiosities. They grow at one end of the aisle, near the pew formerly occupied by Mr. Kyrle, who was, when alive, famous in the neighbourhood for his love of trees. They were originally suckers from the roots of some large Elms outside, which had to be cut down some years ago. These trees, as might be expected, are not notable for great vigour, but they have trunks as thick as a man's leg.

Gardeners, Protect Your Friends.—We have frequently read the account of the introduction of a ladybird named *Vedalia cardinalis* from Australia to California, where a white scale known as *Icerya purchasi* was threatening the entire destruction of the Orange tribe so extensively cultivated there. The December number of "Knowledge" states that the white scale in question is now no longer an important injurious insect. In Britain we have a considerable number of species of ladybirds which prey upon various kinds of aphides, and other soft-skinned vermin. These beetles are generally either black or red, the predominating colour being spotted with the other, and easily recognised, so that every cultivator should take care not to molest them more than he can help.

Messrs. Fell & Co.'s Root Show.—The annual root show promoted by Messrs. Fell & Co., of Hexham, was held in the Town Hall, Hexham, on the 13th and 14th December. The entries were fully equal to those of former years, and the high quality exhibited in former seasons was more than sustained this. Swedes and Mangels were especially good. Messrs. T. Rutherford & Co., Brokenheugh, Haydon Bridge, secured the leading award for twelve Swedes, and Mr. Robert Ard was first for six yellow Turnips; also for six white fleshed Turnips and twelve Potatos. Mr. A. Maughan, Shaw Well, sent the best collection of agricultural produce in twelve kinds. The prizes were for the most part given by Messrs. W. Fell & Co. The display of Apples was excellent. Mr. Harris, gardener to the Duke of Northumberland, Alnwick Castle, sent a capital collection that included such varieties as Bramley's Seedling, Newton Wonder, Ribston Pippin, Dumelow's Seedling, and Tyler's Kernel. Mr. Elliott, formerly one of Messrs. Fell & Co.'s pupils, who is now in charge of King's Acre Nurseries, Hereford, also had a nice lot of Apples, some of the most noteworthy sorts being Annie Elizabeth, Golden Noble, Gascoigne's Scarlet, and Tower of Glamis.

Philadelphia is unique in having an "Onion Club."

All the Difference.—Clergyman: "My child, beware of picking a toadstool instead of a mushroom; they are easy to confuse." Child: "That be all roight, sur, that be. Us bain't agoin' to eat 'em oorselves—they're agoin' to market to be sold."

South American Forests.—Thousands of acres of forest in South America have been cut down, and the home they afforded to epiphytic Orchids thus destroyed. This is especially the case in the regions suitable for the cultivation of the coffee. The plantations of the latter are, year by year, increasing. The Cattleyas are the greatest sufferers, although *Odontoglossums* have also been affected to a considerable degree.

Mistleto.—From the orchards and woods of the "West Countris" vast supplies of Mistleto are placed on the market. A gentleman at Penzance has a plant growing in his garden, which, he says, can be traced back as having been there for upwards of a hundred years. A correspondent writing from a village in north Devon, says that there is a huge bunch growing over a wall in his village, and overhanging the public road. He mischievously suggests that the district council should cause a seat to be placed there.

The Canna Disease.—In a recent bulletin of the Trinidad Botanic Gardens it is stated that one of the new strains of Canna imported for the gardens has been badly attacked by a yellow rust called *Uredo Cannæ*, described as a parasite on Cannas from Brazil. Bordeaux mixture seems to have had no effect upon the fungus, and the infested plants soon die. This disease has not hitherto been heard much of, but, if its virulence and deadly character are not exaggerated, it soon will be. Meanwhile, we have no doubt that stringent measures are being taken to limit as far as possible, the sphere of its operations, otherwise the queenly Canna will be in some danger at what is practically the beginning of its horticultural career.

Roof Gardens have up to the present not "caught" in London, although several attempts have been made at various times to naturalise them. In American cities and towns, on the other hand, the roof gardens constitute a happy feature of gardening, and in some of the most crowded cities the poor as well as the rich have them attached to their houses. Great business houses, too, utilise their large roof areas in this way, and their employes reap the advantage. At the present time we have an instance of roof gardening a little nearer home. Mr. Julius Wernher has formed a very pretty terrace garden on the flat roof of Bath House, Piccadilly. He is, of course, not the first West End resident who has followed out the idea, but if he succeeds where others have failed in popularising this style of gardening he will at least score a triumph.

Dessert and Cooking Apples.—In the judging of Apples a considerable amount of doubt must often exist as to whether certain varieties should be classed as culinary or dessert. With a view to obviate this difficulty the council of the Royal Horticultural Society made a classification of a considerable number of varieties, stating definitely which were to be regarded as dessert and which culinary. Judges at the shows of the society will now have to be provided with the lists, so as to obviate mistakes, such as occurred at last year's Crystal Palace show. Hitherto, Blenheim Orange has been admissible in either class at various shows, but it is now classed as a dessert variety alone. The Council admits, however, that the distinction is arbitrary, and that "everyone is at liberty to use a variety for any purpose he likes." Many will, no doubt, fail to see that information is tendered by the statement. The intention, however, is to make a fixed line of division, solely for exhibition purposes, to prevent disappointment at their shows. In order to have the proposition universally adopted, it might have been worth while consulting with the leading societies throughout the country, because if adopted by them likewise, all the smaller societies would sooner or later follow suit. We offer the suggestion gratis.

Plant diseases distributed by Insects.—Recent experiments conducted by Italian scientists are stated to demonstrate conclusively that moulds and other fungoid diseases are readily carried by insects from diseased to healthy plants.

Christmas Trees are not always young trees but the top of old ones, or the thinnings of woods and forests. This year they have come from the north of England, from Scotland, Woking in Surrey, and largely from Belgium.

The Sacred Lily.—The selling of worthless roots as rare bulbs too often proves a paying game for the unscrupulous vendor, but a losing one to the buyers who may not only lose their money but their temper. It is declared that hundreds of gardeners have been victimised by a man selling what he called "bulbs of the Chinese Joss Flower or Sacred Lily." These gardeners could hardly have been professionals, but that does not make the offence any the less. The vendor had a coster's barrow, on which he had the nut-like fruits of the Water-chestnut (*Trapa natans*)—price sixpence each. On the barrow also were pictures of plants bearing flowers of large size and brilliant colours, which would have made the Sacred Lily itself (*Narcissus tazetta chinensis*) green with envy. These fruits are obtainable in Covent Garden at twopence or threepence a dozen. They constitute an article of food in the far East, where they are grown in great quantity. This man having done good business in Brighton left for a tour amongst other provincial towns. One of our correspondents noticed the scoundrel in several places, and tackled him upon the subject, whereat the vendor replied that he knew too much, and should give him a chance.

Hybrid Roses.—Professor J. L. Budd, of the State Agricultural College, Iowa, U.S.A., has been busy since the spring of 1892 in crossing the beautiful *Rosa rugosa* with pollen from such varieties as General Jacqueminot, Lamarque, and La France. He has as a result a large plantation of hybrids. The plants show a good deal of variation in the habit, style of growth, foliage, and flowers, but all are alike in being vigorous and healthy. A large percentage of the flowers have come single, but they exhibit a wide range of colour and size, some of the smallest being little buttonhole Roses, whilst the largest run to a diameter of fully 5 ins. The colours merge from deepest crimson to purest white. The influence of the variety General Jacqueminot is very marked in the rich hue of the flowers of the progeny. Professor Budd's hybrids will largely augment those raised from *R. rugosa* and some of the best German Roses by the German growers, and their perfect hardiness, the ease with which they stand drought, and their high decorative value should make them eagerly sought after both in the "States" and the United Kingdom as well as, in a less degree perhaps, upon the Continent.

"Who Sets the Fashion in Flowers?"—This question is discussed by a writer in *Longmans*, but there is no attempt to answer the question. Too often the rarity or the price of the specimen is the determining rule. No matter how beautiful it is, so soon as a bloom can be easily obtained it is termed common, and loses interest forthwith, adds the writer. This may be true to some extent but not to the degree that the writer claims. The Rose has more than held its own, and the national emblem of Southern Britain seems likely to do so still. The Primrose and the Violet are both common and fashionable, both of them perhaps from sentiment, particularly the former. Price is undoubtedly an attraction to the collector of Orchids who has the means to gratify his passion for collecting, but we think the high esteem in which Orchids are held generally is due quite as much to their intrinsic beauty as to the comparative rareness of some of them. Fashion in flowers, just the same as fashion in other things is worked by more than one string, and in this one direction the workings of the human mind are very complex. We do not claim that gold is highly esteemed because it is rare, or that diamonds are eagerly sought after by the *beau monde* because every man cannot dig them in his back garden, although of course the price is regulated by the relations of supply to demand, but the demand for these things is decided by their intrinsic value. A man sees a flower, and is attracted by it for a while, but like an overgrown child he tires of it, calls for something new and—the fashion changes.

THE NEW CATALOGUES.

It almost seems as if no season was now entirely exempt from catalogues and lists, but the finest and heaviest mostly appear when the old year is passing into the new. In any case gardeners are on the outlook at this season for the new catalogues that are to serve them with every requisite for the garden during the year that has just been ushered in. Our weekly announcements show those that are on the move. Amongst the earliest of the well-got-up catalogues to reach us in December was that of Messrs. SUTTON & SONS, Reading, of which we made mention at p. 246.

Next in sequence came "Carters' Tested Garden Seeds," from MESSRS. JAMES CARTER & Co., High Holborn, London, with a sprightly and clean-looking cover, having a coloured illustration of varieties of the Comet Aster on the front, and another of *Dianthus chinensis Heddewigii* on the back. Coloured illustrations are not yet entirely abandoned for there is a well executed one of various popular florists' flowers facing p. 96. Numerous other illustrations with which the pages of this massive annual are adorned are mostly photographic reproductions, many of which are admirably executed. We would mention especially the photographs of Peas, Carter's Improved types of Runner Beans, the Melons, Carrots, Cauliflower, Onions, and Carter's Snowball and other Potatos amongst the vegetables. Many flowers are also well represented.

The Catalogue of Seeds, &c., sent out by Messrs. JAMES VEITCH & SONS, Ltd., Royal Exotic Nursery, Chelsea, is also freely illustrated with numerous photographic reproductions, all well executed, and which go to show the popularity of this art for representing garden produce. Peas, Potatos, Melons, Mushrooms, and all the Cabbage tribe are well displayed by means of the process we have just mentioned. Many flowers are in no way behind the vegetables, the natural characteristics of Veitch's Petunias, China Asters, Foxgloves, *Streptocarpus*, *Phlox Drummondii*, &c., being brought to great perfection. The full page and coloured illustration of Veitch's large-flowering Sweet Peas is simply charming, and the best plate of this popular class of flowers we have yet seen. The colours are beautifully contrasted and brought out with great fidelity to nature.

The Spring Catalogue of Messrs. WEBB & SONS, Wordsley, Stourbridge, comes out in rich brownish-purple covers, ornamented with raised gold lettering. Here again photography has been turned to good account in the excellent illustrations of Scarlet Runners, French Beans, Cauliflower, Broccoli, Melons, Onions, Peas, Tomatos, Potatos, and other vegetables, which are abundantly represented on almost every page. There are also some good reproductions of flowers from photographs, but a good few woodcuts are still utilised in this section. Altogether it is a well got up publication.

MESSRS. DOBBIE & Co., Rothesay, come up with their Catalogue and Competitor's Guide as full as ever, indeed, fat with its onerous burden of vegetable and flower seeds, the florist's varieties of the latter being very fully recorded and otherwise dealt with. The illustrations are numerous, though moderate in size, and consist mostly of woodcuts. The lettering in various colours on the front cover constitutes another triumph of the printers' art.

MESSRS. H. CANEELL & SONS, Swanley, in their Complete Catalogue of Golden Seeds, also use woodcut illustrations very largely, though by no means exclusively, the larger ones being mostly photographic reproductions. A circular bed of *Antirrhinum*s shows what may be done with a judicious arrangement of the dwarf races around the taller growing types.

MESSRS. CHARLES SHARPE & Co., Limited, Sleaford, issue a well-printed catalogue of "Standard" Seeds, illustrated by woodcuts and photographic reproductions, Peas and Potatos particularly being admirably represented by the latter process.

PUBLIC PARK NURSERY, ROTHESAY.

HERBACEOUS and alpine plants receive the most attention from Mr. Michael Cuthbertson, Public Park Nursery, Rothesay, N.B. Spring and summer are the best times to see these things in perfection, or, at all events, to see the greatest number of plants in bloom at any one season. During the second week of September last we made a hurried inspection

of the nursery, but lack of time prevented us from doing more than making a general survey of the plants cultivated. Some rare border and alpine plants have, however, been got together, and those desirous of seeing them should pay a visit of inspection during the spring or summer months.

The Saxifragas, of which many sorts are grown, look best during May and June when in full bloom. Sedums and Sempervivums are also grown in great variety, being well adapted for cultivation on rockeries. *Acoena Novae Zealandiae* grows and flowers well in this equable climate on the banks of the Firth of Clyde. Another uncommon plant is *Saponaria ocymoides*, of creeping habit, and well adapted for hanging over the ledges of rockeries. More choice even is *Ramondia pyrenaica*, which was grown in pots, though we think it would answer well if planted between sandstone rocks in the damp climate of this western district.

It is now some years since *Veronica longifolia subsessilis* was introduced, yet it still remains the first and most effective of the group, of which *V. longifolia* is the well known type. Some or other of the forms are to be met with in every garden, but *V. l. subsessilis* has yet an abundance of room for dissemination in British gardens before every cultivator makes a practical acquaintance with it. *Galtonia candicans* (the Cape Hyacinth) makes an admirable companion for plants in beds of a most varied description. In this northern latitude it reaches perfection in August and September. Other choice herbaceous subjects in bloom on the occasion of our visit were *Helenium pumilum*, *Chrysanthemum maximum*, late flowering Phloxes in great variety, and the choice *Montbretias* now rapidly getting disseminated amongst the leading gardens everywhere.

Dianthus neapolitanus is a richly coloured hybrid, with crimson-scarlet flowers, that does well in cool northern districts particularly. The variegated *Hypericum moserianum tricolor* is being recognised at the hands of many growers. It grows more slowly than the type, though that is always a neat, beautiful, and interesting plant. *Tropaeolum tuberosum* is anything but a common plant, notwithstanding that it gives the greatest satisfaction in gardens of a widely varied description at different points between Rothesay and the Channel Islands.

British Ferns are not overlooked, their cultivation in this equable and moist climate being of the easiest description, even in the open ground. *Chrysanthemums* are also grown to some extent, the flowers they furnish in autumn being very serviceable, as are those of Sweet Peas, which keep on flowering till late in the autumn. Several varieties of *Mimulus* are grown, including *M. cupreus*, *M. cardinalis grandiflorus*, and others of those types. *Violas* are at home in this northern district, and are grown in some quantity. During the summer months the glasshouses are largely devoted to the cultivation of Tomatos. The nursery is within easy reach of the pier at Rothesay.

A TAME WILD BIRD.

I WAS very much interested in "The Strange Freak of a Blackbird," page 278, and can fully realise the interest W. K. must have taken in his dicky-birds. I am sure no one who has never had a *tame wild bird* (Irish) would believe how interesting they are. For instance, we always have two or three robins' nests in our greenhouses each year. Last spring one built on a shelf within a foot of our heads where we were dodging about all day packing, and actually stole the moss and bits of cocoanut fibre or anything it could lay it han'—oh, no—beak upon.

One young rascal got so bold that it used to be about with one or other of the members of the establishment almost the whole day; and no cage bird ever had half so much notice taken of it. It would hop about on the potting bench and pick out wireworms and other moving insects; but its favourite morsels were earwigs and spiders. It would feed out of our hands, follow us indoors, or into the greenhouses and shop, and was always twittering. The amount of insects he or she would eat is simply marvellous—sometimes twenty earwigs at a meal! We very rarely wasted an earwig, spider, or wireworm, but used to put them in a glass bottle; and it was amusing to see him (it I mean) when the bottle was presented. He would dance round the bottle like a pig round a potato sack, and

no other robin dared tread over the chalk mark; for robins (like the tribes in India) have a sort of settlement of their own, and there is fighting when other tribes intrude (this is an object lesson). Our robin got so well-known amongst the people who used to come to see the *Chrysanthemums* that they used to bring crumbs for him to feed out of their hands; but "no," says he, "give me a spider, and the bigger, the better."

On my return from Ireland, poor Bob had disappeared. Oh those blooming cats! I am thankful there is no duty on cats. I would rather have one robin than forty cats. I offer, gratis, this hint to gardeners who grow *Chrysanthemums*, "tame a robin."—*W. Wells, Earlswood.*

FLOWERING SHRUBS THAT THRIVE UNDER TREES.

As most of us well know it is difficult to get grass seeds to grow under the shade of trees; and if good turf is laid down, after a few years the ground again becomes bare. Especially is this the case where very little light or sun reaches the spot. And if this should be the case anywhere in the pleasure grounds, what is more objectionable than to be constantly seeing such barren places when a few plants would quickly remedy the evil? I give a few which I find do well under and in proximity to tall Conifer and deciduous trees that have got leggy and where turf will not make the least commencement to grow.

The bushy *Veronicas* grow and flower well with this treatment, where not too much exposed to cutting winds. These are not quite hardy in some counties, but where they do stand out and thrive I can confidently recommend them for this purpose.

Some of the species of *Berberis* are well adapted for this, notably *B. Aquifolium*, *B. Darwinii*, and *B. nepalense*. The various green and variegated *Periwinkles* as well as the stronger growing *Ivies* do well as an undergrowth or as margin plants. Most of the *Aucubas* are amenable in this position, and it is best to plant both male and female plants or berries will be scarce. Nothing with me thrives better than the old St. John's Wort (*Hypericum perforatum*) which increases very fast and also flowers well every year, though immediately under a large spreading Oak tree.

Before planting the ground should be broken up and have some well-rotted leaf soil or short manure worked in, as such positions are sure to be impoverished. The plants should have a thorough soaking of water and not allowed to suffer for the want of such the following summer during the hottest and driest months.—*J. Mayne, Bicton.*

THE MONKEY AND THE TOMATOS.

A YOUNG gardener not a hundred miles from London Bridge made up his mind to try a number of the best varieties of Tomatos in order to ascertain which was the most suitable for the establishment under his control. Seed of seven or eight varieties, in as many packets, was procured.

Sowing time in due course arrived, and the seed packets were taken in a basket to a vinery, where pots and compost already prepared were stored in readiness for use. Before the gardener commenced sowing the seeds, the dinner bell warned him that he had another duty to perform during the next hour, and he obeyed the summons, leaving the packets unopened, and in no special danger, as he thought, or failed to think—most likely the latter.

A monkey kept on the premises, and securely housed in his cage close by, had been intently watching this preliminary performance; but like most of his kind was discreet enough not to ask any questions which might arouse suspicion. Curious to know all about the contents of those packets, he reached and opened every one of them during the absence of the gardener, and left the seeds of all the varieties mixed indiscriminately at the bottom of his cage. On the return of the gardener the monkey had a lively time of it during the afternoon, and twice attempted to drown himself in the tank; but on each occasion was fished out before his rash act had time to take effect.

The Tomato seeds were scraped together, sown in mixture, and planted out in due course. Every year for the last three or four summers, such fruits as most nearly approached the ideal market Tomato were selected from some hundreds of plants. Whether the present strain originated from one variety, or can claim lineal descent from the eight it would be difficult to say; but certainly the medium-sized fruits are shapely, smooth, highly coloured, solid, and of excellent flavour. The setting and cropping qualities of the plants are equally good. The mystery of parentage, however, remains where the meddlesome and inquisitive monkey left it.—*J.*

HARDY FRUIT GARDEN.

THE pruning of standards, and the pruning and nailing or tying of wall trees, are now occupying the chief part of the attention in this department. With the open season there is everything in favour of getting this class of work well forward before the swelling buds render the operation hazardous. It must be borne in mind, however, that the mild winter will be sure to cause an early spring, and the season for such work will thus be proportionately shortened, unless we have a further taste of winter. The late cold snap was of service in putting a check on too forward buds, but the speedy recurrence to high temperatures will restore things to their precocious state.

STANDARD APPLES.—In the case of orchard trees the work of pruning is reduced to a minimum, and in some quarters dispensed with entirely, or to quote a homely phrase, "the pole of the axe used instead of the head." An annual look round, however, would be of service, inasmuch as timely attention will help to lengthen the lives of fruitful trees, and bring to esteem it their special lot in life to bring forth nothing but leaves. Any dead branches that may be observed should be cut out without delay, since, if left they only serve to carry decay to more vital parts of the tree, and also serve as a harbourage for insects. Any branches that are observed to be crossing each other must also be seen to. Usually the best plan of dealing with them is to cut one clean out. Spray-like growths that are observed to be issuing from the main branches toward the centre of the trees should likewise be taken out, as it only serves to choke up the centre and exclude the light and air that are so necessary for the proper maturation of the wood and the formation of fruit buds. Where large branches have been cut the wounds should be dressed with coal tar as a preservative.

PYRAMIDAL APPLES.—If proper attention has been given to summer pinching the winter pruning of these becomes a very light matter. It simply consists in cutting out all dead snags or injured spurs, and in making clean cuts where the summer pinching has left rather ragged ends, or in completing the spurring back to the fruit buds where necessary. The shortening of the leaders must finally be seen to if close pruning is followed. Leave these at lengths varying according to the strength of each growth, and with a keen eye, of course, to the future symmetry of the tree. Shorten to a wood bud, which should point outwards, so that the next shoot may be in the desired direction. When the upper bud points inwards the growth is towards the centre of the tree, and thus a crooked main branch results.

EXTENSION SYSTEM FOR APPLES.—In not a few gardens close pruning is carried to excess, and the result is stunted trees that never carry half the fruit they ought to. Unfruitful bush or cup-shaped trees of this kind may often be vastly improved by allowing the leaders to remain at their full length, pinching back the laterals during the summer in order to foster the development of fruit buds at the bases of the spurs, and following this up at the winter pruning by cutting over the spurs where necessary and removing snags or dead wood. Of course the growth made by the leaders during the first year or two is great, but each succeeding season lessens it until the branches reach what is practically their natural limit of growth. It may be argued that such trees as these are ungainly objects from their great height, but surely this is counterbalanced by the increased crops of fruit. If desired, a few trees only may be first treated in this fashion, and then, once the success of the system has been demonstrated, it may be extended.

Most old gardeners shun the use of secateurs in pruning, and stick to the older-fashioned knife, not without some reason be it said, for there can be no doubt that the latter is the safer instrument to use, more especially when dealing with young trees. A good pair of secateurs, however, if properly used makes a fairly clean cut, and bruises the wood very little indeed. The point therefore is, do not the greater facilities for speed given by secateurs more than make up for a slightly inferior cleanness of cut? For small fruits at all events the secateurs are far and away ahead of the knife, and we have never been able to trace evil results from their employment upon cordons and espaliers, and pyramidal, close-pruned trees.

PLANTING AND TRANSPLANTING.—As long as the soil is not too wet the planting of all kinds of fruit trees may be pushed on. Transplanting too may claim consideration in cases of trees that have hitherto proved unfruitful. The check consequent on lifting may induce them to set well with fruit buds during the coming season, and the following year will then be all the richer in fruit.—A. S. G.

Kitchen Garden Calendar.

THE rains which have fallen so abundantly after the frost have made the soil so unworkable in low-lying places, that it would be far better to defer getting thereon until it has somewhat dried up, than to run any risk of losing a crop through trampling upon the ground when it is in such a condition. Stiff retentive soils are always difficult to manage, though, if taken in hand at the proper time, they are usually more suitable for the production of good vegetables than those of a light sandy nature, which are, however, always more easily worked. There is always plenty of work to do in this department, if the cultivator will only look around him; and as many of our vegetable crops transplant so well, they can be brought forward in a limited space under cover.

PEAS.—If these are sown in large 60's where the pots can be afforded the protection of a cold frame, a three-light box would hold sufficient for a large establishment; and those of first-class quality could be grown, such, for example, as Early Morn, Gradus, Sutton's Early Marrow, Gem, and the like. If from ten to a dozen seeds are placed in a pot of the above size, 100 pots will be sufficient to plant a row 22 yards long. By sowing now and keeping the plants protected at night and exposing them fully on all favourable occasions in the daytime, they will be both sturdy and well hardened off, ready for planting out when favourable weather occurs, towards the latter part of March, or in the more northern districts, early in April. From such sowings we have frequently gathered Peas at the end of May and early in June. Peas do well when grown in pots, and now that the Chrysanthemum season is past there will be ample room to bring them along. It is not necessary that they should be sown in large pots, as they transplant admirably, so that where room is limited the smaller pots may be used. Where there are several successional Peach houses there will be no difficulty in bringing them forward, so that good crops may be gathered early in May. Some varieties are hardier than others and these should be chosen for sowing in the open ground as soon as the weather is favourable. Springtide, Exonian, and Duke of York are good tall kinds; while Chelsea Gem, William Hurst, and Carter's Seedling are very good dwarf kinds. These latter may be sown on a warm border as soon as the soil is in a workable condition.

ONIONS.—Where large Onions and Leeks are desired a sowing of these should be made in boxes, which should be placed where a gentle heat can be afforded, so as to ensure free germination. When the seedlings appear they should be kept as near to the glass as possible. A sprinkling of Lettuce and Cauliflower may also be treated in the same way.

FORCED VEGETABLES.—There is now a great demand for forced vegetables, and as these entail a great amount of labour special preparations should be made for their growth. Hot-beds should be formed for Carrots, Potatos, Asparagus, and such things, of sufficient depth to retain the heat till there is sufficient warmth generated by the sun to maintain the requisite temperature. If leaves were got together when they were dry, two-thirds of these to one-third of stable manure will retain the heat far longer than stable manure alone. Care must be taken to rid the soil of any insect pests before sowing and planting, or the crop will either be a failure or very much damaged. Young snails are very partial to Carrots just as they appear through the soil, so that a sharp look out should be had for these. A sowing of Radishes should now be made on a slight hot-bed, and where the soil is light and dry a pinch of seed can also be put down in a warm border. This should be covered with straw mats or litter till such time as the seed germinates, after which the covering may be dispensed with in the daytime, unless it is very frosty. Birds are very destructive to this crop just as the young plants are making their appearance; therefore a close watch must be kept. When the weather

is unfavourable for outside work Seakale cuttings can be made. If the lower end of these is cut in a diagonal manner, and the top horizontal, there will be no difficulty experienced in planting them. When the cuttings are made they should be covered with decayed litter to protect them from frost.—*Kitchen Gardener.*

The Orchid Grower's Calendar.

ODONTOGLOSSUM CRISPUM ALEXANDRAE.—At the famous auction rooms of Messrs. Protheroe & Morris, in Cheapside, on Friday, we were given a chance to select from a splendid importation of this, the most popular, the most easy to grow, and the most variable of all the cool house Orchids. There are, doubtless, amongst the purchasers some to whom a few hints on their treatment will be of some service.

Our plan with imported *O. crispum* is on arrival to get the plants thoroughly cleaned, cutting away any decayed pseudobulbs, some of the old bracts, &c, but in doing this always be careful not to expose the young growths too much. They do not appear to us to come away so freely as they do when protected for a time with the bracts, which is after all only natural. This being done lay them out singly on the stage of the cool house. Here they should remain for about three weeks, when, if the house is a fairly moist one, they will have plumped up and be in a fit state to pot. Sometimes, however, at this time of the year, we get some very severe weather, and the houses dry up very quickly consequent on the hard firing that obtains. Such being the case we would recommend a layer of live moss being put on the stage to lay the plants upon. This will help them considerably.

In potting up imported plants always use as small pots as is possible, and plenty of drainage. Some there are that advise their being put in crocks alone for a time, but it is not a practice of ours, believing, as we do, that it is a waste of time. The compost should be Polypodium or peat-fibre (the latter for preference) and an equal quantity of Sphagnum moss. The peat should be fairly moist, and the moss also, but not wet, and pressed around the plants moderately firmly, so that the plants do not topple over at every little touch. Until established they may be stood pot thick, which prevents their drying up too quickly. A gentle syringing over head to keep the moss alive is all they require till the growths are well up and roots are running through the compost, when the supply should be ample. Some are afraid to syringe overhead in the winter, but there is no need for alarm unless the temperature is allowed to run down low. It is not safe to let it go below 45°, unless the outside temperature is exceptionally low.

This Orchid may be described as one of the cleanest grown, when the atmospheric conditions of the house are suitable; but with severe weather and hard firing, it is subject to the attacks of yellow trips, which secret themselves in the hearts of the young growths, crippling the same and spoiling the spikes completely, if not kept under. Dipping in a solution of tobacco water and fumigating with XL All will keep them in check.

If these few hints are acted upon we feel sure that the results will be as satisfactory as are our own.—C.

Tubercles on the Roots of Pea Plants.—Some experiments have been conducted at the Louisiana Experiment Station, U.S.A., with the view of ascertaining the influence of deep and shallow planting upon the root tubercles of Pea plants, the depth to which the nitrifying germs penetrate, and the results of transferring them to different host plants. The Field Pea was planted at depths varying from 1 in. to 6 in., and the root system was best developed in the case of plants from seeds placed at 2 in. or 3 in. from the surface. Pots were filled with soil taken at depths varying from 1 ft. to 3 ft., but tubercles were found in relatively small quantities only on those plants grown in soil not more than 12 in. below the surface, the rest having no tubercles. When the surface was artificially inoculated with germs, root tubercles were produced in abundance. The experiments also go to show that each species, or at most, each genus of plants has a different microbe peculiar to it.

HINTS FOR AMATEURS.

CHRYSANTHEMUM CUTTINGS.

THE amateur who takes up the culture of the Chrysanthemum in order to find something to occupy his spare time often discovers that he has got rather more to do than he bargained for at the start. Right through the year he finds that there is always something to do in connection with his favourites, and that unceasing care and vigilance must be exercised the whole season through.

At this time of the year all Chrysanthemum growers, both big and little, amateur and professional, are concentrating all their energies upon the getting up of stock. For purposes of general culture we treat the Chrysanthemum as an annual, that is to say we rear the plants, flower them, and throw them away in the one year. It must not be supposed from this that the old plants could not be successfully grown on for another year, or for a number of years for that matter, for the reverse is the case, but experience has demonstrated that finer flowers are borne by the younger plants, and so, despite the increased amount of trouble, we propagate every year.

In the case of those who grow upon a large scale, or who enter extensively into the whirl of competition at shows, an early start is made with the cuttings, for the blooms are scarcely off the plants in November before a diligent search is made for the cuttings, more especially of varieties that are new, of the greatest service, or more than commonly shy in throwing up suitable cuttings. From November onward to the end of January is the busiest part of the year for seeing to the cuttings that are destined to produce plants to bear blooms of show size. Even after the end of January, and for fully another month or even six weeks, cuttings may still be inserted for yielding plants to furnish flowers for decorative work.

Of late years the practice of growing exhibition blooms in 6 in. or 7 in. pots has received a good deal of attention. It has been demonstrated beyond question that it is possible to grow plants in the pots that shall throw first-class blooms. Such plants are of the greatest service for the formation of groups of Chrysanthemums which are each year becoming a more noteworthy feature at the shows. The blooms these plants carry are not always large enough to take their place upon the show board by themselves, but they come in very handy where two or three fair-sized blooms are required for completing a stand. In some cases, on the other hand, the flowers are fully able to hold their own with regard to size in competition with the others borne by plants grown in the larger pots. The month of March is the time for inserting cuttings to give this kind of material. By that time there will be plenty of cuttings, and only the least need be taken.

It will be seen at once that by this method the rooting of cuttings in the worst months of the year, viz., November, December, January, and February, is obviated, and this is a matter of considerable importance to the amateur who has to feel his way along, as it were.

For ordinary purposes the present is a capital time to take the cuttings, for each day now will bring a slight increase in the light, whereas in November we had to look forward to a daily decrease in that valuable commodity. Cuttings inserted now, moreover, have a fairly long season of growth in front of them—quite long enough with skilled treatment to produce first-class flowers.

Striking the Cuttings.—During the last few years a great revolution has taken place in the actual treatment of the cuttings. Formerly it was not an uncommon thing to see them coddled and placed in warm houses or hot beds. The result was, as might have been expected, drawn, spindly looking plants, with thin, yellow, and weakly foliage. But this was not the worst, for the check consequent on potting, and the shift into cooler quarters was so severe that it was a long time before the plants pulled themselves together and made real progress. All this delay was naturally a loss of valuable time, that brought its own penalty at flowering time. Nowadays nobody, unless it be the veriest tyro, thinks of subjecting the plants to heat. "Keep the cuttings cool" is the advice that would be given to

the enquirer by any and every successful grower, and sound advice it is, based upon that surest of foundations—practical experience. It will thus be perceived that no expensive glass structures are necessary to root Chrysanthemum cuttings, and, in fact, no further convenience than the ordinary amateur can well command. There are many winters, indeed, in which a cold frame would afford all the shelter needed, but we cannot depend upon this, and, therefore, some structure is needed from which the frost can be excluded at will. The great drawback to the welfare of the cuttings when they are placed in a cold frame with no other protection than mats is not so much the degree of cold but the exclusion of the light, which may result for a week two or together when frost holds day and night in such a way that it is impossible to remove the coverings from the frame.

Clear a place on the greenhouse stage where there is plenty of light, and stand on it a small hand-light. In this put a layer of about 4 in. of clean ashes. This will serve to plunge the little pots in. Coconut fibre refuse may be used if desired, but ashes are rather cleaner and better.

Selecting the Cuttings.—There is a good deal more art in this than many people fancy. There is a great tendency to go for fat, succulent shoots, but these rarely do so well as the more wiry ones, having, among other bad qualities, a greater tendency to damp off. First of all do not take the cuttings, unless it is absolutely unavoidable, from the plants which have been very highly fed. This practice carried on over a series of years has a very prejudicial effect upon the stamina of the plants. If possible a few plants should be grown specially each year for the production of stock. No stimulants of any kind should be given them, and they will then produce quantities of sturdy, wiry shoots. The best cuttings are furnished by the suckers thrown up from the roots. Some growers are fond of taking these off with a hard base and a few roots attached, but although these are almost certain to root they do not seem to make so much headway as others which have been cut off above the surface of the soil. A good cutting should be from 2½ in. to 3 in. in length. Steer clear of "stem" cuttings, i.e., shoots that are thrown directly out from the hard stem of the old plant. Such rarely do well, and are always liable to prematurely throw flower buds.

Soil and Pots.—The compost should consist of equal parts of loam and leaf soil, with enough sharp sand added to keep the whole open. A capital addition is a little of the ash obtained from the combustion of the stems and leaves of the old plants. About a thirtieth of this in bulk may be added to the heap and well mixed up. It is astonishing to note the difference that is apparent between young plants grown in soil to which the ash has been added, and others which have not had this attention paid them. The pots used should be small, rather long thumbs. One crock at the bottom, covered with a little of the roughest of the compost, will be sufficient drainage. One cutting should be inserted in the middle of each pot. Roots are more quickly formed, perhaps, when the cuttings are placed close to the edge of the pot, but there is then a difficulty in getting the young plants into the middle of the larger pots during subsequent shifts.

Subsequent Treatment.—After the first watering but very little water will be needed, and that must be applied carefully and with discretion. Keep the handlights closed for the first week, and shade if necessary from sun should the days be bright. After the expiration of the week, if the cuttings are looking well, a chink of air may be admitted, increasing this as the days go by. Should flagging be observed, however, the lights must go on at once. In a few weeks' time the lights may be removed during the middle of the day, and finally may be left off altogether. Pay close attention to damping. Any leaves that show signs of it should be removed at once to prevent the infection spreading.

Fuchsias.—Both those plants which have been grown in pots and those which were planted in the flower garden last summer and were lifted from thence at the beginning of October may be laid closely together on their sides. No water will be needed. It will be advisable, however, not to lay the plants too close to the pipes.

Agapanthus umbellatus.—These plants will do with a place underneath the stage but it should be as far forward as possible close to the border of the path-

way, so that they may get plenty of light. It is a common but erroneous practice to keep the plants without any water at all from the time they are boused in the autumn until they are put out of doors again next spring. This treatment is little short of barbarous, and it is only by reason of its unfailing good nature that the Agapanthus stands it. Give the plants a fair amount of water, sufficient to keep a healthy green hue upon the foliage instead of the sickly yellow that one often sees, but not a drop of liquid manure or any stimulant whatever.—*Rex*.

Correspondence.

Questions asked by amateurs on any subject pertaining to gardens or gardening will be answered on this page. Anyone may give additional or more explanatory answers to questions that have already appeared. Those who desire their communications to appear on this page should write "Amateurs' Page" on the top of their letters.

Bees.—*G. A.*: The super should be taken off the hive at once. There will be no bees in it, of course, but it would tend to make the hive cold and draughty. We think you ought to cover your hives up more warmly.

Rose Marechal Niel.—*Enquirer*: You may certainly grow this Rose in a large pot under glass, but the plant will not do so satisfactorily as it would if it were planted out. Can you not make up a bed of soil beneath the stage to accommodate it? Use good loam, and add to it a sixth part of short, well-rotted manure.

Smilax Going Wrong.—*A. A.*: It is more than likely that your plants were injured by frost. The fact that they are throwing up fresh growths from the bottom would seem to point to this.

Begonias.—*Star*: If you have a warm house you might sow the Begonia seed about the end of January. As the seed is very fine it must only be lightly covered with earth. The seedlings will be sure to exhibit a good deal of difference in the colour of their flowers. Hence you will not be able to make use of the plants this year for filling beds where the colours are to be restricted to one or two. For filling mixed beds, of course, they are suitable enough.

Freesias Turning Yellow.—*Yeo*: You have subjected your plants to too much fire-heat, and this is the cause of the foliage going yellow. You appear to have given sufficient water at the root. Try and surround your plants with a more kindly atmosphere.

Pear Louise Bonne of Jersey.—*Amator*: This variety will do remarkably well either as an oblique or an upright cordon.

Red Currant.—*Amator*: The Old Dutch Red is a variety of long standing, and when well grown is a good all-round variety. The fruit is of good flavour and colour, and the tree will grow and crop well in almost any locality.

Dahlias.—Is it necessary to divide the roots of Dahlias before planting them next year? I have quite as many plants as my garden will contain, and therefore I do not wish to propagate.—*Dahlia*.

You may if you choose cut away some of the smaller tubers before you plant the rootstocks, but this is not at all necessary. The safer plan will be to plant them just as they are and thin out the growths presently if the plants threaten to become too big. You will then be able to go to work warily.

Clubbing in Cabbage.—*Greengrocer*: This is caused by a slime fungus which infects the roots of the plants. In pricking out the plants from the seedbed into their permanent quarters it is always well to be on the lookout for the first evidence of the disease and to reject such plants as show the protuberances, even if the latter are but small. A good dressing of gas lime should be applied to the ground while it is vacant previous to the Cabbages being planted. Two bushels of gas lime will form an effective dressing for three rods of ground in bad cases. The gas lime should be obtained fresh from the works if possible.

Sparrows and Carnations.—I notice during the

last few weeks that the sparrows have made a dead set at my Carnations, and that they have plucked off many of the leaves, and bitten others in two. Do the birds obtain any food by doing this, or is it done out of sheer mischief? For my own part I am inclined to the latter idea.—*Vexed.*

Our correspondent doubtless is right in his surmise. Sheer mischief will cause sparrows to do much.

HYDRANGEAS IN COUNTY DOWN.

THE accompanying photograph is a view of a Hydrangea garden at Old Court, Strangford, Co. Down, the residence of the Right Hon. Lord de Ros,

It would surprise many to see the Fuchsias; for they grow twelve and fourteen feet high, and I have measured some of the trunks nine and ten inches in diameter.

This pretty demesne is situated on the western shores of Strangford Lough, and the Hydrangeas shown grow within forty feet of the water's edge. The building shown in the background is his Lordship's private chapel. It was built in 1529, and presented to the Earl of Kildare (Lord de Ros, ancestor), by his agent, Valentine Payne. There is a churchyard adjoining the chapel, but it was closed a few years since on sanitary grounds. His Lordship is always most willing to give anyone permission to visit his beautiful demesne, and a

straightens and recovers, at least partially, its freshness; then all that part of the stalk which has been immersed in the hot water is cut off and the flowers replaced in cold water.

GLASGOW BOTANIC GARDENS.

DURING a hurried ramble through the houses and the grounds of the Botanic Gardens, Kelvinside, Glasgow, last autumn, we had sufficient time to note a vast improvement upon things as they were at the time of our previous visit several years ago. The people of Glasgow like to see showy and what are usually termed useful plants in contradistinction to

HYDRANGEAS IN COUNTY DOWN, FROM A PHOTOGRAPH TAKEN 23RD DECEMBER, 1897.

K.C.V.O. The photograph was taken by the Right Hon. Lady de Ros, who is a horticultural enthusiast. The variety grown is the ordinary *H. hortensis*, and the photograph gives one a good idea of the mildness of the weather (it being taken on December 23rd, 1897), in the Emerald Isle.

Coniferae of every description find a congenial home here, many of the varieties growing to such an extent as to puzzle experts who are used to seeing specimens grown in England and Scotland. Cupressus, Cryptomerias, and shrubs of all kinds have a robust look about them which surprises many on their first visit to the arboretum. Desfontainia spinosa grows luxuriantly and flowers in profusion.

good many avail themselves of the privilege which is so kindly granted.—*Diosma.*

To keep cut flowers fresh—Cut flowers can be kept longer, says the *Gazzetta delle Campagne* of last August, by previously placing a little powdered charcoal into the water of the vases, but the end of the stalk must be cut a little daily. A little camphor dissolved in the water also preserves freshness. A solution made with one litre (88 quarts) of water and three grammes of sal ammoniac (1692 drams) answers the same purpose. When the flowers begin to fade they can be revived by dipping the ends of the stalks into boiling water. When the water cools the flower

those that are merely of botanical interest, so that the greatest alterations or developments are along those lines. Of course this also is one of the features of the National gardens at Kew, but the grounds and houses at Glasgow are not so extensive and must be utilised to the best advantage. With this object in view, batches of useful plants are grown wherewith to keep up a display in the show houses to which the public are admitted.

At the time of our visit the Chrysanthemums were still in the open air. About 3,000 were grown mostly in the bush form, with a few confined to single stems. They flowered well and were dealt with in our pages during the proper season. In the Ewing

range of houses a recently acquired collection of Cacti is accommodated. *Clianthus Dampieri* in pots and planted out was displaying its remarkable flowers. The Moss house still contains a collection of mosses and various other cryptogams, including grand pieces of *Todea superba*, the Killarney Fern and other species of *Trichomanes*, also *Hymenophyllum* and that curious subject named *Mesplitis*, which grows best on a living Tree Fern stem.

PRIVATE HOUSES.

Passing thence into the pits and private houses we noted large batches or sometimes a houseful of such things as Chinese Primulas, *Streptocarpus*, show, fancy, and zonal Pelargoniums, Ferns, stove plants, Orchids and Poinsettias. Young and old plants of the latter had been cut down and grown on with three to four fine heads on a plant. Amongst Orchids such things as *Dendrobium crassinode*, *D. nobile*, *D. wardianum*, *Coelogyne cristata*, *Cattleyas*, and *Miltonias* were finishing up excellent growths. The cool *Odontoglossums* were also making good headway. A feature in this latter house was an edging to the benches of *Nepeta Glechoma variegata*, which hung down in long and beautifully variegated festoons.

ORCHID HOUSE.

Autumn is not the time for the best display of Orchids, yet a considerable number were in bloom including the curious *Pholidota*, *Dendrobium Phalaenopsis*, and *Oncidium incurvum*, with long panicles of flowers. Very fragrant was *Anguloa Clowesii*, and handsome were *Odontoglossum grande* and the Swan's Neck Orchid (*Cynoches chlorochilum*). Both interesting and always pretty are *Oncidium dasystyle* (the Bee Oncid), *O. flexuosum*, *Spathoglottis Fortunei*, *Masdevallia triaristella*, *Epidendrum cochleatum*, and *Dendrobium thyrsoflorum*, the latter being of course showy and conspicuous. Passing into the

FERNERY

We noted a general collection in fine condition; but the house also accommodates collections of insectivorous plants such as *Sarracenias* and *Droseras*. Conspicuous amongst the latter were *D. capensis* and *D. binata*. Fine plants of *Plumbago capensis* were trained under the roof, and seemed satisfied with their surroundings. For the convenience of the public the houses are connected and lead from one into the other, the temperature and moisture being suited to the several occupants.

AZALEA AND GREENHOUSES.

Of Azaleas it is interesting to note how well they are cared for. Many tall and perfectly pyramidal specimens show that they find many admirers amongst the good people of St. Mungo. Hybrid greenhouse *Rhododendrons* are represented by large and pyramidally trained specimens of *R. Countess of Haddington* and *R. Gibsoni*. The porch of this house was brightened with *Lilium speciosum* in pots.

Witsenia corymbosa in a No. 1 pot, and measuring 4 ft. to 5 ft. through, was coming into flower the second time, and constituted the feature of another house. There is a similar plant in the Botanic Gardens, Glasnevin, which is slightly larger if anything; but the two plants are amongst the finest in the British Isles. The stem is woody, much branched, and bears tufts of leaves on the branches like a miniature Iris, and cymes of sky-blue flowers. The species might not inaptly be described as a tree Iris. *Lonicera sempervirens* was flowering profusely on the roof. *Centradenia divaricata* is not unlike a Myrtle when flowering profusely. The foliage of *Vitis purpurea* was deep purple. The finely trifoliate leaves of *Rhus excisa* recalled *Choisya ternata*.

SUCCULENT HOUSE.

The collection of succulent plants is pretty extensive, and amongst them is a fine specimen of the Elephant's Foot (*Testudinaria elephantipes*), always an object of great curiosity. There are also large and well grown plants of *Agave Americana* (in a massive tub), *Euphorbia grandidens*, the Night Flowering *Cereus*, and the Old Man Cactus (*Pilocereus senilis*). Many others are noteworthy of their kind, and if their object is to be gaunt, grotesque and forbidding to the hands in their respective coats of mail, they certainly succeed.

PALM HOUSE.

A roomy house accommodates many fine Palms that are attractive to the general public by reason of their majestic heads of feathery or fan-shaped leaves always suggestive of tropical countries.

Sabal blackburniana stands 20 ft. high to the top of the fan-shaped leaves, supported by a massive trunk. The huge panicles of green and black fruits are attractive at all seasons. *Livistona chinensis* belongs to the same group, and is massive beside a fine tree of *Euterpe edulis* having gracefully arching leaves of another type. The tall clean stem of *Seafortia elegans* carries the head of foliage close to the roof. There are several tall trees of *Astrocaryum mexicanum* whose trunk is always guarded with formidable, black spines. The long lianes, characteristic of a tropical forest, are supplied by the supple and winged stems of *Vitis pterophora*, leaping from point to point of whatever object may be supporting them. Bananas are represented by many tall, fruiting stems. Stove *Begonias* and other fine foliage plants occupy some of the side shelves.

ECONOMIC HOUSE.

There is a fine collection of economic plants at Glasgow, and if the species are not numerous, the plants are in excellent condition. They are planted out in the central bed of the house, and afforded sufficient room to develop into large, well furnished specimens, in many cases fruiting freely. In this category may be placed *Cinnamomum Cassia*, *Ficus Parcelli*, *F. Cooperi* and *F. edulis*. The numerous orange-red, globular fruits of *F. Cooperi* were very showy. The fruits of *F. edulis* are produced in quantity along the old, leafless portions of the stems. There are also tall and vigorous plants of *F. religiosa* and the Mango tree. A grand specimen of *Passiflora quadrangularis* was carrying its third crop of large, egg-shaped fruits for the season.

TROPICAL FERNERY.

A general collection of tropical Ferns was in healthy and fresh condition. A special feature of this house are the several cork arches on either side of the building, and planted with Ferns and various fine foliage *Begonias*. Nothing, however, was better done than the healthy and vigorous specimens of *Gymnogramme schizophylla gloriosa*, suspended in wire baskets, Maidenhair Ferns in baskets also show that a bold attempt has been made to break away from the usual formalities of plant houses; and of this we should like to see more.

STOVE AND AROID HOUSES.

The usual occupants of the stove are well represented, including large and healthy pieces of *Anthurium Veitchi*, *A. crystallinum*, *A. warocqueanum* and others. *Coleus*, *Dracaenas* and *Caladiums* uphold their respective sections, together with a mixed assemblage of *Begonias*. *Costus speciosus*, by no means a common plant, was well flowered; and the same may be said of *Thunbergia alata*, in orange and white varieties.

Amongst the more notable of the Aroids were large and well furnished plants of *Anthurium acaule*, *A. Reine de Belges*, with rosy-pink spathes, *Caladiums*, *Alocasias*, *Calatheas* and others of that ilk, in healthy condition. *Vandas*, *Aerides*, and other Orchids, that delight in plenty of moisture, occupied the side benches.

WATER-LILY HOUSE.

This is devoted to tropical and sub-tropical species and varieties such as *Nymphaea Lotus ortgiesiana*, deep red; *N. stellata zanzibarensis*, intense blue; *N. devoniensis*, with large and rosy-red flowers; and various others, with which the tank was crowded. The above, although so late in the season, were still flowering. Many kinds of Gourds were trained to the roof, adding greatly to the interesting character of the house. Pitcher plants in pots and baskets suspended from the roof, also had congenial quarters here.

KIBBLE PALACE.

This is practically a temperate house or winter garden, but is kept gay at various times of the year with such flowering subjects as may be in season. It is a large circular building, with a domed roof, and a wing on each of two sides. The circular portion is 150 ft. in diameter, so that it is at once a prominent and conspicuous feature of the garden, and of which the citizens may well feel proud. At the time of our visit, the two wings were gay with *Lilium speciosum*, early-flowering *Chrysanthemums* in pots, *Cannas*, *Fuchsias*, tuberous *Begonias*, *Pelargoniums*, &c. *Lapagerias*, white and red, were flowering profusely on the roof overhead.

The roof of another portion, surmounting a fountain and circular basin, is draped with *Roses*, *Passionflowers*, *Lapagerias*, and *Clematis Henryi*, all flowering profusely at the time of which we speak.

The central portion of the dome is not furnished with glass, but opaque, and under the shade of this a fine collection of tall Tree Ferns in grand condition is located. Radiating around the Ferns are tall plants of various kinds hailing from temperate countries, and including fine trees of *Araucaria Bidwilli* and *A. excelsa*; also *Rhododendrons*, *Camellias*, *Acacias*, *Fuchsias*, *Aralias*, *Pittosporums*, tall trees of *Eucalyptus*, floriferous specimens of *Datura sanguinea*, and *Clerodendron foetidum*. A large specimen of *Acacia decurrens*, with fine foliage, has pressed itself against the glass till it has assumed an umbrella form. There is also a tall and fine tree of the fan Palm, *Trachycarpus excelsa*. Long, flowering shoots hung down from a giant *Fuchsia* trained under the roof. Very effective was a large bush of *Arundinaria falcata* having long branches, gracefully arching over one of the side walks. There is no more rampant climber than *Cobaea scandens*, which here reaches over a great portion of the roof, scrambling up, as it were, from the pillars supporting the roof, and hanging in leafy festoons. A large specimen of the night-scented Tobacco, planted out in a side border, is not only perennial, but flowers all the year round.

ROCKERY AND AQUATIC PONDS.

In a semi-shaded portion of the gardens a rockery has been constructed by Mr. D. Dewar, the curator, who has been making his influence felt in every corner and department of the place. The rockery is situated not far from the Kibble Palace. Herbaceous and Alpine plants are planted in suitable positions, and Ferns occupy the shaded end. In a bog bed filled with suitable occupants *Primula japonica* might have been seen flowering entirely out of its season, as a result of the abundance of moisture, perhaps, for it was in front of a dripping well. Behind the rockery is the hardy Water Lily pond, well filled with a collection of *Nymphaeas* in bloom on the occasion of our visit. A fountain occupies the centre of the pond. On higher ground is another pond filled with a general collection of hardy aquatics, mostly British and including fine clumps of the rare *Ranunculus Lingua*.

HERBACEOUS BORDERS.

The borders mostly run from the higher grounds towards the hothouses, and being public promenades are filled with a great variety of showy flowering plants. In autumn there were masses of *Carnations* in bloom, also *Gladioli*, *Oenotheras*, *Golden Rods*, *Michaelmas Daisies*, *Coreopsis*, *Godetia*, *Malva*, *Coronilla*, *Hypericum*, *Impatiens Roylei*, &c. There were also beds of *Anemone japonica alba*, *Rudbeckia speciosa*, *Golden Rod* and *Galtonia* in mixture, *East Lothian Stocks* and other subjects on the grass not far from the walks and giving great variety.

Mr. Dewar is to be congratulated on the keeping of the gardens which are now a source of great attraction to the citizens of Glasgow. He is well supported by his foreman in the glass department, Mr. James Rourke.

BENMORE, ARGYLLSHIRE, N.B.

"Where fairy Eck sleeps 'neath the azure dome,
And Holy Loch lies fringed with silver foam—
There nestles sweet Benmore, a regal home."

Benmore, as the above lines indicate, is charmingly situated in the vale, or Strath, of Echaig, a delightful spot between Lochs Eck and Holy, the overflow of the former, in addition to the River Masson and numerous mountain burns, going to swell the waters of the latter. Thus the vale is made musical with running water. Great mountains tower up on either side, and thus one is reminded of the "Prince of Abyssinia," and the "Happy Valley," where, "from the mountains on every side, rivulets descended that filled all the valley with verdure and fertility."

Dr. Johnson, then, must have had some such scene as this in his mind, when he penned that fascinating story concerning *Rasselas*, and which *Boswell* states he read religiously once a year at least.

Be that as it may, Benmore is a fine structure and a fine estate. It is built in the Scotch baronial style, and takes its name from the Gallic "Beinn Mhor," which means "the great hill"—the great hill attaining an altitude of 2,433 ft.

The mansion, which is lighted by electricity, is occupied by William Younger, Esq., of the celebrated

Yonger's Ales. The gardens and pleasure grounds are extensive and well conceived; and are presided over by Mr. Stark, who must be a busy man to be able to compass the exacting work of so large and varied an estate. "The sides of the mountains were covered with trees, the banks of the brooks were diversified with flowers"; in fact, a small fortune has been spent on trees; Conifers line the hills; Conifers adorn the dale; Conifers have congregated together in all parts of the grounds; Conifers constitute the arboretum; in fact, Conifers are like our troubles, they never come alone, but in battalions. Avenue after avenue of these beautiful trees are very much in evidence, and in luxurious growth; the Scottish clime with its copious rainfall and heavy mists being seemingly suitable to this particular natural order of trees—*Picea nobilis*, *Wellingtonia gigantea*, *Pinus Strobus*, *Picea nordmanniana*, *P. Pinsapo*, *P. concolor*, etc., responding in fine style to the dripping skies. *Cupressus lawsoniana*, *Cedrus Deodara*, *C. atlantica* and its variety, *glauca*, *Araucaria imbricata*, and *Abies Douglassii*, among others, go also to show the quality of the site and the quantity grown.

The arboretum also affords a fine view from the mountain sides above; in fact, we,—*i.e.*, Mr. John Fraser, The Gardens, Ardenlee, Dunoon, and Mr. McLeod, The Gardens, Hafton House, Hunter's Quay,—entered by the gate leading to Loch Eck, where Mr. Stark courteously met us; and after traversing Puck's Glen—a perfect fairyland of Ferns and Mosses—and scrambling up a considerable height, we descended by winding and romantic paths into the vale below. Here, after inspecting the arboretum, above described, at close quarters, we were invited to a substantial and welcome Scotch tea, which, coming on the top of a ten mile walk, was much appreciated.

After this interesting ceremony was duly accomplished, we took to the large glass structure known as the "Winter Garden," which fact seems to imply that even in this comparatively warm corner of bonnie Argyll, weather, more or less vigorous is not unknown.

This large structure—which measures 150 ft. by 50 ft. and is proportionally lofty—is, however, unheated, *i.e.*, no firing has been used of late years; and yet the contents seem to be doing remarkably well. Palms, Tree Ferns, Eucalyptus, Camellias, Acacias, etc., content themselves with mere protection. The Silver Tree Fern (*Dicksonia antarctica*) is a fine specimen; the variegated New Zealand Flax (*Phormium tenax variegatum*), is all there in green and gold; while the Blue Gum (*Eucalyptus globulus*) is 18 in. in girth, 3 ft. from the ground, and 40 ft. high. *Bocconia frutescens*, *Datura* (*Brugmansia*) *sanguinea*, *Dicksonias*, and Climbing Roses, etc., vie with each other for the upper spaces, the ground line being covered with smaller and dwarfer plants. There is also a very handsome marble fountain and basin, round which British Ferns, like *Athyrium Felix-foemina cristata*, *Polystichum angulare proliferum*, *Lastrea pseudo-mas cristata* or *Osmunda regalis cristata*, display their beauties to advantage. Moreover, the whole of one side is clothed with Ferns of various species and varieties, the wall being wired and padded in the usual way.

Thence we visited the stoves and greenhouses where an immense quantity of material is stored for various purposes. In one of the former *Aristolochia elegans*, a beautiful free-flowering climber of elegant habit adorned the roof; while in one of the latter the pendulous blossoms of *Lapageria rosea* and *L. r. alba* were worth looking at. *Campanula isophylla* *alba* were white with flowers and bespoke July, rather than September, the time of our visit.

But let us get out in the open again—the day warrants it, for it happens to be one of those glorious occasions when all nature seems to unite to make amends for man's benefit. With a cloudless sky, with a soft, sweet sun, and with just enough of gentle zephyr in the air to encourage locomotion, one cannot help feeling the joy of existence, the pleasure of life. In the borders *St. Bridget Anemone* is gay with colour; and all this display is the result of a sowing last March. Herbaceous plants are in fine form; such things as *Montbretia crocosmiaeflora*, with orange-scarlet flowers; *Lysimachia clethroides*, with upright spikes of white blossoms; *Achillea Eupatorium*, with brilliant yellow heads; *Hemerocallis fulva flore pleno*, with double bronzy-yellow blooms; *Helenium pumilum*, another useful yellow plant; *Chelone obliqua*, rosy-purple; *Phloxes* in

variety and a dozen other things, including *Colchicum autumnale*, with bright purple tubes, will give the reader some idea of the flush of colour which still prevails in this fertile valley.

By-the-bye there is one other flower which does well in these parts, and which must not be omitted, viz., *Tropaeolum speciosum*, a flower which, for colour, contour, and habit, can hardly be overrated. Here, there is a long line of it scrambling over an iron railing, its rich vermilion-scarlet blossoms glowing in the soft sunlight like "flames" of fire. Mr. Stark, however, is of opinion that the best position for it is at the foot of a hedge, where it will be comparatively dry, and where it can cling to the latter for support. This may be a suitable site in a moisture-laden clime, but would, we think, be certain death to it in the sunny south. As we had no time to inspect other departments of this very interesting garden, we passed down another avenue of Pines and made our exit by the "Golden Gate."

This, again, reminded us of the "Happy Valley," for it is a fine piece of wrought iron workmanship, emblazoned with that sovereign colour from which it takes its name. On either side of the Golden Gate trees of *Cupressus lawsoniana* stand as sentinels, while the Scotch Fir and the native Larch form the vista in the beautiful background. No one can look on such a picture as this without being affected; and so it was with us. We acknowledged the power of Nature and the glory of landscape effect; we saw and were conquered; we said "adieu"! and retraced our steps, but the vision of beauty still lingers with us.—*C. B. G., Acton, W.*

ORIGIN OF SPORTS.*

WHAT is termed "sporting" in *Chrysanthemums* is by no means uncommon. A few of the very best sorts at present in cultivation have been derived from this source. So far as I know no explanation of a satisfactory kind has been forthcoming regarding their origin. In a recent issue of the *Journal of Horticulture*, one of the best known and most competent authorities on the history and cultivation of the *Chrysanthemum*, writes:—"With all our increasing knowledge we do not appear to be any the wiser with regard to the origin of 'sports.'"

The plant sent in by Mr. Mirrlees to-night is a variegated "sport." The divergence is seen in the leaves. The root is not changed, and a small twig at the top shows the normal character of the plant. Now as we have two varieties on this plant, to perpetuate them it is only necessary to take cuttings of both. The root cuttings would produce plants true to the original, and the variegated portion would perpetuate the sport. For some considerable time the sport shows a tendency to revert to the original. Even after they become what is called "fixed," variegated sports are difficult to retain, and frequently revert entirely.

Variegation can hardly be called a disease. We have many very delicately marked leaves, that are not rich in chlorophyll, which are noted for their vigorous growth. They are, however, very susceptible to injury. The slightest check is apparent, either from chills or moisture.

There are instances on record of double sporting, that is, of one variety sporting in different places with the same result. It is noteworthy that no change takes place in the form of the flower, the colour only being changed. For example, a pink flowered variety gives a terra-cotta sport, while another pink variety produces a yellow sport, and still another pink variety gives a perfect green flower.

Regarding the origin of sports, I can only give the result of my own experience, extending over thirty years, which is that hybridism is the principal cause of all sports. I will give an example of this. By cross-fertilisation I have frequently produced sports in the tricolor *Pelargonium*. To accomplish this I take a silver-leaved or tricolor *Pelargonium* as the seedbearing parent, and a zonal as pollen plant. The seedlings resulting from this cross would mostly take after the pollen parent, while a small proportion would resemble the seed bearer. These, of course, would be kept if as good as the parent, but the plants resembling the pollen parent would likely be thrown away. If, however, these plants were kept,

* A paper read by Mr. George Russell, Redlands, Glasgow at a meeting of the Natural History Society of Glasgow.

at some time or other they would reveal their hybrid origin by throwing out a sport. I used to cross these plants by the hundred, and had good opportunities of seeing the results.

Take another genus. *Azalea indica* is another instance. I have seen as many as four different sports on the one plant, all clearly showing that cross-fertilisation was responsible for them also. The *Azalea* being a hard-wooded plant, it takes some years before you can see the result of the crossing. From seedlings of my own crossing I have also had sports from the *Azalea*.

Orchid sports are very rare. So, until recently was their hybridisation. Twenty years ago Messrs. Veitch, London, were about the only operators, but now nearly every one who has Orchids is crossing and raising seedlings. A number of natural hybrids are known, which makes it probable that hybridism may have had some influence in the production of the few sports we have. Four years ago I showed an Orchid sport, namely, *Coelogyne cristata*, variegated. The *Coelogyne* is more inclined to sport than any other Orchid I know. Mr. Whitton, I recollect, had one, and another friend, Mr. Brooman White, Arrdarroch, had a variegated plant of *Odontoglossum*.

Dendrobium nobile in three different places—one of which was Redlands—produced a variation, named *D. n. Cooksonii*, after the gentleman who first showed it at a meeting of the Royal Horticultural Society.

If then, sports can be produced by hybridism, I do not see how it can be denied that it has more than anything else to do with the "Origin of Sports."

THE NEPENTHES HOUSE AT KEW.

THE highly ornamental appearance of the *Nepenthes*, apart from the fact of their interest to the botanist and the student of Nature, has given the plants a claim upon the special attention of the gardener both in the private establishment, and in the more pretentious Botanic Garden. The idea of a house specially devoted to them, which has so successfully been carried out by the authorities at Kew during the past year, has thus been an exceedingly happy one. Until recently there was no home for the *Nepenthes* in our great national garden, although the plants found fairly comfortable lodgings in stove number 9, and in the warm pits in the propagating department, the latter, of course, not being open to the general public. It is true that there were some excellent specimens of the most noteworthy species, hybrids, and varieties in "number 9," but they did not impress themselves so strongly upon the visitor as they might, and would have done, had the different members of the collection been all brought together into one place.

The new house, which was built by the Messrs. Dorey, of Brentford, lies on the eastern side of the T range, and adjoining stove "number 9," from which access is obtained to it. It is a well built and substantial span roofed erection, measuring some 75 ft. in length, by 12 ft. in width. As the principal occupants of the house are suspended from iron rods attached to the roof, there is no need for the stages with which plant houses are usually provided. Instead of the stages we find beds at the ground level enclosed with substantial stone curbing, covered with finely crushed coke, which has a neat and cleanly appearance. These beds are filled with various large stove plants, including Palms, Pandanads, *Crinum*s, and *Heliconias*. There is a 3 ft. central passage covered by iron gratings, the greater portion of the pipes being disposed in the cavity below.

The temperature for the winter months is fixed for 60° to 65° Fahr., or that of an ordinary warm stove. It was kept much hotter than this at first, but it was found that no better results were obtained by the greater degree of heat.

The house was opened to the public at the beginning of last October.

The collection is at present composed of twenty species, twenty-three garden hybrids, and three other forms, whose exact status is obscure—forty-six in all. The whole of the plants appear to be in excellent health, and the majority of them are well-pitched. Some especially handsome specimens of *N. intermedia*, *N. rafflesiana*, *N. lindleyana*, *N. morganiana*, *N. mixta*, *N. Hookerae*, *N. Curtisii*, and *N. C. superba* are very conspicuous.

As the number of garden hybrids produced by enthusiastic hybridists becomes multiplied so will the collection increase, ditto its value for purposes of reference and identification. Those who are interested in this curious class of plants will find much to engage their attention in the latest completed addition to the glass at Kew.

HINTS FOR EMIGRANTS.

FROM information supplied us by the chief clerk at the Emigrants' Information Office, 31, Broadway, Westminster, S.W., we extract the undermentioned particulars.

There is no demand for anyone in Canada at this season of the year, except for domestic servants. The routes to the new Klondike gold-fields are now closed by ice, and will not be again opened till May: explorations of the various Passes are now being made, and it is expected that the best routes will be known shortly. Persons going there should leave England not later than in March or April, but only those who are strong experienced miners or men accustomed to prospecting for minerals in wild and unsettled countries, and have at least £300 for journey and food, should think of going; all others are strongly warned against going there.

In New South Wales there is no demand for more labour, and many workmen at Sydney are unable to find employment; the number, however, of the unemployed, both at Sydney and in country districts, is now much less than it has been in previous years.

Reports from Melbourne, Ballarat, and other towns and districts in Victoria state that there is no demand for more labour; gold miners however, have been busy. The vine-growing industry—for which Victoria is admirably suited by nature—is now in a very depressed condition, owing to the low prices offered for the wine, and the general want of co-operation among the wine producers.

In South Australia there has been a remarkable revival in gold-mining during the last year or two: the total yield of gold is still small, but it was nearly four times as large in 1896 as it was in 1895. There is no demand for more mechanics or farm labourers.

Queensland has been suffering for some time past from the tick plague, which has seriously damaged the cattle industry, and from drought, which has been prevalent throughout Australia. From these causes the demand for labour has been small, but the numerous railway and other works, which are now in progress, are helping to provide labourers with work. An agricultural college has been recently established under Government at Gatton, where students may learn farming for a small fee, and other steps are being taken to promote agricultural settlement. The progress of gold mining, and other branches of the mineral industry, has been very satisfactory. In agricultural districts there is a demand for good ploughmen and farm hands. The sugar industry is in a prosperous condition, and there are excellent openings for farmers with a little capital, after they have acquired some experience of the country.

In Western Australia there is a good demand for carpenters, bricklayers, and other mechanics; a large number of public works are being carried out by the Government, which provide work for artisans, navvies, and other labourers. Saw-mill hands have been very busy in the timber districts, and some of the gold fields have been in want of experienced miners; domestic servants are much needed.

In Tasmania the important saw-milling industry of the Huon district in the south-west of the colony has greatly improved of late, and work has been brisk. A report from the mining town of Zeehan, on the west coast, states: "There is a good demand for country carpenters, and a fair one for blacksmiths; good miners can always get work."

Large numbers of persons continue to arrive in Cape Colony from England and Australia, and many find much difficulty in getting work. In the case of any local demand arising, it is readily supplied by men from Johannesburg (Transvaal) and other parts of South Africa, where the labour market is overstocked. Speaking generally, there is at the present time no demand for anyone in the Colony except thoroughly skilled mechanics; inexperienced hands will find great difficulty in getting work.

Farmers in Natal, as in other parts of South Africa, have experienced great losses from rinder

pest. There is very little demand for more labour in the Colony, and many persons at Durban have been unable to find employment.

Female emigrants are strongly warned to use the utmost caution in regard to advertisements in the United Kingdom offering them situations at high wages as domestic servants, barmaids, &c., at Johannesburg, in the Transvaal.

THE LATE MR. JAMES BROWN.

BEING now in a position to give a portrait of this well-known gardener, we now give a few more particulars concerning him. He was a native of

MR. JAMES BROWN.

Fifehire, where he was born early in the thirties, being in the 65th year of his age when he died. Mr. Brown served his apprenticeship at Grange Muir Gardens, in the same county. He commenced his career at a time when travel was less common amongst gardeners than at the present day. That, coupled with the fact that the value of his services was early recognised, prevented him from making a long sojourn as a journeyman amongst the gardens of the country; for we find that he left the gardens at Dupplin Castle, on the banks of the River Earn, near Perth, at the age of twenty-one to take up a position in the gardens of Abercairney House, Crieff, about eight miles westward. Here he remained till the day of his death, a period of forty-four years.

Needless to say, he earned the esteem of his employer, by virtue of duty faithfully fulfilled within the walls of the garden. Whether as a judge or a successful exhibitor outside the garden, he earned and enjoyed the esteem of his fellow gardeners and others with whom he came in contact. He has been regarded as a man of mark almost ever since the present generation of gardeners can remember.

He went to church on the 12th ult., when, it is believed, he caught a chill, for he complained on the next day, took to bed on the Tuesday, and died on the tenth day afterwards (22nd December). Acute pneumonia was the cause of death, being all the more regretful because it came so suddenly.

Rabbits in Australia and New Zealand.—Opinions are now divided at the Antipodes as to whether the great spread of rabbits is a blessing or otherwise, according to *The Queenslander*. In South Australia the industry of preserving and exporting rabbits has attained such dimensions, that benefit rather than harm has apparently resulted from the greatly despised and blamed bunny. The latter, it is admitted, has reduced the capability of the land for the rearing of sheep and cattle; but the number of people employed in capturing, preserving, and shipping the rodent is greater than that section of the population which has been driven off the land by the rabbits. Something like 96,000 of the latter were shipped to Britain in one day and 150,000 more remained in the stores in a frozen state. A writer hailing from Otago, New Zealand, wishes that

"rabbits were of no more value than rats and other vermin," for then the people would labour unanimously for the destruction of the pest. Whether frozen rabbits are worth 6d. or 10d. in London, the trade is and always will be a mere bagatelle compared with the loss caused to the community generally by them.

RECOLLECTIONS OF THE QUEEN'S REIGN.

AT whatever department of human affairs we take a survey of the remarkable advance made during the present reign it is most astounding; and the progress made in horticulture is well abreast of the strides made in other directions. The present reign has witnessed some of the most surprising results in the evolution of cultivated flowers and plants which have ever been attained in the world's history, and some of the results were never even dreamt of till well within the present reign. One of the most notable is the hybridisation of Orchids by which means many most beautiful and valuable additions have been made to a family of plants, upon which Nature herself has been most prodigal in her gifts of enchanting beauty. Then the fancy Pansies, full of a rich beauty peculiarly their own as we now know them, have had their rise and progress during the present reign, which, too, has witnessed the addition of a host of beautiful additions to what most of us fondly style the Queen of Flowers. Even Poppies have in a marvellous way yielded to the guiding hand of the florist, the most notable instance being the Shirley Poppies, which have under the guiding hand of the Rev. W. Wilks made the name of a small village a household word in all temperate climes.

It has seen many changes in popular taste, witnessing the rise into general popularity of gold and silver tricolor Pelargoniums, and also the gold and bronze section. When these sections were at the zenith of their fame, prices were paid for some kinds which rendered them, if divested of pots and soil, many times more valuable than their weight in gold. This may appear to some of your readers an extravagant assertion, but the writer has had ample means of verifying the statement. In the flowering sections of zonal Pelargoniums, our earliest acquaintances were Globe Compactum and Huntsman. This was before the advent of Tom Thumb. The white and pink varieties, so far as memory serves me, were unknown. The nosegays to a large extent were the creation of Donald Beaton, and the doubles came on the scene a few years later.

The present reign, too, has witnessed the rise and decline in popular favour of the Hollyhock. During the fifties, the time of its greatest popularity, many new varieties were sent out from nurseries, and found a ready sale at 10s. 6d. each. It formed quite a leading feature, both as spikes and single flowers, at Metropolitan and provincial flower shows. During the latter half of the fifties it was attacked by a disease totally unlike what is now known as the Hollyhock disease, which destroyed some of the best collections. So far as I know, that eminent florist, the late Charles Turner, found it the only foe of the kind he could not grapple with; at all events owing to its ravages he gave up the Hollyhock in despair.

The number of plants introduced during the present reign is simply legion, many possibly consigned to oblivion, and others retained, commanding universal popularity. When viewing some of the most artistic groups of plants ever set up, the thought crosses the mind, what would our forefathers have said of them; for with the limited materials at their command, similar results would have been unattainable. The art of the hybridiser has done much to enrich our stores of decorative material.

In this connection the name of the late Mr. Bause deserves a passing comment, he being the originator of the modern forms of Coleus. Weeds though some may term them, they have proved of great value as decorative plants. His name will, I think, be perpetuated in *Dieffenbachia Bausei*. I well remember being at Chiswick one day and congratulating him on his success with Coleus. The pride and satisfaction with which he showed me the seedling plant of *Dieffenbachia* was delightful. The present race of *Dracaenas* is largely the result of his labours. He was the raiser of many varieties, and his skill as a grower has never been surpassed.

Turning to flowering plants the tuberous Begonias, which seem almost a thing of yesterday, have yet

been among the most popular of flowering plants for something over twenty years. These, as we now have them, constitute one of the most triumphant successes of the reign. To the foresight and indomitable perseverance of Mr. J. Laing, senior, of Forest Hill, much of this is attributable. When he took them seriously in hand, some, who ought to have known, thought that very little, if anything, more could be accomplished, than had been. Now we have nurserymen growing them by the acre, and see them displacing to a large extent the older kinds of bedding plants; and in their varied forms they constitute one of the principal adornments of our conservatories. Many a humble cottager rejoices in the possession of a few as window plants.

Gloxinias, Streptocarpus, and Caladiums have improved by leaps and bounds. The same may be said of Cyclamens, Primulas, and Cinerarias. I have plants of the latter dating back to the early part of the reign, which to those who only know Cinerarias as they now are, would be scarcely recognisable. With respect to Dahlias I am very much of Dr. Hogg's opinion concerning the show and fancy varieties. The Cactus varieties, now so popular, are quite a recent addition; and are, many of them, for decorative purposes, far superior to the older types.

Now for the 'Mums; possibly the most popular, with the exception of the Rose, of all cultivated flowers. Their present popularity is largely due to the introduction and improvement of the Japanese section, prior to which they were losing to some extent their hold on the public. The evolution of these from the thread-like and fantastic forms, first exhibited by Mr. J. Salter, to the broad-petalled and enormous flowers we now commonly see, is one of the marvels of the age. These are destined to oust from cultivation the older Chinese varieties; for, at the present rate of progress, it will not be long before there appears among them incurved varieties as perfect in form with much larger flowers, and having the robust habit of growth which renders them easiest to manage. This will cause a sharp twinge of regret to many a lover of the older class of flowers; but the inevitable will have to be accepted with as good grace as possible.—*W. B. G.*

HURST & SON'S CLOVER AND GRASS SEED CIRCULAR.

January 1st, 1898.

WE trust our annual report upon the past Clover and Grass seed harvests may be of interest to our customers.

From personal observation and careful enquiries in all the Clover seed producing districts of our own country, we are of opinion that the total yield will be under the average. From some of the Continental countries we hear of good supplies, and America appears to have an abundance of seed to export.

ENGLISH RED CLOVER AND COWGRASS will vary more in quality and character than they usually do, and we are of opinion that the superior grades will be very scarce. The eastern counties have by far the largest crops; the southern, western, and midland counties have in the aggregate a largish acreage, but the samples from these districts that we have already seen show inferior quality, not well-ripened, and the yield per acre unusually small. Yearling, or rather two-year-old, seed, for there was only a small quantity saved in 1896, is now almost exhausted. As heretofore, we have the most favourable arrangements for purchasing English seeds on the various markets from veritable sources, and whatever we offer as "English," customers may absolutely rely upon.

SINGLE CUT COWGRASS is in small supply. We shall have as usual some well-known pedigree stocks.

FOREIGN RED CLOVER.—France and America seem to have the largest crops: from both countries offerings have already been freely made in large quantities; the States seeds are clean, but lack size. The North of France samples are the best we have seen from there for some years, large-grained, and of good character. As usual, there will be considerable quantities of the very weedy, small-grained, seed from the badly-farmed districts of the South of France. Canada has not at present placed much on the markets, and neither Germany nor Russia offer with the freedom they have done for several seasons.

WHITE CLOVER.—A fair English crop, but fine samples will be scarce. The large American supply that characterised last year's trade cannot be repeated, but the German offerings are plentiful, especially of the lower grades. The finest samples are undoubtedly scarce everywhere.

ALSIKE seems to be in much smaller compass this year. For several seasons it has been abnormally plentiful, Canada sending us heavy supplies. So far this season the offerings are on a very restricted scale, and samples lack good colour. The German crop, we hear, is an average.

TREFOIL.—A smaller crop of English than usual, and although the Continental crops are not up to an average, perhaps, the very large quantities of yearling seed still held in this country will prevent prices being high.

LUCERNE.—Short crops both in France and America.

SAINFOIN.—English Giant an under-average crop; a fair supply of English Common. French Giant is reported scarce, and of generally inferior quality.

ITALIAN RYEGRASS.—The French crop is under average, and fine Mayenne does not offer freely; the re-cleaned qualities will be very scarce towards the end of this season. Irish crop again large, and of good quality. English quite up to average.

PERENNIAL RYEGRASSES.—Not quite such large crops as for several years past, but still plentiful. The natural weight per bushel lower than last year.

NATURAL GRASSES vary as usual. Cocksfoot is in fair supply from New Zealand, but we are not getting offers from America. Timothy still plentiful. Crested Dogstail in larger supply than for several years. Meadow Fescue very fine, but not so plentiful as last year. The Poas in short supply; this applies also to Sheep's and Hard Fescue.

WHITE MUSTARD.—A fair average crop of good quality.

RAPE.—Smallest crops for some years.

SPRING TARES.—Reported below average.

WINTER TARES.—Very large supplies held over. A considerable speculation has taken place in these at the tempting prices current last autumn.

GARDENING MISCELLANY.

BEGONIA HAAGEANA.

IN the newly-erected wing of the temperate house at Kew is a grand plant of this handsome Begonia. In common with the other subjects in the house it is planted out in a prepared bed, and, like them too, has been flourishing finely. The plant in question is between 4 ft. and 5 ft. in height, is clothed right to the ground with vigorous foliage, and is carrying several large panicles of light pink flowers, its whole appearance, indeed, being one of apparently perfect health. At the other end of the garden the pot plants of *B. haageana* are looking miserable enough from the effects of the fog. Can it be possible that the mere fact of the plant being accommodated in a more natural way in a border instead of in a pot is the cause for the difference in its behaviour under the same trying conditions? Experiments carried out on a larger scale would soon prove this. Meanwhile, if the fact is an accident it is a sufficiently striking one.

SPORTING OF CHRYSANTHEMUMS.

I WAS pleased to see Dr. Masters' remarks at the close of the paper on the "Sporting of Chrysanthemums" (p. 281) read by the Rev. Geo. Henslow. Thirty years ago I used to cross Pelargoniums largely, and found it perfectly easy to produce sports in plenty; indeed, they came oftener than wanted. I notice Mr. Pockett, of Australia, is in favour of hybridism as the most likely cause of sports, and he should be, I think, one of the best authorities, as he flowers thousands of seedlings every year.—*Geo. Russell.*

ROOTS OF PLUM TREES.

LATELY I examined the roots of some Plums growing against walls, which were partially lifted during the early part of September. The long roots, which were then shortened back and re-planted in fresh soil, were healed over, and a bunch of healthy fibres emitted from each. The growth ceased when the

lifting of the roots was done, but the foliage remained and ripened off naturally. A number of Apple trees, which fruit freely every year, were making gross wood, and have been treated like the Plums, but not till the crop was gathered.—*M. T., Carron, N.B.*

HAMAMELIS ARBOREAS.

THE circular bed filled with this fine winter-flowering tree that lies close to the entrance to the Orchid houses at Kew is at the present time a very beautiful sight. The plants are sturdy, healthy specimens, every branch and twig being loaded with expanded flowers or flower buds. The flowers are very handsome and conspicuous by reason of the contrast between the bright primrose yellow petals, and the rich claret sepals. The flowers will stand a good deal of frost with impunity, and the plant, taking it altogether, is a very desirable subject for the adorning of the winter flower garden. *H. arborea*, as the specific name denotes, assumes the dimensions of a small tree, thereby being distinct from the American species, *H. virginica*. The flowers, too, are larger and finer. *H. arborea* was brought from Japan in the year 1862. It has been described in the *Botanical Magazine* under the name of *H. japonica*, but is quite distinct from that species.

PANDANUS BAPTISTII.

WITH the notable exception of *Pandanus Veitchii*, the Pandanads or Screw Pines do not bulk very largely in the ordinary collections of stove plants. The form under notice, however, is well worthy of cultivation, for it is a most handsome plant, and is without of noble and distinct appearance. The leaves are long, and arch gracefully over. They are about 2½ in. in width and very stout and leathery. The midrib is yellow and there are two or three lines of the same colour running down the whole length of the leaf by the side of the midrib so that the whole centre appears to be yellow. The margin shows a broad band of lively green. The edges of the leaves are entire and totally destitute of spines, so that there is not the difficulty in handling the plant experienced in the case of the prickly ones, such as *P. utilis*, *P. cardelabrum*, and *P. c. variegatus*. The plant is a native of New Caledonia, and like the other Pandanads needs a stove temperature. A very fine specimen is a distinguished occupant at the present time of the new *Nepenthes* house at Kew.

CHRYSANTHEMUMS FROM HELENSBURGH.

WITH the last week in the old year now gone, with its tale of work accomplished or of work left undone, into the mists of the past there came to us a box of seedling Chrysanthemums from Mr. James Bryson, Helensburgh, N.B., for our opinion. Five varieties were sent, all of them being singles. The most promising among them was one numbered 18. This is after the style of Miss Rose in build, size, and colour of bloom, but inclined to be larger. The plant, too, is evidently of vigorous growth. Not the least charm of the flowers is their strong, but by no means unpleasant smell. This variety would probably yield excellent results if grown for supplying cut flower. The other varieties were of very little value, and certainly not worth troubling more about, with the possible exception of No. 13. If this variety is a late flowerer it should be of value, although the colour, rose-magenta, is not a popular one for some reason or other. No. 16 was remarkable chiefly for the way in which the flower buds were clustered upon the tips of the shoots.

HELLEBORUS NIGER.

THE Christmas Roses have been very handsome objects in the wild garden and on the rock-work at Kew this year. The dense fogs that have visited this part of the suburbs of London have not sullied the purity of the flowers so much as they generally do. In a sheltered nook of the rock garden a batch of strong clumps of *Helleborus orientalis* is already throwing up numerous flowers buds, which if the weather hold mild for another few days will soon be fully expanded.

KNIPHOFIA PRIMULINA.

THE common *Kniphofia aloides*, or as it is variously called, *K. Uvaria*, *Tritoma Uvaria*, or *T. aloides* is a distinguished-looking plant for the outdoor garden but the species under notice, *K. primulina*, is every

whit as noticeable, although a rarity. At the present time it is flowering in the Temperate House at Kew, and amidst the generally gloomy surroundings of a foggy January day, its spikes of bright primrose-yellow flowers are conspicuous enough. The leaves are about 2 ft. long, and $\frac{3}{4}$ in. in width, with a heavy prominent midrib, and arch gracefully over. The flower scapes with the flower spikes are some 3 ft. in height. The plant in question is a stray from somewhere, nobody seems to know how or from whence it came to its present abode, but at any rate it is a vastly pretty stray. If this is normally a winter-flowering species it cannot fail to prove of great value.

APPLE DIRECTEUR RODIGAS.

A COLOURED plate of this Apple in the *Bulletin d'Arboriculture, de Floriculture, &c.*, shows it to be of medium size, with the shape of Beauty of Bath, and the rich colouring of Hoary Morning. The fruit is globular, slightly flattened, with a dark yellow ground, is heavily suffused with dark red all over, splashed and striped with crimson-red on the exposed side, and spotted elsewhere with the same hue. The flesh is white, somewhat tender, crisp, juicy, sugary, acidulated and agreeably perfumed. The quality is good, and if the fruit is not very bulky, the tree is very fertile and the fruiting regular. The tree, if left alone, takes a globular, slightly flattened form. The wood is strong and the branches numerous. The variety is a seedling obtained by selection from the culture of M. Victor Biebuyck, who strives to improve his products by selecting according to the quality of the fruit, the fertility of the tree, and its merits generally for open air culture. He expressed a desire to dedicate his Apple to M. Em. Rodigas, the director of the School of Horticulture of the State of Ghent. After tasting the fruits on February 11th, 1896, the Committee of the Cercle d'arboriculture de Belgique considered the variety deserved to be propagated.

QUESTIONS AND ANSWERS

Sowing Fern Spores.—*T. H.*:—If left to themselves the spores would naturally sow themselves as soon as ripe; but out of the thousands or perhaps millions that are sown in an ordinary fernery, very few ever germinate and fewer still grow into plants. By sowing them as soon as they are ripe you will succeed in proportion to the period that elapses before the approach of winter, in any given year. The chief or practically the only difficulty attaching to late sowing is the liability of the protballi or early stage of the plants to damp off during the dull days of early and mid-winter. Your better plan now would be to wait till the days lengthen out a bit, say towards the middle or end of next month, and then sow the spores. They would then have the whole of the growing season before them, with less danger of damping.

Butter Tree.—*A. C.*: There is nothing improbable about the story so far as you give it. Butter from a tree would simply be vegetable butter, also spoken of as vegetable fat. The Indian Butter tree is *Bassia butyracea*, from the seeds of which the white buttery substance is obtained by bruising or squeezing. Other species of *Bassia* also yield fatty matter used for making soap, for burning and other purposes.

Gas Lime and Cabbage Ground.—*W. Carr*: You may safely apply a good dressing just now without any fear of the safety of the crops that may be planted in spring arising from the use of the lime. Give a sufficiently thick dressing to show white all over the surface of the ground. Before proceeding to scatter it over the ground you should first remove all roots of the Cabbage tribe, particularly the thick nodules or tubercles which might be too large for the lime to have any effect upon the same. Take them to the rubbish heap and have them burnt when you light a fire, or bury them deeply in some out-of-the-way corner where they are not likely to be dug up for a year or more until the spores have perished.

Sowing Maize Seed.—*Western*: There is plenty of time yet, as you need not sow the seed for the next seven or eight weeks. The plants will then be sufficiently early to insure their fruiting provided you sow only early kinds which generally give most satisfaction in this country. If you sow too early you would have to repot the plants once or twice to keep them growing and prevent the roots getting pot-bound before it would be safe to plant in the open ground about the end of May. A sunny, fully exposed position is the best situation, and most likely to bring the cobs to a useful size. They cannot have too much sun beat in this country.

Grafts of Fruit Trees.—*Henry Drew*: The prunings of your fruit trees will keep perfectly well till grafting time; indeed, they will be all the better for

being cut off now to prevent them from pushing into growth before they are required in the event of the present mild weather continuing for any length of time. Take out a trench behind a north wall, where they will be cool and not exposed to sunshine. Lay in the cuttings thickly, but not so that they will form beaps, otherwise some of them may get dried up before the time arrives for using them. Cover them for more than half their length, and tread the soil firmly against them.

Aubergine and Egg Plant.—*R. Wood*: Both of these names are applied to *Solanum esculentum*, also known as *S. Melongena*. For garden purposes they may be regarded as representing two well marked groups of varieties of the plant. The name Aubergine is generally applied to the elongated and purple forms, resembling Marrows in form, but only 3 in. to 4 in. long or thereby. The fruits of the Egg plant proper are white, much smaller than those of the Aubergine, and in shape like a hen's egg. All require similar treatment in a pit or stove, at least during their earlier stages.

Names of Plants.—*A. J.*: 1, *Aspidium falcatum*; 2, *Aspidium caryotideum*; 3, *Sparmannia africana*.—*W. K.*: 1, *Oncidium pulvinatum*; 2, *Oncidium crispum*; 3, *Eucomis punctata*; 4, *Pelargonium denticulatum*.—*R. Milne*: 1, *Mentha Requeini*, not a species of *Thymus*; 2, *Nephradium molle corymbiferum*; 3, *Pteris tremula Smithii*; 4, *Tsuga canadensis*; 5, *Camellia japonica* var.; 6, *Erantbemum nervosum*; 7, *Goldfussia isophylla*.

Communications Received.—*A. D. W.*—*A. P.*—*J. R.*—*McDougall Brothers.*—*A. O.*—*Examination.*—*A. V. S.*—*E. Jackson.*—*Diosma.*—*Robert Sydenham.*—*Sutton & Sons.*—*R. H. S.*—*J. G. H.*—*G. T.*—*R. Mearns.*—*Aloe.*—*P. P.*—*S.*, *Waltbamstow.*—*Dianthus.*—*Peaches.*

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.

Notice is hereby given, that a SPECIAL GENERAL MEETING of the Members of the Gardeners' Royal Benevolent Institution will be held at "SIMPSON'S," 101, STRAND, in the County of Middlesex, on THURSDAY, the 20th day of JANUARY, 1898, at 2 50 p.m., for the purpose of electing Two Trustees to fill the vacancies caused by the death of Robert Hogg, LL.D., and the resignation of John Lee. And the FIFTY-NINTH ANNUAL GENERAL MEETING of the Members of this Institution will be held, at the same place and on the same date at 3 p.m., to receive the Report of the Committee and the Accounts of the Institution (as audited) for the year 1897; to elect Officers for the year 1898, and other affairs; and also for the purpose of placing NINETEEN Pensioners on the Funds;

Ten to be recommended to be placed on the Pension List without the trouble or expense of an Election in accordance with Rule III. 5; and nine to be elected by votes from an approved list of 44 candidates.

The Chair will be taken by HARRY J. VEITCH, Esq., Treasurer and Chairman of Committee, at THREE o'clock.

The Poll will be open at THREE FIFTEEN o'clock and close at FOUR THIRTY o'clock precisely, after which hour no Voting Papers can be received.

The Voting Papers have been issued, and any Subscriber who has not received a copy is requested to communicate with the Secretary

GEORGE J. INGRAM, 50, Parliament St., S.W.

A Special Offer to Readers of THE GARDENING WORLD 25/- BOOK for 8/-

NO HOME SHOULD BE WITHOUT ONE.

Ogilvie's Encyclopædia OF USEFUL INFORMATION AND WORLD'S ATLAS.

No Single Book ever before contained such a Wealth of Knowledge.

By Special Arrangement with the Publishers of the "Encyclopædia of Useful Information and Atlas of the World," we are enabled to offer to the Public a Magnificent 25s. Volume for 16 of the coupons, which will appear weekly, together with 6d. each, accepted in Weekly Instalments, or the Coupons may be held until the whole period has elapsed and brought or sent to the Office with 8s., and 6d. towards carriage.

A COMPLETE ILLUSTRATED LIBRARY IN ITSELF.

A universal assistant and treasure-house of information on every conceivable subject, from the household to the manufactory. In short, gives information about everything, is absolutely indispensable to everyone in all walks of life; the contents being so separated, indexed, and arranged that they can be turned to at once. It is

THE BEST { BOOK OF } EVER { INFORMATION } ISSUED. Size of Encyclopædia: 9 by 11½ inches. 656 Pages.

It contains

MANY MAGNIFICENTLY ENGRAVED COLOURED MAPS,

and a description of every country under the sun, besides much other matter relative to the Home, the Farm, the Factory, a Dictionary of Statistics—many Useful Tables, Poetical Selections, Synonyms, Famous Bridges and Ships, How to Calculate, How to Cook, How to Get Rich, How to Cure all Diseases, How to Succeed in Business, Table of Weights and Measures, and

HUNDREDS OF OTHER TOPICS OF GREAT VALUE TO EVERY PERSON

who desires to be up to the times. To see the Book is to want it. To Members of Mutual Improvement Societies it will prove of inestimable value.

The articles are written by men whose lives have been devoted to the subjects treated, are short and concise, but contain full information up to date. It is to be consulted on every subject that arises in everyday life, by old and young alike. It contains a complete Illustrated Atlas of the World.

IN THESE DAYS OF COMPETITION

it is imperative that a Gardener should be a well-informed individual. Here is an Encyclopædia containing an immense amount of knowledge that will be of the greatest service to him.

YOUNG GARDENERS,

do you wish to be successful? Then remember that to possess knowledge is the surest way to achieve success.

It is elegantly bound in Morocco Cloth, with beautifully designed Gilt Side-stamp and Red Edges, making at once the most handsome and durable as well as THE MOST USEFUL BOOK EVER MADE or sold for 25s.

8198. COUPON.

Ogilvie's Encyclopædia of Useful Information, AND WORLD'S ATLAS, (Published Price 25s.) 16 COUPONS, AND 6d. WITH EACH.

WEBBS'

NEW

CUCUMBER, "BOUNTIFUL."

THE BEST FOR EXHIBITION

1/6 & 2/6 per packet, post-free.

A splendid new variety for either exhibition purposes or ordinary cultivation. The fruit grows to about 24 inches in length, is straight, smooth, and of deep green colour, very handsome in appearance, and of first rate quality.

From Mr. C. BROCK, Gardener to C. D. Batt, Esq., Witney.

"Your Bountiful Cucumber is the best I have ever grown for all-round work; it is very handsome in shape, length 18 to 22 inches, and excellent for exhibition purposes."

Webbs Spring Catalogue, post-free, 1s.

WORDSLEY, STOURBRIDGE.

BEGONIAS A SPECIALITY.

Seed saved from prize plants. Choicest mixed, single or double varieties, 1s., 2s. 6d., and 5s. per packet; collections (seed) single, 12 named varieties, separate, 9s. 6d.; 6 ditto, 3s. Tubers, named singles, from 18s. to 50s. per doz.; choicest seedlings, 3s. to 30s. per doz.; bedding, choicest, 3s. to 9s. per doz.; choicest named doubles, from 18s. per doz.; choicest seedlings, 6s. to 30s. per doz.; choicest mixed, for bedding, 9s. to 18s. per doz. BARR'S SEED GUIDE

FOR 1898

IS NOW READY,

And will be Forwarded Free on Application.

Barr's Seed Guide for 1898 contains a Select List of the best Vegetable Seeds and most beautiful Flower Seeds. It is full of Practical Hints, and will be found invaluable to Gardeners, Amateurs and Exhibitors. *Sent free on application.*

Barr's 21s. Collection of the Best Vegetable Seeds contains 14 Pints of Peas (best successional sorts), 6 Pints of Beans (Broad, French, and Runners), and a liberal Assortment of other Vegetable Seeds, for One Year's supply. *For full particulars see Barr's Seed Guide, free on application.*

Barr's 10s. 6d. Collection of Choice Flower Seeds contains a liberal selection of the most beautiful Annuals and Perennials. Full particulars in **Barr's Seed Guide**, in which will also be found many sterling Novelties for 1898.

All Seeds sent Carriage Paid on receipt of remittance.

BARR & SONS,

12 & 13 KING ST., COVENT GARDEN, LONDON.

Nurseries:—LONG DITTON, SURREY.

(Surbiton Station, S.W. Railway).

SEED LIST

(Free on Application).

FEATURES:—

Alphabetically arranged.

Best sorts, in heavy type, can be seen at a glance.

Probably the most explicit practical instructions for cultivation ever published in any Catalogue.

Many hints and recipes for cooking and serving the various vegetables.

Directions for the storing and forcing of vegetables

Medical qualities of many vegetables and herbs.

Prizes of £5, £3, (two of) £2, and £1 offered for photographs of horticultural subjects (see page 2 of Catalogue).

THE LIST, containing 93 pages and a profusion of illustrations, shows (a) WHAT TO GROW, () HOW TO GROW IT, and (c) WHAT TO DO WITH IT WHEN GROWN, and has been described by an Agent as one of the largest estates in England as a BOOK OF REFERENCE.

Another Customer, testifying as to quality writes:—"I should like to add that all the Seeds, &c., purchased from your establishment during the past 14 years have been of the very best quality, and have given great satisfaction."

(by Parcel Post—it is so large).

CONTENTS—The Best Seeds and Potatoes for Garden and Farm; also Descriptive Lists of Carnations, Chrysanthemums, Dahlias, Fuchsias, Gladioli, Herbaceous Plants, Pansies, Pelargoniums, Pentstemons, Phloxes, Pinks, Pyrethrums, Roses, and Violets; with full Cultural Directions for each.

PRESS & OTHER OPINIONS OF THE BOOK.

WEST HUMBERSTONE.—"Your Catalogue and Guide safe to hand. I am very pleased with it, and I am sure every every Amateur, in particular, should have one in his possession, as they are worth 100 times their cost."—T.H.

Leeds Mercury.—"For a useful selection of vegetables and flowers, and a trustworthy guide in the culture of these, it is vastly ahead of ordinary catalogues."

AREBROATH.—"Very many thanks for your valuable Catalogue and Guide. As an Amateur, I find cultural instructions of immense value."—D.A.

Bell's Weekly Messenger.—"Contains elaborate and complete articles on cultivation for exhibition as well as ordinary purposes. It is thus far more than a mere catalogue—quite an encyclopædia of farm and garden plants."

YARM.—"Thanks very much for your Catalogue of 1897. In looking through it, I find it is even better than last year's, which I thought could not be surpassed."—W.C., Gardener to Sir T. Richardson, M.P.

SEED GROWERS AND FLORISTS TO THE QUEEN

ROTHESAY.

"Gardening is the prnest of hman pleasnres, and the greatest refreshment to the spirit of man."—BACON.

The Gardening World.

Edited by J. FRASER, F.L.S.

SATURDAY, JANUARY 15th, 1898.

NEXT WEEK'S ENGAGEMENTS.

TUESDAY, January 18th.—Sale of Anemones, Azaleas, Palms, Carnations and Cannas by Messrs Protheroe and Morris.

WEDNESDAY, January 19th.—Sale of Japanese Lillies, Stove and Greenhouse Plants by Messrs. Protheroe and Morris.

THURSDAY, January 20th.—Sale of Hardy Plants by Messrs. Protheroe and Morris.

FRIDAY, January 21st.—Sale of Imported and Established Orchids by Messrs. Protheroe and Morris.

QUALITY IN SWEET PEAS.—To many cultivators the classification of Sweet Peas according to the shape of the standard may seem arbitrary and a matter for convenience, or a thing to be ignored altogether. Those, however, who once for all give the subject sufficient consideration to clearly distinguish the differences are almost bound to come to the conclusion that there is something in it after all. It may be a matter of opinion or taste as to which class or type is the most ornamental, but that does not alter the fact that classification furnishes the cultivator with definite lines upon which to gratify his particular taste in the selection of varieties. Many growers and admirers, but particularly fanciers, will admire anything in the shape of a Sweet Pea for a time at least; but unfortunately the deformities that arise amongst them are as likely to be lauded as

those that are really beautiful. Admirers of Orchids, for instance, are satisfied with anything for a few years after taking them up as a hobby, but sooner or later they begin to recognise in what direction true beauty and quality lies, and follow them up according to the means at their command. So it must be with Sweet Peas. The idea of classifying Sweet Peas by the form of the standard was first suggested by the Rev. W. T. Hutchins, the Sweet Pea specialist of the United States, and as his arrangement is very closely identical with that of the leading growers in this country, his classification may be adopted until a better is devised. Form has precedence in this arrangement, while colour may be taken as a second basis for division.

The old form of the standard was erect, but flat, wedge-shaped at the base and of small size. This would correspond to the first group. The second group includes those that have the standard reflexed at the sides and wedge-shaped at the base. The third type has an erect and rounded standard of large size, expanded, and truncate or even auricled at the base owing to the great development of the organ there. This is undoubtedly a vast improvement upon either of the two preceding types. The fourth group would include all those having a hooded standard of large size, with auricles at the base. This also is a highly evolved form, and there are doubtless many who would give preference to either one or the other of groups three and four. In this country we know that some prefer the third group in which the standard is flat or nearly so. We consider that both forms are very beautiful notwithstanding differences of taste, and that they might be encouraged for the sake of the variety they afford in representative collections, or those having any pretensions to being so. Much divergence of opinion also exists as to whether the notched or rounded standard is the better form to adopt; but the fact remains that we have fine varieties in both divisions. Then again, Sweet Peas are not yet so firmly fixed as to prevent variation or degeneration. No flower, perhaps, is more influenced with variations in temperature and the state of the air as to moisture. A few days of sunless or comparatively sunless weather, with a soft moist atmosphere causes the flowers of Sweet Peas to spread open to their fullest extent; while an arid atmosphere will soon cause them to become more hooded than they would otherwise be. The duration of the flowers as well as their quality are greatly affected by an arid atmosphere; and other signs of degeneracy are evident when the plants are becoming played out by drought and age. The standard often becomes notched at the apex even in those varieties which are reputed to be rounded. A greater disfigurement is seen in those that develop a saddle-shaped standard owing to the same causes, coupled, it may be, with a dry and poor soil. The side shoots produced as a result of second growth likewise show more or less of these defects. Cultivation can come to the rescue, and under skilled and attentive growers, ensure success where even the best varieties might otherwise result in failure. The same thing happens with the garden Pea with which expert growers are able to cope even in dry soils and seasons. Fresh ground should be secured where possible every year, but in every case the soil should be properly prepared according as it may be heavy or light, and manured accordingly. In light soils the surface should be undulated in such a fashion that surface moisture may run into furrows where the roots of the Peas are situated, and after sowing it should also be trodden. Early sowing is also a matter of vital importance with Sweet Peas, be-

cause they thereby get firmly established before prolonged drought makes its presence felt. All these precautions are necessary to insure the quality of the flowers independently of the intrinsic merit of the variety itself; and gardeners should attend to these matters at present while the ground is being prepared for the reception of the seeds later on. A fertile soil well supplied with the requisite degree of moisture affects not only the form of the flower, but also the colour, which often varies to a degree which recalls the mutability of the Chrysanthemum. In the absence of any classification of Sweet Peas according to form, the cultivator would do well to make a classification of all that he grows and flowers, for his own guidance in succeeding years, putting new varieties to the same test as they come out.

BRITISH HYBRID PRIMULAS.—There are three very distinct forms of *Primula* in Britain over which there has been much discussion as to whether they should be regarded as distinct species or varieties of one. They are easily distinguishable by anyone gifted with the faculty of observation and the power to distinguish between one flower and another. This of course applies to the normal or typical form of each, but so many intermediate stages have been discovered between *Primula vulgaris* (the Primrose), *P. veris* (the Cowslip), and *P. elatior* (the Oxlip) that many admittedly good botanists have classed them as varieties or forms of one species. Other good authorities affirm that all three are specifically distinct, and that the intermediate forms are truly of hybrid origin. Amongst these we note that Miller Christy, Esq., F.L.S., takes his stand. In the *Journal of the Linnean Society Vol. XXXIII., No. 299*, he gives a very elaborate and excellent paper on the distribution of "*Primula elatior* in Britain," in which he discusses the relationships of the three types above mentioned. The synonymy of the botanical names is very confusing even to the best informed; but as in the case of *Abies*, *Picea* and *Pinus*, the best plan is to fall back upon the popular or English names, which most people can understand and follow.

The chief or only difficulty with the common names is that a few cultivators may still be liable to confuse the true or "Bardfield" Oxlip with the common, spurious or Hybrid Oxlip, which may occur in a state of nature as well as in cultivation. We think it a good plan to speak of the Hybrid Oxlip as the Polyanthus, for it is a yellow form that is hardly, if at all, distinguishable from garden forms of Polyanthus of the same colour. The Primrose has a flat or expanded lamina with raised corrugations or wrinkles round the eye. The wild Cowslip differs by having smaller, nodding, cup-shaped flowers elevated on a common stalk. The true Oxlip has flowers that are open in the throat, that is, without wrinkles, and elevated on a common footstalk. The Polyanthus agrees most closely with the Primrose, and differs chiefly by having its umbels of blossom supported by an elongated or common footstalk. There are other minor differences in the foliage, the leaves of the Primrose tapering more regularly to the base than in the case of the Cowslip and Oxlip.

All the three species are shown by Mr. Christy to form hybrid unions, the one with the other two, as well as reverse crosses, producing perplexing intermediate forms, which he regards, nevertheless, as true hybrids. Occasionally the Primrose produces an elongated peduncle elevating the umbel of flowers; but he is somewhat doubtful whether this should be regarded as a hybrid or otherwise. The Primrose is

the most widely distributed species in Britain. The Cowslip, although nearly as widely disseminated, is more restricted in its habitats, being partial to open meadows. The true Oxlip is confined in Britain to two districts, namely, that lying between Bishop's Stortford in Hertford, running through Essex to Stowmarket in Suffolk; and a small district in Cambridge. It is also found at two points further north, one in Suffolk and the other in Norfolk.

Mr William Johnson, who entered Kew in April 1896, has been appointed acting curator for six months at the Botanical Station, Aburi, Gold Coast, as *locum tenens* for Mr. Charles Humphries, who is to be released for a six months' holiday.

Greenwich Park.—Fifteen acres of land, hitherto attached to the Ranger's Lodge at Greenwich Park, have been added to the latter, and laid open to the public. This is another of the many acts of the Queen to commemorate the past year.

Hard on Dame Nature.—According to *American Gardening*, "nature will have to bustle if she is to keep up with the modern horticulturist." In view of the recently discovered existence of the "perfectly green Rose" and the "Rose as big as a cartwheel" this is not inapt.

The Old Kew Palace.—It was announced on Tuesday last that the Queen had graciously consented to throw open the old Kew Palace as a public museum. The grounds surrounding Queen Anne's Cottage at the far end of Kew Gardens from the main entrance are also to be thrown open to the public. Every corner of the extensive gardens will now be a free promenade to the public, with the exception of the nurseries and the reserve ground in which the private pits, glasshouses, and offices are situated, to which no one could reasonably expect admittance except on business. The Queen has been pleased to do this by way of commemorating the Diamond Jubilee year that has just closed, and her subjects cannot be otherwise than highly gratified.

Lewes Chrysanthemum Society.—The annual meeting of the Lewes and District Chrysanthemum Society took place at the King's Head, Southover, Lewes, on the 4th inst., when there was a capital attendance. Mr. Adames read the report for the past year, which, subject to an amendment as to thanks to the special prize donors, was accepted. The balance sheet showed a deficit on the year's working of £5 17s., but the society had a balance of £38 1s. 3d. at the bank to meet it. Passing to the election of officers the whole of the staff was reinstated, with the addition of the Mayor (Councillor Gates) as vice-president. A hearty vote of thanks was accorded to Mr. Adames for his services, and to the other officers. A special meeting to arrange the schedule for 1898 was fixed for the 19th inst. Mr. Shrivell's offer of a lecture on March 2nd was unanimously accepted.

Chiswick Gardeners' Mutual Improvement Association.—There was a good attendance of the craft at the meeting of this society on the 6th inst., to hear an address delivered by Mr. Alexander Dean, of Kingston-on-Thames, on "Edible Stem Vegetables." This designation he applied to such subjects as Seakale, Celery, Rhubarb, and Asparagus, the leaf-stalks of which are blanched in the case of Celery, while those of Seakale and Rhubarb are both forced and blanched. He is one of the lecturers employed by the Surrey County Council, and he explained that he was in the habit of grouping those vegetables that required somewhat similar treatment. Mr. Dean illustrated his remarks with some excellent diagrams showing how to proceed and what to avoid in the propagation and raising of those vegetables from seeds or cuttings of the roots or rootstock, according to the kind under consideration. His address led up to a lively discussion afterwards, but the allotted time was too short for all those who were desirous of speaking to take part in the same. The lecturer was accorded a hearty vote of thanks at the close of the discussion.

The Lost Kew Pelicans have been replaced by two others, now in the pond by the Palmhouse or its immediate vicinity, so that visitors are again comforted.

Mr. Harry Danney, one of the under-gardeners to the Duke of Bedford, at Woburn Abbey, recently committed suicide by hanging himself in a storeroom near his bedroom. He suffered acutely from indigestion.

Death of M. Jean Linden.—As we were going to press on Wednesday last we were grieved to hear of the death of M. Jean Linden, the deputy administrator of "L'Horticulture Internationale," Société Anonyme, Parc Leopold, Brussels, who died peacefully that morning. He was widely known throughout the civilised world for his connection with Orchids.

The Crystal Palace.—There is still some doubt as to the ultimate fate of this huge glass structure; and the *Daily Chronicle* would like to see it bought out and given to the public as a national place of recreation for ever. With this object in view our energetic contemporary some time ago issued some questions to several London and suburban corporate bodies in order to obtain a plebiscite. The questions were (1) "Do you favour the purchase of the Crystal Palace by public authorities as a public pleasure ground and a place for recreation?" (2) "Would you support a contribution from the body with which you are connected?" To these questions there were only 62 definite noes. Many replied "yes" to the first question, but "no" to the second, thus showing how far their sympathy went. From Hackney came 28 ayes, and 3 noes; Islington, 23 ayes, 1 no; Kensington, 18 ayes, 8 noes; Shoreditch, 23 ayes, 3 noes; St. Pancras, 21 ayes, 1 no; Marylebone, 15 ayes, 7 noes; Fulham, 19 ayes, 4 noes; St. George's, Hanover Square, 11 ayes, 4 noes; Westminster, 10 ayes, 3 noes; Hampstead, 11 ayes, 5 noes; Stoke Newington, 9 ayes, 3 noes; Paddington, 11 ayes; St. Luke's, 9 ayes, 2 noes; and Mile End, 11 ayes, 3 noes. Many gave affirmative replies with qualifications, the most notable of which was that if the Crystal Palace were purchased for South London, the Alexandra Palace should be given in the same way to North London.

Dinner and Presentation at Cheltenham.—On Friday the 7th inst. about seventy of the employees of Mr. James Cypher, of the Queen's Road Nurseries, Cheltenham, were entertained by him to a sumptuous dinner, prepared on the premises and served in one of the glasshouses, which had been transformed into a temporary dining room. Mr. Cypher presided and was supported by Mrs. and Miss Cypher, Mr. W. J. Cypher (vice-chairman), Mr. and Mrs. John Cypher, Mr. and Mrs. Frank Cypher, Messrs. Aston, Keylock, Weaving, Cull, and others. The dinner was partly meant to celebrate Mr. Cypher's seventieth birthday, and the post-prandial speeches and proceedings testified to the good feeling existing between employer and employed. After the usual loyal toasts, "the Firm" was proposed and received with much enthusiasm. "The Healths" of Mr. Keylock, representing the indoor department, and of Mr. Wallace in a similar capacity in the outdoor department, were heartily received in connection with two presentations that were made. Mrs. Cypher was made the recipient of a silver-plated cheese-dish and cover, bearing the inscription, "Presented to Mrs. J. Cypher by the indoor staff of the nursery, January 7th, 1898." Miss Cypher received a massive pair of alabaster vases accompanied by a card bearing the inscription, "Presented to Miss Cypher as a mark of respect by the outside staff, January 7th, 1898." The presentations were made by Mr. W. J. Cypher on behalf of the men. He considered it an appropriate time at which to make the presentation to Mrs. Cypher, at whose hands, as well as from Mr. Cypher they had received many acts of kindness; and he had great pleasure in handing her the token of respect from the staff. Miss Cypher was similarly addressed amidst the cheers of the employees. Mr. Cypher responded for both. He also reminded his audience of the present of an easy chair he had received from them some time previously, which he greatly appreciated. Vocal and instrumental music enlivened the proceedings, and a very enjoyable evening was spent.

White and Pink Clover Blossoms, when chopped up finely and served with pure cream, are reputed to furnish a delicious salad.

Erratum.—At p. 294 in the forty-third line from the top of the third column, for "Hypericum perforatum" read "Hypericum calycinum." This may be described as merely a *lapsus pennae*.

Orchids at the Sale Rooms.—The sale of *Odontoglossum crispum* at the Sale Rooms of Messrs. Protheroe and Morris, Cheapside, on the 7th inst. was the largest and most successful that has taken place for a long time. The importation was extensive, and the pseudobulbs were in excellent condition. There was a large attendance of keen buyers, and the sale was calculated to realise somewhere between £1,000 and £2,000. A grand piece realised £2 15s.; while another brought £2 10s. From 20s. to 25s. were common prices. The rank and file of pieces of moderate size averaged about 10s. each. The importation came from a good district for this species, so that buyers entertain hopes of many fine varieties when the plants come into bloom. An established price of *O. crispum roseum* was secured for 30 gs.; and another brought 9gs. A fine variety of *Laelia anceps* realised £7 10s. at the fall of the hammer. It was something in the way of *L. a. hardyana*. There was some keen bidding for semi-established plants of *Cattleya dowiana aurea*, which had made one growth since they were imported. The general run was £1 per plant, but a unique specimen fetched 18gs., the buyer being glad to get it at the price.

Devon and Exeter Gardeners' Association.—The annual supper of this society took place in the Castle Hotel, Exeter, on Friday the 7th inst. Mr. W. Chorley, of Wonford House, presided, and the vice-chair was taken by C. H. Clark, Esq., one of the honorary members. After an excellent and well-served repast the chairman called upon Mr. A. Hope to read a telegram of apology from Mr. Crahbe who was unable to preside, being detained in Cornwall. A number of letters were read explaining the absence of other members. Henry Hill, Esq., of Pinhoe, sent some dishes of Apples for the company. The loyal toast was received by singing the National Anthem. Mr. Andrew Hope, in proposing the "President and Vice-president," said he was glad to see some who were present at their first meeting. Mr. Roberts, who was then the hon. secretary of the Horticultural Society, was the first president they elected, and the selection was a good one. The speaker believed that the key of the success of the society was due to the officers having been selected on account of their interest in horticulture, and their acquaintance with the same. Mr. E. A. Sanders, their president, was the only one that had been re-elected, and this was due to his keen interest in the affairs of the society throughout its existence. Mr. Sanders had also been an active president in all weathers, notwithstanding his multifarious duties in the city. Among their vice-presidents were many men of distinction in the horticultural world, including Dr. Dangar, Mr. Baker, Mr. Cann, Mr. P. C. M. Veitch, Mr. Snow, and others. Their patrons, though not included in the toast, still showed much interest in the society, including Mr. Lethbridge, of Courtlands; the Right Hon. Sir John Kennaway, Sir John Shelley, Col. Halford Thompson, and others, all of whom had shown kindness with their annual excursions and in other ways. The toast was warmly received, and Mr. James Weeks and Mr. Rogers responded. The chairman next proposed "The Association and its Work," referring to the aims of the society, which were in the best interests of horticulture. The work they had done was recognised by authorities outside the county. The papers read at their meetings were of a valuable character, having been in many cases prepared by experts. Mr. Wallace Mackay, the hon. treasurer, responded. Mr. W. P. Parkhouse also replied, saying that he had derived much benefit from his connection with the society. Mr. Berry, the lecturer for the Devon County Council, wished the society every success. The vice-chairman proposed "The Committee," and Mr. W. Rowland and Mr. W. R. Baker responded. Other toasts proposed were "The Press," "The Chairman," "Mr. A. Hope" (the hon. secretary), "Mr. W. Mackay" (the hon. treasurer), the "Vice-chairman," and "The Host and Hostess." Songs and other entertainments beguiled the intervals during the evening.

Gardeners' Royal Benevolent Institution.—The Duke of Portland has fixed Wednesday, June 8th, for the 50th anniversary festival dinner in aid of the funds of the Gardeners' Royal Benevolent Institution, at the Hotel Metropole. We are pleased indeed to learn that so busy a man has been able to fix a date for this important function.

Wenn, Gardener, Petersham. — A respectably dressed young man was recovered from the pond surrounding the Diana fountain, Busby Park, Hampton Court, the other week. The overcoat and hat of the deceased were picked up on the bank near where the body was recovered, and the above name and address were found on a card inside the hat.

Woolton Gardeners' Mutual Improvement Society.—On Thursday of last week a capital lecture was delivered by Mr. R. Pinnington, of Rohy, on "Herbaceous Plants" under the presidency of Mr. J. Jellicoe. The lecture proved an admirable one, the lecturer laying down lines that must prove satisfactory if followed. The arrangement suggested was a wide border with a system carefully worked out as regards colour and season, introducing many of our spring hulks, to form carpeting for the loftier specimens of later flowering plants, so that heauty could be found nearly all the year round, in broken groups and patches, ignoring the old straight lines. Details of preparation and general culture were given, which should be a liberal one, and free use of manure water was also recommended to secure the best results. Tying received special notice, the practice of hunching being strongly objected to. He advised his hearers that stakes, or in some cases a small number of stakes, should be given so that the flowers or spikes were not crowded in bunches. Messrs. T. Carling, R. Todd, G. Haigh, and the chairman took part in the discussion, after which a vote of thanks was tendered to Mr. Jellicoe and Mr. Pinnington for their valuable help.

Messrs. Barr & Sons' Catalogue.—This growing annual is a great improvement on that of last year, and it is evident that the Messrs. Barr are sparing no efforts to make this a useful seed guide to amateurs and professionals alike. The catalogue makes no pretensions at showiness, but is replete with everything that can be required in the best of gardens. They have made a select list of what they believe to be the finest vegetables in cultivation, according to their own experiments and observations as well as those of other cultivators and experts. Those who require dwarf and early varieties of Maize suitable for cultivation in this country will find some of the most suitable recorded here. That the more generally grown and useful vegetables should have received their best attention goes without saying. Moreover, this is not merely a bald list of names, but page after page is packed with descriptive and cultural information that cannot fail to be useful for whomsoever intended. Flower seeds have had an equal share of attention, and a full descriptive list of the most decorative kinds given. On p. 24 are notes intended to help the amateur and beginner to sow and rear hardy and half-hardy annuals, greenhouse annuals, hardy perennials, and biennials. Four pages of photographic illustrations have been added, besides others.

FLOWERING SHRUBS THAT THRIVE UNDER TREES.

MR. MAYNE, on p. 294, mentions, amongst others, *Hypericum perforatum* as being a thriving and suitable subject. Does he not mean *H. calycinum*, said to be the Rose of Sharon? (Yes. ED.). The latter is a dwarfer plant having larger leaves and flowers than *H. perforatum*, which grows wild in abundance in many places, the margins of rivers and streams in this neighbourhood being gay with it in summertime. Although the leaves and flowers are much smaller the plant itself grows taller than *H. calycinum*. It has a large corymbose inflorescence and is rather a weedy-looking plant for gardens. If the small leaves are held up to the light the small dark dots can easily be seen, which characteristic suggests the name *perforatum*. Plants of the latter have for several years flourished on the top of a wall in this garden. Old-fashioned people, I believe, use *St.*

John's Wort to make an ointment for cuts, etc.; formerly it was held in great repute by housewives. A description from an old herbal may be interesting if only to illustrate the advance of descriptive botany.

DESCRIPTION.—Common St. John's Wort shooteth forth brownish, upright, hard, round stalks, 2 ft. high, spreading branches from the sides up to the tops of them, with two small leaves set one against another at every place, which are of a deep green colour, somewhat like the leaves of the lesser Centaury, but narrow, and full of small holes in every leaf, which cannot be so well perceived as when they are held up to the light; at the top of the stalks and branches stand yellow flowers of five leaves apiece, with many yellow threads in the middle, which being bruised do yield a reddish juice like blood; after which come small round beads, wherein is contained small blackish seed, smelling like rosin. The root is hard and woody with divers strings and fibres at it of a brownish colour which abideth in the ground many years, shooting anew every spring. This groweth in woods and copses, as well those that are shady, as open to the sun.

GOVERNMENT AND VIRTUES.—It is under the celestial sign Leo, and the dominion of the Sun. It is a singular wound herb; boiled in wine and drank, it healeth inward hurts or bruises. The decoction of the herb and flowers, especially of the seed, being drank in wine with the juice of knotgrass, helpeth all manner of vomiting and spitting of blood, is good for those that are litten or stung by any venomous creature, and for those that cannot make water."

I may add that the herbal from which this was culled has been described by an eminent living botanist as a mixture of botanical knowledge with astrological folly.—A. P.

PEOPLE I HAVE MET.

MR. ROBERT SYDENHAM.

"SECOND return Palace, please!" I thought I knew that voice, and turning round, recognised at my elbow the beaming features of my friend Mr. Sydenham. The scene was early morning in the booking-office at Ludgate Hill Station; a crowd of ardent enthusiasts seeking tickets for the great Palace fruit show.

"Travelled 'up from Birmingham this morning, Mr. Sydenham?" I asked, knowing that, when once on the road, our friend from the Midlands has a reputation for getting over a lot of ground in a very little time, often doing in a day what many would think hard work for two.

"Well, no," said he; "but I have had a lot to do since I arrived in town yesterday; you see I have lots of horticultural friends in this part of the country, as, indeed, I have in every part of the British Isles, who, like myself, make a study of special branches of horticulture, and whose collections I like to see when I am up this way. I never make it a trouble to be up early or late if I have an opportunity of seeing them, often starting at 5 or 6 in the morning and going on till 10 or 11 p.m."

"Well you have certainly made an earnest study of the possibilities of horticulture, Mr. Sydenham"

"Yes," said he; "and I don't know another pursuit or hobby, call it what you will, out of which a man of business life can get the same amount of true recreation; it is a pursuit which opens up boundless possibilities, so to speak, and at the same time yields a solid satisfaction in the possession of a garden bright with flowers of every hue."

As the train sped along, Mr. Sydenham's views on the practicability of suburban gardens was an insight into his thoroughly genuine and earnest character. "Years ago," said he, "I was struck with the hindrance to garden developments so far as the small grower at home was concerned, by reason of the high price of bulbs and small seeds; and I set to work to find out why they should be so. That indeed first gave me the idea of distributing bulbs and so forth in a sort of private way, without any notion that one day a business of very considerable magnitude would grow up around me. As you know, my business in our wholesale jewellery firm demands a vast amount of personal time and attention, and it has only been my spare hours that I have really been able to devote to the study of bulbs and seeds. But I have made it a study, and, my friends are pleased to tell me, with a certain amount of success. Anyhow, I have made it possible for the amateur

who desires the *best things* to grow to get them in a way that shall be within his reach."

"You must have an army of correspondents, Mr. Sydenham" I remarked, recollecting the piles of letters I had seen in process of being dealt with at the Tenby Street headquarters of the Messrs. Sydenham.

MR. ROBERT SYDENHAM.

My fellow traveller assented; said he, "why, in our seed and bulb correspondence we probably deal with as many letters a day as many a similar business would do in a week; and it is a matter of gratification to me that in addition to supplying my friends with bulbs and seeds—you know we have added seeds now—I can often give them information and cultural hints which will help them. Such an army of recruits to the love of horticulture has been the outcome of my system that I am convinced, from the evidence before me every day, that very many amateur enthusiasts to-day only date back their interest to the time when they first read my publications."

"Then it follows, Mr. Sydenham, that the trade at large is indebted to you as a pioneer in this matter."

"Yes, I think that may be the feeling now; but I fancy that at the start my practical methods were thought a trifle revolutionary and at first, too, some ill-feeling found expression, that I as a confessed amateur, with the frankness to admit that much, should be able to accomplish that which the trade as a whole had failed to do or indeed to realise. They believe now, I think, that any harm I may have done in one way is more than counterbalanced by the good I have done in another."

We had by this time reached our destination at the High Level station, Crystal Palace, and Mr Sydenham was off, with a cheery good morning, and that vice-like grip of the hand, peculiarly his own, as of to emphasise all that he has told you.

A man of middle life, Mr. Sydenham is an instance of well-developed energy and enterprise. Few probably would have had the inclination, or indeed, the perseverance, to take up and supervise a business outside his own calling, which, for absolute command of detail, and the exercise of keenly directed judgment, stamps the man who engages in it successfully, as one above the ordinary run of mortals. All this is the rightful due and tribute of Mr. Robert Sydenham.

Recalling a visit I made to Birmingham in August I was struck with the enthusiasm and *esprit de corps* he imparts to the Carnation and Picotee Society's shows. An excellent judge of these flowers himself, and one of the most successful exhibitors the last three years, he has the ability to instil into others a little of that enthusiasm with which he is so replete; whilst a visit to the immense wholesale jewellery warehouse, with its strong rooms and safes, stored with gems and precious stones on one floor, and a complete and perfect seed and bulb warehouse and offices on another floor, with rooms, 67 ft. long—impresses one anew, and proclaim the man again a master of

detail, a guiding spirit in all that he undertakes, with a masterful method of accomplishing anything upon which he sets his heart. Ten years ago Mr. R. Sydenham could not have told us the name of any flowers or bulbs, whereas now, there are few, if any, who could name more bulbs correctly than he can when in flower, or name the Hyacinth bulbs in their dry state.—Gyp.

ORCHID NOTES & GLEANINGS.

BY THE EDITOR.

Odontoglossum crispum guttatum pittianum. *Nov. var.*—This magnificent variety is now flowering with H. T. Pitt, Esq., Rosslyn, Stamford Hill, London, after whom it is named. The original *O. c. guttatum* is nowhere by comparison with the variety under notice, and the owner may justly feel proud of it. The flower is of average size and a very fine round form, the petals overlapping the sepals considerably. The ground colour is pure white, thus bringing into great prominence the group of large chestnut-red blotches on the centre of the sepals. The petals are also similarly adorned with a group of smaller blotches. The white lip has a large, nearly heart-shaped, chestnut-red blotch in front of the crest, and several small ones on either side of the crest. The possessor of it secured it last year as a very small piece at the sale rooms of Messrs. Protheroe and Morris, Cheapside. Since then it has more than doubled in size, and now carries nine of these beautiful flowers on a spike. Mr. Pitt intended to exhibit the plant at the meeting of the Royal Horticultural Society on Tuesday last, but the morning was frosty.

Cypripedium W. H. Cannon, *Nov. hybr.*—This bold flowered and handsome hybrid was obtained from *C. nitens superbum* with the pollen of *C. insigne Chantini*. The dorsal sepal is white, with a pale green base, heavily blotched with dark purple for two-thirds of its length; the upper portion is white, and marbled with purple along both sides. The petals are of a rich brown, edged with yellow. The lip is also of a shining dark brown, the mouth of the pouch being bordered with old gold. The rich spotting is easily accounted for, seeing that both parents are characterised by the abundance and prominence of their markings. It is now in the possession of William Handel Cannon, Esq., Vanda Lodge, Whitton Road, Twickenham, Middlesex, in compliment to whom it has been named.

CYPRIPEDIUMS AT FALKLAND PARK.

LITTLE or no fog of any consequence prevailed in Christmas week on the high ground at Falkland Park, South Norwood Hill, the residence of T. McMeekin, Esq. It often happens that the sun is shining on the top of the hill while all the lower ground in the valley of the Thames is invested in a thick sooty fog, and so it was on this occasion.

Cypripediums are always in season when the conditions are favourable, and the undermentioned species, varieties, and hybrids, amongst others, have been flowering for some time past. *C. williamsianum giganteum* is flowering for the first time from plants raised at Falkland Park, between *C. villosum superbum* and *C. harrisianum*. The cross has been raised by other growers so that the original name given the progeny has been adopted. Though the plant is small the lip and petals of the flower are of handsome proportions, well meriting the varietal name. *C. Calypso Falkland Park var.* is a striking and handsome hybrid, with flowers of great size and beautifully spotted on the dorsal sepal. The most remarkable peculiarity of the plant is that the lateral sepals of the flower are perfectly separated from one another.

C. Niobe is one of the prettiest of the *C. fairieanum* hybrids, having the dorsal sepal Apple-green at the base, the upper three-fourths being white and beautifully marbled with rose. The blackish-brown blotches on the petals of *Cypripedium venustum Falkland Park var.* are very noticeable, both petals and lip being of large size and tinted with reddish-brown. *C. crossianum* and *C. c. amandum*, flowering together, show the characteristics and differences of the two admirably. Though they are generally regarded as distinct hybrids, the difference is one of degree only, the type being almost entirely un-

spotted, while the variety is heavily spotted with brown. Rather a distinct thing is *C. J. Bartels*, which is the offspring of *C. callosum illustre* crossed with the pollen of *C. villosum Boxallii superbum*.

C. Mrs. Botterill was raised at Falkland Park, and is a beautiful hybrid between *C. lathamianum* and *C. savageanum superbum*, both parents being themselves hybrids. The dorsal sepal is white, marked with purple along the centre, and very pretty. The black cilia on both edges of the petals of *C. Smithii* are very noticeable; the hybrid resulted from *C. lawrenceanum* crossed with *C. ciliolare*, and is intermediate in character. The handsome *C. oenanthem superbum*, with its glittering flowers, is well known. The above are only some of the *Cypripediums* in bloom at present, the collection being widely representative of this popular section of the family.

A specimen of the elegant *Saccolabium bellinum* 1 ft. high carries four spikes of flowers on the stem. The species is seldom seen of this height. *Calanthe Veitchii* has been flowering in quantity for some time past. It is yet rather early for *Dendrobiums*, yet a number may be seen in bloom, including *D. wardianum*, *D. Ainsworthii*, *D. formosum giganteum*, *D. Dearei*, with the green throat, and the beautiful *D. findlayanum*. Mr. A. Wright gives attention to both warm and cool house Orchids, *Cattleyas*, *Dendrobiums*, and *Cypripediums* being particular favourites.

PHYSALIS FRANCHETTI.

THIS, Red Winter Cherry, as it is commonly called, is, as the introducers, Messrs. J. Veitch & Sons, claim, a novelty of sterling merit, and worth a place in every garden. For winter decoration of vases, or for church work, it is invaluable. Some ladies, who were interested in church decoration, seeing it for the first time last autumn were quite charmed with it, and I think when better known and more abundant it will be largely used. Its large bright-red calyces, or leafy capsules, show very conspicuously in dark corners and out-of-the-way places, and when interspersed with the silvery *Honesty* and ornamental dried grasses may be used for a variety of purposes, and in various ways. According to a contemporary, several cultivators have failed to obtain satisfactory results, and complain that no fruit or capsules were obtained, and this is easy to understand. It is strictly a perennial and requires two seasons to reach the flowering stage.

From Messrs. Veitch's catalogue one is apt to infer that seed sown in spring will give plants strong enough to flower and fruit in the following autumn, and here is where the disappointment comes in. I purchased a packet of seed in the spring of '96, which I sowed and planted out in due course, and allowed the plants to remain. Large roots formed underground, and last spring these threw up stout growths that bloomed freely, producing an abundance of fine fruit and husks which were much admired. I am sure those who felt disappointment this autumn, if they allow their plants to remain, will be amply rewarded next year.—*Arthur Pentney*.

THE PLANT HOUSES.

Cool Conservatory.

If the supply houses have been worked to advantage the conservatory should now be gay and bright with forced flowers. There will consequently be a good deal of shifting in of new plants and moving out of shabby ones if the house is to be kept in trim. As long as we are favoured with the mild weather we are at present enjoying, the process of shifting has no special terrors. It is only during frosty weather, and when the supply houses are situated at some distance from the conservatory that the removal of plants gives such a lot of trouble.

LILIES OF THE VALLEY.—Small 48-sized pots fitted with selected Berlin crowns render good service. Every one of these crowns can be relied on to throw a good bloom, and they may be forced very easily indeed. Moreover, the blooms last a long time in condition. The clumps, although rather cheaper as far as first cost goes, are not really so in the end, for they do not produce so many or such fine flowers as the selected crowns.

CHINESE PRIMULAS are a host in themselves, for there is a good deal of diversity in the habit and

foliage of the plants as well as in the colours of the flowers, which now range from a respectable blue, red, and crimson, to pure white. That splendid form, *Sutton's Star*, is one of the finest things for conservatory decoration that can possibly be grown. The flowers are not so large as those on the dwarf plants, and they are rather looser in build, but they are produced in imposing pyramidal masses that rise to a height of fully 2 ft. upon well grown plants. This gives the section a wonderfully distinct appearance. The fern-leaved varieties, too, are exceedingly handsome, both flowers and foliage being very ornamental. *Sutton's Giant Strain* exemplifies varieties with flowers of huge size, and great substance that stand the drying influence of fire-heat remarkably well. White and crimson, and several shades of pink are available. The double and semi-double varieties, too, are exceedingly useful, for not only are they capital decorative material as pot plants, but the flowers can be turned to excellent account for cutting. A representative collection of Chinese Primulas is almost a necessity for every establishment where a good deal of conservatory furnishing has to be done. Not infrequently, however, we see the plants arranged in a stiff and formal fashion in rows—a proceeding that much detracts from their effectiveness. Very pretty groups may be devised by staging the plants in batches with Ferns, *Grevilleas*, and other foliage plants, and individual taste will suggest effective modifications of these.

CYCLAMEN bulk quite as largely as the Primulas, and although there is not quite so much diversity of habit amongst them as in the latter they are most useful subjects. The crested varieties, such as *Bush Hill Pioneer*, are handsome and distinct. In gathering the flowers for cutting it will be well to draw the stems clean out, for if they are cut off, the ends which remain damp off and spread the decay all round.

Other forced flowers that are now available will include Roman Hyacinths, *Narcissi*, *Lilacs*, *Deutzias*, *Staphylea colchica*, and *Azaleas*, of which a constant supply must be kept up by the forcing houses.

ERICAS AND EPACRISSES.—Such *Ericas* as *hyemalis*, *E. b. alba*, and *E. gracilis* have been rendering a good account of themselves of late, and now they are further reinforced by the pretty and distinct habited *E. melanthera*, which is just coming in. Seeing how liable *Ericas* are to take harm from draught it will be well to give the plants a warm corner of the house. Many of the *Epacris*s are commencing to open their flowers, and the plants will soon be a blaze of beauty. In the meantime a little weak liquid manure should be afforded them—cow manure, if the position of the conservatory warrants its use.

RICHARDIAS.—The *Arum Lilies* are deservedly great favourites, and seeing that they are comparatively easy to grow it is always advisable to have a good batch of them. *R. africana* stands first in point of usefulness, for there is no more noble subject than a good plant, with one or two flowers open. That very dwarf and sturdy form, the *Godfrey Calla*, should find a place in every establishment, for it flowers with great freedom, and the blooms come in very handily for cutting. The fine yellow species, *R. Pentlandi*, and *R. elliottiana* can scarcely be too highly praised—both of them should be grown.

DAPHNE INDICA RUBRA.—Considering the sweet scent exhaled by the flowers of this pretty *Daphne* it is curious that it is not grown in greater quantity, for it is, in fact, an ideal plant for a conservatory, where fragrance is only second in importance to colour and size of flower. For button-hole work, too, there is nothing finer. Through the winter months the watering can will have to be used very carefully upon these plants or the leaves will go sickly and yellow, and the flower buds will drop before they have a chance to expand.

VIBURNUM TINUS.—All gardeners know this plant in connection with the outdoor garden, but to some of them no doubt its behaviour as a pot plant under glass is an unknown quantity. To those who have not seen it tried in this capacity we can only say that it is a distinct success. The plants readily assume a symmetrical bush-like habit, and, providing they are not exposed to too much heat, they flower as well as they do in the open-air. Very ornamental plants may be grown in six and seven inch pots.

Pits and Frames.

In the supply department the introduction, to heat at suitable intervals of the various subjects needed

for the furnishing of the conservatory, is now a most important item in the routine of work. The houses in which forcing of this class of material is being carried on should be given a temperature ranging between 55° and 60° Fahr. The plunging beds will need to be occasionally refreshed by means of linings of fresh fermenting material, unless they are well-fitted with hot water pipes. Keep the syringe at work morning and afternoon, using for syringing, water at the same temperature as the house.

LIGHT.—So all important is light to the welfare of plants generally, and so serious are the effects that are produced by its partial absence or diminution by the fogs that have been so prevalent of late that active steps must be taken to insure as much of it as possible. The damage directly done to plant life by the fogs in the metropolitan area is incalculable, but even after the fogs themselves have lifted they leave behind them a disagreeable reminder in the shape of a thick grimy deposit upon the glass that effectually excludes the light. This undesirable shading must be removed at once. A few hours spent using mops or long haired brushes, dipped in water, will much improve matters, even although the time can be ill-spaced on account of the shortness of the days.

PROPAGATING BEDDING PLANTS.—Where a large stock of bedding plants has to be worked up it is imperative that a start should be made early in the year. The tops may be taken off last autumn's *Pelargonium* cuttings, and put in without delay. As soon as the growths are long enough batches of cuttings of *Lobelias*, *Althernantheras*, *Heliotropes* and *Verbenas* should likewise be inserted.

DAHLIAS.—The old rootstocks of rare or special varieties should be introduced to heat at an early date. They may be laid close together on a bench or temporary stage near the glass, on which has been placed a few inches of soil, and covered lightly with soil. An occasional syringing will assist them in breaking into growth. It is necessary to make an early start with those sorts that it is intended to propagate extensively, but the beginning of February will be early enough for the main stock.

BOUVARDIAS.—Some of the strongest old plants which were allowed to go absolutely to rest in the latter part of the autumn, and have been hibernating under the stage in a cool house, should be brought out, slightly pruned by cutting off the tops of the shoots, and introduced to a temperature of about 60° to produce cuttings. The young shoots strike readily if taken off when they are from 1½ in. to 2 in. long, inserted in very sandy soil, and plunged in a propagating frame having a temperature of 70°. Five-inch pots will be found a suitable size. If by any means the cutting case is full and no room can be found for the *Bouvardias*, the latter will do very well if placed in the body of a warm house, and covered with a bell glass, but in this case the glass should be taken off daily and wiped dry.

CHRYSANTHEMUMS.—Continue to insert cuttings until a sufficient stock has been obtained. Cuttings that are rooted may be taken out of the handlights, and placed on shelves close to the glass, but before giving them this shift give them plenty of air whilst they are in the handlights, in order to see whether they can stand the exposure without flagging. The old plants may now be consigned to cold frames, and may, if desired, be lifted out of their pots. This will give an opportunity of having the latter washed ready for further use during wet weather, when help from outside is usually available.

CYCLAMEN.—A sowing of seed may now be made as a succession to the autumn sowing. Sow rather thinly, and bury the seed not more than a quarter of an inch deep. As *Cyclamen* seed germinates more or less irregularly it is well to have plenty of patience with it.

GLOXINIAS.—Sow a pinch of seed in a well-drained pan filled with sandy soil to within half an inch of the rim. The seed should be scattered thinly, and a little very fine soil sprinkled lightly over it. Cover the pan with a sheet of glass and place it on a shelf in a warm house. A batch of the old plants should also now be started for early blooming. Place them near the glass and water them repeatedly until the balls are moistened through. As soon as the young growths begin to push potting may be conducted.

ACHIMENES.—A small batch of these for early work should be started. The old plants have been allowed to winter in the pots in which they flowered last summer. A few of these should be knocked out for present need, but the remainder may be allowed to stay where they are until they are required a few weeks hence.—*A. S. G.*

HINTS FOR AMATEURS.

Forcing Asparagus.—No matter at what time of the year it may be forthcoming, Asparagus never comes amiss; for the demand is always in excess of the supply, but it is doubly precious in the winter months when it is only by judicious and careful forcing that it can be obtained. It is a rather expensive vegetable at such a time, no matter whether it is purchased from the market or the greengrocer, or grown at home. Not only must a fairly high degree of heat be given the roots to throw them into activity, but this heat must be continuous and well sustained, otherwise the best results cannot be expected. Then, again, there must be a sufficiency of ground to grow on a supply of roots, for after they have once been subjected to the strain of forcing the roots are of no further value, and may as well be thrown away at once. In many gardens beds which have become nearly worn out are dug up and the roots employed for forcing preparatory to throwing them away. Even in such cases, however, it is obvious that there must be some store from which to repair the waste of forcing, for if only a single bed be destroyed occasionally, another one must be made to supply its place if the supply is to hold out.

Forcing in Frames.—This system is, perhaps, the one most usually followed in private gardens for supplying early material. A hotbed of fair size and depth is erected, and the frame with its attendant lights placed on the top of it. The hotbed should be made about 3 ft. bigger each way than the frame itself so as to allow of a margin round which the person may pass who has to attend to the frame. Three or four inches of fine soil should next be placed in the bottom of the frame and levelled nicely down. Upon this the roots may be placed. Pack them closely together until every corner is filled. Afterwards cover with a layer several inches thick of any light soil, leaf mould for preference, and the work is completed. If the hotbed be composed to a large extent of stable litter there will be no difficulty in getting sufficient heat for as long as it may be required. The best produce is that grown in a steady temperature of 60° Fahr., although 65°, and even 70° of heat may be given when it is necessary to cut heads by an early date, and the time is short; beyond the last-named temperature, however, it is not advisable to go in any case.

The cultural routine, after the roots have been packed away in the manner suggested, is exceedingly simple. A good watering with tepid water should be given to settle the soil, and occasional sprinklings with the syringe or a fine rose-can, should be given subsequently as required. A little crack of air may be necessary at first as the gases given off by the hotbed in its first stages will be rather rank and strong. After the first heat of the bed has subsided, the lights should be kept fairly close, but air may be given on bright or mild days. Should the heat of the frame decline too low it must be raised by means of linings of fresh fermenting material placed round the sides and trodden down firmly. At night-time the frame should be covered with mats, for even if frost does not supervene, the temperature will be rather low, and a covering will be necessary to keep in the heat.

If the amateur cannot see his way to the construction of a hotbed, either from lack of the necessary materials, space, time, or all three together, fairly good Asparagus may be obtained by placing the roots in a warm house. A vinery that is being forced, and was started with that intent about the middle of December, or even earlier, is a capital place, for here the buds will develop slowly, and will acquire almost as much flavour as if they had been grown in the open ground. The humid state of the atmosphere too is very much to their liking. The Asparagus bed may be made up on the Vine border in much the same way as it was in the frame, viz., first a layer of 4 in. or thereabouts of soil upon which the roots are to be packed closely together, and then a covering layer of leaf mould, not less than a couple of inches in depth. The produce from these forced roots may be cut off down to the last bud, for sticks that are too thin for serving at table in the ordinary way will be greeted for the purpose of flavouring soups by the cook.

A frame heated with hot-water pipes is one of the handiest contrivances for forcing Asparagus, because the heat is not only constant, but it can be regulated

at will. If such a frame is possessed by the amateur he may turn it to capital account in this way, although the difficulty is that such a handy fixture is almost sure to be wanted for something else, such as bedding or other tender plants. During cold and windy weather the frames should be warmly covered with mats to economise the heat.

Supposing all the above contrivances to be wanting, the amateur need not entirely despair, for the roots may be laid in shallow boxes, and the latter placed beneath the greenhouse stage. Of course, the heat here would not be great enough to bring about actual forcing, but the slight stimulus will cause the heads to be thrown up much sooner than they are in the open ground, and they will be very sweet and of capital flavour.

The above remarks apply only to the practice of lifting and forcing the roots. The reader will have come to the conclusion that it is an expensive and a rather wasteful method of procedure to indulge in, unless there is a supply of old, nearly worn-out roots to fall back on. This is only a reasonable conclusion to come to, and so we may proceed to look at the other system whereby early Asparagus can be obtained. This is to force in the open, leaving the beds as they are, not disturbing the roots, but simply inducing the buds to appear earlier than they would under ordinary conditions. The outdoor beds are specially constructed with a view to this intent, and, although the trouble and first expense are considerably increased thereby, they are without doubt both repaid in the long run. A good instance of handily built beds is furnished by those at Syon House, Brentford, and from them each season Mr. Wythes cuts some splendid samples of what Asparagus should be, and not what it too often is. The beds in question are about 4 ft. in width. They are not raised above the level of the surrounding ground, but are enclosed on all sides by a brick wall sunk in the ground to the depth of several feet. The wall itself is not solid, but is perforated with holes, which not only permit of the roots finding exit if they require it, but, as we shall see presently, afford a ready passage for the heat generated by the fermenting material. The alley between the beds is 2 ft. in width, and the bounding wall of the beds on either side converts it into a deep pit-like cavity. Each autumn, say about the beginning of November, this is cleared out and refilled with fresh leaves and other heating substances.

Such beds as these can scarcely fail to give satisfaction if they are properly looked after, and not cut too hard. Of course, the sooner that cutting is begun upon these plants the sooner must it cease, otherwise the bed will not last for very long, but will soon become worn out.

Their management is exceedingly simple. All that is necessary is to cover over the beds with a heavy layer of leaf mould immediately after the fermenting material has been placed in the intervening trenches. Over the top of this should be placed boards or shutters to throw off the rain. These may be lifted off every morning to allow of the produce being cut.

Asparagus forced in this fashion is very nicely blanched, and is much valued on account of its tenderness.

Another method of forcing the coveted esculent without lifting the roots is to cover portions of the beds with frames, placing around the latter thick linings of fermenting material. As the heat goes out of these linings they must be renewed. The frames are kept quite close, and are heavily matted over, both to keep in the heat and to promote blanching.

From the variety of methods mentioned above, all of which will be attended with success if properly carried out, the amateur may select according to his circumstances and requirements.—*Rex.*

Correspondence.

Questions asked by amateurs on any subject pertaining to gardens or gardening will be answered on this page. Anyone may give additional or more explanatory answers to questions that have already appeared. Those who desire their communications to appear on this page should write "Amateurs' Page" on the top of their letters.

Fuchsia Cuttings.—*G. T.*: You have kept the old plants rather warmer than you ought to have done, hence the breaking into growth so early. If you have a propagating frame or a house in which a gentle heat can be given, you may strike the cuttings easily enough, even thus early in the year. Good cuttings

are furnished by young shoots between 2 in. and 3 in. in length. Take them off with a heel, *i.e.*, a portion of the old wood attached to the base of the cutting. If you have no propagating frame either put the cuttings on a shelf in a warm house or put them on the plant stage and cover them with a bell-glass. This should be taken off and wiped each morning, otherwise the cuttings will be liable to damp. After the cuttings have been taken off, the old plants may be pruned still further if necessary.

Planting Narcissus.—I have some bulbs of *Narcissus Golden Spur*, which were overlooked last autumn. Is it too late to plant them now? *S., Walthamstow.*

It is certainly very late in the season, and the bulbs will be much weakened by being kept out of the ground so long; but if they are good bulbs they will flower fairly well, and will recoup themselves by another season. Plant at once.

Pruning Black Currants.—*P. P.*: What you want in your bushes is a sufficient supply of young wood. You must, therefore, cut out each year as much of the old wood as you can. Next thin out the weakest and most spindly of the young growths. Do not attempt, however, to shorten any of the growths, for those that remain should be left at full length, otherwise you will spoil the cropping powers of your trees.

Autumn-sown Peas.—*R. Mearns*: It is evident from what you say that mice are the disturbing element among your Peas. It is advisable to soak the seed in petroleum for about twenty minutes preparatory to sowing. Had you done this the mice would not have troubled the Peas. You might remember this hint for next autumn. You must now employ traps to catch the marauders.

Seakale.—*G. Tarn*: The small side roots or thongs may be cut off the main roots when the latter are lifted for forcing. Tie the little root cuttings into bunches, and cover them with leaf soil or sand. They will then keep as well as if they had remained undisturbed in the ground.

Horseradish.—Please tell me the way to propagate Horseradish, and the best time to do it.—*A Reader.*

Horseradish may be propagated by root cuttings in the same way as Seakale. Choose clean straight pieces of the smaller roots, cut these up into lengths of from 4 to 5 in., and the cuttings are made. They should be dibbled into ground that has been deeply dug some time before the old plants commence to grow in the spring. By the following autumn these little root cuttings will have developed into stout serviceable roots.

Parsnips.—*A. O. E.*: Leave the Parsnips in the ground for the winter. The roots are much sweeter when kept in the ground than they are when lifted and stored in a shed or house. If severe frost threatens cover a part of the break with a layer of dry hay, straw, or bracken. This will keep the frost out of the ground and enable the roots to be lifted at any time.

Oil Stove in Greenhouse.—*Opal*: There must be something wrong with the oil stove to cause the unpleasant smell. Certainly harm will result to the plants if this is continued. Consult a practical man used to dealing with such lamps.

Dieffenbachia picta is the name of the plant you send, *E. Alton*. It needs stove heat, but may be grown in a greenhouse during the warmest part of the summer.

Epiphyllum truncatum.—*E. Alton*: This is generally grafted on pieces of *Pereskia aculeata* and *P. Bleo*. This is to give the plants a stiff stem to lift their trailing branches above the ground, and not because cuttings will not strike easily enough. The cuttings should consist of points of the branches two or three inches in length taken before the plants commence to make fresh growth. Place the cutting pots on a shelf in a warm house, but do not cover them with a bell glass or they will be likely to rot.

PEA CARTERS' EARLY MORN.

PEA CARTERS' EARLY MORN.
 THE possible improvements amongst garden Peas have not yet all been exhausted, judging from the appearance of this new variety and the results that have been obtained from it by a trial amongst gardeners last year. After an effective cross has been made it takes six years or thereby to fix any new variety that may

finally be selected from amongst the progeny of the original. This fact may be gleaned from the history of Carters' Early Morn, which was obtained from Daisy crossed with Lightning. Both of these varieties are now well known, the latter having first been offered to the public in 1887, that is, ten years ago. Daisy did not come before the public till 1892, and that was

the work of seven years of patient care in selection from a cross between Carters' Stratagem and Giant Marrow.

In 1892, when Daisy was first placed before the public, Messrs. James Carter & Co., High Holborn, London, set about crossing Daisy with Lightning, in order to get a first early Pea, having the sweet

marrowfat qualities, and size of pod of the wrinkled and later varieties, including Daisy, the mother of the new Pea under notice. When the pods ripened during the first year of the cross there were three white, three blue, and one green seeds in a pod. Two seeds, namely a blue and a white, were smooth, and the other five variously wrinkled. All of the seeds were sown and an observant eye kept upon them to see whether any of them held out promises of the characteristics desired. After five years of repeated selection Early morn at length became evolved, while another year's trial proved that it had become fixed.

As will be seen from the accompanying illustration the pods are straight, of great thickness, and when well grown they equal in length those of Duke of Albany or Daisy, even when they are in their best form. It is very little behind the earliest round-seeded varieties, while the pods are well filled with seeds of excellent marrowfat flavour. The haulm grows about 3 feet high; and if the seeds are sown during February or March the crop will be fit to gather some time in June.

FORESTRY.

FOR a period of years, many eminent men have been using their influences, and taking steps to bring the subject of forestry before the Government, pressing it forward that it is the nation's duty in disseminating a scientific knowledge of the subject. There are good hopes that the efforts that have been, and are still being, made will ultimately succeed. Should they fail, the nation will be a sufferer; while the hope of Government support lies in the future.

It is satisfactory to be able to record that the advocates of a higher and more improved system of forestry have the joy of seeing some fruit of their labours, in more than ways than one. They contended that it was the duty of our universities to open their doors and impart a knowledge of the principles of forestry, and to give one instance of fruit, I shall mention the forestry class in the university of Edinburgh, which is presided over by Colonel Bailey, who is an undoubted authority on forestry. The winter session of the above class was opened by Colonel Bailey on the 12th October, and in his introductory address he dealt with "Our timber supplies." From the *Scotsman* I take a brief extract of some important truths that the lecturer expounded believing that they are of interest to your readers.

"The lecturer stated the quantities of wood annually imported from foreign countries, and proceeded to show that the supplies from these countries could not be depended on. The consumption of wood in the United States exceeded by more than 50 per cent. what their present forest area could produce as an annual yield, and the demand increased 25 per cent. in every ten years. That meant that the States would very soon take the whole of the wood that Canada might have to spare, &c." The lecturer then discussed the situation in Canada, whence he had lately returned. He said "no effective measures of conservancy or regulations of fellings had yet been taken. The forests were cut without thought of regeneration and fires swept through them burning up young trees with the old ones, vast tracts which a few years ago were covered with unbroken forest were now completely denuded, and there was little to be seen but bare rock with burnt and bleaching trunks. The effect was not only to render enormous areas unproductive, but to dry up springs, lessen the flow of rivers, cause floods by sudden thaw of snow, and drought over large areas in summer. That condition of affairs extended over vast areas up to and into the Rocky Mountains, and the valley of Columbia. The time was not far distant when Canada would cease to be a timber-exporting country unless a proper system of forest management was introduced without delay. Considering the uncertainty of their foreign supplies, it was a matter of national importance to grow their own supplies at home—that was to grow wood in sufficient quantity—of a quality suited to their requirements."

This brief outline of Colonel Bailey's address gives us harrowing details of the conditions of our wood supplies, and I am sure it will impress itself on most thoughtful men, that the subject of forestry demands serious attention. It appears to me that it is the bounden duty of those who are more less engaged or connected with forestry to study it. We

have many eminent authorities in our midst, whose attainments in the scientific and practical departments of forestry are an honour and credit to them. The times demand that the field of knowledge and intelligence of the subject must be evidenced, and that a greater number of individuals should turn their attention to it.

I am not for a single moment overlooking the highly commendable progress that has been made in many ways, and especially by some societies in arousing attention and bringing it prominently before the public. I am aware of untiring efforts and zeal by the leaders and members of societies and others, which will never be compensated nor receive any reward. I am making no appeal to these or on behalf of any society. From a financial point many, with the varied claims made on them, prefer to keep outside these societies. My contention is that by a greater number taking more interest and studying its varied aspects, this increasing intelligence will possibly aid and help those that are striving for a higher and better system of forestry. If sympathy given to a good cause has been productive of beneficial effects, surely then—the wider the interest taken in forestry—the benefit will be of some importance in the cause of progress.

One does not expect that every individual who turns to the study of the question will become the possessor and master of a sound knowledge of the most scientific principles that are found or known in the domain of forestry. The higher the attainment the better it will be for the individuals and the progress of forestry; but it is of considerable importance to get a grasp of the subject and the interests that are at stake, for I am confident that in many quarters these are not fully realised.

The basis of the truths contained in Colonel Bailey's address have long ago been digested by many; but this is no reason against extending these truths to the field of a far wider circle of individuals.

It is to be trusted that this subject of national importance will meet with greater support than it has received in the past; and that many defects of the past management of forests in our and other lands may be rectified; that the dark blots and stains flapped in our faces—of inferior home timber and the eternal stipulations in specifications of foreign woods—will be gradually removed; and that a higher and better system of forestry will take the field, and model forests for instruction and experiments become established in our midst.—*J. Cameron, Byethorn Gardens, Corbridge-on-Tyne.*

MEADOWBANK NURSERY, ROTHESAY.

WHILE paying a visit of inspection to several places in Rothesay last September, we had a run through the grounds of Mr. Alex. Lister, florist, Meadowbank Nursery, Rothesay, and could see at a glance that Dahlias, chiefly the show and fancy types, were one of the chief specialities here. Many other florists' flowers are cultivated, but Mr. Lister devotes considerable attention to Dahlias, of which he is a successful exhibitor.

That show Dahlias are well known and appreciated will be gathered from the mention of such varieties as John Walker, John Rawlings, Wm. Keith, Purple Prince, Norma, J. T. West, Coronet, Nubian, Pioneer, James Cocker, Maude Fellowes, Mrs. Gladstone and many others that are of constant occurrence on the show boards at all the leading Dahlia shows. While inspecting the varieties what struck us most was their remarkably dwarf and sturdy habit. The soil is very heavy and inclined to clay, and this, no doubt, explains to some extent the dwarfness of the plants; while climate would also share in that responsibility.

Other fine varieties belonging to this section were Harry Walton, yellow, edged bronzy-red; Agnes, golden-yellow and of fine form; William Powell, a very large form of a softer yellow; Mr. Charles Noyes, deep buff-yellow, and Bismarck, a huge crimson-purple flower. Edged varieties were well represented, including Mrs. Morgan, white, tipped with purple and very pretty; Shotsham Hero, pink, and edged with deep purple; Majestic, white or soft lilac, tipped with purple and fine in form; and Mrs. Langtry, buff, with a broad, deep purple edge. Amongst the choicer selfs we noted W. H. Williams, a huge glowing-scarlet flower; Joseph Green, crimson-scarlet; Duke of Fife, deep crimson, almost

maroon; John Hickling, clear yellow and of fine form; James Stevens, of a handsome orange hue; and Yellow Boy, a huge, finely built flower. Many other show varieties, scarcely inferior to the above-mentioned, were in the collection, but time, or rather the lack of it, prevented us from going more largely into details.

Fancy Dahlias were by no means neglected, but fully maintained the importance of their section. Mrs. Saunders we have always looked upon as one of the best and most charming of this section. The florets are yellow, tipped with white. The paler colour being confined to the tip serves to distinguish a true fancy (according to the florists) from the edged varieties in the show section, where the darker of the two colours is disposed round the margin or confined to the tip. Prince Henry is lilac, with crimson markings. General Grant is buff yellow, flaked with crimson. Greater complication is noticeable in Lottie Eckford, which has white flowers, flaked with red, and mottled with purple. It is also a neatly built bloom. On the contrary, Gaiety is yellow, mottled with buff, and shaded with white. Dazzler is a buff-yellow mottled with crimson. Very curious is the mixture of colours displayed by John Cooper, which is white, flaked and mottled with maroon.

Other florists' flowers cultivated here are Violas, Penstemons, Carnations, Roses, and Pelargoniums, all of which have their special uses in the business conducted by Mr. Lister.

A general collection of hardy herbaceous perennials is an adjunct to most of the nurseries in Scotland, the climate of which is particularly favourable to the growth of this class of plants, getting more and more popular every year. *Coreopsis lanceolata*, *Statice latifolia*, the true *Eryngium alpinum*, and *Sidalcea Listeri* are choice things we noted, which should be present in every collection of this character. The flowers of *Sidalcea* are satiny pink, but the fringed corolla is the special characteristic of the plant, which received an Award of Merit from the Royal Horticultural Society last summer.

NOTICES OF BOOKS.

HARDY HERBACEOUS PLANTS.

HARDY PERENNIALS AND OLD-FASHIONED GARDEN FLOWERS. Describing the most desirable plants for borders, rockeries, and shrubberies, and including both foliage and flowering plants. By John Wood. Illustrated. London: L. Upcott Gill, 170, Strand, W.C. Price 3s. 6d.

THE book under notice is intended to meet the wants of amateurs in quest of hardy perennial plants upon which they can rely to give them the longest succession of flowers during the year in the open ground. The writer is an amateur who loves his garden, and has successfully cultivated all the plants of which he speaks at his home at Woodville, Kirkstall, Yorks. This latter fact in itself would limit the number of hardy herbaceous subjects that might be grown with ordinary care in various other parts of the country, better favoured in the matter of climate. Nevertheless the plants recorded in this octavo volume of some 330 pages, including an index of the species and varieties, show that Mr. Wood's garden must be extensively stocked with these hardy subjects. He grows something like thirty-five species and varieties of *Saxifraga*, though the names employed are not always that of the botanist. Indeed, unless he were a botanist himself, he could hardly be expected to furnish the botanical name in all cases, for many things still remain incorrectly named in gardens throughout the country.

The generic names of the plants are arranged alphabetically and under them come the specific appellations, having the same order of precedence. The botanical names are followed by the synonyms, if any, and those again by the common names and occasionally by old names now neglected. The author is evidently interested in ancient descriptions, of which he gives a quotation now and again from such herbalists as Gerard and Parkinson. In speaking of "reeky" towns he makes use of a word that smacks distinctly of very old English, but nevertheless a very graphic term. We do not quite agree with the writer, however, when he uses such names as *Andromeda tetragona*, and *Acaena Novae Zealandiae*, and then gives the correct names (*Cassiope tetragona*, and *Acaena microphylla*) as synonyms.

The author is at his best when he describes the method of treatment by which he succeeds in cultivating any of our troublesome favourites. For instance, he experienced great difficulty with *Cassiope tetragona*, for many years trying it in various positions and soils. Then he hit upon the plan of digging out a hole about 18 in. in diameter and of similar depth. This was filled with sandy peat made firm, and the surface of a neighbouring walk so sloped that all the surface water would run into the hollow cavity formed, thus transforming it into a miniature bog. A partially shaded position was selected for this and the *Cassiope* rewarded him with satisfactory growth. He propagates it by division, and plants the pieces deeper in the soil than they had been previously, by which means the old and dead leaves are buried, and fresh roots are emitted higher up the stems. His excursions into descriptive matter and his method of cultural treatment are rather lengthy, but in our opinion are the most valuable part of the book; and space permitting, we consider that the method by which success is attained should always form the feature of books meant to guide or assist the amateur or even the young professional gardener. Mr. Wood says that *Anemone alpina* closely resembles *A. sulphurea*, and is considered to be the parent of the latter; yet he describes *A. sulphurea* as if it were a distinct species. He could have improved upon his descriptions if he had placed *A. sulphurea* under *A. alpina* as a variety of the latter, which, indeed, it is. He might have mentioned a larger number of the Michaelmas Daisies or Starworts than he has, for many of the showiest and most floriferous October flowering species and varieties that fill the cut flower vase are omitted. They have now a much greater number of admirers and cultivators than they had a few years ago, and this result is largely due to the excellent qualities and undoubted beauty of many of them having been brought to the notice of the public by various cultivators in different parts of the country, and to the trial of them that was made by the Royal Horticultural Society at Chiswick. The author will have a surprise in store when he comes to make the acquaintance of *Heuchera sanguinea*; for it is the finest and most handsome of all the *Heucheras* without detracting from the merits of those he has recorded.

The book is admirably printed on good paper and is freely illustrated throughout with woodcuts of well-known and many, to amateurs, little known hardy plants worthy of a place in every collection of any pretensions.

WORK IN THE GARDEN.

My Garden Diary for 1898. Publishers, Sutton and Sons, Reading.

THIS annual publication of some 28 pages has its front cover adorned with a garden scene in April, when Tulips, Wallflowers, *Doronicums*, Apple blossom, &c., enliven the scene. Pale and dark blue and pink varieties of *Myosotis alpestris* *Victoriarum* brighten the back cover in a tasteful and artistic way.

The diary is purely a calendar of operations that may be conducted in the garden, and the left-hand pages record this work for each month of the year. Even for the month of January it is remarkable what a number of things claim the attention of every gardener who desires to be up-to-date in supplying the necessaries (we shall not say luxuries) of modern establishments. Eleven paragraphs serve the purpose of reminders (pointers our American contemporaries would say) of the work that might or should be done even at this early period of the year. Peas, Dwarf Beans, Cucumbers, Carrots, Lettuce, Radishes, Potatoes, Cabbages, Cauliflower, Strawberries, Artichokes, Celery, Rhubarb, Seakale, Longpod Beans, and numerous flowers require attention during the present month. At the bottom of the same pages, various events and matters in connection with them are recorded for the benefit of those concerned. The mean temperature for the month, the height of the barometer and the rainfall taken from the monthly averages at Greenwich during the last 55 years are items for which many may find a use while conducting their garden operations.

The right-hand pages furnish the days of the month and week, together with the rising and setting of the sun and moon. A considerable amount of blank space on these pages is intended for notes and memoranda, which might be rendered not only interesting but useful by diligent and keen observers

for future reference. These diaries could of course be filed every year for future use, so that records made in them would come in useful at any future time. Incidentally we note that the day lengthens 1 h. 11 min. during the month of January, to wit, 25 min. in the morning and 46 min. in the afternoon. During the shorter month of February, the day gains 1 h. 41 min. by the close of the month—the gain being 52 min. in the morning, and 49 min. in the afternoon. The unfortunate part of it is that within the smoky compass of London we often fail to discover either sunrise or sunset. Under favourable circumstances, however, gardeners can calculate upon that increase of daylight.

HOLIDAY WALKS.

A district fresh to English holiday makers, and reached as easily as the Ardennes, will be opened up in "New Walks by the Rhine," by Percy Lindley, whose "Walks in the Ardennes" and "Walks in Holland" did so much to popularise new Belgian and Dutch touring grounds. Starting from the Rhine mouth at the Hook of Holland, "New Walks by the Rhine" will cover the picturesque wooded and rocky side valleys of Rhineland, from the Ahrthal, near Cologne, to the Neckarthal and the "Blue Alsatian Mountains" of the Vosges; and will include the districts of the Taunus, Eifel, Odenwald, Hunsruck, and the Palatinate. Living is said to be as inexpensive in some of these districts as in the Ardennes. Mr. J. F. Weedon will supply the illustrations. The handbook will be published shortly.

DAPHNE INDICA RUBRA.

FLOWERS that are possessed of an agreeable fragrance in addition to a fair share of beauty, and that flower in the winter months, are unfortunately all too rare, but among the number this pretty *Daphne* occupies a very high position. A small plant with two or three flowers will scent a house, so strong, and yet so agreeable, is the perfume.

Amongst gardeners generally *Daphnes* are looked upon as being somewhat difficult to grow, and there is no doubt that they are intractable to some extent unless their wants are pretty closely looked after. Occasionally we come across a miserable looking plant or two of the type, *D. indica*, in private gardens, and it is the exception indeed to see them looking really happy. The variety under notice is not more fortunate. Mistaken kindness with water is, we presume, the most fruitful cause of sickness among the plants, which are, moreover, allowed to remain for years in the same pot until the drainage is choked up, and the soil, as a natural consequence, sour and waterlogged. As if to increase the burden laid upon these poor plants every scrap of flower is eagerly cut off them as soon as it makes its appearance, and the result is that they soon look bare and scraggy.

If they are to do really well more reasonable treatment must be accorded them. The pots must be well drained to start with, using as a compost fibrous loam and peat in equal proportions, with plenty of clean, sharp sand. Pot fairly firmly. The plants are naturally of slow growth, and it is thus a mistake to overpot, but the drainage must be kept clear or failure will result. Even during the growing season water should not be given before it is required, and during the winter months, while the plants are enjoying a partial rest in the greenhouse before being taken into a gentle heat at the beginning of the year to induce them to flower, even less water will be required. At this stage of their career, indeed, too much care cannot be exercised.

Then again caution must be observed in cutting the flowers. Those on weakly plants should not be cut at all, and on the stronger plants those should be selected from the most vigorous shoots which have plump buds in the axils of their leaves, which will subsequently break into growth. The practice of indiscriminately hacking off each scrap of flower cannot be too strongly condemned.

After flowering is over and the plants commence to break into growth they should be potted, if this is necessary, taking care to avoid too large a shift. A gentle heat and an occasional syringing will assist them much at this time, and lay the foundation for well furnished plants. As the pots become filled with roots, liquid cow-manure, with a little soot mixed, may be applied with advantage,

but if an error is to be made in the giving of stimulants let it be on the side of weakness.

As the growths harden and mature themselves the plants may be placed amongst the ordinary greenhouse hard-wooded plants for the autumn, to enjoy their partial rest, during which they must not be excited in any way.

If this course of treatment were followed we should not hear so many complaints about the plants being "miffy" doers.

With regard to the propagation of the plants, grafting is usually employed, the common *D. Mezereum* being the favourite stock. Plants are obtained much quicker by this method than by cuttings, but grafted plants almost invariably go gouty and deformed at the point where the scion was inserted upon the stock, and as the years go by this infirmity becomes aggravated with each succeeding season. Cuttings, although much slower in making plants are really more satisfactory in the long run, and for private establishments that have to be, as nearly as possible, self-supporting, this system of increasing the stock is to be preferred to grafting.

The cuttings should be composed of points, some three inches in length, of the half-matured shoots of the current season's growth. Take these off about the middle of August and insert them in pots or pans filled with sandy soil. Place them in a cool house, and cover them with bell-glasses. Shade carefully, and keep moist until a callus is formed, then remove them into a gentle heat, where they will root. They should be kept gently moving all the winter, although growth will be very slow. The young plants should be ready for potting off into 3-inch pots some time during March. Their subsequent treatment will be the same as that advocated for the older plants.

As the varietal name denotes *D. i. rubra* has more colour in the flower than has the type, but otherwise there is little or no difference.

At the time of writing there is a fine batch of plants in flower at Chelsea, with Messrs. Jas. Veitch & Sons, Ltd. We found upon inspection that all these have resulted from grafts. They are all full of flower, and a peep into the house they occupy affords a treat to the visitors' senses of both sight and smell.

GRAND YORKSHIRE GALA.

THE annual meeting of the guarantors and life members of the Grand Yorkshire Gala was held at Harker's Hotel, York, on the 7th inst., under the presidency of Ald. Sir Joseph Terry, when there was a good attendance.

The chairman, on rising, read letters from several important absentees regretting their inability to attend. Referring to the Gala of last June when the flower tents were wrecked by a disastrous gale, he said that the circumstance had prevented the public from seeing the usual beautiful floral exhibition. If it had not been for the disaster he believed that the show would have been of an exceptional character, and would no doubt have been immensely appreciated. The damage done by the storm of wind amounted to £600, a catastrophe which had never been previously experienced. The circumstances everywhere created regret, and expressions of sympathy had been received from many, including exhibitors. Mr. Atkinson, of Sheffield, had sent the society a donation of five guineas. Continuing, he said he sincerely hoped they might never again experience similar conditions. The coming season he trusted would be so eminently successful as to recoup them for the loss of the past.

With regard to the coming fête he announced that they had been again able to make satisfactory arrangements with the Bootham Asylum authorities. The Lord Mayor (Mr. Edwin Gray) and the City Sheriff (Mr. Harold Copperthwaite) had been elected life members, and the former had consented to act as president for the current year. He then formally proposed that his lordship be so elected.

The proposition was seconded by Ald. Border, and carried with unanimity.

Ald. Sir Christopher Milward proposed the re-election of Sir Joseph Terry as chairman of the council, seeing that he had been associated with the society for many years, and had always taken a great interest in its welfare. He was sure the audience would join with him in congratulating Sir Joseph on the fact that he had attained his seventieth birthday.

It was a pleasure to the citizens to see him so hale, hearty, and able to discharge his important duties. His improved health was matter for rejoicing, and he hoped Sir Joseph would be spared for many years to come. Ald. Purnell seconded the proposal which was heartily endorsed.

Sir Christopher Milward was proposed as vice-chairman, but to this he demurred on the ground that he had been ordered complete rest on account of the unsatisfactory state of his health. Ald. Border eventually consented to stand again and was re-elected vice-chairman.

The other officers appointed were:—Treasurer, Mr. Joseph Wilkinson; secretary, Mr. C. W. Simmonds; and auditors, Messrs. Pearson and Taylor. The usual committees were also elected. The following members were elected on the council: Ald. Sir Christopher A. Milward, Messrs. R. Anderson, G. Balmford, J. Blenkin, J. Biscomb, Ald. Clayton, J. W. Craven, M. Cooper, H. C. Day, Ald. Dale, Councillor Foster, G. Garbutt, T. G. Hodgson, J. J. Hunt, A. Jones, G. Potter-Kirby, E. B. Kendall, T. M. Lambert, Ald. Purnell, E. S. Robinson, H. Scott, W. S. Sharp, and J. B. Sampson.

For the ensuing gala it was arranged to spend £650 on floral arrangements, including the £50 as a Victorian commemoration prize, offered last year, but not awarded; also £200 for music; £100 for fireworks; £150 for amusements; and £50 for balloons.

Votes of condolence were presented to the families of the late Sir Frank Lockwood, Q.C., M.P.; Mr. T. P. Bulmer, J.P.; and Mr. George Dennis, all of whom had been associated with the gala.

The proceedings terminated after the health of Sir Joseph Terry had been proposed by Ald. Purnell, who congratulated him upon having attained his seventieth birthday, and said that no gentleman in the city was more esteemed.

STRAW MATS.

THE use of these is very wide spread, but at the same time I submit they are not so much used as they well might be in very many instances where straw costs but little. They are very much cheaper than any other material for covering pits and frames. Many who might avail themselves of them fail to do so, not knowing how to make them. We have seen and practised several methods closely resembling one another, the materials used being twine and straw. The mats are made of different thicknesses to suit the purposes for which they are required, and being made to roll up, the objections to this plan are that unless made very thin they are, when wet, heavy to move about, and are at all times very littery.

For the two reasons stated I have adopted a fresh method of making them. This is done by procuring 2-in. galvanised wire netting of a light gauge, the width of which should correspond to the length of the lights to be covered. The netting should be cut in lengths rather more than double the width to be covered in order to allow sufficient material to cover in the two sides. This must be determined by the thickness the mat is purposed to be made. In many instances, for the convenience of lifting about and storage, when not in use, it will be found preferable to make two mats for each light. Having the netting in readiness, double it over and place a straw band in at the bend, fastening it in position with twine, taking care to have the wire, when doubled, as straight and square as possible. Then lay in the straw of the required thickness, straightening and even pressing it firmly against the band till 1 ft. or more according to circumstances is filled up; then insert another straw band, press the straw down firmly, and fasten the band tightly in position with twine drawn through the netting from top to bottom. Continue the process till the mat attains the required dimensions.

The top and bottom require a little care to finish them off satisfactorily. The best way is to lay in a straw band, allowing some of the loose straw to just cover it top and bottom. Make all secure by drawing the two edges of the netting together with twine, enclosing the straw band at the same time and making it secure to the netting. This also applies to the finishing off at the side of the mat opposite to its commencement. The advantages of mats made in this way are greater durability and freedom from litter. They are readily moved about, and the

netting gives them a certain amount of rigidity which admits of their being stood against anything where the wind can play through them and so dry them far more quickly than mats made in the ordinary way. One of the principal objections to these thick mats is the difficulty of drying them.—*W. B. G.*

WESTMOUNT, GLASGOW.

FOR many years past Westmount, Kelvinside, Glasgow, the city residence of Hugh Stevens, Esq., has been noted for its fine collection of cool Odontoglossums, though other sections of Orchids and indoor gardening generally are well cared for by his genial and courteous gardener, Mr. David Wilson, who every now and again asserts his prowess in the Orchid classes at various flower shows in Scotland.

Mr. Wilson, like many another gardener, has been drawn into the fascinating operation of hybridising Orchids, for we noted a healthy batch of *Dendrobium* seedlings with pseudobulbs 2 in. to 3 in. in length. The seed was sown in April, 1896, and the plants have already made their second growths, the first having leaves only $\frac{1}{2}$ in. in length, so that no time has been lost since germination took place.

We happened to visit the place just after a ball had been held at the seaside residence of the owner, so that the cool Odontoglossums had been severely punished in order to supply cut flowers. A few had escaped the knife, and spikes were being thrown up plentifully to renew the display of bloom. *Odontoglossum acuminatissimum* seemed to be a natural hybrid between *O. crispum andersonianum* and *O. luteo-purpureum*. *O. Rossii majus*, *O. crispum*, and *O. Pescatorei* were also well represented. The plants were in robust health, and accommodated in a well-constructed, well-lighted house, the framework and staging of which consists of iron. A large number of the plants are elevated on iron, movable pedestals, which serve the purpose of bringing the plants near the glass and of keeping them out of the way of slugs to a large extent. *O. Rossii majus* and other compact-growing kinds are suspended in baskets from the roof.

In one of the warm Orchid houses numerous *Cypripediums* were flowering freely, including a grand piece of *C. Morganiae*, carrying ten large flowers on five spikes. This same plant took the first prize in a class at the Edinburgh show in September last. *C. harrisianum superbum* also carried very fine flowers, as did *C. Charlesworthii*, *C. Sedenii*, and various others. The flowering of some hybrid *Cypripediums* is also eagerly looked for. A fine piece of *Oncidium incurvum* supported half-a-dozen graceful spikes. *Dendrobiums*, in the same house, were finishing up admirable growths. *Begonias* of the *B. corallina* type and *B. haageana* also served to keep the house gay with their showy and attractive flowers.

Passing into a low span-roofed house we found a splendidly grown collection of *Crotons* of a useful decorative size. Other fine foliage plants located here included *Episcia fulgens*, *Pelionia pulchella*, *Fittonia Verschaffeltii*, *F. argyryneura*, *Alocasias*, *Schizocasia sanderiana*, *Caladiums*, in many fine varieties, *Selaginellas* and other indispensable things for establishments where the owners are really plant lovers. Being all scrupulously bright and clean they afforded ample testimony of the care bestowed upon them.

The hothouses are peculiarly situated in being built on the steep bank of a glen or valley, so that flights of steps both outside and inside the houses lead from house to house on different terraces. The conservatory is a roomy building on one of these terraces, and has climbers upon the roof, including well-flowered *Lapagerias*. Large plants of *Asparagus plumosus nanus* climb to the roof upon strings, and are found useful in many ways. A collection of large-flowering *Chrysanthemums* was even then flowering from the early buds. *Hydrangea paniculata grandiflora*, *Begonia metallica*, *Clerodendron fallax*, and other useful subjects were flowering profusely.

The stove contained a collection of *Ixoras*, *Crotons*, *Dracaenas*, *Ananasa sativa variegata* and others of that class. They were clean, healthy, and vigorous, while many of the fine leaved subjects were displayed to the best advantage by being elevated on iron pedestals like those employed in the Odonto-

glossum house. A large piece of *Angraecum caudatum* was noticeable in this house. The huge leaves of *Sphaerogyne latifolia* are always interesting. Here also was another old favourite, namely, *Beaucarnea recurvata*, of which there were two specimens, each 6 ft. or more in height.

A lengthy and lofty cool house stands on the highest terrace, and here again we found a great variety of subjects for which a cool airy atmosphere is suitable. Some large plants of *Eurya latifolia variegata* showed how ornamental they may be when well grown. The orange-scarlet flowers of *Fuchsia Mrs. Rundle* showed themselves to great advantage suspended from the rafters of the house on drooping sprays. *Crinum mooreanum* was in fine form. The long drooping or creeping shoots of *Nepeta Glechoma variegata* answer admirably as an edging to the benches of cool houses. Very few British weeds can aspire to such honourable distinction. Many cool Orchids found suitable quarters in this house, the *Odontoglossums* throwing up many fine spikes.

Amidst the love for flowers in this establishment, Vines are not neglected. One viney was filled with *Gros Colman*, *Alicante*, and *Lady Downes*, the first-named being conspicuous on account of the handsome proportions of its berries, and *Alicante* by reason of its high colour and finish. The next viney contained a heavy crop of Grapes not quite finished at the time of our visit. The varieties grown included those already named, with the addition of *Madresfield Court*, which we considered exceptionally fine. Lack of time prevented us from inspecting the flower garden; and having been only half-an-hour or less upon the premises Mr. Wilson accompanied us to the next place of call for the sake of "Auld Lang Syne," and to make up for the brief stay.

GARDENING MISCELLANY.

ARAUCARIA EXCELSA.

WE were reminded of the usefulness and popularity of this pretty *Araucaria* as a pot plant on seeing a splendid batch of it during a recent visit to the Chelsea establishment of Messrs. Jas. Veitch & Sons, Ltd. Whilst other plants that have claims upon our regard were hanging out unequivocal signs of distress as the result of the fogs, these plants looked not a whit the worse. In a small state *Araucaria excelsa* makes a handsome table plant, and is alike effective in plant stands or windows in the dwelling house, since a shapely little specimen can be accommodated in a 48-sized pot. In its later stages it makes a noble occupant of the more pretentious winter garden, if care is taken, while it is yet young, to see that it is not permanently disfigured by the premature loss of one or more of its branches. At no time of its life is it difficult to grow, and at all times it is beautiful.

"ORCHID HUNTING, ITS HUMOURS AND ADVENTURES."

This was the title of a paper given by Mr. G. Lee before the members of the Torquay District Gardeners' Association recently. Mr. Lee dealt in an interesting fashion with the adventures of Orchid-hunters in various parts of the world. Some of them had spent years searching for certain plants in wild and desolate regions, risking life and limb amongst swamps, savages, and wild animals, and the story of their lives read like a romance. It was said that Roezl, and other early collectors, used to buy the semi-sacred plants of the priests, and what they could not buy they bribed the natives to steal for them. Mr. Lee cited a very amusing incident in the life of M. L. Hamalin, a French collector in Madagascar, who was made blood-brother to one of the chiefs. Whilst Orchid-hunting on one occasion Hamalin's escort was under the command of a brother-in-law of the king's. This young chief was killed by a lioness, and Hamalin was made responsible for his death. He was offered the alternative of marrying the young widow and taking the family belongings or being greased and burnt. Hamalin took the widow, but found a speedy pretext for returning to England sans his enforced bride. The lecture was illustrated by some fine Orchids shown by Miss Lavers, Mrs. Wilson, and Lady McGregor.

TROPAEOLUM SPECIOSUM.

I CAN assure "C.B.G." that there are favoured spots even in the sunny south (or foggy, shall we say?) where *Tropaeolum speciosum* will thrive. I remember a few years ago seeing a very healthy specimen growing on a wire fence bounding a tennis lawn, and that was a very sunny spot in a sunny county, or rather in a county noted for the sandy character of its soil, and therefore greatly influenced by the sun. Last year I was in the same garden, not 100 miles from Acton, and although I cannot remember seeing this particular fence, I was struck with the beauty of several fine examples of the *Tropaeolum* which were growing in Rhododendron beds, rambling over the heads of their supporters and bearing a profusion of scarlet flowers. If only I had the pen of "C.B.G." to describe that picture, I would start every reader of THE GARDENING WORLD growing, or trying to grow, *Tropaeolum speciosum*.—A. P.

BEGONIA GLOIRE DE LORRAINE.

THIS "glory" among Begonias has made for itself many friends, and secured a good deal of well-merited attention. The dense fogs which have done so much damage of late to plants in general and Begonias in particular have only served to demonstrate an excellent quality that the plant possesses of resisting the influence of the fog, and although we would, perhaps, have been better pleased had the fogs been content to leave us alone, and not put us and our plants to such a severe ordeal, it is well to know the capabilities our floral friends possess in the direction indicated. There are a number of sturdy little samples of this Begonia in the Begonia house at Kew that do not seem to have suffered appreciably, despite the fact that in the same house may be seen many other plants half stripped of their leaves, and generally appearing as very pitiful looking objects indeed.

SOCIETIES.

ROYAL HORTICULTURAL.—January 11th.

CYCLAMEN, Chinese Primulas, Orchids, and fine foliage plants were the features of the first meeting of the year on Tuesday last. A few brightly-coloured Carnations also furnished a hit of colour to the tables. Fruit was as well represented as anything, particularly Apples and Grapes.

Messrs. Hugh Low & Co., Upper Clapton, London, N.E., exhibited a small group of Orchids set up with Palms and Maidenhair Ferns. They had a beautiful hybrid *Cypripedium* named *Cyp. F. S. Roberts*, of which *C. niveum* was one parent, the other being unknown. Interesting was a pale yellow *Odontoglossum* named *O. crispum tackianum*. There were also several other fine forms of this popular species. *O. Hallii* as well as several forms of *O. crispum andersonianum* were in good form and interesting.

Messrs. F. Sander & Co., St. Albans, staged a small group of Orchids surrounded by well grown plants of *Dracaena godseffiana*. *Laelia anceps Dawsoni*, *L. a. sanderiana* and *L. a. Hillii* are all good forms of this popular *Laelia*. Several *Dendrobiums*, including *D. Johnsoniae* and the hybrid *D. Dulce Oakwood var.*, and *Cypripedium Calypso* were beautiful and interesting types of their respective kinds.

Fred Hardy, Esq., Tyntesfield, exhibited plants of *Cypripedium insigne Sanderiae*, *C. Calypso*, and a form of *O. crispum andersonianum*.

Captain Holford, Westonbirt, Gloucestershire, sent a fine collection of cut flowers of hybrid and other *Cypripediums*, including *C. leeanum superhum*, *C. Calypso*, *C. Niobe*, *C. insigne citrina*, *C. Wallace Lunt*, *C. lathamianum*, and various others which were eagerly inspected by the visitors. He also had fine bunches of *Laelia autumnalis* (Silver Banksian Medal).

De B. Crawshay, Esq. (gardener, Mr. S. Cooke), Rosefield, Sevenoaks, exhibited cut flowers of *Laelia anceps amesiana Crawshay's var.*, a very attractive and well formed flower.

Isaac Carr, Esq., Poolemeade, Swerton-on-Avon, exhibited some hybrid *Cypripediums*, including the finely blotched *C. Gwendoline*. *C. L. N. Ingram*, Esq. (gardener, Mr. T. W. Bond), Elstead House,

Godalming, showed the handsomely blotched *Cypripedium Magnet*. F. A. Rehder, Esq. (gardener, Mr. Norris), The Avenue, Gipsy Hill, staged the hybrid *Cypripedium Rehderianum*, a very dark sort.

One of the brightest and prettiest exhibits was the large display of *Cyclamen* made by Messrs. Sutton & Sons, of Reading. The specimens were dwarf, exceptionally free-flowering, and the flowers needed no support. The collection consisted of seedling plants raised from seed sown in November, 1896, and illustrated the various types of this beautiful flower. Among the varieties that attracted the most attention were Sutton's Salmon Queen, flowers of a bright salmon colour deepening to crimson-purple at the base; Sutton's White Butterfly, unsurpassed as a white variety, with flowers remarkable for their great substance and good form; and Sutton's Vulcan, of the darkest crimson colour and a charming contrast to Butterfly. The "Giant" varieties were noticeable for the extraordinary size of the blooms. The forms shown of this strain included Sutton's Giant White, with flowers of lovely form and of the purest whiteness; Sutton's Giant Crimson, especially distinct and telling, brightening up the appearance of the whole group; Sutton's Giant Pink and Sutton's Giant Crimson and White. For comparison, a few specimens of *Cyclamen persicum*, the original type, were exhibited, which illustrated the great strides made in this now popular winter-flowering plant. There were also some semi-double forms, and others with the margins of the segments charmingly lacinated that were both handsome and interesting. A Silver Flora Medal was awarded.

Messrs. John Laing & Sons, Forest Hill, S.E., received a Silver Flora Medal for a very showy group of flowering and foliage plants. *Clivia striata aurea* was represented by a finely variegated piece. There were also two grand plants of *Begonia Gloire de Lorraine*. *Nepenthes*, *Crotons*, and *Dracaenas* were all very bright and handsome, and the whole of the plants were attractively staged. *Dracaena Distinction* and *D. Excellens* were two of the finest forms.

Messrs. H. Cannell & Sons, Swanley, Kent, staged a capital table of Chinese Primulas. This was a very representative collection, many of the leading types being on view. Amongst the singles Eynsford Red, Swanley Yellow, Distinction, Cannell's Pink, Swanley Blue, Eynsford White, Emperor Improved, and My Favourite were well shown. A hatch of double varieties included such well-marked and useful varieties as King of Purples, Mrs. R. Crabbe, Annie Hillier, and Teronica (Silver Flora Medal).

A nice hatch of *Cyclamen* came from Messrs. Hugh Low and Co., Bush Hill Park, Enfield. The plants were exceptionally sturdy, and the flowers very large and fine. White, crimson, pink, and purple were the colours of the varieties shown. Samples of the new tree Carnation Winter Scarlet were also on view (Silver Banksian Medal).

A grand array of Primulas came from Mr. John Box, West Wickham. The plants were wonderfully vigorous, and the foliage, [more especially of the Fern-leaved varieties was really splendid. The flowers were also of great size and substance, but all the petals were much crimped and gophered. The type of the whole exhibit was that class of Primula common to the Midlands, where a much longer season of growth is afforded the plants. Princess Mary, Queen of Primulas, Rosamond, Wickham White, and Cannell's Pink were some of the finest forms forthcoming (Silver Flora Medal).

Sprays of the winter flowering shrubs, *Garrya elliptica*, *Hamamelis arhorea*, and *H. japonica zuccariniana* were exhibited by Messrs. James Veitch and Sons, Ltd., Chelsea. A stand of cut-blooms of hybrid *Rhododendrons* of the Javanico-jasminiflorum section was also sent by the Chelsea firm. Lord Wolseley, Minerva, Sybil, Aphrodite, Thetis, and Amabile were all vastly pretty varieties.

Four pans of *Narcissus monophyllus*, full of flower were sent by Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, N. A pot of *Fritillaria oranensis* also came from the same firm.

At a meeting of the fruit and vegetable committee a Silver Banksian Medal went to Mr. W. J. Empson, gardener to Mrs. Wingfield, Amptill House, Amptill, for thirty dishes of excellent Apples and Pears. The fruit was in good condition for the advanced season of the year. Gascoigne's Scarlet, Baumann's Red Winter Reinette, Beauty of Kent, King of the

Pippins, and Ribston Pippin were some of the best Apples.

A Silver Knightian Medal went to Mr. J. Bury, Petersham Grange, Byfleet, Surrey, for a collection of well preserved Grapes.

Fifteen dishes of Apples were submitted for the Veitch flavour prize. Mr. J. C. Tallack, Livermere Park Gardens, Bury St. Edmunds, was placed first with Margil. Col. Brymer, Islington House, Dorset, was second with Claygate Pearmain.

Two dishes only of Pears were sent. Mr. C. Ross, gardener to Captain Carstairs, Welford Park, Newbury, was first with Josephine de Malines. Mr. Thos. Rochford, Turnford Hall Nurseries, showed the new Grape, Turnford Hall. Messrs. T. Francis Rivers & Son, Sawhridgeworth, showed Citrons, and a bunch of Grape Mrs. Pearson.

A cultural commendation was awarded to Mr. J. Miller, Ruxley Lodge, Surrey, for a splendid box of Mushrooms.

QUESTIONS AND ANSWERS

* * * Will our friends who send us newspapers be so good as to mark the paragraphs or articles they wish us to see. We shall be greatly obliged by their so doing.

[Correspondents, please note that we cannot undertake to name florists' flowers such as Carnations, Pelargoniums, Chrysanthemums, Roses, nor such as are mere garden varieties, differing only in the colour of the flower. Florists' flowers, as a rule, can only be named by those who grow collections of them.]

Climbers for Pillars.—A. C.: Although your district is wet we should understand that the temperature is mild and equable, and that you would have little frost or snow. If so a good many climbers ought to succeed. Amongst deciduous kinds you might well try Tea Rose Gloire de Dijon, Noisette Rose Wm. A. Richardson, *Wistaria chinensis*, *Jasminum officinale* (white), *J. revolutum* (yellow), *J. nudiflorum* (yellow and flowering in winter), Honeysuckle, *Aristolochia Siphon*, *Clematis Jackmanni*, *C. Flammula* (small sweet-scented flowers), *C. Viticella* (small purple flowers), *Rosa moschata* (the single Musk Rose) and *Lonicera flexuosa aurea reticulata*. Amongst evergreens you might use varieties of the Ayrshire Roses, also *Crataegus Pyracantha*, the broad-leaved Ivy (*Hedera Helix latifolia*), *H. H. palmata*, and other varieties of Ivy which you might feel inclined to use. *Passiflora caerulea*, *Clematis montana*, and *Solanum jasminoides* are somewhat tender, but very handsome climbers. They flower profusely in various parts of the country where the cold is not too great for them. *Ampelopsis Veitchi* would not produce showy flowers, but the foliage is very effective and quite distinct from any of the above kinds.

Worms in Carrot ground.—A *Grampian Reader*: We are not quite sure whether you mean that your ground is infested with earth worms, or simply the grub of the Carrot Fly. If it is the former we scarcely think they would do the Carrots harm. Old garden soil, rich in vegetable mould, is always more or less infested with earthworms; but this matter could be greatly remedied by an application of lime which would cause the vegetable mould to decay more rapidly and become fit for plant food. Most likely, however, you mean the grub of the Carrot Fly which makes the roots wormy. We have no great faith in dosing the ground with paraffin as we consider it inimical to plant life, especially if used in any quantity. Should you be determined to use it, the best plan would be to wait till the Carrots are germinated, and then get a barrow load of river sand on which you should pour sufficient paraffin as to moisten it or taint it sufficiently to make it offensive to the winged state of the fly. Scatter this thinly all over the ground between the lines, without letting the sand touch the plants. The operation might be repeated after an interval of two or three weeks while the Carrots are in that stage when the grubs do most harm. This will help to drive away the mother flies and prevent them from laying their eggs there. The only way you could spread paraffin and water evenly over the ground would be by the syringe, stirring it all the time, otherwise you cannot keep them mixed. Well prepared ground often grows better Carrots than attempting to correct it by insecticides. Trench the ground 2 ft. or 3 ft. deep if the soil is good, otherwise bring some fresh soil and spread over the old, mixing the two in trenching. Lime would improve heavy or old garden soil rich in humus. Wood ashes would be distinctly advantageous in most cases. Trenching is advantageous in burying the pupae of the fly. Heavy soil is sometimes improved by a dressing of peat, and burnt clay crumbled up finely serves the same purpose and promotes the growth of the Carrots.

Slugs on Strawberry Beds.—*Dodford*: It is difficult to deal with slugs on so large a scale as you mention, especially when one considers how well

CARTERS

GREEN PEAS—JUNE TO NOVEMBER.

CARTERS

A correspondence was raised in the Daily Press last Autumn upon the shortness of the season when Green Peas are available, both in gardens and on the market. We now offer the following as representing the best collection selected from 1,024 rows we had under trial last season. It would be difficult for us to give precise dates for putting the seed into the ground, as so much depends upon soil and situation. Successional sowings may be made any time between these dates, and the last sowing not later than the second week in June.

| NAME. | DESCRIPTION. | HEIGHT. ft. | WHEN TO SOW. | EXPECT READY TO PICK. | CARRIAGE FREE. Per pint. Per qt. |

 { 1 quart each of 7 varieties, price 22s. 6d. }

PURCHASERS SHOULD SEE THAT THESE PEAS ARE IN OUR SEALED PACKETS.

The Queen's Seedsmen,
 237, 238 & 97, HIGH HOLBORN, LONDON.

they are protected by the foliage of the Strawberries. Clayey and heavy soils are often infested in the way you mention. Nevertheless, it might be worth your while to try some remedies. Wood ashes or charcoal dust is considered a better remedy than either soot or lime. This might be scattered over the ground in spring after growth has been proceeding for some time. A second application might be given before covering the ground with straw to protect the berries from being splashed with sand and mud. Ducks might be allowed to roam at large over the Strawberry ground at all times until the berries get to some size. A good way of applying lime would be to steep some quick-lime in a large barrel or two and then water the ground with it by means of a rosed watering pot. This should be done in moist warm weather when the slugs are out feeding, or on dewy mornings or evenings. The lime water should be allowed to settle till it is clear before using, and if very strong it should be diluted. Nitrate of soda dissolved in water and distributed over the ground in the same way is also said to be a good remedy. If done after the fruits are of some size, it would be less likely to cause an over luxuriance of leaves, than if it were done earlier. Wet weather is your chief enemy, greatly assisting the slugs, when the crop is ripening.

Unfruitful Walnut.—*J. T. Thurston*: It would be difficult to say exactly why your tree will not fruit more abundantly without knowing something of the circumstances of the case. Trees raised from nuts do not as a rule come into bearing until they are eighteen or twenty years old, though frequent transplanting in the nursery stage sometimes causes them to come into bearing as early as the sixth year. Trees that are budded or inarched always come into bearing at a much earlier age than trees raised from nuts. As to the other points at issue we suggest that you root-prune the tree if it is growing too vigorously. Take out a trench half way round the tree and at a distance of 5 ft. from the trunk, cutting the stout roots with a clean cut, and also those that penetrate the soil perpendicularly. This may be done now, and the remainder at the end of next September. If your tree is in poor soil feeding would be the most obvious remedy. This could be done by top-dressing the soil very heavily with old but rich soil from beneath the potting benches, mixing it with leaf mould, wood ashes, and well decayed stable manure. This could be done now and again next autumn. The Walnut also likes shelter from cutting winds, especially in spring when the tree is in flower. Late spring frosts also destroy the blossom. Climate is a potent factor in the fruiting of the Walnut; but there should be no difficulty on that score in your district. Shelter from east winds would be serviceable, however. You will have to study which of the above remedies most applies to your case and act accordingly.

Excrescences on Apple Trees—*Examination*: Your trees are very badly affected with the American Blight (*Schizoneura lanigera*) a species of woolly plant louse allied to *Aphis*, and, in fact, belonging to the family *Aphididae*. The specimens you sent us are as bad as we have seen upon young trees. The Woolly Louse attacks the bark of the young shoots in summer, and punctures the bark in order to suck the juices. As a result the injured shoots cannot swell properly, but split, and then develop warty excrescences of spongy tissue. The insects take up their quarters where they get the most shelter. You did right to wash the shoots with an insecticide. You do not mention what you used, however. You should repeat the operation again in spring when the weather gets warmer. A useful wash can be made with a solution of 5 lbs. of quicklime, 1 lb. of sulphur, and 2 gallons of water, heating until the sulphur is dissolved. Use a painter's brush, half worn, with

which to wash the shoots, rubbing the insecticide well into the axils of the branches and the cavities in the injured wood. The work might be repeated during summer if the pest shows itself. Paraffin emulsion is another good remedy, but must be carefully and properly made to prevent damage to the foliage. A safe remedy would consist of Gishurst's Compound, which you may use in lather from the cake, rubbing it well into all cracks and crevices. You might remove some of the soil from the base of the trees, and re-place it with fresh. Persevere till you succeed in eradicating the pest.

SEED MARKET REPORT.

London, Jan. 11th, 1898.

Messrs. Hurst & Son, 152, Houndsditch, and 27, Seed Market, Mark Lane, report a moderate enquiry for agricultural seeds. English Red Clover is being marketed slowly and price is expected to recede when weather is more favourable for threshing. Foreign Red Clover is in full supply and very cheap. White Clover offers at reasonable rate. Alsike neglected. Trefoil steady. Ryegrasses unchanged.

McARTHUR & CO.'s 1898 HORTICULTURAL GUIDE for Amateurs & Exhibitors.

SENT POST FREE TO INTENDING CUSTOMERS.

THIS Guide or Catalogue is beautifully arranged and illustrated, and contains one of the finest selections of Novelties in the Kingdom. The greatest care has been taken to select the finest quality seed, and cannot fail to give satisfaction. All who wish to have beautiful flowers in their greenhouses, and in the open ground, at about half the price advertised by other firms, should send for this Guide.

The very smallest orders are acceptable, and will receive as much attention as the larger ones. Threepence in the Shilling discount allowed for CASH ONLY on all orders booked before the end of January, and can be forwarded whenever customers wish.

Order this Guide AT ONCE to prevent disappointment, as I have only a limited number of copies and cannot reprint. My advertisement for Prize Collections of Flower Seeds will appear in January.

Please mention this Paper to—

WEBBS' CHOICE CELERIES.

The Best in Cultivation.

WEBBS' NEW GIANT WHITE.

Valuable for exhibition or table purposes. The heads are very large, white, and exceedingly crisp and sweet in flavour.

1s. per Packet, post free.

WEBBS' PINK PERFECTION.

A new early variety. The stalks are large, thick, and of rich nutty flavour; retains its freshness a long time after being dug up.

1s. per Packet, post free.

WEBBS' MAMMOTH RED.

THE BEST RED CELERY. Very large, solid, crisp, and possessing an excellent nutty flavour. Grown successfully everywhere.

6d. and 1s. per Packet, post free.

See Webbs' Spring Catalogue, post free, 1s.

BARR'S SEEDS

OF FINEST SELECTED STRAINS
AND TESTED GROWTH

Barr's Ne Plus Ultra French Bean.

A fine forcing variety, very early, and producing an abundance of fine pods Per quart, 1s. 6d.

Barr's Earliest French Shorthorn Carrot.

A favourite for soups, and extremely early; the best variety to sow in frames. Per oz., 10d.

Barr's Pride of the Market Cucumber.

A specially fine selection, dark green, and of handsome shape, a favourite in Covent Garden Market. Per packet, 1s. 6d.

Barr's Improved Telegraph Cucumber.

A fine selection, handsome straight fruit of fine flavour, very prolific. Per packet, 1s. and 1s. 6d.

Barr's "Eureka" Melon.

A grand new scarlet-fleshed variety, fruit large and densely netted, flavour delicious, heavy cropper and early; a splendid exhibition variety. Per packet, 1s. 6d. and 2s. 6d.

Barr's First of All Radish.

Fine little, short leaved, very early Radishes, scarlet or white. Each, per oz., 6d.

Barr's Early Ruby Tomato.

Large, solid, bright scarlet fruit, of fine form; an abundant cropper, and best first early Tomato. Per packet, 1s.

Barr's Thick-fleshed Tomato.

Surpasses all other varieties for depth of fruit, solidity of flesh, high quality, and heavy cropping. Per packet, 1s.

Barr's Seed Guide, containing a full descriptive

List of the best vegetables and most beautiful flowers, sent free on application.

BARR and SONS,

12 & 13 KING ST., COVENT GARDEN, LONDON.

SEED LIST

(Free on Application).

FEATURES:—

Alphabetically arranged.

Best sorts, in heavy type, can be seen at a glance.

Probably the most explicit practical instructions for cultivation ever published in any Catalogue.

Many hints and recipes for cooking and serving the various vegetables.

Directions for the storing and forcing of vegetables Medical qualities of many vegetables and herbs.

Prizes of £5, £3, (two of) £2, and £1 offered for photographs of horticultural subjects (see page 2 of Catalogue).

THE LIST, containing 93 pages and a profusion of illustrations, shows (a) WHAT TO GROW, (b) HOW TO GROW IT, and (c) WHAT TO DO WITH IT WHEN GROWN, and has been described by an Agent as one of the largest estates in England as a BOOK OF REFERENCE.

Another Customer, testifying as to quality writes:—"I should like to add that all the Seeds, &c., purchased from your establishment during the past 14 years have been of the very best quality, and have given great satisfaction."

RD. SMITH & Co.,

Seed Merchants & Nurserymen,

WORCESTER,

TO THE TRADE.

NEW VIOLET Mrs. J. J. ASTOR.

We beg to draw the attention of all growers of Violets to this beautiful double variety now first introduced by us from America. Of a lovely shade of rosy-heliotrope, the fine flowers are rather darker than Mme. Millet, and the growth more vigorous. It is also a surprisingly free bloomer, early and very sweet scented. The stock being limited, we advise all intending purchasers for spring delivery not to delay sending their orders which will be executed in rotation. Over twenty-five other varieties in stock.

SUTTON'S PEAS

For Early Work.

SUTTON'S MAY QUEEN.

Per quart 2/6.

'Your May Queen is the earliest and finest-flavoured Pea I have ever grown. Side by side with William I. and American Wonder, May Queen was a fortnight in advance. I picked them in the third week of May.'—Mr. GEORGE TOMLINSON, Gardener to D. SYKES, Esq

SUTTON'S A1.

Per quart 3/-

'Your A1 is the best and earliest Pea I have grown, coming in one week before William I.'—Mr. F. F. WHITEHEAD, Gardener to J. H. FISHER, Esq.

SUTTON'S EXCELSIOR.

Per quart 3/-

'For forcing, border and early growing, your Excelsior Pea is superb. It bears pods in pairs at every joint, well filled and of handsome shape.'—Mr. ALBERT PRIOR, Gardener to P. FRANCIS, Esq.

FRIDAY, January 28th.—Sale of Imported and Established Orchids by Messrs. Protheroe and Morris

POTATO EXPERIMENTS IN IRELAND.—It is not surprising that the celebration of the tercentenary of the introduction of the Potato at Dublin on the 9th and 10th December 1896, should have given some fresh impetus to the cultivation of the noble tuber in the Sister Isle. Mr. William Hosford, of Cork, has been giving an account of his experiments, with varieties largely picked up at the tercentenary exhibition, in the *Irish Farming World*. In speaking of the Potato crop of 1897 in Ireland, he considers it the lightest and most indifferent in quality they have had for many years past. Potatoes planted on well prepared dry land previous to the 25th March gave a fair average; plantations from that time till the middle of April on low lying land gave half a crop; while grass land, turned up into lazy beds about the end

of April and the beginning of May produced a crop not worth the trouble of lifting. Old customs die hard, but surely a crop that is so valuable in Ireland deserves better attention than the system of culture known as lazy beds. Mr. Hosford says there are three requisites in order to insure a profitable crop, (1) a good variety of seed; (2) proper cultivation, including manuring; (3) the right season of planting.

Independently of his results with the different varieties of Potatos, his experiments with manures are interesting, if only to confirm the results obtained by good authorities in this country. Mr. Hosford says that until recently it was the belief that profitable crops of Potatos could not be grown without farmyard manure; but he now affirms that the idea is not a correct one, though he asserts that good farmyard manure contains most of the ingredients necessary for the growth of the Potato. In our opinion it is largely a question of the state of the soil as to the humic matter it contains, and the nature of the season as to dryness or moisture. A good tilth of the soil would also tend to compensate for any lack of humus and a dry season. Farmyard manure, if really well made and not subjected to wasteful loss, acts mechanically as well as chemically by greatly assisting the retention of soil moisture, without which the Potatos would be unable to utilise the nutritive elements in the soil. Granted sufficient decayed animal and vegetable matter in the soil, and a moderate rainfall, farmyard manure could easily be dispensed with in the cultivation of Potatos. Ireland is better supplied with moisture during the growing season than this country, and could, therefore, the more readily dispense with farmyard manure for this particular crop. We understand that the planting of Potatos in low lying and bog land is the cause of more than half of the trouble with Potato culture in Ireland. Farmyard manure in such land is generally a greater evil than all the good derived from it under those conditions, for the simple reason that it favours the rapid growth and spread of the Potato disease, fostering it in any season, but more particularly when wet.

The experimenter speaks very highly of artificial manures, and we can quite believe they would give even more satisfactory results in Ireland than in this country, because they do not retain the moisture so favourable to the growth of the Potato fungus. Potash is required by the Potato plant in considerable quantity, and can be supplied most cheaply by the use of the salt known as kainit. He mixed this with an equal quantity of the best superphosphate (35 per cent. soluble), and used it at planting time. A small dressing of nitrate of soda was given when the Potatos were being earthed up; but in some of the lines sulphate of ammonia was employed instead of the nitrate. The sulphate is usually the stronger of the two nitrogenous manures, but the only perceptible difference was that the Potato haulm kept green for a week longer in the case of the sulphate. The results of using these three manures in the manner indicated were obviously good. Where the nitrogenous manures were both omitted the growth of the plants was weak. This is what we should have suspected, for nitrogen favours vegetative growth, and is of primary importance to Potatos. In other plots kainit and superphosphate were each used separately along with farmyard manure at planting time. Kainit gave the better result, thus showing that for Potatos the order of importance for all these artificial manures is (1) nitrogen (2) potash (3) phosphates. The first applied as a dressing, when earthing up the Potatos, and the two latter given in mixture with farmyard manure at plant-

ing time gave the best results of all. The net result again proves that an over-supply of one particular element of plant food, without an adequate proportion of all the other necessary elements is useless and wasteful.

The skill of the cultivator is put to the test when he determines by experiment what particular elements of plant food are most deficient in any given soil; for by supplying this deficiency, and that only, he gets the best possible crop with the smallest necessary outlay upon manure. Mr. Hosford also pitted farmyard manure against the artificial fertilisers in separate pots, and was greatly surprised at the much better results given by the latter alone. The plants supplied with the artificial manures led the way from the first and maintained it to the last. They also gave the greater weight of tubers, which were of equally good quality when cooked. The question arises whether or not the benefit obtained by the use of artificial manures will only be temporary. This is only what might be expected, because being more readily soluble than farmyard manure, they would to a great extent get used up the first season. This need not trouble the cultivator, who practises a judicious rotation of crops, for if the land requires more humus for the retention of moisture, it can be applied for the sustenance and benefit of the succeeding crop which may not suffer from the Potato disease. In the case of land containing sufficient humic matters its fertility can be renewed by a fresh application of the artificial manures removed by the Potatos.

Royal Gardeners' Orphan Fund.—We have to announce that C. E. Keyser, Aldermaston Court, Reading (formerly of Stanmore) will preside at the annual festival dinner of the Royal Gardeners' Orphan Fund, which will be held on April 20th, at the Hotel Metropole.

Royal Horticultural Society's Meetings and Shows, 1898.—The following are the dates fixed:—February 8; March 8; 22; April 12; 26; May 10; 25, 26, 27, Temple Show; June 14; 28; July 12; 26; August 9; 23; September 6; 20; 29, 30; October 1, Fruit Show; October 11; 25; November 8; 22; December 13.

Liverpool Horticultural Association.—On last Saturday evening the members of this society held their annual reunion at the Adelphi Hotel, Liverpool, Mr. W. Fletcher Rogers, hon. treasurer, occupying the chair. The gathering proved a most successful one, 120 members and friends being present. After the dinner an entertaining smoker was carried out with unanimous appreciation, Messrs. R. P. Ker & Sons adding in no small degree to this gratifying position.

Public Gardens of Exeter.—The capital of Devon has recently become conscious of her responsibilities in the matter of making the public gardens more attractive, and operations with that object in view will shortly be commenced. Several of the watering places on the south coast of Devon, with the exception perhaps of Torquay, are no better supplied in this respect. Brighton, the queen of watering places on the south coast, is as bald, or more so than most other maritime resorts. Notwithstanding these facts it is asserted that meteorological observations have proved that Devon and Cornwall enjoy a climate in some respects superior to that of the Riviera. Why then do the inhabitants not put their gardens in order to attract the visitors who annually seek enjoyment at the maritime resorts of the Continent on the shores of the Mediterranean. Should Exeter succeed in beautifying the gardens of the already interesting and quaint old city, other resorts, particularly those on the sea board, might well follow the example. The paper by Mr. Richard Gill, of Penryn, read at the last meeting of the Devon and Exeter Gardeners' Association, showing the capabilities of the south western counties to support a rich and varied vegetation, some of which flower in the open air from mid-winter onwards, should nerve the people to plant freely, and judiciously.

The old way is the best.—First lady gardener: "So you have given up gardening of which you pretended to be so fond." Second lady gardener: "No fear; I wanted a job, so I just said 'yes' when the gardener asked if I would take sole charge of his nursery."

Rose Kaiserin Augusta Victoria.—*The Florists' Exchange* announces that a pure yellow sport from this hybrid Tea Rose is reported from Waynesboro, Pennsylvania. It opened on Christmas morning. If that had opened in London we fear the air was too impure for anyone to have discovered it.

Royal Horticultural Society.—The Council having been consulted as to a proper mode of the use of the Victoria Medal by members of the trade have decided that the only permissible method is by the letters V.M.H. following the name of the holder of a medal. No other mention of the medal can be properly made in any application pertaining to horticultural trade or relating thereto.—*W. Wilks, Secretary. By order of Council.*

"Garden and Forest."—With the completion of the tenth volume of this excellent American paper, devoted to gardening and forestry, on the 1st inst., its publication was discontinued, after ten years' useful service. The publishers announce that they have made an experiment extending over ten years with the view of establishing a weekly journal devoted to gardening and forestry, but absolutely free from all trade influences. The ten years' trial has shown conclusively that there is not a sufficient number of people in the United States, interested in the subjects at issue, to make a paper of this class self-supporting. This, we consider, is matter for regret; but surely the time cannot be far off when gardening in private establishments in the United States should represent a big and important interest. The florist there is simply a trader and entirely different from the cultivator and lover of flowers for their own sakes in this country.

Loughborough Gardeners' Association.—Mr. A. Hamsere presided at a meeting of this society on the 4th inst. Mr. J. Lansdell, of Barkby Hall Gardens, gave a lecture on "Soils." In his opening remarks the lecturer dealt with the formation of soil from the rocks through the action of the atmosphere, rain, etc. The disintegrating influences of the lichens on the rocks upon which they grew also received mention. Specimens of various soils were submitted for inspection, a few remarks being given on each. The fertilising of soils by the admission of nitrogen was next explained at length, and the great advantage of proper draining touched upon. From experiments made at Rothamsted in the month of June it had been found that the temperature of well-drained land was 67° Fahr., whilst on undrained land it was as low as 47°. On the approach of winter vacant land should be broken up to a good depth and left to the influences of rain, frost, etc.

Torquay Gardeners' Dinner.—The Torquay District Gardeners' Association held its sixth annual dinner at the Union Hotel, Torquay, on the evening of January 4th. Dr. Hamilton Ramsay filled the chair. Apologies from several gentlemen who were prevented by stress of business from being present were read. Upwards of seventy sat down to dinner, including Mr. W. B. Smale, J.P., Dr. Horton, and Messrs. A. Shelly, W. A. Masterman, J. Dendle, A. Chandler, G. J. Bulgin, G. Goodman, and Fred. C. Smale. The usual loyal toasts having been duly honoured, Mr. J. Dendle submitted "Success to the Association." He alluded to the services rendered by the president and secretary. Mr. F. C. Smale, in responding, appealed to gardeners not members to join the association. They had received £6 more in subscriptions than ever before during the past year, and they had now a list of members 130 strong. Mr. A. Shelly proposed the "Readers of Papers." The health of the president was heartily drunk at the invitation of Mr. W. B. Smale, who eulogised the services Dr. Ramsay had rendered both to their association and to horticulture generally. Dr. Ramsay's garden, continued Mr. W. B. Smale, was a splendid advertisement both of Torquay's climate, and of the achievements of horticulture. Dr. Ramsay briefly replied. Music contributed by Messrs. A. J. Blacker, J. C. Lockyer, G. H. Brierley, Damerell, and Prowse enlivened the proceedings.

Mr. H. B. Lloyd, for the past seven months on the staff at Kew Gardens, and formerly of Croxteth Park, Liverpool, has been appointed assistant curator under Mr. John H. Holland, curator at the Botanic Station, Old Calabar. Mr. William H. Johnson, whose appointment we mentioned last week, sailed for Aburi on the 19th inst.

Royal Horticultural Society.—The society's annual examination in the principles and practice of horticulture will be held on Tuesday, April 5th, 1898. Candidates should send in their names not later than the 1st of March. A Scholarship of £25 a year for two years is presented by G. W. Burrows, Esq., F.R.H.S., Member of the Court of the Worshipful Company of Gardeners.

Kelway's Manual.—This might almost be placed in the category of books, except for the nature of its contents, for it measures 10½ in. by 8½ in. and runs to 200 pages. The covers are ornamented with a coloured illustration of one of Kelway's new single Paeonies, the combination of shades and tints of the exterior and interior of the flower being admirably represented. Messrs. Kelway & Son, Langport, Somerset, are well known for the specialities which they cultivate so extensively in their nurseries at Langport. Some of them, such as Gladioli, Delphiniums, Pyrethrums, tree or Moutan Paeonies, and herbaceous Paeonies are illustrated with large photographic reproductions. Single and double flowered Cinerarias also receive a considerable amount of attention. Amongst vegetables, Peas, Runner Beans, Onions, and Potatos also constitute some of the finer pictures of the Manual, which is also a catalogue of all classes of plants likely to be required in the garden, herbaceous, shrubby, hardy, and tender. It is also a seed list, containing every requisite for the kitchen garden, as well as sundry farm crops. Most things recorded are more or less fully described, a considerable amount of information being attached to the garden flowers, such as a record of the height, the months of flowering, the colour of the flower, use, soil, position, treatment, and other remarks. These things will be of great service, not only to amateurs, but also to those who are not so well versed in the subject of botany as to remember what the various plants and flowers should be like.

Scottish Horticultural Association.—The annual meeting of this association was held on the 11th inst., at 5, St. Andrew Square—Mr. Todd, president, in the chair. Mr. R. Laird, the secretary, in his report congratulated all concerned on the very large measure of success which had attended the efforts made in bringing the association to the high state of perfection both as regarded its literary work and the influence it had brought to bear in cultivating the tastes of the general public with a love for horticulture in its higher branches. From its foundation in 1877, each year had shown a large increase in membership, which had been the means of establishing the association on a sound basis. In referring to the first minutes the membership numbered about 100, while at the close of the present session the number was 600. The last Chrysanthemum show, held from 18th to 20th November last, proved to be a gigantic success, there being 242 competitors. That being the Diamond Jubilee, it was resolved to commemorate the event by offering a special grand Jubilee prize of £150 for twenty varieties of Chrysanthemums in vases. The association also resolved that, to still further mark the appreciation of this event, to allocate the surplus profits of the show to charitable purposes. The sum realised, £250, was allocated as follows:—£100 to the Pavilion Fund of the Royal Infirmary, £50 to the Sick Children's Hospital, £50 to the Royal Gardeners' Orphan Fund, and £50 to the Gardeners' Royal Benevolent Fund. Mr. Alex. Mackenzie, the treasurer, submitted the financial statement, which showed that the revenue for the last show amounted to £1,264 7s. 8d., and the expenditure to £1,189 6s., showing a balance of £75 1s. 8d. There was also a balance of £88 19s. 2d. on the association's funds, and this left a total surplus of £164. The reports were adopted, on the motion of Mr. R. W. E. Murray. The following officials were elected:—Hon. president, the Duke of Buccleuch; president, Mr. M. Todd; vice-presidents (two vacancies), Mr. D. P. Laird and Mr. James Grieve; secretary, Mr. Robert Laird, 17, Frederick Street, Edinburgh; assistant secretary, Mr. J. H. Murray; and treasurer, Mr. A. Mackenzie.

An Observatory for the Royal Botanic Society.—At a recent fortnightly meeting of this society, held at the gardens, Major Cotton, who presided, said that the year 1897 had been a very eventful one in the history of the society, and he was pleased to be able to congratulate the Fellows upon the improvement in the prospects. A new lease for the maximum period of thirty-one years had been promised by the Commissioners of Woods and Forests. Not only were the gardens open for study to pupils at the various medical schools, but a school of practical gardening had been started, with the approval and aid of the London County Council. The council of the British Astronomical Association were taking steps to build and equip an observatory in the gardens. Reference was made to the great increase in the number of Fellows admitted to the society during 1897, being over eighty above the average annual number for the last ten years.

Shirley Gardeners' Mutual Improvement Association.—A meeting of the above society was held at the Parish Room, Shirley, Southampton, on Monday the 17th inst., the president, W. F. G. Spranger, presiding over a fair attendance. Mr. E. T. Mellor, B.Sc. (London), lecturer in biology at the Hartley College, gave a lecture—illustrated by lantern slides—on "Fungi; Their Mode of Life and Reproduction." The lecturer said the majority of fungi were like the beggars and thieves of humanity, living on the labours of others. He showed how they were so easily reproduced in enormous numbers, and the difficulty in dealing successfully with them to prevent this increase, even when the climatic influences were against them, owing to their being able to produce resting spores which could wait till the conditions were favourable. The lecture will be followed by another next month entitled—"Injurious and Beneficial Fungi." A hearty vote of thanks to Mr. E. T. Mellor brought a very instructive evening to a close.

Devon and Exeter Gardeners' Association.—Himalayan Rhododendrons formed the subject of the paper for the evening at the meeting of this association on the 12th inst. Mr. Richard Gill, gardener to H. Shilson, Esq., Tremough, Penryn, Cornwall, prepared a paper, but being unable to be present, the paper was read by Mr. Henry Webber, of the Royal Nurseries, Exeter. Mr. Gill indicated that the cultivation of Himalayan Rhododendrons had birth concurrently with the publication of Sir J. D. Hooker's journals of the Himalayas. Previous to that time Himalayan Rhododendrons were scanty in our conservatories, and no one apparently dreamed of their suitability for outdoor culture in this country. Their introduction instituted a new era in gardening history. When people discovered that Rhododendrons from the Himalayas could be grown in the more favoured parts of this country, the wealthy turned their attention to the cultivation of many tropical subjects during the summer months. In the southern counties of England and Wales many plants of a sub-tropical character are planted permanently in the open-air. Meteorological observations went to prove that the two most westerly counties of England enjoyed a climate superior in many respects to that of the Riviera. Some plants which get killed in the south of France during severe weather, pass the winter unharmed in the more favoured parts of those counties. Rhododendrons, whether regarded from a landscape point of view, the length of their flowering season, or their beauty of form and variety of colour, more than repaid the time and money bestowed upon their culture. It is true that some of the earlier varieties are liable to be destroyed by sharp frost, but latter displays more than make up for the loss. The humidity of the atmosphere in the west of England and South Wales, in addition to the mildness of the same, greatly favoured the wellbeing of the Rhododendrons. They also liked peat in some form or other and plenty of granite sand; but lime, chalk and a water-logged clay soil were their enemies. Being surface rooting plants they could not stand prolonged droughts. The lower branches should be carefully preserved, as they served to retain the moisture. Other details of culture were given, followed by notes about the more important of the forty-three species of Himalayan Rhododendrons described by Sir Joseph D. Hooker. T. Kekewich, Esq., J.P., Peamore, occupied the chair. A lively and profitable discussion followed the reading of the paper.

The Everbearing Peach is a variety recently given to the United States by Mr. Berckmans. It is said that the earliest fruits commence to ripen by the beginning of July, and successive crops are produced for the next three months by the same tree. The other good qualities of the variety are not so pronounced.

Chrysanthemum Show and Congress at Lille.—We are requested to say that an International Show and Congress to be held under the auspices of the Northern French Chrysanthemum Society will take place at Lille on the 10th November next. The show will be held in the Palais Ramea, a vast building eminently suitable for the purpose, and will be open five days. Amateurs and nurserymen of all nationalities are invited to take part. The Schedule will be issued in a short time, and it is expected that the Railway Companies will make a reduction of fifty per cent. in the fares.

Ealing Gardeners' Society.—On the 11th inst. there was a very good meeting and exhibition in connection with this society. In the class for a collection of vegetables (six dishes), there were six entries, which gave the tables quite a furnished effect, as the collections were well-grown and well set up, one member going so far as to neatly label his specimens with their botanical names. For instance, his Brussels Sprouts were designated "*Brassica oleracea bullata gemmifera*, Sutton's Exhibition" an education in itself. Mr. George Wythes, Syon House Gardens, supplied the incentive, the prizes going to Messrs. R. Green, J. Long, and C. Edwards. A collection of Potatos (three dishes, distinct) brought out four lots, the awards being made to Messrs. A. Crabh, W. Roberts, and C. Edwards. These prizes were in kind, and given by local tradesmen. Some other exhibits were also staged, including a dozen fine examples of Cranston's Excelsior Onion, by Mr. James Gibson, Devonhurst Gardens, Chiswick, and which were considered sufficiently excellent to receive a cultural certificate. Mr. Gihson stated that he brought them over to show that exhibition Onions, if well-grown, would keep as well as other varieties. They were large, solid, and of good appearance. Mr. Gibson occupied the chair, and in opening the meeting referred to the excellence of the exhibits and the credit it reflected on the exhibitors for the season of the year. Mr. F. Miles, Hangerhill House Gardens, then read a practical paper on Crotons, which received a meed of praise, and produced a good discussion. The botanical members preferred the more correct term of "*Codiaeums*" as representing the proper section of Euphorbiaceae, to which these garden plants belong. The chairman and Mr. Miles received the customary hearty votes of thanks.

LACHENALIAS.

WHEN well grown these Cape Cowslips make a good show in a greenhouse from the New Year onwards; and being amenable to gentle forcing a succession can be kept up by those having a good stock.

Their culture is very simple, but a few remarks may not be out of place to those who may be contemplating giving them a trial. June or July is about the best time to purchase the bulbs when resting. They should be potted up soon after receiving them, placing nine bulbs in a five and a half inch pot, or three less in a four and three-quarter inch pot, just leaving the top of the bulb above the soil. Press them fairly firm, water them if the soil is at all dry, and place the pots in a cold frame kept close until growth takes place.

I find it a good plan to cover the pots with cocoanut fibre refuse which prevents them drying up so fast. As soon as they make a new start place them as near the glass as possible, still keeping them in a cold frame or pit. Give the plants more space as growth extends, and on no account must they be allowed to suffer for want of water. As soon as you find the pots filled with roots, which is not long after potting, give them a little weak manure water once a week, and this must be continued right up to the time the little bell-shaped flowers begin to expand, increasing the stimulant as the plants gain strength.

The soil should consist of loam and leaf-soil, one-third of the latter to the former, adding a six-inch potful of bone meal and soot respectively, to each bushel of soil, with a fair quantity of rough silver sand. As with Freesias, the cooler they are brought into flower the finer the spikes. After flowering they

must be kept under glass and not allowed to suffer for water, though this must be gradually withheld as the growth matures and turns yellow, when they may be laid aside for a time. They should again be shaken out and repotted towards the end of July or early in August, discarding all offsets, unless required to increase the stock. Give the same treatment as before advocated.

There are a score or so of species and varieties, but my experience is limited to the following:—*L. luteola*, light golden yellow; *L. Nelsoni*, rich yellow; *L. pendula*, red, tipped green and yellow, a very pretty variety and a strong grower; and *L. tricolor*, very free flowering, yellow, margined with green and red. The last-named has its leaves spotted. There are some white, as well as rose sorts, the best of which I hope to add to our collection a little later. I have used them as cut flowers for vases, but to my idea they appear a bit shy for this purpose.—*J. Mayne.*

NOTICES OF BOOKS.

THE GARDEN ANNUAL ALMANACK AND ADDRESS BOOK. Published by W. Robinson, London; "The Garden," and "Gardening" Office, 37, Southampton Street, Strand, W.C. 1898. Price 1s.

THIS annual publication maintains the principal features of former years, namely, the almanack for each month of the year 1898; an alphabetical list of nurserymen, seedsmen and florists in the United Kingdom; foreign nurserymen, seedsmen and florists; horticultural builders, engineers and sundriesmen; the principal gardens in the United Kingdom; an alphabetical list of country seats; gardeners' names and addresses; the principal horticultural and botanical societies; the new plants of 1897; postal information, &c., all of which are more or less useful to various people throughout the horticultural world, but particularly in Britain and Greater Britain.

Incidentally we note that the inside title page announces that the book contains an almanack for 1897, but this must be an oversight. The weather warnings and kindred statistics of some former editions have been omitted and their place occupied by more up-to-date requirements of the gardener and gardens. A list of the principal horticultural and botanical societies, and a list of the staffs of botanical departments and establishments abroad, but in correspondence with the mother garden at Kew, are also useful additions. The volume has slightly increased during the past ten or fifteen years, the pages during that period rising from 319 to 411; and this is the case notwithstanding the fact that the new plants are now no longer described beyond a record of the award each has received, the society awarding it, the date of the same, and by whom exhibited.

The leading and most essential feature of the "Annual" is the address list given under its several headings. Leaving out of account the horticultural and botanical societies at home and abroad, as well as the botanical gardens abroad, the pages rise from 187 to 291 during the past fifteen years. This must be largely due to the greater number of addresses that have been got together, as well as to the new gardens that have been laid out since then, the increase of nurseries, and of establishments that supply the ever-increasing wants of the garden. We are amused to notice only one address given under the heading of Haddingtonshire, the rest being given under East Lothian, as if it were a separate county, which is not the case. Nevertheless the desert has not yet wholly been brought in, as Kipling would say; for many establishments now exist as deserving of being recorded as some of those that are. There is an increase of country seats in various parts of the British Isles, as well as the town or suburban residences of merchant princes, of which we fail to find record. Some of the most remote and seemingly isolated garden establishments are, moreover, in touch with the newest Rose, Chrysanthemum or Carnation, and therefore, deserving of recognition.

The names given are not, however, correct in all cases. A perfect list would be almost impossible of accomplishment for any one year, owing to the incessant changes amongst gardens, gardeners, and even employers, all over the country. Establishments in some cases get completely broken up, some

of them in fact, being built over, leaving no trace it may be of the erstwhile fine gardening establishment. This is entirely human; but the address list will be found most useful all the same.

REPORT OF THE COUNCIL of the Royal Horticultural Society for the year 1897-98, with the List of Fellows, Associates, and Affiliated Societies; also Arrangements for the year 1898. 117, Victoria Street, London, S.W.

The Report of the Council gives a list of Fellows, of whom there are something between three and four thousand. It also contains the annual revenue and expenditure account, which the Fellows will peruse with interest. From it we note that the Temple Show was at once the most popular, most expensive, but most remunerative, of the shows held by the society during the past year. It may interest our readers to know that the expenses connected with the Victoria Medal of Honour amounted to £174 14s. 3d. The produce sold at Chiswick Gardens, admissions, and other miscellaneous items, brought a return of £357 3s. 3d., reducing by that amount the maintenance of that historic trial ground. The total expenditure of the society was £5,481 6s. 3d., and the total revenue £6,303 13s. 7d., thus leaving a balance of £822 7s. 4d. on the right side, which will be the most interesting item to many.

The list of plants for distribution from the society's gardens at Chiswick accompanies the report. Some of the plants offered are scarce, as is usually the case, but Ivies and Phloxes are numerous in variety, particularly the Phloxes, of which the trial has been extensive for some years past.

The "Arrangements for the Year 1898," besides the record of arrangements, gives some interesting items concerning the examination in horticulture to be held on April 5th next. G. W. Burrows, Esq., F.R.H.S., a member of the Court of the Worshipful Company of Gardeners, offers a scholarship of £25 a year for two years to the student who shall pass highest at the examination and comply with the conditions. A similar scholarship is offered by the Rt. Hon. the Lord Amherst for 1899.

THE ENGLISH TULIP, and its History, with notes on its Culture and raising of new Seedlings. Barr & Sons, 12 & 13, King Street, Covent Garden, London, 1897. Price 1s. 6d.

The terms English Tulip apply to the varieties of the florist's Tulip, which have long been cultivated by amateur specialists, more particularly in this country, and which, presumably, have for the most part been raised in Britain. As our readers will remember, a great Tulip Conference was held by the Royal National Tulip Society in the Royal Botanic Society's Gardens, Regent's Park, on May 12th, 1897. We gave an account of the conference at the time, but permanence is also given to the papers read by their being embodied in pamphlet form. An illustration on the back cover shows the main characteristics of a feathered, flamed, and breeder English Tulip; and the text of the lecture on "The History and the Properties of the Florist's Tulip," by J. W. Bentley, will enable the would-be student to master the details that limit and hedge about a Tulip admissible within the pale of that select group of varieties originating from *Tulipa gesneriana*, which the florist proper will condescend to recognise. As in the case of many other floral phenomena, the florist has never dreamed nor been able to imagine why his breeder Tulips should in course of time become variegated, that is, broken or rectified.

The known and recorded history and other items of information will, however, constitute interesting information for those who desire to make an acquaintance with the florist's Tulip. There is also a chapter on "Seed and Seedlings of the Florist's Tulip," by the Rev. F. D. Horner, M.A., V.M.H.; and another on "The Cultivation of the Florist's Tulip," by C. W. Needham, all of them being well worthy of perusal, because written by specialists of this particular culture.

PRACTICAL HINTS ON THE CULTURE OF CACTI. By Geo. Bourne (Silver Medallist). Price 2d. Biggs & Son, 139-140, Salisbury Court, London, E.C.

This, a pamphlet of thirty pages, is No. 4 of Messrs. Biggs & Son's handy series of fruits, flowers, and vegetables. It contains a number of woodcut illus-

trations of various genera belonging to the Cactus family. The author of it is himself a cultivator of what he considers an abused and neglected class of plants, capable of affording genuine pleasure to their devotees. Their culture is of the easiest description, and they are consequently adapted for those who have little time to attend to the requirements of their plants. The stems are usually quaint and singular, but their flowers vary from the purest white to the most gorgeous carmine, crimson, and rich yellow. Many of them are well-adapted for window culture, including showy flowering kinds like *Epiphyllum* and *Phyllocactus*. The author says that in Belgium and Germany the peasants are very partial to the Rat's-tail Cactus (*Cereus flagelliformis*), of which he has seen specimens in their windows, 9 ft. in circumference, and covered with bloom.

Some pages are devoted to the cultivation of Cacti, and the information supplied will prove most serviceable to beginners. Small pots are advocated; that is, small by comparison with those generally used for plants; and established plants require repotting only once in three or four years. The various requirements of the family are discussed, including syringing, watering, and compost. The only stimulant advocated is clear soot water once or twice a week during the growing season. Propagation is dealt with, as well as insect pests. These instructions are followed by short descriptive lists of all the species, under their respective genera, which the author considers worthy of the attention of the amateur. We think the spines are more liable to cause inflammation, rather than that they are poisonous. The Hedgehog Cacti, including the Devil's Pincushion, should not be sat upon. The booklet is unpretending, but well worth twopence.

PLANTS RECENTLY CERTIFICATED.

AT the meeting of the Royal Horticultural Society on the 11th inst., the undermentioned awards were made.

Orchid Committee.

CATTLEYA TRIANAERI SANDERAE, *Nov. var.*—The sepals of this variety are of the faintest blush, almost white; but the large, ovate and crisped petals are a shade deeper in hue. The lip is by far the finest and most conspicuous feature of the flower, its rich colours being brought into prominence by the pale sepals and petals. The large lamina is much crisped and crimson purple with a white edge; the tube is lilac externally, and striped with purple internally, while the blotch in the throat is lemon. The flower as a whole is large and handsome. Award of Merit. Messrs. F. Sanjer & Co., St. Albans.

LAELIA ANCEPS AMESIANA CRAWSHAY'S VAR. *Nov. var.*—The sepals of this variety are of the palest lilac, but somewhat darker at the tips. The petals are ovate, being of the same broad form as *L. a. Dawsoni*, but of a soft lilac with deep purple tips. The lamina of the lip is dark crimson, the disc golden, and the side lobes dark purple. The flower is larger than that of the type. Award of Merit. De B. Crawshay, Esq. (gardener, Mr. S. Cooke), Rosefield, Sevenoaks.

CYPRIPEDIUM F. S. ROBERTS. *Nov. hyb.*—This beautiful hybrid was obtained from *C. niveum*, and some other unknown parent. The dorsal sepal is orbicular, acute, white and lined with rosy-purple along the course of the veins. The broadly oblong petals are declinate, blunt and rounded at the apex, lined and finely dotted with purple all over, thus giving a rosy tint to the white ground. The large and beautifully formed lip is lined with purple veins on a white ground and suffused with purple in front. It was well worth the Award of Merit it received. Messrs. Hugh Low & Co., Upper Clapton, London.

Fruit and Vegetable Committee.

PEAR PRESIDENT BARABE.—On December 14th last this received an Award of Merit, and the Veitch first prize for flavour, as recorded by us on p. 263, thus testifying to its value as a late keeping variety of excellent quality. It was brought up again on the 11th inst., when the committee considered it worthy of a First-class Certificate for flavour and keeping qualities, and made the award accordingly. Mr. W. Allan, gardener to Lord Suffield, Gunton Park, Norwich.

The Orchid Grower's Calendar.

OVERCROWDING.—The overcrowding of soft-wooded plants is well known to be most injurious, and very few succeed where such a state of things exists. Orchids for some reason or other are thought by a good many to possess the faculty or power to thrive and do well if huddled together like a drove of sheep. For a time they will certainly withstand such treatment, and only because they are slow growers in comparison with other plants is it that the harm done by not being allowed sufficient breathing room is not observed until the plants begin to lose their former vigour. Unfortunately this state of things prevails in nine cases out of every ten in places where the owners are experts and fully alive to the advantages derived from plenty of fresh air and light. The old saying, "Don't do as I do, but do as I tell you," comes in well here.

I believe for certain that the plants are found growing together in masses, but the trees are no doubt far enough apart to admit of a free circulation of air amongst them. Besides, do not the plants grow near the tops, showing that this position is most congenial to them? Lower down germination is retarded, and when it does take place the plants become puny, as do the children in our dark, overcrowded cities. In the last calendar I mentioned that plants of imported *Odontoglossum crispum* may for a time stand pot thick, and it was reading it over in print that prompted me to write an article on overcrowding, in case your readers might take it that in all cases this would apply. With imported *Cattleyas*, however, it would be very different, because if they have arrived in good condition, as we are accustomed to see them now-a-days, with plenty of leaves, they would, after the first few weeks, require to be stood well apart. This will give the young growths plenty of opportunity to come away strongly. Another grievous error into which amateurs only too often fall is that they fail to see that Orchids require to be provided with fresh material to root into annually. This arises, perhaps, from the notion that is only too prevalent amongst beginners, that Orchids can live on what some term suction alone. Imported Orchids will grow and do well for the first twelve months in crocks only if kept well supplied with moisture at the roots. They are only drawing, however, on the supply stored up in their native habitats, and after that is exhausted the plants begin to go back, and once this retrograde step commences it is a bad look out. The object, then, of every grower is to keep the plants under his charge in good condition by adding some fresh food when required in the shape of fresh live sphagnum moss and good peat.

Yet another mistake is insufficient piping when putting up new structures. Plants, like ourselves, object to the harsh heat given off from the pipes when made too hot. With a small quantity of piping this is bound to happen in very severe weather and the plants suffer accordingly. When the temperature can be kept up without overtaxing the heating apparatus the plants pass through a spell of cold weather without the attendant ill effects of hard firing.—C.

Kitchen Garden Calendar.

FRENCH BEANS.—Now that the days are getting longer these will set more freely, therefore, to keep up a supply it will not be necessary to sow quite so many at one time. The sowings, however, should not be at longer intervals than three weeks from each other, or there may be blanks. Where space is limited the sowings may be made in pots or boxes, as French Beans transplant readily if not allowed to get too long before being put in their permanent quarters. About five seeds could be put into a 48 pot, to be afterwards transferred to those of larger size. The most simple mode, however, of growing this crop is to sow the seed on slight hot beds, in pits that are heated with hot water pipes; a constant and steady heat may then be maintained. When these have to be grown in fruit houses, as is sometimes the case, a close watch must be kept for that troublesome pest the red spider, and if any are observed the leaves of the plants should at once be sponged with spidercide, which will soon destroy

them. There are many varieties of dwarf Beans, but some force much better than others. Prolific, Negro, Syon House, Early Forcing, and Ne Plus Ultra are amongst the best. It should, however, be borne in mind that there is nothing gained by attempting to grow them too thickly; better err on the side of sowing thinly than having the plants over-crowded. Special attention should be paid to this when they are grown in heated pits.

POTATOS, growing either on dung-beds or in pits heated with hot-water, must have sufficient air admitted on all favourable occasions to keep the foliage sturdy. Sets for succession may be selected, choosing those of medium size; these could be started in small boxes, and gradually brought forward till such times as the beds can be got ready for them. It is not well to start these in too high a temperature, as they only become drawn up and spindly, and suffer afterwards. Any that are forward enough to require earthing ought to have attention that the haulm may not get injured in the process. As cold frames are emptied of Strawberry plants some of these may be planted with Potatos. If the sets are placed a foot apart in the row and a distance of 18 in. is allowed between the rows fine crops may be had. A sprinkling of Radish seed may be put in between the rows. All early varieties should now be stood with the eyes upwards in a light, airy place, but, unless required for planting in frames, they should be kept as cool as possible, simply excluding the frost. Sets so treated will make short stout growths that will not easily break off at the time of planting.

ASPARAGUS.—Another batch of roots should be introduced as soon as that growing on hot beds shows signs of exhaustion, in order that the young growths may be ready for use by the time the other fails to send up a supply. If such beds receive a slight dressing of sulphate of potash or kainit, to be afterwards washed into the soil with luke warm water, or a little sulphate of ammonia dissolved in the water before watering, this will assist the plants in prolonging the supply.

GENERAL WORK.—Make small sowings of Mustard and Cress, and continue to introduce Endive, Chicory, and the like for blanching in small quantities to suit the requirements of the establishment. There is much work that can be pressed forward at this time of the year that will greatly assist the kitchen garden operations later on when work of other kind needs attention. For example, all Pea and Bean stakes should be procured and sharpened, labels should be made, any gravelling needed ought to be done, that when the soil is in a workable condition there is no hindrance to preparing it to receive the various crops. A sowing of Broad Beans should now be made, and those who neglected doing this in November should lose no time in planting a few in boxes to be brought forward under glass, and afterwards transplanted in the open. Pay strict attention to Lettuce and Cauliflower plants in frames, and as soon as any leaves show signs of decay remove them that the air may circulate more freely amongst those left. All such plants should be kept as hardy as possible by a free circulation of air whenever the weather is favourable.—*Kitchen Gardener.*

FRUIT UNDER GLASS.

MELONS.—A sowing of seed should be made at once to provide for an early crop. Sow the seeds singly in 3 in. pots, using a compost of two-thirds loam to one of leaf soil. These seed pots should be plunged in a frame having a bottom heat of not less than 70° Fahr., in order to insure speedy germination. By thus placing only one seed in a pot the young plants do not receive any check, for by the time they have filled their pots with roots and have made their first rough leaves they are ready for planting out.

Meanwhile a house should be prepared for them. A lean-to or three-quarter span pit facing to the south is the most suitable for early work, and if the floor of this is sunk for 2 or 3 ft. below the level of the surrounding ground so much the better, as these sunk houses are more economic of heat than others not thus built, and, bearing in mind that a high temperature is required for the plants throughout, this is a matter of some importance. After the beds have been cleared of the whole material the house

itself should receive a thorough cleansing, first of all by means of fumigation with flowers of sulphur, and subsequently by the washing of glass and wood-work. All the walls should also be whitewashed. If the house is part of a range the greatest care must be exercised during the burning of the sulphur to see that none of the fumes escape into the houses containing plants. It will be advisable to hang wet sacks and mats against the partition or partitions to make assurance doubly sure. The fermenting material for making up the beds, which should consist of two-thirds leaves, and one-third stable litter will have received a couple of turnings previous to this date. A third turning should be given before it is used. In making up the bed the litter must be trodden down very firmly so as to obviate as far as possible the shrinkage caused by decomposition. The soil should consist of good mellow loam. This may be placed in a single ridge along the front of the bed near to the sides of the house if a single row of plants only is to be put in; in a double ridge if two rows are projected.

CUCUMBERS.—These may be associated with the Melons in the same house if it is desired to economise space. Three-quarter span-roofed pits of the kind described have usually a narrow bed on the north side of the central pathway, and in this the Cucumbers may be placed. The two subjects may be treated the same for heat, airing, watering, etc., but as the season wears on the Cucumbers will require shade, and the Melons will not.

STRAWBERRIES.—A constant succession of these must be introduced to heat in order to keep up the supply. The size of each batch must, of course, depend upon the individual requirements of each establishment. The stock of plants should have been plunged at the beginning of the winter in ashes in cold frames, in order to prevent them from becoming too sodden. During the first stage of forcing a minimum temperature of 45° Fahr. by night will be quite high enough. If any of the deep brick pits are available these make capital forwarding places for Strawberries, if filled with leaves to afford facilities for plunging. Keep the plants well supplied with clear water, and syringe well daily to keep down red spider.

STRAWBERRIES IN FLOWER.—As soon as the blooms expand they should be gone over in the middle of the day with a camel's hair brush in order to assure the settling of the fruit. The flowers that open first are invariably the strongest and give the best fruit. Once about nine fruits are set to each plant the remainder of the flowers may be picked off. A healthy plant should ripen nine good fruits, but if more are left on, the fruits will be rather undersized, save in exceptional cases. Up to this stage clear water has been sufficient for the needs of the plants, but now assistance in the way of manurial stimulant should be given. There is nothing better than liquid farmyard manure if it can only be obtained fresh. Keep the syringe well to work, and maintain a temperature of between 60° and 65°.

VARIETIES.—Royal Sovereign is, perhaps, the best all-round variety for forcing, but Laxton's Noble makes a fine early variety. The flavour is not so good as that of Royal Sovereign, but the plants crop and do well, and the fruit colours finely and has a taking appearance. Not a few growers stick to Vicomtesse Hericart de Thury, also a good forcer; and Keen's Seedling, August Nicaise, and La Grosse Sucrée are still favourites. That splendidly flavoured form British Queen forces fairly well, but must not be hurried too much. It comes in well after Royal Sovereign, and just before the earliest plants from the open ground. All it needs is to be forwarded along gently, introducing the plants into a Peach or Orchard house about the beginning of March.

POT VINES IN FLOWER.—The vines started at the end of November are now in flower, and a rather drier atmosphere must exist in the house. The temperature should range between 65° and 70° by night with a proportionate rise by day. Go over the canes in the middle of the day, and give each of them a gentle tap with the hand to facilitate the dispersal of the pollen. Stop each shoot from two to three joints beyond the bunch, and cut off any superfluous bunches that may be shown. Great caution must be exercised in admitting air, for a check now would have serious results. Hitherto we have had very little frost or cold winds, and there has been no difficulty in keeping up the temperature with a moderate use of fire heat.—*d. S. G.*

HINTS FOR AMATEURS.

Raspberries.—Amongst all the small fruits there is none that pays better for good cultivation than the Raspberry. As a crop for market work it is rather a difficult one to manage, unless the market is close at hand, for the fruit is so soft and bruises so readily that it will not stand transit for long distances and a delayed sale. A few hours only is quite sufficient to spoil both the appearance and flavour of travelled fruit, and thus it is only when the fruit can be taken off the canes and used almost directly that it can be had in proper condition. The difficulty of obtaining good Raspberries in the market, however, is an additional inducement to the amateur gardener to grow a few for his own consumption. In the kitchen the Raspberry is held in high esteem for the making of preserves, and for imparting a delicate flavour to various dishes of cooked fruits. It is very seldom indeed that too many Raspberries are grown for those who preside in the kitchen. Then the freshly picked fruit is by no means a mean addition to the dessert table, whilst the virtues of Raspberry vinegar are well known to most.

If Raspberries are to be had in quantity and in good quality they must receive proper attention. This, unfortunately, they are not favoured with, for we not infrequently see quite as fine fruits upon the wild bushes in the woods as upon the weedy specimens that are allowed to cumber and disgrace some cottage and villa gardens. Weedy the best plants soon become if their requirements are not attended to, and it matters little what the variety is, it is sure to degenerate, and that speedily. In most cases the plants are allowed to stand for many years on the same piece of ground, and as the years roll by the latter becomes well-nigh or quite exhausted, owing to the rich feeding nature of the plants and the lack of manurial application by the grower and owner. Now a good stool of Raspberries takes up very little more room than a poor one, although a little more attention is needed, but there can be no comparison between the returns of fruit from the two.

We will first proceed to consider the seasonable requirements of a plantation that has been kept well in hand, and not suffered to "gang its ain gait."

Pruning.—In order to have an intelligent idea of the kind of pruning needed by the Raspberry we must first of all look at the kind of growth that bears the fruit, and act accordingly. The fruit is borne on canes that are in their second season of growth, that is to say, that the young canes thrown up this year will bear fruit the next. We thus see that in order to insure a regular supply of fruit, a succession of young wood must be kept up, the two year old canes that have already fruited being cut out annually to make room for the new. This is really all there is in pruning Raspberries, but on its proper performance depends to a very large extent success or failure.

The most enlightened cultivators make a practice of removing the old canes at the end of the fruiting season, thinning the young canes at the same time. The stools are thereby relieved of a burden, and the young growths that are left not only enjoy a greater exposure to light and air, but also a larger share of nutriment from the roots. The result is that by the time the winter has set in they are plump, and well ripened. To those who wish to grow first-class Raspberries we strongly recommend this system. Supposing the above to have been performed, all that is necessary to do now is to give the young canes a further thinning, selecting three or four of the best, according to the size of the stool, and cutting the others clean out. The tops should be removed at a point where the canes begin to get thin and twisted. The cut should be made slanting so as to throw off the rain. Even then the points will die back a little, but not farther than the first-joint or node. Some growers are averse to pruning at the beginning of the winter on account of this, but we have never seen any injury to result. The exposed pith is sure to die in any case no matter at what time the cut is made. Finally the canes should be secured to the pole or wire, and the job is completed.

Those plantations in which the canes were not thinned in the autumn in this fashion will take a little longer to prune, but the only difference is that the pruning is all done at one time instead of at

twice. The same lines as suggested in the first place should be followed.

Manuring.—After pruning has been completed the next job will be the application of manure. Give a good dressing of well decayed stable litter, and fork it in lightly, taking care not to disturb the roots too much. It should be buried a few inches beneath the surface, but deep stirring of the soil is not advisable. Cow manure is an excellent food, and if it can be obtained in sufficient quantities may well be made use of.

An annual dressing of this kind is very necessary if the quality of the fruit is to be maintained. Lack of this attention is one of the great reasons why we see the miserable worn-out looking specimens that we have previously referred to. If only the annual manuring is missed for one year it becomes a matter of considerable difficulty to start it again, for great numbers of roots are produced close to the surface, and suckers are thrown up all over the place. The result is that any disturbance in the way of digging puts a tremendous check upon the plants, although they may benefit by it in the long run. Where plantations have got into a bad state therefore it becomes the wisest and most satisfactory plan to root the whole lot up and have a fresh start in another part of the garden. This gives the operator time to thoroughly prepare the ground previous to planting, and the young plants have a fair chance. It will be best in such cases to obtain some fresh plants, although if the old ones are of good varieties some of the strongest of the plants may be utilised for making up.—*Rex*.

WORK IN THE SUBURBAN GARDEN.

THERE is a good deal to do in the garden nowadays, and this will afford pleasurable occupation for spare moments, thereby helping to checkmate the gentleman who is so officious at finding something for idle hands to do.

The greenhouse will take a little looking after. It will be well to ornament it with a new door handle, for string wound round a nail, although an ingenious fastening, is not a sightly one. Plants are queer things and behave strangely sometimes. One of their favourite habits is to jump off the shelf and hide beneath the stage out of the way when they are in indifferent health. Everything likes to die quietly, of course. A look under the stage will therefore show much that is novel and interesting that an unobservant eye would be likely to miss. Do not disturb these resting plants under any consideration.

Dutch bulbs in a greenhouse are grand, and it is wonderful what a lot of killing they take. The tuberous Begonias that went to sleep so quietly last autumn are still sleeping. Do not wake them yet by any means, for you are sure of them now. Pelargoniums are looking fine, but want a little hustling up. A minute examination will reveal some "fly" on them—at least if it doesn't it ought to. Here is a job for a rainy day.

Passing to the outside garden you may, on your way, give a gentle kick to an iron hoop that has strayed. It is wonderful to see how much kicking these hoops will stand. The coal scuttle that somehow got hurried about the middle of December in the centre flower bed should now be resurrected and laid on one side for a future occasion. It at least gives a furnished appearance to the garden, quite Japanese in fact, and you may even improve it by filling it with hardy Ferns. A movable Fernery such as this is an acquisition.

Two or three old hoots that were deposited on the herbaceous border at the beginning of the year may now be taken away. They may be ornamental, but they do not possess any fertilising powers as far as we are aware, although, like manures of various kinds, they are highly odoriferous. There will not be so much variety when they are gone, but something else, in the mysterious economy of backyard nature, will be likely to take their place.

Coals are rather dear just now, hence it will be policy to collect the various lumps you have shied at the cats during the last three months. Things move very slowly at this season of the year, including the cats, unless proper measures are taken.

The labels in the herbaceous border have evidently been having a scrimmage, during which some of them have got knocked out. From a sense of tidiness this should be rectified. If you do not exactly know where the labels should go try the "dickery, dickery, dock" arrangement, but whatever you do put them in straight, for a lopsided label has a dis-

reputable appearance. It will be highly interesting presently to see how the label lottery turns out.

Attend to the pruning of fruit trees, for it is a *sine qua non* to successful fruit growing that something should be cut off the trees each year, it does not much matter what, but the main stem must be left, or you will get no fruit. Your pruning knife left you at the beginning of the summer, through mistaken fondness for an outdoor life. A mouch round will probably find it, and then operations may commence. If you are in any doubt as to a certain shoot, cut it out, for habits of decision mark the truly great man in gardening as in aught else.—*Nouveau Calendrier*.

Correspondence.

Questions asked by amateurs on any subject pertaining to gardens or gardening will be answered on this page. Anyone may give additional or more explanatory answers to questions that have already appeared. Those who desire their communications to appear on this page should write "Amateurs' Page" on the top of their letters.

Moles.—*R. Meavns*: Apart from the vexed question of the food of moles there is no doubt that these burrowers do considerable harm to plants by cutting or otherwise injuring the roots during their mining expeditions. On lawns they are an especial nuisance, and you should make every endeavour to catch the one that is now disturbing yours. We say one advisedly, for we do not think it likely that there are a number at work, as one animal in a single night will make a lot of disturbance. You can obtain the ordinary steel mole trap from any ironmonger. This must be carefully inserted in the principal burrow.

Peach Wall.—*Peaches*: If the wall is a high one the quickest way to cover it will be as follows: Plant a row of dwarf fan-shaped trees, and train these to cover the wall to a height of 7 ft. or so. Between each dwarf tree plant one having a clean stem of about 6 ft. with a good head at the top. These taller trees should also be trained fan-wise. You may have to pay a little more in order to get trees of the right stamp, and if you order them from a local nurseryman we should advise you either to take a practical man with you or commission him to obtain the trees for you. If you write to any good nurseryman, however, and say what you want you would be served as well as, or perhaps rather better, than if you chose the trees yourself.

Root-Pruning a Plum Tree.—*Aloe*: We think you are quite right in deciding to root-prune the Plum tree. Its tendency to make over-gross shoots must be checked if it is to become fruitful. Open out a trench about 4 ft. or 5 ft. from the stem, and work gradually downwards. Cut through all the big roots, and carefully move on one side the smaller ones. Dig down until you have actually got under the ball of the tree. Afterwards work gradually towards the centre with a fork, cutting all the larger roots met with that have a downward direction. Then refill the trench, spreading out the fibrous roots that have been moved on one side in digging. Commence operations as soon as the soil has recovered from its present stickiness. The suckers thrown out from the base of the tree should be removed.

Begonia manicata.—*A. O.*: From the particulars you send it is evident that your treatment of the plants is all right, and that it is not to blame for the falling of the leaves. This might be ascribed with certainty to the malign influence of the fogs which have been so prevalent of late.

Grapes.—*A. O.*: The best white Grape to force early with Black Hamburg is Foster's Seedling.

Young Vines.—I planted a house with strong young Vines, three-year-old, last year. In accordance with advice received I took up one shoot from about 3 ft. from the ground and removed all the others. The shoots that were left have developed into first-class canes which have been shortened back to within about 6 ft. of the point at which they originated. Would it injure the canes to allow them to carry fruit this year?—*Reader*.

You may allow each cane to carry two or three bunches without fear of injury to the plants.

Cyclamen—*N.B.*: You are rather late in sowing the seed. The plants will flower late next season after those raised from the autumn sowing are past their best. The seed should be buried about a quarter of an inch deep, but not more. A temperature of 55° will be necessary to insure speedy germination.

A North House.—A glass house such as you describe, *G. Hendon*, facing to the north may be turned to good account in a variety of ways. First of all you may turn it into a Fernery with the best of results. It would also do for late Camellias, some of which might be planted out if the house is large enough, and others grown in pots. *Lapagerias* might be utilised for covering the roof. Such a house will also be handy for retarding flowering plants of various kinds. If you want it permanently furnished, however, the Fernery project would probably yield the most satisfaction.

Cherries Under Glass—Cherries are not grown so frequently under glass as Grapes or Peaches, *E. Morton*, but they are still treated in this way fairly extensively. The great thing in their under-glass cultivation is not to force them too hard at the early part of the season. Cordon trained trees are the most suitable. If you decide to plant some Cherries we shall be pleased to give you a list of good desert varieties.

NOTES FROM CHELSEA.

BEGONIA EUDOXA.

Not the least charm that attaches to the foliage of Begonias lies in the fact that they are so distinct in habit and general appearance from any other of the plants with which they are associated in the warm or intermediate houses. The curious obliquity of the leaves common to the members of the genus gives them a certain grotesqueness of form that arrests the attention of even the casual observer, and when to this is added unusual shades of green, with quaint dottings or markings, the foliage becomes beautiful, while the plants do not cease to be interesting. The accompanying illustration (for which we are indebted to the Messrs. Veitch) shows a charming novelty in this class of Begonias, which is being sent out this year by the Chelsea firm, and is certainly one of the handsomest plants ever raised

BEGONIA EUDOXA.

at the Royal Exotic Nurseries. It is of hybrid origin, having been obtained from *B. Burkei*, fertilised with the pollen of *B. decora*, a well-known and beautiful foliage Begonia.

The leaves are from 6 in. to 9 in. in length, and, as will be seen in the illustration, of pronounced obliquity. The nerves and ground colour of the upper surface are rich bronze-green, the whole

surface being thickly studded with white verrucosities, which are tinted more or less with light rose. The under surface is rich carmine in hue, and perfectly smooth. Seen in a good light this colour imparts a richness of tone to the whole leaf, which is really pellucid. In habit the plant favours that of the pollen parent, *B. decora*, which is dwarf and spreading.

DRACAENA WARRENII.

DRACAENA WARRENII.

There are now so many *Dracaenas*, representing a wide range of habit and style that a new one must of necessity be really first-class if it is to attract attention. Through the kindness of the Messrs. Veitch we are enabled to present our readers with an illustration of a very elegant new variety named *D. Warrenii*, which is the result of a cross between *D. Gladstonei* and *D. vivicans*. It was raised by Mr. Albert Offer, gardener to John Warren, Esq., Handcross Park, Sussex, from whom the Chelsea firm has acquired the stock. The plant is most distinct in habit, and is in fact one of the very finest of the narrow-leaved forms. The gracefully arching

GREENHOUSE RHODODENDRONS.

AMONGST the numerous plants in the cultivation and improvement of which Messrs. James Veitch and Sons have played a most important part there has been no more conspicuous success obtained than in the case of the hybrid greenhouse Rhododendrons. So skilfully has Mr. John Heal employed two or three species that he has given us an entirely new race of plants remarkable for their beauty, freedom, and continuity of flowering, while they are of comparatively easy culture. The value of these plants for conservatory decoration, more especially during mid-winter when flowers of all sorts or any sort are at a premium, can scarcely be too highly appraised. It does not seem to matter much what time of the year a visit is paid to the Royal Exotic Nurseries at Chelsea, some of the Rhododendrons are in flower.

On December 26th last there were no fewer than thirty-two distinct forms in full bloom, and this number had even increased when we paid a visit early in January. We found that the plants had been recently potted, and, although it would seem to be rather early in the year for this kind of work, this treatment seems to suit the plants to perfection. They are given a temperature of from 50° to 55° Fabr. by night with a proportionate rise by day during the winter months, and the atmosphere is kept constantly moist and kindly. Flowering and growth are well-nigh continuous as a consequence.

There are several distinct sections of these hybrids, both single and double flowers being represented, although the former are numerically much the stronger. By crossing the Javan species *R. javanicum*, which has orange-yellow flowers, spotted more or less with red, and *R. jasminiflorum*, a species which bears white Jasmine-like flowers with a pink eye, common to Malacca, the race of *Javanico-jasminiflorum* hybrids has been obtained. In this section we get dwarf sturdy plants with flowers of varying sizes, but generally large, and as varying, brilliant colours. Many of these have from time to time received a First-class Certificate or Award of Merit from the Royal Horticultural Society, and abundantly indeed are the awards deserved. *Hercules* is an especially grand form with huge flowers that exhibit a rich shade of orange-yellow, toned here and there with splashes of rose-pink. *Lord Wolseley* may be described as an improvement upon the species *R. javanicum*, for the flowers are bright orange-yellow spotted with rose towards the

deeply channelled leaves are from fifteen to twenty inches in length, and a little over an inch in width. The colour is rich crimson-black, the younger leaves breaking the monotony by having a comparatively broad carmine marginal or sub-marginal stripe running their whole length. The general appearance of the plant is exceedingly elegant, and it will, without doubt, be largely grown in the future

margin. Purity is a charming pure white form which comes close to *R. jasminiflorum*, but differing in the shape of the bloom, and of course without the pink eye that characterises that species. The segments of the corolla too are broader and smoother. Imogene is a large buff-yellow flower with bright carmine filaments to the anthers which set it off amazingly. On first opening the flowers of Aphrodite are blush-white, but after they have been expanded for a few days they lose the colour and change to pure white.

Of the older varieties Princess Alexandra is still one of the best, and in its own way is every whit as useful as the larger flowered newer varieties. The flowers are white, tinged more or less with blush. Princess Beatrice is of wondrously free flowering habit, and throws large, almost globose trusses of flowers that exhibit a delicate shade of yellow suffused with pink. By crossing *R. Teysmani*, a Sumatran species introduced a few years ago by the Chelsea firm, and the Javanico-jasminiflorum hybrid Lord Wolseley a magnificent form named Cloth of Gold has been evolved. This was certificated by the R.H.S. in November, 1896, so that it is still a novelty. The flowers are of great size, being fully $2\frac{1}{2}$ in. in diameter, and bright golden-yellow in hue. The tube is wide and open at the mouth, and the segments are broad, reflexed, and spreading. The truss is of great width in proportion to its depth, and inclines to a certain flatness on the top.

Repeated crosses between the Javanico-jasminiflorum hybrids and *R. multicolor* have resulted in a race or section of hybrids that contain many promising and valuable forms. *R. multicolor* itself is a very floriferous species from Sumatra, which varies considerably in the colour of its flowers. The leaves are narrow and the habit dwarf. The progeny has without exception inherited from this parent great freedom of flowering, combined with sturdy habit, and rather smaller leaves. Latona is one of the finest forms of this group. It is the offspring of *R. Princess Beatrice*, and the species above referred to. The flowers are large, cream-yellow in hue, and the segments of the limb of the corolla are broad and spreading. The trusses are rather lax. *R. Princess Beatrice* is also the parent on the Javanico-jasminiflorum side of the pure white Mrs. Heal, which was one of the finest things ever sent out by the firm. The bright orange-yellow anthers serve to still further set off the flower. Neptune, a brilliant scarlet flower, was raised from *R. Minerva* fertilised with the pollen of *R. multicolor*. Triton exhibits a delicate shade of rosy-carmine, with a yellow throat. *R. multicolor* and *R. Souvenir de J.H. Mangles* were its parents.

The form Little Beauty is noteworthy, not only on account of its beauty of which it has more than little, but by reason of the fact that it is the pioneer of yet another group or race of warm greenhouse Rhododendrons. The parents are *R. Monarch* on the Javanico-jasminiflorum side, and the species *R. malayanum*, common to the Malay Archipelago and introduced from thence in 1854. Little Beauty is dwarf and bushy in habit. The trusses, which are produced with great freedom, carry from six to nine rather small glowing carmine-scarlet flowers that have an exceptionally brilliant appearance in the dull winter months. Throughout the collection this charming plant was easily to be distinguished from its warmth of colour.

The double-flowered or Balsaminaeflorum group is a splendid augmentation to the charms of the singles. The flowers are large, very double, and are not unlike some of the finer double Balsams at first sight. From a decorative point of view they are fully as effective as the singles, and although the number of varieties is limited, a considerable range of colour is yet presented. *R. balsaminaeflorum album* is, as the name denotes, a pure white form. The flowers are of great size and substance. *R. b. aureum*, *R. b. roseum*, and *R. b. carneum* are the counterparts of *R. b. album* in yellow, rose, and flesh-pink respectively. *R. b. Rajah* is a fifth form that is to our way of thinking the handsomest of all. The flowers are bright fawn-yellow in hue, tinted at the margins of the central florets with rose—a distinct break away from the self coloured varieties.

All the foregoing forms, together with many others, of which space forbids mention, caught our eye as we were piloted round by Mr. Heal, whose care for these plants is that of a father.

REDLANDS, GLASGOW.

GARDENING is still carried on with spirit at Redlands, Kelvinside, Glasgow, the residence of J. B. Mirrlees, Esq., in the suburbs of the great city. Mr. George Russell, the genial and courteous gardener, has conducted the affairs of the garden for many years, and is as enthusiastic as ever over the Orchids, stove plants, and other subjects that make up the collection. During the past autumn we paid a visit of inspection, and passing into the stove, noted the gigantic specimen of *Anthurium warocqueanum*, bearing eleven of its huge and velvety leaves on a tall stem. Its congeners, *A. Veitchi* and *A. crystallinum*, were also in fine condition, though smaller. Very striking also was a specimen of *Dracaena goldieana*, of great size, and consisting of numerous stems, a condition in which we rarely find this species, because constantly propagated to furnish decorative plants in small pots. *Croton russelliana* is one of the best of the broad-leaved varieties, and was raised here by Mr. Russell as a result of the crossing of *Disraeli* with *andreaum*. The leaves are obtusely three-lobed and much coloured with crimson and red. Stove plants have long been well cared for at Redlands. The singular *Coryanthes speciosa* and the curious *Gongora maculata* flowered recently in this same house.

Suspended from the roof are numerous species and hybrids of *Nepenthes*, all well furnished with a wealth of richly-coloured pitchers. *N. dicksoniana* is notable for its flowering while the plants are yet in quite a small state. *N. northiana* also does well, for we measured pitchers $3\frac{1}{2}$ in. to 4 in. in length without the lid. The glaucous bloom and the blotches in the throat of this species are very handsome, as they are uncommon in the genus. The large pitchers of *N. rafflesiana* hold over a pint of liquid and ants are captured in great quantities by them. *N. Mastersi* and *N. intermedia* are also very serviceable hybrids. The pitchers of *N. hookeriana* forcibly recall those of *N. rafflesiana*, but they are shorter, wider, and more highly coloured. The freedom with which it produces pitchers is one of its valuable characteristics; and its value is here evidenced by the large number of plants, both old and young in the stove. There is a large plant of *N. Veitchi*, by no means a common species. The pitchers of *N. ampullacea* are smaller and less conspicuous than either of the above, but they are produced in great numbers, and often upon leaves that lack the usual green blade considered by scientific men a dilated or winged leaf-stalk.

The back wall of the propagating pit is beautifully draped with *Cissus discolor* and *Hoyas*. Here were some well-furnished plants of *Sphaerogynae latifolia*, though actually only recently-rooted cuttings, consisting of the tops of large plants. Many other stove plants are treated with equal success. In passing from one house to another we noted a *Dahlia* growing in a sheltered corner, a position it has occupied for the last twenty years. Surely that is uncommon in this country, particularly in a latitude so far north as Glasgow, where it "snaws" in the intervals between the showers of rain, though the latter are by far the more common.

The Orchid houses are well packed with a useful collection of all the leading classes or types of this popular family. A good many of them were in bloom on the occasion of our visit, though the bulk of them were practically out of season. A fine piece of the rare *Dendrobium brymerianum harveyanum* valued at £25, was sent here by mistake for a more common kind, and is highly valued by the possessor. It may be remembered that *D. nobile Cooksoni* turned up here some years ago in an unexpected way, as noted in our pages. Others are grown in great quantity and variety. Alongside of them was a handsome plant of the singularly blotched and marbled *Tillandsia (Vriesia) hieroglyphica*.

In one of the cool houses *Odontoglossums* and allied subjects presented a wonderfully interesting display for that particular time of the year. A spike of *Oncidium macranthum* carried twenty-five fine blooms. Other useful and ornamental subjects in bloom were *Odontoglossum crispum*, *O. Uro-Skinneri*, *O. harryanum*, and many natural hybrids belonging to the genus. The panicked brown flowers of *Oncidium confertum* are seldom seen in collections. The exceedingly pretty *O. Phalaenopsis* or *O. nubigenum*, having white flowers, tinted with violet and having violet blotches, is likewise a more

uncommon plant than it was some years ago, a fact which goes to prove that the grower takes excellent care of his favourites. Another cool house contained a fine variety of *Odontoglossum tripudians* and other interesting subjects. Tufts of prairie grass from Table Mountain, Cape Colony, were covered with seedling *Disas* which the gardener is nursing into life and beauty. Various curious and interesting subjects come into bloom amongst the grass, including a white flowered *Utricularia*. The hybrid *Disa kewensis* also finds a home at Redlands.

The *Cattleyas* are largely grown in baskets, and *C. intermedia* was amongst those in bloom. The fragrant *Oncidium tigrinum*, and a large healthy piece of *Miltonia spectabilis moreliana* helped to keep the house gay. A batch of *Saintpaulia ionantha* showed that the atmosphere of this house agreed well with it.

A house was gay with tuberous *Begonias* in all the principal colours, and as they are grown cool the plants make dwarf and sturdy specimens, with large circular flowers, some of which last season measured 6 in. across under glass—a size that is surely sufficient to satisfy the most fastidious. Single varieties are also used for bedding out and do well here during the summer months.

The conservatory occupies an elevated position abutting against the mansion, and is well exposed to light and air on all sides. Orchids in bloom were mixed with the other occupants of the house, and included such things as *Zygopetalum Mackayi*, *Acropera Loddigesii*, *Stanhopea grandiflora*, *Dendrobium formosum giganteum*, and others. The grand old specimen Tree Fern that formerly occupied the centre of this house, and had been lowered once or twice, got too tall at last and was bequeathed by the owner to the Parks department of Glasgow, and is now housed at Camphill there, under the care of Mr. Mc Iver, one of Mr. Whitton's foremen. A tree of *Cyathea medullaris*, 20 years old, now occupies the centre of the conservatory, making up in width what it lacks in height; for it has a spread of 25 ft. across the fronds, each of which has a diameter of about 5 ft. On the stems of other Tree Ferns from Australia is an unknown species of *Lycopodium*, of curious but graceful and beautiful form. It took sixteen years to germinate, or in other words the spores lay dormant upon the Fern stems which had been stored away for a great portion of that time in a cool place.

In passing through the flower garden we noted that *Violas* were freely used as edgings bordering upon the walks. *Crosford's Old Gold* is a strangely coloured flower having two black eye-like spots on the upper petals. *Holyrood* and *Bullion* are other favourite varieties. On the lawn is a pink flowered variety of Hawthorn which has been a favourite with three generations of the family, and has been shifted three times in order to get it under the eye of its admirers. The tree is yet perfectly healthy, and seemingly none the worse for the disturbance to which it has been subjected. About 600 to 700 *Chrysanthemums* in pots were standing about preparatory to their being housed; but to find room for them must have cost some thinking and shifting about of the other occupants.

Space everywhere gets well occupied here, but hardy fruit is not neglected. Amongst a collection of standard Apple trees we noted heavily cropped trees of *Cellini*, *Hawthornden*, *Lord Suffield*, *King of the Pippins*, and various others; but time being pressing we were unable to give them the attention we should have liked. "Nae man can tether time or tide," and we had to beat a rapid retreat in order to keep other engagements that same afternoon, so we reluctantly parted with our guide, philosopher and friend.

The Arnold Arboretum, Boston, U.S.A., is one of the finest of its kind in the world. It comprises 165 acres, traversed by five miles of drives and walks, and contains by far the most varied collection of hardy trees and shrubs in America. An arrangement has been made with Harvard University, which controls the fund from which the expenses of the Arboretum are supplied, and Boston City, by which the whole of the Arboretum is included within the park system of the city. Many of the plantations have been recently made, and a number of years must elapse before the young trees develop their true characteristics.

UTILITY OF EARTHWORMS.

EARTHWORMS have not a very good character in our country places. Often they are regarded as a useless product of creation, if not as enemies of culture, only to be trampled under foot when they meet our scornful gaze.

However, agriculturists have already told us that far from being injurious the worm aerates the soil with its furrows, bringing to the surface the fertilising principles carried by water into the lower layers, under the form of fine humus, absorbing humidity, aiding nitrification, possessing the value of real manure.

In fact, the worm lives on animal and vegetable remains, the decomposition of which it accelerates, rendering their assimilation by the roots of our plants easier. There is only one objection to the worm, viz., it transports to the surface microbial germs or spores, which, being produced by animals that have died from carbuncle and been buried too near the surface, might develop on the grass in pasturages and transmit disease of a carbuncular kind to cattle. It is very easy to prevent this danger by completely burning the carcasses of diseased animals or burying them very deeply, surrounded with a layer of quicklime. As such precautions should always be taken we may call worms our auxiliaries.

Mr. Wolny, professor at Munich, fully informs us of the services they render. He recently made a series of cultural experiments in two sets of boxes, in one of which earthworms were placed, whilst the other had none. The boxes containing worms always gave the best results. The following, according to *Illustrirte landwirtschaftliche Zeitung*, are the extra percentages obtained in crops:—

| | SEED. | STRAW. |
|-------------|--------------|--------------|
| Peas .. | 25 per cent. | 95 per cent. |
| Haricots .. | 69 " | 47 " |
| Rye .. | 94 " | 48 " |
| Colza .. | 92 " | 156 " |

Potatos gave 130 per cent. more tubers.

With such eloquent figures all comment is needless. Do not crush the worms!—*Agriculture Moderne*, October 3rd, 1897.

“THE TROPICAL SUMMERS OF 1896-97: THEIR EFFECTS ON THE FRUIT TREES AND FRUIT CROPS.”*

IN reviewing the many-sided effects of the tropical summers of 1896-97, the facts range themselves as favourable and unfavourable. The tropical heat, combined with drying winds, and that general absence of rain during the spring months of the period under notice, dried the soil to an unusual extent; and although in 1896 abundant autumnal rains fell, in 1897 the months of September and October were the driest known for years.

The effect of the heavy rains of the autumn of 1896 was felt in the activity of the sap and the adhesion of foliage on fruit trees rather later than usual, and consequently the trees did not get that rest which is as necessary for the vegetable world as for the animal creation; and we agree with Mr. R. D. Blackmore that the general failure of fruit crops in the spring of 1897 was largely due to that cause.

The want of power in the trees themselves to lay up that necessary nutriment, and ability to perfect embryo fruit buds, was arrested at a critical period, and as reported in the gardening papers, many cases of imperfect blossoms were noted in fruits, and doubtless many more facts would have been discovered had they been suspected and looked for.

To outward appearance the blossoms were perfect, the corollas being bold, as usual; but in many individuals either stamens or pistils were wanting. No doubt also the upper or fruit nourishing roots suffered from the want of surface moisture, and thus were prevented from doing their work—while lower anchor roots struck deeper and deeper to gain moisture and sustenance for the development of the tree, making the subject less fertile, and adding gross wood to all garden trees, and thus trees were found to require root pruning more than usual to restore that relative balance of fruit and wood-producing power which a well managed fruit tree should exhibit.

In orchards (especially among young trees) the want of fruit was a distinct benefit, as they were then enabled to form vigorous trees before starting to

crop, and a foundation was thus laid for full development and after success; as if a young orchard tree commences to crop in its earlier stages, its after-growth is checked for years, and in the future such checked trees produce pecks where bushels of fruit should be garnered.

In the dry autumn of 1897 matters were different, and the glorious and gorgeous colours of the foliage on Cherries, Peaches, and Nectarines, the fine russet-brown of the Apple foliage, and the golden Plum leaves, has led us to infer that Nature's work has been well and truly done, and with a fair spring a good all-round crop may be anticipated in 1898.

Although from a nurseryman's point of view the shorter and stouter growth fruit trees made in 1896-97 meant some loss and extra expense in staking for standard trees, &c., still the growers cannot fail to be great gainers in having the wood of fruit trees well ripened, hardened, and consolidated for future benefit, as heavy frosts tell much less severely on such perfected trees. If this is felt in the south, how much more must it benefit planters who live in the midland and northern counties! The pretty fruit shown by Mr. Day, from Galloway, and the grand Pears from Mr. Divers, Belvoir Castle Gardens, sent to the Royal Horticultural Society, bear out this fully.

The fruit crop of the Jubilee year, 1897, will be noted in our minds for its remarkably high colour and development more than for its great size. Many examples submitted to us have been beautiful beyond all former years; for example, crimson Blenheim Orange Apples, Warner's King, and other green Apples with scarlet flushes on the sunny side; and Comice and other Pears with lovely red cheeks; while many Russets have lost their character and come out with golden skins, only broken here and there with russet. Many of the less hardy Apples as Lord Suffield, Ribston, and King of Pippins, and Glou Morceau, Bergamot d'Esperen, Gansell's Bergamot, and other Pears have been so handsome and good, that planters have called for them freely, forgetting that they are not to be relied upon (as a rule) for freedom from canker, or quality. Their extra good appearance, flavour, &c., points a moral, and doubtless we ought to place these and similar good but variable Apples on walls or in warmer places. Apples of the type of American Mother, Melon, Scarlet Nonpareil, Allen's Everlasting, Duke of Devon, Sturmer Pippin, with those that do not always ripen well, as Calville Blanche, Boston Russet, Calville Rouge, Chatley's Kernel, Reinette du Canada, and Dutch Mignonne Apples, with Beurré Diel, Bergamot d'Esperen, Olivier des Serres, Beurré Rance, Beurré Baltet, President Osmonville, Easter Beurré, Zéphirin Grégoire, &c., Pears, would not be out of place on many walls which are well situated, and now devoted to a doubtful crop of Peaches or Nectarines, especially those old walls, unpointed and full of nail-holes one often sees in ancestral gardens, where choice Pears and Apples would flourish and give good results.

The extended use of large and handsome Apples for decoration should lead growers to place Peasgood's Nonsuch, Buckingham, Belle de Pontoise, the Queen, King of Tomkin's County, Twenty Ounce, Gascoigne's Seedling, &c., on walls for this purpose.

One special feature of the 1897 fruit crops was the general success of the British raised varieties, such as Nonpareil, Northern Greening, Wyken Pippin, Blenheim Orange, Devonshire Quarrenden, Yellow Ingestre, Stirling Castle, Wellington, Ecklinville, Kerry Pippin, Keswick Codlin, Winter Queening, Nanny, Hormead's, Lane's Prince Albert among Apples; and Hessel, Althorp Crassane, Hacon's Incomparable, Bishop's Thumb, Pitmaston Duchess, Crawford, Aston Town, Eyewood, and Knight's Monarch, among Pears, causing a demand to arise for trees of many old and superseded kinds, which for market purposes are yet valuable.

The general crops on the Codlin and early Apples and Pears need only be noted to state the fact that such kinds have time to recover themselves after the fruit is gathered, and so prove regularly fertile.

Exceptional prices have been made of some fruits. In our district, Devonshire Quarrenden, Ingestre, and Ribston Apples paid well (one grower selling 100 bushels of the latter as gathered at 14s 6d. per bushel), while Cox's Orange Pippins made up to 25s. per bushel retail; and Wellingtons, with a Peach-like colour, made 10s. 6d. wholesale.

As might be expected, the heat and drought have

caused all late Pears to ripen months before their usual season, and by the time this is in print many fruit rooms will scarcely have a Pear in them; at present Olivier des Serres and Beurré de Jonghe with a few of Easter Beurré from open trees are all we possess.

But we are inclined to think thorough ripening will allow us to keep Apples as late as usual, while they will certainly not be such large examples—in short, beauty will compensate for mere size.

Perhaps no outside fruit felt the grand weather of 1896-97 more than Peaches and Nectarines on walls. The trees made that reddish wood so dear to the cultivator's eye, and the crop set well. The fruit, where the trees were copiously watered, grew out to a fine size, and coloured to perfection, raising the almost lost hopes of many old gardeners and encouraging them to persevere in their open-wall cultivation. Those who had late Peaches made long prices, as the fruit under glass was forwarded by the heat, and thus made a market for the outdoor crop. Peaches and Nectarines are yearly more in demand.

We attribute the failure of the Plum crop to the causes already named, for Plums by their surface-rooting nature, would naturally be affected more than deeper-rooting fruits.

We cannot refrain from again cautioning gardeners from relying on a few varieties for an annual crop; and the best kinds for quality should be planted in various positions to ensure a return, and also to lengthen the season of each kind.

Market growers naturally go in for the sorts favoured by the public, but we are inclined to think many less known but reliable croppers should be introduced.

Strawberries, Raspberries, and bush fruits generally cropped where good deep cultivation was practised.

In conclusion, it is evident that cultivators should do all in their power to utilise all the sunshine possible, and the protection they possess, added to careful thinning of boughs and fruit, and by giving liberal encouragement to the trees that crop, and not over-stimulating those that are barren.

READING AND DISTRICT GARDENERS.

THE annual general meeting of the Reading and District Gardeners' Mutual Improvement Association was held in the club room, British Workman, on Monday, the 10th inst., when Mr. C. B. Stevens presided over a good attendance of members. The report and balance sheet read by the hon. secretary, Mr. James Pound, jun., were of a very satisfactory nature, both showing that the association was in a very flourishing condition. The membership was still on the increase, thirty-one new members had been elected during the year 1897, making over 180 "paid-up" members on the books, whilst the balance in hand was double that at the end of 1896.

The Committee regretted the death of Mr. Alfred Sutton, who had always taken a great interest in the work of the association, and had, since its formation in 1888, provided gratuitously the club room for their meetings. They also record the death of Mr. George Palmer, who was an annual subscriber from the commencement of the association. The meetings during the year had been well attended, on some occasions upwards of eighty members being present, and with the subjects so varied and interesting—such as soils; insects injurious to plant life; table decorations; summer bedding; zonal Pelargoniums; bees as friends and enemies of the gardener; kitchen garden work; Tomatos and their diseases; the Balsam; fruit growing; Sweet Peas; some types of insect pests; a chat about Chrysanthemums, &c.—much benefit and help must have been attained by meeting together.

The thanks of the committee were due to the president, Mr. C. B. Stevens, for the great interest shown, not only in presiding at their meetings, but taking an active part in all the other business connected with the association; to Messrs. Sutton & Sons for their kindness in providing a room at the Abbey Hall for the use of the members and supplying it with horticultural and other literature; to the honorary members for their kind and general support; to those who have helped forward the work by reading papers and introducing subjects for discussion; to those who have added so much interest to the meetings by bringing exhibits of flowers, &c.; and last, but not least, to the horti-

*A paper read at a meeting of the Horticultural Club on Tuesday, the 11th inst., by Mr. George Bunyard, V.M.H.

cultural and local press for publishing reports of the meetings.

After the report and balance sheet had been adopted, the following were elected to fill the various offices during the coming year: President, Mr. C. B. Stevens; Chairman, Mr. T. Turton; Vice-Chairman, Mr. G. Hinton; Librarian, Mr. J. Martin; Asst. Librarian, Mr. E. Dore; Treasurer, Mr. W. Phipps; Hon. Secretary, Mr. J. Pound, jun.; Committee, Messrs. F. Bright, C. Burton, R. Butcher, R. Chamberlain, H. G. Cox, B. Dockerill, H. Farey, W. Goddard, F. Lever, T. Neve, J. Pound, G. Smith, W. Smith, W. Townsend, H. Wilson, and J. Woolford; Auditors, Messrs. F. Tufnail and A. Smith; whilst Messrs. Cox and Woolford were elected to represent the association on the Reading Horticultural Society and the Reading Chrysanthemum Society. A beautiful group of well-grown Cyclamen was shown by Mr. Mr. W. Townsend, The Gardens, Sandhurst Lodge, noticeable being Sutton's Butterfly, Vulcan, Salmon Queen, and Giant White varieties.

FORCED FLOWERS

AT MR. WILLIAM ICETON'S.

WE have on previous visits had occasion to remark on the important part played by Mr. W. Icton, in supplying the British public with what it needs in the way of cut flowers. He has specially taken up the forcing of the Lily of the Valley, and so much space is devoted to it at the establishment at Granard Park Gardens, Putney Park Lane, that the place may well be called a Lily farm. Right through the year, from one end to the other, this handsome Lily may there be seen in bloom, although, naturally enough, there are especially busy periods as well as times of comparative slackness when the demand is small.

Any system whereby such a continuity and adequacy of supply is obtained, must of necessity be extensive and well organised, and Mr. Icton's is both. Moreover, practice has evolved a very easy and effective method of forcing, whereby the utmost is got out of the plants in the least possible time and with the minimum of waste.

The flowers are all obtained from the picked Berlin crowns which are infinitely superior to the clumps, flowering with more certainty and producing better flowers, while more can be got into the space. With the exception of one or two favoured parts our islands are not suitable for the growing of good crowns fit for forcing, and thus the chief supply comes from the neighbourhood of Berlin. Upwards of three and a half million crowns are imported by Mr. Icton each year. This represents an average of nearly 10,000 crowns for every day in the year, and between 11,000 and 12,000 for each day exclusive of Sundays. As each crown may be depended upon to flower, the number of racemes of bloom is as the number of the crowns. The winter and spring months are the busiest time of the year, and at the period of our visit there could not have been far short of 250,000 plants in full flower, or closely approaching that stage. We were informed also that in three days during Christmas week 500 dozen bunches were cut. As each bunch is composed of a dozen racemes this gives a total number of 72,000. If we allow twelve bells to each raceme—a fair average—we shall get a grand total of 864,000 of the fragrant bells.

The crowns are imported in bunches each of twenty-five. These bunches are laid in double layers out of doors and covered with soil during the winter months. A glimpse at the large area of ground even then required to accommodate them, affords to the visitor some idea of the magnitude of operations.

After the winter has passed the crowns are then consigned to a gigantic refrigerator where they are prevented from breaking into growth by the action of the cold. It is from these frozen crowns that the supply of material for forcing during the summer and autumn months is obtained. The seasons are thus made to be continuous, and they even overlap, for we were shown a batch of plants that had been kept back through the whole of 1897. Nothing in their appearance, however, could lead one to surmise this for they were fully as strong, and the flowers equally as good as those thrown by the recently imported crowns.

The plants are all grown in cocoanut-fibre in

shallow, light wooden boxes, each box containing about a hundred. A temperature of between 70° and 80° Fahr. is preserved until the flowers commence to open. In the earliest stages the houses are matted over to exclude the light, and kept thus until both leaves and flowers are well advanced. The plants are then gradually exposed to the light, the flowers expand fully, and the foliage loses much of its sickly yellow-white hue. From three to four weeks elapses from the time the flowers are placed in heat to the fully opened flower fit for cutting.

A peep into a house, filled with Lilies of the Valley, on a January day is a treat of the rarest kind. The eye is almost dazzled by the glittering white sheen of the flowers, and the warm moist air is laden with the lovely fragrance to such an extent as to be almost overpowering. Under the able superintendence of genial Mr. Kyaw, whose paternal care is manifest in this as in other branches of the establishment, the forcing of Lily of the Valley at all seasons is attended with the greatest success.

In addition to the Lilies other subjects are forced in great numbers. Thousands of Roman Hyacinths, for instance, are grown in boxes to supply the large demand. Such Tulips as Cottage Maid, Thomas Mocre, Prince of Austria, Duc Van Thol, and La Reine are also grown in great quantity, and with highly satisfactory results.

Of Liliiums there is a great store; and we would not like to say how many thousands are passed through the place each year. The quantity of bulbs potted up and standing covered with ashes in the plunging ground awaiting their turn to be removed to the houses is immense. *L. longiflorum* and *L. l. Harrisii* are the favourites. The earliest batch of the latter consists of sturdy plants about 15 in. high at the present time which will be in flower some time during March. Two or three bulbs have been placed in a 6-in. pot. Other extensive batches will keep up the succession, so that there will be no lack of flowers presently.

THE FRENCH HORTICULTURAL SOCIETY OF LONDON.

THE ninth annual dinner of the above society was held on Saturday evening last at the Imperial Restaurant, Strand, Mr. Herbert Cutbush presiding.

There was a large company of friends and members assembled, amongst whom we noticed several gentlemen representative of English horticulture, viz., Messrs. William Cutbush, H. J. Jones, J. Weathers, Harry Laing, Harman Payne, and others. The proceedings were of the heartiest nature, and dessert having arrived, speech-making and music filled up the evening.

In formally introducing the chairman to the company, Mr. Geo. Schneider, president of the society, reminded them that Mr. Cutbush's position in the gardening world and the interest he took in the society were ample recommendations for their selection of him as chairman on this occasion, and very heartily proposed his health.

Mr. Cutbush replied, saying that ever since the society was started in 1888 it had been most successful, a fact that was very largely due to the ability of its officers and the enthusiasm of its members. Numerous additions to the roll of membership had been made during the past year, and it was interesting to record that besides being represented in every European state, the society had members also in America, Algeria, the Congo, and elsewhere. Financially, there was good reason for congratulation, the society being at present in a much better position than this time last year. Many valuable additions had been made to the library, which was one of the leading features of the society. The bulletin had been improved, and the new one for 1898 will be still more so. He was pleased to raise his glass and invite them to drink to the "Continued success and prosperity of the society," coupling with the toast the name of their worthy president, Mr. Schneider.

Mr. Schneider, in reply, briefly reviewed the work of the past year, and thanked the members for the spirit of comradeship that always animated them. He also attributed a large measure of the success to English friends who kindly found room for many of the young men who desired places in this country. In conclusion he gave the toast of "The Visitors."

Mr. Harman Payne replied. The toast of "The Officers" was responded to by Mr. Friedrich.

At this point a little surprise was in store for Mr. Schneider, as Mr. Gachelin arose to make him a presentation of a case of cutlery and an address on behalf of the new members. Mr. Schneider appropriately replied to this unexpected demonstration of good feeling towards him.

Vocal and instrumental music was excellently rendered, and as a close to the proceedings the company very heartily sang the English and French national anthems.

Messrs. Wm. Cutbush & Son, of Highgate, received a cordial vote of thanks for the floral decorations.

TROPAEOLUM SPECIOSUM.

TROPAEOLUM SPECIOSUM, or the Flame-flower, is a plant to be conjured with; rather should I say it is a plant that conjures up pleasant memories, for it is only when I have been *jour de fete* that I have come across the finest specimens. It is, however, a subject fit for any theme, and one which has wound itself round my imagination, leaving, in consequence, a deep and permanent photographic impression on the retina of my visual organs. Therefore "A.P.'s" note last week has acted as an incentive, and brought back visions of the most brilliant description.

It is a plant with a character, but it requires certain simple, though necessary, conditions to bring out its character, which, when fully realised, is patent to all, and well deserves its common, as well as its specific name. But I am afraid those conditions are not obtainable even in sunny Surrey, genial though it be, because the coolness and the moisture which we find in the Welsh valleys, the Scotch glens, or the hilly districts on our western shores, are absent from our southern shires.

If, as "A. P." suggests, a sandy soil is synonymous with a sunny site, and agreeable to the plant's requirements, I ought to be able, at least, to report progress. Alas! these conditions have not sufficed! A sandy soil is a dry soil—hence I attribute the failure. But, as I do not yet intend to close the contest, I procured last spring a fresh stool, and planted it in my hardy Fern-house in a mixture of peat, loam, and leaf-soil, where, although it did not bloom, it made good growth. Should it attain a floriferous condition during the ensuing season, under altered circumstances, I should be pleased to add the reason why. I am greatly indebted to "A. P." for his compliments, which are only half-deserved, for though I may sometimes scintillate, he is always "A. P." ('Apy) in his references to plants and garden-lore—C. B. G., *Acton, W.*

LAW NOTICE.

ASHWORTH v. WELLS.

Mr. Justices Day and Lawrence were engaged on Tuesday in hearing an appeal by the plaintiff in the action Ashworth v. Wells from the decision of the learned county court judge at Manchester, who had entered judgment for defendant with costs.—Mr. C. A. Russell, Q.C., and Mr. Tweedale appeared for the plaintiff in support of the appeal, while Mr. M. Lush opposed it on behalf of the defendant.

It appeared that down to 1895 the defendant possessed a large and well-known collection of Orchids, and the plaintiff was also a grower of Orchids. In June of that year defendant sold his collection by auction, and at the auction the plaintiff purchased for twenty guineas a bulb described as a *Cattleya Acklandiae alba*. Plaintiff cultivated the plant for two years, and then it produced a purple flower. Plaintiff brought an action to recover damages for an alleged breach of warranty, and at the trial several Orchid growers were called and gave evidence to the effect that a white *Cattleya* was such a rare flower that it was seldom met with, and that the value of a plant of this description varied from £60 to £150. The county court judge, while being of opinion that if the Orchid in question had been an actual alba it would have been at the time of the sale worth more than £50, held that until the plant had shown its real nature no Orchid grower would have given more than twenty guineas for it. As the defendant had paid that sum into court he entered judgment for him with costs.

Mr. Justice Day said he had come to the conclusion, somewhat reluctantly, that the county court judge had erred in the matter of law. He was not in a position to say what a white *Cattleya* would be

worth if it were discovered; it was impossible to speculate on the value of a thing which had never been known to exist. However, he thought the plaintiff was entitled to recover not only the money he had paid for the Orchid, but interest on that sum and compensation for the trouble and expense to which he had been put in growing the Orchid for two years. Therefore the appeal would be allowed with costs, and the case sent back to the county court judge for a new trial.

Mr. Justice Lawrence concurred.
Leave to appeal granted.

GARDENING MISCELLANY.

ROSE, WHITE MAMAN COCHET.

THE Tea Rose known as Maman Cochet succeeds well in this country, and frequently makes its appearance on the exhibition table. As a result of this it is popular with a large number of growers. The new variety has pure white flowers of the same size and beautiful form as the type. It also possesses the vigorous habit and free flowering character of the parent; and the flowers may be utilised for all ordinary purposes in the cut state as well as for exhibition purposes. We note that its merits were recognised at the Hamburg exhibition by the award of a large Silver Medal. It is now being put into commerce by that Rose specialist, Mr. Peter Lambert, Trier, Germany.

PEA CARTER'S EARLY MORN.

I WAS pleased to notice an illustration of the above new early Pea in your issue for January 15th. It is very faithfully represented. I had no hesitation in deciding what variety it was before reading the name. A small packet was sent to me for trial last spring by Messrs. J. Carter & Co, which I sowed with several other well-known varieties, and it proved a great surprise to me. It is not only very early and prolific, continuing to bear for a much longer period than any other large-podded variety that I am acquainted with, but it is by far the finest Pea for either exhibition or home use I have yet seen; and if I am not mistaken it will, when better known, become a great favourite for market use; and the flavour is excellent. I would strongly advise exhibitors that are on the look out for a good Pea to give this a trial, feeling sure they will not be disappointed.—*Edwin Beckett, Aldenham House Gardens, Elstree, Herts.*

IRIS KAEMPFERI.

My employer was in London last June, and saw the flowers of the above in a florist's window, and was so much pleased with them that we bought in a few hundred roots last autumn. A gentleman who has tried them, told me the other day, that he has had them for the last three years, but they have never flowered with him. He added that they have never been known to flower in this country. Perhaps some of your numerous readers could say something about their culture.—*Nial.*

ROSE, RED MARECHAL NIEL.

THERE are now three varieties of the popular Rose Maréchal Niel, namely, yellow, white, and red. The yellow is, of course, the old variety with which we have been acquainted for many years. The White Maréchal Niel we first recorded in 1895, and there is now a considerable quantity of it in this country. The Red Maréchal Niel is named Grossherzog Ernst Ludwig, in compliment to a gentleman of that name at Hessa. It was raised by Dr. Müller from the hybrid perpetual Pierre Notting, crossed with Maréchal Niel. It seems somewhat strange to speak of it as a Tea Rose, seeing that neither of its parents belonged to that section; but that is what Mr. Peter Lambert, Trier, Germany, is calling it, and now putting the variety into commerce. Possibly Maréchal Niel is considered a Tea in Germany. The flower is large, well-shaped, full, and of a carmine-red colour. It is also deliciously fragrant, and flowers profusely from the wood of the previous year. It is a climber, though not so strong as Maréchal Niel, though otherwise bearing a strong resemblance to it. At the Rose Show at Frankfurt-on-Main last year it was awarded a Gold Medal.

OBITUARY.

THE LATE M. JEAN LINDEN.

As briefly mentioned in last week's issue, this veteran traveller, botanist, and horticulturist died peacefully at his residence in Brussels on the morning of the 12th inst., and the world is the poorer for his loss. He was born at Luxembourg on the 3rd February, 1817, and was consequently almost on the point of

veteran collector himself conceived the idea of cool treatment for *Odontoglossums* and others which live in cool, elevated regions, and advocated the system which has since become so successful.

The subject of this notice long retained the health and vigour which were the characteristics of his youth, and though not taking so active a share in the management of *L'Horticulture Internationale* as

ALDERMAN SIR JOSEPH TERRY.

completing his 81st year. Early in his career he went to Brussels, with which city he has ever after been identified while in Europe.

The Belgian Government in 1835 sent him to South America on a scientific expedition, landing in Brazil after a journey of three months' duration. He and his companions succeeded in making extensive collections of scientific interest for the Belgian Government. Various other countries were visited north and south of the Isthmus of Panama, particularly in Central America, and, after a period of six years, he returned to Belgium. During his journeys he had many hair-breadth escapes by mountain, flood, and field, falling a victim to yellow fever, from which he was recovered by slow degrees.

His adventures, escapes, and successes so fired him with enthusiasm for travel that he did not long remain in Europe, but returned to South America, travelling extensively in Columbia, where he discovered *Odontoglossum crispum*, which was named and described by Lindley, then in the height of his career. M. Linden ransacked the mountains and forests of various provinces of that country, collecting *Odontoglossums*, *Cattleyas*, and other Orchids, which have since attained to great repute in Europe and North America. Various other countries of the South American continent were explored by him, passing northwards till he reached Cuba, from which he went to the United States, returning to Belgium after a career of ten years' travelling.

M. Linden now settled down as a nurseryman at Brussels, where he, in course of time, attained and for many years maintained a world-wide reputation in connection with Orchids and fine foliage plants, with which he has made us familiar at the Temple Shows, and in *Lindenia* and *L'Illustration Horticole* by means of his descriptions and full page, or even double page, coloured plates.

He was so familiar with the native habitats of the plants with which he has for long been identified that he sent out collectors from time to time to bring home fresh importations of well-known plants, and search for others. That he was abundantly successful in this respect the pages of those publications amply testify. Many of the valuable finds have been recorded in our pages from time to time. Several enterprising horticulturists in this country imitated M. Linden by sending out collectors. The

formerly, he maintained his position as director or administrator of the business till the last. He also had similar control over the publications above mentioned. His son, M. Lucien Linden, has for many years past relieved him of the more onerous duties of management of the establishment at Parc Leopold, Brussels. The deceased was Honorary Consul General of The Grand Duchy of Luxembourg, Commander of the Order of Leopold, and had many other honours besides. He leaves behind him a wife, son, some grandchildren, and various other relatives to mourn his loss. We tender our sympathy to the bereaved in the hour of their cruel and irreparable loss. The funeral service took place on Friday, the 14th inst., in the parish church of Saint Josse-ten-Noode.

ALDERMAN SIR JOSEPH TERRY.

This distinguished gentleman presided at the annual general meeting of the Grand Yorkshire Gala on the 7th inst., when he was congratulated upon having attained his seventieth birthday; but, scarcely have the sounds of congratulation died away, we regret having to announce, when the city of York has been thrown into grief by the irreparable loss of one of its most prominently useful and esteemed citizens.

Sir Joseph Terry was chairman of Lord Charles Beresford's election committee, and having entered upon the work with his accustomed energy, he took up his station in the Royal Station Hotel. On Tuesday he seemed full of health and vigour, and retired to rest at midnight, after seeing Lord Charles and his committee. He was seized with a violent fit of coughing about 3 a.m. on Wednesday, the 12th inst., and was dead before medical aid could be procured, although Lady Terry rang at once for help. Death was due to syncope as a result of heart disease.

Sir Joseph was born in York in January, 1828, where his family had lived before him for a long period of years. He had been Lord Mayor of York on four occasions, was knighted in Jubilee year, 1887, and filled many other public offices with great success. He entertained a great love for horticulture, in token of which he has been associated with the Grand Yorkshire Gala for a great many years, taking a great interest in its welfare, so that the society will feel the loss keenly. He had just been re-elected chairman of the council of that body on the 7th inst., when Sir Christopher Milward and Ald. Purnell congratulated him upon his hale and hearty appearance.

A portrait of Sir Joseph, then Mr. Alderman Terry, appeared in *THE GARDENING WORLD* for June 11th, 1887.

GREEN PEAS—JUNE TO NOVEMBER.

C
A
R
T
E
R
S

A correspondence was raised in the Daily Press last Autumn upon the shortness of the season when Green Peas are available, both in gardens and on the market. We now offer the following as representing the best collection selected from 1,024 rows we had under trial last season. It would be difficult for us to give precise dates for putting the seed into the ground, as so much depends upon soil and situation. Successional Sowings may be made any time between these dates, and the last sowing not later than the second week in June.

| NAME. | DESCRIPTION. | HEIGHT. ft. | WHEN TO SOW. | EXPECT READY TO PICK. | CARRIAGE FREE. Per pint. Per qt. |

QUESTIONS AND ANSWERS

Will our friends who send us newspapers be so good as to mark the paragraphs or articles they wish us to see. We shall be greatly obliged by their so doing.

[Correspondents, please note that we cannot undertake to name florists' flowers such as Carnations, Pelargoniums, Chrysanthemums, Roses, nor such as are mere garden varieties, differing only in the colour of the flower. Florists' flowers, as a rule, can only be named by those who grow collections of them.]

Flower of Odontoglossum crispum.—T. S.: There is nothing wrong about the form of the flower, as the sepals and petals are relatively broad and overlapping one another. Before it would be appreciated, however, it would have to be twice its present size at least. We take it for granted that the plant is small and not yet thoroughly established. The true quality of the flower is best seen when the plant has attained full vigour. The variety is what we should call a light one, being nearly white, with the exception of the lip, which is blotched. The petals are beautifully crisped, and altogether the variety is pretty, but far too small at present to be appreciated.

Fowls Manure for Vines, &c.—Reader: The most valuable constituent of plant food that fowl droppings contain is nitrogen. The phosphates in it are also valuable in their way. The absolute value of the droppings would depend upon the richness of the food supplied to the fowls, and whether or not the droppings have at any time been subjected to rain or allowed to get wet. The drier they are kept till required for use the better; if exposed to rain the soluble nitrogen gets washed away and lost. Upon these facts depend the strength of the droppings and the quantity you may safely apply to Vines, Tomatos, and Strawberries. If the droppings are dry you may put a peck in a bag and sink the latter in a tub or tank containing 20 to 24 gallons of water. After it has been in the water three or four days you should give the bag a shake up now and again to facilitate the distribution of the manurial ingredients in the water. With this liquid you may water your Tomatos and Strawberries about every second or third day after the fruits or some of them are set. We should understand they are in pots. Vine borders may be watered with this solution every time they get sufficiently dry to require it. The droppings in the bag might be renewed every ten days or so. Make an estimate of the strength of the droppings according to their purity, that is, freedom from litter, &c., and whether they have previously been kept dry or not. Always err on the side of giving the liquid too weak rather than too strong. You may also give the Vine borders a dressing now of half a bushel to the rod of ground, pointing it in with a fork. About a six-inch potful of droppings might be mixed with each bushel of compost for the Tomatos and Strawberries, breaking the droppings up rather finely and well mixing them with the potting soil.

Training of Clematis.—D. W. D.: You had better attend as closely as you can to the training of the young shoots and stems as they grow during each summer for the first few years at least until they cover the allotted space. At the winter pruning it will be very difficult or impossible to do this on account of the interlacing of the stems and the twisting of the petioles or leafstalks, which become hard and woody, rendering the unravelling of the stems during winter a work of great difficulty or an impossibility. This is more particularly the case with the early summer flowering varieties. In some districts C. Jackmanni is cut down to the ground annually after frost has killed the foliage, and young stems trained up regularly every year. The best plan is to train up the young stems separately, distri-

buting them regularly over the allotted space. After they get to the top of the wires, they may be allowed to hang down loosely, at least during the summer months. They may be trimmed back more or less in winter for the sake of tidiness; but you must remember that the early flowering kinds bloom from the wood of the previous year, so that this must not be cut away, if you can avoid it. Separate the stems and tie them upright before growth recommences in spring. Do not give any pruning at first beyond cutting away dead or weak and useless shoots.

Starting Dahlia Roots.—D. W. D.: Your best plan under the circumstances would be to pot up the roots, without dividing them, in the month of March and put them in cold frames, provided they are secure from frost. In the absence of better convenience could you not make up a bed of fermenting manure to start the roots? Cover the manure with a few inches of soil and stand the pots on the top of it, covering the whole with a cold frame. This would bring the roots along as fast as anyone in a private establishment could desire. As the shoots come away give them more and more ventilation according to the state of the weather, finally hardening them off by taking the lights off altogether during the day, or even at night provided there are no signs of frost. The plants will be dwarf, but should flower well enough during the end of summer and autumn, till frost cuts them down.

Names of Plants.—G. Clayton: Acacia dealbata. —G. Ross: 1, Ficus repens minima; 2, Ficus falcata; 3, Tillandsia zehrina; 4, Carex brunnea variegata. —A. Warwick: 1, Coleonema album; 2, Pelargonium radula; 3, Oncidium praetextum; 4, Dendrobium nobile (a fairly well coloured and pretty variety); 5, Odontoglossum Rossii majus; 6, Laelia anceps —J. C.: 1, Nephrolepis davallioides furcans; 2, Nephrolepis acuta; 3, Pteris scaberula; 4, Hedera Helix arhorea. —A. Reid: Pernettya mucronata.

WEBBBS' NEW PEAS.

WEBBBS' PIONEER.

Now Offered for the First Time.

This new Pea is a remarkably handsome blue wrinkled Marrow, growing from 3 to 3½ feet in height; it is hardy in constitution, and very early in coming to maturity, following immediately after the early small round varieties. The pods are very large, straight, and contain from 8 to 10 fine Peas of most excellent quality.

2s. 6d. per pint, post free.

WEBBBS' ASTRONOMER.

A remarkably handsome main crop variety growing about 3 feet in height. It is a wonderful and most persistent bearer, and is invaluable for general or late sowing. The pods are of medium size, closely filled with Peas of the finest quality.

3s. 6d. per quart, post free.

WEBBBS' SENATOR.

This splendid new Pea is a very remarkable cropper, the pods being produced mostly in pairs; they are of good size, and contain on an average about 9 large peas, which are sweet in flavour.

2s. 6d. per quart, post free.

See Webbs' Spring Catalogue, post free, 1s.

WEBBBS' Wordsley, STOURBRIDGE.

BARR'S SEEDS

OF FINEST SELECTED STRAINS AND TESTED GROWTH

Barr's Ne Plus Ultra French Bean.

A fine forcing variety, very early, and producing an abundance of fine pods Per quart, 1s. 6d.

Barr's Earliest French Shorthorn Carrot.

A favourite for soups, and extremely early; the best variety to sow in frames. Per oz., 10d.

Barr's Pride of the Market Cucumber.

A specially fine selection, dark green, and of handsome shape, a favourite in Covent Garden Market. Per packet, 1s. 6d.

Barr's Improved Telegraph Cucumber.

A fine selection, handsome straight fruit of fine flavour, very prolific. Per packet, 1s. and 1s. 6d.

Barr's "Eureka" Melon.

A grand new scarlet-fleshed variety, fruit large and densely netted, flavour delicious, heavy cropper and early; a splendid exhibition variety. Per packet, 1s. 6d. and 2s. 6d.

Barr's First of All Radish.

Fine little, short leaved, very early Radishes, scarlet or white. Each, per oz., 6d.

Barr's Early Ruby Tomato.

Large, solid, bright scarlet fruit, of fine form; an abundant cropper, and best first early Tomato. Per packet, 1s.

Barr's Thick-fleshed Tomato.

Surpasses all other varieties for depth of fruit, solidity of flesh, high quality, and heavy cropping. Per packet, 1s.

Barr's Seed Guide, containing a full descriptive List of the best vegetables and most beautiful flowers, sent free on application.

BARR and SONS,

12 & 13 KING ST., COVENT GARDEN, LONDON.

VEITCH'S SUPERB TOMATOS.

VEITCH'S "GOLDEN JUBILEE."

First-Class Certificate, Royal Horticultural Society, May 26th, 1897.

A splendid acquisition; one of the finest Tomatos of recent introduction, of a beautiful golden colour, magnificent cropper, and of excellent flavour.

PER PACKET, 2/6.

"FROGMORE SELECTED."

First-Class Certificate, Royal Horticultural Society.

This exceedingly prolific variety was raised by Mr. Thomas, the Royal Gardens, Frogmore. The fruit is of a bright red, medium in size, very uniform and smooth in outline, and suitable either for forcing or outdoor cultivation.

PER PACKET, 1/6.

"HAM GREEN FAVOURITE."

First-Class Certificate, Royal Horticultural Society.

This splendid variety for two successive seasons held the foremost place in the comparative trials of Tomatos at the Royal Horticultural Society's Gardens, Chiswick.

PER PACKET, 1/6.

James Veitch & Sons, Ltd.,

Royal Exotic Nursery,

CHELSEA, LONDON, S.W.

"Gardening is the purest of human pleasures, and the greatest refreshment to the spirit of man."—BACON.

The Gardening World.

Edited by J. FRASER, F.L.S.

SATURDAY, JANUARY 29th, 1898.

NEXT WEEK'S ENGAGEMENTS.

TUESDAY, February 1st.—Sale of Lilies, and hardy plants by Messrs. Protheroe and Morris.

WEDNESDAY, February 2nd.—Sale of Tuberoses, Gladioli, and Roses by Messrs. Protheroe and Morris.

THURSDAY, February 3rd.—Sale of Tuberoses, Gladioli, and Roses by Messrs. Protheroe and Morris.

FRIDAY, February 4th.—Sale of Imported and Established Orchids by Messrs. Protheroe and Morris.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—The annual general meeting and the election of candidates to the benefits of the charity dispensed by this institution again brought before the British public on the 20th inst. some idea of the amount of distress prevailing amongst the members of the profession of gardening or their wives; and although there were fifty-four applicants for help, it can hardly be expected that this number represents the total of the indigent members of the craft, that have been incapacitated for work through age, accident or the various infirmities to which human flesh is heir. In the face of this the need for a charity of the nature of the Gardeners' Royal Benevolent Institution is self evident. Notwithstanding the vast sums that have been given for all sorts of

purposes during the past year, the institution has been fairly prosperous compared with former years; nevertheless the whole of the money at the disposal of the charity, invested or otherwise, is wholly inadequate to meet the wants of the destitute.

Close upon £3,000 has been spent in supporting the pensioners during the past year. Ten fresh ones were placed upon the funds without the trouble or expense of an election, according to Rule III., 5; and ten others were elected by the votes of the electors. One of these was put upon the list of pensioners merely by virtue of a legacy left by the late J. W. Thompson, for sometime gardener to George III., and afterwards at Syon House. The money was intended for the benefit of a widow or widows, and accordingly the widow receiving the highest number of votes amongst the unsuccessful candidates was declared elected to this benefit. Something less than the desired £5,000 to establish what is known as the Victorian Era Fund has been secured, but the fund is still open in the hope of completing the necessary amount, the interest of which is intended for the benefit of the distressed amongst the unsuccessful candidates. The fund can only provide sums ranging from £10 downwards in behalf of those just indicated. Altogether there were 97,951 votes sent in; but the extraordinary number of 1,152 were lost through the voting papers being unsigned, and owing to 117 the subscriptions for which had not been paid. This must represent a great amount of carelessness on the part of voters. The report for the past year, and the proceedings of the meeting will be found on another page.

PROFITABLE FRUIT CULTURE.—A paper on this subject was to have been prepared for the Chiswick Gardeners' Mutual Improvement Association later on in spring by Mr. S. T. Wright, the superintendent of the Royal Horticultural Society's Gardens, Chiswick; but owing to the failure of two other lecturers to turn up on the 20th inst. by reason of important engagements elsewhere, Mr. Wright undertook to fill the gap and delivered a lecture from a few notes. It was entirely of a practical nature, and dealt chiefly with the speaker's experiences in the Apple-growing counties of the west of England. As in the case of most lectures dealing with the commercial aspect of fruit culture, most attention was devoted to the Apple, which is generally admitted to be the king of British fruits for outdoor culture. For the benefit of the young men assembled, the lecturer took up the various points of cultural detail, touching upon the value of a loamy soil overlying the red sandstone formation for Apple orchards. Size and colour were two of the primary requisites in fruits to take the eye of the public. In spite of differences of opinion that still prevail amongst cultivators, we agree with the speaker that Apple orchards should not be sown down with grass, but kept loose on the surface during the growing period. This is more particularly essential in the southern counties where long continued drought often interferes with growth and a full crop upon the trees. The most suitable time for planting was declared to be the latter half of October and the first of November, for the fresh roots made by the trees before winter finally sets in enables the trees to start away freely in spring as if they had been established for some time. The question of stocks for the trees was also discussed.

In connection with the most suitable varieties to grow for market he said that in this country or the United States there may be some hundreds or thousands of varieties in cultivation, yet of this vast number it was

had policy to plant more than a few varieties whose cropping capabilities and general good qualities were well recognised. He was totally averse to the planting of early varieties as the orchards were overdone with them already. Apples that keep sound for the longest periods of time and are otherwise recommendable, should have the first claim upon the planter, because by their use the markets can be kept continually supplied without the necessity for glutting the same at any particular period. Lane's Prince Albert he placed first on the list because it keeps sound and usable from September to May, and all that time may be marketed. In the midland and northern counties few Apples were in more popular demand than Worcester Pearmain, which fetched from £20 to £30 a ton, and never less than £18. Warner's King was a large and profitable variety, as each tree would produce from $\frac{1}{4}$ cwt. to $\frac{1}{2}$ cwt. of good fruit. Usually it was a green Apple, but under certain conditions of soil, exposure and treatment it assumed an amount of colour as to render it almost unrecognisable. Cox's Pomona was a highly coloured, and attractive sort, with the additional recommendation of being a good cooking fruit. In the market it fetched 15s. or 18s. a hundredweight. There was no more continuous cropper than Golden Spire, and notwithstanding the lack of size, which detracts from its value in the market, it fetched about £12 a ton.

In the matter of flavour we, in common with many others, would place Cox's Orange Pippin first on the list, and no doubt it would be accorded the same honour for market value provided it could be cultivated successfully on as great a variety of soils as the average of sorts can. The lecturer considered that there was none better for market work on suitable land, for £2 2s. to £2 10s. was obtained for it per hundredweight. This says a good deal for the awakening of the British public to the value of flavour in preference to mere size and colour. The limited supply, however, must contribute largely in maintaining the price of the fruit of this variety. Other varieties recommended were Lord Grosvenor, for size and earliness, Golden Noble one of the freest bearers under proper treatment; Bismarck for size and appearance, though the variety is only yet under probation; Stirling Castle, for its free cropping properties and general utility; Yorkshire Beauty and Bramley's Seedling, the latter fetching £24 per ton in the market.

The principal insect pests that infest the Apple were mentioned, and remedies explained. Then followed a discourse upon the general features of Plums, Pears, Raspberries and Strawberries for market. The lecturer agreed with the general opinion of connoisseurs that Pears are very uncertain in our climate, so that little dependence can be placed upon them. In speaking of Royal Sovereign Strawberry he considered it a valuable sort for market, though many growers were yet prejudiced in favour of Sir Joseph Paxton. For late work he considered it advisable to obtain a variety with the cropping qualities of Royal Sovereign by crossing the latter with something likely to furnish the desideratum.

Odontoglossum crispum at the Sale Rooms.—The second big sale of this popular Orchid took place at the sale rooms of Messrs. Protheroe & Morris, Cheapside, on the 21st inst., when the prices realised were quite as good, if not better than on the previous occasion. Twenty-seven pieces on a stick as imported fetched from £2 5s. to £2 10s. In other cases, fifteen to eighteen fine pieces tied or fastened on a board, were bought at £12, £10 and £15 per board.

The Wild Bird Protection Act has been adopted and put in force in the counties of Inverness and Elgin.

The Rainy Season has now commenced in the drought stricken districts of the north and north-western districts of Queensland.

A Tortoiseshell Butterfly, in excellent condition, was recently caught in the office of the goods' manager of the North London Railway at Poplar.

Mr. Thomas Phillips, for three years gardener at Bellevue, Delgany, Co. Wicklow, has been appointed gardener to C. Tuysden Hoare, Esq., Bignell House, Bicester, Oxon.

"Rascal Florists."—Referring to Mr. Simpson's notes, says the *American Florist*, in the December 25th issue, a subscriber signing "Molly" says that the farther west you go the more "Rascal Florists" you meet. True! Molly—too true! and Canada Thistles and Ox-eye Daisies, and English sparrows and other things also infest the western country, but they came from the east.

Veitch Memorial Trust.—At a meeting of the trustees, held on January 19th, Dr. Maxwell T. Masters in the chair, it was unanimously resolved that medals for objects to be hereafter determined should be allotted for the present year, at exhibitions to be held at Bristol, Leicester, and Cardiff respectively. A sum of £20 was voted to the trustees of the Lindley Library towards the preparation of the catalogue now in progress. Medals were also allotted to M. Marliac, in recognition of his success as a hybridiser; to M. Ed. André, of Paris; and to M. le Comte de Kerchove, of Ghent, President of the Royal Agricultural and Botanical Society of Ghent, for their respective services to horticulture.

Eastbourne Horticultural Society.—The annual meeting of this society took place at the Natural History Rooms, Eastbourne, on the evening of the 11th inst., Mr. W. Sharp occupying the chair. The financial statement for the past year showed total receipts amounting to £136 4s. 1d., with an expenditure of £122 4s. 7d., thus leaving a balance in hand of £13 19s. 6d. The report of the committee recommended that an offer made by Mr. F. W. E. Shrivell, F.L.S., to deliver a lecture entitled "the results of four years' experiments on vegetables with and without manure" be accepted. An acceptance duly followed. It was also decided that the radius of the society's influence should be extended to ten miles.

Newcastle-on-Tyne Flower Shows.—We have received a copy of the schedule of the above. The spring show will be held in the Olympia on Wednesday and Thursday, 20th and 21st April, 1898. The summer show will be held in the Recreation Ground, in conjunction with the Northumberland Agricultural Show, on Wednesday, Thursday, and Friday, 13th, 14th, and 15th July, 1898. The Royal Horticultural Society's Council have accepted an invitation to be present, and will send a deputation with full powers to make awards. The attendance at the last joint show in the year 1893 was enormous, and the financial result was a very successful one. Copies of the schedule may be had from the Secretary, 54, Westgate Road.

West Derby Gardeners' Mutual Improvement Society.—The second meeting of this newly formed Society was held on the 5th inst., at the Social Club, Mr. J. B. Patterson presiding over a good attendance of members. The chairman in introducing the lecturer referred to the extensive culture of the Rose from a commercial point of view, and gave some interesting information as to the extent and form of this important industry, after which he briefly introduced Mr. R. G. Waterman, who had come to lecture on "Roses for Exhibition." As an introduction a few important details of its history was given with some few notices of our latter day introductions, showing the marked improvement made by our own raisers, who were now able to hold their own against the French varieties. The details of the preparation of the ground, planting, and general culture were given at some length, so that the uninitiated could follow the rules laid down. After the lecture a discussion followed in which several of the members and the chairman took part. A cordial vote of thanks to the chairman and lecturer terminated the proceedings.

Doctors are now recommending Grapes for strengthening the voice.

"Jeemes," said the laird one day to his gardener, "there was something I was going to ask you, hut man, for the life o' me I canna mind what it was." "Mebhe," said Jeemes, who had received no pay for three weeks, "mehhe," said he, "it was to spier at me fat way I was keepin' body and soul tgether on the wages I wisna gettin'."

Huxley and his Garden.—In his later life he devoted himself to gardening at Eastbourne. All through his last prolonged illness from early spring to mid-summer, he loved to hear how the garden was getting on. When the warm weather came, he spent most of the day there, and even recovered so far as to be able to walk once more into the lower garden and visit his favourite flowers. These children of his old age helped to cheer him to the last.—*Century Magazine*.

Lost Votes at the Royal Gardeners' Benevolent Election.—It is with great regret I call the attention of subscribers to the above, because 1,152 votes were lost—1,035 through not being signed, and 117 through subscriptions not being paid. This is a serious matter, for many of the candidates must suffer through the neglect. The Royal Gardeners' Orphan election takes place on Feby. 18th, therefore let me advise those who have votes not to forget to sign their names and mark their voting papers in a plain manner to save a repetition of what I anxiously draw their attention to.—*Alfred Outram, F. R. H. S., 7, Moore Park Road, Fulham, London, S.W.*

Ealing Gardeners' Society.—On the 18th current, Mr. W. Farr, Isleworth, presided over a well-attended meeting of this society, when Mr. J. Hawkes, of Osterley Park Gardens, read a very able essay on the "Cultivation of the Gloxinia." Mr. Hawkes dealt with his subject in all its stages, in fact, he covered the whole field of Gloxinia culture from the tiny seed to the full-blown flower. Mr. Hawkes' paper, in consequence, was much appreciated, for gardeners are nothing unless they are practical; and when an experienced cultivator, like the essayist, elects to go into detail, his audience—especially the younger gardeners—are always interested. The discussion which followed was necessarily terse, because each speaker admitted the completeness of the lecture and the ability of the lecturer. Mr. Hawkes and the chairman were each accorded a hearty vote of thanks.

The Killing of Rare Birds.—There are great differences of opinion, and probably always will be, about the shooting of rare birds, whether they are true natives of these islands or merely visitors and stragglers. Mr. W. H. S. Monck has a complaint about the subject in the January number of *Knowledge*. Speaking of four rare birds that were shot, he says that most probably they had mates and would have augmented their rapidly-diminishing race; but the collector with his gun must needs make these rare birds extinct birds. The result would no doubt make his specimens more valuable, while if he allowed them to escape he would have no specimens. He contends that they are not intended to be eaten, that they are harmless, and the only crime of which they are guilty is their rarity. Rather than extirpate a dying race, he would preserve them as long as possible as "footprints on the sands of time," indicating certain climatic or other physical changes, the history of which we might hereafter desire to trace. The Editors of our contemporary defends the action of killing the birds on the plea that unless "certain birds are killed ornithology will not advance. In Mr. Howard Saunter's manual recently published there are six out of the twenty-four described which would never have been known to have visited the British Islands if they had not been shot. None of the four stragglers mentioned by Mr. Monck would have bred here if they had been left, and their identity could never have been recognised, had they not been shot. The Editors do not, however, advocate the killing of every rare bird. Here is where the difficulty comes in. We would require a law preventing any but scientific men from shooting anything but certain well known and plentiful birds. For instance, a man that would shoot a tame pelican, as happened recently, could not be trusted to spare anything outside the walls of a fowl yard.

Double Sweet Peas.—Mr. A. P. Wyman, who writes the notes on the trial of Sweet Peas conducted at the Cornell University Experiment Station, in delivering himself upon the status of double varieties says, "doubles are generally strong strains and give a profusion of large bloom, most of which, fortunately, is single." Evidently he does not believe that any alteration from the natural single towards the double form of the Sweet Pea would be an improvement.

Robbery in mid-air.—In the January number of *Knowledge*, Mr. F. G. Aflalo speaks of sparrows pursuing pigeons in mid-air, white ones for preference, and snatching feathers from their breasts and sides with which to line their nests. They had commenced operations about the end of the year, though the writer had never previously seen them start their depredations till the regular nesting time in March. This circumstance he regards as an interesting sign of the abnormal condition of the weather.

The Essex Field Experiments.—A meeting to consider the results of the field experiments carried out for the Technical Instruction Committee of the Essex County Council during 1896 and 1897, was held at the County Technical Laboratories, 78, Duke Street, Chelmsford, on the afternoon of Tuesday the 25th inst. James Round, Esq., M.P. occupied the chair. Mr. T. S. Dymond, F.I.C. gave the results to the meeting. The experiments comprised (1) manurial trials on Beans, followed by wheat; (2) manurial trials on permanent pastures; and (3) experiments on laying down land to grass. The meeting was then thrown open to discussion.

Preston and Fulwood Horticultural Society.—Mr. J. Williams, F.R.H.S., Bowgrave, Garstang, read a most interesting paper before this society, on "The culture of Flowering Roots and Bulbs. This class of plants, said the essayist, to anyone with limited means or accommodation, make a special appeal, not only because of their first small initial cost, but because they have such a wide range of adaptation. Mr. Williams then gave details, both cultural and descriptive, of many valuable roots and bulbs that appealed strongly to the amateur as well as to the professional cultivator. A brisk discussion took place subsequent to the reading of the paper, in which a number of prominent members took part.

Chesterfield and District Chrysanthemum Society.—The annual meeting came off on January 14th at the Station Hotel, Chesterfield, Mr. J. E. Clayton occupying the chair. Mr. W. G. T. Burr read the balance-sheet, which declared a total revenue for the year of £106 12s. 9d. The expenses amounted to £92 17s. 8d., leaving a balance of £13 5s. 1d. This was a smaller balance than that of the previous year, but it was owing to the fact that the spring show had not been so successful. At the election of officers Colonel Allen, of Wingerworth, was chosen as president, and Mr. Burr treasurer. Mr. Nelson was re-elected secretary, and it was decided that he should have an assistant to relieve him of some of the work. An interesting feature was the presentation to Mr. Burr of a handsome oak tobacco cabinet, in recognition of his past services to the society. The presentation was made by the chairman on behalf of the meeting. Mr. Burr made a suitable reply.

The Catalogue of Messrs. Daniels Bros.—"The Illustrated Guide for Amateur Gardeners" sent out by Messrs. Daniels Bros., Norwich, is more than up to its usual standard, being printed in clear type on good paper, and well executed generally. It is of large size, runs to 144 pages, and is profusely illustrated with coloured plates, wood-cuts, and photographs of various garden flowers, varieties of Nasturtiums adorning the covers. There are also two well executed chromoliths of various garden flowers in the body of the work. There are good photographic illustrations of Peas, Potatoes and other vegetables. Flowers do not respond so readily to the photographer's art as the more solid vegetables, their colours interfering with the work of the camera, or rather they elude its powers. They are well represented, however, by pictures of various kinds. The lists of flowers, fruits, and vegetables are descriptive, and at the head of most of the genera short articles deal with the cultural treatment for the benefit of amateurs, and which will prove serviceable as reminders to many others, thus justifying the title of the guide.

Strawberries to the extent of 1,000 tons are annually sent from the Clyde Valley to the markets of Glasgow, Dundee, Edinburgh, Liverpool, and other populous centres.

Battersea Park.—A committee of the London County Council has under consideration a scheme for making this an educational centre for horticulturists and hotanists. It is proposed to utilise special portions of the park for this purpose. Practical work will be done under the supervision of Mr. Coppin, the park superintendent. Demonstrations in scientific horticulture and in landscape gardening would also be given.

Messrs Cockers' Spring Catalogue.—The seed and plant catalogue issued by Messrs. James Cocker & Sons, 130, Union Street, Aberdeen, and intended to supply the wants of the garden in spring, contains many novelties in the way of Peas, Beans, Potatoes, and other vegetables. Flowers are equally well represented by the newest as well as more recent introductions, including many things that will be appreciated, both hardy and tender. A red Rose adorns the front cover, on a golden ground, and is appropriate to this well-known northern firm of Rose growers.

The People's Palace, Glasgow Green, which was opened by Lord Roseberry on the 22nd inst., is the latest addition to the public buildings of Glasgow. It comprises a large winter garden in which the opening ceremony took place, a museum, a picture gallery, and a music hall—an entirely original departure, for no other municipal body than that of Glasgow has attempted this combination under what is practically one roof. Prior to declaring the People's Palace open to the people for ever and ever Lord Roseberry made a lengthy, but interesting speech in which he pointed out the necessity of such buildings as they were now in for the education and recreation of the people, and that he considered the action taken by the Glasgow municipal body as a sign and token of its duty and its responsibility to all classes of the great community over which it was privileged to rule.

Woolton Mutual Improvement Society.—The annual meeting of this society was held at the Mechanic's Institute, on the 20th, inst., the Rev. R. E. Roberts presiding. From the report, the position of the society shows a decided improvement in point of number of members and subscriptions. The papers have been excellent, and a greater interest has been infused into the discussions. The microscope has been used at each gathering with pleasing results. The income amounts to £21 16s. 10d., including the balance from last year of £6 15s. 8d. The expenditure is £14 11s. 8d., leaving a balance of £7 5s. 2d. A donation of £10 17s. 8d. has been sent to the Victorian Era Fund. Mr. R. G. Waterman was re-elected Treasurer and Secretary. Seven microscopes with various slides were on the table for the use of the members. Mr. R. Todd contributed forty-four varieties of cut Orchids which were greatly appreciated.

Decorations at the New Club Ball, Cheltenham.—This ball is regarded at Cheltenham as one of the special features of the social season. This year it proved a huge success, thanks, in a great measure, to the splendid way in which the floral decorations were carried out by Mr. James Cypher. One of Mr. Cypher's triumphs was an Eastern grotto set up in the recess of a window. On a groundwork of virgin cork many choice plants and flowers, including Palms, Dracaenas, Eucalyptuses, Acacias, Araucarias, Cinerarias, Tulips, and Grevilleas were displayed. Scarlet drapery was freely employed in the balconies, and here again flowers were tastefully used. The large supper table was a triumph of floral art. The centrepiece was a large Palm placed on a tall pedestal from which four arches dressed with greenery and flowers radiated to the four corners. Smaller vases were filled with many beautiful Orchids, including Cattleyas, Odontoglossums and Cyripediums in variety, as well as forced flowers, such as Tulips and Lilies of the Valley. Other and smaller tables also prettily dressed filled the corners of the room. In the second upper room there was another series of supper tables which Mr. Cypher's skill and taste had gaily dressed with the products of his nurseries.

Mr. William R. Greenway, gardener to Sir Lionell Darel, Fretherne Court, Gloucester, we are pleased to learn, is so far convalescent that he was able to leave the hospital and he taken home after being laid up for five weeks. Our readers may remember that, owing to the result of an unfortunate gun accident, he had a leg amputated above the knee.

Royal Caledonian Horticultural Society.—We note from the schedule of this society, now to hand, that £272 is offered as prizes in 128 classes at the spring show, 6th and 7th April, next. At the autumn show 14th and 15th September, £364 is offered as prizes in 263 classes. At the latter show £7, £5, and £3 respectively are offered for the most tastefully decorated table of dessert fruit; £5, £3, and £2 are offered for a circular table of plants; and similar amounts for the best and most artistically arranged table of cut flowers of hardy plants grown in the open air, besides valuable prizes in other important classes.

Birmingham and District Amateur Gardeners' Association.—The fifth annual report of this enterprising body is before us, together with the balance sheet. It is printed in a handy pamphlet form, which contains the list of members and the programme of events for 1898. The year just closed seems to have been a fairly prosperous one with the society, and the average attendance at the meetings compares favourably with that of former years. Last year 83 prizes were offered, as against 50 in 1896. The summer exhibition attracted a large number of visitors, and was a great success. The results of the Chrysanthemum show were also satisfactory, and the committee proposes to give additional prizes this year. The annual excursion was not so well supported as it might have been. This was probably owing to the fact that many of the members were away on holiday on the date fixed—August 14th. The statement of accounts shows a total income of £40 14s. 9d., which includes last year's surplus of £8 14s. 9d. The expenses for the year have been £35 17s. 2d., thus leaving a balance of £4 17s. 7d. with the treasurer. The arrangements for the first half of 1898 include papers by Mr. W. Walker, on "The Culture of the Tomato"; Mr. J. S. Cornwall, on "Chrysanthemums"; Mr. J. W. Oliver, who treats upon "How Plants Feed"; Mr. W. B. Griffith, who tackles "Judging"; Mr. C. H. Herbert, who will talk about "The Cultivation of some useful Flowering Plants for the Conservatory"; and Mr. W. B. Child, who will have something to say on "Exhibiting Plants and Flowers." The sixth annual excursion will take place on June 25th.

Ulster Horticultural Society.—The Lord Mayor of Belfast (Mr. James Henderson, J.P.) presided at the annual general meeting held at the Windsor Hotel, Donegal Place, Belfast, on the 13th inst., and favoured the meeting with a speech, in which he spoke of the society as one of the most important associations in Ulster, and deserving of the best support of all lovers of fruit and flowers in the province. The annual report and statement of accounts was then submitted by Mr. Paul, the hon. secretary. The report showed that in spite of the severe weather last year's Chrysanthemum show was better attended than on any previous occasion. Special interest was evoked by the Victoria Jubilee Championship. The best thanks of the society were due to the City Council for the use of the St. George's covered market, and also to the gentlemen who had generously given special prizes. The receipts from all sources totalled £659 17s. 2d., and the expenditure £642 14s. 2d., leaving a balance of £17 3s., which added to the balance brought forward showed a total of £72 1s. 5d. in hand. Out of this it was proposed to devote £30 to the Victoria Jubilee Hospital scheme, which would leave a sum of £42 1s. 5d. with the treasurer. Mr. M. Lees moved the adoption of the report, and in so doing spoke of the gratifying successes of local exhibitors. He thought that the society was particularly indebted to Mr. Hugh Dickson and Mr. Pollock. Mr. Hugh Dickson seconded the adoption of the report. The new committee for the year was then elected, the list of gentlemen proposed by Mr. Thomas H. Dickson, supported by Mr. McLaren, being unanimously passed. Mr. H. M. Pollock asked for a vote of thanks to the Lord Mayor, and this was carried with acclamation. His Lordship suitably responded.

HINTS FOR AMATEURS.

Raspberries.—Last week we considered the kind of treatment that healthy, vigorous Raspberries in bearing condition required in the way of pruning, manuring, etc. We have now to deal with the question of the formation of new plantations, either to replace old worn-out ones, or to supplement others already in existence.

New plantations may be formed at any time between the beginning of November and the middle of March, so that there is a fairly long season in which to work. This admits also of waiting for a favourable opportunity when the ground is fairly dry and in good working condition before operations are commenced. To make a new plantation properly requires a good deal of labour in the preparation of the site, for, as we mentioned last week, the Raspberry is a rich feeder, and it is not every soil that chemically and mechanically is fit to receive it.

Any good garden soil that is not too stiff and has been well cultivated will suit the Raspberry. Once the site has been selected the work of breaking it up, and getting it into proper fettle must proceed. In the case where such a site is upon ground that has been trenched once or twice previously, and the subsoil consequently in good condition, it will be perfectly safe to trench again to the depth of two or three feet, working in a heavy dressing of good farmyard manure, which practically contains all the necessary elements of plant food in an easily obtainable form. If the subsoil is very poor, however, it will not be wise to trench, for this means that a lot of poor soil is brought close to the surface, and as it is from the upper strata of soil that the roots of the young plants will have to first find their sustenance, the young plants are starved at the outset, and growth is slow and unsatisfactory.

When the subsoil is poor therefore it will be advisable to bastard trench, or double dig the ground instead of trenching it. The only difference between this and trenching proper is that the subsoil, instead of being brought to the surface, is broken up, turned over, and put back in its place. In order to do this properly a trench two or three spits wide, must be opened at one end of the site, the soil taken out of it being taken to the opposite end of the ground to fill up with at the last. Proceed then as in ordinary digging, turning over the top spit first, and putting the soil at the far end of the trench, then operating upon the under or second spit. Work in plenty of manure among the subsoil, for this will prove a great attraction presently to the roots of the young plants after they have got a hold of their new quarters.

Planting.—Perhaps the commonest style of planting is to place the plants 3 or 4 ft. apart in rows, a space of 5 ft. being allowed between the rows. Each stool is provided with a stout stake, to which the canes are attached. This system is one of the very best for ordinary purposes. A variation of it may be had by allowing 8 or 10 ft. between the rows, and cropping the intermediate spaces with various kitchen garden crops. We do not favour this system, however, as the roots of the Raspberries are disturbed oftener than they like when it is followed.

Espaliers.—This is a capital method of training Raspberries. The plants may be placed about 2 ft. apart in the row, and the rows may be a little closer to each other than when the plants are grown in independent clumps. We have picked some of our very finest fruit from plants trained to espaliers, the extra amount of light they get being very beneficial.

After Planting.—As it is manifestly desirable that the young plantation should commence to yield fruit as soon as possible, the canes on the young plants should, before the buds upon them commence to swell, be cut down to within a few inches of the ground. If the plants are put out in the early part of the planting season this initial pruning should remain over until spring. The effect of this is to cause the stools to throw up strong and healthy shoots which will fruit the next year. If the cutting back were not attended to, only comparatively weak canes would be thrown up, and several years might elapse before the plants got into fruit-bearing habits. When more than four, or at the most five, shoots appear the weakest should be removed at an early

date, for to allow them to remain would only be taxing the strength of the plant to no purpose.

Varieties.—For general purposes Superlative is the best variety in cultivation. The plants are vigorous growers, and heavy continuous bearers, while the fruit, which is rich dark red in colour, is of superb size and flavour. If only one variety can be grown, this is the one to select. Baumforth's Seedling is also an excellent variety. It may be described as an improved Northumberland Fillbasket, and, like that fine sort, is of vigorous and hardy constitution. The fruit is large and bright red in colour. Fastolf, too, is highly thought of by some growers. Yellow varieties are generally much appreciated upon the dessert table, where the fruit forms an agreeable change in point of colour from the red and crimson varieties. The plants, however, are not usually so prolific, and should not be depended upon for a general crop. Yellow Antwerp and Magnum Bonum are two of the best yellow sorts.

Autumn-bearing varieties are not very largely grown, although they are useful for prolonging the season. They are not such sure or heavy croppers as the summer sorts, but if there is room a few of them will be of some service. October Red and October Yellow are two of the best.—*Rex.*

WOES OF AN AMATEUR.

THE gardener who has a number of convenient glass-houses wherein he may give his plants all the attention they need, is generally unable to understand the straits an amateur, possessed of limited conveniences, is sometimes put to. I can assure you Mr. Editor that I speak feelingly on this point, as the following experience will serve to show.

Having been told that Crocuses could easily be grown in cocoanut fibre and charcoal in any sort of receptacle, with no other shelter than an ordinary dwelling-room, I made a desperate resolve last autumn to have a try. I purchased a stock of Crocuses, and some cocoanut fibre and charcoal, ready mixed. They were duly consigned to a number of glass dishes of various sizes, for which I drew upon the kitchen store. This, of course, made a row, and was the beginning of the trouble. Women profess to like flowers, but they don't seem to appreciate a man's efforts to grow them for them.

Well I'm bound to say the Crocuses themselves went on finely, and threw up a lot of strong shoots, but about three weeks ago an enemy came in the night and sprinkled them with fat bugs, or flies, or something between the two which grew and grew, and multiplied apace. I suggested to my wife that she should sponge them off, as I was busy; she wouldn't, and—there was another row.

Matters went on like this, the flies ever multiplying and fattening until some of them got too heavy to hold on to the Crocuses, fell down, and walked about the room making an awful mess. This brought the affair to a crisis, and another row.

In the nick of time there was brought to my notice an invention of McDougall Bros., in the shape of a "fumer" that was warranted to kill everything that can crawl or fly. I obtained one, and after reading the instructions carefully, I determined to make use of it. The contrivance consisted of a little tin box in two parts, the upper containing the killing stuff, and the under part a wick and some oil, or grease, or some such tackle which had to be lighted. The "fumer" was said to be sufficient for a house containing 1,000 cubic ft. of air, but as I thought my "bugs" were extra tough 'uns, I resolved to put the thing in the scullery, which contains only about 500 cubic ft., along with the Crocuses, and let it do its worst or best.

As the project had to be kept dark, the first thing was to get the "missus" out of the way, which, after lying like a Trojan, I finally accomplished, although not without exciting her suspicion, as after events proved.

To cut matters short, the plants were placed in the scullery and the infernal machine set to work. All went well for a time until I heard the front door click, and then I knew the game was up, for the "missus" had come home. In she marched with a mightily suspicious air and asked what I was doing with the mat against the scullery door, and what I had got there. I suggested that she should satisfy her curiosity herself, which she promptly proceeded to do, and then the fun began. She opened her mouth to shout and got a mouthful of fumes, which

about staggered her. I had to laugh, but then Nemesis overtook me, for the fumes blinded, dazed, and choked me. I couldn't see, neither could she, and we daren't shout for fear of another mouthful, so we beat a retreat, and that blessed "fumer" smoked calmly on and sent its insidious fumes all over the house from basement to garret.

By this time the neighbours had got a taste of it, and there were hasty slamming of windows and sundry hursts of coughing. Next door's dog began to howl, others joined in the chorus, and there was a general hubbub.

When peace was finally restored, and the house cleared of the fumes, a row of another sort began, and my meek assertion that the smell was not disagreeable at a distance was received with scathing scorn. I found subsequently that all the "flies" were stone dead, and I don't really wonder at it, for I was about "cooked" myself, the "missus" has not been right since, and the neighbours all regard me as a maniac of the worst class, with considerable ingenuity in the way of annoying people.

Moral:—This new "fumer" will, I am fully persuaded, kill any insect under the sun, but don't use it in a scullery or it will nearly kill you.—*Long Suffering.*

Correspondence.

Questions asked by amateurs on any subject pertaining to gardens or gardening will be answered on this page. Anyone may give additional or more explanatory answers to questions that have already appeared. Those who desire their communications to appear on this page should write "Amateurs' Page" on the top of their letters.

Vines.—R. S.: A temperature of 45° Fahr. by night will be quite high enough for the Vinery for a start.

Morello Cherries.—E. Morton: Morello Cherries may be grown as standards, although the more generally adopted plan is grow them against a north wall where they do admirably, and fruit with great regularity. If you have a deficiency of wall space, however, you might well invest in a few standard trees. The pyramidally trained tree is the most suitable form.

Pear Souvenir du Congres.—Exhibition: This Pear is a seedling from that excellent variety Williams' Bon Chretien, and like it is an early sort, coming into condition in August and the early part of September. For exhibition purposes it is first-class, as it grows to a large size and is of very attractive appearance, besides being of good flavour. It does very well as a pyramid, but even better against a wall as a cordon. If you have wall space at your disposal we should advise the latter system.

Stewing Pear.—Exhibition: The most suitable stewing Pear to grow for exhibition purposes in a class where any variety is allowed would be Uvedale's St. Germain. It grows to a large size and forms a very imposing dish. For general purposes, Catillac would be our choice. Both varieties are hardy, prolific bearers, and good keepers.

Tying-Down Vines.—Will you please tell me what is the reason for unloosing the canes of Vines that are to be forced, and bending them down close to the ground? Is the practice necessary?—*Amateur.*

Taking the second question first, the practice is necessary in dealing with Vines that are to be forced early, but is not so important when the Vines are allowed to start into growth naturally. The sap naturally flows to the highest point, and the result is that the buds at the top of the cane, when the latter is allowed to keep its normal position, are better nourished than the lower ones. They start away too strongly, and appropriate sustenance that ought properly to go to the lower buds. This causes the lower shoots to be very small and weak, and under the disadvantage of early forcing they become weaker still, and do not fruit well. By bending the canes down in the manner you mention the flow of sap is more evenly distributed to all the buds along the whole length of the stem, they break into more equable growth, and we do not find one or two shoots at the top running away at the expense of the rest.

STAPELIA GIGANTEA.

This remarkable flower is one of the wonders of the vegetable world, and the species under notice is certainly the finest and most striking of the genus. We have on several occasions seen it in bloom with flowers ranging from 10 in. to 12 in. in diameter; but as far as we know that which was flowered recently by Mr. C. F. Wood, gardener to St. Barbe Sladen, Esq., Heathfield, Reigate, Surrey, beats the record. The accompanying illustration was prepared from a photograph of the plant when in bloom. It is, of course, very much reduced, for the open flower was

thinly covered with short hairs, and fringed with hairs at the margin. The flower as a whole bears a remarkable resemblance to a gigantic starfish.

The following account of the cultural treatment of the plant is supplied by Mr. Wood:—"Perhaps a note of its management may assist those who may not have been successful in flowering this wonderful plant. Plenty of heat and full sunlight in a stove, on a shelf high up over the hotwater pipes, close to the glass are what I give our plants. They delight in a sandy and rather rough compost, consisting of loam, lime rubble, and leaf soil. Good drainage is also

GRANARD GARDENS, PUTNEY.

LAST week we made mention of the subjects which are grown in quantity by Mr. W. Iceton for the supply of cut flowers. It must not be supposed, however, that these monopolise all the attention, for Mr. Iceton runs a general plant nursery, paying special regard to those plants which find a ready sale, and are in request not only in the general market but in private gardens also. Just as Lilies of the Valley are the speciality among flowering plants, so Palms are the chief object of consideration amongst foliage plants. There is this important

STAPELIA GIGANTEA.

15½ in. in diameter, and the bud also shown in the figure measured 14½ in. when fully expanded. The first records said that the flowers were 12 in. to 14 in. across, and those figures were considered excessive for some years.

Mr. Wood grows and flowers some rare and very curious things, having first acquired the love for them some years ago when at Pendell Court, Bletchingley, under Mr. F. Ross, who then had charge of the late Sir George Macleay's renowned collection. The flower is slightly concave, but otherwise spread out, five lobed, pale yellow, and thickly covered with transverse, brownish-red bars, finely wrinkled and

necessary; also a moderate supply of water when growing, and a little feeding as soon as the flower buds are noticed. Rub off the young growths as they appear, that is, which arise on the same stem as the flower buds. By doing this while the shoots are very young I attribute my success with the flowers, for the buds have a nasty way of dropping off when left to struggle with the young growths by their side."

Cucumber Rollison's Telegraph is not only a standard variety in this country, but is thought highly of and grown largely in the United States.

difference, however, that the latter are raised and reared to saleable size at home, while, as we have already noticed, German horticulturists contribute the required annual supply of Lily crowns.

Mr. Iceton has also an extensive business as a furnisher and decorator, and several of the largest and most important metropolitan hotels are among his clients. This part of the business necessitates that there shall be a stock of good plants of all sizes upon the place, in readiness to replace others that come back in a more or less crippled condition from a lengthy stay from home, or to supply fresh orders at a moment's notice. To accomplish this, plenty of

under-glass space is needed, as well as a large staff of labour. Much of the glass in the nursery, in fact, is devoted to Palms of different sizes.

Of these houses the most conspicuous is the large conservatory, whose front faces Putney Park Lane. This is a lofty and roomy house, but it is neither too lofty or too roomy for the numbers of plants it contains. Here one sees superb specimens of such useful decorative forms as *Archontophoenix cunninghamiana*, or to give it its every-day garden name, *Seaforthia elegans*, *Howea (Kentia) australis*, *H. fosteriana*, *H. belmoreana*, *Cocos plumosa*, *Livistona rotundifolia*, *Rhapis humilis*, *R. flabelliformis*, *Phoenix canariensis*, *P. rupicola*, and *P. reclinata*. These plants are ever in demand, and a good specimen never comes amiss.

Many other smaller, but still roomy houses are filled with these Palms and a few others in quantity. One point particularly strikes the visitor, and that is the comparatively low temperatures in which many of the plants are grown. This is done for the purpose of bringing the plants up as hardily as possible, and of training them, so to speak, to stand a little knocking about. In not a few nurseries the reverse of this is often the case; for a great deal of heat is given which results in rapid growth it is true, but the plants are not so sturdy or resistant of lower temperatures should they happen to come. It is obvious that the harder training is an advantage to plants that have to stand for days, sometimes weeks, together in draughty corridors or in the arid and unkindly atmospheres of dwelling rooms.

The number of young seedling Palms in the establishment is enormous. In several of the houses we see tier after tier of shelves filled with them, and they are represented in all stages from the baby plant to the comparative veteran of four, five, or six years, and upwards. *Cocos weddelliana* alone is grown in its thousands, for it is whilst in the small state that it finds its readiest sale. It is exceedingly handsome at any time, but the price, of course, grows with the plant, and as it is not the most suitable for the amateur cultivator to try his 'prentice hand upon, the price is a deterrent. *Stenersonia grandifolia* is a distinct and handsome plant. The leaves exhibit a shade of bronze-green, and are curiously dotted over with iron rust-coloured spots. The presence of these spots has led purchasers to fancy that their plants are in a state of ill-health, or that they have been bitten by some insect or other, but the spots are natural, and no sign of either fact. *Phoenix Roebelini* is an exceedingly pretty subject, but as seed cannot be obtained of it, the price continues high. The commoner *P. rupicola*, although, perhaps, not quite so ornamental, is yet a good substitute.

Stove foliage plants are well looked after. The earliest batch of *Caladiums* is already started, and some of the plants have several good leaves already. *Dracaenas* are represented by such forms as *D. Lindenii*, *D. sanderiana*, *D. Lord Wolseley*, *D. rubra*, *D. congesta*, *D. pendula*, the handsome but high-priced *D. Doucetii*, and *D. lineata*. Of the latter Mr. Icton has a grand stock of large plants. These know their way about town pretty well, for they are great favourites for decoration. *D. sanderiana* we have never seen better, the variegation being very strong and well marked. *D. Lindenii* is especially well done, for many of the plants are perfect models of symmetry with leaves right down to the pots, and such leaves too!—of great width and substance, and splendidly coloured. Several of the taller plants have been recently "ringed" and tied round with moss to favour the formation of roots. Amongst stove Ferns *Adiantum farleyense* is exceedingly well done, and its treatment is evidently well understood. *Crotons* in variety are grown. Amongst Bamboos, *Bambusa falcata* is one of the most useful forms. It is highly decorative, and stands well. A fine stock of plants of all sizes greets the visitor.

Eurya latifolia variegata is one of the most handsome and useful foliage subjects, and we were not surprised to find that Mr. Icton goes in for it extensively. It is given an intermediate temperature, and the results are to be seen in the wonderful development of colour which characterises the foliage. Some grand specimens in 6 in., 7 in., and even 8 in. pots looked fit enough to go anywhere, for they were clothed with foliage right down to the rims of the pots, and were very different from the scraggy-looking objects that are not infrequently met with.

A most successful line at Granard Park Gardens is the decorative forms of *Asparagus*. Several houses have the roof entirely covered with it, and odd plants are trained up pillars in other houses. Vast quantities of seed are obtained each year, although Mr. Kyaw, the manager, informed us that they were queer things to fruit, for sometimes the plants would flower with exceptional freedom, and comparatively few fruits would set, and individual plants seemed to like to have a season's rest from fruiting now and again. The young stock is represented by many thousands of seedlings in small thumb pots that will soon make good plants. *A. Sprengeri* is a handsome species that is of the utmost value for the filling of baskets for suspension in the conservatory. It grows freely, and is a good doer generally. Some young plants in 32-sized pots that were placed on a shelf near the glass were presenting a very pretty picture with their long pendant or sub-pendant growths.

The popular *Smilax (Myrsiphyllum asparagoides)* which is so extensively used for decorative work is cultivated at Granard Gardens to a considerable extent. It is planted out in a specially prepared bed in a warm house, and the growths encouraged to twine round slender black strings, stretched from the roof to the ground. When trails of the delicate greenery are needed, all that has to be done is to cut these strings with the growths upon them.

Aspidistras are never a drug in the market, and any stock that can be raised is always eagerly snapped up. Quantities of young plants in thumbs are, at the present time, furnishing material for filling small fancy vases, and, of course, growing into money in the meantime. The merits of *Araucaria excelsa* are fully recognised, and the customer can take his or her choice from plants about a foot in height, shapely trees in miniature, up to stately specimens 8 ft. or 9 ft. in height, and as perfect in symmetry as the younger ones. The variety *A. e. glauca* differs from the species in having longer and more pendulous branches. The whole plant, too, is dwarfer and rather more squat in habit, but is a very pretty subject.

Before leaving the nursery we had a peep at the fine old *Stephanotis* plants, than which there are none finer in the country. They have just been pruned hard back, and the young growths were being trained in the way they should go. Both plants bear evidence of perfect health.

Both Mr. Icton and his capable manager, Mr. Kyaw, are to be congratulated on the way in which the various strings working such an establishment as this are gathered up and held in hand, for order and business activity were apparent everywhere.

VALUE OF CERTIFICATES.

LEAVING out of question the XXX and XX given to various plants by the committees of the Royal Horticultural Society, how many have considered the relative values or significance given or implied by the awarding of a First-class Certificate and an Award of Merit respectively? Awards of Merit are generally understood to be the highest recognition that can be given a purely florist's flower, which is generally raised from seed, though some of them may be, and are, sports of already existing varieties. This would imply that there is little or no difficulty attached to the raising of them, they may generally be raised in abundance, and the life of a variety may be of relatively short duration, either through degeneracy, or by their being superseded by something better. In any case Awards of Merit given to the best of them serve to mark and to encourage progress, as well as being a record of progress.

In some cases, however, particularly that of Orchids, an entirely different aspect is put upon the question, which can only be known to those who are acquainted with the circumstances under which the award is given. Let us take the Award of Merit as the unit of value, and the First-class Certificate as twice the value. The sum of the two awards would be three units of value. Occasionally an Orchid brought before the meeting would receive an Award of Merit. The same plant, if brought up at a subsequent meeting, it may be in better condition, sometimes gets a First-class Certificate. This would obviously double the value of the original award. There is another, and a frequent instance, in which a good thing gets a First-class Certificate on the first occasion it is presented. A better variety of the same thing, or in the same section, may, and does

turn up, but this only gets an Award of Merit, because a First-class Certificate has already been given to the type or one of the same affinity. If the first variety or hybrid presented gets a First-class Certificate, it would seem to be a case of progressing backwards if a better thing gets only an Award of Merit; but because the first one in the same line or pedigree blocks the way, the giving of the lower award really means that it has been added to the first, thus raising the value of the newer variety to three, instead of one. A case in point occurs in *Laelia anceps amesiana*, which was awarded a First-class Certificate on July 24th, 1888. On the 11th inst. *L. a. amesiana* Crawshay's var., with larger and finer flowers than the original *L. a. amesiana*, was brought before the society by De B. Crawshay, Esq., Rosefield, Sevenoaks, and received an Award of Merit. Looked at in this light it should combine the value of both the awards.

LOW-PRICED SEEDS A MISTAKE.

IT is a mistake to suppose that it is wise economy to obtain seeds simply because they are low in price. Nothing is more misleading than to say these are cheap. Much of the low-priced seeds are not worth putting into the ground; it is far better to obtain the very best article, regardless of the price, than to sow such rubbish.

In these days, when everything is cut so low (seeds amongst them) these are often obtained from such doubtful sources, that it is advisable to caution the amateur and young hand against sowing seeds of a doubtful quality, even if they were given, to grow. In lecturing I always point out what a mistake many cultivators make. As you often see, they go to a deal of trouble well working and manuring their land, and then go and get the lowest-priced seeds they can, which are often rubbish compared to good selected stocks. When the crop is to hand they are disappointed, and this the more so when they compare it against a good strain.

Many people never consider the time, trouble, and expense it takes to rogue out the poor and weakly portion of many vegetables. Again, speaking in a general way the best types give the smallest quantity of seed, being more shy in seeding. Compare a good selected stock of William the First Pea, against a stock that has been grown on without being rogued, and see the difference. The same may be said of most of the Cabbage family.—*J. C., Chard.*

ORCHID NOTES & GLEANINGS.

Laelia pumila praestans.—A plant of this *Laelia* has been flowering for some time past in the collection of Sir F. Wigan, Clare Lawn, East Sheen, Surrey, under the care of Mr. W. H. Young. It was obtained from the Downside collection in 1887, and if not that originally described by the late Professor Reichenbach, it may be regarded as one of the earlier importations. Reichenbach first described it in 1857 as a species under the name of *Laelia praestans*, but later on changed it to *Bletia praestans* in his *Xenia Orchidacea II.*, p. 43, t. 114. As disputes are likely to arise from time to time, we here give particulars of the plant at Clare Lawn. The petals are rhomboid, suddenly narrowed to a subacute point at the apex, and of a deeper rose shade than the sepals. We come to the crux of the situation in the lip, which furnishes the most reliable characters by which the variety can be distinguished from the type, and the variety *L. pumila dayana*. The lip of *L. p. praestans*, grown at Clare Lawn, has a curved or trumpet-shaped lip, the tube of which is tightly rolled into a cylinder with the edges overlapping one another considerably. The tube is purple externally, and dark crimson-red internally, with two very shallow ridges running along the centre, and one on either side of the central pair, almost obliterated. The lamina is small, nearly orbicular, emarginate, and of a rich crimson purple. The column is pale lilac and pressed with its back against the upper side of the tube of the lip. The pseudobulbs are fusiform, and 3 in. or 4 in. in length. The leaves are oblong, and 4 in. to 5 in. in length. It will be seen that this differs from some recorded descriptions of *L. pumila praestans* in which the disc or central area of the tube is described as orange-yellow. That of the flower we examined was dull crimson-red. *L. p. dayana* has a white disc, on which five to seven purple lines and several shorter ones are depicted.

Cattleya Trianaei Atalanta.—Delicately pretty are the colours of this *Cattleya* now flowering with William Handel Cannon, Esq., Vanda Lodge, Whitton Road, Twickenham. The flowers measure $7\frac{1}{2}$ ins. across the expanded petals, which is a fine size for a form of *C. Trianaei*. Each petal is $2\frac{1}{2}$ in. in diameter, and of a delicate blush, fading off almost to white at the base. The sepals are paler, being almost white. The lip is $3\frac{1}{4}$ ins. long, the elongated tube and the lamina being several shades darker than the petals. The customary blotch in the throat is lemon-yellow passing into white at either side low down in the tube. Coming at this early period of the year the flowers are doubly welcome, after the dense fogs that have been so prevalent for some time past along the Valley of the Thames. Mr. Cannon, by the way, is an enthusiastic lover and collector of Orchids.

TROPAEOLUM SPECIOSUM.

My friend, C. B. G., does not seem able to associate *Tropaeolum speciosum* in flower with Nature in her sunniest and best mood, and growing in soils remarkable for their light and porous character. He is a man of wide experience and never loses an opportunity of adding to his varied store of knowledge. I hope he will preserve one day in his engagement book (I know he is a busy man) next summer, and together we will go (like the two friends of whom Tennyson sings)—not to see the gardener's daughter—but to see the Flame Flower, growing and flowering in a district where a fine day is not so remarkable a phenomenon as to deserve recording.

It may interest C. B. G. to know that since his note appeared, a friend gave me a tuber of this plant, and she herself acquired her stock (which she has not yet succeeded in flowering, in a back-yard almost within a stone's throw of Kew Gardens) from a cottage garden in Egham, also in Surrey where she saw it, admired, and duly received some roots. So I am not without hope that in Middlesex I may be able to flower it, and that when C. B. G. pays me another visit he will be able to enjoy a sight of the Flame Flower, without burdening himself with his umbrella or mackintosh.—A. P.

BINROCK, DUNDEE.

LIKE many another busy industrial city in the United Kingdom, Dundee is growing at such a rate that, one after another, suburban residences get absorbed. Binrock may, however, still be considered in the suburbs of Dundee, as it is situated on the Perth Road, at the extreme western end of the city, and is the residence of W. L. Boase, Esq. Formerly it belonged to James Keillor, Esq., of marmalade fame, and, needless to say, it is still a well furnished and well appointed place. The mansion itself is a conspicuous pile, and like the gardens and grounds, situated on the steeply sloping banks of the Tay, or they may be described as situated upon terraces, the lowest one of which has practically been reclaimed from the bed of the river, and grows splendid vegetables. Trees have been planted with great liberality, so that the estate is now beautifully sheltered, shaded and secluded, notwithstanding the proximity of the much-frequented highway to Perth and other places on the northern side.

We had the pleasure of inspecting it at the end of November last after the effects of the summer season were past, and the shows were over; so that the place could hardly have been visited at a more unpropitious time. We were delighted with the natural beauty, as well as the keeping of the place, however, and considered the time well spent by an inspection of the same. From most parts of the grounds a grand prospect of hills and water opens to the eye of the beholder, including the broad estuary of the Tay, the Tay Bridge, and the towns of Newport and Wormit on the Fife side of the river, which rises steeply forming hills of no mean height, with commanding residences, thickly planted on the slopes.

Mr. A. C. Cameron, the gardener, is young and enthusiastic, being an ardent and successful exhibitor of fruits, flowers and vegetables. We have on several occasions seen his fine exhibits of the latter, in the cultivation of which he is a champion. For the decoration of the place he grows Carnations largely in summer, and Chrysanthemums for autumn and winter work. Of the latter he had something between 600 and 700 in pots, including large flower-

ing, pompon and single varieties, many of which are grown in bush form for decorative purposes.

On entering the houses we noted that they were furnished with strong slate stages, resting upon upright iron supports. This arrangement enables everything to be kept neat and clean. Single Chrysanthemums are favourites, the first house entered containing numerous varieties, amongst which we noted Dolly Vardon, amaranth, free and pretty; floriferous bushes of Mary Anderson; and Miss Rose, 2 ft. high, and laden with blossom. Golden Rosinante is a golden and bronze pompon; and the decorative *L'Isle des Plaisirs* was only 3 ft. high.

Next to this came a Peach house having borders 3 ft. wide, 3 ft. deep and wholly inside, being for early work. A fine batch of Cinerarias in 24-size pots was housed here. A vinery was also in the resting stage, and the borders, again inside, were 5 ft. wide and 3 ft. deep. Single Chrysanthemums were the feature of it at the time of our visit. Very pretty was Miss Annie Holden, a yellow sport from Mary Anderson. Other handsome and highly ornamental kinds were Gus Harris, rose; Jenny Wren, buff red; Emily Wells, rose and white, or blush at the base of the rays; S. Arthur Rose, deep yellow; S. Treasure, golden yellow, and a little smaller than the last named; and Crimson Gem which is well named. Purity is pure white, semi-double and very pretty. Amongst large flowering kinds we noted a good batch of Mme. Carnot intended for late work, the terminal buds having been taken. Fine heads were just then developing. C. H. Curtis carried larger blooms than any at the Dundee show. Niveus is almost an incurved Japanese sort as grown here.

The stove contained a fine collection of flowering and foliage plants. *Musa Cavendishii* was grown in tubs. *Eucharis grandiflora* was flowering freely. The leaves of *Alocasia Lowii* were of unusual size, and in fine condition. *Geonoma gracilis* stood 7 ft. high to the apex of the leaves, quite an unusual thing for this species. *Cocos weddelliana* was in all respects similar in size, and in healthy condition. A well-furnished piece of *Goniophlebium subauriculatum* was suspended from the roof.

Ferns are evidently great favourites at Binrock, for a large number of them were of unusual size for modern private establishments. *Davallia elegans dissecta*, grown in a basket, measured about $3\frac{1}{2}$ ft. across, and *D. fijiensis plumosa* was 5 ft. across the fronds. The beautiful dark green-leaved *D. Tyermanni* is often seen in bad condition but here it had a spread of 3 ft., and was in grand order. Very fine also was *D. bullata*, about $3\frac{1}{2}$ ft. wide in a basket. The well-known *Microlepia hirta cristata* measured 8 ft. across the fronds.

Space is a matter of some consideration here, and every glass structure is utilised to the best advantage. One had been filled with Tomatos during the past summer, Chrysanthemums in the autumn, and Richardias in winter. *Maréchal Niel* Roses, put in pots last spring, had thrown up stems 20 ft. in length by November last.

The fruit trees in the orchard house are grown in tubs, and, therefore, movable at pleasure. Of Peaches and Nectarines there are seventeen fine trees, which ripen their fruits in the order of the following names:—Early Alexander, Waterloo, Crimson Galande, Stirling Castle, Dr. Hogg, Gladstone, Barrington, and Admirable. The favourite Nectarines are Lord Napier and Elruge. All of these varieties give excellent results at Binrock. Pears and Figs are also grown under the same conditions.

Near by the great conservatory is a house devoted to Cinerarias and Chinese Primulas, both of which were coming into bloom. *Primula obconica* is hardly ever out of season. The conservatory is fitted up with the electric light, being one of the finest, if not the finest installation in Scotland. The engine which supplies the motive force is of 22 horse power, and there are seventy storage cells of large size. One end of the structure abuts against the mansion, while the other is curvilinear, and directed towards the Tay. The framework is of iron, and on the ridge is a massive lantern. The walks around the central bed of the conservatory are paved with white tesserae, and ornamented at the sides with lines of coloured ones. Around the central bed is an ornamental wall, 27 in. high, of brown enamelled bricks.

Iron gratings occupy the space beneath the side stages. The wall of the mansion forming the northern end of the conservatory is covered with wire, and padded with soil and moss, in which a great variety of fine foliage plants is grown, including long trails of *Tradescantias*. There are also Begonias of the Rex type, as well as those related to *B. corallina*; also Ferns, *Chlorophytum elatum variegatum*, *Aspidistras*, and many others which prove suitable for this kind of work. As the conservatory is wide and very high, there is a large area to cover in the way just described.

The body of the house is filled with large plants in tubs, including massive specimens of *Areca Baueri* and *Livistona chinensis*, with long and healthy leaves. *Phoenix reclinata* keeps throwing up numerous suckers from the base. *Monstera deliciosa*, Tree Ferns, *Ficus*, *Eucalyptus globulus* also occupy a considerable amount of space. The last-named tree is trained up the iron rafters of the house. A magnificent effect is produced here, when the electric light is switched on at garden parties or other functions.

The forcing of Bulbs such as Roman Hyacinths, Tulips, and other spring flowers is carried out very extensively here; and to facilitate this kind of work there are 100 frames heated with hot water. Supplies of forced vegetables are also kept up all the winter. Pits and low span-roofed houses are also used for the cultivation of Primulas, Cyclamen, Smilax, Tomatos, &c.

It was too late in the season to see the trees and pleasure grounds at their best; but we came across a bold bit of rockwork, with a fine fountain occupying one terrace. Amongst and creeping over the stones were various rock plants, Ferns and *Yucca gloriosa*, while on the top of the steep bank were neat specimens of *Retinospora*, *Olearia Haastii* and other ornamental shrubs.

The various pieces of ground devoted to vegetables were well-stocked with Leeks, Brussels Sprouts, Cauliflower, Celery, and other useful things not then lifted, and which Mr. Cameron takes pride in growing to great perfection, whether for the exhibition table or the kitchen. Altogether there are eight acres of garden and pleasure grounds within the walls. Anyone seeing the place for the first time cannot help being carried away with the beauty, magnitude, and charm of the situation and prospect. The gardener's cottage is conveniently situated at one corner of the grounds abutting on the Perth Road; and consists of eight rooms, including bathroom, laundry, and other modern conveniences.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.

THE sixtieth annual general meeting of this well-known charitable institution was held on Thursday January 20th, at Simpson's Hotel, 101, Strand, W.C. Prior to the general meeting a special gathering was held to elect two trustees to fill the places of Robt. Hogg, Esq., LL.D., deceased, and John Lee, Esq., retired. Mr. H. J. Veitch was elected to the chair, and moved that the Hon. Walter Rothschild and Bruno Schroder, Esq., should be asked to fill the office of trustees. Mr. J. Denning seconded, and the motion was carried with unanimity.

The special then became merged in the annual general meeting. The notices convening the latter were first read by the secretary, Mr. G. J. Ingram, and the report and balance-sheet for the year were then presented.

REPORT OF THE COMMITTEE FOR 1897.

It affords the committee considerable satisfaction to submit their annual report for the year 1897, together with an audited statement of accounts, and in doing so they are thankful to be able to record the continued prosperity of the institution, and its increased benefit to those old and needy people in whose behalf it was founded.

With great pleasure the committee have to report that the fifty-ninth anniversary festival dinner in aid of the funds held in May last was most successful, and they desire to express their gratitude to the Right Hon. Lord Rothschild for so kindly occupying the chair on that occasion, and for his able advocacy of the claims of the charity, which met with so liberal a response. They would also gratefully acknowledge their indebtedness to those gentleman

who so kindly served as stewards, to those who sent flowers and fruit, and to other friends who in any way assisted in making the festival a complete success.

During the past year nineteen pensioners have died, seven of them leaving widows, of whom five, whose cases on being carefully investigated and found to be in every way satisfactory, have been placed on the pension list at £16 a year, in succession to their late husbands, in accordance with Rule III., 13. The committee have now the pleasure to announce that they have decided to add nineteen additional pensioners to the number now on the funds, ten of whom, having been accepted under Rule III., 5, they recommend the subscribers to place on the pension list without the trouble and expense of an election; the remaining nine will be elected by votes from the approved list of candidates in the usual way. This addition will make the total number of pensioners 168, the largest number of beneficiaries receiving permanent aid since the foundation of the institution. And yet there will be thirty-five unsuccessful candidates who will perforce have to wait for that assistance which they so much need. The committee heartily wish it were possible for them to render aid to a larger number, but with financial responsibilities to those now on the funds, which are impossible to accurately calculate, they do not feel in a position to recommend a further increase in the annual expenditure than that entailed by the addition of the number already stated.

In the past year there have been in aid of the charity held an amateur operatic performance at St. George's Hall, kindly organised by Mr. H. Morgan Veitch; a flower and fruit stall at Richmond Horticultural Exhibition, kindly arranged by Mrs. Algernon Chancellor; garden fêtes at Reigate and other places, concerts at Altrincham, and various other functions in different parts of the country, to the promoters of which, one and all, the committee tender their very hearty and sincere thanks.

It will be remembered that the committee in their last report announced their intention to send to each unsuccessful candidate at the 1897 election the sum of £5 on June 21st, in honour of the Diamond Jubilee. This they are happy to say was done, and the grateful letters of acknowledgement received from the recipients showed how greatly appreciated were the welcome and, in many cases, timely gifts. The committee likewise announced that they had inaugurated a fund to commemorate the long and beneficent reign of our beloved Queen—the patroness of the charity. This fund, by her Majesty's gracious permission, they proposed to call the "Victorian Era Fund." They are now gratified beyond measure to state that the appeal issued in its behalf was most generously responded to, the sum of £4,075 being received, which amount has been invested in the names of the trustees in Great Western Railway 3 per cent. guaranteed consolidated stock, and the interest derived therefrom will be annually divided *pro rata* amongst those unsuccessful candidates who formerly were subscribers to the institution, in order to render them some temporary assistance whilst awaiting election, but no candidate may receive more than £10 in any one year.

The committee would like to mention the names of all those who have so liberally and kindly contributed to this special object; but whilst gratefully thanking all who did so, they hope it may not seem invidious if they particularise a few generous and munificent donations which greatly helped to secure the substantial amount raised:—His Grace the Duke of Westminster, president; Lord Rothschild and Messrs. N. M. Rothschild & Sons; the Baron Schroder, vice-president; Harry J. Veitch, Esq., treasurer; N. N. Sherwood, Esq., trustee; C. Czarnikow, Esq., vice-president; Arthur W. Sutton, Esq., member of committee; George Munro, Esq., member of committee.

The committee are happy to acknowledge the following legacies which they have received:—£457 5s. 11d. from the late Mr. J. W. Thomson, formerly gardener to his Majesty King George III., for the purpose of applying the interest for the special benefit of a widow or widows, and £100 from the late Colonel Thos. Page, formerly a life member of the institution. They also thankfully acknowledge the receipt, just before the close of the year, of special donations to the general funds of £50 from the Royal Scottish Horticultural Society, and £26 5s. from the Royal Caledonian Horticultural Society.

In common with other charities, the committee have to deplore the removal by death of several friends and supporters, amongst whom may be mentioned the late Dr. Hogg, a vice-president and trustee, who for many years took a warm and practical interest in the institution, and the late Mr. Richard Chrimes, who for upwards of thirty years had been a liberal subscriber to its funds; the late Lord Hindlip and Mr. J. Travers Smith, both of whom had been annual subscribers for many years.

Thomson, formerly gardener to George III, was left for the benefit of a widow or widows, and invested in the special fund. After the poll it was proposed that the unsuccessful widow who stood next highest on the list should receive the benefit of the legacy. She would then be known in future as the "Thomson" pensioner. The interest of the legacy was not quite enough to keep a widow on the funds, but the committee would furnish the balance. Looking at the large amount they had invested, nearly

MR. ARTHUR W. SUTTON.

They have also to record that in consequence of advancing age Mr. John Lee has felt compelled to relinquish his position as a trustee of the institution. From its commencement Mr. John Lee has been one of its warmest friends, and whilst accepting his resignation with the deepest regret, they know that as long as he may be spared he will continue to take a special interest in its welfare. It is a source of much gratification for the committee to notify that the Hon. Walter Rothschild and Bruno Schroder, Esq., have consented to fill the vacant trusteeships, and they desire to express their sincere thanks to those gentlemen for so kindly giving their services in this way to the institution.

In concluding their report the committee have to make the welcome announcement that the fifty-ninth anniversary festival dinner in aid of the funds will be celebrated on Wednesday, June 8th next, at the Hotel Metropole, when his Grace the Duke of Portland (vice-president) has kindly undertaken to preside, and from a long experience they are encouraged to hope that all those friends who have the well-being of the charity at heart will again do in this sixtieth year of its history all in their power to insure the success of the anniversary. And whilst rejoicing in the solid prosperity of the charity, they still earnestly invite the kind co-operation of its present supporters in procuring new subscribers, so that its work may be not only fully maintained, but enlarged, and the ever-increasing number of applicants helped and benefited.

The chairman moved "that the report of the committee together with the statement of accounts (as audited), be received and adopted, and that the best thanks of the meeting be presented to the committee for their able management of affairs of the institution during the past year." Mr. Veitch commented upon the fact that the past year had been a very prosperous one for the society. They were much grieved to lose their two former trustees, but were fortunate in securing the services of the two gentlemen just appointed. The legacy of Mr. J. W.

£30,000, some might be inclined to think that it was too much, but he would remind them that in order to keep faith with the pensioners already on the books they needed £3,000 per annum, and thus if the income of the society ceased there was only enough to meet these annual disbursements for about ten years. The Victorian Era Fund had been a great success. They had asked for £5,000 and had got over £4,000, which he thought was pretty good in a year when appeals had been made to charity for furnishing anything from a pump-handle to a chime of bells.

Mr. Gardner seconded, and the report and balance-sheet were duly passed.

On the motion of Mr. A. Outram, seconded by Mr. E. G. Munro, Mr. H. J. Veitch was re-elected treasurer, and cordially thanked for his past services.

Mr. Wythes proposed that Mr. G. J. Ingram be re-elected secretary. He considered that they were fortunate in securing the services of Mr. Ingram, who got through a vast amount of work. Mr. Osborn seconded, and the meeting gave a general and hearty assent.

Mr. V. Morgan proposed, and Mr. Manning seconded that Messrs. W. Denning, James Douglas, N. Sherwood, and Jas. H. Veitch be re-elected members of the committee, and Messrs. E. Ranger Johnson and M. Gleeson be chosen members of the same body in place of Messrs. R. Milligan Hogg, and Thos. Glen, who retire.

It was moved by Mr. J. Hudson that Messrs. T. Manning, T. Swift, and J. Willard be elected auditors for the ensuing year.

Mr. W. Denning proposed, and Mr. Melady seconded that Messrs. W. Beste, W. Crane, H. Higgins, W. Johnson, and R. Jack be reappointed arbitrators for the ensuing year. All these proposals were passed unanimously.

The following ten candidates were placed upon the list without going to the poll, on the motion of the chairman:—John Battersby, John Berry, Daniel

Boreham, George Daniels, William Davidson, Thomas Ffoulkes, John Mitchinson, John Perkirs, John Rolfe, and Silas Warr.

We have audited the accounts and certify the same to be correct, and are pleased to state that we have found the books well and accurately kept. We have also satisfied ourselves that the securities of the invested funds are in the hands of the Bankers.

(Signed) Jan. 18th, 1898.
THOMAS MANNING.
THOMAS SWIFT.
JESSE WILLARD.

The meeting then became special for the purpose of appointing scrutineers of the ballot. Messrs. A. Outram, T. Manning, and E. G. Munro were the chosen gentlemen. An adjournment was then made to await the

DECLARATION OF POLL.

This took place at 4.50 p.m. The nine candidates who headed the list, and the number of votes received by each were as follows:—Henry Ellis, 4,249; Thos. Bundy, 3,900; Robert Begbie, 3,878; James Baker, 3,868; Wm. Wood, 3,790; David Cornell, 3,663; Geo. Hewitt, 3,651; Thos. Edwin, 3,550; and Lydia Rose, 3,534. Mrs. Elizabeth McCulloch, who received 3,031 votes, came next on the list of widows, and was consequently the lucky candidate for the "Thomson" pensionership.

The poll was stated to have been the heaviest on record, no fewer than 97,951 votes having been registered. It was to be regretted, however, that there were as many as 1,152 spoiled votes. Of these 1,085 were due to the omission of the necessary signatures to the voting papers, and 117 had come from people who had not paid their subscriptions.

A vote of thanks to the scrutineers, proposed by Mr. Melady, seconded by Mr. Hudson, and replied to by Mr. A. Outram, concluded the business.

THE ANNUAL FRIENDLY SUPPER.

A goodly company of members and friends of the institution met at the annual supper, which was laid in an adjoining room for six o'clock. Arthur W. Sutton, Esq., of Reading, occupied the chair. After a substantial repast had been well discussed, the chairman rose to give the loyal toast of "The Queen, the Prince and Princess of Wales, and the other members of the Royal Family," which he did in a few well-chosen and appropriate words. He laid stress

upon the sympathy that existed between Her Majesty and her subjects, and the popularity of the Royal Family as a whole. The accompanying is a portrait of Arthur W. Sutton, Esq. (see p. 348), a member of the famous Reading firm, who presided during the evening.

The toast of the evening, "Continued prosperity to the institution and its Victorian Era Fund," was also given by the chairman. Mr. Sutton said that his association with the society was only a comparatively recent one, but that he was very favourably impressed with the efficient way in which it was organised. He then proceeded to briefly review some of the salient features in the history of the society. It was started in 1838, and Queen Victoria became its patroness, and the Prince Consort its patron in 1851. In 1864, the Prince of Wales succeeded his deceased father as patron. In 1851 the receipts were £743, of which £512 were paid to thirty-five pensioners. Now there were 168 pensioners on the books, for whom a sum of £3,000 was required annually. Last year (1896) the total receipts were £4,739, this year (1897) they amounted to £8,575. This was largely due to the Victorian Era Fund for which over £4,000 had been subscribed. Over £71,000 had been distributed in charity by the society since its inauguration. Mr. Sutton paid a tribute of praise to the energy and ability of their secretary, Mr. G. J. Ingram, and said that it was entirely due to him that Lord Portman has been secured as chairman for the forthcoming annual dinner at the Hotel Metropole. Mr. Ingram had also given another proof of promptness and business capacity in obtaining for the society £250 from the legacy left to charity by the late Mr. Thomas Gibbs. Mr. Sutton regretted that the society could not help even more than it does, and hoped that its sphere of usefulness would increase year by year. He coupled with the toast the name of Mr. H. J. Veitch, whom he described as the keystone of the society. The toast was received with the greatest enthusiasm.

Mr. H. J. Veitch responded at some length, and supplemented the facts showing the progress of the society, given by the chairman and others, in which he drew a comparison between ten years ago and now. Ten years ago they had £21,000 in the funds, with 128 pensioners; now they had £29,000 invested, and 168 pensioners. More of the latter had been elected during the last two years than in any other three. Ten years ago they had no auxiliary societies, now they had several, including a very vigorous one at Worcester. Speaking of the Victorian Era Fund, he said it was for the benefit of candidates who have previously been subscribers. He had made a calculation and had found that sums varying from £10 downwards would be given according to the number of years the candidates had subscribed. He concluded by saying that the Victorian Era Fund was still open for those who would like to contribute, and that he hoped yet to see the £5,000 asked for fully subscribed.

The health of the committee, coupled with the name of Mr. Owen Thomas was proposed by Mr. Geo. Bunyard. Mr. Thomas replied in a practical and able speech in which he stated amongst other things that they were indebted to Mr. H. J. Veitch for the establishment of the Victorian Era Fund.

Mr. H. B. May, in the absence of the Rev. W. Wilks, gave the auxiliary societies, to which Mr. J. R. White, hon. sec. of the Worcester Auxiliary responded.

The toasts were interspersed with vocal and instrumental music. The chairman had very kindly secured the services of Mr. Mel. B. Spurr, of the Egyptian Hall, who delighted the audience with his well-rendered songs, and musical sketches. Capital songs were also given by Mr. Fred Bevan, and Mr. J. R. White, whilst Mr. E. G. Munro upon the cornet and Mr. Harry Turner upon the concertina scored distinct successes.

By the kindness of the chairman a selection of instrumental music was given by the "Red Band."

A vote of thanks to the chairman which was proposed by Mr. N. N. Sherwood brought a very enjoyable evening to a close.

The Maggots of the Rose Chafer have been blamed for doing a great amount of mischief to root crops during the past season; but this must have been of local occurrence.

READING AND DISTRICT GARDENERS.

UNDER the auspices of this successful horticultural association a tea and smoking concert were held in the Abbey Hall, Reading (by kind permission of Messrs. Sutton & Sons), on Monday evening 17th inst. Nearly 100 members sat down to tea, which was presided over by the president, Mr. C. B. Stevens. The tables were decorated with plants and flowers from the gardens of East Thorpe (Mr. Woolford, gardener). Among the company present were: Mr. Leonard G. Sutton, Mr. M. H. F. Sutton, Messrs. T. Turton and Hinton, chairman and vice-chairman respectively of the association for the season 1898, Messrs. J. Pound junr., Martin, Woolford, Smith, Bright, Dockerill, Chamberlain, Jones, Bright, H. G. Cox, Spencer, Parsons, Neve (Sindlesham), Townsend (Wellington College), Barefoot, Thatcher, Castle (Mortimer), Rigg, Pound sen., Farey, Fixter, Hobbs (Caversham), Dearlove (Burghfield), Lacey, Wagstaff (Bearwood), W. H. Cox (Calcot), &c.

After justice had been done to an excellent repast, the chairman proceeded to propose the usual loyal toast, and in so doing said that they as an association were greatly honoured, for on the occasion of their annual outing (which took place in July last) to Windsor, they had not only the pleasure of looking through the gardens and grounds at Windsor and Frogmore, but by Her Majesty's gracious permission they were allowed to inspect also the "private portion" of the gardens at the latter place; a privilege of a very rare character. They were greatly indebted to Mr. Owen Thomas, the Queen's gardener, for having spoken on their behalf. The toast, needless to say, was most loyally received with musical honours, Mr. James Martin rendering the solo in capital style.

The second part was carried out on similar lines to that of last year, viz:—a smoking concert, the programme being contributed by members and a few friends (thereby saving the expense of engaging professional talent), and was even more successful than before, thus showing that gardeners were also a "social and musical body." The "tit bit" of the evening was without doubt the Bones Solo by Mr. Sweetzer. The following contributed to a very large programme:—Messrs. Martin, Woolford, Cox, Sweetzer, Poole, Dell, Gardener, Wren, Bush, Lacey, Heather, Wagstaff, Jacobs, Hobbs, Froud and Blay. Mr. W. Lewis accompanied in his usual excellent style.

IRIS KAEMPFERI.

THERE are more sections of Iris than one, and I fear your correspondent "Nial" (on p. 333) has fallen into the trait of many others, by treating the above as ordinary garden Irises. For the benefit of "Nial" and other readers of THE GARDENING WORLD it may be as well to remind them that the Irises may be divided into three sections, namely, those with thick fleshy roots or the rhizomatous sorts, such as *I. flavescens*, *I. albicans*, *I. florentina*, and the common Blue Flag, generally known as German Irises. Secondly, there are those beautiful bulbous Orchid-like varieties in all possible shades of colour, such as the varieties of *Iris Xiphium* and *I. Xiphoides*, known as English and Spanish Irises, though all really of Spanish origin. Thirdly, we have the varieties of *I. Kaempferi*, (syn. *I. laevigata*) with fibrous roots, commonly known as Japanese or Clematis-flowered Iris, on account of their close resemblance in size and shape to the flowers of Clematis. The two former groups are grown successfully in the garden borders in ordinary garden soil, but by preference a rich light soil suits them best. The latter group of varieties of *I. Kaempferi*, being semi-aquatic, require a very different position, a position situated at the foot of a bank, leading to a ditch, pond, or lake, and planted so that the fibrous rootlets are constantly in water.

If lovers of this beautiful Iris have no lake or pond by which to plant the same, they might easily contrive to arrange a bog garden in the lowest lying part of their garden, planting in a soil composed of rich loam and peat, not so much for nutriment as for its retentive qualities of moisture. In this they will grow and flower luxuriously. Continuous supplies of water must be given judiciously and regularly during hot and dry weather, from the first growing stage until the flowering period, after which they may be left to Nature's own supplies.

As to their not being known to flower in this country this is quite wrong, as a visit to Kew Gardens

GREEN PEAS—JUNE TO NOVEMBER.

A correspondence was raised in the Daily Press last Autumn upon the shortness of the season when Green Peas are available, both in gardens and on the market. We now offer the following as representing the best collection selected from 1,024 rows we had under trial last season. It would be difficult for us to give precise dates for putting the seed into the ground, as so much depends upon soil and situation. Successional Sowings may be made any time between these dates, and the last sowing not later than the second week in June.

Barter's THE QUEEN'S SEEDSMEN, 237, 238, & 97, HIGH HOLBORN, LONDON

during June and July will clear that error, or to Messrs. Barter & Sons Nurseries, Long Ditton, Surrey, where they are grown by hundreds in water and on a bank by the side of a stream. They will flower in full exposure to sun or in partial shade; but by preference in full sun. The planting season is autumn and spring, when they should be planted in clumps from 2 ft. to 4 ft. apart, and when established will give a gorgeous range of colours from snowy white to bright blue, deep purple, and crimson, in self and mottled, double and single flowers, many of the blooms measuring from 8 in. to 10 in. across.—*Grower of Iris.*

QUESTIONS AND ANSWERS

* * Will our friends who send us newspapers be so good as to mark the paragraphs or articles they wish us to see. We shall be greatly obliged by their so doing.

[Correspondents, please note that we cannot undertake to name florists' flowers such as Carnations, Pelargoniums, Chrysanthemums, Roses, nor such as are mere garden varieties, differing only in the colour of the flower. Florists' flowers, as a rule, can only be named by those who grow collections of them.]

The White Butterfly.—*Enquirer*: There are two white butterflies that attack the members of the Brassica family, while a third one is known as the Green-veined White. The Large White Butterfly (*Pieris Brassicae*) of the Cabbage makes its appearance in April and keeps on till June. This is the first brood, and the females commence to lay their eggs soon after, in clusters of 20 to 30 upon the under sides of Cabbage leaves or allied plants. The eggs hatch out at various rates according to the temperature of the air, and may be found abundantly in June, some earlier and some later. They pass through the egg, caterpillar and pupa stages appearing as perfect butterflies again in July and August. The caterpillars from this brood appear in September and later, according to the weather and the time the eggs were laid. This late brood passes through the winter in the pupa stage, suspended by a band of silk to some wooden fence, wall, or other structure which will keep them dry and sheltered. The perfect insect from these pupae hatches out in April to lay its eggs again. Some authors say that the Large Cabbage Butterfly gives rise to a constant succession of broods all through the summer and autumn, but as the eggs of different individuals are laid at various times, it follows that caterpillars may be found over a considerable time according to the state of the weather. The presence of food and the absence of frost would have a great deal to do with this, and your geographical position would prevent you having anything like the winters usually experienced even about London. There are many caterpillars belonging to butterflies and moths that infest the Cabbage, and the specimens you found in January might have belonged to a moth. The perfect insects of the Large White Cabbage Butterfly die long before winter.

Clubbing of Brussels Sprouts.—*R. Henderson*: There are really two forms of swellings upon the roots, not only of Brussels Sprouts but most other members of the Brassica tribe. Small ones, more or less globular, may be the result of the weevil *Ceuthorrhynchus sulcicollis*. If the excrescences are as large as the fist or thereby it is without doubt the result of a fungus named *Plasmiodiophora Brassicae*. You should dig (not pull) up the roots after the sprouts have been gathered, and carefully burn them to destroy the fungus. Then trench the ground deeply, putting the top spit into the bottom of the trench, so as to bury the spores in it. Turn the

loose earth of the first spit into the trench likewise; and give a good dressing of gas lime on the top. Another dressing on the top of the next spit would do no harm. None of the Cabbage tribe should be planted on this ground for a year or two.

The best white Clematis.—*Omega*: For early flowering one of the best white varieties is Mrs. George Jackman, with satiny white flowers having a creamy bar. Though it is one of the Clematis patens section, it sometimes flowers on the young wood as well as the old. Smith's snow-white Jackmannii is one of the late flowering sorts and a very fine one belonging to the Jackmannii section. Both are perfectly hardy. You ask a question about the best time to plant Clematis something, but we cannot make out what. Please write the name a little plainer and we shall help you.

Matchbox with Grub.—*Enquirer*: The box you mentioned in your letter has not yet arrived, and must have gone astray or been smashed to pieces in coming through the post. If you think it worth while sending another, we shall be pleased to assist you.

Transplanting Rhododendrons.—*J. Wilson*: This could practically be done at any time of the year except during times of too severe frost or severe drought and heat. The principal points to be attended to are lifting the plants with a good ball, transferring them to their new quarters at once, before the soil and roots get dried up, and making sure that you put them in suitable material. Select positions for them where the soil is comparatively cool and moist, otherwise you must improve the staple of the natural soil by removing half or the whole of it and making the amount good by means of peat, which need not be particularly fine, that is, you need not get Orchid peat, nor the fibrous and selected material that is used for Heaths and Azaleas in pots. Peat serves to keep the roots cool in droughty summer weather. Dry sandy soils, and clay require a considerable amount of peat to enable them to be suitable for Rhododendrons in the more southern counties.

Weeping Willows.—*R. G. S.*: By rooting shoots either of the Kilmarnock or the American Weeping Willows you will only have bushes that trail on the ground. You must bud or graft them on upright stems of some other sort. The Goat Willow (*Salix Caprea*), is often used as a stock, and always, we believe, in the case of the Kilmarnock Willow. Stocks of the Goat Willow may be raised from cuttings and grown to the height required before budding the weeping form upon it.

Dendrobium Phalaenopsis schroderianum.—*Len*: The flower you send is a very pretty one and well worth growing. So many varieties have been named, that it would be difficult to distinguish from some that have received names. The clear rose and veiny outer lobe of the lip makes a beautiful contrast with the lemon and white tube, and the nearly white sepals and petals. By way of distinction it might be named someone's variety, or the variety of your place.

Iris Kaempferi.—*Nial*: For a reply to your query in last week's issue see p. 349.

Margillo Apple.—*H. Walker*: We do not know of an Apple named Margillo. It is probably a mistake for Margil, an old and much esteemed variety on account of its excellent flavour, which has been compared to that of Ribston Pippin. The tree, however, is more healthy, less liable to canker, and a free bearer. The fruits are of medium size. You should have no difficulty in procuring it, under the name we have given, from any nurseryman who grows a good collection.

Marguerite Leaves tunnelled.—*Omega*: The galleries in the leaves are the work of a small black

fly named *Phytomyza nigricornis*. As the grubs of this insect burrow between the two skins of the leaves, you cannot apply any insecticide that will destroy them without also killing the leaves. You might pick off and burn the worst of the leaves, and pinch or squeeze the rest between the finger and the thumb. By examining the underside of the leaves you can see where the grub is situated. Syringing the foliage with weak tobacco water at intervals of a week or two would serve to keep the flies from laying their eggs upon the same.

Names of Plants.—*Geo. Haig*: *Cattleya labiata percivaliana* (well-coloured and of good substance)—*T. W.*: 1, *Dendrobium findlayanum*; 2, *Cattleya labiata Trianaei*; 3, *Odontoglossum crispum guttatum*.—*H. Miller*: *Eranthemum nervosum*; 2, *Ruellia Portellae*; 3, *Nepeta Glechoma variegata*; 4, *Yucca filamentosa variegata*; 5, *Sibthorpia europaea variegata*; 6, *Carex brunnea variegata*; 7, *Carex Morovii variegata*.—*J. Andrews*: 1, *Crocus susianus*; 2, *Crocus Imperati*; 3, *Jasminum nudiflorum*; 4, *Asplenium bulbiferum minus*; 5, *Davallia Tjernmanni*.—*T. Cox*: 1, *Retinospora plumosa*; 2, *Retinospora pisifera*; 3, *Cupressus thuyoides*; 4, *Taxus adpressa*.

WEBB'S

NOVELTIES.

WEBB'S PEA. New Pioneer.

A remarkably handsome blue wrinkled Marrow, growing from 3 to 3½ feet in height; it is hardy in constitution, and very early in coming to maturity. The pods contain from 8 to 10 fine Peas of most excellent quality. **2s. 6d.** per pint, post free.

WEBB'S TOMATO. New Sovereign.

A very handsome golden-yellow variety, of vigorous habit of growth, and an abundant cropper. The fruit is of large size, flattish round in shape, solid, and most delicate in flavour. **1s. 6d.** and **2s. 6d.** per packet, post free.

WEBB'S LETTUCE. New Paragon.

A compact-growing new variety, with smooth, light green leaves. It forms large solid heads, which are remarkably crisp. **1s. 6d.** per packet, post free.

WEBB'S BEET. New Satisfaction.

Root of medium size, long and tapering in shape, of deep blood-red colour, of fine grain, sweet and delicate in flavour. **1s.** per packet, post free.

The Queen's Seedsmen,
WORDSLEY, STOURBRIDGE.

BARR'S SEEDS

OF FINEST SELECTED STRAINS AND TESTED GROWTH

CHOICE FLOWER SEEDS.

BARR'S "PRIZE STRAIN" SINGLE BEGONIA.

Saved from the finest colours and best formed flowers. Per packet, **1s. 6d.**, **2s. 6d.**, and **3s. 6d.**

BARR'S "PRIZE STRAIN" DOUBLE BEGONIA.

Saved from the highest quality flowers. Per packet, **2s. 6d.** and **3s. 6d.**

BARR'S "FIRST PRIZE" CALCEOLARIA.

Saved from the finest selected flowers and richest colours. Per packet, **2s. 6d.** and **3s. 6d.**

BARR'S EXTRA CHOICE MIXTURE OF CARNATIONS AND PICOTEES.

Saved from the finest double flowers of the highest class. Carnations and Picotees, per packet, **2s. 6d.**

BARR'S "FIRST PRIZE" CINERARIA.

A select, comparatively dwarf strain, saved from largest flowers of finest form and best distinct colours. Per packet, **2s. 6d.** and **3s. 6d.**

BARR'S SUPERB MIXTURE GLOXINIA.

Saved from the finest sorts. Per packet, **1s. 6d.**, **2s. 6d.** and **3s. 6d.**

BARR'S "Covent Garden" PRIMULA.

A very select strain, flowers of the finest colours, and of good substance. Per packet, **1s. 6d.** and **2s. 6d.**

BARR'S SEED GUIDE.

Contains a Select List of the best Vegetable Seeds and most beautiful Flower Seeds. It is full of Practical Hints, and will be found of great value to Gardeners, Amateurs and Exhibitors.

Sent free on application.

BARR and SONS,
12 & 13 KING ST., COVENT GARDEN, LONDON.

THE NEW MELON

For 1898.

SUTTON'S

ROYAL JUBILEE.

A new Green-fleshed Seedling Melon, raised at the Royal Gardens, Frogmore, by Mr. Owen Thomas, Gardener to Her Majesty the Queen. This magnificent new Melon is worthy of its origin and its associations. Fruits large, handsomely netted, possessing deep rich green flesh of the most superb flavour. The plant is robust in constitution, and sets freely.

Per Packet, **2s. 6d.** and **3s. 6d.**

POST FREE.

GENUINE ONLY DIRECT FROM

"Gardening is the prnest of human pleasures, and the greatest refreshment to the spirit of man."—BACON.

The Gardening World.

Edited by J. FRASER, F.L.S.

SATURDAY, FEBRUARY 5th, 1898.

NEXT WEEK'S ENGAGEMENTS.

TUESDAY, February 8th.—Royal Horticultural Society; meeting of committees at 12 o'clock; annual general meeting at 3 p.m.

Sale of American shrubs and hardy plants by Messrs. Protheroe and Morris.

WEDNESDAY, February 9th.—Sale of Lilliums, Roses, and hardy perennials by Messrs. Protheroe and Morris.

FRIDAY, February 11th.—Sale of Imported and Established Orchids by Messrs. Protheroe and Morris.

ESSEX FIELD EXPERIMENTS.—During the past two years the Technical Instruction Committee of the Essex County Council has been conducting experiments with manures at a number of places in the county. The experiments were of four kinds, and a report of the same has been compiled by Mr. T. S. Dymond, F.I.C., staff-lecturer in chemistry. The particulars given below relate to the "Manurial trials on Beans followed by wheat." Beans constitute a garden crop, while they are also akin to Peas, French Beans and Scarlet Runners in their manurial requirements. It is the custom in Essex to dress the land with farmyard manure previous to sowing Beans, and reasoning from the fact that leguminous crops can avail themselves of the free nitrogen of the air, it was considered probable

that the farmyard manure could be more economically applied to other crops; while Beans might be stimulated with artificial manures to make a more vigorous growth and thereby store up a greater quantity of atmospheric nitrogen to the advantage of the succeeding crop. It is well known that the stubble of a Clover or other leguminous crop leaves the soil richer in nitrogen than it was before. The experiments were conducted at six centres so as to have the various classes of soil in Essex fairly well represented.

The ground under trial was laid out in seven plots at each of the places, and different manures or mixtures of them were used on each, with the exception of a check plot, which was left unmanured. The wheat that followed the Beans the succeeding year received no manure whatever, so that the results depended entirely upon the single application. The first plot was supplied with farmyard manure at the rate of 12 tons per acre and at a cost of 60s. The results showed no very marked advantage over the plot which was unmanured except in the case of wheat at Gosfield and Tendering. This might have been due to the nature of the soil at the two places named, and the fact that the early part of the season during both years of the experiments was very dry when the crops were making their growth. The second plot received 3 cwt. of superphosphate in addition to the farmyard manure, raising the total cost to 67s. 3d. The increase of crop in almost every case was well marked, and more than repaid the additional cost of the superphosphate. The great increase of the wheat is considered to be due to the enrichment of the land by the vigorous growth of the Bean crop, resulting in a greater storage of nitrogen in the soil. The residue of the superphosphate from the previous season could scarcely have accounted for the results.

Twelve tons of farmyard manure, 3 cwt. of superphosphate and 3 cwt. of kainit per acre were applied to the third plot, and the results we must admit were very puzzling. With one exception the weight of both Beans and wheat has been reduced simply by the addition of the kainit. The total cost of the manures was 73s. 11d. and the value of the increase was only 29s. 9d. above that of the unmanured plot. In plot two the value of increase was 46s. 6d. The only explanation that the report offers is that the kainit may have prevented the fermentation of the manure or promoted "denitrification" and loss of nitrogen. Superphosphate of lime was employed alone, to the extent of 4 cwt. per acre, on plot five, at a cost of 9s. 8d.; and the resulting crop was equal or slightly better in most cases to the harvest produced by the much more expensive application of farmyard manure in the first plot. Basic slag, at the rate of 5 cwt. per acre, was applied to plot six, at a cost of 12s. 1d. The results in this case are of a mixed and uncertain character, though in several instances the crops were better than those produced by farmyard manure. One outcome of this trial is that the lime in the basic slag added materially to the weight of the crop at Tendering, where the soil is naturally but ill supplied with lime, and consists of a heavy loam overlying brickearth. On plot seven 4 cwt. each of superphosphate and kainit produced varying results, but on the whole scarcely superior to the harvest obtained after an application of superphosphate alone. The Beans derived the greater advantage from the kainit, the most important ingredient of which is potash, of leading importance to all leguminous crops.

The most unsatisfactory results, perhaps, in the above trials, were obtained from the use of farmyard manure and kainit. No

estimate, however, as far as we observe, has been made of the quality or otherwise of the farmyard manure employed, nor of the animals that supplied it. The age of the animals, the nature of the food supplied to them, and the making of the manure itself must all be taken into consideration in estimating the actual value of such a fertiliser. We are pleased to note that the experiments are to be continued. Other seasons will, in all probability, give different results; for the weather as to temperature and moisture often nullifies the effects of manuring. If the same ground is to be used again, for the same crops, some plots should be set apart to test the effect of the rotation of crops in husbanding soil fertility.

Seaweed is said to be richer in nitrogenous constituents than Oatmeal or Indian Corn. It should therefore be a very nutritious vegetable food.

Royal Horticultural Society.—The next fruit and floral meeting of the Royal Horticultural Society will be held on Tuesday, February 8th, in the Drill Hall, James Street, Westminster, 1 to 4 p.m. At 3 o'clock the annual general meeting of the society will be held in the Lindley Library, 117, Victoria Street, S.W.

An Army of Pensioners.—There are on the United States' pension list no fewer than 4,620 survivors of the late war who are either florists, nurserymen, seedsmen, or gardeners. These men seem to have taken the scriptural injunction to heart, and to have turned their swords into ploughshares and their spears into pruning hooks.

Rye Gardeners sat down to their annual dinner at the Cinque Ports' Assembly Room on the 20th ult. The Rev. A. J. W. Cross presided over a large attendance. In replying to the toast of "The Society," proposed by Mr. C. Hayles, the president remarked that the society owed its success to the labours of the officers and the interest displayed by the members. The point money won by the various exhibitors through the year was distributed during the course of the evening.

N.C.S. Smoking Concert.—The second annual smoking concert in connection with the National Chrysanthemum Society will be held at Anderton's Hotel, Fleet Street, E.C., on Monday evening, 14th February, at 7.30 p.m. That the soothing influence of the noble weed may be extended—Oh! no—in order that invitations may be extended to ladies, the annual "Smoker" will, on this occasion, take the form of a cigarette concert. Seeing also that the 14th is St. Valentine's Night there should be a very large attendance. The hon. secretaries and treasurers of the concert are Mr. Richard Dean, V.M.H., Ranelagh Road, Ealing; Mr. H. J. Jones, H.F.N.C.S., Rycroft Nursery, Hither Green, Lewisham; and Mr. A. E. Stubbs, 290, Dashwood House, New Broad Street, London, E.C.

Native Guano.—This is the title of a pamphlet of seventy-two pages, giving an account of the results of the practical application of "Native Guano" to farm and garden crops. The text matter consists almost entirely of testimonials from various people, practical and scientific, throughout the country, the greatest number being in England. The manure has been used for all sorts of garden crops, including representatives of fruits, flowers, and vegetables. An index at the end refers the reader to the pages where each particular crop is mentioned. Most things have of course been mentioned by a great number of people who furnish the results they obtained. As far as we notice the testimonials refer to last year only. Dr. A. B. Griffiths, the great authority on horticultural chemistry, describes it as an excellent manure for a large number of crops, as it contains nitrogen and phosphoric acid, as well as other fertilising substances not recognised in ordinary official analyses. These substances probably render the inert constituents of the soil available as plant foods, and in that respect are valuable. The pamphlet is issued by the Native Guano Company, Limited, 29, New Bridge Street, Blackfriars, London, E.C.

As Orchards Increase in number and extent in Britain, so do their insect enemies multiply.

Sparrows are now singing on the housetops, I see by the papers. Well, leave them there, say I, not because I'm charmed with the song, but the Gooseberry buds will be safe.—*Snaggs*.

A Banffshire gardener lost his watch while digging about three years ago. The lost time-piece turned up again the other week while digging was being carried on, though the same ground had been dug three times in the interval.

M. Anatole Cordonnier was nominated a *Chevalier de la Legion d'Honneur*, on the occasion of the last Chrysanthemum exhibition at Brussels. He is a Vine and Chrysanthemum grower, and the author of a book on *Le Chrysantheme a la Grande Fleur*. M. Cordonnier is in all circumstances a man of progress, so that this new distinction at the hands of the French Republic is well merited.

An Ancient Orchard.—Some time ago during trenching operations in the orchard at Pitfour, Aberdeenshire, the men found three feet of good loam on the surface, below which was a layer of closely placed granite blocks over-lying a layer of sand. Below that, good soil again descended to some depth. This had been the monastery orchard of Pitfour, and must have been made about the year 1218. The custom of paving the site of fruit trees must therefore be a very ancient one, though not much practised now.

Deverill's Seed and Plant Catalogue.—If amateurs do not garden finely in modern times, it is not for lack of material, nor want of instructions how to set about it in the orthodox fashion prescribed by the profession. The usual lists of flower and vegetable seeds and plants are set forth in the catalogue of Mr. H. Deverill, Banbury, Oxon.; but to amateurs the hints on "Growing and Selecting Vegetables for Exhibition" should prove both interesting and useful. The chapter is written by Mr. W. Pope, gardener to the Earl of Carnarvon, Highclere Castle, Newbury, a noted vegetable grower and exhibitor, so that amateurs may feel sure they are following a reliable authority. The subjects dealt with are Beet, Longpod Beans, Carrots, Cauliflowers, Celery, Cucumbers, Onions, Leeks, Potatos, Peas, Parsnips, Dwarf Beans, Tomatos, and other subjects which most amateur gardeners like to cultivate for use as well as exhibition. For the latter purpose the art must always be carried to greater perfection than when the vegetables are merely grown for home use. There is also an article on the cultivation of a few popular flowers, such as amateurs generally may desire to cultivate. Hardy, herbaceous, alpine, and bulbous plants are also described at fair length, giving such information as beginners may require.

Sir John Lubbock, Bart., M.P., on Buds and Stipules.—There was a large attendance at the Royal Institution on the 21st ult., to hear Sir John Lubbock's lecture on "Buds and Stipules." Sir Frederick Bramwell presided. The unwonted earliness of the season enabled him to be better provided with specimens than he could have anticipated. The large number of diagrams, however, with which Sir John is always provided enables him to place the subject-matter before his audience with great clearness at any season of the year. The subject, moreover, is of perennial interest, as leaves, stipules and buds are present in some stage or other during every day of the year, while they are quite as interesting in winter as in summer, the so-called resting buds being particularly instructive to the student of Nature's way of taking care of her subjects. Even the outermost Oak leaf in the bud is protected with forty greatcoats, that is, twenty pairs of stipules. Some Rock Roses have stipules while others have none; but in such cases the leaf is differently formed at the base, thus making up for the deficiency of stipules. Many other cases were cited to show that stipules were of primary importance for protecting the buds in winter; while in other instances they assumed the form and functions of leaves in summer. In conclusion, he stated that if his hearers would examine the buds of our native trees and shrubs in spring, they would be more and more filled with wonder at the varied provisions made by Nature to protect the tender buds in winter.

Amber in enormous quantity has been discovered in British Columbia, sufficient it is said to supply the pipe-makers of the world for the next 100 years.

In Onion there is strength, says *American Gardening*, and in proof thereof quotes the case of a school-mistress who objected to and forbade one of her scholars eating Onions, but who was forced to give way when all the pupils took to the same diet.

Royal Botanic Society.—Fruiting branches of *Euonymus japonicus*, not often seen in this country, were sent from Dawlish, Devon, to the meeting of this society on the 22nd ult. A paper on "Plant Variations" was read by the Rev. G. Henslow, and illustrated by oxyhydrogen views. Papers of botanical interest are to be given at the meetings of the Fellows during spring and summer.

Botany in London Parks.—The London County Council has been recommended by the "Parks and Open Spaces Committee" to give orders for plots to be laid out in Battersea, Ravenscourt, and Finsbury Parks in such a way as to afford instruction to scholars in elementary and secondary schools in the practical study of botany. The plants in these plots are to be labelled with their common as well as their Latin names. It is suggested that the trees in the park should be similarly labelled. This is a step in the right direction and we trust one that will be appreciated, when no doubt similar instructions will be given to those in charge of the other parks and open spaces.

Chrysanthemum "At Home."—This is the title of a small booklet by Mr. C. Orchard, Harbour Gardens, Bembridge, Isle of Wight. In the absence of information we take it for granted that Mr. Orchard, who is a noted Chrysanthemum grower, has written it during his idle hours, or may-haps to kill time while riding on the railway in returning from the shows, as well as to amuse his personal friends. It is a humorous skit on Chrysanthemums, the names of the varieties being interwoven with the language of the 'Mum grower in such a way as to produce an amusing train of ideas, the force of which will be more apparent to growers of the golden flower than to outsiders.

Ealing Gardeners' Society.—The usual weekly meeting of this society was held on the 25th ult., John Hughes, Esq., F.R.H.S., presiding. The attendance was not quite so good as the subject warranted, many being, no doubt, deterred by the term "chemical." However, the very respectable number who did put in an appearance were more than gratified—they were enthusiastic. The occasion was an address on "Chemical Manures," by F. W. E. Shrivell, Esq., F.L.S., of the Tonbridge Experimental Farm. Mr. Shrivell possesses not only a fund of information on this important question, but a very happy knack of rendering it available. This he did partly by the aid of the blackboard and partly by his affable manner and concise demonstration of facts. He stated, at the outset, that he had nothing to sell; he came before them solely in the interests of science and the benefit of horticulture; and that while Dr. Bernard Dyer was the scientific adviser, he, himself, was the practical worker. He did not despise farmyard manure; on the contrary, he called it his "sheet anchor," and said that it not only contained all the elements of plant food, but that it acted mechanically on the soil improving its condition as well as adding to its fertility. He then described dung as consisting principally of straw, ammonia, phosphoric acid, potash, and lime. He recommended fresh or green dung as a base for vegetable culture for the reasons given above, and gave copious statistics to prove his case. Dung, however, was not sufficiently powerful in itself to give the best results, so that lime and kainit were added at the same time, the more soluble chemicals, like nitrate of soda being applied subsequently. Mr. Shrivell gave his experiments with Asparagus, Strawberries, Cauliflowers, Brussels Sprouts, etc., over a series of years, showing some very remarkable results. Strawberries, it seemed, could not be grown satisfactorily without farmyard manure, while Cauliflowers and Brussels Sprouts—indeed the Brassica tribe generally—were enhanced in value by chemical manures alone. Much more invaluable information of this sort was accorded, which was received with a hearty and generous assent.

Woking Horticultural Society.—Mr. J. O. Law presided at the fourth annual meeting of this body which took place at the Railway Hotel, Woking, on the 19th ult. The report of the committee, presented by Mr. Jones, stated that the Diamond Jubilee Year had been a very trying one for them, and that they had reason to congratulate themselves that the deficit on the year's working, which they had to report, was no larger. The statement of accounts showed total receipts of £244 11s. 1d., and an expenditure of £239 15s. 10d., thus leaving a balance in hand of £4 15s. 3d., as against last year's balance of £9 1s. 1d. The balance sheet was adopted on the motion of Mr. Neal, seconded by Mr. Jones. At the election of officers, which followed, Mr. J. O. Law was requested to keep the post of president, and Mr. Taylor, Mr. Robinson, and Mr. Neal were re-elected treasurer, secretary, and chairman of the committee respectively.

Devon and Exeter Gardeners' Association.—At the meeting held on the 26th ult., Mr. George Lee gave a lecture on "Orchid Growing," especially dealing with Cattleyas. In his opening remarks he alluded to the discovery of *C. labiata* by Mr. William Swainson in Brazil, and its introduction to this country. Proceeding to cultural details, he said that in order to grow Cattleyas properly the structure must be suitable, for Cattleyas were difficult to manage if their requirements were not closely looked after. Mr. Lee advised care in potting, and warned his hearers against potting too frequently. All Cattleyas in their growing season required an abundant supply of water at the roots and in the atmosphere, but sometimes damage was done to late growing forms by water lodging and causing the young growths to rot. Mr. Lee gave a list of the most useful species of Orchids for the grower to invest in.

An Association of Working Men Gardeners.—The efforts of the East Suffolk County Council to encourage the cultivation of fruit and vegetables are bearing good fruit. The lectures given by the teachers employed by the council in various local centres have been much appreciated, and the cultivation of garden produce generally has been much improved and stimulated thereby. At one of these centres, where an especially enthusiastic class has been drawn together, the idea of forming an association of working men gardeners has been evolved. The objects of this association are mutual assistance in the way of still further improvements, the purchase of the best seeds and manures at the most reasonable prices, and the disposal of surplus produce to the greatest advantage. These working men gardeners have been greatly impressed by the necessity of obtaining good seeds and manures, both from the lips of the lecturers and from practical experience gained in their own garden plots. However much criticism people may be disposed to bring to bear upon the working of county councils, it is satisfactory to find that, in some directions at least, their efforts to procure a more enlightened state of affairs have not been in vain.

Colchester Rose and Horticultural Society.—The third annual general meeting of this society took place at the Town Hall, Colchester, on the evening of Wednesday, 19th ult. Mr. Claude E. Egerton-Green presided. The report for 1897 was presented by Mr. P. R. Green, and stated that the year lately closed had been one of steady progress, and the only drawback to a successful year was the fearful storm on June 24th, the day of their summer show. The balance sheet showed receipts amounting to £318 14s. 11d., and an expenditure of £311 2s. 9d. A balance of £7 12s. 2d. remains with the secretary. The chairman, in moving the adoption of the report and balance sheet, apologised for the absence through illness of their president. Mr. C. E. Cant seconded, and the motion was duly carried. At the election of officers Mr. P. R. Green announced that Mr. Jas. Paxman, the present Mayor of Colchester, had signified his willingness to accept the office of president. The following officers were then chosen:—Hon. Treasurer, Mr. C. R. Gurney Hoare; Hon. Secretaries, Mr. Claude E. Egerton-Green and Mr. O. G. Orpen; Auditors, Mr. C. H. T. Marshall and Mr. C. E. White. The members of the old committee were asked to serve for the ensuing year, and Mr. J. T. Bailey was added to their number. Some conversation arose anent the visit of the National Rose Society to Colchester during the coming summer. It

was hoped that Colchester would give the "National" a good reception, and that the town would reap considerable advantage from the visit.

Lady-crofters.—The Countess of Warwick proposes to establish a training college for lady-crofters wherein they shall be taught dairying, pig and poultry keeping, horticulture, etc. The crofts are to range in size from one to four acres, and each croft is to be occupied by two lady-crofters—who may be either joint tenants, or head and subordinate—all to be under the control of a lady warden. The objects of Lady Warwick's practical scheme are (1) to open up a new field of work for women; (2) to check the depopulation of rural districts; and (3) to keep at home some of the money annually sent abroad for poultry, dairy, and horticultural produce. Only those ladies who have taken the course at the college, and who, moreover, possess incomes of from £20 to £50 per annum will be recognised as lady-crofters. The woman's movement, inaugurated by the Swanley Horticultural College, seems to be finding zealous supporters, and if this new development proves successful, other undertakings of a similar nature will doubtless be heard of ere long.

CARNATION VEITCH'S EARLY PERPETUAL.

UNDER this name I obtained a packet of seed of this type of Carnation. They were sown in March in a warm frame. When strong enough the seedlings were pricked out into shallow boxes and returned to the frame again. When established they were removed to a cold frame, the lights being drawn off during the day.

In July they were potted, three into 4 in. or 5 in. pots. When the pots were full of roots the plants were potted into 6 in. and 7 in. pots, without disturbing the roots, and placed again in the cold frame. We find it advisable to keep all winter-flowering Carnations under glass in stormy weather, as our situation is low and damp, and this so soon engenders spot on the foliage. When the autumn advanced they were removed to a high shelf in a cool, airy Peach house till the end of October, when they were removed into a house with a night temperature of about 50° and 55° to 60° by day.

They commenced blooming in October, and have given a good lot of bloom through the dark days of winter. Evidently they will continue all through the spring. By potting three plants in a pot it gives a chance of not having a pot without some doubles in it. Being seedlings, there are sure to be some single ones amongst them, but the percentage is very small, and the blooms are of all shades, many sweet-scented ones being amongst them. I am well pleased with them.—*J. C., Chard.*

SCOTTISH NOTES.

VEGETABLES, FLOWERS AND THE WEATHER.

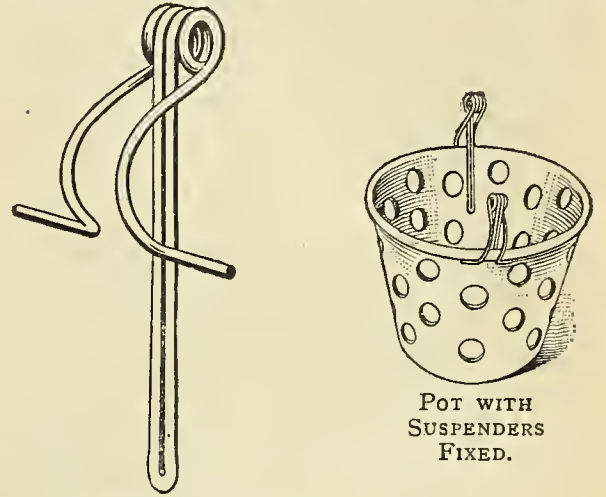

The chief topic in our district in the middle of January, is the weather. Seldom have we had a January so mild, but sunless and foggy. A temperature of 45° to 50° is generally indicated, but often higher in the shade at mid-day. December will be remembered for fogs. The foghorns on the River Forth gave out their gruesome sounds almost continually, and the heavy rains have saturated the land. Vegetables have been very abundant and good—both roots and green crops. Celery planted on the surface of the soil is the best we have had for some years. Trenches formed deeply in this low-lying locality are unsuitable for this popular vegetable. Broccolis are very firm and compact. They were planted by means of a crowbar into very solid ground, as planting in loose, rich soil means failure, especially if weather is severe from frost or damp. One of the most useful winter vegetables is Rosette Colewort. When planted during July and August (first and second crops), a good supply may be had throughout autumn and winter. Veitch's Earliest Cabbage has been of much value during the mild weather—so mild that mowing of lawns has had to be done in January. Pansy Bullion has bloomed throughout the season, and, though in a damp undrained position, it continues to bloom. This is the most useful yellow we have tried for bedding. What a useful shrub is *Garrya elliptica*, which is one of the hardiest which we know. During the terribly severe winter of three years ago this shrub was

uninjured. In a position where water cannot be drained off, it is loaded with Catkins, and in another dry position on gravelly soil the plants in pyramidal form are attractive. I do not understand why so many writers in the South report it as being tender.—*M. Temple, Carron, N.B.*

LAWTON'S PATENT POT SUSPENDER.

PATENT No. 2658.

THIS simple, valuable and unique invention will be found useful to the horticulturist, in a variety of ways, amongst which may be specialised the suspension of plants in pots for conservatory or other decorations, either against a wall or from the roof.

SUSPENDER.

POT WITH SUSPENDERS FIXED.

To the Orchid grower it is invaluable, as by its use a few moments only are required to make any pot or pan ready for suspension, without any of the usual difficulties and unsightliness caused by the binding round of string, wire, etc.

The suspenders can with equal facility be used for suspending cut flowers in vases, &c. (it may even be used for an ordinary tumbler), thus getting over one of the greatest difficulties in floral decorations for walls.

It also makes an excellent substitute for the wire holdfasts used for holding plates, plaque, &c., when wanted to hang against a wall, and has the advantage of being considerably less in cost.

The inventor has had these clips in use for some considerable time and can guarantee their efficacy and durability.—*Sole Agent, J. George, Horticultural Sundriesman, 14, Redgrave Road, Putney, S.W.*

SEASONABLE NOTES.

FRUIT FORCING.—Peaches and Strawberries I class together, as more often than not these two fruits are brought on in the same house, and the temperature given the former suits the latter in every respect. The past month has been very much against these early fruits. Houses which were closed about the second week in December will be in full bloom by this time, especially the Peach. The sun seems to have disappeared from our shores for a time, and I do not think I remember such a sunless month for January. A spell of frosty weather would be acceptable as it generally gives us bright sunny days, which are almost necessary for the free setting of the above named fruits.

In lieu of this we have been obliged to make use of more fire heat than is usually required. A temperature of about 50° at night with an advance of 8° or 10° through the day is necessary to dry the pollen (not too plentiful I find), and a little chink of air should be kept on day and night at the apex of the house. The flowers should be gone over about mid-day with a camel-hair brush, lightly touching each bloom which will help to distribute what pollen there is. This applies to both fruits, though the Strawberries on shelves in this house will scarcely be open yet; at least mine are not; but I have 5½ dozen plants on a shelf in the early vinery fast coming into flower, the variety being Royal Sovereign, which are looking most promising. The Peach house is given a thorough damping with the syringe each morning at 9 a.m. over the border, walks, and stems of the trees, making sure no water reaches the flowers. This suffices for the day during this dull weather. A sharp look out must be kept for green and black fly, and the pest at once dusted with tobacco powder if found.—*Practical.*

HINTS FOR AMATEURS.

THE SEED ORDER.

WITH the advent of the new year the seed catalogues drop in with their long lists of proved varieties of fruits, flowers, and vegetables, and their usual sprinkling of novelties. The amateur of a few years standing will be able to notice a considerable difference in the appearance of these catalogues a few years ago and what they are now. The services of photography have been strongly impressed into the service, and there can be no doubt that the illustrations they give of various subjects are highly satisfactory. The old-time coloured plates which used to be such a source of wonder and delight to children have, to a large extent, disappeared, their places having been taken by the more accurate and aesthetic photogravures.

In making out the seed order for the year the amateur is confronted by a task of no small magnitude for there are such numbers of varieties of all the popular races of flowers and vegetables that it is only with amount of puzzlement that it is possible to make a selection commensurate at one and the same time with the requirements and the purse of the grower. A few hints as to what to order may be of some service to those who are not old hands in the process of selection. Those who have gardened for a few years soon get to know in the school of experience, what varieties do best in their own special locality, and we may say at the outset that information such as this is of the greatest value, and these hints are not meant in any way to supersede them, but to supplement them, if possible.

But a comparatively small number of amateurs can afford the time, trouble, and expense of experimenting with novelties, and hence it is sound practice to pin faith in standard varieties for producing the main crops. The trial of a few novelties is, of course, a most interesting and valuable experiment, and if carried out thoroughly does not often lead to utter failure, although success may be a limited quantity. Seedsmen, nowadays, are exceedingly careful to test each new variety more or less exhaustively before it is catalogued and sent out to the general public, although it is, of course, not possible to give these novelties the severe and ultimate test of culture in all parts of the country prior to its being sent out.

FRUITS.

There are not many fruits that are associated with the lists of vegetables, and of which seed is offered, and thus the task of selection is a fairly easy one.

Melons.—Only those amateurs who have had a little experience should attempt the culture of Melons, for though they are not exactly difficult to grow they must receive close attention, otherwise the venture will be almost sure to prove a failure. Once the seed of any variety is obtained from the seedsman the private establishment may be self-supporting, for seed may be saved each year for the next season from some of the finest and best flavoured fruits. There is a number of varieties from which to pick and choose, representing fruits with scarlet, green, and white flesh. For a scarlet-fleshed sort Sutton's Ar will be found first-class. Not only is the flavour and appearance of the fruit good, but the plants are strong and robust in constitution, and do not readily go off with rot and canker. If a second scarlet-fleshed variety is required, the old Blenheim Orange takes a lot of heating. For a white-fleshed sort the amateur cannot do better than grow Hero of Lockinge, which is also of some years standing. If it is proposed to grow the plants in frames the Hero is especially suitable for cultivation in this way, and this can by no means be said of all Melons. Sutton's Imperial Green is a first-class green-fleshed form of which the fruit will grow to a great size. La Favourite is also good, but the fruits run smaller, although this is often an advantage rather than otherwise, for very big fruits are not of value proportionate to their size in many private establishments.

Cucumbers.—It may seem somewhat strange to place Cucumbers among the fruits, for we generally regard it either as a vegetable or as a salad, and it is almost certain to find a place among exhibition collections of vegetables. Of course, from a botanical point of view, it is, strictly speaking, a fruit, but this,

by the way. It naturally associates itself with the Melon, however, by reason of the fact that the treatment of the two exhibit certain points in common, although there are also points of divergence. The same house, however, may be made to grow both Cucumbers and Melons. The Improved Telegraph is, perhaps, the best all-round form. It may be made to grow well in either house or frame. Lockie's Perfection is also good, and the fruits are distinct in shape from those of Telegraph. The Ridge Cucumbers are not very much grown, but Long Green, which is of unusual length for its class, and is highly recommended for flavour and constitution, is one of the Messrs. Sutton's novelties that is well deserving of a trial.

Alpine Strawberries.—Here we have a section of Strawberries that is of great service. The ordinary large fruited varieties are, of course, propagated from runners each year, but the Alpines come easily from seed, and this is the best way to treat them. Seed may be either sown under glass in January or February to produce a crop in September, or out of doors a little later. Plants from the out-of-door sowing will yield some fruit in the autumn, and a heavier crop the next year. It will thus be seen that for prolonging the Strawberry season the Alpines are of considerable value, apart from the fact that the flavour of the fruit is delicate and good. A packet of seed of each of the Improved Large Red, and the Improved White should be obtained. Belle de Meaux is a third fine variety.

VEGETABLES.

Tomatos.—The Tomato might, with as much justice as the Cucumbers, have been placed amongst the fruits, but while it is popularly regarded as a vegetable or a salad, and finds a place in exhibition collections as such, it is associated with kitchen garden crops generally, or with the cultivation of vegetables under glass. The number of varieties is legion, and each year sees further additions. Many varieties are only distinct with regard to their names, but even if we remove these from the lists there is still left a wide range from which to select. Of the red-fruited varieties the Perfection type is probably the most useful. Select a good form of it from the catalogue of a reliable seedsman, and there will be no fear of the results in anything like an ordinary season. The great value of the Perfection type of Tomato is that it is alike good for underglass or out-door cultivation. Young's Eclipse which was a seedling raised from Conference, a well-known variety, is a medium-sized, free fruiting variety of considerable merit. It is a good cropper. Frogmore Selected is another comparatively new variety of great value. The fruit is of medium size, nearly round in shape, and of smooth outline, while the flesh is solid and of great depth, with but comparatively small part of it occupied by the seeds. Amongst yellow sorts one of the most promising novelties is Golden Jubilee, which was obtained by Mr. Owen Thomas, of the Royal Gardens, Frogmore, by crossing Golden Princess and Frogmore Selected. Sutton's Golden Nugget may form a good second variety, as it will do well either under glass or in the open. A packet of seed should be obtained of each of these varieties. The Red Currant Tomato, too, should not be forgotten. It bears its fruits in long, pendulous trusses (racemes) of twelve or fifteen fruits which are about the size of a large red Currant. The appearance of these fruits is exceedingly ornamental, and the flavour is good. Apart from this the plants have a capital constitution, and set well and freely with fruit. The Miniature Pear-shaped is another very handsome ornamental form with small Pear-shaped fruits that have an agreeable flavour. It may well be grown if room can be found for it, as the small fruits are a distinct novelty to those (and there are many), who are accustomed to see only the large-fruited sorts.—*Rex.*

Correspondence.

Questions asked by amateurs on any subject pertaining to gardens or gardening will be answered on this page. Anyone may give additional or more explanatory answers to questions that have already appeared. Those who desire their communications to appear on this page should write "Amateurs' Page" on the top of their letters.

Cherries under Glass.—*E. Morton*: You will find the following varieties all good for cultivation under glass:—Early Rivers' black, very large and handsome, with a small stone; Belle d'Orleans, yellow-

white, flushed with pale red, medium size; May Duke, dark red, large, very fine in flavour; Bigarreau de Mezel, pale rose, striped with deep red, very large; Bigarreau Napoleon, pale yellow, mottled with red, with rich, juicy, and well-flavoured flesh, one of the best of the Bigarreux; and Late Duke, large, bright red, with a pleasant acidity. These six varieties will give a good succession of fruit, the order in which the fruit ripens being in accordance to their place upon the list—thus Early Rivers' is the earliest, and Late Duke the latest.

Bambusa falcata variegata.—*Gracias*: The apparent difference in the young plant and the older ones is, we think, due to the fact that the former is a comparative cripple. If once you can start it growing vigorously it will be almost sure to throw off the peculiarities that it now exhibits.

Bouvardias.—*C. Wilkins*: You may easily get up a stock of young plants from cuttings. Partly prune the old plants by shortening the shoots by nearly half their length.

Old Vines.—*J. Clavrig*: It is evident from what you say that the Vines need to have drastic treatment; spurs nearly a foot in length are preposterous. You may certainly cut these back and try to induce the canes to break out from the base if you like, but we do not at all advise this system. A far better plan is to head the old canes off at a point about 3 ft. from the ground. This should be done at once, and the house started soon, so as to give the Vines a good long season of growth. Keep the stumps well syringed twice or thrice a day. When they break into growth, which they should show signs of doing in a few weeks' time, gradually disbud to one strong shoot, which must be carefully looked after, and induced to grow away freely without a check. Each of these shoots will form a sound cane in the single season. They may be pruned back next year according to their strength, and you will then have the basis of good, new fruiting canes. If you wish for an interesting experiment, leave one of the old canes now at full length, and cut back the spurs in the way you proposed doing. You will then have a good opportunity of comparing the merits of the two systems.

Musa Cavendishii.—*Rob*: This Banana may be fruited in fairly large pots if your house is of good size. Better fruit, however, is invariably produced by plants which are planted out in a prepared bed or border. *Musa Cavendishii* needs plenty of heat and moisture, both in the air and at the roots.

Pot Vines.—*Rob*: Canes which were started the first week in November will furnish ripe Grapes by the end of March or beginning of April, according to the character of the season, whether mild or otherwise. This is an important factor in the getting of early Grapes by a certain time, for it is manifest that growth must be comparatively slow and uncertain when the fires have to be driven hard to keep the temperature up, and snow is lying on the ground outside for weeks together.

Lilies of the Valley.—*H. N.*: Coconut fibre refuse is to be preferred to soil for growing the Lily crowns in. It is cleaner, lighter, and quite as efficacious as soil, for the crowns draw upon their contained stores of nourishment to enable them to flower, root action being exceedingly weak. If you maintain a high temperature you should be able to cut the flowers at the expiration of three weeks from the introduction of the crowns to heat.

Ants on a Peach Tree.—*E. A.*: Tie a band of cotton-wool round the stem of the tree; the ants will not be able to crawl over it.

Soil for Lapagerias.—*G. Anvers*: We have found these pretty climbers to do well in a compost of peat, with plenty of sand, to which a few lumps of sandstone and charcoal have been added.

Herbaceous Border.—*Hardy Plants*: If the soil is fairly dry and in good working condition you may at once set about the making of the border. The width, of course, must vary according to individual requirements, but we may suggest 6 ft. as being a fair width. It will enable you to grow almost any-

thing. Unless the garden is very small, 4 ft. would be too narrow. Bastard trench the site in preference to trenching it, and work the manure well down into the subsoil instead of bringing the latter to the surface. You will thus give the plants something to root down into when they have got a start. This will be a matter of considerable importance if we get a spell of drought in the coming summer.

THE WESTERN HEMLOCK.

(*TSUGA MERTENSIANA*).

UNDER the name of Prince Albert's Fir (*Tsuga albertiana*) this tree is most commonly to be found, but priority of nomenclature causes the present name to be now generally adopted. The tree was introduced in 1857 by the Oregon Association of Edinburgh through their collector Jeffrey, and named in honour of the patron of the association—the late Prince Consort.

Probably no other species of *Tsuga* is better adapted for growth in this country, certainly none grows quicker or sooner forms a sturdy well-branched ornamental specimen than that under notice. The habit of growth is both erect and spreading, the flexible leading shoot keeping well ahead of the long, lithe, and thickly produced branches which are clothed throughout with distinctly pendulous and feathery branchlets. Some difference in the shade of foliage colouring is noticeable on different specimens, but usually this is of a dark green and nearly approaching that of the better known and more commonly cultivated Hemlock Spruce (*L. canadensis*).

The foliage is two-ranked and horizontally arranged, each leaf about $\frac{1}{2}$ inch long; while the cones are an inch in length and of a beautiful russet-brown when fully matured. For afforesting purposes *Tsuga mertensiana* is well worthy of a trial, and experiments in this way instituted a few years back have given general satisfaction. The production of timber is rapid, that of a specimen which I measured in North Wales averaging $1\frac{3}{4}$ feet per annum, or a total of $48\frac{1}{2}$ cubic feet for thirty-five years.

Seldom, indeed, is it that we find a larger or more perfectly developed specimen than that just figured, and which is growing, with lots of other uncommon Conifers, at the Emmetts, Ida Hill, Sevenoaks, the recently acquired and delightfully situated property of F. Lubbock, Esq. The photograph was taken by the nephew of the Right Hon. Sir John Lubbock, Bart., M.P.—*A. D. Webster*.

LEICESTER PUBLIC PARKS AND RECREATION GROUNDS.

THERE is no city or town in the United Kingdom that is better provided with the above than the Borough of Leicester. The corporation seize every opportunity of securing suitable spots for the recreation of the public, and which I am pleased to say is greatly appreciated. They have, in addition to those I am about to mention, purchased 180 acres, which are well timbered or wooded, beautifully situated, easy of access to the town, and about two miles from the Abbey Park. The laying out of this is entrusted to Mr. John Burn, the superintendent of parks and gardens, and in whose hands nothing will be wanting to convert this into a paradise for the people. He has already been entrusted with the laying out of all the parks and gardens, and his work has proclaimed for him a practical monument of his abilities. The corporation did well for themselves and the public, when they secured his services; for no grounds are better and more practically cared for than those of Leicester.

THE ABBEY PARK.

Sixteen years ago this was an unused swamp; look at it to-day with its 70 acres of ground, almost in the centre of the town, and beautifully laid out. Its undulating grounds, its picturesque lake, its ornamental buildings, and its grand conservatory are all alike examples of horticultural skill. It is most astonishing how well the trees and shrubs do. Some large trees have been moved from time to time by Mr. Burn, with great success. Trees and shrubs, 30 ft. high, take some moving, and all, with more or less success, have done remarkably well.

In the Abbey Park the public get a taste of all kinds of ornamental gardening; carpet bedding is

well done; ribbon borders are perfection; sub-tropical work astonishes the public; and succulent gardening they look upon with amazement. For those who wish to study botany a useful officinal and medicinal garden in a secluded spot is everything that can be desired. The roads are perfection, and everything is neat and natty, including the beautiful bowling green with its verdant sward like a carpet, which is a boon to the many players. It is in this park that the annual floral fetes are held, and which have done so much to stimulate a love for gardening, especially in the district. These grand exhibitions increase in popularity every year. Entries are more numerous, and what is better the public increase in numbers. This must be gratifying to the town council as well as the superintendent, Mr. Burn. The grand conservatory here is always full of interest winter and summer, and is especially kept by one whose untiring energies on all occasions never seem to flag. I have heard from those in a position to speak, that is, from my brother judges, who like myself have had

advantage has been taken by the landscape artist to make the most of the situation, and that he has succeeded is quite evident by many of the artistic tit bits that one meets.

BELGRAVE ROAD RECREATION GROUND.

Here we have another fine open space of 12 acres, designed by Mr. Burn and planted about four years ago. It is a most popular resort for the thousands.

THE WELFORD ROAD RECREATION GROUNDS consist of 15 acres beautifully surrounded by trees. The grass, roads, and walks are well suited for the position, and the great advantage of the beautiful open space is greatly appreciated by rich and poor.

ST. MARGARET'S PASTURE AND RECREATION GROUND.

This is close by the Abbey Park, being 10 acres in extent, and beautifully belted by fine trees, planted some twelve years ago. This is used for cricket, football, and other sports; and is what every city and town ought to have for these manly sports. Thousands flock here to enjoy themselves.

THE WESTERN HEMLOCK (*TSUGA MERTENSIANA*).

great experience in various parts of the United Kingdom, that a better place for an exhibition and a better managed one it has not been our lot to find. That is the verdict of all; long may the show continue to prosper.

THE OLD RACECOURSE.

This was converted into a park by Mr. Burn about six years ago. It is 70 acres in extent, and 12 acres are devoted to a cricket ground, which is a model of perfection.

SPINNY HILL PARK.

This is about 32 acres in extent, and was converted into a park about twelve years ago. It claims for itself one of the best kept and prettiest parks in the Midlands.

FOSSE ROAD RECREATION GROUNDS—OR NEW PARK.

This park of some 12 acres to 13 acres is just completed, and will be a great boon to the inhabitants of this district. It is splendidly laid out, and every

THE AYLESTONE ROAD GROUNDS

are just about to be made, and Mr. J. Burn is preparing plants for the 14 acres of which the area consists, and in whose hands nothing will be wanted to secure everything that can be desired.

CORPORATION TREE PLANTING, ROADS, &c.

A vast number of trees has been most successfully planted, and keeps many men employed. No one can grudge any expense, however, when one sees what lovely trees they are and the beautiful effect produced. Every available spot is taken advantage of, and a finer lot of town or city trees cannot be found in the United Kingdom. Those recently planted are doing magnificently. The task of superintending such a number of grounds and parks is very great. No one but a thoroughly practical man could manage it; but to Mr. John Burn it seems to come naturally. We heartily congratulate him upon his sound practical abilities in laying out and managing the numerous departments, which are such a boon

to the vast population. I inquired of Mr. Burn if much damage was done by the frequenters of the parks. "Nothing at all worth speaking of," was his ready reply; "the public protect their property, which is made for their enjoyment, in a manner creditable to themselves.—*Alfred Outram, F.R.H.S., 7, Moore Park Road, Fulham, London.*

ARDARROCH, DUNDEE.

THIS, the town residence of Ex-Provost Ballingall, of Dundee, is situated in a prominent position high above the level of the Tay and the city itself, thus commanding a fine view of the latter as well as a long reach of the Tay and the opposite or Fife side of the river. The Constitution Grounds, a public resort under the care of the Corporation, occupy the steep hill side and a terrace at a lower level than Ardarroch.

Last autumn we passed through the latter place with Mr. William Kennedy, who has championed the cause of the Chrysanthemum in this locality for some years past, particularly by growing and exhibiting trained specimens. The stove contains various fine foliage plants such as Crotons, Dracaenas, Maranta bicolor and other useful subjects. Late in the season as it was, we noted a number of Orchids in bloom, including *Cypripedium lawrenceanum*, with twin flowers; *C. insigne*, in variety; *Miltonia spectabilis*, and *Masdevallia tovarensis*. One variety of *C. insigne* was notable for its curiously ribbed lip. The species proves well adapted for cultivation in a smoky place like Dundee, for Ardarroch is quite within the influence of the sooty atmosphere notwithstanding its elevated site.

One house is occupied with an interesting bit of rockwork in the style executed by Messrs. Pulham & Sons, Broxbourne, Herts, with whose work we are familiar in various parts of the country. Ferns were originally planted amongst other subjects on the rockery, but now the artificial stonework is covered with self sown seedlings everywhere, including fine pieces of *Adiantum Capillus-Veneris* springing from the bare rocks. The benches on one side of the house are chiefly occupied with *A. cuneatum* grown for the sake of cut fronds. There are other *Adiantums*, *Woodwardia radicans*, *Aspleniums*, *Scolopendriums*, *Nephrolepis*, *Ficus repens*, and *F. r. minima*, occupying the pockets, and creeping over the stony surface at random.

The conservatory comes more nearly in line with the front of the mansion, and is a moderately high, cool, airy, structure of neat and ornamental design. Some of the more permanent occupants of this house are large specimens of *Cibotium*, *Dicksonia antarctica*, *Chamaerops Fortunei*, and other subjects to supply the necessary greenery. There were also plants of *Clivia miniata* and *C. cyrtanthiflora*. A large specimen of the latter has been in the same pot for the last eleven years, and flowers regularly twice a year, being in bloom when we saw it. There seemed nothing in the pots but a dense mass of roots. The house was brightened with large specimens of *Chrysanthemums* in full bloom. *Vivian Morel* carried two dozen large blooms on a plant. The incurved *Mrs. Dixon* was equally well flowered, as were *Mrs. George Rundle*, *Mary Anderson*, and other varieties grown and trained with great care, purely for brightening the conservatory and decorative purposes in the mansion itself during the dull days of autumn. We were particularly taken with *Mary Anderson* for this kind of work, the flowers being very numerous, large and of snowy purity. The garden is rather restricted in area on this hillside, and quite inadequate to accommodate the plants requisite to meet the needs of the establishment, consequently there is a range of houses at

ST. MARY'S TERRACE.

Plants of a varied description are grown here for use at Ardarroch. The glass at St. Mary's Terrace is on a lower terrace and more under the influence of smoke, though there is a beautifully wooded park on the north side, and stretching up the hillside. Here again *Chrysanthemums* were in full swing, both as bushes for decorative work and for large exhibition blooms. The pure white flowers of *H. Shoesmith* are very graceful and useful for cutting. Others that prove useful for decorative work are *Mrs. West Harris*, single, crimson and pretty; *Elsie Burden*, silvery-blush; *Snowdrop* and *Mary Anderson*, both very floriferous; *Mrs. E. D. Adams*, valuable for late

decorative work; *Puritan* and *Niveus*, white sorts; *Golden Ring*, *Lord Brooke*, *W. H. Lincoln*, and many other sorts usually grown for exhibition blooms. They have been selected by Mr. Kennedy to keep up a long continued supply of flowers, and many of them were only showing their buds. The latest to bloom here is *Mrs. Langtry*, a single variety with pink flowers. The buds were only beginning to show themselves in November, and are expected to expand in April next.

For exhibition blooms the Japanese varieties are the most popular. Only some of them like the atmospheric conditions here, but all have to be tried to determine which of them will stand the ordeal of being grown into large blooms. For instance, *M. Pankoucke*, *King of Chrysanthemums*, *Niveus*, *Nyanza*, and *Mrs. W. H. Lees* do not give satisfaction, though *Niveus* takes very high rank for decorative work when not disbudded. On the other hand *Surprise*, *Le Verseau*, *Mrs. E. D. Adams*, *Florence Davis*, *Van den Heede*, *G. C. Schwabe*, *Marie Hoste*, *Charles Davis*, *Vivian Morel*, *Miss Maggie Blenkiron*, *Madame Ricoud*, and various others prove quite tractable and grow to large size. It is also interesting to see how they vary in colour, and sometimes even in form in this northern latitude, with its cool and moist atmosphere in summer.

More than one house was filled with *Chrysanthemums*, but as the bulk of them had finished blooming and been taken away, *Tea Roses* in pots for forcing were introduced to their place. Heated frames were filled with *Hippeastrums*, *Dendrobes*, *Cypripediums*, *Coelogynes*, &c. Another set of frames was filled with *Hyacinths*, *Tulips*, *Narcissi*, and other bulbs for forcing; but at that time they were plunged in ashes.

While passing through the frame grounds we noted that *Choisya ternata* and *Deutzia gracilis* prove hardy here; while *Francoa ramosa* and *Agapanthus umbellatus* are almost hardy. Tomatos and Figs are also grown in some quantity at St. Mary's Terrace in summer.

READING AND DISTRICT GARDENERS.

"STRAWBERRIES from seed, or the cultivation of the Alpine Strawberry" was the subject of a paper read by Mr. James Hudson, of Gunnersbury, before the members of the above association on the 24th ult., in the club room, British Workman, when Mr. C. B. Stevens presided over a good attendance of members. The subject was certainly a new one, and perhaps the first time that a paper on this particular fruit has been given before a gardeners' association. In the discussion which followed, all the members taking part had to plead ignorance of the cultivation of the Alpine Strawberry; but after what the lecturer said in its favour, and the fact that a dish of Strawberries during September and October would be a great addition to the dessert, as well as being greatly appreciated by employers, many of the gardeners present will, no doubt, be giving this variety a trial.

Mr. Hudson, in introducing his subject, said:—The Alpine Strawberry is, at the present day, a comparative stranger in many gardens, both large and small, but he was fully persuaded that when it is given a fair trial, a great majority of gardeners will be disposed to extend its cultivation. The culture is of the simplest, and given weight for weight upon the same space of ground, the "Alpines" will not be one whit behind that of the average crop of other Strawberries. The real success of the culture of the Alpine Strawberry is in the raising of one's own seedlings or in the purchasing of seedlings. The French adopt the plan of growing their stock from seed, but it is only within the last few years that English firms have catalogued the seed, although the plants from runners are, as a rule, offered in most of our Strawberry lists in a similar way to the large fruited varieties. This plan of offering the runners instead of the seed did nothing for, but rather acted against, any extended culture.

After dealing fully with the system of cultivation carried out at Gunnersbury, the speaker gave much valuable advice as to soils and their adaptability for growing Alpine Strawberries, also the position most suitable. As to varieties, the Alpine Strawberry, as it was known only a few years back, must not be taken as the present day standard of this fruit. The two varieties best for general cultivation are *Royal Amelore* and *Sutton's Large Red Alpine*. The

former produces fruits 2 in. long, whilst the latter, although not quite so large, is equal to it in every other respect, and with some it would be preferred because of its more handsome shape. Other varieties worth growing are *Belle de Meaux*, colour of the deepest red, and flavour first rate; *Berger Improved*, a variety very highly thought of by French growers; and *Large White Alpine*, which, on account of its colour, makes a pleasing change for the dessert. A hearty vote of thanks was accorded Mr. Hudson for his interesting paper. A box, containing some 120 to 140 spikes of well-grown *Lily of the Valley*, many of the spikes having fourteen or fifteen bells each, was shown by Messrs. Rigg & Fixter, the Nurseries, Caversham, and attracted great attention. Eight new members were elected.

ORCHID NOTES & GLEANINGS.

Odontoglossum crispum norwoodense, *Nov. var.*—The flowers of this variety are of large size, and round in outline, with broad, overlapping segments of a pure white, slightly tinted with rose on the back of some of them. The sepals are broadly elliptic, with a chestnut blotch in the centre. The triangular petals are deeply jagged at the edges, with or without the chestnut blotch. The lip has a large chestnut-red blotch in front of the crest, and numerous small ones scattered over both the white and yellow ground. The variety is flowering for the second time in the collection of Thos. McMeekin, Esq., Falkland Park, South Norwood Hill, and is of great decorative value. The massiveness of the flower, and the pure white ground colour are its most striking characteristics.

Cypripedium Mrs. Caroline Allen, *Nov. hyb. var.*—The flowers of this hybrid variety are of great size, measuring something like 6½ in. across the petals. All parts of the flower look as if varnished, a character derived from the parents, namely, *C. oenanthum superbum* × *C. villosum*. The colour is largely due to the former. The dorsal sepal is roundly oval, and of a dark brownish or blackish-crimson, fading into a prominent network of veins towards the top. The margins are white, but what is more peculiar is a yellowish-green blotch of large size a little below the apex, and in strange contrast to the other rich colours. The long, spreading petals are of a dark shining brown on the upper longitudinal half, and paler on the lower half. The lip is also of large size, and dark brown in front. This fine variety is now flowering with Mr. P. McArthur, The London Nursery, 4, Maida Vale, London, W.

Cypripedium W. A. Allen, *Nov. hyb. var.*—This is the product of *C. harrisianum nigrum*, crossed with the pollen of *C. villosum*, and largely reflects the character of both parents, but particularly the former. The dorsal sepal is of a rich brown, except the margins, which are white, and the base and apex, which are tinted with green. The lower sepal, consisting of the two lateral ones united, constitutes the distinguishing feature of this hybrid variety. The organ is about twice the size we should expect it to be, and is a distinct attempt at peloria. The central portion is nearly white, traversed with bright green veins, but a broad border on either side is coloured like the dorsal sepal on both faces. If it had been separated into two, and wholly coloured like the dorsal sepal, the peloria would have been complete. The upper longitudinal half of the long petals and the front of the lip are dark brown. The whole of the flower has a varnished appearance. The variety has been flowering for some time past with Mr. P. McArthur, 4, Maida Vale, London, W.

Odontoglossum crispum Mendham House var., *Nov. var.*—The top flower of the spike of this handsome variety measured about 4 in. across the petals when we saw it the other day. The broad sepals are beautifully shaded with a soft shade of rose, and the petals are similarly tinted, but differ in being broadly ovate and deeply jagged at the margins. The three colours of the lip make a fine finish to a beautiful flower. It has a large golden disc, a large chestnut blotch in front of this, with a few smaller ones, the ground colour being white. The variety was secured for fifteen guineas at the Sale Rooms of Messrs. Protheroe & Morris by Mr. G. E. Day, gardener to H. J. Simonds, Esq., Mendham House, Park Place, Leyton, Essex. Mr. Day also netted a grand variety of *Odontoglossum triumphans* for the same collection. The golden-yellow sepals and petals are richly banded with chestnut-red. The lower half of the lip is white, and the rest chestnut-red.

The Orchid Grower's Calendar.

EAST INDIA HOUSE OR STOVE.—The deciduous section of *Calanthes* which include *C. Veitchii*, *C. vestita rubro-oculata*, and *C. v. luteo-oculata* will very soon require potting up again. It is a very good plan to place the pseudobulbs thickly together in shallow boxes in an upright position to start them. When the growths are about 2 in. high they may be potted up. Treated this way you can select the most forward with each growth well up.

The potting compost should consist of two parts nice silky loam, and one part cow dung which has been dried (the top of the furnace is a good place to dry it) and rubbed through a $\frac{1}{2}$ -in. sieve. To this add some charcoal or crocks broken up rather fine, and a little silver sand. See that it is not too wet or too dry. The pots may be of various sizes to suit the requirements of the establishment. We have seen good strong spikes of *C. Veitchii* from a medium-sized hulk in a 60-pot, and where a lot of house furnishing has to be done, their usefulness is at once apparent. For general purposes one large pseudobulb will fill a 5-in. pot, whilst three medium-sized ones would make a good show in 6-in. or 7-in. pots. The drainage should be ample, but not so much as when potting *Cattleyas* and the like, as the bulbs do not require to be elevated. Indeed, they should be, if anything, just below the rim of the pot.

WATERING.—Great care must be exercised on the young growths will become spotted and damp off. Too much moisture in the early stages and a low temperature must be avoided.

DENDROBIUMS.—The plants of the early flowering *D. wardianum* are making rapid growths, and should be re-potted at once, using the best peat obtainable, with a few live heads of moss worked in as the work proceeds. See that the peat is not too dry and that the moss is not too wet. When such a state of things exists, the plants very rarely take hold of the compost kindly. Water sparingly for a time, as there is more harm done by over-watering newly potted plants than a great many suppose.

CATLEYA HOUSE.—The mild weather tends to hasten the potting of such things as *Laelia autumnalis atro-rubens*, *L. gouldiana*, the early flowering forms of *L. anceps*, &c. We have always found that to make success doubly sure, it is a good plan to afford the plants some fresh compost to root into each season, although the compost they are in does not appear to be quite exhausted. There is, however, but very little left in it for the plants to feed on. A small quantity of fresh material will induce the new roots to push out in quantity from the newly made-up growths. In a word it acts like magic. Therefore do not try to grow Orchids well without providing them with the necessities of life; for, if you do, you are almost sure to fail.

TEMPERATURES.—Warm division, 65° at night; intermediate, 55° to 58°; cool, 50° at night, with a rise of 5° or 10° by day.—C.

Kitchen Garden Calendar.

The dry open weather of the last month has been a great help to those who had much digging to do, as the ground has been in splendid condition for working. Where any light land has yet to be dug, this should be done as soon as possible, that the soil may settle down again before the dry weather sets in. When light land is worked late in the season, too much moisture is extracted for the benefit of the crops; for this reason, where such vegetables as Onions, Peas, and other moisture-loving crops are intended to be grown, the soil should be somewhat consolidated before sowing or planting takes place. Peas sown in November are looking well, therefore, to prevent any mishap now, it would be a good plan to stake them as soon as possible, and afterwards protect them with some evergreen boughs stuck alongside the rows. Another sowing may be made in the open quarters. When the land is dry choose some of the early Marrow kinds such as *Early Giant*, *Excelsior*, *Empress of India*, *Duke of York*, or *Gradus*.

BROAD BEANS that were sown in the autumn have made splendid progress, and may be now transplanted with little fear of loss, though in cold districts where the plants are not too forward, this

operation may be deferred till a little later on. There are many fine varieties of Broad Beans not in general cultivation, which, if well grown, are sure to give satisfaction. There is the *Green Longpod*, *Masterpiece Longpod*, *Green Giant*, and *White Longpod*, all of which will be found most useful. A sowing of any of these may now be made in the open quarters, taking care to allow plenty of room for them to develop, as there is nothing gained by overcrowding.

CAULIFLOWER, LETTUCE, AND ONIONS that were sown in boxes early in the last month will by this be large enough for pricking off. Where a slight hot-bed can be afforded them they will make far more rapid progress than if put out in boxes; therefore an effort should be made to provide space in such quarters to give them a start. Where, however, this cannot be done, boxes are preferable to pans, as the soil in them does not dry too rapidly. The chief evil in growing these things under glass is caused by not making the soil firm enough for the roots to take hold of. In all cases the soil used should be made firm. A small sowing of both Cauliflower and Lettuce may be made in a cold frame. Those who experience any difficulty in procuring fine heads during the latter part of July and August should make a sowing of *Mammoth*, *Autumn Giant*, and *Early Giant*. If these are planted early they will take hold of the soil before the hot weather sets in, and may then be had in good condition at the time required. Lettuce, too, may be grown in the same way, but the ground must be heavily mulched to prevent evaporation.

THE FORCING DEPARTMENT will need much attention at the present time. See that a succession of French Beans is put in as the spaces become vacant, that there may be no blanks. Any that are in flower should have rather a drier atmosphere for a few days. Though the weather has been mild, there has been an absence of sun to raise the temperature of the forcing house in the daytime. Have small batches of *Endive*, *Chicory*, *Seakale*, and *Rhubarb* put into heat as the others become exhausted. These will blanch much faster now than they would a month or two ago; therefore a less amount should be introduced at one time, while shorter intervals should be allowed between them. The last batch of *Asparagus* may now be taken up for forcing, as the permanent beds may soon be brought into use by covering them with lights, and putting a lining round. If raised beds are planted with this object in view, having a space of 4 ft. between them, there is no difficulty in introducing sufficient fermenting material to maintain the requisite heat to encourage a healthy growth.

During wet weather see that the vegetables stored away are carefully looked over, and all decayed ones removed. Seed Potatoes should be spread out thinly, and exposed to the light, that the growth made may be sturdy.—*Kitchen Gardener*.

THE FLOWER GARDEN.

SURELY there never was such a mild January as that we are now passing through, which has, indeed, nearly come to a close. The days have been quite warm and springlike, and the result is that things generally are getting dangerously forward. The young year, 1898, has indeed signalled its advent in a remarkable manner, but gardeners generally will not be at all thankful for it if March or April bring frosts with them to nip precocious flowers and foliage. The early season must, to some extent, force the gardener's hand; and much as he would like to defer them the advanced state of vegetable life calls for their attention. A spell of frost now would be a real blessing, for it would keep things back in their proper place.

PRUNING CLIMBERS.—In the southern counties, at least, a start should be made with the pruning of these, and tying or nailing will follow immediately after. It is well to get this work forward as soon as it is possible to do so, especially where herbaceous borders run along 'neath the shelter of the wall, for it is not economic of labour to give the borders their spring digging and manuring until the greater part of the necessary treading upon them has been got through. In the northern counties a start should first be made with the hardier subjects, leaving the tenderer plants until the last.

ROSES.—As the soil is now in fairly good working condition, the planting of all Roses, except Teas, should be carried on. Nothing suffers from late planting more than the Rose, and as the middle of March is quite late enough to plant in an ordinary season, and we are weeks earlier this year than is usual the present is a favourable time to inquire into the condition of any Roses that appear to be in a sickly condition. Take them up, and carefully look over the roots, cutting out any that are injured or appear to be unhealthy. Any suckers that show should also be removed. In replanting, take away part of the old soil, and substitute for it some good fresh loam with a little old mortar rubbish mixed. Timely attention, such as this, will often prevent plants from going wrong, or getting so had that they are past recovery. All the newly planted Roses should be mulched with short stable or farmyard manure which, for the sake of appearance, should not be too strawy.

THE ROSE GARDEN.—Any alterations or extensions that it is proposed to make in the Rose garden should not be longer deferred. In making new beds it should be remembered that beds of intricate design are not suitable. The size does not matter, for it may vary from the little circle not more than a foot in diameter, and containing only a single standard to others in which fifty or sixty plants may be accommodated without crowding. Generally speaking, however, it is well to have the beds of good size as they are much more effective, but too large beds do not admit of the flowers being cut without treading on the soil, which should be avoided as far as possible. See to the cutting of the grass edges, and attend to the renewal of the surface of gravel paths if necessary.

NARCISSI.—If any bulbs of *Narcissi* have been kept out of the ground for any reason, they should be planted at once. It is, of course, too late to put them in flower beds, for the bulbs have been greatly weakened by their inability to make roots, and will take some time to recuperate themselves, possibly a full season. If they are employed for planting in the grass, however, failure to bloom, or poor flowers will not so much matter, and next season they will be right enough. Bulbs of this kind may be purchased cheaply enough at this time of year, and they are not at all a bad speculation.

GENERAL WORK.—If by stress of weather outside work should become impossible, there is plenty that may be done under cover. Labels and stakes may be made and painted in readiness for use during the forthcoming season. Seeds collected last year should be looked over, and those ordered from the seedsman run through, and placed in readiness for sowing, for the season will soon be here now. If the frost, of which there is no sign at present, supervenes, the hardness of the ground may be utilised for wheeling or carting manure or soil from the yard to the points at which it is to be employed.

HARDY FRUIT GARDEN.

WALL TREES.—The pruning, and nailing or tying of these should be hurried on, as the buds are swelling rapidly under the influence of the mild weather.

APRICOTS.—As these are among the earliest of the hardy fruits to flower, they should be dealt with before any of the other wall trees are touched. If the trees were properly seen to last summer for pinching there will be comparatively little pruning to be done beyond cutting off any ragged ends of the spurs. Neglect in pinching is sure to result in long ragged spurs that project far out from the wall, and thus neutralise the advantage that should be obtained from the shelter of the latter. The branches of the Apricot have a most reprehensible habit of dying off without any warning, and for no apparent reason; hence it is always desirable that a little young wood should be trained in to fill a possible gap. This must not be overdone, however, for crowding is an evil that must be studiously avoided. Sturdy young shoots of last year's production that may be required for succession should be shortened to about a foot in length, varying this length according to the strength of the shoot; thus it may be longer if exceptionally strong, and shorter if weaker. If any large branches have died during the winter these should be cut clean out at once.

PEACH WALLS.—If insect pests have been trouble-

some amongst the Peaches some steps should be taken to clear them right out. The trees were untied from the wires at the end of last November, and secured by tying them together in loose bunches and fastening them to stout stakes. The wall should now receive a thorough lime washing, taking care to work the wash thoroughly into all the crevices with the brush. This done, pruning and tying may follow. If the old bearing shoots were not cut out last fall after the removal of the fruit, it may now be done, leaving only the old wood that is necessary for the increase of the spread of the tree, and the succession shoots trained in their places. As in the case of the Apricot, so with the Peach—a good deal of the necessary pruning may, and ought to be done during the spring and summer months, with the finger and thumb.—A. S. G.

NOTICES OF BOOKS.

THE CULTURE OF VEGETABLES AND FLOWERS FROM SEEDS AND ROOTS, by Sutton & Sons, Reading. Seventh Edition. London: Simpkin, Marshall, Hamilton, Kent & Co., Ltd. 1898. All Rights Reserved. Price 5s.

Here is a large octavo book of some 427 pages, practically a manual, dealing with the whole subject of vegetable and flower culture, and well within the reach of anyone who possesses a garden, and loves it for the sake of what he can make it produce for his table or minister to his delight. It is essentially a book for the beginner, whether amateur or professional, and a handy book of reference for the experienced gardener, as an aid to memory on doubtful points. A comprehensive index will enable him to turn up quickly the subject to which he wishes to refer. The book will be of excellent service to the young man, who, while yet a student, should read and re-read it, until every one of its precepts is thoroughly understood, and then acquire other books that deal more particularly with certain branches or phases of gardening in which he may be interested either from choice or necessity. The seventh edition into which the book has now entered is sufficient guarantee of its continued utility and the demand for it.

In the section devoted to vegetables we open the book at Globe Artichoke and find the details of culture necessary to produce good heads under various systems of treatment, as well as methods for the profitable cropping of the ground, while the Artichoke plants are yet young. Under the same heading comes the word Chards. How many gardeners know that Chards are the leaves of Globe Artichokes blanched in the same way as Cardoons? Asparagus is popular with a much greater number of the community; yet the successful cultivation of it proves troublesome to not a few. While the demand for it is universal, the soil is not universally suitable in every garden; hence a considerable amount of space is devoted to the details of cultural treatment in the book, and the information vouchsafed cannot fail to prove useful. All other garden vegetables are dealt with proportionately to their value, and the complicated nature of their requirements or otherwise. Even the humble Dandelion, though a weed of the vilest character when out of place, under the simplest of requirements may be turned to profitable account as a wholesome and toothsome vegetable.

"A Year's Work in the Vegetable Garden" is practically a vegetable calendar for every month of the year, which everyone should read who fondly imagines there is nothing to be done in the vegetable line during January and February. Independently of outdoor operations, there is practically a vegetable garden under glass, or should be in every well-appointed place. We refer to the raising of various vegetables under glass, as well as the forcing of those things which were grown to maturity in the open ground during the summer months. Much of the forcing that is advocated may, however, be effected by means of beds of fermenting manure in those gardens not well furnished with the necessary hot-water apparatus.

The chapter on "The Rotation of Crops in the Vegetable Garden" should supply the young gardener with many a valuable hint, to be followed up while the years of his career unroll, so that when the time comes he may not only be able to turn his knowledge to practical account, but to add to the general store of information at the service of the profession. The soil is here shown to be a mine or

storehouse of plant food, which is slowly rendered soluble by the action of air, rain, frost and sunshine, and thereby brought into a condition in which plants can appropriate it for their sustenance. That process is constantly in progress, so that the total exhaustion of a soil is a thing unknown. Nature is always restoring the fertility of a soil, but the latter under intense culture, and cropped with a few plants only is being depleted of certain elements of plant food at a greater rate than the same can be restored by the slow and natural process. An observant and diligent study of a proper rotation of crops will enable the cultivator not only to economise the natural fertility of a soil, but to restore those ingredients which have been carried away in the crops, and augment them, and that, too, at a minimum of cost.

Flowers are also dealt with exhaustively under the headings of "The Culture of Flowers from Seeds," "The Culture of Flowering Bulbs," and "Flowers All the Year Round." Then come lawns and tennis grounds, followed by three chapters on the insects and fungi that prey upon living plants, the various pests being represented by woodcuts. The whole of the printing consists of large and clear type, and the bindings leave nothing to be desired.

"THE ADVERTISER'S A B C: THE STANDARD ADVERTISEMENT PRESS DIRECTORY." Published by T. B. Browne, Ltd., 163, Queen Victoria Street, London, E.C. 1898 edition, price 10s. 6d.

The following are the chief contents of the 1898—the twelfth—edition of this work, which has just been issued:—

A complete list of the Newspapers, Magazines, and Periodicals published in the United Kingdom, with the particulars relating to each publication revised up-to-date. In each instance a brief description of the paper is given, and in nearly every case either the full advertisement rates or an extract therefrom.

The particulars of any individual paper now appear on the same page, which is a distinct improvement on previous editions, in which the particulars were split up into different sections of the work. By the new arrangement reference is materially simplified, hence it will, no doubt, be much appreciated by those who are in the habit of consulting the pages of the "A B C." Several facsimile reproductions of the title pages of papers are given, together with much information as to circulations and other items of special value to advertisers, and all having transactions with the Press.

Another section of the book is devoted to the Colonial and Foreign Press, and this also has been thoroughly revised, and may be taken as a reliable index to the Colonial, Indian, and Foreign Press.

The work is interspersed with several articles on the subject of advertising, including one on "Press and Poster Advertising," in which it is claimed that advertising by poster can at best only be regarded as an *adjunct* to Press Advertising, which, it is asserted by the writer, is the only system of advertising giving in itself satisfactory results. An illustrated sketch of T. B. Browne's Advertising Agency is given, together with some sixty or seventy specimens of pictorial advertisements designed and published by this house. There are also several articles in the Colonial section, giving statistical and other information, showing in what direction home manufacturers may cultivate trade with our possessions across the seas.

The general index—also entitled a Directory in Brief—is in itself a concise record of the newspaper and magazine press of this country, and classified lists follow. The new publications and "deaths" of the year are noted, and the London offices and representatives of the provincial papers are given.

The book ends with a geography of the Press. The work is, as usual, handsomely bound in red cloth with gold lettering, and is as bulky as ever.

Fungus on Beech.—At a meeting of the Scientific Committee of the Royal Horticultural Society on the 11th ult., a box of fungi was received from Lady Cave, Cleve Hall, Downend, near Bristol. They were forwarded to Kew, whence it was reported that they were *Pleurotus ostreatus*, *Jacq.*, "one of the best and safest of edible fungi." The specimens were taken from a very old Beech in the gardens of Cleve Hall. They were growing on the wood about 12 feet from the ground.

QUESTIONABLE EXHIBITS.

THE special prizes offered at the October show of the National Chrysanthemum Society are deserving of some attention, when so much is being said about the society's doings. It is bad enough taste to see prizes offered with the conditions attached that the seeds must be obtained from the firm offering the prizes—is this a premium on bad seeds? otherwise, why is it necessary to impose such conditions? If the seeds or plants are the best in their respective classes rest assured exhibitors will soon find it out, and will be pleased to grow them to the exclusion of inferior varieties. It is a further disadvantage to the firm offering the prizes, because there are seldom any means of comparing their produce with others. The N.C.S., however, goes further than this, they give countenance to a system which may be questioned as being honest. Here the intending exhibitor must obtain his seeds from that particular firm direct—or if indirect in his packets, for which he pays the full value. Naturally, one would conclude that the produce would be his own; but no. There is another condition imposed, and that is what I more particularly desire to draw attention to, viz., the exhibits are to become the property of the firm offering the prizes at the close of the exhibition. There is something wrong here, and I would like to ask if it is yet too late for the N.C.S. to withdraw those conditions when they issue their schedule of prizes for the current year.—*A member of the N.C.S.*

LOW PRICED SEEDS—A CHALLENGE.

To all advertisers in THE GARDENING WORLD the article in your issue of the 29th ult., signed "J. C., Chard," will be of interest, varying no doubt according to the prices in their seed lists.

"J. C." may be a lecturer, and as such can doubtless give some excellent advice; but his letter shows either woeful ignorance of the wholesale value of seeds, or an alliance with some house where high prices and large profits rule. We do not attempt to deny that there is much rubbish sold as seeds; this is done as often at high prices as at low. What we do most strongly object to is the wholesale condemnation of all low-priced seeds. Surely "J. C." must have overlooked the number of prizes which in open competition are annually won by the produce of low priced seeds. In these days of keen competition, the man who would extend his business by giving better value for money has enough fair opposition to contend against without being subjected to such unwarrantable abuse of low prices and bolstering up of high prices and large profits as is contained in "J. C.'s" article. But, enough; it is not our intention to show up before the readers of THE GARDENING WORLD the percentage of profits which some retailers require. Since "the proof of the pudding is in the eating" and not in the cook's description, we make the following offer:—To any reader of THE GARDENING WORLD who cares to try for themselves the relative merits of low and high priced seeds by growing them side by side, we will send gratis a packet of any variety of seeds enumerated in our list, the only conditions we impose being that a fair trial be given and the result made known to us with the name of the firm from whom the other seeds were obtained, and the price paid for them.

And with this offer I leave the subject to the common sense of your readers. Before being misled by the views of one man let them try for themselves.—*H. Allen Davies, Redhill, Surrey.*

FLOWER PICTURES BY LADY ARTISTS.

THE forty-third exhibition of pictures under the auspices of the Society of Lady Artists now being held in the Galleries of The Royal Society of British Artists in Suffolk Street, Pall Mall East, is a distinct advance upon the exhibitions of former years. The collection on view comprises no fewer than 473 pictures of various sizes, some of them in oils, and some in water colours, together with exhibits of various handicrafts in the shape of special objects of *virtu*. It follows as a matter of course that in such a collection of pictures some of inferior quality should be found, but, generally speaking, the standard of merit is high, and some of the canvas betrays real genius.

Flowers are so closely, and [even inseparably, associated with the various phases of human life that it is not wonderful that the artist, lady or otherwise, should employ them to a considerable extent. "A Path of Roses," by Ethel Wright, depicts a girl partly clothed in some diaphanous material holding a bunch of Roses in her right hand and strewing Rose petals with the left. This is prettily designed and well executed. An even finer picture called "The Rose," by Mrs. Waller, has for its subject a young girl holding a Rose-bud. The girl's hair is of that rich auburn shade that the gods are said to love, and the whole picture is instinct with life and beauty. "To-day and Yesterday," by E. E. Greatorex, is somewhat gruesome in design, but the subject has been well-handled. It shows a human skull lying on a table side by side with a freshly-plucked Rose.

Tit-bits of scenery seem to have been favourite themes with the ladies, and we noticed some exceedingly pretty pieces of work. "At the Head of Glen Falloch," by Freeman Kempson, shows a mountain glen, with the overhanging peaks and ridges partially shrouded in mist. "Above Loch Lomond" is by the same artist. "In the New Forest," by Edith M. Kemp-Welsh, is a pretty panel picture showing a nook of that historic forest with two patient "neddies" grazing in the foreground. "Sunny September," from the brush of E. Stewart Wood, shows a farm scene in which are all the gorgeous colouring and repose of the first month of autumn. "The end of the Hop Harvest" is from the same artist. "A Peat Marsh, Dartmoor," has been well executed by Annette Elias.

Of the various flowers which the lady artists have portrayed the most successful attempts are "Iris," by Mrs. Minnie S. Beavis; "Japanese Anemones," by Laelia Loddiges; "Chrysanthemums and Autumn Leaves," by Mary T. Fuller; "Orchids," by Helen Thorneycroft; "Azaleas," by Emma Walter; and "Old Man's Beard," by A. Madeline Lewis. "Poppies," by M. C. Bedford represents fairly well the gaudy scarlet of our common field Poppy.

"Autumn Fruit," by Emma Walter, is a fair representation of the drawing master or mistress

MESSRS. JAS. CARTER & CO'S.
PRIMULAS.

THE glass department of the Forest Hill Nurseries of Messrs. Jas. Carter & Co. is just now a blaze of

brilliancy of colouring characterising the flowers. The arrangement, too, has been carried out in such a way that the best characteristics of each form can be seen at a glance, as each of the five varieties is staged in batches of hundreds. Thus, on entering

PRIMULA CARTERS' PRINCESS MAY.

beauty with a splendid collection of the popular Chinese Primulas. No fewer than seven arge and roomy houses are filled with them, and the plants make a grand total of upwards of 7,000, so the extent and variety of the display may be imagined.

the houses, on either hand one sees long glowing vistas of colour until they melt into indistinctness in the distance, for the houses are of great length. The generous reds, the pure whites, and the beautiful blue stand out most prominently from the various intermediate and more subtle shades, which require closer inspection before they can be fully appreciated.

First a word as to the condition of the plants themselves. We found them in the pink of condition, with not a weakly or sickly one amongst them. They were obtained, our guide informed us, from seed sown at the end of July last, and they were not put in their flowering pots (48's), until the first week in December. We found them, therefore, in the first flush of their maiden beauty, the sturdy flower scapes, lifting their grateful burden of bright blooms well above the rich green foliage. The work of pollination, already begun, will be actively carried on for the next few weeks in order that the huge seed warehouses of the firm in Holborn may be kept supplied with seed. The display of bloom will thus be heavily handicapped, for fertilisation shortens considerably the life of the flower, but despite this there will be plenty of colour for some time yet.

Of the numbers of fine single-flowered varieties included in the collection, Princess May is second to none in vigour, floriferousness, and general excellence. The flower trusses are of immense size, and lifted well above the foliage, whilst the delicate blush-pink flowers are of good substance, and perfect form. The accompanying illustration gives a good idea of it.

Elaine is a grand fern-leaved white of surpassing merit, and Holborn Queen, the flowers of which are slightly tinged with pink is equally as good. Holborn Blue represents the latest advance in its colour, which as seen at Forest Hill is rich and vivid. No weakling, either, is it in habit or constitution. Rose, another fern-leaved form has light lilac flowers when they first open, but the hue presently changes to a rose-lilac that is at once rich and delicate. Ruby is much after the same style, but the flowers are a shade or two darker. Vermillion is a handsome crimson-cerise flower that up till the present has been the best of its kind, but a seedling raised from it, of which we saw a few plants, bids fair to surpass it, for the flowers are larger, more open, and several shades darker—a capital thing all round. Holborn Salmon represents a distinct shade of salmon-scarlet, whilst Holborn Scarlet is the nearest approach to true scarlet in the Chinese Primula that we have yet seen. The brilliant effect produced by a batch of plants is easier to imagine than describe.

CARTERS' PRINCE OF WALES PRIMULA.

sort of picture. It shows a group of Grapes, Apples, and Plums, with coloured Vine leaves in the background.

The visitor scarcely knows which to admire the most—the strength and vigour of the plants, their great floriferousness, or the size, beauty, and

Before leaving the singles we must not forget to mention that curiosity, Bouquet, in which the calyx of the flower has become foliaceous. The white flowers are frequently borne singly on the scapes after the fashion of the common Primrose, but usually in umbels in the normal manner. The foliage is of great substance and quite distinct in appearance. Venus is another novelty in which the flowers are prettily mottled and flaked with rose on a white ground.

The doubles constitute a very valuable and charming section. Blue Rosette is the double counterpart of Holhorn Blue. Prince of Wales (for which see illustration), exhibits a delicate shade of rose-pink. The flowers are of good size, and produced with exceptional freedom. Princess of Wales is white, prettily mottled and flaked with rose, after the style of Venus. Aurora is a rich salmon-pink, whilst Snowflake, in accordance with its name is pure white. Vivid, too, is well named, for the blooms are vivid carmine-scarlet, and the plants, whether viewed severally or collectively, very showy. Lilac Queen, which has deep lilac flowers, completes a list of varieties that should be in every up-to-date collection. At Forest Hill, under the skilled cultivation given, they acquit themselves marvellously well.

We are indebted to the Messrs. Carter for this opportunity of figuring the two varieties, Princess May, and Prince of Wales.

PHENOMENAL WEATHER.

SINCE the short spell of frost and fog at Christmas we, in West Middlesex, have experienced nothing but the most phenomenal weather; in fact, the temperature has been more indicative of April than January. Night after night the thermometer has not gone down below 40° to 45°, rising about 10° during the day.

This abnormal state of things is, unfortunately, having its effect in the garden, where herbaceous and other plants are being unduly stimulated. Phloxes, for instance, are quite an inch above the ground, while Roses are covered with shoots of an equal length. *Dicentra spectabilis* is showing its rich young growths too far above the soil, and *Sedum spectabile* is a mass of glaucous leaves. *Narcissus*, *Tulips*, etc., also exhibit too much precocity; while a tour "round the houses" this afternoon (January 23rd) discovered *Snowdrops*, *Winter Aconite*, and even *Crocuses* in a very advanced stage. *Jasminum nudiflorum*, of course, was on the walls in full beauty; *Crataegus Pyracantha* was still in fresh fruit; *Daphne Mezereum* showed much colour; and many other shrubs and sub-shrubs told the same tale; for although plants generally appear to exhibit some sensitiveness, they seem to be totally unable to distinguish between the true season and the false.—*C. B. G., Acton, W.*

PRUNING AND DRESSING VINES.

THE importance of taking these operations in hand in good time cannot be over-estimated; the well-being of the Vines is largely influenced thereby. Should the pruning be delayed till after the sap commences to rise bleeding sets in, and in spite of any and every means taken to prevent it, the prospective crop is more or less jeopardised; for the long continued loss of sap weakens and hinders the growth of the young shoots to such an extent that they are some time before they gain strength sufficient to make healthy progress. However satisfactory this may appear they cannot make good the damage already done. Vines are so generally grown on the spur system that any remarks upon the pruning of them are usually taken, as in this instance, to refer to canes or rods managed in that way. In pruning them one eye only should be left on a spur; for if more are retained they, after a few seasons, get a long way from the parent stem, and assume a gnarled and knotted form, through which the sap cannot flow to the bunches of fruit with that degree of freedom it should do.

Where Vines have, through mismanagement, got into this condition, young rods should be taken up to replace the gnarled and knotty ones, which, as the younger ones come into bearing, may be cut out. Under the term dressing, as respects the winter management of Vines, I include the removal of any

really loose bark, and in this connection must utter a word of protest against that barbarous plan of skinning them to the wood, which is far too prevalent, thus depriving them of their natural protection. A glance at a vinery will soon convince a practised eye whether the Vines have been treated in this unnatural fashion, or the more rational one; for rods thus yearly deprived of much of their natural coating do not swell out as they should do.

The plea urged in defence of the practice is that it is necessary for the destruction of insect pests. In answer to this it may be asked, what pests? If mealy bug, all I have to say is that anyone having it among their Vines to such an extent as to be driven to the extreme measure indicated, is either much to be pitied or highly blamed, it being the only insect which can be successfully banished from our plant houses. What germs of red spider or thrip may be in hiding among the loose bark may be easily dealt with by well-painting the rods with Gishurst Compound, as directed by the makers. I have made different washes with tobacco, sulphur, lime, clay, soot, &c. The Gishurst Compound, an old remedy, is quite as effectual and far more cleanly than either.—*W. B. G.*

GARDENING MISCELLANY.

GALANTHUS IKARIAE.

THIS seems to be more or less intermediate in character between *G. Elwesii* and *G. latifolius*, but has been described by Mr. J. G. Baker, of Kew, as a new species from Nikaria. The strap-shaped leaves are bright green, resembling those of the latter, but differing in being slightly hooded at the apex, and otherwise being almost quite flat without the channel down the centre. The outer segments are oblong-spathulate and narrowed to a broad base that almost completely covers the inner segments. The latter resemble those of *G. Elwesii* in being erect, crisped at the apex and finely ridged and furrowed longitudinally; but they differ in having only one large green blotch round the sinus, outside and inside. *G. Elwesii* has the inner segments green throughout the inner face except at the margins, with a large green blotch at the base externally, and a small one round the sinus. Its outer segments are also narrowed to a claw. Altogether, *Galanthus Ikariae* is a beautiful Snowdrop at a casual glance recalling *G. latifolius* on account of its bright green leaves and large flowers. The species is now flowering on the rockery at Kew.

AN EFFECTIVE COMBINATION.

COLOUR contrasts are always more or less effective, but, as a rule, there is not much colour out-of-doors in our climate in mid-winter. As, however, this climate of ours—like some other things I could mention—is not always strictly congruous, so it happens sometimes that the garden is gay before the normal time. At least I thought so on the 30th January last when I took a stroll through our great hotanical establishment at Kew. But, in addition to the unusual amount of colour for the season there present, I was struck with a very simple but very effective group of the Red Osier Dogwood (*Cornus alba* var. *siberica*) set in a carpet of gold—the Winter Aconite (*Eranthis hyemalis*). The beautiful yellow cup-shaped blossoms, sessile on their deeply-divided leaves, presented such a regular and even carpet of colour that the bright red or red-purple stems of the Dogwood appeared to be reflected as in a mirror. Whether this reflection be fancy or fact matters not much; the combination of colour was there; the effectiveness was also present; while the simplicity of the arrangement recommends itself to all gardens.—*C. B. G., Acton, W.*

* CARNATION JACK FROST.

THIS is a huge white Carnation which is credited in the United States with being the largest white Carnation in existence. Reports are to hand of flowers 4 in. in diameter, that is as large as a fine *Malmaison*. The petals are fringed. It is said to be an exceptionally strong grower, and to be immune from attacks of rust. If it does as well this side of the water it will receive a warm welcome, and will be largely grown.

OBITUARY.

MR. FREDERICK E. WILLEY.

IT is with sincere sorrow and regret that we hear of the untimely death of our old friend and comrade Mr. F. E. Willey, who has succumbed to the unhealthy climate of Sierra Leone, Western Tropical Africa, after a residence there of only two years, during which he held the post of Curator of the Botanic Gardens. Mr. Willey entered as a young gardener at Kew in 1892, and after a year's service was chosen as relief man for the Botanic Station at Ahuri, Gold Coast, during the absence on holiday of Mr. W. Crowther, also since deceased. Upon his return he remained awhile at Kew, but was appointed in October, 1895, to take charge of the new station at Sierra Leone. Those who knew Willey, and the grit and determination that lay beneath his genial and prepossessing manners, need not be told that he did his duty well and reaped no small measure of success upon this fever-swept outpost of the empire. In his capable hands the economic resources of the colony were being developed apace, and his friends were all hoping that a long and prosperous career lay before him. But it was not to be, for the great reaper Death had marked him for his own, and on the 22nd ult. removed him to that place where "the wicked cease from troubling and the weary are at rest." *Requiescat in Pace.* Kew mourns a worthy son, and not a few of us a friend.

MR. THOMAS SHEASBY.

We regret to announce the death of Mr. Thomas Sheasby, gardener to Lord Dunleath, Ballywalter Park, Newtownards, Co. Down, on the 21st ult.

QUESTIONS AND ANSWERS

* * * Will our friends who send us newspapers be so good as to mark the paragraphs or articles they wish us to see. We shall be greatly obliged by their so doing.

[Correspondents, please note that we cannot undertake to name florists' flowers such as Carnations, Pelargoniums, Chrysanthemums, Roses, nor such as are mere garden varieties, differing only in the colour of the flower. Florists' flowers, as a rule, can only be named by those who grow collections of them.]

Grub in Box.—*Enquirer*: The box you sent containing an insect came to hand last week after we had gone to press, and must have been delayed, as the letter posted on the same date arrived three days earlier. The specimen was alive and well. It is the pupa or chrysalis stage of the Cabbage Butterfly (*Pieris Brassicae*). The caterpillars after being full fed last autumn must have crawled into your vinery and lain up there. It is the resting or rather the hibernating form of the insect, and would have hatched out in April.

Strawberries and Soot.—*F. G. Brewer*: We have very little doubt that the conclusion you have come to is the right one. In all probability more than sufficient soot was used, mixed with the soil, so that an additional supply over the crocks in the pots has injured the young roots as soon as they pushed through the soil. We have witnessed an entire absence of Carrots, and even weeds on a piece of ground that was overdressed with soot to destroy the Carrot grub. The only thing you can do is to turn the ball of soil out of the pots, and take off as much of the soot as you can without disturbing the roots more than you can help. Crock the pots with clean pot sherds after wiping out the pot itself. Repot firmly and give the plants a further trial. Use only those that have not yet started into growth. If you have any good Strawberry runners in the open ground you might pot up a batch or two of them with the view of getting a few dishes of fruit this year by forcing. This has been successfully done, so that you might very well try it. The lack of sunshine for months past has been very detrimental to the forcing of Strawberries and other fruits.

Natural breaks of Chrysanthemum.—*Cupidus Scientiae*: You stop your plants twice with the object of getting a sufficient number of shoots to produce the desired number of flowers. This we speak of as the bush form, and we do not know any other way of obtaining the requisite number of shoots. You desire to take some on the first and some on the second crown bud. That is evidently what you have been doing when you speak of being careful to remove all side growths after taking the buds at the proper time. Some varieties produce several crown buds in succession, and these buds may be known by their being surrounded by leafy huds which grow into shoots. Terminal buds are surrounded by flower huds, but not leafy ones. This is the only distinction, no matter at what time the buds are taken. If you take the first bud that makes its appearance, it must be the crown bud. If you remove this for any particular reason, and take the next that comes on the natural break, it must be the

GREEN PEAS—JUNE TO NOVEMBER.

A correspondence was raised in the Daily Press last Autumn upon the shortness of the season when Green Peas are available, both in gardens and on the market. We now offer the following as representing the best collection selected from 1,024 rows we had under trial last season. It would be difficult for us to give precise dates for putting the seed into the ground, as so much depends upon soil and situation. Successional Sowings may be made any time between these dates, and the last sowing not later than the second week in June.

| NAME. | DESCRIPTION. | HEIGHT. ft. | WHEN TO SOW. | EXPECT READY TO PICK. | CARRIAGE FREE. Per pint. Per quart. |

OFFERED IN SEALED PACKETS ONLY

Carters THE QUEEN'S SEEDSMEN, 237, 238, & 97, HIGH HOLBORN, LONDON

second crown bud. To get these in time your plants must be rooted early, and the stopping done correspondingly early. We are not quite sure if this is exactly what you mean, but we can help you if you give further explanations. You must, however, stop the plant more than once to get the requisite number of shoots. Growers for exhibition stop their plants only once, and do it early or late according to the variety, simply to time the appearance of the first bud, the others being timed by the latter. Edith Tabor for exhibition comes best on the early crown bud, being a late variety; Duke of Wellington on the second crown bud, stopping it in April; Elsie Teichman, on the first crown, stopping it in April; Lady Ridgway, on the terminal bud, stopping it in April; Globe d'Or, on the crown bud; and Perle Dauphinoise, on the crown bud.

Best Scarlet Border Carnation.—*Omega*: The best Carnation of this class for border work is Hayes Scarlet, which is of excellent colour and form, flowering with tolerable freedom.

Single Yellow Chrysanthemum.—*Omega*: The most refined yellow we know is Miss Annie Holden, a canary-yellow sport from Mary Anderson. Buttercup is a richer yellow, with incurving florets, and useful for decorative work. Both are free flowering.

Worms on Lawn.—*H.*: Unslaked stone-lime is the best material to use for making a solution of lime water. Sprinkling lime upon a lawn has no effect whatever in bringing out the worms, except it were followed soon after by a heavy shower of rain, which might occur during the night. Even then if the worms did come out, they would enter the soil again before you might have an opportunity of collecting them. Water can only take up a certain amount of lime in solution, so that there would be little chance of overdoing it. You may put about a peck of lime in a bag, tying the mouth of the latter and sinking it in a cask containing 30 gallons of water. After it has stood for some hours, and the water is quite clear you may take a three-gallon watering pot and fill it two-thirds with clean water. Then take a small watering pot and fill up the remaining third of the big one with the prepared lime water so as to dilute the solution. Put arse on the big pot and give the lawn a good sprinkling. When the worms have had time to rise to the surface, get a broom and sweep them up. Roll the grass so as to level down the worm casts. You may repeat the operation in the course of a few weeks if you think there is any need for doing it.

Propagating Poinsettia.—*Poinsettia*: You must have grown them strongly if the 5 ft. or 6 ft. stems were all grown last year. We rather suspect they are old plants, however, of more than one season's growth. You should have no difficulty in propagating them by cuttings in spring and the early part of summer. At present you may allow the plants to get dry, keeping them in a house with a night temperature of 45°. Some time next month you may place them in heat, and syringe them to start them into growth. Give them water as they commence growing. When the young shoots are 2½ in., or 3 in. long you may take them off with a small heel of the old wood. Allow the cut to dry a little, then insert the cuttings singly in sandy loam in thumb pots. Plunge the latter in a hotbed having a bottom heat of 60° to 65°. Be careful not to over-water them while roots are being formed. Later buds will be produced by the same old plants, thus giving you a succession that will continue the flowering season till a late period. You may also keep the old plants, if you care to, because each will furnish a number of heads according to the number of shoots. As soon as the cuttings are rooted you may repot them into pots a size larger, repeating the operation as required till the plants are in 48 or 32-size pots according to their strength. Use a compost consisting of sandy loam, with a little peat and leaf soil. Pot firmly, so that the wood may be short-jointed. When the weather outside becomes warm

with plenty of sunshine the Poinsettias may be transferred to cold frames where they will be close to the glass and get plenty of sunshine.

Planting Clematis Outside.—*Omega*: The best time to plant out Clematis is in March, earlier or later, according to the state of the weather, but before growth has made much headway. Mrs. George Jackman would be the best of the two white varieties you mention to grow alongside of the old Clematis Jackmanni, because the other flowers too early.

Late Vinery.—*Omega*: Gros Colman and Alicante Grapes are often grown in the same vinery as Black Hamburg, with very fair, but we should not say the best results. Hamburg is early, and would require a shorter season to come to maturity, and more abundant ventilation before the others are ready for it. By careful attention you might grow them together with fair success, but we think you would do better to grow Black Hamburg in a separate house.

Maids of the Village.—*Sigma*: We fail to find any record of this as a name for a plant in the books; but if we yet discover it we shall let you know. A specimen of it would insure the name; and a good description might. *Ranunculus aconitifolius flore pleno* is sometimes called Fair Maids of France.

Names of Plants.—*R. M.*: 1, *Galanthus nivalis*; 2, *Galanthus Elwesii*; 3, *Asplenium Trichomanes*; 4, *Asplenium marinum*.—*T. Wilson*: 1, *Eupatorium weinmannianum*; 2, *Primula floribunda*; 3, *Aralia Veitchii*; 4, *Sempervivum canariense*; 5, *Sempervivum Haworthii*.—*E. S.*: *Dendrobium aureum*; 2, *Dendrobium nobile* var.; 3, *Odontoglossum luteo-purpureum*; 4, *Odontoglossum crispum andersonianum*.—*T. B.*: 1, *Davallia elegans*; 2, *Blechnum occidentale*; 3, *Selaginella Martensii variegata*; 4, *Selaginella caulescens minor*; 5, *Lomaria gibba*.—*G. W.*: The shrub is *Cornus mas*; the *Dendrobium* is a variety of *D. wardianum*, differing only from *D. w. candidum* in having purple tips to the segments (we should have liked to see the stems); for the *Cypripedium*, see next week.

AMATEURS

Who follow the instructions given in

'The Amateur Orchid Cultivators' Guide Book.'

By H. A. BURBERRY, F.R.H.S.,
ORCHID GROWER TO

The Right Hon. JOS. CHAMBERLAIN, M.P.,

CAN GROW ORCHIDS

In Cool, Intermediate, or Warm Houses,

SUCCESSFULLY

There is a Calendar of Operations for each month, and full information as to the treatment required by all Orchids mentioned in the book.

With some fine coloured illustrations

Second Edition.

5s. od.; post free, 5s. 3d.

"GARDENING WORLD" Office,
1, Clement's Inn, Strand London.

DIRECT FROM COLLIERY. PATRONISED BY HIS GRACE EARL WINCHILSEA.
 GUARANTEED 25 PER CENT. MORE DURABLE THAN CHEAPER SORTS.
 Used at the Mansions and Gardens of the NOBILITY and GENTRY, and at the principal Maltings in United Kingdom.
 (DOWSON'S PLANT) AND WATER GAS FOR STEAM. HOP AND ORCHID GROWERS AND NURSERYMEN.

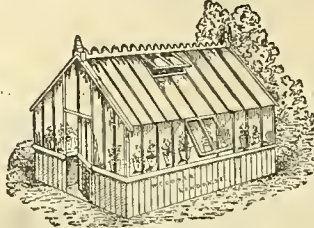

ESSERY'S ORIGINAL ANTHRACITE.

Machine Cut. Three sizes ready for use. Hard and Large, entirely without Smoke, superseding Coke in every respect. Effecting a very important Saving by constant combustion. Much greater Heat, Durability, Cleanliness, and Diminution of Labour. Autograph Certificates.
 References—First Cost Prices.

Can be had only from **WILLIAM H. ESSERY, Pantyffynon Collieries, SWANSEA.**
 Established 1848. *N.B.—Not my Coal unless delivered in trucks painted "William H. Essery."*

W. COOPER, Ltd., Horticultural Providers, 755, OLD KENT ROAD, LONDON, S.E.

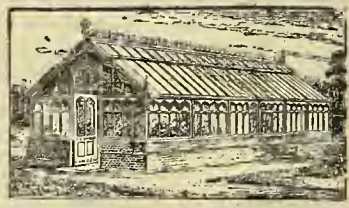

Amateur
 Span-Roof Greenhouse.
 Everything Complete, and Ready for erecting.
 From £2 16s.

"Cooper" Cycles.
 Latest design frame, large weldless steel tubes, ball bearings, tangent wheels, and break and mud guards. Gent's from £5 10s; Ladies', with dress and gear guards, from £6.
 Twelve Months' Warranty. AGENTS WANTED.

Span-Roof Conservatory.
 Substantially and Handsomely Built.
 See No. 19 in List.

Improved Poultry House. Span-Roof Poultry House.

SATURDAY, FEBRUARY 12th, 1898.

NEXT WEEK'S ENGAGEMENTS.

MONDAY, February 14th.—Smoking Concert at Anderton's Hotel, Fleet Street, E.C., on behalf of the N.C.S. reserve fund.

TUESDAY, February 15th.—Sale of American shrubs and hardy plants by Messrs. Protheroe and Morris.

WEDNESDAY, February 16th.—Sale of Lilies, Palms, and Roses, etc., by Messrs. Protheroe and Morris.

THURSDAY, February 17th.—Sale of Roses, Fruit Trees and hardy plants by Messrs. Protheroe and Morris.

FRIDAY, February 18th.—Sale of Imported and Established Orchids by Messrs. Protheroe and Morris.

Annual general meeting of subscribers to the Royal Gardeners' Orphan Fund at Anderton's Hotel at 2 p.m.

CHOICE HARDY AND OTHER FLOWERS AT POOLEWE.—Enthusiastic plant lovers about London and the south coast of England, often speak in glowing terms of what they are able to accomplish with choice flowers whose hardiness is largely determined by the favourable character of the climate of the locality in which they are planted.

We are also apt to forget that the influence of the Gulf stream and deep water generally influences climate in a remarkable degree all along the west coast of Britain to the extreme north of Scotland, as well as some distance down the eastern coasts, of Caithness, Sutherland, Ross and some other counties. Mr. O. H. Mackenzie of Inverewe, Poolewe, is an enthusiastic plant lover, who finds the climate at the mouth of the River Ewe and at the

south end of Loch Ewe on the west coast of Ross-shire particularly favourable to the gratification of his taste in the cultivation of choice and interesting flowers. He supplied an account of his doings to the Scotsman last month, and an Inverness correspondent calls our attention to this communication in the Northern Chronicle. Mr. Mackenzie's most striking success in 1896 was the flowering of Liliun giganteum and Michauxia campanuloides. The former was a good 9 ft. high and carried seventeen blooms, which beats the record at Kew so far as he has been able to ascertain by inquiry. We figured two plants flowered by a correspondent near Aberdeen in our issue for the 6th November, 1897, p. 153. These plants were 9 ft. 9 in. and 9 ft. respectively, and carried 23 and 21 blooms. What is more the plants were raised from seeds and developed to the flowering stage.

Mr. Mackenzie has bloomed two species of Watsonia including W. marginata. He also travels and has been collecting some of the wild plants of Corsica, including a lemon-coloured Orchis which has flowered regularly with him ever since. Pan-cratiun illyricum from the same island took some years to recover, but flowered in 1896 and even better last year. In its native home it grows on the seashore almost within reach of the waves as well as in the clefts of limestone rocks, thousands of feet above the level of the Mediterranean. He would like to know whether this species has ever before been bloomed in the north. What gave him peculiar satisfaction was an effective combination consisting of a large mass of a white variety of Iris Kaempferi beneath which was a mixed mass of Tigridia aurea and T. lilacina grandiflora, with the brilliant blue Commelina coelestis—a striking mixture indeed. Another combination consisted of Michauxia, surrounded by varieties of Platycodon grandiflorum (Japanese balloon plants) and Swainsonia galegifolia alba in mixture. A collection of Mariposa Lilies (Calochorti) obtained from the south gave him unbounded pleasure and satisfaction last year, and were the envy and admiration of all who saw them. He had a narrow border on a sunny terrace, filled with the best soil he could procure, and in this the bulbs were planted in November 1896. They began to bloom on the 25th June last year, and he does not think they could have done better in their native Californian forests. There were seven varieties and the owner thinks that nothing more fascinating and artistic for vases could be grown in a British garden. They last a long time in water. Butterfly Tulips is an epithet he applies to them, and has not only increased his collection of them, but added a whole collection of Brodiaeas to which he lost his heart at the Temple Show last year. The rarest and most recent introductions of Erythronium have also been added to his collection, as well as Montbretias, Crinums, bearded Irises, Trilliums, and similarly choice subjects. Amongst Tulips, Tulipa Kaufmanni and T. Greigi are favourites. Ixias grow like weeds, and a bed of them last year came next in importance to the Mariposa Lilies. They were so brilliant on sunny days as to dazzle the eyes, and were almost as good as ever he has seen them in Italian gardens. The only fault applicable to Ixias at this place is that they refuse to go to rest in the autumn, but commence throwing up their leaves in October, to get punished by black frosts in spring. Left to their own resources they, nevertheless, do well. Further to the south Liliun auratum does splendidly at Torridon, as well as Alstroemia psittacina, with which he was very much taken, but they do not give satisfaction with him. Liliun Martagon album, L. testaceum and L. washing-

tonianum do well, however, at Poolewe. With slight protection in winter the evergreen Chilian shrub, *Mitraria coccinea* produced a wealth of its curved, orange-scarlet flowers. He has not yet got the blue sheen of *Gentiana cruciata* out of his eyes. We should advise him to try *G. verna* and *G. acaulis*, the former being particularly brilliant. The cool, moist atmosphere of the west should suit them admirably. The Penzance Sweet Briers have found their way here, the variety *Lady Penzance* having met with great favour. *Orchis foliosa* from Madeira was particularly vigorous last year, one large clump consisting of twenty-five strong spikes. The perennial *Silver Queen Poppy* and the silvery-leaved *Salvia argentea* are much admired favourites. For some years *Sparaxis pulcherrima* had been anything but a success till a specimen supposed to have come direct from South Africa was sent him, and this flowered as freely as the native heather on the hills, quite indifferent to the gales of the West Coast. *Barnardia*, more correctly described as *Scilla chinensis* and figured as such in the *Botanical Magazine*, t. 3,788 rewarded him by flowering freely after a number of years and he was able to supply the Botanic Gardens, Edinburgh, with bulbs, as well as plants of *Fabiana imbricata*, an evergreen, heath-like shrub from Chili, but which he obtained in the form of cuttings by parcel post from Ajaccio, Corsica. It flowered in his garden without protection during last winter.

The same collection speaks in glowing terms of the improvements that have been worked amongst modern as compared with the old named varieties of Pentstemons. He was highly pleased with the results from a packet of seed, but was lost in wonderment over the large flowers that turned up in another batch of seedlings also raised from seed. Though he gives no name of the place nor the horticulturist from whom he obtained the seed, we can, through the mind's eye, perceive the Surrey garden in which the Pentstemons and Lobelias, he mentions, are growing. He describes the individual blooms as positively as big as small *Gloxinias*. We were amongst the first to find any merit in single *Cactus Dahlias*; but amongst others they now find a warm advocate in this enthusiastic plant grower. He admits that the taste is an acquired one after being accustomed to the ordinary single sorts having blooms about as round as the compass can make them. Since he first saw them they have been greatly improved, and his people have taken a great fancy for them. From an artistic point of view he considers them by far the more beautiful of the two types, and they look well in vases without any special arrangement. From the 18th October to the 11th November last, there was neither rain, fog, frost nor wind at Poolewe, and during his thirty years' experience he has never had such a wealth of perfect Tea Roses, even in the best June weather, as during that period. Some clumps of *Oxalis bowiana* commenced flowering in June, and continued without intermission till November, when they were masses of crimson. Though there is a slight difference in colour between the flowers of *Schizostylis coccinea*, *Rhododendron nobleanum* and *Gloire de Margot* in Roses, there seemed very little either when under the influence of lamp light or bright sunshine. These scarlet flowers adorned his dining-room table on the 3rd December. Again on the 5th ult. he was charmed with the lilac and gold flowers of the Algerian Iris (*I. stylosa*), which he considers one of the most charming of winter flowers.

Camphor comes mostly from Japan and Formosa.

A Cinematograph registers slow as well as rapid motion, and it is reported that a camera has been invented to register the growth of plants.

Birmingham Amateur Gardeners' Association.—The first meeting of this society's 1898 session took place on the 2nd inst., when Mr. W. Walker gave an address on Tomatos. Details of cultivation were dealt with, and a list of suitable varieties was given.

A Record for Gardeners.—How is this for a record? A gardener from East Lothian told me the other day that he had been thirty-eight years in his present place; his predecessor was forty-five years; and the man before him fifty-five years. The present man looks fit to beat his predecessors.—R. L.

Spring Flowers in January.—A correspondent from the neighbourhood of Leeds writes to the effect that seventy-six species and varieties of plants were in flower in a garden in Leeds at the end of January, and comments upon this unusual feature. The list includes, besides a number of Hellebores, five varieties of *Anemone Hepatica*, ten Snowdrops, *Leucojum vernalis*, *Cyclamen Coum*, six Primroses of various colours, *Erica carnea*, *Eranthis hyemalis*, *Saxifraga Boydii*, *Tussilago fragrans*, *Adonis amurensis*, five *Crocus* species, *Cardamine trifolia*, *Hacquetia (Dondia) Epipactis*, a Wallflower, and *Rhododendron praecox*.

Practical Botany at Glasnevin.—The young gardeners at the Royal Botanic Gardens, Glasnevin, are to have the advantage of scientific training such as exists at the Kew and Edinburgh establishments. Dr. T. Johnson, Professor of Botany in the Royal College of Science, will lecture on botany. The curator of the gardens, Mr. F. W. Moore, will lecture on horticulture and floriculture, explaining the scientific classification of the plants in the beds and houses in the gardens. We understand that the Department of Science and Art has made the arrangement, but the instruction will be modelled on the same lines as at the two botanical establishments above-mentioned. We congratulate the Sister Isle on this evidence of progress with the times.

Cheltenham Bachelors' Fancy Dress Ball.—Mr. W. F. James (of Messrs. Shirer & Haddon) and Mr. Cypher, both of Cheltenham, gave a splendid manifestation of their skill as decorators at this annual function, which was the excitement at Cheltenham on the 2nd inst. One special feature was a trellised archway which led the way from the refreshment-room. This archway was prettily wreathed with trails of Ivy and other climbers, and ornamented with flowers. Against the drapery which concealed the balconies were arranged groups of choice plants which produced an excellent effect. In the gallery itself was a pretty representation of the front of an eastern residence which was elegantly decorated with curtains and hanging baskets of flowers. It was in the chief supper-room, however, that Mr. Cypher's efforts were most evident. The centre diamond table was adorned by two three-span arches, upon which Orchids, Lilies, and Camellias, displayed their charms in conjunction with suitable greenery.

Kew and Chiswick Gardeners Fraternizing.—Dr. D. H. Scott, the honorary keeper, Jodrell Laboratory, Kew, is to deliver a lecture on "The Construction of Plants" at a meeting of the Kew Gardeners' Mutual Improvement Society on the 14th inst., at 8 p.m., to which the members of the Chiswick Gardeners' Mutual Improvement Association have been invited, with the consent of the director, Mr. W. T. Thiselton-Dyer. For many years past we have been pleased to meet and associate with many of the young gardeners from Kew at the meetings of the Chiswick society. We have also attended some of the meetings at Kew as an old member, but this is the first occasion on which the Chiswick society has had a general invitation from the authorities at Kew, and the innovation meets with our cordial sympathy. This form of fraternizing has much to recommend it, and is an example that might well be adopted by other societies throughout the country. We hope the Chiswick gardeners will attend in strong force to mark their appreciation of this invitation. The entrance is by the Melon Ground gate at the north end of the Richmond Road, Kew, and the gate will be open a few minutes before 8 p.m.

Mr. James Ogston, for the past four years gardener to John White, Esq., Dalhobby, Cults, Aberdeenshire, has been appointed superintendent of the new Grove Cemetery, Woodside, Aberdeen. Mr. Ogston enters his new duties on the first of March.—D. A.

National Chrysanthemum Society.—We understand that James Herbert Veitch, Esq., F.L.S., of the Royal Exotic Nursery, King's Road, Chelsea, is to take the chair on the occasion of the annual "smoker" of the National Chrysanthemum Society at Anderton's Hotel, Fleet Street, London, on the 14th inst. The meeting was a success last year, but it should even be more strongly supported on this occasion by the members and others.

The Scent of Roses.—In giving awards to meritorious Roses, the National Rose Society has decided that in the future judges shall consider more carefully the scent than hitherto. Had this rule always been observed some existing varieties would not have ranked so highly as they have done. Her Majesty, one of the earliest of the late Mr. Bennett's pedigree Roses is scentless. So also are *Baroness Merveille des Blanchés*, and *Merveille de Lyons*. The hybrid Sweetbriers raised by Lord Penzance should satisfy those people who wish for fragrance in both leaf and bloom.

Symmetry in a Garden.—A Scotch gardener—one of the old school—was so fond of symmetry in the garden that every bed, border, bush, and tree had its counterpart in some other corresponding part of the garden. One summer-house was not sufficient; it had to be matched in another portion of the grounds by another precisely similar in all its details. The laird was passing through the garden one day accompanied by the gardener, and espied a boy imprisoned in one of the summer-houses. "Why is the boy locked in there?" he enquired. "I caught him stealin' yer lairdship's fruit," replied the gardener. This was sufficient answer, but presently he came upon the other house and exclaimed, "Losh me! gardener, has your son been stealing fruit, too?" "Na, na, your lairdship; I only put him in for the sake of seemmetry."

Scottish Horticultural Association.—The opening meeting of the session of the Scottish Horticultural Association was held on the 1st inst. at 5, St. Andrew Square, Edinburgh—Mr. M. Todd presiding over a large attendance. The lecturer of the evening was Mr. H. J. Jones, of Lewisham, who spoke on "Chrysanthemums and their Culture." In introducing the lecturer the Chairman said that to think of Chrysanthemums was to think of Mr. Jones, who, perhaps more than any one living, had done much to popularise and improve the cultivation of that flower. In the course of his lecture Mr. Jones said that no greater mistake was made in the cultivation of the Chrysanthemum than in making the first shift before the plant pressed its claims for that treatment upon the grower. After mentioning several methods to be adopted in testing whether the plant was ready for shifting, he cautioned growers to see that the plant had proper atmospheric conditions, and advised them against overcrowding. He strongly recommended that the ash of the old Chrysanthemum stems be used as part of the food of the plant; emphasised the importance of the soil being in the right condition; and recommended the growth of two weak plants in one pot. It sometimes happened, he said, that too much water was put into one pot, and if one of the plants was in a healthy condition, it absorbed the extra moisture, and thus helped its weaker brother. Shading he condemned, and suggested that cuttings should be put in boxes or frames in preference to small pots. The lecturer next described the course to be followed in the various pottings, gave details of the compost to be used, and said that in shifting to the flowering pot it was safe to err on the side of having small rather than large pots, it being necessary that the pots should be filled with roots. Mr. Jones also emphasised the necessity of potting firmly, and said that, though the flowers should be watered thoroughly, too much water was often more injurious than too little. It was a mistake to assume that because the plant had got rain, and the earth appeared moist on the top, that it had had sufficient water, and he therefore suggested sounding at the bottom rather than at the top of the pot. Mr. Jones was accorded a hearty vote of thanks for his address. In the course of the evening a number of new members were admitted.

Tobacco Culture occupies about 1,500,000 acres of the earth's surface.

Potatoes are prepared for table in 100 different ways; but how many of them are bad is not stated.

A Fact.—Overheard at a recent horticultural exhibition at Exeter.—Prominent tradesman, to a leading horticulturist of the district: "Oh, are you one of the judges to-day?" Horticulturist: "Oh no; I am an inspector." P. T.: "Ah! I see. I am a surveyor."—*Snaggs.*

Coming of Age Celebration.—The Scottish Horticultural Association is to celebrate its majority or "coming of age" on the 8th March next, by a supper and social gathering of the members and their friends. The association was founded in 1877, as a mutual improvement organisation amongst the gardeners of Edinburgh and the surrounding district. Its beginnings were very small, but like the thrifty acorn, it has grown to great proportions, with a healthy and vigorous constitution, which will carry the association to a hale old age. We wish it long health and prosperity, and sympathise with every wholesome endeavour it makes for the benefit of gardeners and gardening.

Sevenoaks Horticultural Society.—Mr. F. S. Paine presided at the annual meeting of this society, which took place recently at the Royal Crown Hotel, Sevenoaks. The statement of accounts for the year was presented, and showed a balance in hand of £4 19s. 11d., the income for the year having been £305 1s. 4d., and the expenses £290 1s. 5d. It was decided that the annual flower show should take place on the 10th August next, subject to the approval of Lord Sackville. His lordship was again appointed president, and the vice-president and committeemen, with the exception of one member of the latter body, who had left the neighbourhood, were also re-elected. Mr. C. Essenhigh Corke was asked to continue the office of auditor, and Mr. Stanford J. Young was chosen as his colleague *vice* Mr. S. Young, deceased.

Study of Mosses.—The *Fern Bulletin* has extended its sphere of influence so as to include mosses. This new departure has been made with the object of enabling amateurs who may be interested in mosses to get some knowledge of the bryophytes without excessive labour or expense. The books recommended as part of the young collector's outfit for this particular study must constitute a serious item for the pockets of any but the well-to-do amateur. No hobby can, however, be indulged in without some initial outlay, whether the would-be student is a gardener, bricklayer or millionaire. The quarterly just mentioned is to assist by means of illustrations in each number, accompanied by descriptive text; by the naming of specimens; by distributing dried and mounted ones; and in other ways. In the winter number the Common Hair Moss (*Polytrichum commune*) is well illustrated and in detail. Like many other British plants, this moss occurs in the United States, being, indeed, so common, that scarcely any meadow or roadside is free from it. In many parts of New England it is a great nuisance by killing the grass in old meadows.

The Liverpool Horticultural Association.—The annual meeting of this society was held in the Free Library, Liverpool, on the 29th ult., Mr. Thomas Foster presiding. The accounts show an income of £130 16s. 9d. from the summer show; £175 11s. 2d. autumn show; subscriptions, £403 7s. 4.; Advertisements and bank interest, £11 11s.; with a balance brought forward of £101 9s. 5d., making a total of £827 15s. 8d. The expenditure includes for summer show, £380 1s. 5d.; autumn, £283 19s. 9d.; general, £84 2s. 8d.; total expenditure, £748 3s. 10d., leaving a balance in favour of the society of £79 11s. 10d., or a loss on the year's working of £21 17s. 7d. The statement of accounts and the report as read by the secretary were adopted. The sub-treasurer, Mr. G. Blackmore, the auditors, Messrs. Peers and Waterman, and Mr. W. Dickson, the secretary, were re-elected. Arrangements were made to hold two shows, spring and autumn, during the ensuing year. The subscriptions of £3 3s. and £2 2s. to the Gardeners' Royal Benevolent Institution and to the Royal Gardeners' Orphan Fund were unanimously voted. Some five changes were made in the committee. A vote of thanks to the chairman concluded the business.

Lignum Vitae and Pomegranate woods are the heaviest, while cork is the lightest. Some may, however, object to cork being considered wood.

Iron Tonics.—A French chemist proposes to feed plants judiciously with iron fertilisers in order to obtain easily assimilable iron tonics from vegetables.

Popping in Acorns.—As Collingwood never saw a vacant place in his estate but he took an acorn out of his pocket and popped it in; so deal with your compliments through life. An acorn costs nothing, but it may sprout into a prodigious bit of timber.—*Thackeray.*

Golden Gate Park, San Francisco.—A few years ago the site now occupied by this grand park was a wild waste of sand running in places to a depth of 200 ft., but a liberal expenditure of money and talent has made it what it is to-day—one of the special features of the Golden City of the West. It has an extreme length of four miles and slopes right down to the Pacific Ocean. All Australian and Japanese plants do well in the kindly climate. No fewer than thirty forms of Acacias are represented by healthy and vigorous specimens, also Conifers of various kinds, notably *Sequoia gigantea*, *Cedrus atlantica*, and *C. Deodara*. The main roads in the park are 75 ft. in width, and no trouble or expense is spared in keeping them in condition. The glass department is well found, and accommodates some excellent collections of Orchids and foliage plants. The *Victoria regia* is also well done, and blooms very freely.

Moles and their Food.—The generally prevalent opinion about the gentleman in black velvet is that he lives on an animal diet chiefly. Every now and again this gets controverted, and recently so by a writer in the *Rural World*. This penman says that moles live on seed corn, Carrots, Potatoes, Turnips, Asparagus, and similar dainties, but chiefly those. From such a statement it would seem as if the mole had been specially created for the annoyance of man. Surely it ought not to be difficult to settle by properly authenticated and reliable examination of the contents of the stomach by scientific men, or in other words well-qualified naturalists. Moles no doubt existed in Britain long before any of the above named plants existed in sufficient quantity, and in various parts of the country, to supply the moles with food. Whether they are animal or vegetable feeders, or both, should be placed beyond the bounds of uncertainty. According to our experience they are most abundant in meadows where the soil is relatively soft, moist, rich, and capable of supporting plenty of animal life, but from which all of the above crops may have been absent for many years.

Woolton Gardeners' Mutual Improvement Society.—The usual meeting was held on Thursday, the 2nd inst., at the Mechanics' Institute, Mr. W. W. Gamble in the chair. The subject for consideration was "Economy in Chrysanthemums," by Mr. J. Devaney, Botanic Gardens, Liverpool. The chief points reviewed were the season, cleanliness, quantity of bloom and the system of grouping. The speaker was especially strong on the best means of staging, and continually varying the same. One week he would arrange the groups or banks with Palms and other foliage plants; in the next he would show the beauties of the flowers without the aid of outside helps; at other times he would group in distinct colours or kinds. These changes of systems gave a stronger interest to the general public. The speaker in answer to the position of the "Mum" as a popular flower in Liverpool stated that last season the number of visitors far exceeded those of previous years, and, although the doors were opened an hour earlier than usual, the crush was so great that many were unable to gain admission. There had been on some occasions 4,000 visitors, 600 being unable to obtain admission. Mr. J. Hogan contributed some 9 or 10 bunches of cut Chrysanthemums in splendid perfection, for which a Certificate of Merit was awarded. Mr. R. Todd also received a Certificate of Merit for forty-three varieties of cut Orchids shown at the previous meeting. The secretary was instructed to write and thank Mr. R. J. Harvey Gibson, M.A., for the loan of half-a-dozen microscopes. Votes of thanks to the lecturer and chairman concluded the business.

ORCHID NOTES & GLEANINGS.

Laelia anceps schroderiana Rosslyn var. *Nov. var.*—Amongst the numerous white varieties of *Laelia anceps*, the form known as *L. a. schroderiana* must take a prominent position on account of the great breadth of the lamina of the lip, this, we consider, being its primary distinguishing feature. Amongst hundreds of plants that may be seen during the flowering period of the species, it will be noted that the lip is relatively narrow even while the petals are broad. The whole flower of the Rosslyn var. is of splendid dimensions and the plant of vigorous growth. The sepals and long, elliptic petals are pure white. The same may be said of the lip with the exception of the disc and the radiating lines on the interior of the side lobes. The latter are of a rich purple deepening to carmine-crimson at the opening of the tube. The raised golden disc is striped with dark purple lines on its lower half only. The lamina of the lip measures $1\frac{1}{2}$ in. in length, and $1\frac{1}{8}$ in. in breadth. The flower measures $4\frac{1}{2}$ in. across the petals without flattening them; and $5\frac{1}{2}$ in. vertically. The side lobes spread wide open. This grand variety was secured for twelve guineas at the Sale Rooms of Messrs. Protheroe & Morris, on the 4th inst., by H. T. Pitt, Esq., Rosslyn, Stamford Hill, who is to be congratulated on being the possessor of the best form of *L. a. schroderiana* in cultivation

QUESTIONABLE EXHIBITS.

To most people it will come as a surprise that the National Chrysanthemum Society has fallen so low as to accept prizes with such conditions as those mentioned in last week's issue by "A Member of the N.C.S." In small local shows such a thing might be tolerated, but should not be encouraged; but in a society like the N.C.S. it is surely unnecessary. I believe the offering of these prizes leads to a great deal of dishonesty, and should not be encouraged.

As secretary of a Chrysanthemum show I have frequently had to decline similar offers from firms, who evidently think this a cheap way of advertising.

I would call upon the N.C.S. and all horticultural societies to purge their prize lists of such "liberal" donors, and feel certain they will not lose by it—in reputation at least.—*Secretary.*

LOW-PRICED SEEDS.

My attention has just been called to a communication in your paper of January 29th, in which your correspondent attacks, without any exequation, the sale of what he terms "low-priced seeds." Under some circumstances, no doubt, his opinion may, to some extent, be endorsed, but it does not follow that his version is absolutely correct. As senior member of my own firm, I venture to submit to you that we supply seeds of unquestionable value—no better is it possible to procure—yet our prices are fully 50 per cent below some houses for the same class of goods. How can we do this? Simply because our catalogue prices are the net prices to us. We sell our seeds entirely upon their merits and at a fair remunerative profit, which, as I said before, is net to ourselves. I should not have troubled you with this explanation but that your correspondent seemed to infer that it was impossible to offer a good article in this particular business without charging an exorbitant price, but when the expenditure comes to be analysed a little it will fully explain itself.

That we are doing the thing that is right, and giving the public satisfaction is evident from the numerous testimonials we are daily receiving and the very rapid extension of our business.—*C. Fidler.*

I AM obliged to your correspondent at p. 364 for his reply to my previous note on this subject. I may say here that, after thirty-five years' careful observation and comparison over a wide area as to prices, quality, &c., I maintain all I said, and this without prejudice to any one or class. May I ask your correspondent to note that there is a wide difference between *low and high prices*, as he puts it, just as there is a middle between two ends; but it can answer no good purpose to discuss this question further, as I am quite prepared to leave the matter with the common sense of the readers of THE GARDENING WORLD. Now I have had my say in the matter.—*J. C., Chard.*

HINTS FOR AMATEURS.

THE SEED ORDER.

Potatos.—Nobody will deny the important position that the Potato holds amongst the list of vegetables. In the garden of the cottager it occupies an almost pre-eminent position, and this by reason of its economic value as a cheap and wholesome food, or at least as an important addition to the foods, available for the cottager. In the smaller gardens, however, the Potato is looked upon as a rather coarse vegetable, and the space devoted to it is accordingly but comparatively small. People are inclined to think that it is cheaper to buy Potatos from the greengrocer than to grow them, and they take action accordingly. Of course, there is something in the argument, but not so much as these people imagine. Potatos of a kind can be easily purchased cheaply enough it is true, but the quality is usually very inferior, and although there is nothing nicer than a really good Potato, there is nothing nastier than a bad one. If only for the sake of procuring an article of good quality, some Potatos should be grown, but a selection should be made of good varieties, and the stock should be occasionally changed. Most cottagers make the mistake of keeping the same stock year after year without a change until it gets, to use a technical phrase, thoroughly "soil-sick," and the result is to be seen in decreasing crops, and deterioration in the quality of the tubers. It is absolute folly, then, to attempt to grow on old varieties year after year without a change. On the other hand, it is remarkable what excellent results follow a change of "seed," and therefore an effort should be made to effect a change every second or third year.

With regard to varieties, it is evident that not many are required, for two or three good ones will keep an ordinary establishment going, although where the time and money can be spared, a little experimenting is always of value. For an early crop there is nothing to beat Sutton's A 1. The tubers are round in shape, of medium size, and the flesh is firm and good—not mashy, as the old style of early Potato used to be. The haulm is dwarf and sturdy, and the variety is thus as suitable for cultivation in frames as in the open ground. Sutton's Ringleader is in all respects first-class as an early kidney-shaped variety, and is much to be preferred to the Ashleaf sorts. The various stocks of Ashleaf have been and still are largely grown in gardens. The best of them, as far as our experience goes, is Myatt's Ashleaf, when it can be got true to name; still we would give preference to both A 1 and Ringleader.

Sutton's Windsor Castle is a splendid second-early variety, although, as the tubers keep well, it may be regarded as a suitable main cropper. The tubers are of an elongated pebble shape, with very shallow eyes, and of capital cooking quality. They are, moreover, produced in great abundance in almost any soil.

The Sutton Flourball, which was first sent out by the Reading firm in 1895, and may therefore be regarded as a comparatively new variety, has won golden opinions from all parts of the country as a fine Potato of good cooking quality, and a grand cropper. It resists the disease wonderfully well, and is especially worthy of notice on that account. Being a strong grower it is suitable for field culture.

Satisfaction is remarkable for the uniform size of its tubers which are of a thick pebble shape. The skin is rough, and the eyes shallow. This is a capital exhibition Potato, and a free and certain cropper.

The Bruce is a heavy cropping late variety of great merit, that is grown very largely in the north of England and Scotland. It is, however, most suitable for field culture, the richer soil of the more highly cultivated garden plot not being so much to its liking. It has been in cultivation since 1885, so that it is a fairly old variety.

White Elephant is a favourite in some gardens, more particularly in the south of England, but chiefly on account of its heavy cropping qualities. The tubers often grow to a tremendous size, but although they cook fairly well, the quality is rather coarse. Where mere size is more desired than quality, White Elephant generally gives satisfaction.

Beet.—Year by year Beetroot seems to become a

more popular vegetable if we may judge from the large quantities of cooked roots exposed for sale on the costers' barrows in our towns and cities. There seems very little, or at best only a half-hearted attempt made, however, to induce the cottager to take up its cultivation. It is a tasty vegetable, and its food value must at least be greater than that of the Carrot, which finds a place in most cottage gardens.

In no vegetable is good, reliable seed of more vital importance than it is with Beetroot. Where the seedsman has been careless in growing his stock, the seed produces a weedy lot of plants that yield roots big enough, it is true, but coarse and stringy, no matter how much or how well they are cooked. Big roots are not required, but medium-sized ones, free, as far as possible from side roots. We have found Pragnell's Exhibition one of the very best for general purposes. The roots are of medium size, and almost perfect shape, while the colour and flavour is all that could be desired. Those who like a very dark variety will find what they want in Dell's Crimson, which is everything that could be desired.

Carrots.—For a main crop there is nothing to beat a good strain of the Intermediate type. James' Intermediate is a well known variety that has been much cultivated, and which can generally be relied on to turn out a lot of clean shapely roots. Sutton's New Red Intermediate illustrates a still further advance, for the roots are brighter in colour, cleaner, and more weighty. Long Red Surrey is also much grown in gardens, but the roots grow to an enormous length, and are not so suitable for shallow soils. Besides a late or main crop it is necessary to have a bed from which early Carrots can be pulled. For this early work, one of the stump-rooted varieties should be chosen. Early Nantes is one of the very best of these. The roots have but very small core, and if the seed be sown on a warm south border, they will be ready for pulling at an early date. When full-grown, the roots are of medium size, and the flavour is good from the earliest stages, i.e., as soon as they are big enough to pull.

Parsnips.—In most cottage gardens, Parsnips are one of the chosen vegetables, and some very creditable produce may be seen turned out of these gardens. The old Hollow Crown is the variety chiefly to be met with, and it generally gives satisfaction. Veitch's Improved Hollow Crown is, however, a distinct improvement on the older variety. Student may be sown as a second variety, if one is required. It produces medium-sized roots of first-class quality, and capital shape.

Onions.—These are almost as indispensable as Potatos, and a most profitable vegetable to boot. The varieties required will depend upon the purpose for which they are to be employed. If for exhibition Ailsa Craig, Cranston's Excelsior, and Rousham Park Hero are the stamp of stuff that is required. They all grow to large size, and great weight, and are thus suitable for the exhibition table. For general purposes, however, there is a prejudice against these big Onions, medium-sized hulbs being in greater favour. Of these, Veitch's Main Crop is almost an ideal Onion. The hulbs exhibit a striking uniformity in size, and the flavour is good. They also keep well to a fairly advanced season. For a late variety, there is nothing to surpass James' Keeping, an old and approved variety which can scarcely be too highly praised for its long keeping qualities. It has, moreover, great weight and depth of bulb, well developed specimens being so filled up at both top and bottom as to be nearly round.

For autumn sowing, some of the Tripoli varieties, such as Early White Naples, and Giant Rocca are the best. It is always advisable to have a bed, if only a small one, of autumn-sown Onions, for they fill up a gap between the time when the last of the old crop has been used, and the date at which it is possible to pull from the spring-sown bed of the current year. Besides this, they afford a supply of green Onions for salading all through the autumn and winter, and this in itself is worth consideration.

Celery.—As a winter vegetable, the value of Celery is well known to every gardener, and thus it is a common sight to find large plots of land set aside for its accommodation. Two or three varieties should be grown. Early Rose is valuable on account of its earliness, but the heads remain for some time in condition. The main-crop red variety, Major Clarke's Fine Solid Red will form a good succession to it. It is of exceedingly sweet flavour, and of hardy

and vigorous constitution. Sandringham Dwarf White is one of the best of the white sorts. It is dwarf and sturdy, and although the heads are not so large as those of the two red varieties mentioned, they will be found of a very useful size.

The Turnip-rooted Celery, or Celeriac, is a great favourite upon the Continent for flavouring soups, stews, &c., but it is not so much in demand on this side of the Channel, chiefly because no serious attempt has been made to push it. As an adjunct to, but not a substitute for, the ordinary Celery, it is well worth growing, and it will be advisable, therefore, to include a packet of seed in the order.—*Rex.*

Correspondence.

Questions asked by amateurs on any subject pertaining to gardens or gardening will be answered on this page. Anyone may give additional or more explanatory answers to questions that have already appeared. Those who desire their communications to appear on this page should write "Amateurs' Page" on the top of their letters.

Protecting Hyacinths.—Owing to the very mild winter some Hyacinths that I planted in a bed out of doors are through the ground already, and have made quite long growths. How can I best protect them in case of cold weather? I see that a neighbour of mine has been covering his with a layer of cocoa-nut fibre. Will this answer the purpose.—*Eva.*

The cocoanut fibre will answer the purpose of protection well enough as long as it is dry, but should it become wet, which is not at all unlikely, it would be of very little good. A better plan will be to cover the plants with branches of evergreens, should it turn cold, or insert several wooden hoops in the bed by bending down the two ends of straight sticks and pushing them in the soil, afterwards covering these hoops, should occasion arise, with mats or other protective material.

Ixias.—*Oswald S.*: It is certainly rather late for planting Ixias, but the past January has been so uncommonly mild that they were probably better out of the ground than in it. Had they been planted in autumn they would have started to grow, and a frost or two now would have sadly crippled them. In planting, choose a warm, sunny corner of the border, as the plants do not do well in a cold, sunless position. The soil should be rather sandy, and if it is not so naturally a little sand or road scrapings should be mixed with the soil. Ixias are well worth taking a little trouble over.

Araucaria excelsa.—*P.*: This pretty plant is usually propagated from cuttings obtained in the following way; Plants that have grown too tall are headed back, their tops being put in as cuttings. After a while the headed back plants commence to push young shoots or leaders, and these, as fast as they become large enough are also taken off and put in for cuttings. Use sandy soil, and give a warm greenhouse temperature, and roots will soon be made. Plants may certainly be raised from seed, but the seedlings are leggy, ragged-looking things that never make well-clothed, neat pot plants like the cuttings.

Iris stylosa.—*C. Johns*: This is the pretty Iris that you refer to. It is generally in flower by the end of January or the beginning of February, but this season it commenced to bloom early in January. It should be given a sheltered position if possible so that its flowers may not have to put up with the full effect of cold biting winds. There is a white form, I. s. alba, and a deep blue one, I. s. speciosa, that are both equally as beautiful as the type, and well worth growing.

Forcing French Beans.—*T., Horsham*: You may either sow the Beans straight away in the pots in which they are to fruit or sow in small pots (thumbs) and repot the young plants. Both methods have their advantages. If you adopt the former it saves a certain amount of trouble, but not so much as appears at first sight, and the large seed pots should only be filled about half full of soil, a top dressing being subsequently given when the plants are a few inches in height. For soil, use three parts of good loam to one of leaf soil, with a little sand added just to keep the soil from getting pasty. You will need a temperature of not less than 60° Fahr. to insure speedy germination, and a good rise in temperature may be given during the day. Keep the syringe briskly at work upon the plants twice a day to keep

down red spider, which is very partial to them. A sowing made every ten days will insure a succession, for the plants do not last long in bearing. You will find Osborne's Forcing and Ne Plus Ultra two first-class varieties for forcing.

Saddle Boiler.—*Rob*: There is no way of patching up a worn-out boiler. You must have a new one in. Of course it is unfortunate that it should give out just now, but that is a mean way that boilers have—they always strike work when they are most wanted.

Tuberous Begonia Seed.—*O. T.*: If you can place the seed pans in a temperature of 60° Fahr. you may sow the seed as soon as you like. The young plants will reap the benefit by having a longer season of growth, and should then come into flower early. Cover the seed pans with a sheet of glass. It will help to keep the atmosphere in direct contact with the seed moist.

Tuberose.—*F. Ayres*: After they have once flowered the bulbs are of little further use, and may be thrown away. The results obtained by keeping them for another season are very poor indeed, and would not repay your trouble. A fresh batch should be bought in each year.

DENDROBIUM FORMOSUM GIGANTEUM.

NEXT, perhaps, to the delight of adding new plants to a collection of Orchids is the pleasure and satisfaction of seeing them succeed under one's care. Both of these forms of enjoyment apply to Mr. W. Angus, gr. to J. Ogston, Esq., Norwood Hall, Cults, Aberdeen. He is an enthusiastic grower of Orchids, and we are familiar with the quality and rich colours of the flowers he grows in the pure atmosphere of Deeside.

The accompanying photograph represents *Dendrobium formosum giganteum*, an old and popular species, which, however, is more often seen in the form of small and comparatively recently imported specimens rather than otherwise. The specimen was purchased at a sale a few years ago, for the matter of a few shillings, and is now growing in a 7-inch pot. Under the care of Mr. Angus it has made a vigorous growth annually. The plant carried sixty-two flowers of large size, forty-one of them being fully expanded when the photograph was taken. The leads were fairly numerous for a plant of moderate size, and one stem alone carried as many as fifteen flowers, an unusual number for this species. When in bloom it stands a low temperature for sometime with impunity, and the illustration suggests a purpose to which it may with great advantage be put. The compact habit of growth possessed by the plant and the great size of its flowers, render it a beautiful and useful subject for table decoration. The large, rich yellow blotch in the throat throws the pure white flowers into strong relief.

LISMORE, BROUGHTY FERRY.

LISMORE is one of the many residences crowning the ridge of the high banks of the Firth of Tay, and though subject to the gales that occasionally sweep the valley, it is more or less sheltered by trees, and has a sunny, southern exposure. It is the residence of J. Leadbetter, Esq., who encourages gardening in its various phases, amongst which Chrysanthemums constitute a prominent speciality, rendering several of the houses gay during the autumn in proximity to the mansion itself.

The Chrysanthemums were in their glory on the occasion of our visit, and, looking out upon the shrubbery, the lawns, and the approach to the mansion, presented a cheerful appearance. Most of them were grown in exhibition form, though some large bushes were fine on another part of the property. Many of the exhibition blooms were notable for their rich colour, notable in this respect being E. Molyneux, Lord Brooke, Henry Jacotot fils, Dorothy Shea, Modesto, Georges Biron, and many others. The last-named is much appreciated, on account of its rich crimson-red, with old gold reverse. Mrs. C. Harman Payne, and G. C. Schwabe attain magnificent proportions here. Other

varieties that do well here are Miss Florence Davis, Miss Rita Schroeter, Madame Ad. Chatin, Souvenir d'une Petite Amie, Louise, Le Verseau, M. Demay Tillandier, Jules Chretien, Niveus, &c. Mrs. Bruce Findlay is a blush-white variety, which behaved in rather a strange way last autumn in the production of numerous miniature heads beneath the large one, hen-and-chicken fashion. The broad yellow florets of Sir E. T. Smith presented a very handsome appearance. The clear soft pink shade assumed by Louise in this northern latitude was both delicate and pleasing.

Amongst hirsute varieties Dr. Ward was rather curious in having its yellow florets margined with red. Madame M. Ricoud, with amaranth flowers and a silvery-pink reverse, also does well, and Charles Shrimpton seems to succeed everywhere. Wilfred Marshall had built up huge blooms of long, incurved, fluted, deep canary-yellow florets. The blush-white, quilled florets of Mrs. Armitstead make a bloom somewhat in the way of Shasta. Mrs. G. J.

Late grapes were still hanging in a late vinery, including samples of good cultivation in Gros Colman, Lady Downes, and Muscat of Alexandria under the name of Tynningham Muscat, the berries of which were large and of a rich yellow hue. Some large bushes of Chrysanthemums were quartered here, including Vivand Morel, which, though disbudded, carried a large number of blooms of many shades of colour, and useful for decorative purposes. Madame Cambon and Wm. Holmes were also grown in the form of large bushes, the latter being particularly bright and floriferous. Margot, as a bush plant, is sometimes disbudded, but is much more effective when not subjected to this operation.

Greenhouse Rhododendrons and other plants that delight in a cool, airy house are also well grown at Lismore. We noted fine specimens of Rhododendron fragrantissimum, R. Lady Mary Fitzwilliam, and R. Princess Royal. A large Orange tree was laden with fruits in the mature stage. A grand piece of the dark orange *Clivia miniata superba* pro-

DENDROBIUM FORMOSUM GIGANTEUM

Beer has pink and purple blooms. Charles Davis also develops grand blooms here. The silvery-lilac M. Edouard Rey proves very early compared with other varieties at Lismore. Several varieties grown for late work were housed in a cool, airy structure. Mr. R. W. Saunders, the gardener, is an enthusiastic Chrysanthemum grower, and attains success with a large number of varieties. New sorts are well tried, and those which do not come up to the requirements of size and colour are discarded to make room for others.

In passing through the stove we noted some huge plants of *Asparagus plumosus nanus* grown in tubs for exhibition purposes. *Rhapis flabelliformis* is also grown to large size, the pot plants consisting of many stems well furnished with foliage. Other Palms were well represented, as well as Crotons, *Davallia fijiensis plumosa*, and other Ferns of large size. The greenhouse also contained some fine exhibition plants, including large specimens of *Lapageria rosea* and *L. r. alba*.

duces about twenty spikes of bloom every spring when it is highly effective. Marguerite Carnations and Cinerarias are also appreciated and grown in batches. Tuberous Begonias are favourite subjects in summer, being grown in considerable quantity.

The kitchen garden is separated from the rest of the grounds by a public thoroughfare. Some more glasshouses are located here, including the Orchid houses, in one of which *Oncidium incurvum*, *O. ornithorhynchium*, and various *Cypripediums* were flowering. Amongst Cattleys we noted *C. Mossiae*, *C. Trianaei*, *C. lawrenceana*, *C. guttata*, and *C. pericaliana*, which had made good growth. *Laelias* were likewise represented by such useful sorts as *L. purpurata*, *L. crispa*, *L. anceps*, and *L. Perrinii*.

Stove plants also get a considerable amount of attention, and well repay it. *Eucharis grandiflora* in pots and tubs grows like weeds, and occasions no trouble at all to the cultivator. Two large tubs produced twenty spikes of flowers each in September last, and a similar quantity at their best in the third

week of November. *Pancreatium fragrans* also does well here, for we measured bulbs from 3 in. to 4 in. in diameter. *Croton Weismanni* Improved is a highly decorative subject, producing long and richly-coloured leaves. *Dracaena goldieana*, *D. Fredericki*, *Schizocasia sanderiana* and *Davallia mooreana* were also in fine form.

Even at that late period of the year a number of Orchids were flowering in the cool house, including *Odontoglossum crispum*, *O. maculatum*, a beautifully spotted form of *O. nebulosum*, and several *Masdevallias*. After producing excellent crops in pits, the Tomatos were cleared out to make way for Chinese Primulas, which were rapidly advancing to the flowering stage. A fine lot of zonal Pelargoniums was also housed here. The Peach house is well occupied with trees trained against the front glass, while the back wall is usefully occupied with Camellias. Mr. Saunders is as enthusiastic over hardy subjects as well as those under glass, and as the shades of eve were falling he pointed to the old flower stems of *Yucca filamentosa*, which flowers finely in the open border even in this northern latitude.

BRUSSELS SPROUT, VEITCH'S MARKET FAVOURITE.

I KNOW of no crop in the garden during the winter of so much importance as a good patch of Brussels Sprouts, and this the more so if the strain is a good one. It makes all the difference what the strain is, as is clear to all those who move freely about in gardens; and there are good, bad, and indifferent strains (or selections) in Brussels Sprouts. Rather than sow some seed, if given to me, I would go to a good firm and pay a good price, and sow a kind that would give pleasure and profit. By obtaining the best article you get the cheapest. In a good selected strain well rogued when the sprouts are on them, and the best kept for seed, you can rely on every plant being a counterpart of its neighbour, and this may be had from any really good seed house.

The value of a close selection was strongly impressed on me in December, when visiting Didlington Hall, Norfolk, as I walked through the kitchen garden and saw a large breadth of Sprouts under the above name. It was astonishing to observe the uniformity of the whole lot. They were equal in height, which was of medium proportions; and every plant appeared to be a counterpart of its neighbour. They were covered the whole length of the stem (except a few inches at the bottom) with sprouts of medium size and very closely packed, which is a great accommodation in two ways, viz: better to eat and very much more frost proof.—*J.C., Chard.*

STANSTEAD PARK NURSERIES, FOREST HILL.

IN the well equipped and managed glass department of the Stanstead Park Nurseries of Messrs. John Laing & Sons, at Forest Hill, there is always something of interest, and in the busy seasons of the year a little more than something. Just now things are beginning to move apace after the comparative stagnation of winter. The Forest Hill Clivias are celebrated the country over as among the best of their kind. At the time of our visit they were looking remarkably well, and bidding fair, if strength and apparent healthiness count for anything, to give a capital account of themselves. Some of the earlier plants were throwing up a truss of bloom here and there, but we were informed the plants would not be in full flower until at least the beginning of March, when they will well repay a visit. On the side stages of the house they occupied we found a miscellaneous collection of flowering plants that included Ericas, Epacrises, Tulips, *Acacia Drummondii*, and Roman Hyacinths, all of which appeared to great advantage by reason of the contrast afforded by their bright colours and the deep, almost black-green of the Clivias.

In another house devoted to flowering plants we found the supporting pillars prettily wreathed with the twining growths of *Cobaea scandens variegata*. Here were batches of the Otahete Orange—clean, shapely plants with heavy loads of fruit—Azaleas, Chinese Primulas, and Cyclamen were all gay and full of flower.

Stove foliage plants are a speciality with the

Messrs. Laing, their collection being a very comprehensive one. Palms, of course, form a staple in this direction, evidence being observable on all hands of the popularity of such subjects as *Cocos weddelliana*, *Areca lutescens*, and the Kentias. *Geonoma gracilis* is a highly decorative Palm that is not so much grown as it might be, for it is very handsome in build and general appearance. *G. imperialis* resembles it somewhat, but the pinnae are broader and more drooping. In the young state especially it is exceedingly graceful, as was well evidenced by the fine stock of plants we saw of it.

Of Dracaenas we noted all the best and most useful types. *D. sanderiana* is both handsome and distinct, but it needs to be continually propagated, for it is only in the young state that it is to be seen to the best advantage, the old plants having a great tendency to become "leggy" and bare of leaves at the bases of the stems. Three young plants in a forty-eight pot is a capital way to grow it, and when the variegation is well marked, as it was in the cases before us nothing prettier could be desired. *D. godseffiana* scarcely looks like a *Dracaena* at all upon first sight, the elliptic-shaped leaves thickly dotted with variegated areas, and the small wiry-like stems serving to give it a unique character in the genus. It is a vastly pretty plant, however, and will become popular when it becomes more widely known. *D. goldieana*, *D. rubra*, *D. pendula*, and *D. Doucettii* are all well-known forms. Of the latter particularly there is a good stock at Forest Hill, some of the plants being real models of symmetry. Distinction is a novelty that has been appropriately named. The leaves are narrow, pendulous in habit, and bright green in colour with a rose or rose-white margin. It makes a splendid table plant. Excellent has rather wider, more erect green leaves with a broad white marginal band. These two forms constitute a pair of highly promising subjects.

On all sides the Crotons were displaying exceptionally brilliant colouration, the winter having apparently had little or no prejudicial effect upon them. *Chelsoni*, *Queen Victoria*, *Thompsoni*, and *Reedii* were all in grand condition. A very handsome form called *Davisi* caught our eye. It bears a certain resemblance to *Weismanni* in build, but the leaves are relatively shorter and broader, but not sufficiently so to rob it of the elegance that characterises *Weismanni*. The colours in the two varieties are the same, but the distribution is different, both green and gold being present in larger areas.

Lea amabilis splendens is a subject that should be in every collection of stove plants. The bronze, green, and white of its leaves are not easy to beat, and the habit is distinct from that of anything else. The foliage of this variety is finer and more handsomely marked than that of the type.

Speaking of plants that are not too commonly met with, we may make mention of *Centradenia rosea*, with its fine bushy habit, and general beauty and usefulness. No matter whether in or out of flower, it is always attractive, for the bright rosy hue developed upon the under surface of the leaves contrasts agreeably with the olive-green of the upper surface. We noticed some fine plants of it, just bursting into flower, which will be a perfect picture in another week or so. The flowers are bright pink, and produced in sub-corymbose racemes.

Than *Begonia Arthur Malet* it would be exceedingly difficult to find a brighter plant for the winter decoration of the warmer houses. The leaves are of noble dimensions, and exhibit a peculiar shade of bronze purple that is at once striking and beautiful. A nice batch of plants in one of the stoves was a special feature of the establishment. *Begonia Gloire de Lorraine* was giving evidence in several places of its beauty and free flowering qualities. *Acokanthera*, better known in gardens as *Toxicophloea spectabilis*, was flowering very freely, and the fragrance of its pure white blossoms was much in evidence.

The *Darlingtonias* constitute a most interesting and rather curious section of plants. We noticed three forms in excellent condition, viz., *S. Courtii*, *S. Drummondii*, and *S. D. alba*. With these were associated other bog and aquatic plants, such as the curious *Pontederia crassipes*, with its swollen bladder-like stems or rhizomes filled with air for the apparent purpose of keeping the plant, with its heavy succulent leaves, afloat. Here, too, were noticed the curious lace-leaf or lattice-leaf plant, *Ouvirandra fenestralis*. *Caladiums*, not long potted up, were

growing away finely, and throwing up strong handsomely sized leaves. In another house hybrid *Streptocarpuses* were just starting into new growth, after an early potting.

Ferns are grown to a considerable extent at Forest Hill, for there is always a demand for them. *Pteris Wimsettii* is an especially prime favourite, and such forms as *P. tremula*, and *P. argyrea* also take well. The genera *Nephrolepis*, *Adiantum*, and *Asplenium* are also well represented.

There is a large number of pits attached to the larger houses, and serve as feeders for the larger houses. We observed, amongst other things, fine collections of border Carnations and Pentstemons, both of which popular plants have been assiduously cultivated and improved by the Messrs. Laing. The plants appeared to be in perfect health, and like other things were showing the effects of the very early season.

RETINOSPORAS.

NOTWITHSTANDING that the authorities at Kew have placed the above Conifers under "*Cupressus*," we still cling to the first name, and catalogue our collection under it. That the majority of them are well suited for planting in suburban gardens or small lawns most arboriculturists will admit, on account of their finely divided and feathery branches and the compact habit of most of the varieties. They enjoy a fairly moist soil, and thrive better, I consider, where they are slightly protected from the wind.

I append the names of a few, with remarks thereon, that we have thriving in the arboretum here. *R. obtusa* makes a grand specimen of compact growth and pretty foliage, and is at present nearly covered with its brown cones, which make it look very conspicuous. This tree stands over 30 ft. high, and is said to reach nearly 100 ft., so should not be planted unless a good space can be given for the plant to develop. *R. o. gracilis aurea* is a very pretty shrub of rather spreading nature, though graceful. Ours is only a young tree, about 4 ft. high. *R. o. tetragona aurea* is represented in a young state, standing 5 ft. high, with a horizontal growth. *R. pisifera* is a strong grower, and of compact habit in a young state; but our largest tree is of irregular growth, and reaches a height of 30 ft. *R. p. aurea* in our soil strongly resembles *Cupressus lawsoniana* at present in a small plant. *R. p. plumosa* makes a splendid specimen, is very compact, has feathery foliage, and is altogether a very pleasing Conifer, about 13 ft. in height. *R. lycopodioides* is another pretty one, with beautiful dark green foliage, especially in our tree, which stands 12 ft. high. *R. leptoclada* is an erect and slender growing species, with light green foliage, and reaches 8 ft. in height. *R. squarrosa* I consider one of the prettiest; it makes a good specimen, and is at all times attractive on account of its feathery-like foliage of a glaucous green, sometimes almost of a pale blue colour, which greatly adds to its beauty.—*J. Mayne, Bickton.*

EXTRAORDINARY OAK.

ORIGIN OF *QUERCUS CERRIS LUCOMBEANA*.

UNDER the heading "A New and Singular Species of Oak" a letter appears in the *Scotts' Magazine*, dated February 24th, 1773, at Exeter, from John Zephaniah Holwell, Esq., F.R.S. In the letter he describes a visit to the nursery of Mr. Lucombe, of St. Thomas, and to which place he was evidently attracted by a report of the discovery of a new species of Oak, "discovered and propagated by that ingenious gardener." Mr. Zephaniah goes on to relate how the "ingenious gardener" happened to discover the Oak, which was, to all appearance, at that time destined to revolutionise Oak growing in the future. "A parcel of Acorns," says the writer, "saved from a tree of his own growth of the Iron or Wainscot species," produced the new Oak which had the peculiarity of retaining its leaves all the winter. This feature of the plant was considered phenomenal, and caused Mr. Lucombe to propagate the species by grafting to the extent of "some thousands" in the short time of seven years.

"I," says the writer, "had the pleasure of seeing these eight days ago in high flourishing beauty and verdure, notwithstanding the severity of the past winter. The various qualities which it possessed or

promised to evolve were evidently of an excellent character—straight and handsome as a Fir. Its leaves are evergreen, and its wood is thought, by the best judges, in hardness and strength, to excel all other Oaks. It makes but one shoot in the year, viz., in May, and continues growing without interruption, whereas other Oaks shoot twice, viz., May and August." He goes on then to speak of its rapid growth, which in part he attributes to its production of one shoot a year. He gives the dimensions of the parent tree of seven years and a grafted one of four years respectively as 21 ft. high, 20 in. in girth, and 16 ft. high and 14 in. in girth.

"The first grafted is six years old, and has out-shot his parent by 2 ft. in height." The tree in question was, the writer says, called the Lucombe Oak, which made shoots 4 ft. to 5 ft. yearly, and he inferred from that feature in forty years it would out-grow the other Oaks of a hundred years. He adds, in conclusion, that, except the leaves, it is quite distinct in every way from the Iron or Wainscot Oak, and that many gentlemen in Cornwall and Somerset planted young trees, which are doing well. It would be interesting to know how these have turned out after a growth of 125 years.—*D. Chisholm.*

THE PLANT HOUSES.

The Stove.

WITH the month of February it is to be expected that things will move a bit, and therefore it will be well to increase the temperature of the stove by a few degrees. It should not be allowed to drop below 62° Fahr. by night. It is rather early to start the regular morning and afternoon syringings yet, but advantage may be taken of fine days to give the plants an occasional shower bath. This, however, must in every case be seen to early enough in the day to admit of the foliage becoming dry before night. Prosecute vigorously the war against all insect pests, and supplement the occasional use of the syringe by the sponge.

POTTING.—It is advisable to make an early start with this, for by getting the work forward now it will lessen the pressure a month or six weeks hence, when things begin to hum, and one does not know which job to turn to first. Once a year at least all the occupants of the stove should have a thorough overhauling. Some of them will not require to be potted so often as this, but if a shift is not needed a top dressing may be of service, and it is of the greatest importance to see that the drainage is in proper working order, and likely to remain so for a time. Vigorous plants need a lot of water during the summer months, and thus anything like a choked-up drainage system is inimical to their interests. Keep a sharp look-out for plants that were over-potted last year, or of which the roots have died to some extent. It pays to reduce these subjects pretty heavily, for it is only courting failure to attempt to put a plant with two or three roots in a big pot, even although it may be a veteran, and the size of the head seems to warrant it. Try and keep such things as Crotons, *Dracaenas*, *Dieffenbachias*, and some Palms in as small pots as possible, for their value for house furnishing will thereby be much enhanced. All this class of subjects will need to be potted firmly, and if the compost is in a proper condition, *i.e.*, neither too wet nor too dry, the rammer may be freely used without fear. The result will be seen in close jointed sturdy growth that will stand knocking about a lot better than the more sappy stuff. Any plants that it is found will have to be disturbed a good deal should be taken out of the large stove subsequent to potting and placed in a close pit where a temperature of from 65° to 70° Fahr. can be easily maintained, and where the syringe can be set to work amongst them daily. Above all, use clean sound pots. Any cracked ones might as well be broken up at once, or in shifting about presently these will be likely to lead to falls and further breakages. If the cracked pots are retained, see that they are secured with wire.

NYMPHAEAS.—If these charming aquatics have not been already potted up no time should be lost in seeing to it. In accordance with instructions given previously the water should have been nearly drawn off, and the plants allowed to go completely to rest. In turning them out of their old pots be careful with the tubers for some have a knack of getting down close to the bottom, even although the plants were

not deeply covered with soil last year. Good loam mixed with cowdung in the proportions of four to one makes the best compost for the *Nymphaeas*. Where many are grown it is a capital plan to stack the loam with the cowdung about six months before it is wanted, therefore, giving the two time to incorporate with each other thoroughly. The difficulty of mixing the two fresh ingredients is thus avoided. After potting return the water to the tank, allowing it to reach about two-thirds of the way up the pots. Keep it at a temperature of 65° and increase it in depth week by week, until the depth is normal.

CALADIUMS.—The tubers which were started about the middle of last month have now a leaf or two, and will soon be ready for potting up. Another batch of tubers should be started in shallow boxes, covering the tubers with cocoanut fibre. The rarer sorts will be best in small pots by themselves in order that they may be kept separate from the commoner ones, and given special attention. A temperature of not less than 65° should be given. Do not keep them too wet for the first few weeks or the tubers will be in danger of rotting off.

Pits and Frames.

TUBEROUS BEGONIAS.—If seed of these popular and useful plants has not been sown during the past month no time should be lost in doing it. Drain the seed pots thoroughly, and fill them to within an inch of the top of the rim with fine, sandy soil. Press this fairly firm, and smooth the surface by means of a small piece of board or other flat article. Give the soil a light watering prior to sowing the seed. Sow thinly and cover with very fine soil or sand. Cover each seed pot with a sheet of glass, and place it on a shelf in a light position in a house having an equable temperature of 65°. Plants from this sowing will, if generously treated, commence to flower in June and July.

CANNAS.—Seed should be sown at once, and in a temperature of not less than 75° to ensure speedy germination. As the testa of the seed is exceedingly hard, so hard indeed that the embryo plant finds a difficulty in breaking through it, some means must be taken to weaken or reduce it in places. Various devices are resorted to to accomplish this end. Some growers file the testa through, others cut away pieces with a sharp knife, but both methods must be employed with caution, and both are tedious to accomplish. A better plan than either is to soak the seed in tepid water for not less than twenty-four hours immediately previous to sowing. The root-stocks of the old plants may be introduced into heat—a warm house with a temperature of from 60° to 65° will suit—in order to induce them to break into growth when they may be potted up. Propagation of desirable varieties by division of the crowns may be carried on as required, as the pieces will start into growth as quickly and as well as the whole root-stock.

COLEUSES.—Make a start in working up an early batch of these handsome foliage plants by putting in as many cuttings as can be obtained. The cuttings struck last autumn to preserve the stock, and which have remained in their cutting pots all the winter, will furnish the material. Take off two or three inches of the tops, and insert in a brisk heat. The beheaded plants will soon break into growth, and more cuttings can then be had. Successional batches of dimensions to suit the needs of the establishment must be put in for the next four or five months, as the old plants quickly get shabby.

FUCHSIAS.—Continue to insert cuttings of these as fast as they can be obtained. The earliest batch will by this time have made sufficient roots to warrant potting off. Pot loosely in light soil, using only small pots. Be very careful with the watering, for indiscretion in this respect will be attended with fatal results thus early in the year. If any seed of desirable varieties has been saved from last year it should be sown now. Give it a temperature of about 70° to obtain quick germination. Seedling Fuchsias, if properly treated, will flower within six or seven months from the date of sowing. These plants may, therefore, come in very handily for filling up a gap towards the end of the summer.

GENERAL WORK.—Make a sowing of *Petunias* for pot work. A pinch of seed of *Cockscombs* and *Celosia pyramidalis plumosa* should also be sown to furnish early plants. Introduce *Lilacs*, *Deutzias*, and bulbs of all sorts to heat as required for succession. Combat greenfly on its first appearance amongst *Pelargoniums* and herbaceous *Calceolarias*

by means of XL All or McDougall's new fumer, both of which are exceedingly effective and safe contrivances. Border Carnations in frames will now be needing a little water, but do not overdo it, and avoid wetting the foliage. Air all cold frames as freely as possible. Such subjects as *Violets* and *Carnations* are better with the lights pulled off them during such fine weather as we have been having lately.—*A. S. G.*

JUDGING AT HORTICULTURAL EXHIBITIONS.

WE have listened to a deal of discussion of late on judging at horticultural exhibitions (much of which is the usual twaddle), but we read of something fresh, for which, I fear, one of the combatants in the strife will not find much sympathy from the majority of judges. He has adduced that it is an error to award equal first prizes in cases where the points are the same in every respect. It is also questioned if two lots can be equal, either in single exhibits or in collections. Plants and cut flowers, where there are distinct species tabled, seldom can be made equal in points, but in such cases the decision is left very much to the caprice or taste of the judges. When there are, say, a score each of *Roses*, *Dahlias*, *Carnations*, or *Chrysanthemums* the counting of the points is all that a *skilful* judge has to do, and if two lots are in every way equal and of first-class merit it would be unjust to give awards other than first prizes to each. The judging of fruits and vegetables comes under the same rules; but when there is great divergence in collections, distinct in variety, and the most of them in species, the most correct "pointing" may fix a wide opinion between judges and exhibitors, and this we have witnessed at exhibitions hundreds of miles apart. At the late largest shows held in the north recrimination has not been absent; which, in the majority of cases is by green hands, whose exhibits are seen by themselves as others *do not* see them. To err thus is only human, and was clearly illustrated in *Punch* over a political matter by two Hindoo ladies with babies, each asserting that her own blessed one was fairest, while both were nearly of ebony hue. Illustrations from one's own experience may give some force to the necessity of equality in rare cases.

A few years ago, when judging at a large exhibition, I was armed to another class, where I was not engaged, by a friend who had been a leading exhibitor for years, and a strong opponent was against him in a class of, I think, twelve sorts of vegetables. I was asked my opinion. After carefully turning over his *Parsnips*, *Carrots*, &c., searching for the weak points, I soon decided that my friend's would be in the position of ex-champion, and pointed also that it would be a struggle to gain the second prize—more likely the position would be equal second. There were 10 other exhibits in this class, and my friend was equal second, and second for a collection of eight sorts. In each case cleanness and quality had highest honours. The judges were "old hands" at their work, and, I think, did it well. I have often been placed "equal" first, and more than once or twice have been placed first when I should not have been. The "dishing-up" should always be done as skilfully as possible, but the searching for weak points is also a legitimate duty (in fact, imperative) of the judges. The placing of two exhibits *equal* when they are so is also in every respect the duty of censors.—*M. Temple, Carron, N.B.*

Dwarf Oaks.—In this country we are accustomed to associate with the Oak immense size, stateliness, and strength, but in parts of New Jersey, U.S.A., there are woods where numbers of diminutive specimens not exceeding 2 ft. in height of *Quercus nigra* can be seen. That these little trees have reached maturity is, moreover, apparent from the way in which they bear, for them, heavy crops of acorns. In the face of this it is rather surprising to find that in other parts of the American continent, notably Pennsylvania, this species assumes the form of a sturdy tree 30 ft. or 40 ft. in height. It would be interesting to discover the reason for this curious dwarfing, which is all the more notable because, in the same wood, all sizes of trees between the two extremes may be seen.

NOTICES OF BOOKS.

GARDENING ABROAD.

GARDEN NOTES FOR THE COLONIES AND ABROAD. Second Edition, 1898. James Carter & Co., Royal Seedsmen by Special Warrants to H.M. the Queen and H.R.H. the Prince of Wales: High Holborn, London, England.

This is a small book of some fifty pages, the latter being large, however, so that a considerable amount of information is given relating to various parts of the globe, wherever there is a British possession, colony, island or inhabited rock. Other countries are also mentioned, where British settlers, or those in an official capacity may find themselves. In any case a Briton is almost certain to grow or try to grow the flowers and vegetables with which he has been familiar in the old country; and will struggle under the most adverse conditions to obtain fresh vegetable food from the soil of his new home, or find delight in the flowers he can raise.

The book aims at stating the facts pertaining to the physical and climatic conditions of the countries or stations mentioned; and furnishes hints as to some of the means adopted to assure success to the cultivator. In tropical and sub-tropical countries advantage is taken of high altitudes where possible, and of the winter season. Many countries or portions of them are sandy, sun-burnt deserts, but that is no indication that they are barren. Irrigation, even by artificial means often enables them to blossom as the Rose.

In spite of the disparaging statements that have been made regarding Rhodesia, it is evidently not all barren. In the neighbourhood of Salisbury the soil is black, rich, and grows vegetables luxuriantly. We have no doubt that many of the flowers grown here would succeed in Rhodesia under those conditions; and where water is plentiful almost anything could be brought to perfection that requires the shelter of glasshouses in Britain. India covers a vast range of latitude, longitude, and altitude, and its gardening capabilities being well known, a considerable amount of space is devoted to it. A calendar outlines the work that may be done during every month of the year. In Bengal, the plants that grow here will only succeed there during the four months from November to February. We have on former occasions given lists of plants that succeed admirably at Calcutta during the winter months. Very interesting information is given regarding Chile owing to the great diversity of its climate. This is due to the length of the country from north to south, and the proximity of the Andes to the whole length and breadth of the country, from whence innumerable streams descend and water the fertile soil. Three successive crops can be raised off the same patches of land during the year on the rocky island of St. Helena.

Short chapters towards the end of the book describe the vegetables and flowers that may be grown in foreign parts. The Rose, grass lawns, bulbous plants, fruits, seed Potatos, and other subjects are dealt with in a general way. The book cannot fail to be of service to those contemplating going abroad, as well as to those already there. We congratulate the Messrs. Carter for their enterprise and service to the community in thus directing attention to gardening beyond the narrow confines of this island.

THE CHRYSANTHEMUM.

MODERN CHRYSANTHEMUM CULTURE FOR THE MILLION. A Handbook for the Amateur and Cottage Gardener. By George Garner, Silver Medallist, &c., Liverpool: Blake & Mackenzie, Printers and Publishers, 1897. Price 6d.

Some sixty-four pages are devoted to elucidating the various details connected with the cultivation of the golden flower by amateurs, and the general body of cultivators who grow their own flowers. The subject is dealt with by a gardener who is also a prize winner at competitions. The author, Mr. G. Garner, gardener to A. C. Drummond, Esq., Cadland Park, Southampton, commences with propagation, and from thence proceeds through the various stages of growth till the flowers are fit for exhibition. He also gives directions for preserving the flowers if they have reached their full development before they are wanted. The vexed questions of timing and taking the various buds are fully but simply described; and the would-be cultivator is assisted by photographic illustrations, so that he should have no difficulty in

following the directions given, if he is sufficiently enthusiastic as to observe closely. Short chapters are devoted to the various pottings required, the composts employed, and other cultural items. Chrysanthemums in bush form, as well as for the exhibition table, are taken into consideration. Select lists of suitable varieties belonging to the various sections are given towards the end of the book, which is well within reach of the amateur's means. Printing and paper are both excellent, and quite equal the quality of more expensive books.

VISIT TO A FAMOUS ROSE NURSERY.

HAVING a few hours at my disposal I thought I could not do better than give the famous Rose nursery of the Messrs. A. Dickson & Sons, Newtonards, a visit. I had what a Scotchman would call "a sicht for sair een."

Entering the nursery by a side gate the first item to call attention is a splendid border of young Apple trees, all in the pink of condition. Mr. Dickson's method is to grow his cordons upright for two years, then lay them diagonally. By this method he claims to have superior fruit to that grown in the ordinary way.

Passing on to the Roses—the extent of ground under this noble flower is between thirty and forty acres. There were a good many varieties in flower during my visit (January 13th), which says a good deal for the climate of Ireland. After visiting this nursery one can quite understand how the fine plants with the mass of fibrous roots are grown. As Mr. Dickson is the owner of a large farm, his method is to take his oldest pasture and trench it about 2½ ft. deep, with the turfy part or "Scran" just under the Rose roots, with a liberal allowance of manure from the cowshed. I may mention that the firm buys about 1,000 tons of manure annually.

To visitors from England and Scotland, where the spade is universally used, it comes as a surprise to learn that a spade is never used in the preparation of the ground. It is all done with digging forks. Mr. Dickson says the spade does not pulverise the ground enough, and if good stock and healthy plants count for anything his theory is a sound one. There are about six acres under seedling Roses, all "standing their trials," and I have no doubt many of them will come through them well. There is a fine lot of the famous "Ulster," which has not been sent out yet.

Leaving the Rose we come to the Coniferae department, and here the same skill is shown as among the Roses. The plants are grown in the open, there being no sheltering hedges to nurse them as seen in so many nurseries. This method makes the plants very hardy, and gives them a double chance when removed to sheltered positions. There was a fine batch of *Pittosporum Mayii*, which gave this department a bright appearance. It is a wonder that this beautiful tree is not grown more generally than it is.

Passing again into the fruit tree department the visitor is surprised to see the amount of room allowed to each tree. This insures a short, sturdy growth, which is a great consideration to the fruit-grower. By allowing the trees plenty of air and light, there is none of the long sickly growths so often met with to be seen here. In the herbaceous department, Mr. Dickson is equally as successful as he is in other branches of the profession. There is a splendid specimen of the Cork tree (*Quercus suber*) which was planted by Mr. Dickson's father.

We next come to the glass department, which is kept in excellent order. The first house entered contained a magnificent collection of Palms, including a freak of nature in the shape of a variegated *Latania borbonica*, which has a very pleasing appearance. The next house was devoted to *Pteris tremula*; and I can safely say I never saw a healthier lot of plants. The next house is perhaps the most interesting in a Rose nursery, for here thousands of roses are being worked on to their stocks, chiefly the Brier and Polyantha Rose. In another house the Chrysanthemums were being cleared out preparatory to their place being filled with young Vines. I may mention that all stages and plant cases in this nursery are so constructed that they can be removed and packed into small space when the class of stuff grown requires more headroom. Under the stages, Tulips, &c., were

being forced by the thousand, all being wanted to supply Messrs. Dicksons' florist establishment at 55, Royal Avenue, Belfast. After partaking of Mr. Dickson's hospitality I took my leave and like the "Twa Dougs" in Robbie's poem, "Resolved tae meet some ither day."—*Diosma*.

EARLY FLOWERS AT KEW.

ON account of the large number of species and varieties of plants grown at Kew, that famous establishment is, consequently, a faithful reflex of weather conditions, for no part of nature, I suppose, responds more freely to the stimulus of heat, or is retarded more surely by excessive cold, than the vegetation of our globe.

As, therefore, indicating in some degree the former conditions, I herewith append a short list of plants in flower in the open-air at Kew on January 30th last, merely premising that the said list does not pretend to be complete, and that, moreover, many of the subjects named had been in bloom for some time. The Snowdrop, which Mr. Burbidge calls the "pearl of the opening year," was very much in evidence, while the genus *Crocus* gave the gardens quite a gay effect. Of the latter the following species, which are grown in circular beds in the grass, made a grand display:—

| | |
|------------------------|---------------------------|
| <i>Crocus vernus</i> , | <i>C. tommasinianus</i> , |
| <i>C. biflorus</i> , | <i>C. etruscus</i> , |
| <i>C. Sieberi</i> , | <i>C. Imperati</i> . |

On the walls:—*Chimonanthus fragrans* var *grandiflorus*, *Umbellularia californica* (flowers developing), *Pyrus japonica*, *Lonicera Standishii*, *Sarcococca hookeriana* (flowers developing), *Eccecremocarpos scaber* (strong, new growth), *Jasminum nudiflorum*.

Shrubs:—*Daphne Mezereum*, *Berberis Aquifolium*, *Cornus mas*, *Viburnum Tinus*.

Rockery:—*Galanthus nivalis*, *G. Elwesii*, *G. caucasicus*, *G. Icaria*, *Crocus* species, *Saxifraga ligulata*, *S. apiculata* and *S. sancta* (developing), *Scilla bifolia*, *S. sibirica*, *Cibonodoxa Luciliae*, *Anemone apennina* var. *blanda*, *A. Hepatica*, *Arabis procurrens*, *Corydalis solida* var. *densiflora*, *Erica carnea* and *E. c. alba*, *Daphne Mezereum* and *D. M. alba*, *D. blagayana* (fat buds), *Helleborus* in variety, *Narcissus minor* var. *minimus*, *Erantibus hyemalis*, *Iberis gibraltarica*, *I. sempervirens* var. *garreuxiana*, *Leucojum vernum*, *Lonicera fragrantissima*, *Cyclamen Coum*, *Merendera caucasica* (*Colchicum* like), *Primula denticulata*, *P. vulgaris*, and Wilson's Blue Primrose in variety.—*C. B. G., Acton, W.*

GARDENING MISCELLANY.

THE GRAPE ROOM.

THIS season is certainly by far the worst that I have had for keeping the fruit. Instead of only looking over the bunches once a week as formerly, I have been obliged to give them attention about every other day. There must be a cause for this, but whether I attribute the right one or not remains an open question. I think the mild, damp, and, I may say, almost sunless weather we have had for the past few weeks must have had some effect upon them. Not only do the berries decay, but the stem of the bunch sometimes in the centre has decayed or gone mouldy, if I may use that term. Perhaps some of your many readers can throw a light upon this subject; at any rate it would be interesting to know how other gardeners, who may have some grapes bottled, are faring in this respect.—*Perplexed*.

CHRYSANTHEMUM MRS. CHAS. CAREY.

AMONGST the many new kinds that are continually coming before the public one is apt to overlook some old favourites, and amongst them is this Chrysanthemum. It was put into commerce a long time ago, but I cannot give it up for late work. Up to the present I cannot find a white kind so good. I am aware it is not a full flower, but a semi-double. All the same, it is none the worse for decoration, seeing its lightness is a recommendation to it. It is a strong grower, and the buds do not go blind as in some kinds. We have several plants, and these will give us material to cut for filling tall vases till February.—*J. C., Chard*.

RIVINA HUMILIS.

THIS old inhabitant of our stoves I have always considered to be one of if not the most beautiful berry-bearing plants we have. Some will object that it is very apt to get leggy. This may be remedied to some extent by judicious stopping and keeping the plants near the light. When once allowed to shed its berries about the house there will always be a plentiful supply of young plants, so that leggy specimens may be cast away without the least compunction. The greatest drawback in connection with it is the ease with which the berries when ripe drop. This precludes the plants being used for general decorative purposes, if they have to be sent long distances. Could they be taken or sent to market as well berried plants in 4-in. pots, a ready sale would be found for them, but unfortunately, for the above reason, the case is hopeless. I have used them grown in pots for house decoration, and in a cut state among flowers for table adornment, when it has always been much admired. The racemes of small shining berries, some 4 ins. in length, have a brightness and beauty about them, unique in their way.—W. B. G.

PRIMULA SINENSIS ALBA PLENA.

I AM sure most gardeners will agree with Mr. J. Mayne in all he has said in favour of the above Primula in a recent issue. It is in the vicinity of large towns affected with fogs that one can with some pleasure look upon this plant as a special boon, in addition to its otherwise useful character. I noticed a fine batch a few weeks ago in the gardens of Miss Behrens, The Avenue, Regent's Park, W., that would have been a credit to any gardener had they been flowering in a pure country atmosphere; but the most noticeable feature was that they evidently kept flowering away in spite of the fog (which has been of an exceptionally severe character in London this winter), while other subjects were injured even before they had reached the flowering stage. Mr. J. Addison, the gardener, had previously noticed the value of this Primula for town work, and had worked up an exceptionally fine stock of it. A batch of single varieties at the same place was rendered almost worthless by the fog.—James Gibson, Devonhurst, Chiswick.

THE COLT'S-FOOT.

TUSSILAGO FARFARA, the technical name for our common Colt's-foot, is said to be one of the most pernicious weeds. True, it is not one that possesses much merit in the leafy month of June; but in mid-winter its bright, orange-coloured, wheel-shaped flowers, refresh the eye with their beauty, inasmuch as these are produced amidst the most grotesque surroundings and in the roughest and sootiest of places. On the last day in January of this year I was, therefore, pleased to spy its cheerful blossoms on the embankment of the railway at Willesden Junction, where the sunshine, combined with the late high temperature, had induced them to come forth thus early. Is not this a record date for the common Colt's-foot?—C. B. G., Acton, W.

DICTAMNUS FRAXINELLA.

THIS fine old border plant, one with which many among us have been familiar for many years, is one of the most attractive and beautiful of our hardy perennials, growing from 2 ft. to 3 ft. in height. Its spikes of flowers, which are of a peculiar reddish tint, are very fragrant. There is a white variety the counterpart of the type in everything save colour. It is a favourite plant with all who know it, yet comparatively scarce, for the two following reasons:—First, it does not readily admit of division. This, in fact, should never be attempted, on account of the risk run in losing the parent stool. The second reason is that unless the seed is sown at once when ripened it rarely germinates. Seed can always be bought, but, if success in raising it is to be assured, it must be procured from those having plants, and at the proper time.—W. B. G.

THE WITCH-HAZEL.

HAMAMELIS arborea, the tree-like and winter-flowering Witch-hazel, is now (January 30th) a mass of bloom. It is, in fact, a sight worth seeing, for at Kew, where several strong plants have been grouped together, the *tout ensemble* is unique. At a little distance from the group the plants or trees appear

to be in full summer dress, but a closer inspection reveals nothing but the flowers. These flowers, however, are very curious and, consequently very interesting. They are lavishly produced, and are of a bright rich yellow, the calyxes being of a deep purple or claret colour. They are, moreover, somewhat spicy in their fragrance, and appearing so early in the season, and so profusely, are well worth attention in gardens of limited dimensions. This particular group is carpeted with the pretty little creeping Wintergreen (*Gaultheria procumbens*), whose edible red berries, although they crop up above the foliage, do not seem to be readily accepted by the avis tribe.—C. B. G., Acton, W.

DAHLIA CULTURE.

THE cultivation of the Dahlia is not so well understood as it might be, says Professor Harshberger, of The University, Pennsylvania. The professor thinks that the gardener does not follow Nature closely enough, and advises him to alter his tactics in this respect. In the Mexican valley the dry season lasts from October to June, the rains returning at the latter date. The tubers lie dormant during the drought, but when the rains come they start to grow, and commence to flower about the end of August. The rainy season has cool mornings, thundery afternoons, and rainy evenings. It would be impossible to treat our cultivated plants exactly as Nature in Mexico does, but after all the difference is not great seeing that we only give the plant a longer growing season, say from May till October, and a shorter resting period. Professor Harshberger comments upon the great variability of the Dahlia in its wild state, which he says is as marked as when the plants are under cultivation.

SOCIETIES.

ROYAL HORTICULTURAL.—Feb. 8th.

THE stronger features of the meeting on Tuesday last were Orchids, Chinese Primulas, Freesias, Hellebores and other hardy plants, flowering bulbs, flowering shrubs and fruit.

Messrs. J. Veitch & Sons, Ltd., Cbelsea, exhibited a large group of Orchids, including many choice hybrid Dendrobiums, such as *D. schneiderianum*, *D. endocharis*, *D. Cordelia flavescens*, *D. Dulce*, *D. euosmum*, *D. Domini*, *D. splendidissimum*, *D. s. grandiflorum* and others. Very pretty were the hybrid Epidendrums, such as *E. elegantulum*, and *E. Endresio-Wallisii*. *Oncidium spilopterum* is a handsome yellow-lipped species having a rich purple disc.

Sir F. Wigan (grower, Mr. W. H. Young), Clare Lawn, East Sheen, exhibited *Laelia pumila praestans* in fine form, and *Odontoglossum schillerianum*.

Sir Trevor Lawrence, Bart. (grower, Mr. W. H. White), Burford Lodge, Dorking, exhibited an interesting group of well-grown Orchids, including a large and floriferous piece of *D. burfordiense*, a massive pan of *Sophranites grandiflora*, in the collection since 1889; also fine pieces of *Odontoglossum andersonianum*, *Angraecum eburneum*, *Masdevallia polysticta*, *Epidendrum polybulbon* and many other fine things (Silver Gilt Banksian Medal).

Messrs. Hugh Low & Co., Clapton, exhibited a group of Orchids, amongst which we noted *Dendrobium Venus*, *D. ballianum*, *D. Luna*, *D. crassinode* and various other hybrids and species. *Oncidium*s, *Odontoglossum*s, and *Cypripedium*s were freely interspersed in the group (Bronze Banksian Medal).

Messrs. B. S. Williams & Son, Upper Holloway, staged a group of Orchids, a conspicuous feature of which was various varieties of *Coelogyne cristata*. *Laelia anceps williamsiana* was plentiful and freely flowered. Other things included *Odontoglossum*s, *Cypripedium*s, *Dendrobium*s, &c.

Lord Folley (gardener, Mr. Miller), Ruxley Lodge, Esher, Surrey, set up a large and well-flowered group of *Cypripedium insigne* in pots. The plants were set up with Palms, Crotons, and Ferns.

Phaiocalanthe grande, *Cypripedium Ceris*, *Calanthe splendens*, *Laeliocattleya Doris*, *Cypripedium Morganiae*, and a grand hybrid *C. sander-superbiens*, were exhibited by M. C. Cookson, Esq. (gardener, Mr. William Murray), Oakwood, Wylam-on-Tyne. *Dendrobium nobile* Mrs. Wingfield's var. was exhibited by Mrs. Wingfield (gardener, Mr. W. Empson), Ampthill House, Ampthill. Philip Crowley, Esq. (gardener, Mr. J. Harris), Waddon House,

Croydon, exhibited a choice and very handsome *Laelia* named *Laelia anceps waddoniensis*.

Messrs. F. Sander & Co., St. Albans, staged *Lycaste Skinneri alba*, *Cattleya Trianaei* var. *Calanthe rubens alba*, and some others. *Cypripedium villosum* Doncaster's var. was shown by S. G. Lutwyche, Esq. (gardener, Mr. T. Paterson), Eden Park, Beckenham. W. Thompson, Esq. (gardener, Mr. W. Stevens), Walton Grange, Stone, Staffs., exhibited *Odontoglossum excelens spectabile*, a very fine variety, indeed. He also had *O. hystrix grandis*. *Cypripedium Chapmani* Chard's var. was exhibited by C. W. Chard, Esq., 15, The Pavement, Clapham Common.

A splendid array of Exotic Ferns came from Messrs. J. Hill & Son, Lower Edmonton. It included some large fine plants of such kinds as *Davallia Tyermanni*, *D. bullata*, *Nephrolepis davallioides furcans*, *N. exaltata*, and *Adiantum elegans*. These were staged in the background. In the foreground was a number of shallow, oblong baskets filled with healthy young plants of *Asplenium Nidus*, *A. Colensoi*, *Aspidium caryotideum*, *Pteris palmata*, *P. Mayii*, *Cheilanthes elegans*, *C. ellisiana*, and *Adiantum farleyense*. A Silver Gilt Banksian Medal was awarded.

A showy collection of miscellaneous flowering plants put up by Messrs. John Peed & Sons, Roupell Park Nurseries, Norwood Road, S.E., received a Bronze Banksian Medal. The display included *Lilacs*, *Lily of the Valley*, *Cyclamen*, *Saintpaulia ionantha*, and *Begonia Gloire de Lorraine*, with a backing of *Aspidistras* and *Palms*.

On the left-hand side of the entrance to the hall, Messrs. W. Paul & Son, Waltham Cross, Herts., put up a grand group of *Camellias*. There were fourteen large, well-flowered plants, of such varieties as *Double White*, *Corallina*, *Madame A. Verschaffelt*, and *Exquisite*. A row of boxes filled with beautiful cut blooms formed the front rank (Silver Gilt Flora Medal.)

On the opposite side of the doorway was a very meritorious exhibit from Mr. John Russell, Richmond, Surrey. It consisted of a large and comprehensive collection of *Euonymuses*, both standard and bush plants being shown. *E. japonicus ovatus aureus*, *E. j. o. albus*, *E. j. radicans variegatus*, *E. microphyllus*, and *E. m. argenteo-variegatus* were some of the best forms shown; all of them were highly decorative. From the same exhibitor came baskets of splendidly-flowered plants of *Daphne Mezereum*, *D. M. flore albo*, and *D. M. atro-rubra*; also *Andromeda Catesbaei*, with its highly-coloured foliage.

Hardy flowers in variety came from Messrs. Barr & Sons, Covent Garden. *Crocuses*, *Cyclamen ibericum lilacinum*, *Iris reticulata bulboides*, *Narcissus minimus*, and *Scilla bifolia* were all represented, whilst *Lenten Roses* formed a major part of the display. *Helleborus punctatus*, *H. guttatus superbus*, *H. antiquorum roseus*, *H. a. James Atkins*, and *H. viridis graveolens* were some of the most notable forms shown (Bronze Banksian Medal.)

Mr. J. G. Mowbray, gardener to Major Hon. H. C. Legge, Fulmer, Slough, received a Silver Banksian Medal for a splendid display of *Freesias*. The plants were exceptionally well flowered, but the flowers were not so strongly scented as usual.

Messrs. H. Cannell & Sons, Swanley, Kent, had a long table filled with various types of their renowned strain of *Primulas*. One of the finest varieties was an improved form of *The Lady*, named *Lady Whitehead*, which has much larger flowers. Mrs. R. W. Cannell has also "*The Lady*" blood in it and is a capital thing. Of the other varieties *Swanley Blue*, *Cannell's White*, and *Her Majesty* were of the best. The plants were well-flowered throughout, and bore unmistakable evidence of high class culture. (Silver Flora Medal.)

Messrs. Paul & Son, The Old Nurseries, Cheshunt, had a nice group of hardy flowers, chiefly *Lenten Roses*, which were in capital condition.

A very bright and comprehensive display of hardy flowers came from Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, N., for which a Medal was voted. *Iris reticulata*, *Anemone Pulsatilla*, *Saxifraga crassifolia*, and *Narcissus Golden Spur* were especially good.

Messrs. Jas. Veitch & Sons, Ltd., showed *Amygdalus davidiana alba* in flower. From the same firm came a capital collection of Chinese *Primulas*, including such valuable types as *Stellata*,

Cbelsea Blue, and the "gigantic" strain in shades of blue, rose, and white. The plants were all well-flowered and in first-class condition (Silver Flora Medal).

Messrs. R. & G. Cuthbert, Southgate, sent a nice collection of early bulbs. The straw-coloured (so-called) Roman Hyacinths were very noticeable here; so also were the Crocuses which were shown in pots of named varieties.

Mr. W. Camm, gardener to Her Grace the Duchess of Cleveland, Battle Abbey, showed some magnificent sprays of flowers of *Bougainvillea spectabilis*, and some handsome trusses of the rich orange-yellow *Bignonia venusta*.

Mr. George Mount, Canterbury, showed a box of two dozen cut Catherine Mermet Roses in excellent condition.

Mr. J. George, 14, Redgrave Street, Putney, showed samples of his new suspending clip for pots or pans.

At a meeting of the fruit and vegetable committee, a Silver Banksian Medal went to Mr. George Mount for a collection of Apples in fine preservation. *Mère de Menage*, Cox's Orange Pippin, Wellington, Court Pendu Plat, and Cox's Pomona were in especially good condition.

Twenty-five dishes of Apples were shown in competition for the Veitch flavour prizes. Mr. W. H. Divers, gardener to His Grace the Duke of Rutland, Belvoir Castle, Grantham, was placed first with Cox's Orange; and Mr. G. Woodward, gardener to Roger Leigh, Esq., Barham Court, Maidstone, second with Calville Blanche.

Of the ten dishes of Pears shown, the first award went to *Passé Crassane*, shown by Mr. G. Woodward; and the second to *Olivier de Serres*, shown by Mr. Divers.

Messrs. Sutton & Sons, Reading, showed two magnificent baskets of Sutton's Superb Early White Broccoli, the individual heads being of immense size; also a basket of the early Pea Sutton's Bountiful.

Mr. Owen Thomas, The Royal Gardens, Frogmore, sent half a dozen fruits of the new Cucumber Every Day. Mr. J. Clarke, gardener to S. W. Keene, Esq., Mill Lodge, Barnes, received a cultural commendation for a basket of splendid Mushrooms. Mr. Miller, gardener to Lord Foley, Ruxley Lodge, Esher, sent a collection of Apples and Mushrooms. (Bronze Banksian Medal).

ANNUAL GENERAL MEETING.

The annual general meeting was held in the Lindley Library, 117, Victoria Street, at 3 p.m. Sir Trevor Lawrence, Bart., in the chair. After the secretary had read the notice convening the meeting and the minutes of the last general meeting, the election of fellows was proceeded with. It transpired that 113 new fellows had already applied for membership in the new year. Mr. Harry Turner and Mr. Geo. Bunyard were appointed scrutineers of the ballot. Mr. Pearson proposed, and Mr. G. Gordon seconded that a vote of thanks be given to the retiring member of the council. The services of Mr. Douglas were specially eulogised by the president.

The report commented upon the fact that the year 1897 had been a very noteworthy one in the history of the society from the fact that it had seen the establishment of the Victoria Medal of Honour, which had been conferred on sixty recipients who had distinguished themselves in various ways in the art and science of horticulture. The medal was awarded for personal merit only, and was in no way connected with prize winning.

Summarising the work accomplished by the society during the year it was stated that twenty fruit and floral meetings had been held at Westminster during the year, and fifteen committee meetings at Chiswick, besides the larger shows in the Temple Gardens, on May 26th, 27th, and 28th, and at the Crystal Palace, on September 30th, October 1st and 2nd. Lectures had been delivered at seventeen of the meetings, exclusive of those at the Crystal Palace. A total of 1,008 awards had been made including Certificates and Medals of all grades.

On Wednesday, July 14th, the council invited all the members of committees to lunch at Chiswick, and to examine the gardens. After luncheon an address on the possibilities of the extended use of the gardens was given by Dr. M. T. Masters, F.R.S. Dr. J. Augustus Voelcker, M.A., had been recently

appointed consulting chemist to the society, and an arrangement had been made with him whereby all fellows desiring analyses of soils or manures, or advice as to either might receive information at a very small cost.

The attention of the fellows was drawn to the advantages they might derive from the services of the Scientific Committee which was composed of gentleman well qualified to advise on all matters relating to plants and plant life. The council also wished to express thanks to the Director of the Royal Gardens, Kew, for allowing Mr. George Massee, F.L.S., to give the society the benefit of his knowledge and advice on the matter of fungoid diseases.

With reference to the principal shows held it was stated that both the Temple Show and the Exhibition of British Fruit at the Crystal Palace had been attended with great success. It was pointed out, however, that the annual continuance of the latter show depended upon the subscription of £100 towards the prize fund. The show involved the society in a deal of expense without the possibility of a return, and thus it was necessary that some such rule should be made. Subscriptions should now be sent to the Secretary, 117, Victoria Street, Westminster, and if the list proved satisfactory, the schedule would then be issued in April, and the show for 1898 held on September 29th, 30th, and October 1st.

A deputation was sent by the Council in August last to the great horticultural gathering at Shrewsbury, as a result of the courteous invitation of the local authorities. Congratulations were expressed for the grand display forthcoming at Shrewsbury. An invitation for a similar deputation to be sent to the Newcastle Show on July 13th, 14th, and 15th, 1898, had been accepted from the Botanical and Horticultural Society of Northumberland, Durham, and Newcastle-on-Tyne.

An examination in the principles and practice of horticulture was held on April 6th currently in various parts of the kingdom, wherever a responsible person could be found to superintend. One hundred and eighty-one candidates presented themselves for examination. It was proposed to hold a similar examination in 1898 on Tuesday, April 5th. Candidates who wished to sit should make application at once.

The best thanks of the society were due to all the members of committees, and also to those who, like Mr. N. N. Sherwood and Mr. C. J. Graham, had offered special prizes for competition; likewise to those who had contributed either by the reading of papers or exhibits of fruits, plants, or flowers to the success of the Drill Hall fortnightly meetings.

It was announced that G. W. Burrows, Esq., of the Worshipful Company of Gardeners, had offered a scholarship of £25 a year for two years at the forthcoming examinations. A similar scholarship had also been promised by Lord Amherst, of Hackney.

It was also announced that the Rev. George Henslow, M.A., had been appointed Professor of Botany to the society, and that he would give addresses during the year at several of the meetings.

The number of deaths in the past year had been heavy, totalling 53; they included many staunch and energetic supporters of the society.

Under the head of ordinary expenditure at Chiswick £1,850 had been spent on the general work and maintenance of the gardens. Several houses had been under repairs, and one entirely rebuilt. The receipts for sale of surplus produce amounted to £357, making the net cost of the gardens £1,493.

The statement of accounts for the year was also submitted. It showed a totality of receipts amounting to £6,303 13s. 7d., and expenses £5,481 6s. 3d., thus leaving a balance in hand of £822 7s. 4d.

In rising to move the formal adoption of the report, Sir Trevor Lawrence said that he was glad to see the interest taken by the members in the society show itself in a large meeting. In commenting with the information laid before them in the printed report, he hoped that the gardens at Chiswick would become more and more a credit to the society and horticulture generally. The fortnightly shows were fully maintained, and they could easily be doubled in extent if space permitted. It was necessary for London to have a Home of Horticulture, but it was largely a question of money.

The lunch given at Chiswick to the members of Fringed White, Double White, Chelsea Rose,

committees would, be hoped, be repeated in the current and ensuing years. He reminded his audience of the many advantages which Fellows obtained for their guinea. The increase in membership amounted to 325 during the last year. Sir Trevor alluded to an unfortunate mistake in the journal of the society, whereby the paper on "market gardening of the Queen's reign" was attributed to Mr. John Moore instead of to Mr. Assbee as it ought to have been. In conclusion, the Chairman eulogised the work of the treasurer and secretary, both of whom were ideal. Dr. Maxwell T. Masters seconded. The motion was passed unanimously. Mr. Alex. Dean objected on the part of the fruit committee upon the new rule which caused the formation of a composite committee for the making of the awards to groups of exhibited plants. Mr. R. Dean also spoke on the same matter. Mr. John Ince made a very amusing remark in which he stated that Chiswick was a white elephant. A vote of thanks to the president, moved by Dr. Ince, brought the proceedings to a close.

QUESTIONS AND ANSWERS

* * * Will our friends who send us newspapers be so good as to mark the paragraphs or articles they wish us to see. We shall be greatly obliged by their so doing.

[Correspondents, please note that we cannot undertake to name florists' flowers such as Carnations, Pelargoniums, Chrysanthemums, Roses, nor such as are mere garden varieties, differing only in the colour of the flower. Florists' flowers, as a rule, can only be named by those who grow collections of them.]

Boiler and Two Houses.—*Avon*: One boiler will heat the two houses you mention without any difficulty as far as power is concerned, but the house which is situated on a terrace, 8 ft. above the level of the lower one will have a tendency to get overheated unless the valves are in proper working order and can turn off the water pretty closely when required. It would be advisable to give the flow pipe in the vinery a distinct rise all the way to the far end of the house. On the contrary the pipes in the greenhouse on the terrace would be inclined to get overheated by reason of their height above the boiler. They might, therefore, be fixed almost level in the house, and furnished near the boiler with a good stop valve by which you could check and regulate the flow of water, or stop it altogether at pleasure. If you could arrange to place the flow and return pipes for the greenhouse entirely outside the vinery you could heat the greenhouse without affecting the vinery when you wish it to be perfectly cool. There should also be a stop-valve by which you could turn off the water from the vinery at will.

Parasites on plant roots.—*J. S.*: The long, slender creature is a worm of the lower order, and often breeds in enormous numbers amongst leaf soil and other decaying vegetable matter, but we never discovered that they did any particular harm, though they must have got into the potting compost often. These low organisms breed by means of eggs which they produce in enormous numbers. We are more inclined to suspect the short grub, which is the larva of a two-winged fly belonging to the same group as the Cabbage Fly (*Anthomyia Brassicae*) and the Root-eating Fly (*A. radicum*), being constructed precisely on the same plan and about the same size. All of them coming under our notice are parasites, living on fresh vegetation. The perfect flies lay eggs, which hatch out giving rise to the grubs you sent, the larger one of which was full grown and about ready to pass into the pupa stage. The latter after its transformation gives rise to the perfect fly again. We also discovered the mite you mention, but we think it was too lively to be a vegetable feeder. With regard to remedies we consider you adopted the best plan by shaking out the Asparagus plants and washing the roots previous to repotting them. We believe the worms, and possibly the grubs as well, were introduced by the compost, and we take it for granted that you were careful to get clean soil as far as you could see, and that any leaf soil and dung used were free from the vermin. There is another grub that sometimes gets introduced to pot plants, by the compost containing eggs. We refer to the weevils known as *Otiorhynchus* of which there are three, very often too common in gardens and plant houses. The grubs are fatter and more curved than those you sent us. You might lay about some pieces of wood in the houses over night to act as traps, to see whether you can catch any of the long-snouted beetles known as weevils. They are often very destructive to pot plants and other subjects.

Clematis or Banksia?—*Sigma*: The principal climbers on the house you mention are Roses, Clematis, Jasminum, Virginian Creeper, and Ivy. The most likely of these to litter the ground with their fallen leaves would be Roses, probably Tea or Noisette varieties, and very likely a free flowering

CARTERS' GREEN PEAS—JUNE TO NOVEMBER.

A correspondence was raised in the Daily Press last Autumn upon the shortness of the season when Green Peas are available, both in gardens and on the market. We now offer the following as representing the best collection selected from 1,024 rows we had under trial last season. It would be difficult for us to give precise dates for putting the seed into the ground, as so much depends upon soil and situation. Successional Sowings may be made any time between these dates, and the last sowing not later than the second week in June.

| NAME. | DESCRIPTION. | HEIGHT. | WHEN TO SOW. | EXPECT READY TO PICK. | CARRIAGE FREE. |
|--------------------------|-------------------------|---------|-----------------|-----------------------|-------------------|
| | | ft. | | | Per pint. Per qt. |
| Carters' Lightning | First Early White Round | 2½ | In February | May to June | 2s. 3s. 6d. |
| Carters' Early Morn | First Early Marrowfat | 3 | End of March | During June | 2s. 3s. 6d. |
| Carters' Daisy | Second Early Marrowfat | 1½ | Middle of April | Early July | 2s. 3s. 6d. |

| Carters' Michaelmas | Late Marrowfat | 3 | May to June | Sept. to Nov. | 2s. 3s. 6d. |

The Collection—1 pint each of 7 varieties, price 12/6; 1 quart each of 7 varieties, price 22/6, Carriage Free.

OFFERED IN SEALED PACKETS ONLY

Carters THE QUEEN'S SEEDSMEN, 237, 238, & 97, HIGH HOLBORN, LONDON

and white sort belonging to the latter, which is very common in country villages. The Banksian Roses are too small and insignificant to litter the ground to any great extent. There is an evergreen Rose of the name of Félicité Perpétué, with flesh-coloured flowers, so that possibly this is the plant you refer to.

Retarding Bulbs in Pots.—W. S.: The unusually mild season must be held accountable for the advanced state of the bulbs plunged in cocoanut fibre. It would be no advantage to place them in frames or houses, unless the frames face the north. The best plan, probably, would be to transfer the pots to a northern aspect, under a wall, so as to prevent them getting direct sunshine. In case of frost, they would also be safer here, because they would thaw gradually instead of quickly, if in direct sunlight. To save the foliage in case of sudden frost, you could spread a dry mat over them at sundown.

Propagating Golden Privet.—A. C.: Take cuttings of the young wood, that is, last year's shoots and cut them into lengths of 6 ins. to 9 ins. Spread some sandy soil from beneath the benches, and some leaf soil on the ground you wish to be occupied with the cuttings. This may be on a half shady border, or, if you care to, you can fill a frame with them. Dig the soil over, mixing the fresh material with it. Make straight-edged trenches as you proceed, insert the cuttings as you would those of a Gooseberry, and tread the soil firmly about the cuttings. Water later on, if necessary, during dry weather. Smaller cuttings may be used, if you insert them in sandy soil in pots. By placing the latter on a gentle hot bed, roots will be produced more quickly.

Name of Fruit.—New Park Road: The Apple has not been recognised, and is getting out of season.

Names of Plants.—G. W.: The Cypripedium is a hybrid of which the parents are evidently C. javanicum and C. lawrenceanum.—R. M.: 1, Cornus mas; 2, Pyrus japonica; 3, Cupressus nutkaensis (Thujaopsis borealis is only a synonym); 4, Pelargonium radula.—A. C.: 1, Crocus biflorus; 2, Crocus susianus; 3, Helleborus colchicus; 4, Sparmannia africana; 5, Erica carnea; 6, Senecio Kaempferi aureo-maculatus.—S. H.: 1, Begonia haageana; 2, Begonia Gloire de Sceaux.—E. K.: Viburnum Tinus, the Laurustinus, which has been flowered under glass.

LONDON SEED TRADE.

February 8th, 1898.

MESSRS. HURST & SON, 152, Houndsditch, London, and 27, Seed Market, Mark Lane, report a slow demand for Agricultural seeds. English Red Clover is in larger supply and medium grades offer on easier terms. Alsike firm. White Clover and Trefoil steady. Ryegrasses neglected.

EPPS'S COCOA.

EXTRACT FROM A LECTURE ON "FOODS AND THEIR VALUES," BY DR. ANDREW WILSON, F.R.S.E., etc.—"If any motives—first, of due regard for health, and second, of getting full food-value for money expended—can be said to weigh with us in choosing our foods, then I say that Cocoa (Epps's being the most nutritious) should be made to replace tea and coffee without hesitation. Cocoa is a food; tea and coffee are not foods. This is the whole science of the matter in a nutshell, and he who runs may read the obvious moral of the story."

JUNO CYCLES ARE THE VERY BEST.

Easy Terms from 10s. per Month. LARGE DISCOUNT. CARRIAGE PAID.

Price, 22 lbs.; Roadsters, 28 lbs. JUNO Lady's, and Youth's Safeties. JUNO Tricycles. Write at once for new illustrated Juno List, Machines, Fittings, and Sundries, sent Post Free. Interesting to all, and all should have a copy. Metropolitan Machinists' Co., Ltd. Steam Works, Show Rooms, Riding School, Offices—75, 76, Bishopsgate Without, LONDON, E.C. Our new large JUNO Cycle Riding School for Ladies and Gentlemen now open, 1,700 ft. Single lesson, 1/6; come till perfect, 10/6, or free to buyers of the Juno.

POTATO EXPERIMENTS IN WILTS.*—For some years past experiments have been carried on by the Agricultural Committee of the Wilts County Council with the view of testing various soils, manures, Potatos, the checking of Potato disease, Onion, Grass, Peas, Beans and other crops. The experiments last year were conducted at Quemerford and Lickhill in the neighbourhood of Calne, Wilts, and the results have just been published. The town of Calne is situated on the border land between the lower cretaceous and the oolites, both being limestone formations of different geological age. The more we study the experiments that are being conducted in different parts of the country the more evident it becomes that the question of soils, manures, and crops is a complicated one, fully necessitating local experiments to demonstrate their relative values. No set of experiments, however carefully conducted, will apply to all parts of the country on account of the variations of soil and climate. A strong feature of Potato experiments at the present day is the amount of attention that is given to varieties that produce tubers of great size and give the greatest weight per acre. Of this we should have nothing to complain provided always that the quality is taken

*REPORT ON THE CALNE AGRICULTURAL DEMONSTRATIONS. Eyre and Spottiswoode (Her Majesty's Printers), London—East Harding Street, Fetter Lane, E.C. 1898. Price 1s.

BARR'S SEEDS

BARR and SONS,
12 & 13 KING ST., COVENT GARDEN, LONDON.

into account when the tubers are grown as human food. Good table quality and disease resisting power should be placed in the front rank of recommendations even if the weight on any given piece of land might be less.

Noteworthy peculiarities of the soil at the Quemerford station, as shown by analysis were the relatively large percentage of matter insoluble in hydrochloric acid (71.99), the small quantities of lime (4.01), and carbonic acid (2.08). One of the objects of the experiments was to test the cropping qualities of the well-known Potato Reading Giant against the newer variety Wonder. Taking an average of 22 perches in each case it was found that Reading Giant gave 8 tons 17 cwt. 45 lbs. per acre; while Wonder gave exactly one hundredweight more. After removing the small and worthless tubers from both varieties it was found that Wonder weighed over 16 cwt. less than Reading Giant. After being cooked the former had the best appearance, but the latter the best quality. Here again we should advise judges at horticultural shows not to be misled by mere appearance, but to take mealiness and flavour into account when making awards for boiled Potatos. Another object of the trials at this same station was to prove that nitrogen, phosphate and potash are generally desirable when artificial manures only are applied to this particular crop. Our opinion is that it entirely depends upon the composition of the soil, which in this particular case was only moderately fertile. The three ingredients of plant food above named consisted of equal weights of each to which the term "complete chemical manure" was applied. The nitrate of soda was applied at three dressings, while the kainit and superphosphate were applied on the 24th April. When this complete manure was applied at the rate of 8½ cwt. per acre it gave an average return of 9.34 tons per acre for the two varieties of Potato. When 12¾ cwt. was applied the return was 9.23 tons; and 4¼ cwt. gave 8.40 tons of tubers per acre. The difference is certainly not so great as one might have expected, and the reason is not very obvious. We note that the variety Wonder gave the largest return in each of the three cases, but it also gave the greatest proportion of small and diseased tubers. Numerous other statistics of the trials at Quemerford are given in tabular form, and are well worth careful consideration.

Turning to the trials at the Lickhill station, we note that the analysis of the soil showed 32.6 per cent. of matter insoluble in hydrochloric acid; 25.241 of lime, and 18.378 of carbonic acid, the first named being much less, and the two latter greatly in excess of the percentages at Quemerford. The organic matter and combined water, as well as the more important elements of plant food present showed that the soil at Lickhill was more fertile than at the other trial ground. Seventy-eight perches of land divided into thirteen plots of six perches each were placed at the service of the trials at Lickhill. Three plots were left unmanured by way of a check, and gave an average of 5 tons 15 cwt. 22 lbs. of tubers to the acre.

The three plots (18 perches) of land devoted to trials with farmyard manure gave rather interesting results, various important facts being deducible from the table of statistics. The manure was applied at the rate of 16 tons per acre, and the average return for the three plots was 9 tons 17 cwt. of tubers, being considerably greater than that from any chemical manure or combination of them. From results like these, some people are ready to assume that Potatos should never be grown without this particular fertiliser. We consider that the results

were due entirely to the nature of the soil, which was light and contained a large percentage of lime. A mechanical improvement of the soil during the dry summer of last year, particularly during the early part of it, was effected by the moisture-holding character of the farmyard manure. On the other hand we note that the greatest weight of diseased tubers was found on these plots. Farmyard manure always encourages the Potato murrain during wet weather, and this was more than plentiful before the summer was over. The money value of the increase per acre was £9 10s. so that when the cost of the manure (£4) was deducted it left a margin of profit equivalent to £5 10s. as the net profit arising from the use of farmyard manure on this particular soil. The varieties of Potatos employed in the Lickhill experiments were Daniel's Dreadnought, Stourbridge Glory, Reading Giant, Imperator, Reading Russet and Early Puritan.

Complete chemical manure at the rate of 12¾ cwt. per acre gave an average of 9.96 tons of tubers; 8½ cwt. gave 9.71 tons; and 4¼ cwt. gave 8.31 tons. These facts speak for themselves when the varieties of Potatos used, the character of the soil, the cost of the manure, &c., are taken into consideration, showing how necessary it is to weigh everything in the balance when the most profitable culture is the object under consideration. An important result of the trials both at Quemerford and Lickhill was that cut sets of Potatos gave a poorer return than whole tubers even under fairly equal conditions as to soil and manures. There were also some interesting experiments with nitragin, that is, with the microbes or germs that produce the well-known nodules on the roots of leguminous crops, and fix the free nitrogen of the atmosphere.

Another Record for Gardeners.—Father and son were for over sixty-two years head gardeners at the same place. The father was thirty-two years, the son over thirty years in succession without a break, and the latter still looks fit and able to command for years to come a body of "snag-catchers."—*F. B. Peshurst.*

A Forest of Rubber Plants.—A company is being floated to work a forest of Para Rubber (*Hevea brasiliensis*) said to cover an area of 137 square miles in the State of Amazonas, Brazil, and to consist of 1,000,000 matured trees ready for tapping. The estate lies on both sides of the winding Rio Teffé, a tributary of the Amazon, so that there is water communication all the way to the Atlantic.

A Caution.—A man called upon me the other day in answer to my advertisement "businesses for sale," stating he wanted one for his son. Selecting one and noting down the particulars carefully he made arrangements to go and see the same. I, of course, enquired where he lived, and he gave me a bogus address (which I have since found out), saying that he was staying at the King's Cross Hotel (but here he tried the old trick). Says he, "I did a most stupid thing this morning, I came away thinking I had a pound in my pocket, which I find is only a shilling; lend me one." "What?" said I; "try that game here! Get out as quick as you can or I shall help you." Needless to say he went much quicker than he came. Should he attempt a similar game the following description will help anyone to recognise him:—height, about 5 ft. 4 in.; age, about 52; thin, bald-headed; whiskers all over his face, cut short and getting grey; genteelly but shabbily dressed; can tell his tale well, and limps a little when walking. The only regret I have now is that I did not help him off my premises with my foot.—*Alfred Outram, F.R.H.S.*

[On the next occasion this pest of society makes his appearance, and asks for £1 it should be given him, after which he may be handed over to the tender mercies of the law.—*ED.*]

The Kew Guild.—The annual general meeting of the Kew Guild takes place always on the last Thursday of February, so that the forthcoming meeting this year will be held on the 24th inst. It is scarcely necessary to remind Kewites both past and present that all are invited and expected to attend, who can possibly do so.

The Great Fire in Holborn.—Messrs. Carter & Co., The Queen's Seedsmen, beg to announce that the fire-proof outer walls of their premises were scorched only, and this particular warehouse contained but a few score bales of breakfast Oats, so that orders will be executed and despatched with the usual promptitude.

Lord Rosebery at Naples.—The Villa Delahontte, in the neighbourhood of Naples, has been purchased by Lord Rosebery, who has gone to take possession. The Almond trees are in bloom giving a pink flush to the scenery. Scarlet and purple Anemones, blue and white Violets, stud the grass thickly with their brilliant or sober hues, as the case may be, under the dark greyish-green foliage of the Olive trees.

Mr. Rhodes and the Locusts.—Mr. Cecil Rhodes has a farm of some 3,000 acres, in the midst of which stands his stone built house. It is situated near the Inzanga Mountains about seventy miles north from Umbali, and on the border of Portuguese territory in East Africa. The land is watered by streams from the mountains named, and, needless to say, is very rich. It is surrounded neither by hedge nor fence. Almost anything could be grown upon it were it not for the locusts which for two-thirds of the year swarm upon it in myriads, darkening the air as in the days of Moses in Egypt centuries ago. The vile locusts eat up every green thing, while Mr. Rhodes may be seen under the verandah of his house about 5 p. m. enjoying a cigarette or cup of coffee, but at other times walking to and fro reviling the locusts fiercely.

Narrow Escape of Messrs. Carters' Premises.—At a quarter to 3 a. m., on the 10th inst., a fire broke out in White Horse Court, between High Holborn and Eagle Street, Bloomsbury. Two large buildings used by a firm of wholesale druggists were completely gutted. During the progress of the fire there was a series of explosions, and the different stocks of drugs as they became attacked gave off various brilliant hues, and when the roof, burnt through, came down with a crash there was a tremendous outburst of flame and sparks. The intense heat scorched the face of the premises off Messrs. J. Carter & Co., but after an exciting battle with the flames for an hour the firemen got the mastery of the enemy.

The Construction of Plants.—The combined meeting of Kew and Chiswick men as announced in our last issue, took place in the Lecture Room of the Royal Gardens, Kew, on Tuesday last. The Kew men mustered to a man, lady gardeners included, and with the Chiswick gardeners and a few others, the number was run up to seventy-two, who assembled to hear the lecture by Dr. D. H. Scott, F.R.S., honorary keeper of the Jodrell Laboratory, on "The Construction of Plants." Dr. Scott described a living plant as a machine, more or less complicated, but every part well adapted for the work or function it had to perform. In other words it was a machine that constructed itself out of the materials obtained from the air by the foliage, and from the ground by the roots. The subject was a vast one, and he could only deal with it by taking a broad general view and illustrating his remarks by lantern slides thrown on a screen. These consisted of micro-photographs of various plants from microscopic, unicellular plants, upwards to the most highly evolved dicotyledons, monocotyledons, and gymnosperms. All these higher plants were, of course, represented by sections, so that their minute anatomy was clearly drawn upon the screen, and had the recommendation of being not merely diagrams, but pictures true to nature, and, therefore, constituting a most valuable aid to anyone who might be giving instruction in morphology as well as physiology. There were sections of the Lime, Apple, Aristolochia, and other climbers representing dicotyledons both in transverse and tangential sections. Various peculiar types of the same class were shown, as well as the monocotyledonous type of stem. Roots and stems of the Scotch Fir, and various aquatics were most interesting and instructive.

Mr. Joseph Watt, Udston Gardens, Hamilton, has received the appointment of head gardener to Arthur Armitage, Esq., Kerroughtree, Newton Stewart, Wigtonshire, N.B.—*Gama*.

Smoking Bouts.—*Waggs*: "I knew a man so fond of tobacco that he smoked the night scented tobacco." *Snaggs*: "Och, that's naething at a'. I kent a man that smoked a hoose, and many lives were lost, maistly green fly."

Royal Botanic Society.—At the fortnightly meeting of this society, which was held in the Gardens, Regent's Park, on Saturday, 12th inst., Mr. C. Brinsley Marlay in the chair, Mr. J. B. Sowerby, F.L.S., secretary of the society, gave the first of two papers upon fibre plants. He explained the characteristics which vegetable fibres should possess to fit them for the manufacture of textile materials, ropes, etc. Living fibre producing plants, and fibres in various stages of paper making, were shown; also some well-flowered specimens of *Coelogyne cristata*.

Orchids at the Sale Rooms.—Good things still command their price at the Sale Rooms of Messrs. Protheroe & Morris, Cheapside. A piece of *Cymbidium eburneum* fetched 4½ gs.; fine varieties of *Cattleya Trianaei*, 9gs., 5½ gs., and 4½ gs. respectively. *Laelia anceps schroderiana* was secured by Sir Trevor Lawrence, Bart., for 21gs. A grand variety of *Odontoglossum wilckeanum* ran up to 72gs. A dark rose variety of *Lycaste Skinneri* had reached 5½ gs. at the fall of the hammer. *Cypripedium bellatulum album* commanded 5½ gs., and £3 for two small plants.

Syndical Chamber of Belgian Horticulturists.—At a meeting of the jury of this society on the 6th inst. Certificates of Merit were accorded to an exhibit of *Primula*, presented by M. le Comte J. de Hemptinne with unanimity; to *Cypripedium Albert Hye*, shown by M. H. Vanderstraten; to *Croton Mme. Lucien Linden* and *Dracaena godseffiana*, both exhibited by M. A. Rigouts; to *Cattleya Trianaei*, presented by M. J. Boelens; to *Anthurium hybridum*, presented by M. Louis de Smet with unanimity; to *Croton Albert De Smet*, presented by M. L. De Smet-Duvivier; to *Cattleya Trianaei alba*, shown by M. Osc. Wattecamp; to *Vriesia leodiensis x fulgida*, presented by M. L. Poelman Maenhout; and to *Odontoglossum Pescatorei album*, *Laelia anceps* var., *Cattleya Trianaei* var., and *Odontoglossum crispum Trianaei superbum*, all exhibited by M. G. Vincke-Dujardin. The awards were made with unanimity in the case of the first three plants, and by acclamation for the last-named *Odontoglossum* shown by M. G. Vincke-Dujardin. Certificates for culture were awarded to *Araucaria elegans compacta*, presented by M. B. Spae, and to *Lycopodium pinifolium*, shown by M. A. Rigouts.

A Queen's Seedsman Speaks.—On the occasion of his installation as chairman of the London Farmers' Club at the beginning of the present month, Mr. Martin J. Sutton, of Reading, delivered a most practical and statesmanlike address. He first of all glanced briefly at the most important legislative proposals affecting agriculture which are to be discussed by the club whilst he is their chairman, and then proceeded to review the position and prospects of agriculture. He said that, owing to the really fine hay harvest of last year, and the corn harvest which succeeded it, the prospects for 1898 were considerably better than for several years past. Mr. Chamberlain's recent speech before the Liverpool Chamber of Commerce was freely commented on. Mr. Chamberlain's proposed remedy for the failing sugar industry in the West Indies was considered as a hopeful sign that the government of the country were waking up to the fact so ably put by Mr. Chamberlain, that "every country should produce, and should be encouraged, and allowed, and stimulated to produce the articles for which it is by nature best fitted." It was therefore cheering to hope that the "sauce" which Mr. Chamberlain proposed to apply to the "little gosling" of sugar depression in the West Indies will be considered by him to be good enough for the "great gander" of agricultural depression in England. Mr. Sutton concluded by saying that "the farmers of England wanted no dole," but simply justice whereby they might be enabled to fight without one hand being tied by the artificial cheapness of wheat, and meat and dairy produce stimulated by fiscal and other conditions now obtaining.

Ashford Cottage Gardeners sat down to their annual spread on Wednesday, the 9th inst., under the presidency of Mr. W. H. Coke. The toast of the evening: "Success to the Ashford and District Cottage Gardeners' Society," was proposed by the chairman, who spoke of the good done by societies such as theirs. In replying to the toast, Mr. Keene read the balance sheet. From this it appeared that a revenue of £45 had resulted from the summer show. A balance of £3 12s. 1½d. remained on the year's working.

The Royal Horticultural Society of Southampton.—The printed report and statement of accounts for 1897, issued by the Royal Horticultural Society of Southampton, is now before us. It contains a notice that the annual general meeting will be held in Mr. T. Miell's Auction Rooms, Hanover Buildings, Southampton, on Monday, February 21st, when the Mayor of Southampton will preside. The report of the council states that the financial position of the society has been much improved during the past year, the standing debt having been reduced by £62. The results of the summer show were, however, very disappointing, for the gate money was less by £265 than that for the preceding year, and £100 less than the lowest recorded for the last twenty years. The Chrysanthemum show, on the contrary, was a conspicuous success, both from an exhibition and a financial point of view. Having regard to the great risk involved it has been decided to abandon the great Summer Fêtes, at any rate, for a time. Arrangements have been made, however, with the Harbour Board to hold an exhibition on the pier on June 28th and 29th, at which Roses will figure conspicuously. The council looks forward to being able at an early date to clear off the whole of the liability of the society. The statement of accounts shows a total income for the year of £642 18s. 10d., and total expenses for the same period of £581 11s. 1d. The debts standing at the commencement of last season amounted to £198, whereas now they have been reduced to £137 8s. 7d.

Smoking Concert at Anderton's Hotel.—The second annual smoker was held here on Monday last for the benefit of the National Chrysanthemum Society's reserve fund, and the large hall, gratuitously lent by Mr. A. C. Clemow, was crowded all through a lengthy programme and evening. The great success achieved this year was probably due to the fact that a large number of ladies responded to the invitation accorded them. Messrs. W. Cutbush & Son, and Messrs. J. Laing & Sons gave the hall a most pleasing appearance by the artistic display of Palms and pot plants, whilst Mr. D. Ingamells fairly earned the gratitude of the lady artistes by supplying each of them with a very tastefully arranged spray of Violets and Lilies of the Valley. Mr. James H. Veitch, a director of the famous firm whose name he nobly bears, was an A 1 chairman, and well deserved the encomiums tendered to him by Messrs. Richard Dean and Brian Wynne when they asked the audience to give him a vote of thanks. The programme consisted of some thirty items, and each executant justified the good reception given. Mr. Sadleur Browne's songs, "Mary of Argyle," and "Evening Song," were splendidly sung; also "Gipsy John," and "Vulcan Song," by Mr. W. G. Stanley Cleverly, a blind musician and vocalist, who has been certificated at the Normal College. Mr. Albert Bessie in his "School-boy's Song," and "Little Dolly Daydreams," created much amusement. Mr. T. W. Swales, so well-known to members of the National Amateur Gardeners' Association, was again most successful in his rendering of "A Jovial Monk am I," and "The King's Own," and in spite of an apparently severe cold, Mr. Leonard Holmes did good justice to "The Soldier's Song," and "Good Company." The lady artistes, Mrs. Phil Rider, Miss Lily Beste, Miss Emmie Low, and Miss Aida Bessie, L.A.M. Med., of course, formed the great attraction, and the splendid manner in which each performed the allotted tasks will ensure their being asked to assist again. Two special features were: The recitation given in inimitable style by the Rev. H. Vivian Tyrell, and the guitar solo by Mr. Harry Hunter, of the Olympian Pierrots. Mr. Hunter also very skilfully accompanied on the piano. Mr. H. Myers, a representative of the Ichthemic Guano Company, most creditably acted as stage manager. It is expected that a substantial addition will be made to the reserve fund of the N.C.S., through this effort.

When Botanising is dangerous.—Young hotanists should beware of going into a field after the hull rushes and the hedges begin to shoot.

The Lucombe Tree.—If your correspondent, D. Chisholm, refers to Vol. vii., page 490, of THE GARDENING WORLD, he will learn much concerning *Quercus Cerris lucombeana*, and its many varieties; for there I gave the history of this famous Oak—W. Napier, Royal Ashburnham Park Nursery, Chelsea.

Was it worth the trouble?—This question must have been uppermost in the minds of two litigants who recently appeared before Judge Williams at the Aherdare County Court to settle about the produce of a garden. The plaintiff, ex-police constable Thomas Moles, sued his successor, P. C. Parcaiers, for the value of certain vegetables and fruit left in his garden. Judge Williams held that something was due to plaintiff, and said that if the solicitors could not agree, he should have to send a third party to value the claim. Asked whether he would appoint a resident in Aherdare, His Honour said he didn't know; he might send Mr. Pettigrew, and his fee would be five guineas—about twice the claim. This should cure both plaintiff and defendant of going to law.

Sutton's Farmers' Year Book.—Agriculture has so long been under a cloud that it is refreshing to read the opening paragraphs of Sutton's Farmers' Year-Book for the current season. No doubt the authors have exceptional opportunities of glean-ing information from original sources, and they indicate some of the circumstances which justify the opinion that 1898 will prove a favourable year for farmers, should the weather be propitious. One striking feature distinguishes this season's edition of the work from its predecessors. The illustrations almost exclusively represent field crops, and marvellous crops they are. No wonder that the owners were proud to have them photographed. Although pulled roots must always command attention for their typical qualities they are but specimens and the proportion in any crop cannot be inferred from samples. But illustrations of large acreages of fine roots furnish convincing evidence of well-selected stocks. To confirm this view some very remarkable lists are given of the honours won by customers' in open competitions, and these lists of prizes are supplemented by reports from all parts of the kingdom giving the records of weighty crops of Mangels, Swedes, and Turnips. Two of the new introductions have achieved an extraordinary reputation as prize-winners and in each case immense cropping power is combined with high quality in the individual roots. Messrs. Sutton again call attention to the advantages of sowing down land to temporary pasture. These short-term grass layers produce abundant crops of nutritious food for a few years, and when broken up the roots hold a valuable store of nitrogen for the benefit of the following crop. By a proper rotation of grass with corn and roots a supply of nitrogen is thus ensured without the direct outlay of a farthing for this costly manure. Those who contemplate laying down land to permanent meadows or pastures may with advantage study the very practical article on this subject, which is written from the farmers' point of view, and is made increasingly interesting by fifteen illustrations of the most important Grasses. These drawings have been reduced by photography from the larger series published in Mr. Martin J. Sutton's standard work on Permanent and Temporary Pastures. The merits of the different varieties are discussed in a popular way with the practical object of securing the best possible return for the outlay in every instance. To remedy a defective seeding is so difficult and expensive that the frank exposition of this subject by Messrs. Sutton is calculated to prevent a repetition of past blunders. In a season when the short supply of Potatoes has created a famine in certain districts of Ireland it is natural that there should be an unusual demand for the disease-resisting varieties for which the great Reading firm has won a reputation. Crops that have been grown for table use without the attention necessary for maintaining purity and robustness will be offered without scruple as seed Potatoes, and it is therefore of great importance to insure true stocks. Agriculturists will find in Sutton's Farmers' Year-Book a fund of information compiled expressly for their use. Copies will be forwarded free of charge, by the publishers, Sutton & Sons, Reading.

HINTS FOR AMATEURS.

THE SEED ORDER.

Peas.—Amongst what may be termed the higher class vegetables there is none more delicious than the garden Pea. Wonderful improvements have been effected in it of late years, and there is really no comparison between the grand modern varieties and those that used to be grown many years ago; for the former are so immeasurably superior, not only in the quality of the produce, but in the cropping powers and general behaviour of the plants. In no vegetable, with perhaps the possible exception of the Potato, is there a more bewildering list of good things to choose from; indeed there is no list of varieties that can be given, unless it is to assume very lengthy and cumbersome proportions, but would do an apparent injustice to varieties which have not been mentioned, and which, according to some opinions, are fully equal in every way to others that have been included. Opinions vary, of course, and it is as well that they should, and we can only reiterate the advice to individuals who have found a variety that does well in their particular locality to stick to it.

The varieties may be broadly divided into three sections—viz., early, mid-season, and late, and this rough classification will be sufficient for us to group the sorts required to keep up a succession from the end of May, in a favourable season, until the beginning of October, that is to say, a period of five months or thereabouts.

For yielding the earliest crop out of doors most gardeners prefer one of the dwarf varieties. The seed is sown under glass, and the young plants put out in a warm border or other sheltered corner of the garden as soon as the weather permits. Dwarf varieties are especially suitable for this kind of work, as protection can easily be given them if sharp weather comes, although some of the taller-growing sorts do very well under this kind of treatment. American Wonder has long been a favourite for early work, but as far as our experience goes we prefer Chelsea Gem, which is fully as early as American Wonder, and has the additional merit of being a heavier cropper. The pods, which are produced in pairs, are longer than in the first-named variety and hold more peas. The plants run from a foot to 15 in., in height according to the season and the character of the soil in which they are planted.

Carter's Lightning is a taller variety which attains a height of about 2½ ft. For naturally wet or cold soils it may be highly recommended, and in some localities it will turn in before either Chelsea Gem or American Wonder. It is a very heavy cropper, and the pods are always well filled. It is a great favourite with many gardeners, and deserves to be widely grown. Amateurs who have gardens where the soil is very cold will do well not to lose sight of it.

Sutton's Improved William 1st is a real improvement upon the well-known William 1st which has been largely grown in gardens for years past, as an early tall growing sort. The "improved" form is rather dwarfer in habit, being about 3 ft. in height in an ordinary season. A choice may be made between this and Veitch's Exonian.

For a second early variety to succeed the foregoing the cultivator cannot do better than try Carter's Early Morn, a Marrowfat of great excellence both from the quality as well as from the cropping point of view. It is a comparatively new sort but has won golden opinions wherever it has been tried. It was produced by crossing Lightning and Daisy. The height was 3 ft. The pods are large and handsome, and the peas last a long time in condition.

For the main or general crop Carter's Daisy cannot be beaten for a dwarf variety. The plants attain a height of from 15 to 18 in. in height, and crop very heavily, the pods each containing eight or nine large seeds, the quality of which is everything that could be desired. For a tall variety a good stock of Duke of Albany will always give good results, and for exhibition purposes there is no finer sort. The quality is first-class, and the plants crop heavily, the pods being large and handsome. The height is 5 ft. Telephone and Stratagem are standard sorts of great merit, and both of them are 5 ft. in height. Masterpiece is a grand marrow pea 3 ft. high, that has many admirers and can be confidently recommended.

If only two sorts are required Daisy and Telephone will make a capital selection. The other sorts may be included if space permit and if the amateur proposes to exhibit, the claims of Duke of Albany, and Alderman especially should not be forgotten.

Late Peas are not so extensively grown as they might be. It is true that they have a good many enemies to contend against, and have not, on that account, the chance that the earlier crops have of acquitting themselves well. To commence with, the late plants have the drought of summer to contend against, and this in itself is a serious matter, although the difficulty may be overcome to a very great extent by deep cultivation and judicious attention. Mildew is a sore pest to the enfeebled plants and usually makes its appearance to some extent, while it often runs riot. The birds too seem to have sworn enmity to the Peas and peck at and ruin the pods at an alarming rate unless prevented by nets. Despite all these difficulties a few dishes of late Peas are always appreciated.

One of the very best varieties for late work is Autocrat, a blue wrinkled marrow Pea of exceedingly robust habit, a good bearer, and one that puts up well with protracted periods of drought. The height is 4 ft. in an ordinary season, but this will be found to vary considerably according to the special character of the season, whether dry or wet. Sutton's Latest of All is well described by its name, for pickings may be had from it in November—a sufficiently advanced time of the year to suit any and everybody. The plants commence to set their pods close to the ground so that there is very little of the haulm wasted. The height is 3 ft.

Sugar Peas.—These have not been popularised to any great extent in this country, but are highly thought of and largely grown upon the Continent, France notably, where they are known as *Pois sans Parchemin*. The whole of the pods are cooked in the same way as a young French or Runner Bean, and they form a delicious vegetable, and one that is deserving of a little attention. The tough, stringy membrane that is present in the pods of the ordinary shelling Peas that we have been discussing is absent, and its place is taken by a succulent substance that is perfectly sweet and tender when cooked. The catalogues of many seedsman contain no mention of these edible-podded Peas, but the seed can be obtained, if specially asked for, at pretty reasonable prices. Those amateurs who would like to have a little novelty may well invest in this direction.

French Beans.—When grown in pots under glass the dwarf French Beans form a very valuable vegetable during the earlier months of the year. The system of forcing is a simple one and need not give any trouble to an amateur who has a glasshouse in which he can command a temperature of about 60° Fahr. For forcing purposes either Osborn's Forcing, or Ne Plus Ultra will answer admirably, and there is very little to choose between the two varieties in point of forcing, although that little is rather in favour of Ne Plus Ultra. This variety, too, is equally good out of doors for first crops, as it is naturally early, and commences to crop when the plants are yet small.

For a general crop Canadian Wonder is everything that can be desired. It is a most prolific bearer and the pods are of great length and size as well as being of first-class quality when cooked. If only one variety is to be grown this is the one to choose.

The Climbing French Beans constitute an interesting and useful section. The pods are like those of the "dwarfs" in general appearance, being long and relatively narrow, but the habit resembles that of the "runners," from which they differ, however, in their exceeding earliness. Tender and True is one of the best varieties.

The Butter Beans represent a type having a peculiar buttery flavour, which is much admired by some connoisseurs. Sutton's Golden Waxpod is a safe variety to experiment with. It is very dwarf in habit and a free and continuous bearer.—*Rex*.

Correspondence.

Questions asked by amateurs on any subject pertaining to gardens or gardening will be answered on this page. Anyone may give additional or more explanatory answers to questions that have already appeared. Those who desire their communications to appear on this page should write "Amateurs' Page" on the top of their letters.

Roman Hyacinths.—*Oral*: The Roman Hyacinths

so much cultivated are not the offspring of *Hyacinthus romanus*, as you suppose, but of a variety of *H. orientalis* named *albulus*.

Chrysanthemum Cuttings Damping.—*P. L.*: It is sometimes difficult to assign an exact reason for *Chrysanthemum* cuttings damping. You have probably given too much water and have neglected to give air now and again.

Erica Carnea.—This is the Heath you speak of, *Shrubs*. It is one of the finest hardy plants we have, and always blooms early in the year. There is a white form of it (*E. c. alba*), which is equally pretty and valuable.

Daphne Blagayana.—*Shrubs*: It is certainly very early for this pretty *Daphne* to be so far advanced. Perhaps your plant is very much sheltered, and this would account for its precocity in flowering. The season seems out of gear at present.

Pollenising Primulas.—*C. Bent*: You will require a soft camel's-hair brush to pollenise the flowers of your Primulas. Push the brush gently down the tube of the corolla until it touches the stamens, give it a gentle twist round, taking care not to be too heavy-handed, and you will find the pollen adhering to the brush when it is withdrawn. Brush the stigmas, or female organs, over very lightly, for to bruise them would be fatal to the result.

Curious Primula.—*S., Shipston-on-Stour*, forwards a flower of a Chinese Primula which has the calyx developed into a leaf. This is certainly a curious but not a unique production, for Messrs. Jas. Carter & Co., of Holborn, have a variety called Bouquet which always does this. The foliaceous calyx has, in the case of this variety assumed the proportions of quite a large leaf.

Apples on Wet Land.—*E. A.*: Your neighbour is simply courting failure in planting the Apple trees on wet, undrained land of the kind you mention. It should certainly have been drained before planting was attempted. You will at least have an object lesson in how *not* to plant.

Plant for a Front Garden.—*D. W.*: If you will send the measurements of the ground and the approximate shape, we should be in a much better condition than now to advise you as to the number, size, and shape of the beds. You should lose no time in doing this, as the season for planting will this year be a short one, and it is advancing apace. Turf would be a much more expeditious way of forming a small lawn than sowing down with grass seed, but it would also be more expensive, for you must have good turf.

Rhubarb Roots.—*C. C.*: After Rhubarb roots have been lifted and forced as yours have been they are fit for nothing but throwing away, as they are so much weakened that it would take too long for them to recuperate themselves.

Border Carnations.—I intend potting up and flowering under glass in a cool house some of the finest sorts of my border Carnations. Please tell me the best time to pot the plants and the soil to use. Any hints will be appreciated.—*Reader*.

The end of this month will be a good time to pot your plants up, for with the early season they will by that time have made a decent start. For soil you may use three parts of good loam, mixed with a fourth part of dried horse or cow manure rubbed through a sieve. To this add plenty of coarse river sand, and a small sixty pot of scot to each bushel of soil. Mix the whole well together. Pot fairly firmly, and drain the pots well. After potting consign the plants to a cold frame having a bottom of ashes, which keeps the plants clean and moist. The frame should be kept rather close for about a week subsequent to potting, but after the expiration of that time air should be admitted in increasing quantities until the plants are in full swing, when they should be grown as hardy as possible.

Setting Grapes.—*Reader*: It is not necessary to brush the bunches over in order to get the berries to set, as has to be done with early Peaches and Strawberries. A gentle tap on the rods in the middle of

the day is all that is required to produce the desired result, for there is generally plenty of pollen.

THE OLD DOUBLE-WHITE CHINESE PRIMROSE.

As I said in my few notes upon this decorative plant early in January, it is a matter of surprise that in so few private establishments is to be found; and yet, what is more acceptable during the winter months than this exceptionally free-flowering *Primula*? By some, it is considered rather a delicate plant to handle, or difficult of management, especially its propagation. To those hitherto unsuccessful cultivators I commend the undermentioned details which, if strictly adhered to, will reward the grower with satisfactory results, I feel sure.

Assuming then that he has a few stock plants, these should be moulded up at the end of February or early in March with decomposed leaf-soil and silver sand, cocoanut fibre and powdered charcoal, or chopped sphagnum and sand, with a good percentage of the latter, whichever ingredient may be used. This encourages new roots to be made against the time they are pulled to pieces, which with me is generally done towards the end of April, when great care is taken to preserve as many fibrous roots with the healthiest young growths as possible. The soil used for potting consists of finely sifted loam, leaf-soil, and sand, using rather more leaf-soil than loam. Have some small and large 60-sized pots crocked carefully. These should have been previously washed clean and dried before using. The plants should be potted firmly, having a surface of sand over the top, watered with a fine rose can, and placed in a propagating pit or case in an intermediate house having a temperature of about sixty.

Another good place is on a half-spent hot-bed; the little pots should be plunged in both instances, though care must be taken that the little plants do not damp off. I have also been most successful with them placed in a cold frame facing south, kept close, shaded from the sun, and lightly bedewed overhead with the syringe each bright morning. Last season they were placed in a cold pit, due north, where ninety per cent. succeeded. Naturally, in these cold structures, relying solely upon sun heat, they take rather longer to fill their pots with roots; but in whichever position they may be placed, most of them should be making roots and taking hold of the new soil in five or six weeks, consequently a little air should be given them to prevent them becoming drawn.

The plants must be carefully watched in order that no damping of the foliage may occur, or the plant may succumb. All decaying foliage must be promptly removed and a little powdered charcoal and lime applied where the union is broken if at all likely to damp. At the end of June or early in July they should be moved into the pots in which they will flower, the strongest going into 5½ in. or 6 in. pots, while the smaller ones should be put in 4¾ in. pots. The soil for this, the final potting, should be fairly rich, but light material, similar to that given before, with the addition of a little fine peat, soot, and bone-meal. After repotting place them back in a cold frame facing south, and give them close attention in the matters of airing and watering; the last named must never be done unless the plants really want it. They will require a light shading of tiffany or hexagon netting from the month of March up to the end of September, during the brightest part of the day, say from 9 a. m. to 3.30 p. m. The frames should be closed at nights, and if the weather is cold cover with mats.

The plants should, while growing, stand clear of each other, or the foliage will become unduly elongated, and more liable to damp off. Towards the end of September the plants should be taken into the greenhouse, and placed on a shelf or a light position as near the glass as possible, without being in direct touch with it. Speaking generally, an average temperature of 50° suits the plants admirably during the winter months, though the house where mine are flowering often falls to 45° on cold nights. The plants enjoy an abundance of air when once established, but quickly resent anything like a draught.

I find a little weak soot-water, given them once a week when their pots are filled with roots, acts as a good stimulant, and assists them greatly.

Towards the middle of November the successful grower will be well repaid for the little extra care and attention bestowed upon them by seeing good specimen plants full of flower, which they will continue to produce well into March. I should add that great care should be exercised when watering the plants, especially during the winter months. See that it is not poured into the centre, but near the rim of the pot, similarly as when watering *Cyclamen*. The accompanying photograph, which was taken at the end of January this year, shows twelve plants placed at a convenient corner in the same house for the purpose.—*J. Mayne, Bilton.*

CHINESE PRIMULAS AT READING.

THE unusually mild winter has practically resolved itself into spring not only out of doors, but in the indoor department as well, where work is proceeding

experienced workers. The warehouses beneath are piled from floor to roof with bags of other seeds amongst which the garden Peas would seem almost sufficient to sow down the gardens of the world. Other departments are filled with seed Potatoes. All these things are being made up in packets, bags, boxes, and packages of all sizes to suit the requirements of different establishments.

Being some weeks behind our usual time for inspecting the Chinese *Primulas* we fully expected to find them over for a season and laden with seed pods. Fertilisation has been going on for some weeks past and the earliest are practically over, but the mid-season and late varieties still furnish a marvellous display of the size and colour of the flowers into which the old Chinese *Primula* has been transformed by the art of the cultivator, entirely unaided by hybridisation with any other species. The range of colour extends from the purest white to the darkest

F. N. PARSONS,

PRIMULA SINENSIS ALBA PLENA.

BUDLIGH SALTERTON.

at a rapid pace. We had abundant evidence of this the other day as we passed through the extensive seed rooms of Messrs. Sutton & Sons, Reading, while on our way to see the Chinese *Primulas* at the Portland Road Nurseries. In the vegetable seed department the premises have been enlarged and otherwise altered to accommodate the ever increasing business in this particular line. Both here and in the admirably constructed flower seed department order and arrangement are everywhere manifest. In each department the seeds are classified alphabetically, the varieties placed under the species, and all prominently distinguished by printed labels. This facilitates the rapid make-up and despatch of the orders without hindrance or delay. In other departments women were busy sorting the seeds so that all may be spick and span and perfectly reliable. The rapidity with which this operation is accomplished stamps the hall mark of the proficiency of long

maroon-crimson yet seen in the species. Being intended entirely for the production of seed they are grown in 48-size pots without that stimulating feeding which is conducive to gross growth, but inimical to an abundant seed harvest. Under these conditions prolonged flowering is not expected nor indeed desirable, the whole energy of the plant being devoted to the development of good seed after the requisite number of pods have been set.

Sutton's Giant single strain of *Primulas* is the most highly evolved race of the species; and whenever they reach this stage of perfection Chinese *Primulas* seem incapable of going further, and the cultivator gives himself a vast deal of trouble to get the required quantity of seed from any given number plants. Big flowers give few seeds; but the cultivator who grows for decorative purposes will have these fine things, and we can hardly blame him, for a bad variety takes as much time, space and trouble to

grow it as a good one. We passed into house after house until we had been in eight, all filled to their utmost capacity with innumerable varieties arranged in large batches of a colour. Giant Royal White heads the list for size and purity. A watch, with a diameter within a fraction of two inches in diameter when placed against the flowers of this variety, left a wide margin exposed on all sides. The bright carmine-crimson of Giant Crimson seems to scintillate in a clear light as the eye is gazing upon it. Giant Scarlet is quite exceptional in size for so intense a colour, dark varieties being almost always characterised by having small flowers. The variety is early and of the same type as Reading Scarlet, well known for its rich colour. A handsome light variety is that named Giant Silver Gray, a term which well expresses the colour. The flowers are of enormous size, and recall the soft silvery colours met with in the garden varieties of Clematis lanuginosa. It is practically a new variety of which sufficient stock has not yet been obtained to sell otherwise than in the mixed packets.

Large and bright are the flowers of Giant Terra Cotta, well-named, for the flowers are of a rich salmon-rose and easily recognisable amongst other sorts even at a distance. Another handsome flower amongst light kinds is furnished by Giant Pink, which may be described as silvery-pink overlying white. The light green foliage and leaf-stalks conform to or harmonise with the soft hue of the flowers. A similar agreement of parts may be met with in Giant White, the large flowers of which are pure white. Those who like a companion to it will find such in Giant White, Fern-leaved, whose flowers are white when they first expand, but blush with age in a strong light. All of the above may be had in mixture. The flowers of the giant strain are quite equal in size and substance, if indeed, they do not excel in those particulars, to those we have seen when the plants were in their prime, and before the fertilising brush has been at work.

The ordinary type of Chinese Primulas is most profusely varied in shades of colour in conjunction with good habit and free-flowering character. The intensity of colour in Fern-leaved Crimson is certainly remarkable in the species, and indicates careful and constant selection through a long series of generations. It is matched, however, by the Plain-leaved Crimson, whose flowers rise in a pyramidal mass well above a ring of good foliage. The flowers are of an intense glowing crimson, yet brilliant withal, and surely sufficient to satisfy the most fastidious in the matter of contrast with lighter hues. These two varieties are the darkest we have seen amongst Chinese Primulas, and we prefer the plain-leaved sort on account of its more graceful habit. From this to Snowdrift is a great leap in the opposite direction, the profusion of flowers being pure white, and the whole plant light in hue. It is the earliest and most durable variety in the collection, as the flowers wither on the plant, and generally remain there till pulled off. Pearl is a very choice variety, producing a profusion of pure white flowers, accompanied by light green foliage. It has been constant to character since 1879, and still enjoys great popularity. A striking novelty has just been raised from Black Prince crossed with Reading Pink, but cannot yet be put into commerce. The flowers are silvery-white, with a purple centre of that hue seen in a Bougainvillea.

Very choice and handsome is Purity, Fern-leaved, which throws its large, pure white flowers well above the foliage. A few years ago this would have been big enough to be put in the giant strain. Sutton's Blue, Fern-leaved, is a month earlier than the plain-leaved type of the same colour, and throws up huge, pyramidal trusses of brightly coloured flowers. Royal White is the counterpart of Giant Royal White, except in size of bloom. The soft rosy-pink of Reading Pink makes a pleasing light shade of colour. The plain-leaved Double Blue is rather early for a double, and develops massive trusses and flowers of great durability. The rosy-pink flowers of Rosy Queen are almost sufficiently large to take rank with the giant strain. The Fern-leaved foliage is of a pleasing light green, and makes a pleasing setting for the tall flower stems. The bronzy, metallic-looking foliage of Gipsy Queen is in strange contrast with the speckled white flowers, and ought to be more extensively grown for conservatory decoration, the foliage alone being of decorative value.

The moss curled varieties continue to enjoy popu-

lar favour, which does not at all surprise us for they are very unique in appearance. The foliage of the Double Moss Curled White resembles Parsley or something similar at a short distance away, and being incurved, crisped and curled at the margins, displays two or more shades of light green. The foliage of Double Lilac is much darker and bronzy, and the rosy-lilac flowers are produced with great freedom. A considerable amount of table space is devoted to them, and flowers of several other shades of colour besides those mentioned have appeared in the strain.

The plain-leaved Single Blue is a choice and useful sort on account of the pyramidal masses of bright blue flowers it produces. In the same house were numerous double varieties, including Double White, a very early, pure white and floriferous sort. Double Crimson is also early and of compact habit. A clean, soft pink colour is exhibited by Double Pink, the flowers of which are produced in the greatest profusion. The flowers of Double Carnation Flake are pure white when they first expand, but afterwards become flaked.

The house devoted to a trial of varieties is a most interesting sight at the present time. The seed is sown a month later than the rest, and the plants receive no more shifting after they are placed singly in thumb pots, in which they are now flowering. Each plant is a perfect specimen in miniature, bearing a single truss of flowers as large as those in 48-size pots. The giant strain in these small pots is well worthy of inspection. A vast number of varieties is grown, twelve plants of each, and twenty-four when in mixture. Many a gardener would be glad of these small plants for various decorative purposes. All are wonderfully true to name. The trial must be very expensive, and is annually conducted merely to prove the seeds true to name. On one of the shelves of this house is a collection of species of Primula, mostly in bloom, including *P. vulgaris*, *P. Sieboldi*, *P. floribunda*, *P. rosea*, *P. obconica*, *P. sinensis*, and *P. japonica*, with which experiments are being conducted, in the art of hybridising. In another house a whole shelf is occupied with two-year-old plants of *P. floribunda*, most profusely bloomed; *P. obconica*, in many beautiful varieties is also flowering profusely and very attractive.

Last, but not least, comes *P. stellata* or Sutton's Star Primula, to improve which would be to spoil it, notwithstanding all opinions to the contrary. The starry flowers must remain so, and the slender, graceful, elegant, airy, and lightsome habit of the plant likewise. White and Pink varieties are the most noticeable, and the latter shade gets tinted with a beautiful coppery hue later on as the days get longer, the heat stronger and plenty of ventilation is given. Some of the white varieties show a purple flake. The display of bloom shows what can be done by growing this delightful variety for conservatory decoration.

ORCHIDS AT EASTWOOD PARK, NEAR GLASGOW.

THE Eastwood Park collection is very well known to the Orchid "cult." During a period extending over a quarter of a century the enthusiastic owner, D. Tod, Esq., has been constantly adding choice things and weeding out poor forms that do not come up to his standard of excellence. Consequently a visit to this home of good sorts is an education in itself. It has almost become a necessity for one to see the best forms of the different genera, and at Eastwood this can be accomplished.

The following are some of the choice ones that are in flower at the present time:—*Odontoglossum prionopetalon* with a spike of fourteen blooms; and a very choice form of *O. Coradinei* has three spikes of twenty flowers each. The rare *O. wilckeanum* has a spike that carries twenty-four blooms. *O. jenningsianum* is very fine, resembling *O. andersonianum*, only broader in the limbs. *O. sanderianum* carries nine spikes.

O. crispum was well represented by what is called the "Pacho" type. A very striking one, though slightly starry, had large chestnut-red blotches on the sepals and petals, making a magnificent plant. *O. Pescatorei* was not so plentiful, but one splendid variety was in flower, of large size, with the sepals and petals finely shaded with yellow; and the

labellum was finely spotted with lilac, not unlike the markings on *O. Cervantesii*. *O. pulchellum majus* was showing well for flower, the grand plants being in 9-in. pots.

The varieties of *O. Hallii* have always been a notable feature here, and at present two immense specimens are just coming into bloom. There are nine spikes on a plant, each about 4 to 5 ft. long. *O. Hallii leucoglossum* was conspicuous. A huge specimen of *O. Edwardii* carried hundreds of its pretty violet blooms of a larger size than we are accustomed to see.

Coelogynes are finely grown, *C. cristata lemoniana* largely taking the place of *C. cristata*. *C. cristata alba*, 3 ft. across, will soon be a marvel of beauty. The spikes of *Oncidium macranthum* and *O. serratum* are trained under the ridge, and run nearly the length of the house. Suspended from the roof are numerous pans of *Pleione humilis*; and among other things a fine batch of *Sophronites grandiflora*.

Mr. Hutchinson, the gardener, has already won his reputation as an Orchid grower, and, judging from the excellent condition of the plants under his charge, he is evidently determined to maintain it.—*Visitor*.

EARLY SPRING FLOWERS.

WHETHER Nature has been really kind to her children in imparting such an abnormal mildness to the opening month of 1898 is extremely problematical, and will remain so until we have passed through the next two or three months. At the present time we can only remark upon the effects of these continued high temperatures, and hope for the best for the future. The honours of the situation have not for long this season remained with the Snowdrop, and the Winter Aconite, for other subjects have put in a precocious appearance; for instance, Roman Hyacinths, both white and blue, flowering in the open at the beginning of February, as they are in Messrs. Barr & Sons' nursery, at Long Ditton, seem to indicate a curious topsy turvydom of the months, and thus it seems no wonder that other subjects besides the Hyacinths appear to have lost their reckoning.

Long Ditton is not an unusually early locality, for the country is pretty open hereabouts and low-lying, and if there is any cold weather about it is felt here in the biting winds. Still, despite it all, *Scilla bifolia* is in places showing its brilliant blue, and here and there one may note a stray *Narcissus minimus* or *N. cyclamineus* with expanded flowers. On a hedge-bank, facing the west, the large blue *Vinca* is blooming as freely by the side of the common yellow Gorse as if it were a couple of months later. Crocuses, as may well be supposed, have been having a fine time of it, although the sharp frost experienced on the morning of the 5th inst. put their equanimity to a severe test, but of these more anon.

At Long Ditton a number of beds have been enclosed with light wood trellises between 6 ft. and 7 ft. in height, which serve admirably to rob rough or biting winds of their sting, while they do not exclude the light. In these protected areas several early plants are flowering, including *Iris reticulata*, *I. r. Krelagei*, and *I. r. histrioides*. *Fritillaria oranensis*, a native of Algeria, is the earliest of the *Fritillarias*. The flowers are of medium size and nearly globose in shape. The segments are ovate-elliptic in shape, and have a broad maroon stripe down the centre of each upon a bright green ground. The leaves are very glaucous, of great substance, linear-lanceolate in shape, and about 2½ in. in length. The plant attains a height of from 6 in. to 8 in. Here, too, we observed *Galanthus Ikariae*, a fine new species which was fully described in the issue of THE GARDENING WORLD for February 5th. In this case the leaves were exceedingly broad and strong, almost as large, in fact, as those of *G. Imperati*.

In another corner of these protected grounds there were several beds of *Anemone Hepatica* in red, white, and blue, all the plants being full of flower.

Passing to the open we came across one of the most beautiful, and, when we take into consideration its earliness, one of the most valuable of the Hyacinths, *Hyacinthus azureus*, better known, perhaps, in gardens as *Muscari azureum*. The compact little spikes are about an inch in length, and are supported on scapes of 3 in. to 4 in. in length. The colour of the flowers is a light blue—Cambridge

blue, in fact—and as delicate looking as it is beautiful. Always an early bloomer this plant has this year got out of its bed of earth uncommonly early.

On the open rockery we met with an old friend in *Potentilla alba*, which will flower at any season if there is any chance at all. This season has been exactly to its liking, and the white flowers are correspondingly abundant. *Cyclamen Coum*, *C. C. lilacinum*, and *C. ibericum roseum* were also in flower.

The Christmas Roses have been having a royal time of it, and although they were much past their best when we saw them the plants made a brave show from a distance. *Hellehorus niger*, the Bath variety, was the most conspicuous form, and a fine free-flowering one it is.

The Lenten Roses take up the tale where the Christmas Roses lay it down. Mr. J. W. Barr informed us, upon enquiry, that he had never known them do better, for the weather had been exactly in their favour. The Long Ditton collection is one of the finest in existence, for it not only includes all the most noteworthy species, but the best of the hybrids and varieties from the Continent, notably Germany, where *Hellebores* have been systematically taken up.

H. punctatus, which was represented by a large break of plants in full flower, is one of the finest and most useful of the hybrids. Viewed on a sunny day the effect, when seen in the mass of its rose-purple flowers is exceedingly bright.

H. orientalis, the species which is the parent of so many fine varieties, and one of the parents of a number of hybrids is in itself a very ornamental plant. The flowers are of medium size, pure white, and produced in great abundance.

Amongst the seedlings from this species one of the best is *Modesty*, a new one not yet put into commerce. The plant is dwarf in habit, and bears large white flowers heavily spotted with maroon. *Mozart*, another new variety, has large, full, light rose flowers, spotted heavily with maroon. Of the older forms which we noticed in capital condition mention should be made of *Lady Leonora*, rosy-blush; *Queen Victoria*, green-white, spotted maroon at the base, flower of good regular outline, and very compact; *Afghan Prince*, dull green-purple, a curious and fascinating colour; *Frau René Heinemann*, dull purple, heavily spotted with purple-maroon; and *The Geisha*, white. *H. o. antiquorum* is a well-marked variety that is not infrequently accorded specific rank. Both it and *H. o. roseus* were exceptionally full of flower.

The rich plum-coloured *H. colchicus* has given rise to several fine forms of which *H. c. coccineus* is perhaps the finest. The flowers are large and of a rich blood-crimson hue that is splendid when the sun is shining upon it. *Otto Froebel* is another splendid variety with large purple-crimson flowers.

In the *viridis* section we get a lot of plants that may, perchance, be thought to be more curious than pretty, but they are interesting, nevertheless. *H. Bocconi* has large bright green flowers possessing a strong Elder-like perfume. *H. cupreus* has flowers representing a peculiar shade of slaty purple. *H. torquatus* is a very rare plant of very lowly habit suitable for the rock garden. It has dull green-purple flowers. *H. viridis erubescens* is really a rosy-coloured "*viridis*," for habit and build of bloom are identical. *H. v. laxus* has rather smaller flowers than the type, and the habit, as the name suggests, is more lax and spreading.

Of the *Crocuses* which were in flower at the time of our visit none was more beautiful than a bright, orange-yellow, sweet-scented form of *C. chrysanthus*, called *Canary Bird*. The type was also in capital condition. *C. etruscus*, with its delicate white flowers lined and veined with black, was exceedingly good. *C. tommasinianus* is one of the finest of the early spring-flowering species. At Long Ditton it does remarkably well, as was evidenced by the brilliant effect produced by some large beds of the delicate lavender-hued flowers. *C. t. atropurpureus* exhibits a rich shade of blue. *C. versicolor striatus* is a handsome purple variety with deeper purple stripes. *C. biflorus argenteus* is very conspicuous with its snow-white flowers, feathered prettily with black.

All these are real gems for the garden, as those who have seen them planted in masses in the nursery grounds at Long Ditton would not be slow to admit.

The *Globe* discusses the autumn-tinted foliage of *Mahonia Aquifolium* that is used so extensively for associating with *Roses*, and other flowers in button-holes. He is evidently disgusted at having to remove with soap and water the autumn tints that remain upon his fingers after handling the dyed foliage. The practice of dipping the leaves of the *Mahonia* in a bath of dye in order to produce that rich shade of bronze-purple seems to have become a fairly common one of late. It is only an enlargement of the idea that has given us gaudily-dyed grasses, and everlasting.

READING AND DISTRICT GARDENERS.

ALTHOUGH the Fern is one of the most popular plants with gardeners, both professional and amateur, yet an evening had not been devoted to this subject by the members of the above association previous to Monday, the 7th inst., when Mr. Powell, foreman at Park Place Gardens, Henley-on-Thames, read a paper before a crowded attendance of members, presided over by the president, Mr. C. B. Stevens, in the club room, British Workman.

Mr. Powell, in introducing his subject referred to the great popularity of Ferns, and to their being grown by every gardener; for, no matter how small the garden they were required, their uses being numerous. They were plants that could be grown under various circumstances; for it was not only in the greenhouse and stove that you saw excellent specimens, but in the cottage gardens in town and country you very often met with splendid examples of the hardy varieties. After dealing with the varieties most suitable for the out-door rockery, the greenhouse and stove, and the soils best adapted for their successful culture, he impressed upon the younger members in particular the great advantage and pleasure derived from making a study of the various classes of Ferns, especially in the drying and mounting of specimens in books, which would in after years be a source of profit and assistance.

At the request of the lecturer, Mr. Stanton made some very interesting remarks respecting the various varieties, the growth of the spores, and the fertilisation of Ferns, illustrating his remarks by dried specimens of crested Ferns; Ferns with distinct fertile and barren fronds; Ferns showing the various kinds of spore arrangements, whereby botanists were able to determine the genera and species of the family; specimens of peculiar interest such as the gold, silver, variegated and transparent varieties, some of which the speaker had collected thirty-seven years ago.

A discussion took place, bearing chiefly on the culture of *Adiantum farleyense*, in which Messrs. Martin, Turton, Woolford, Neve, Phipps, Bright, Tunbridge, &c., took part. Mr. Woolford exhibited some seedling crested Ferns of various forms, raised at East Thorpe; whilst Mr. Stanton brought a beautiful specimen of *Adiantum Capillus-Veneris* (the British Maidenhair) growing on the outside of an Egyptian earthenware pitcher. Six new members were elected.

GLASTONBURY THORN.

It may not be deemed inappropriate at this season of the year to send you the following as quoted from a well-known periodical of the year 1752:—"We hear from Quainton, in Buckinghamshire, that upwards of 2,000 people came on the 24th December at night with lanterns and candles, to view a Blackthorn, which grows in that neighbourhood, and which was remembered (this year only) to be a slip from the famous Glastonbury Thorn; that it always huddled on Christmas eve at night, was full blown next day, and went all off at night. But the people finding no buds, nor the appearance of any, it was agreed by all, that the 25th December, N.S., could not possibly be the right Christmas day; and accordingly refused going to Church, and treating their friends on that day, as usual. At length the affair became so serious, that the ministers of the neighbouring villages, in order to appease the people, thought it prudent to give notice, that the old Christmas day should be kept holy as before."

It will be remembered that the "New Style" of reckoning, and which was universally strongly commented upon, came into force on the 2nd September of the above year. It will be noticed that the writer of the above designated the Glastonbury Thorn, a *Blackthorn*, by which I presume he means *Prunus*

spinosa, while the Glastonbury Thorn, known to me is a variety of *Crataegus Oxyacantha*, namely, *C. O. praecox*.—D. Chisholm.

GOOSEBERRY PRUNING.

THIS is a much debated subject considering the common-place character of the plant in question. Possibly the thing which imparts the greatest interest to the question is, shall we say, the bird question; for were it not for a few members of the feathered tribe I venture the assertion there would not have been one-fourth of the correspondence in the gardening papers respecting Gooseberry pruning there has been if they would kindly leave our fruit trees and bushes alone, and content themselves with the insect fodder they are credited with being so partial to. It would simplify the task of many a one whose patience with this branch of animal life is often sorely tried. We are told on the one hand to prune late so as to run the chance of a few fruits from the few buds which our kind friends have so generously left us. On the other hand we have the advice to prune early, so that the energies of the plant will be thrown into the buds we ourselves leave. Further than this our advisers direct us to periodically convert ourselves into a kind of hybrid between a miller and a sweep by dusting over our bushes with a mixture of lime and soot. Now, briefly, my experience has taught me that where birds are troublesome the almost only, and certainly the best way is to grow Gooseberries trained to stakes about 5 ft. high, and soon after the leaves have fallen to draw all the shoots closely round the stakes with tar twine, and let them remain so till the buds are too far advanced for the birds to meddle with them. I then untie and thin out the wood. By this plan a good crop may always be secured, unless a late frost of unusual severity occurs. Once or twice I have delayed, with advantage, the untying, because of the prevalence of frosty mornings, till a later period than would otherwise be desirable. Their being close together serves to protect the young shoots to some extent from injury by frost.—W. B. G.

MUSA CAVENDISHII.

ON p. 360 in your issue for 5th February, you give "Rob" some little information respecting this plant, admitting it may be grown and fruited in fairly large pots in a house where there is abundance of heat and moisture. This is very true as far as it goes, and to those who have only just one corner in a stove, where a plant may be placed, it is just worth adopting. Fruit will probably be developed, some of which will ripen; but I fear the result will not be so satisfactory as could be desired. The fact is an ordinary stove is too moist, and too much shaded to grow Bananas well. So many other things are occupants of the same house that constant shading and moisture must be given to the greater number to the detriment of those that revel in heat, light, and at times a drier atmosphere.

It has often appeared to me somewhat surprising that a house specially devoted to the culture of Bananas is not more often erected, when ranges of fruit houses are being put up. If, however, it would be considered out of place among the Vineries, Peach houses, &c., well then devote a separate spot to one such house; and if made at all suitable, I venture to say the results after successful treatment will be that Bananas will become one of the prime factors in the fruit department.

For rich, luscious fruit, commend me to some fine English-grown, thoroughly ripened pods; and, when they are cut from a cluster grown in the garden, there seems to be a double pleasure in eating them. Of course, I by no means seek to slight the grand clusters that are constantly coming over to our ports; they are fine, and if it were not for these we should seldom have a chance of tasting the Banana. *M. Cavendishii* is the one usually met with in gardens, and answers well for all purposes; but *M. paradisiaca*, a taller grower, with much longer leaves, is a most delicious fruit. It has scarcely as long a pod as the former, but it is somewhat stouter. Its height, however, somewhat militates against its culture for fruiting purposes. To those who may purpose growing Musas for fruit, I have in my mind's eye a most useful house adapted to this purpose, and any one putting up one such would find growth and fruiting follow in due course with comparative ease. This house is against the garden wall, somewhat

away from Vineries and Peach houses, though within easy reach of hot-water pipes. The dimensions are 40 ft. long by 7 ft. wide, the front being glass some 12 ft. in height, made of large and convenient doors 6 ft. high, the remaining 6 ft. being fixed sashes. This facilitates the removing of old soil and the placing in of fresh soil or mulching material when such are required. The ends too are of glass; and it will thus be seen that as the house faces the south it commands a large share of light and sunheat.

The inside space is just a 2-ft. path, being iron gratings laid on bricks, and the remaining 5-ft. border, running the whole length, is divided into squares of 5 ft., divided with loose brick partitions, into each of which a plant of Banana is planted. Some small drainage is necessary if the subsoil is sand or gravel, a greater amount of rubbish, brick ends, &c., being used if the under layer is of a clayey nature. Of good loam, say three parts, to one of well rotted manure, with a little gritty substance thrown in to keep the soil from getting too solid, is all that is needed. After placing the soil in the spaces, allowing it to become a trifle warm, the young plants as they are obtained should be planted in the centre, care being taken that they are not put in too deep. It is better to keep them up, as a top-dressing should be given as growth advances, and leaves and stem need large supplies of nourishment.

When once a house of this kind is secured there will be a constant supply of suckers to take the place of those that have fruited and been cut away. It is not wise to let the soil remain for more than two fruitings; it should then be all cleared out of the one or two separate spaces that are being renewed, and a fresh start made, when a new lease seems to be given, and the plants come away with great vigour. When the sunlight and heat are too strong some limewash scattered over the sides and roof are the best breaks that can be given for the intense rays. Abundance of water in the growing season and a high temperature at the same time are absolute essentials.—*W. Swan, Bystock, Exmouth.*

JUDGING AT HORTICULTURAL EXHIBITIONS.

ANYONE who takes a prominent part in judging at horticultural shows must be prepared to be severely criticised not only by the exhibitors but also by the general public, for to please all is simply impossible.

I am quite at one with your correspondent, Mr. M. Temple, in your issue for February 12th, page 379. As an exhibitor I care not who judges my exhibits providing they are practical men, and I am always satisfied with their decision; but I distinctly favour giving equal prizes taken after carefully examining the productions, either by pointing or otherwise, if they are considered of equal merit, and I consider it most unfair to do otherwise. I know it is urged by some that it is an easy way out of a difficulty. Allowing it to be so, surely it is just, and so long as it is my privilege and pleasure to act as a judge I shall certainly support the awarding of equal prizes when I consider it my duty to do so.

I have received equal prizes myself, and have never questioned the award. I will mention one instance which is still quite fresh in my memory. In 1881 when the Kingston Chrysanthemum Society was considered to be one of the most important, if not the most important, show of the kind then held, valuable prizes were offered for trained specimens, and some of the very best judges of the day were appointed to make the awards. The judges deputed to judge the plants were unable to come to a decision and the others were called in, the consequence being the awarding of equal first prizes, which the society generously paid in full, my opponent being my old friend and tutor, Mr. G. King, of Esher. We were both perfectly satisfied with the awards.—*Edwin Beckett, Aldenham House Gardens, Elstree.*

I did not see the article Mr. Temple refers to (page 379), but it is a puzzle to me how judges can find an equal first or second. It is as great a puzzle how they manage to award the prizes in any case "where there are different species tabled" or where it is only "a score each of Roses, Dahlias, Carnations, or Chrysanthemums," if each score contains different varieties, and give anything like an intelligent explanation of how they did it. I have no doubt Mr. Temple will make this clear to the humblest mind in his next article. He assumes that

everyone is satisfied with the present method of judging by points. Now, I think it is on this part of the subject that the greatest misunderstanding takes place. I would like to ask if these points were points of quality, and if one point in one subject was balanced against a similar point in an opposing subject, or if it is only a term used with no definite meaning, but simply used in a general way to mean that figures have been placed to the credit of each subject examined.

If this is so those points are merely figures to remind the judge of the opinions he had formed, and is only a measure of his opinion instead of a sum of qualities, and seeing that men's opinions vary as much as their faces, their judgments must vary in accordance with their opinions, and this is the cause of the "twaddle" that Mr. Temple refers to. There can be no uniformity of judgment till there is a uniformity of opinion, and there can be no uniformity of opinion till we have well defined rules for judging. [There is a small pamphlet of "Rules for Judging," Ed.] The principal cause of disputes at horticultural exhibitions is the attempt to balance qualities against each other which are not the same, and as long as this continues the judgments will be crude and unintelligible. Of course, the remedy for this is to have the same kind of exhibit competing against others of the same kind or variety.—*W. K.*

It is something fresh, to be sure, as related by Mr. Temple, to read of anyone who does not believe in giving equal firsts to equal points. When two and two do not make four, it is about time to be serious. But after all, it was perhaps a deviation from the usual twaddle. The centre of the laws of gravitation is balance—justice; but there are some who are more proud of being out of fulcrum than others of being in. My belief is that such an exposition of unequal judgment upon equal exhibits would do good by exciting pity for a second exhibitor, and wholesale indignation against the abettors and purveyors of their duty.—*A Judge.*

QUESTIONABLE EXHIBITS.

THE affairs of the National Chrysanthemum Society have been subjected of late to a good deal of criticism, and the discussion thus evoked may not be entirely lost as long as it is conducted in a fair and frank spirit. But does not *A Member of the N.C.S.* (p. 364 of THE GARDENING WORLD) go a step too far when he questions the honesty of certain proceedings? Any firm, no matter of what standing, has a perfect right to offer prizes for produce grown from its own seeds, and as perfect a right to make what conditions it likes to govern the competition, provided these conditions apply with equal force to all who enter.

Most people will admit that it is not a fair condition to rule that all produce entered in a competition for vegetables grown from seeds supplied by the firm giving the prizes shall become the property of the donors of the prizes; but what then? Surely if the conditions are not in accordance with the exhibitors' ideas of justice they have the remedy in their own hands, viz., to refrain from exhibiting in that class. There is no dishonesty in imposing any particular conditions, although there may be, and is in this case, *inexpediency.*

Secretary on p. 375 of last week's issue says that "the offering of these prizes leads to a great deal of dishonesty, and should not be encouraged."

Just so! but does not the jeweller who hangs up in his window a tempting selection of jewellery lead men to dishonesty by exciting their cupidity? but we do not shut up the jeweller's shop all the same, although we take steps to guard it.

Neither *Secretary* nor anyone else has a right to impugn the honesty of the gardeners who show, even in classes where the exhibits become the property of the donors of the prizes; indeed, it is only fair to such men to assume, in the lack of evidence to the contrary, that they have their employer's consent to exhibit in the class, and, of course, to abide by the conditions imposed.

Secretary says also that "some firms evidently consider this a cheap way of advertising." Of course it is advertising! what else could it be? what else could a business man expect it to be? but whether cheap or not is another question.

Meanwhile, it is not fair to doubt the honesty of either prize givers or prize winners upon no other foundation than an opinion, for this is a breach of

the laws that govern our country, as well as of the morally not less binding rules that hold society together.—*Fiat justitia.*

The winning exhibits to become the property of the donor is a stipulation which ought not to be tolerated and encouraged in any schedule; be the show what it may, big or little, the principle is the same.

Assuredly, committees in accepting donations admit it is a technical gain to them, and there leave it to the discretion of intending exhibitors to please themselves, but it is neither fair nor wise, and when exhibits are staged, the gardeners do so very often under protest.

I have many times spoken of this restriction, for it is neither giving, selling, nor buying. Only last year in judging the fruit at one show (the extra prizes were mostly of this so-called liberal class) I could not help but remark to my fellow judge that it was a cheap way of purchase, for most of the prize winning kinds would have fetched double the value in the market.—*A Judge.*

LOW-PRICED SEED.

THAT good seed and pedigree under equally good conditions naturally give the best results is incontestable, yet it requires some general insight into things before one can realise what is low, high, or a just position. Morality in explanations, descriptions, and commerce seems to be ignored by mutual consent, and men get so accustomed to misrepresentations that to be open and frank would be to almost break faith with one another.

I would neither condemn source nor seed as doubtful because it has a low selling quotation any more than I would guarantee a sound, costly pedigree animal to do well under a doubtful buyer. Starvation, unsuitable food, inferior conditions, poor, shallow, undrained and unweeded soils are equally as ruinous to all. Seedsmen are aware of these things, and as rightly give no warranty, expressed or implied, in their lists.

Yet there is a class of men who believe in the top price for everything, even for the same variety or pedigree. Indeed, I believe, there is more blame attaching to, and more mistakes are made by thick sowings, planting, and negligence in after cultivation than in all the bad seed put together.

It is certainly unfortunate when some have been at so much trouble and expense in manuring, preparation, &c., to find rubbish. The seed supplied may be good and sound, but *choice* of variety has been the mistake rather than an inferior price.

Cheapness and quality, a go-and-come-again policy in these days, is an adage not to be disparaged, and nothing is more likely to deter the dishonest seedsman than the fear of publicity which the supply of his own seeds will inevitably bring him.

In the seed trade there are some of the most conscientious and upright of men whose quotations are low-priced, yet who would scorn to send seed of doubtful quality.

Our seeds are now to hand. I take a sample quart of a standard sort of Peas at random, and this item alone is 25 and 50 per cent. lower than some. I stake my responsibility, and trust our seedsmen's reputation. Roguing out is quite right, but the expense and trouble are not all this. The fact is many cannot bear brief descriptions, simple lists, small expenses, nett and little profits, but do not scruple to take off their hats, and nearly bow down to the ground to things the opposite.—*B. Lockwood, Lindley.*

PLANTS RECENTLY CERTIFICATED.

THE undermentioned subjects were certificated by the Royal Horticultural Society on the 8th inst.

Orchid Committee.

LAELIA ANCEPS WADDONIENSIS, *Nov. var.*—In this a choice and valuable variety has been added to the list of white forms of *Laelia anceps*. It comes between the varieties *ashworthiana* and *hollidayana*, minus the blotch on the lip of the latter, which circumstance reduces it to the group of *L. a. vestalis*. The sepals are broad, and the elliptic petals white. The lip is white, with violet lines on a very pale yellow ground on the inner face of the side lobes on first expansion; but as the flower gets fully developed,

the violet lines fade to faint, nearly colourless striae, except a dark violet stripe on either side of the yellow disc. It is a delicately marked and very choice variety, well worth the First-class Certificate awarded it. Philip Crowley, Esq. (gardener, Mr. J. Harris), Waddon House, Croydon.

PHAIACALANTHE GRANDE, *Hyb. nov. bigen.*—The seed parent of this bigeneric hybrid was *Phaius grandifolius*, and the pollen parent *Calanthe Bryan*, itself a hybrid. A strong spike bore nine large flowers, the sepals and petals of which are creamy-white, with a purplish tint at the base. The rich purplish-red, projecting lip is a striking feature of a flower that was greatly admired by connoisseurs. Award of Merit. N. C. Cookson, Esq. (gardener, Mr. William Murray), Oakwood, Wylam-on-Tyne.

CALANTHE SPLENDENS, *hyb. nov. bigen.*—This bigeneric hybrid was raised from *Limatodes* crossed with *Calanthe Bryan*, and has a close affinity with *Calanthe Veitchii*. The flowers are large, of a rich rosy-carmine, and very handsome. Award of Merit. N. C. Cookson, Esq.

Floral Committee.

ANTHURIUM DR. LAWRENCE.—The large, heart-shaped spathes of this hybrid are similar in form to those of *A. andreaum*, which was one of the parents, but they are less rugose or wrinkled, and of a beautiful soft salmon colour. The spadix is yellow and ultimately changes to cream. First-class Certificate. Sir Trevor Lawrence, Bart. (gardener, Mr. W. Bain, Burford Lodge, Dorking. It is named in compliment to a son of Sir Trevor Lawrence.

Fruit and Vegetable Committee.

APPLE LORD HINDLIP.—The fruit of this Apple is of large size for a dessert variety, conical, deep yellow, shaded with red and marked with crimson. It is a good keeping Apple of excellent flavour, and having previously received an Award of Merit, was now voted a First-class Certificate. Mr. J. Watkins, Pomona Farm, Hereford.

PEAR PASSE CRASSANE.—The fruits of this late keeping Pear are of large size, pyriform, and heavily shaded with russet on a yellow ground. The flesh is juicy and melting except about the core, and of sweet, agreeable flavour. First-class Certificate. Roger Leigh, Esq. (gardener, Mr. G. Woodward), Barham Court, Maidstone.

CUCUMBER EVERY DAY.—The fruits of this variety are of medium length, but of even thickness almost from end to end, and of a beautiful dark green colour. It has been in bearing all the winter, and is a cross between Rochford's Market and All-the-Year-Round. Award of Merit. Her Majesty the Queen (gardener, Mr. Owen Thomas), Windsor.

Kitchen Garden Calendar.

IN sheltered situations, and on dry sandy soils, a sowing of early Carrots may now be made; but where the land is cold and stiff this had better be deferred for another fortnight. Though Carrots are hardy, and will withstand the frost, there is little or no advantage gained by sowing too soon where the land is wet and heavy, as the rains usually heat down such ground until the surface becomes so hard that the young plants have a difficulty in pushing through. On light soil there is this difference, instead of the surface becoming baked when dry weather sets in, the particles of earth do not run together, therefore the young plants are able to push their way through. Early Gem, Parisian Forcing, Early French Forcing, and Early Nantes are all good kinds, and may be sown in drills 6 in. apart.

A sowing of Early Milan Turnips may also be made on a warm border. The seed should be well protected from small birds, which are troublesome at this time of the year. A pinch of Lettuce, Early Cauliflower, and Brussels Sprouts may also be put in, as well as Radishes. The seed will not germinate very quickly, but the plants will be earlier than those from sowings made in the next month. Where the land is hot and dry in summer there is often some difficulty in getting good Cauliflower during August, but if a sowing be made now of Autumn Mammoth, Autumn Giant, Magnum Bonum, Walcheren, or the Pearl, and the plants put out in good time, before the dry weather sets in, fine, close, compact hearts may be had from the end of July onward.

In warm places in the South, Lettuce that was planted out in the autumn should be looked over, and where there are any blanks these should be filled up from the seed bed. Lettuces in this part of the country have never suffered so much during the winter, for the foliage was very tender owing to the mild autumn, and the foggy weather about Christmas took hold of them severely. With us it was not only those in the open ground that suffered, but plants in frames were killed in like manner. Where the soil is cold, planting had better be deferred for a few weeks yet, as we may possibly get some severe weather in the next month. Do not be in a hurry to transplant autumn-sown Onions, particularly on cold wet land. It is no uncommon thing to see the plants lifted out of the soil by the frost in March, if planting is done thus early; better by far leave them until the end of the next month in the seed beds.

Spring Cabbages are very forward this season, and should the weather continue mild, several of the varieties will be ready for use early in April. Those planted in September will be greatly benefitted by having a sprinkling of sulphate of ammonia or nitrate of soda. This should, however, not be allowed to come in contact with the foliage, but should be carefully put between the rows, to be hoed in when the surface is dry. Such manures soon dissolve when the soil is moist and are, therefore, quickly taken up by the roots.

Seakale cuttings may now be planted. We prefer doing this as digging proceeds, so as to prevent trampling on the ground afterwards. If sets have been made as previously advised, these can be planted in rows 2 ft. apart, allowing a distance of 9 in. or 10 in. between the sets according to the quality of the land. Lily White is a first-class variety which forces much easier than the old purple; it is, however, not quite such a strong grower unless the ground is extra good. The tops of the sets should be kept about 2 in. under the surface of the soil; by so doing they will be out of the reach of frost and will start more readily into growth. Pay special attention to all vegetables under glass, and see that none suffer for want of air. During mild, showery weather snails and slugs are very troublesome, especially to the young tender foliage of Carrots, Lettuce and Cauliflower, all of which they will devour with the greatest avidity before the young leaves are well through the soil. Dusting with lime, soot, or such things as will make them distasteful to their palates, will usually keep them off.—*Kitchen Gardener.*

The Orchid Grower's Calendar.

POTTING.—The potting shed for the next few weeks will be the scene of great activity, and as success depends in a great measure on doing things at the right time, it behoves us all to be ready with plenty of material for the work on hand, so that it may be done quickly and well. The preparation of the compost claims the attention of the thoughtful grower, for he knows by experience that Orchids as well as other plants like to have about their roots something that is sweet and nice, neither must it be wet and heavy, or on the other hand too dry. He, therefore, like ourselves, examines the peat and if (which is generally the case) it is too dry adopts some means to make it sufficiently moist for his purpose. If the compost is used in a dry state the water given the plant runs off instead of soaking through the whole, the consequence being that whilst the moss is sodden wet the peat is dust-dry just under the surface; such a state of things as this never suits the plants.

The way we manage is to wet the turves that are dust-dry and place them on the top of the stoke-hole furnace in the evening. The heat causes the moisture to penetrate the whole mass, so that when pulled to pieces next morning it is warm and in a fit state to use. With the sphagnum moss just the opposite is generally the case, and even were it not so the washing which is required to free it from the small slugs and their numerous eggs makes it so wet that it has to be dried before it can be used. It dries but slowly in an open shed, so that some other means have to be adopted or valuable time is wasted. The plan we find answers well is to spread it out evenly over the floors of the warm divisions at night. The heat from the hot water pipes will dry it sufficiently

that it may, after all the rubbish is picked out, be used with the peat.

In large establishments a heated potting-shed is generally provided, but where there is no such accommodation, it is advisable to do the potting in the house in which the plants are growing. A simple contrivance or make-shift is to get a box, knock out one of the sides, stand the box on the stage, and you have a nice little bench, which you can easily shift about. This is specially adapted for small houses and small plants. When large ones are dealt with, it may be best to lay a mat over the staging.

It will hardly be necessary for me to point out that the crocks for drainage and the pots or pans must be clean, the latter inside and out.

Everything having been got ready as mentioned, commence with those plants that have gone through a slight season of rest. *Cattleya labiata autumnalis*, for instance, should be repotted now. Those plants that are well-rooted and in a thriving condition may require a pot or pan one or two sizes larger, but those with few roots must be kept in as small pots as possible. The pretty little *Sophrontis grandiflora*, that has now done flowering, will be all the better for a bit of new stuff, also the white *Masdevallia tovarensis*. In the cool house there will be several plants that were not repotted in September that may be done at this season.

SHADING.—It is as well that the blinds should be fixed as soon as possible after the middle of the month, for the sun has some power already. Their use will depend on the position of the houses a great deal—one of our cool houses is very much exposed, so much so, that we had to throw mats on the roof last week.—C.

FRUIT UNDER GLASS.

THINNING EARLY GRAPES.—A start should be made betimes with the thinning of the berries on the pot Vines, for with the mild and bright weather they are moving at an unusual pace for the season. Keep a sharp look-out upon lateral growths, and pinch at the first leaf all that appear. The evaporating troughs must be kept filled with water, and the supply of moisture given by these assisted by frequent dampings down.

EARLY PERMANENT VINERY.—The Vines in this house are now in flower, and a drier atmosphere must accordingly be kept up. The sunny fore-half of February has largely made up for the comparatively sunless January, and the growths, with the foliage, have become much firmer and more substantial during the last fortnight. They were inclined to be weak previous to that date.

SUCCESSION VINERY.—Here the work of tying down the shoots in their places must be carried on. Considerable caution must be exercised in this part of the cultural routine. The amount of pressure put upon a shoot at one time should never be very great, and as every Vine has a trick of its own, so to speak, the shoots upon one standing far more without snapping out than those of another, too much care cannot be exercised. Make a running knot on the strings that hold the shoots so that pressure may be increased or decreased according to necessity.

EARLY PEACHES.—After the fruit has been set the syringe may be started to work again morning and afternoon. The work of disbudding too will claim immediate attention. It is not too much to say that disbudding is the most important part of the pruning of the trees, for if the latter are allowed to develop a lot more shoots than are necessary, they become heavily handicapped from the commencement of the season in comparison with others that are properly attended to in this respect. A very little reflection will suffice to convince the cultivator that it is bad practice to remove too many shoots at one time. The operation should therefore be spread over a week or two, allowing from four to five days to elapse between each distinct operation. As a rule two buds will be enough to leave to a small bearing shoot, although three may occasionally be necessary in order to cover the space. The lowest well-placed shoot must in all cases be left for succession, and may be trained in by the side of the bearing one for that purpose. It is also necessary to have a bud beyond the fruit near the apex of the bearing shoot in order to foster a flow of sap past the fruit. On bearing trees intermediate buds may be removed. A start may be made by taking out badly placed

buds, spreading the disbudding fairly equally over the whole area of the tree. For the present a temperature of 55° Fahr by night will be a safe one, a rise of about 10° being allowed on sunny days. Shut up the house early in the afternoon, which will obviate the necessity for so much fire-heat.

SUCCESSION HOUSE.—With the opening of the flowers the syringing must cease, and less water should be thrown about the walls and passages in order that the atmosphere may become sufficiently dry to admit of the easy dispersal of the pollen. The process of artificial pollination must be prosecuted vigorously, going over the flowers each day about noon. A rabbit's tail affixed to a light bamboo rod is the handiest tool to use. It should be borne in mind that a very light touch is sufficient to pick up the pollen from the anthers and transfer it to the stigma, and also that any bruising of the stigma from too heavy handling of the brush is almost sure to prove fatal to the incipient fruit.

EARLY CHERRIES.—As soon as the fruit is set a thorough syringing should be given the trees, which will clear from them all old blossoms, and fruits that have been but imperfectly set. From this time the regular syringings should be kept up until the fruit commences to colour. Meanwhile, attend to the stopping of shoots before they reach an unsightly length, for next year's crop has to be looked after as well as the present one. Take care to avoid draughts, but do not coddle the trees under any consideration, for a too high temperature at this stage would be very injurious.

SUCCESSION HOUSES.—In the second early house the trees are now in full bloom, and pollination, as in the case of Peaches, must be conducted artificially. A temperature of about 50° should be given during the night, with a 5° or 10° rise during the day according to circumstances. Air as freely as the day will permit, but do not open the ventilators on the north side of the house.

THE BORDERS in which Vines, Figs, Peaches, etc., are growing will now require the closest attention, for in the advanced houses the roots are very active, and a check for want of sufficient moisture, although easily enough given, would be attended with very serious consequences. Any water used should be warmed by the addition of hot water until it stands at a temperature of not less than 60° Fahr., and in the case of the earliest Vines if it is 5° or 8° warmer it will be all the better.—A. S. G.

THE SHERWOOD £10 10s. SILVER CUP FOR ANNUALS AND BIENNIALS.

THE details given on page 48 of the Royal Horticultural Society's "Arrangements, 1898," do not appear to some people sufficient, and various applicants have asked the following questions, which, with their answers, the president and council would be greatly obliged by your kindness in publishing for the information of others.

Q.—"The contents of each tube must consist of one variety only. Am I to understand that *Coreopsis grandiflora* and *C. Drummondii*, or *Nasturtium Cloth of Gold* and *N. Crimson King*, and so on may not be exhibited in the same tube?"
A.—"They may not."

Q.—"Are the tubes not to exceed 3 in. in diameter at the top side?" A.—"They must not exceed."

Q.—"The vases must be provided by exhibitors, and must not exceed 6 in. in diameter inside. Does this apply to the 'plain glass vases' only?" A.—"Yes. The tubes must not exceed 3 in. nor the vases 6 in."

Q.—"Who provides the tubes?" A.—"Exhibitor; unless he is content with the stoneware jars the society provides at all times."

Q.—"Will regulation XI. be enforced—all specimens must be the bona-fide property of and grown by exhibitor?" A.—"Yes."

Q.—"Must exhibitor stage, that is, arrange his own exhibit, or may he call in professional help?" A.—"A special person may not be procured for this special purpose. Exhibitor, or his gardener, or some member of the family of either must arrange exhibit."

Q.—"Can the exhibit be repeated?" A.—"Yes."

Q.—"Will other foliage be allowed?" A.—"Only the foliage of the variety itself."

Q.—"May grasses be mingled with flowers?" A.—"No."

GARDENING MISCELLANY.

ANEMONE JAPONICA COURONNE VIRGINALE. M. V. LEMOINE, of Nancy, France, is always eminently successful in the raising of new plants. That under notice is a double form of *Anemone japonica* having about four rows of petals, which show a small cluster of stamens in the centre when fully expanded. The flowers measure about 3½ ins. in diameter, and are white with a shade of rose as they begin to age. They are beautifully neat in form, being built up of a great number of relatively narrow petals after the style of the typical *A. japonica*. A good illustration of it in Möller's *Deutsche Gärtner Zeitung* for 1st January, shows a bunch of flowers and leaves.

BIRDS AND FRUIT BUDS.

WITH such an open and mild winter one would think that insect food could be had in plenty without resorting to the buds of Gooseberries and Currants; but in our case this does not seem to be so, for it is years since I noticed such depredations as sparrows and finches have done up to now. Although there is both wheat and barley-corn in the poultry trough just "over the garden wall," they are still militant. Perhaps, were it not for that corn, the bushes might have gone too ere now, and not have remained as standing mementoes for an order to thread them, and for fishing-net dealers. Who knows?—B. L.

LAW NOTE.

THE CATTLEYA ACLANDIAE ALBA ACTION.

IN the Court of Appeal on Tuesday last, Lord Justices A. L. Smith, Chitty, and Collins were engaged with the case of Ashworth v. Wells, which came before their lordships in the form of an application by the defendant to have the decision of the Divisional Court, directing a new trial, set aside on the ground that the judgment entered for him at trial before the learned County Court judge at Manchester was right, and ought to be affirmed.

Mr. Montagu Lush appeared for the appellant, and said that in 1895 Mr. Wells decided to sell by auction in London his valuable collection of Orchids. Among the purchasers was the plaintiff, who was also a well-known Orchid grower—indeed, it was stated that his collection was valued at something like £15,000 to £20,000. One of the lots Mr. Ashworth purchased was described in the catalogue as a "*Cattleya Aclandiae* alba, seven bulbs, three leads—the only known plant," which was eventually knocked down to him for twenty guineas.

The plant was placed among Mr. Ashworth's other Orchids, and, after two years' careful culture, produced not an "alba," or white flower, but a purple one. It was not disputed that the description in the catalogue was a warranty that it was an alba; that it having proved to be only a common *Cattleya Aclandiae*, the value of which was less than 10s., the plaintiff was entitled to have his money back.

The dispute between the parties was whether the plaintiff was right in claiming special damages for false warranty. The learned County-court judge, while being of opinion that if the Orchid in question had been an actual alba it would have been at the time of sale worth more than £50, held that until the plant had shown its real nature no Orchid grower would have given more than 20s. for it. As the defendant had paid that sum into court, together with £2 as compensation for the loss of time and trouble expended by the plaintiff during the two years upon its culture, he entered judgment for him with costs.

The plaintiff thereupon appealed to the Divisional Court, which decided that the County-court judge ought to have taken a wider view, and not have restricted the damages to the price which the plaintiff had given for it two years ago at the auction.

They therefore directed that the case should be sent back to be retried, and the damages assessed in accordance with their expression of opinion. Mr. Wells then appealed to the Court of Appeal.

Mr. C. A. Russell, Q.C., with whom was Mr. Tweedale, submitted that the appeal was ill-founded and that the opinion as to the basis upon which the measure of damages should be calculated, expressed

by the Divisional Court, was right. The County-court judge ought to have considered the value at which the Orchid would have arrived at by this time. The claim was reduced to £50 in order to give jurisdiction to the County-court to try the case. His judgment was also inconsistent, for he found as a fact that if the Orchid had been really an alba it would have been worth more than £50 at the time of sale. He asked, therefore, that their lordships would direct judgment to be entered for Mr. Ashworth for the full amount of his claim—£50—with costs, and save the expense of a new trial.

Lord Justice Smith, in the course of a long judgment, said the warranty was that this plant when it bloomed—if in fact it ever did bloom—would produce a white blossom. It was not a warranty that the plant would blossom or even that it would live. The plaintiff thought it knowing that he would have to keep it a considerable time in the ordinary course of events before there would be a flower. It was not suggested that if the cultivation had been different the plant would have produced a white instead of the purple flower. The County Court judge was wrong in deciding that Mr. Ashworth was only entitled to have his money back and was not entitled to claim anything more by way of special damage. The plaintiff claimed £50, although evidence was given to show that a white *Cattleya*, if one was ever found to exist, would be worth a very large sum. The Court would order judgment to be entered for the plaintiff for £50, with costs, and the defendant's appeal would be disallowed.

Lord Justice Chitty and Lord Justice Collins agreed to this judgment, and the appeal was dismissed.

OBITUARY.

MR. EDMUND TONKS.

THE ranks of amateur gardeners have been much depleted by the loss of Mr. Edmund Tonks, who passed away at his residence, Packwood Grange, Knowle, Birmingham, after having been for some considerable time an invalid. Mr. Tonks was originally intended for the legal profession, and with a view to that intent went to Oxford and obtained there his B.C.L. He was called to the Bar in 1847 but never practised, circumstances causing him to join his father in the business of Wm. Tonks & Sons, brass-founders, Birmingham. He took a keen interest in all that related to horticulture, and he took especial delight in dealing with problems connected with the diseases of plants. He was a Fellow of the Royal Horticultural Society, and read an interesting paper on "Canker in Fruit Trees" at the Apple and Pear Congress held at Chiswick in October, 1888. His *magnum opus* was, however, the preparation of a "General Index to the Latin names, and synonyms of the plants depicted in the first 107 volumes of Curtis's Botanical Magazine. Only 150 copies of this book were published. Mr. Tonks was much respected and loved by all who knew him. Candid and out-spoken to a fault he lived his life a kind-hearted, generous, and sympathetic gentleman. Of shrewd common sense he had no small store, and his range of reading was wide and thorough.

QUESTIONS AND ANSWERS

* * * Will our friends who send us newspapers be so good as to mark the paragraphs or articles they wish us to see. We shall be greatly obliged by their so doing.

[Correspondents, please note that we cannot undertake to name florists' flowers such as Carnations, Pelargoniums, Chrysanthemums, Roses, nor such as are mere garden varieties, differing only in the colour of the flower. Florists' flowers, as a rule, can only be named by those who grow collections of them.]

Growing Seakale.—T. C. Steel: For the general items concerning the planting of Seakale, see under "Kitchen Garden Calendar" in another column. For your part of the country it would be quite safe to plant Seakale roots or crowns sometime next month, earlier or later, according to the state of the weather and the dry and workable condition of the soil. It is perfectly hardy, so that all you have to do is to select a suitable time, when the ground is in working order. You could at the same time sow seeds in properly prepared and manured ground. The seeds will come up as the temperature rises and you can thin out the seedlings to 9 in. apart in rows 2 ft. asunder. In some parts of the country the seedlings get large enough to be fit for forcing in winter, but unless your soil is very good and the place sheltered you may not be able to accomplish this in a single season. After a second summer's growth, however, the crowns should be strong and excellent for forcing. To economise seed you might place three in a group 9 in. or 10 in. apart in the rows and leave the strongest after the seedlings show which are to make the most vigorous plants. Any gaps that may occur might be filled up with the seedlings lifted. If the crowns or roots give rise to more than one, the supernumerary ones may be broken off, and the remaining one will make useful stuff for forcing. Keep the ground frequently hoed so as to loosen the soil and keep down the weeds.

Calceolaria Cuttings.—A Subscriber: Calceolarias often suffer from a disease or some pathological ail-

ment which causes the leaves to blacken, commencing at the midrib and veins. After examining the specimens you sent us, we could see no symptoms of this form of decay as we usually find it. The skin of the stems was blackened and decayed, even in some cases while the interior of the stem was sound and green. Under the circumstances, we think the damping was due to the late period of the year at which the stems were struck. The crown of leaves was perfectly sound. The cuttings should have been inserted a month earlier so as to give them time to form a callus, and possibly a few roots before the cold weather set in. Of course, you were not responsible for their not being inserted at the proper time, owing to the circumstance you mention. You might be able to get a fresh stock in spring; and, in any case, you should on all future occasions use perfectly healthy cuttings as a safeguard against disease. It is advantageous to get a fresh stock now and again for this reason. When inserting them on future occasions, either in boxes or frames, use plenty of coarse river or silver sand, with some leaf-soil, make the compost quite firm, as it then holds less moisture, and is safer for the plants in winter.

Violets with curled leaves.—*H. D.*: We found a few red spiders on the leaves, but do not think they were the cause of the mischief. Green fly is often very troublesome to the young leaves and shoots of Violets, but we found none on the plant sent, which, however, bore only a few very small leaves. We are rather inclined to think that the foliage was destroyed in autumn by some of the many destructive fungoid pests that attack Violets, some in autumn and some in spring. You should have sent us specimens in autumn, however, as the enemy would have been present in a discernible stage. Although it may yet be hanging about on the plants the small and young leaves do not show anything characteristic by which the pest can be recognised. If the pest proves to be a fungus it will be necessary to get fresh stock, planting it on fresh ground at a distance from the present beds. You do not say whether you have planted any of the Violets on a hot-bed with the object of getting flowers from them. It is just possible that by selecting the healthiest plants and growing them on a gentle hot-bed, you would get them to grow and flower at a time when the fungus is resting. At all events it would be worth a trial. We should like to see specimens in autumn if you decide to keep the plants on for another year.

Apples for Flavour.—*Thos. Rixon*: You, as a gardener, can show Apples for the Veitch flavour prizes. Three varieties of Apples and three varieties of Pears may be sent, but not more; each variety should consist of six fruits. Apply to the Secretary, Royal Horticultural Society, 117, Victoria Street, S.W. The next meeting of the society is on March 8th.

Plans of Flower Beds.—*T. B.*: There are few, if any, books that give designs of flower beds such as you mention; but a good many designs used to be given in the "Guide to Hampton Court." There has been a change of superintendents lately, and we are not sure whether the Guide is continued, although we think it should be. You might apply to the Superintendent, Hampton Court Gardens, Middlesex, enquiring whether it is still in print. We believe it costs about 6d. We gave an illustration of chain bedding in THE GARDENING WORLD for September 2nd, 1897. You might send us your full address (not necessarily for publication) and we may be able to help you further, as opportunity offers.

Camellia Buds Dropping.—*Oak Tree*: We have little doubt that it is a question of treatment, over which, however, you may have little control. Plants in pots are very difficult to manage, especially after they get to some size. Some varieties are more liable to cast their buds than others, particularly early varieties that plump up very large buds at a time of the year when there is great liability to fluctuations of temperature and moisture. Genial mild weather often starts the buds into active growth, when a sudden change of temperature may act as a check and cause the buds to drop. The soil in the pots may get dry though it may appear fairly wet on the surface. We have known gardeners very unsuccessful with Camellias in pots; but who were very successful when they made up a bed of good loam and peat into which they planted the Camellias. The latter then made excellent growth with dark green foliage and flowered profusely. Could you manage to make up a bed for your plants even if it is only 2 ft. or 3 ft. wide and at least 2 ft. deep. Insure good drainage, and use a compost of peat and loam, half and half, broken up rather roughly and mixed with a good sprinkling of sand and lumps of charcoal about the size of walnuts. If the plants are well exposed to light, we have little doubt they will repay the trouble.

Names of Plants.—*D. W.*: 1, *Coelogyne cristata* lemoniana; 2, *Dendrobium wardianum* var.; 3, *Dendrobium crassinode*; 4, *Odontoglossum luteo-purpureum*; 5, *Cattleya Trianaei* var.—*A. T.*: 1, *Forsythia suspensa*; 2, *Libocedrus decurrens*; 3, *Eupatorium ianthinum*; 4, *Carex brunnea variegata*; 5, *Anemone Hepatica alba*; 6, *Chionodoxa Luciliae*.—*R. W.*: *Agepanthus umbellatus variegatus*.

These Carpets are splendid imitations of Real Brussels Carpets, the designs having been carefully copied from the originals, both as regards colourings and patterns, so that when in use it is almost impossible, except by close scrutiny, to detect the difference. All designs are registered, and deservedly considered Works of Art. We can confidently recommend them for use in the Dining and Drawing Rooms, or any rooms and landings where hard wear is a necessity.

We will supply any sized Carpet at 1s. 2d. per yard. Estimates given free on receipt of size.

GIVEN AWAY.

As an advertisement for the introduction of these goods to all readers of THE GARDENING WORLD, we have decided to give away to every purchaser a very handsomely woven Hearthrug, 6 ft. long and 3 ft. wide, to match Carpets in Colours, &c.

Thousands of Repeat Orders and Unsolicited Testimonials Received.

SATISFACTION GUARANTEED OR MONEY WILLINGLY RETURNED.

Acknowledged to be the best market varieties in existence, and have maintained their high reputation when many so-called wonders have been discarded.

Each variety, 1/- per packet.

Exhibition Parsley, unexcelled, superb strain, from exhibition plants, per pkt. 6d., and 1/-.

Austin & McAslan, Seed Merchants, Glasgow.
ESTABLISHED 1717

THE MELON OF THE SEASON.

VEITCH'S TAUNTON HERO.

White fleshed, nearly round, lightly netted, bright golden-yellow, grand flavour, and very rich aroma. A strong grower and free setter, and does equally well in a Melon house or a cold frame.

Eleven First Prizes at West of England Shows.

Per Packet, 1s. 6d. and 2s. 6d.

THE CUCUMBER OF THE SEASON.

VEITCH'S WESTERN

WONDER.

Very handsome, dark green, good size and superior flavour. Easily grown, and a wonderfully free cropper.

Per Packet, 1s. 6d.

ROBERT VEITCH & SON,
EXETER.

"Gardening is the purest of human pleasures, and the greatest refreshment to the spirit of man."—BACON.

The Gardening World.

Edited by J. FRASER, F.L.S.

SATURDAY, FEBRUARY 26th, 1898.

NEXT WEEK'S ENGAGEMENTS.

MONDAY, February 28th.—Annual Meeting of the National Chrysanthemum Society, at Anderton's Hotel, Fleet Street, E.C., at 7 p.m.

TUESDAY, March 1st.—Sale of Roses, greenhouse, and hardy plants, by Messrs. Protheroe and Morris.

WEDNESDAY, March 2nd.—Sale of Lilliums, Roses, and herbaceous plants, by Messrs. Protheroe and Morris.

FRIDAY, March 4th.—Sale of Imported Brazilian and Mexican Orchids, by Messrs. Protheroe and Morris.

NOVELTIES IN VEGETABLES.—The world will never grow old and effete so long as something new can be raised in the way of plant life, whether fruit, flower or vegetable. In this week's issue we make an attempt to review a number of the year's novelties in vegetables. Judging by the number of awards made to ornamental plants and flowers, including Orchids, last year by the Royal Horticultural Society, the palm must be given to this branch of gardening as that in which the greatest activity is displayed in the production of novelties. In the case of Orchids, however, apart from the raising of hybrids, a large number of the new things consist of importations of new finds rather than the production of novelties. Amongst vegetables the field is greatly limited by the fact that human beings cannot utilise a thousandth part of those plants as food, which the eye can admire. It may be remarked that new vegetables are introduced from time to time from more or less distant parts of the world, but they fail to take the fancy of the British public. Even where a good many give these new things a trial, they gradually fall away into desue-

tude and oblivion. Many consider the fresh introductions as inferior to the vegetables we already possess; though in some cases we are charitable enough to consider the verdict given as a matter of opinion or largely due to an acquired taste. The people from whom we get these things may think differently; while in certain cases our climate may be, and sometimes undoubtedly is the ruling factor in the case. In the case of fruits, moreover, there are many exotic kinds for which the community has a decided liking, and some of them are grown to a greater or less extent. World wide inter-communication, rapid transit and artificial means of preserving fruits during the voyage, will tend more and more to bring these things to our doors at less cost than it would take to grow them here.

The above applies only to a small extent in the case of green vegetables, and that only to early vegetables grown in the Channel Islands and neighbouring parts of the Continent. Furthermore, those vegetables are more or less closely identical in kind with our own. Taking all these facts into consideration it will be seen that the production of new vegetables consists chiefly in raising new and improved varieties of those we already possess. For the more or less ancient origination of our vegetables we are indebted to the Continent for the most of them. Cultivation as an art is older upon the Continent, than on this island, particularly on the shores of the Mediterranean, where many of the more important types, exclusive of Potatos, Tomatos, Dwarf Beans and Scarlet Runners were in common use before cultivation had made much, if any, headway in the British Islands. Nevertheless, we must not forget that the botanical or wild species of many of our most common vegetables are natives, or at least wild, in this country.

During the past year, as, indeed, during several previous ones, great activity has been displayed in the raising of new varieties of Peas. Nothing so important amongst Peas has been raised since the hybridising of the Garden with the Field Pea gave rise to the wrinkled marrow type. Since then, however, the modern race of that breed has been vastly improved and practically evolved to the present state of perfection with which mostly every gardener is familiar. There is no telling what the next great leap amongst Peas may be, but we should like to witness the evolution of a race as self-supporting as a field of wheat, and as tall as the average growth of that cereal. True, we have dwarf varieties which require no staking, but the crop they produce is limited by comparison with that of the taller growing varieties which soon fall over and lie upon the ground, while in most cases the haulm is actually restricted or shortened if not supported in the field. We can scarcely imagine the impetus that would be given to the cultivation of Peas by the market grower as well as gardeners in private establishments, were a race of self-supporting Peas (say about 3 ft. high) to become a reality in the near future. By a process of intense culture in garden and field such a quantity of Peas could be raised that the actual area under crop need not be greatly increased; while, on the other hand, the absence of any necessity for staking would so lessen the cost of production as to bring this esteemed and nutritious vegetable within reach of the poorest.

A great and wide-spread interest is still manifested in the raising of new varieties of Potatos; and, indeed, this will always continue to be so while existing sorts tend to degenerate after a number of years of cultivation, and while they remain liable to be ravaged by the Potato disease. The chief aims are to obtain shapely tubers of

large size, good qualities, and possessed of heavy cropping and disease-resisting properties. We remember many old kinds possessing most of these recommendations, except the last named, that have now disappeared from cultivation. Some of them maintained a lingering existence for many years, owing as much to the sentiment of cultivators for the memory of old friends, as to any real benefit they derived from their vanishing favourites. Tomatos are equally if not more liable to degenerate as Potatos. Certain students of the subject reckon that the life of a variety is limited to ten years, after which it is either very inferior or a different thing altogether. Great earnestness still prevails amongst cultivators in raising new sorts. A large number of new Melons, obtained by the crossing of existing varieties, continues to be raised. Flavour and good qualities generally seem to be the chief incentives to their production, while other inducements are no doubt active. Medium sized rather than fruits of gross dimensions are generally the aim of modern raisers, and this is to be commended. Many cultivators also take pride in raising and exhibiting new seedling Cucumbers, by crossing old favourites with the object of combining the good qualities of the parents. Dwarf or French Beans and Scarlet Runners are not neglected. Cabbages, Cauliflower, Broccoli, Turnips, and, indeed, the Brassica tribe generally, receive due attention. The maintenance of the quality of the different strains will always necessitate a considerable amount of attention in the matter of repeated selection, and the keeping of the seed crops sufficiently far apart so as to be beyond the influence of bees and other insects. The unstable character of the Brassica tribe necessitates eternal vigilance on the part of the seed grower.

ROYAL GARDENERS' ORPHAN FUND.—The annual general meeting of this charity is again a thing of the past, having taken place on the 18th inst. It was much better attended than in 1897, and was acknowledged to be in every way a much more successful meeting than on last occasion when, it may be remembered, the whole of the ten candidates were placed on the list of those receiving support from the Fund, and that too without election by way of commemorating the sixtieth year of the Queen's reign. The excitement attendant upon an election has always the effect of drawing together a greater number of those interested in the welfare of the orphans, than the mere perfunctory business of placing their names upon the list. Altogether there were eighteen candidates, of whom the executive committee resolved to elect nine, that is, one-half of the number, to the benefits of the Fund. The highest number of votes polled for any one child was 349 in a most deserving case, and the lowest 19. The total number of votes recorded was 3,157, exclusive of a solitary spoiled vote. This indicates much more careful working on the part of voters than in the case of the other great charity recently reported by us. After the nine successful candidates were declared duly elected as a result of the polling, the next highest candidate was allocated to the benefits of the interest on the J. W. Thomson Trust. The chairman, after having moved the adoption of the report, raised the question of how many children, belonging to one and the same family, might be elected to the benefits of the Royal Gardeners' Orphan Fund during any one year. He spoke of this not in his capacity as chairman, but as a private individual, and suggested that the question might be brought forward and discussed at the next annual general meeting. A more detailed report will be given next week.

Novelties in Vegetables will be continued in our issue for next week, as a number of them have been crowded out.

The Reindeer of Norway, according to Dr. Nansen, will eat nothing but Lichens which grow in Polar regions, and are, therefore, useless for carrying relief to Klondyke.

Mr. William Milne, presently engaged as inside foreman at Lanfine Gardens, Newmilns, Ayrshire, has been engaged as head gardener to F. G. McAndrew, Esq, Knock Castle, Largs, Ayrshire. Mr. Milne, who enters on his new duties on 1st April, leaves Lanfine with the best wishes of all with whom he came in contact.

National Chrysanthemum Society.—The annual general meeting of the members of the above society will take place at Anderton's Hotel, Fleet Street, E.C., on Monday, February 28th next, at seven o'clock, to receive the committee's annual report and statement of accounts; to elect president and vice-president, officers and committee for the year ensuing; to consider certain amendments to the rules; and to transact such business as pertains to the annual general meeting. The attendance of all members is particularly requested.—*Richard Dean, General Secretary.*

Lewes Chrysanthemum Society.—The annual dinner of the Lewes and District Chrysanthemum Society took place at the King's Head, Southover, on the evening of the 8th inst. Alderman Jos. Farncombe occupied the chair. Mr. Prinsep, in proposing "The Lewes Chrysanthemum Society, and the Honorary Members," spoke of the advance made by the society during the years that he had been connected with it. The Chrysanthemums at last year's show would have done credit to any place in the kingdom, but the vegetables were not so well up to the mark. The chairman, who is also president of the society, acknowledged the toast. Other toasts followed. A recitation given by Councillor Lenny, and songs by Messrs. Meux, Bedford, Briggs, Stidworthy, Watkins, Eade, Hunt, and Jupp, added considerably to the enjoyment and success of the evening.

Shropshire Horticultural Society.—The schedule of prizes for the projected spring and summer shows has just been issued by the society. The spring show is fixed for March 29th, for which entries close on March 26th. There are forty classes in this part of the schedule distributed amongst Orchids, Cinerarias, Primulas, bulbs, and miscellaneous collections of spring flowering plants. The summer show is to take place on August 17th and 18th, and entries must be received for it not later than noon August 12th. At this show provision is made for no fewer than 168 classes, which are pretty equally divided amongst plants, flowers, fruit, and vegetables. Numerous special prizes are offered from various sources, and if magnitude of preparation counts for anything the show should be an even greater success than formerly. The prizes in the schedule amount to £950, exclusive of gold and silver medals, which will also represent a tidy little sum. The coming floral fête of 1898 will be the 24th held by the society.

International Horticultural Exhibition at Ghent.—The fourteenth International Horticultural Exhibition is to be celebrated at Ghent, from April 16th to April 24th next, inclusive. The exhibition is held under the auspices of the *Société Royale d'Agriculture et de Botanique de Gand*, and is the 163rd exhibition of this society. Amateurs and trade growers, as well as public Botanic Gardens both of Belgium and other countries, are cordially invited to take part. A programme or schedule of the classes has been issued by the society, from which it appears that prizes are offered in no fewer than 716 classes. The prizes consist of large and small gold, silver-gilt, and silver medals, some of them being prettily mounted or framed in appropriate cases. The exhibits will range through stove and greenhouse, miscellaneous flowering and foliage plants, Orchids, Palms, Cycads, Pandanads, Ferns, herbaceous and hardy plants, succulents, Conifers, forced fruits, cut flowers, etc. These exhibits are divided into twenty-eight groups. The jury of examination will consist of well-known gentlemen, skilled in the various branches of horticulture.

The Biggest Thing on Earth in Parks.—Yellowstone National Park in north-western Wyoming, U.S.A. It has an area of 3,312 square miles.

Preston and Fulwood Gardeners.—At the last monthly meeting the members of this institution were favoured with a paper on "Seeds," by Mr. J. Roberts. Alderman Woods filled the chair. The lecturer dealt in an able manner with the common requirements, growth, and substance of seeds, illustrating his remarks by samples of various seeds in different stages of germination. Mr. Roberts spoke of the requirements of seeds as being air, water, and soil. He referred to the process of malting barley in which the starch contained in the seed was converted into sugar by the action of a ferment. He spoke, too, of the essential constituents of plants, and of the method by which they obtained them from the air and the soil, in the latter case by the action of water. A brisk discussion took place at the close, and many questions were asked. The lecturer subsequently replied to these.

The Swanley College.—The women's department of this famous horticultural training school continues to flourish apace. In the report for the year 1897 just issued by the council of the college reference is made to the fact that so far from the ranks of the gardening profession being overcrowded with women, remunerative employment has been found for all students who were duly qualified, and that the demand is still in excess of the supply. Miss Gulvin, one of the students first employed at Kew, has accepted a responsible post with several gardeners under her, of whom Miss Groome, another Swanley student is one. Miss Hutchings is still at Kew, and two others are in training there. Edinburgh Botanic Gardens have also been opened to two women gardeners. Other students of the college who have done well include Miss Smith, who is still at work at Lady Henry Somerset's Industrial Farm Colony at Duxhurst, where she organises and directs the horticultural work; Miss Prior, who is directing and instructing in gardening the patients at the Hale Convalescent Home; Miss Agar, who is at the Wycombe Abbey School as head gardener; Miss Clark, who has been teaching botany at the Princess Helena College, Ealing; Miss Morrison, who has been employed in laying out gardens in London; Miss Atkey, who has been employed in planting an orchard in Suffolk; and Miss Windermere and Miss Cope, who have been appointed to lecture on bee-keeping and London trees respectively.

The Metropolitan Public Gardens Association has just issued its 15th annual report. This runs to a pamphlet of 116 pages dealing with the work of the association. A map of London and its suburbs comes next to the title page, localities where work has been done being marked with red ink. These red marks are conspicuously numerous in that congested area of the metropolis marked E.C. in the postal guide. The sphere of operations extends from Tottenham and Muswell Hill on the north, to Penge and Lower Tooting on the south; and from Woolwich and East Ham on the east to Twickenham and Ealing in the aristocratic west. The benefits conferred by the association or through its instrumentality include the laying out of open spaces or grants to other bodies for that purpose, opposition to infringements of public rights, negotiations concerning inimical movements, the obtaining of new open spaces, the planting of trees in suitable localities, and the placing of seats and drinking fountains where they may prove of service. Amongst the items of work which have been successfully carried out during the past year we notice a grant of £13 5s. to the Paddington Vestry for trees planted in the Great Western Road, trees planted in Pender Street, Deptford, a recommendation to the St. Giles' District Board of Works to plant trees in Great Russell Street, W.C.; and assistance to the schemes of acquiring Churchyard Bottom Wood, Highgate, N., for a public park, the extension of the Chelsea Embankment, and the appointment of an inspector for judging window and cottage gardens for prizes. In an appendix a list of trees and shrubs suitable for town planting, compiled by Mr. W. Goldring, is given. All those who would like to help forward the laudable work of the society may send their cheques or postal orders to Lord Neath, or the Secretary, 83, Lancaster Gate, London, W.

The Californian Woodpecker must be a good forager. It is said to carry home acorns to its stores from a distance of thirty miles.

Mr. William Paton has been appointed head gardener to Mrs. Harmsworth, Poynter's Hall, Totteridge, Herts. Mr. Paton is a young Ayrshire trained gardener, and judging from his training and experience, coupled with his great energy he will prove himself a credit to the "land of Burns."

Floral Fete for Newton-Stewart.—The annual prize schedule of the Newton-Stewart, Minigaff and District Horticultural Society, which has just been published, is a well got up catalogue. The fete is to be held in Kirroughtree Park, by the kindness of the owner, who is also the president of the society. Amongst the prizes are gold and silver medals from various donors, a silver challenge cup, and the bronze medal of the R. H. S. Messrs. Cocker & Sons, of Aberdeen, offer two silver medals, and Messrs. Sander & Co., St. Albans, a Cattleya value 4 gs. The prizes to be given for Chrysanthemums at the show projected for November next, include a silver-gilt medal from Mr. H. J. Jones, of Lewisham; a handsomely bound volume of *Pearson's Magazine*, from Messrs. C. Arthur Pearson, Ltd.; volumes of *THE GARDENING*

more attractive. There is no word as yet, however, with regard to the flower shows which were held for many years by the present company, but which were latterly discontinued, still with a vigorous and energetic executive we may hope for the best.

EARLY CABBAGE.

WITH us these are quite five weeks in advance of most seasons, and I hear that excellent Cabbage has been cut during the past few weeks in North Devon, where it is much colder than here. I have tried several varieties, but for earliness and compactness none pleases me better than Ellam's Early, this being an ideal Cabbage for a gentleman's table, I consider. Out of 1,000 only 3 per cent. have bolted, but all the three kinds that I am growing are behaving well in this respect, to which I must attribute the exceptionally mild winter. The plants have had no check whatever since they were put out on the 20th September, so they have kept growing, and are now quite nice, firm heads, which we are cutting daily for the dining-room. It is after a mild time, succeeded by severe frost, that I have always found the greatest number go to seed when they make a fresh start again.—*J. Mayne, Bicton.*

TOMATO, THE POLEGATE IMPROVED.

WORLD, and *Gardening Illustrated*, presented by their respective editors, and a volume of *Cottage Gardening* from Messrs. Cassell & Co.

Sale of the Crystal Palace.—We understand that the directors of the Crystal Palace Company have under consideration proposals from an influential quarter for the purchase of the Crystal Palace and Grounds, although no details of the scheme have as yet been made public, but as it will be necessary to obtain special parliamentary powers for carrying through the scheme of reconstruction, the present company having been incorporated by Act of Parliament, they must soon be made so. The capitalisation of the existing company reaches the enormous figure of £1,533,675, and it is proposed to reduce this by more than half, a large working capital being provided in addition. The schools of engineering, art, and music, so long associated with the Palace, will be continued, and increased facilities for tuition granted. Strong representations have been made as to the urgent need for an improved railway service if the enterprise is to pay, and it is highly probable that improvements will be made in this direction. The catering will also be rendered

TOMATO THE POLEGATE IMPROVED.

TOMATOS more than anything, perhaps, require constant attention in order to keep them up to the desired standard, for which reason it is necessary to raise fresh stocks or varieties to take the place of those that get worn out by age and other circumstances. The Polegate Improved is the result of a cross between the old Trophy and Perfection. The former was highly popular and extensively grown for many years, particularly by growers for market, but it has been displaced to some extent by more recent selections or by crossing it with others, as in the case under notice. The fruit is of large size, smooth, and shapely. The skin is bright red, with the smallest amount of waste at the eye, while the flesh is also richly coloured, solid, and of good flavour. A household of 149 plants, confined to a single stem each, gave a harvest of 2,159 fruits in a house unaided by fire-heat, thus testifying to the heavy cropping character of the variety. The accompanying illustration was lent us by Messrs. Wm. Cutbush & Son, Highgate, London, and shows how well adapted for exhibition the variety is.

SEAKALE, THE LILY WHITE.

CONTRARY to most vegetables of note, there are not many varieties of Seakale from which to pick and choose. The ordinary form, or The Old Purple, as it is occasionally called, is possessed of considerable merit, but Lily White is in every way an advance

PARSNIP BARR'S NEW WHITE MARROW.

THIS new variety may be described as of moderate length, thick at the top, and tapering evenly downwards. The accompanying illustration scarcely shows it at its best, owing to the fact that the roots

a funny story of a farmer who, on being served with Artichokes at a public dinner, remarked confidentially to a neighbour that if he couldn't grow better "taters" than them he wouldn't grow any at all.

The establishment of cooking tests for vegetables at horticultural shows is a step in the right direction, for after all the ultimate test of the practical value

PARSNIP, BARR'S NEW WHITE MARROW.

CARROT, BARR'S NEW INTERMEDIATE.

upon it. The flavour is decidedly better, and also the appearance, for the leaf stalks are without that purple tinge to the tips, so characteristic of the older form. Lily White forces exceedingly well, and the shoots blanch easily and well. Gardeners who wish for the best of everything cannot do better than invest in a stock of it. It will take up no more room than the inferior variety, and will give much better results.

from which the photograph was taken were grown in the nursery of Messrs. Barr & Sons, at Long Ditton, Surrey, where the soil is light and sandy, and last summer proved unusually dry and unfavourable to free development. No special preparations had been given the soil, so that growers will know what that means in the case of Parsnips. Moreover, the flesh is of very fine flavour, being considered the most delicate of all, and the roots, when grown in properly prepared soil, are well adapted for the exhibition table. Messrs. Barr & Sons supplied the block.

of a vegetable, especially a Potato, is whether it will or will not cook, and this can only be established with its cooking qualities relative to other varieties by a fair and common trial. Sometimes, of course, the variety is at fault, but far more often the cook

CARROT BARR'S NEW INTERMEDIATE.

CARROTS of medium length are more appreciated than those which are thin, very much elongated, and penetrate the soil deeply. Barr's New Intermediate conforms to this, having been raised as the result of a cross between the half-long and the long types. It resembles a very fine form of James' Intermediate, but is of better colour, being of a rich red hue, and not so coarse in the flesh. The latter is, in fact, finer

THE COOKING OF VEGETABLES.

THE cultivator may cultivate never so well, and the vegetables may come up to the highest standard of

MELON FROGMORE SCARLET.

THE fruits of this Melon are of large size, oval, pale yellow, and faintly netted with creamy-white. The flesh is of great depth, rich scarlet, of excellent flavour, and handsome in appearance, whether in the cut or uncut state. It was raised by Mr. Owen Thomas, gardener to Her Majesty the Queen, from the variety Duchess crossed with the useful old Beechwood, the progeny resembling the pollen parent considerably, and otherwise inheriting its good

MELON FROGMORE SCARLET.

than in the well-known variety just named, and, therefore, constitutes more delicate eating. Its fine shape and colour make the variety well adapted for exhibition purposes. The accompanying illustration was furnished by Messrs. Barr & Sons, King Street, Covent Garden.

excellence, but all avails nought if the cooking is bad. It is an old adage that "God sends the meat and the devil sends the cooks," and bearing this in mind we can only suggest that the cooks in certain quarters are special emissaries, judging from their work. Apropos of being used to bad cooking comes

qualities. It was one of the few Melons which was honoured with an Award of Merit from the Royal Horticultural Society last year, this recognition being given it on the 25th August last. The stock of it has passed into the hands of Messrs. J. Veitch & Sons, Ltd., Royal Exotic Nursery, King's

Road, Chelsea, who have furnished us with the accompanying illustration.

POTATO SUTTON'S IDEAL.

THE raising of new Potatos is not only very engrossing work, but it is absolutely necessary to combat

a vivid recollection of a large heap of the variety last autumn, and must confess we were very much taken with the clean and handsome appearance of the tubers. The accompanying illustration, for which we are indebted to Messrs. Sutton & Sons, Reading, shows tubers resulting from one root, while others not represented brought the total weight up to 8 lbs.

the cooking quality, for all who have tried it are agreed that it is a white-fleshed, mealy Potato of excellent flavour when cooked, and quite free from disease. The skin is very slightly rough, and the eyes are practically on the surface, so that there can be no waste in its preparation for cooking, and for the same reason exhibitors will find it most serviceable.

POTATO, SUTTON'S IDEAL.

disease, and the tendency of old sorts to degenerate. That under notice is a second early Kidney Potato of beautiful shape, smooth and attractive appearance, disease-resisting, and suitable either for the kitchen or exhibition table. It is also an enormous cropper, and, therefore, entitled to the name, Ideal. We have

Several experts have already given it a good trial, and speak of it in glowing terms. One good vegetable grower found the produce, in his trial of the variety, equivalent to 20 tons 6 cwt. per acre. Such enormous weight would seem to be suggestive of coarseness, but that applies neither to the form nor

Choose Big heavy Seed if you want good Lettuce is the advice given to American cultivators by Professor Galloway, for he says, "only the largest seed should be saved, as in most cases the vigour, size, and heading qualities of the plants are in direct proportion to the size of the seed."

POTATO CARTERS' MONARCH.

AMONGST vegetables the Potato has got many advocates who, practically, have pledged themselves to maintain the standard of utility of this useful vegetable, and keep it in the front rank of progress. The variety under notice was raised by Mr. W. J. Stokes, near Trowbridge, and has since been tested by the Royal Horticultural Society at Chiswick, who give it very favourable notice, both with regard to cropping, shape, and cooking properties. During 1894, 1895 and 1897, it has taken the leading place in large, open competitions, when shown by the raiser at the great Bath show. The parents of the variety were Sharpe's Victor and Schoolmaster, the potentialities of which are seen in the tubers, some of which are round, and others oval even at the

BUTTER BEANS.

FROM times almost immemorial our Gallic neighbours have been adepts in the gastronomic art, and one result of this has been that their seedsmen have evolved delicious vegetables that we with our insular prejudice are inclined for a long time to look askance at. The Butter Beans afford a case in point. The French and Runner Beans may be divided into two classes, according to the character of their pods, viz., the "Tough-podded" (*Haricots à cosser* or *Haricots à parchemin*), the pods of which become leathery upon reaching maturity, and the true "Edible-podded" (*Haricots mange tout* or *Haricots sans parchemin*), whose pods never become tough or stringy, even when they are quite ripe. It is to the first class that the varieties grown in this country

fine form of the same height, but with longer and more slender pods. The seeds are white instead of black, as in the former variety, and they possess the additional advantage of being fit to send to table when cooked properly. A third first-class tall variety is Mont d'Or, which was raised in the neighbourhood of Lyons. The pods are nearly 6 in. in length, slender, and of an excellent flavour that has secured its popularity throughout France.

Amongst dwarf varieties there is nothing to beat Sutton's Miniature Golden Waxpod. The plants are of compact and sturdy habit, and commence to fruit at an early stage of their career, continuing this for an exceptionally long period. This variety likewise takes kindly to forcing. As its name indicates, this is a miniature of Golden Waxpod, another sort well worth cultivation.

POTATO. CARTERS' MONARCH.

same root. The dominant type, however, is round, of large size and more or less rough or netted on the surface. On fairly good garden soil heavy crops of shapely tubers are obtained. Several years have now intervened since the variety was raised so that its character should now be well established. The accompanying illustration, for which we are indebted to Messrs. J. Carter & Co., High Holborn, London, gives a good idea of the variety now being put into commerce for the first time by that firm.

The Weight of Bees.—According to the *Irish Farming World* about 3,500 bees moderately filled with honey will weigh a pound. Four pounds of bees will average a prime swarm. Some swarms have been known to weigh as much as ten pounds, and as low as one pound.

belong, for the pods are only edible in their earlier stages. In the second we may place the Butter Beans. All these Beans are characterised by pods of a pale yellow, butter, or wax-like colour—hence the name. Their flavour, too, when cooked is somewhat waxy, although to the palate of the connoisseur they are more delicate than our ordinary French Beans.

We need not enter here into details of culture, for the same treatment that suits our ordinary French Beans will suit them capitally.

Both dwarf and tall varieties can be obtained, and, indeed, there is a considerable number of each from which to pick and choose. The Black Algerian (*Haricot d'Alger Noir*) is one of the oldest varieties, and is in great favour upon the Continent. The height is 6½ ft. The Tall White Algerian is another

CARDOONS.

AMONGST the more uncommon, and to some people novel vegetables, come Cardoons. They may be served at table in a number of ways, and in each will constitute a pleasant variety at a time of the year when the number of vegetables obtainable is not large nor the variety great.

The stalks of the inner and more succulent leaves may be stewed until tender, and sent to table with suitable sauce. These stalks, too, may be, and are, employed as an ingredient in the making of soups, whilst the whole plant, when properly blanched, furnishes an excellent salad.

Any ordinary garden soil will grow Cardoons well enough, provided plenty of water is given during the growing season. The latter is the chief consideration, and to obtain it it is often necessary to consign the

plants to trenches after the manner of Celery. It is only in very thirsty soils or where labour is scarce, however, that this is absolutely requisite, although it is greatly conducive to free growth on any soil.

fleshed, but strictly speaking this is a white-fleshed variety, and a first-class one too. The flesh is of great depth, juicy, melting, aromatic, and of excellent flavour. The plant grows strongly, and sets

THE DICKSON POTATO.

THOSE who have tried this new Potato express golden opinions concerning it. The tubers are uniformly of large size, kidney-shaped, with very shallow

MELON, TAUNTON HERO.

MELON TAUNTON HERO.

THE fruits of this Melon are perfectly globular, golden-yellow, and densely netted with gray lines, as the accompanying photographic reproduction will show. When grown under cool conditions as in

very freely, so that altogether it is a useful all-round variety. Strange to say it has been in existence for at least five years, and during that time has taken eleven first prizes at important exhibitions in various parts of the south and west of England, yet it has only just been put into commerce

eyes, and of a beautiful russety colour. They are not subject to disease (at least that is the experience of some first-class gardeners in the rainy districts of the West of England, and in Ireland), and when lifted are of excellent cooking qualities. There can be no doubt of its productiveness, for one grower,

POTATO, THE DICKSON.

frames the fruits usually average about 4 lbs. each, but when subjected to a high temperature in heated pits under the usual treatment they attain greater dimensions, say 5 lbs. or 6 lbs. It is a very usual custom to describe Melons as green or scarlet-

this year. Why it should thus have been neglected is difficult to say, but a really good thing often takes years to discover its merits. Its recognition is now due to Messrs. R. Veitch & Son, Exeter, who have placed the illustration at our disposal.

who had it on trial, raised 44 lbs. of tubers from 1 lb. of seed. The tubers come into use in succession to the early kidney varieties, and keep as well as Maincrop, Magnum Bonum, and others of that class. Taking these facts into consideration, and its

heavy cropping capabilities, it may properly be classed amongst the maincrop varieties, suitable alike for the kitchen or exhibition table. Some market gardeners have already got their eye upon it, so that there is no doubt a great future before it. Messrs. Dickson, Limited, Chester, furnished the accompanying illustration.

Each contains eight to ten seeds of a fine dark green, and excellent flavour. The variety bears heavily, the pods being brought together owing to the shortness of the internodes of the stem. The accompanying illustration, for which we are indebted to Messrs. Ed. Webb & Sons, Wordsley, Stourbridge, shows the general aspect of the pods, and the number of seeds with which they are packed. Gardeners who

WEBB'S PEA, ASTRONOMER.

WEBB'S PEA ASTRONOMER.

RECENT years have seen great improvement amongst Peas. That under notice is dwarf for a main crop variety, being only 3 ft. high; yet the short-jointed haulm grows slowly, and keeps on bearing over a considerable period. For this reason it is valuable for mid-season or late sowing. The pods are of great length and broad, but not swollen or inflated, so that they turn out well when shelled.

have tried it speak in favourable terms of the cropping capabilities of the variety, and the high quality of the seeds, now put into commerce for the first time.

Lemons are used as soap by people in the West Indies. They squeeze the juice of a lemon over their hands and wash briskly in water till they are clean.

CABBAGE LETTUCE, NANSEN, OR NORTH POLE.

HARDINESS is a matter of primary importance in a Lettuce intended to stand the winter in the open ground. Wherever Lettuces are required (and that is in most establishments) the gardener is often sorely tried in order to get a supply as early as possible from the open ground. Sheltered places under walls

CABBAGE LETTUCE, NANSEN, OR NORTH POLE.

and in cold frames are utilised with this object, and even then the supply is often very limited in quantity after the winter has passed. The variety under notice was planted in considerable quantity on a piece of ground that was inundated during the winter of 1894, and the water frozen over, yet after the water disappeared the Lettuces proved to be quite safe, giving a good account of themselves in spring as the fine weather advanced. The hearts are of medium size, compact, solid for a Cabbage Lettuce, and form tender eating in salad or otherwise. The variety is one of the novelties of Messrs. H. Cannell & Sons, Swanley, Kent, who furnished the accompanying illustration.

TOMATO FIRST AND LAST.

FOR general work Tomatos of medium size are now widely recognised in this country as the best and most useful. The new variety under notice comes under that category, and the accompanying illustration, for which we are indebted to Messrs. Charles Sharpe & Co., Limited, Sleaford, Lincolnshire, shows a fruit that is nearly globular, beautifully smooth,

TOMATO FIRST AND LAST.

glossy, and rich dark red. It is also very solid, having but few seeds. The flavour leaves nothing to be desired. The plant is sturdy, short-jointed, vigorous, continuous bearing, and sets its fruit very freely, so that the bunches commence near the base, and continue to be produced all through the season, provided the plant is confined to a single stem and allowed to run up as high as it likes. Each bunch consists of some nine to twelve fruits of a

good useful size. The variety is also very suitable for early work when treated with that object in view. Those who have tried it speak very highly of it. If sufficiently early to ripen out of doors, its value will be all the greater.

CUCUMBER SUTTON'S PRIDE OF THE MARKET.

FOR market work a dark green hue is highly appreciated, and the new variety under notice not only possesses this recommendation in a high degree, but

sentable for several days after it is cut. The fruits have a very short handle at the end next the stalk, the rest being of uniform thickness, slightly angular, and furnished with a few spines only. The plant possesses a vigorous constitution, grows freely, and

CANNELL'S CARROT, ROBERTS' WINNER.

CANNELL'S CARROT, ROBERTS' WINNER.

THE accompanying figure shows a very distinct Carrot belonging to the early stump-rooted type. Most of the varieties belonging to this section are either short and top-shaped, or if more elongated they taper distinctly from the top downwards. That under notice is cylindrical without waste at either end, in properly pulverised and otherwise well prepared ground. The portion surrounding the core is of a clear and bright red colour, while of close texture and fine flavour. It will prove serviceable either in private establishments as well as in market gardens for an early supply of roots, whether forced or from the open ground. The attractive appearance of well-grown roots will also appeal to exhibitors who patronise the earlier summer shows. Messrs. H. Cannell & Sons, Swanley, Kent, supply the accompanying woodcut of it.

MELON DIAMOND JUBILEE.

THE oblong or oval fruits of this new Melon are of medium size, varying from 3 lbs. to 5 lbs. in weight, according to cultural treatment. The accompanying illustration, supplied us by Messrs. H. Cannell & Sons, Swanley, Kent, gives a general appearance of the fruit, which is golden-yellow and irregularly netted with gray. The flesh is greenish-white, juicy, melting, and of excellent flavour when grown under favourable conditions, for which the grower himself

MELON DIAMOND JUBILEE.

CUCUMBER SUTTON'S PRIDE OF THE MARKET.

is responsible. The variety unites the good properties of Best of All and Countess, which were the parents. It sets freely, ripens early, and is, therefore, well adapted for the earlier crops of the season.

retains it for some days after being cut, so that there is a chance for it reaching the consumer while yet in prime condition. In private establishments, where a whole fruit is not required every day, the gardener has the satisfaction of knowing that it will be pre-

bears abundantly over a long period. The accompanying illustration, lent us by Messrs. Sutton & Sons, Reading, represents a brace of fruits very much reduced in size, but showing the characteristic features of the variety.

CELERIAC.

CELERIAC or Turnip-rooted Celery is a vegetable that is comparatively rarely grown to any extent in English gardens, although upon the Continent—notably in Germany—it is in high favour.

In the ordinary Celery the stem, or at least the edible part of it, is very small, and only serves to bear the leaves, of which the stalks when blanched are eaten, but even this small piece of stem is the sweetest and most toothsome morsel of the whole stick. In Celeriac we have the stem or axis of the plant developed to a considerable extent, and forming a swollen basal protuberance in shape not unlike a Turnip, although here the resemblance ceases. The great advantage attaching to Celeriac is that it withstands the frost much better than the more succulent Celery, and this is no doubt the reason why it is so much grown in Germany, where the frosts are much more severe and of longer continuance than they are in this country.

Celery cooked and served in the same way as Seakale is by no means a strange dish at English tables, and vast quantities are each year consumed in this fashion. Celeriac may be cooked in the same way as Beet and is fully as delicious as, and even more so in some people's estimation than Celery, for the flavour is more delicate. A good plan is to drop the swollen stems, from which the leaves have been roughly cut, into boiling water which should contain no salt or any flavouring which would spoil the fineness of the vegetable. Keep them boiling for an hour or two until they are quite tender, then pare and slice them up, serving with white sauce.

To grow Celeriac well a long season of growth should be given it. The seed should be sown in a gentle heat at the beginning of March, pricking out the young plants into pans in the same way as Celery and growing them on under glass till the weather admits of their being put outside. A light rich soil is the most suitable, and the plants should be put out on the level ground, and not in trenches like Celery. A distance of from fifteen to eighteen inches each way will suffice for room.

QUESTIONS AND ANSWERS

Grubs at roots of Primulas and Begonias.—*W.E.B.*: The grubs you sent are those of an Otiorhynchus, most likely the Clay-coloured Weevil (*O. picipes*). There are two others which infest gardens, but the grubs are similar and you can determine them only in the perfect or weevil stage. All those plants which go wrong in the pots should be turned out, and every grub killed, which you can find. The weevils cannot fly, but crawl into cracks, and crevices of the walls of the houses, and beneath loose rubbish of all kinds. Your best plan then is to cement all crevices, and remove everything which would afford them shelter, but yet are not needed in the plant houses. By laying a few loose pieces of board about the houses over night, and examining these traps in the morning you may be able to catch the old or perfect weevils, thereby preventing them from laying their eggs in the soil of pots, or even under the potting benches. By perseverance in these methods you should be able to exterminate them and so prevent a recurrence of the evil next year.

Daisies on the Lawn.—*X.Y.Z.*: The most effectual remedy is to get a spud or two consisting of a short wooden handle fitted into a piece of iron forked at the end (such an implement is generally easily obtainable from a seedsman, sundriesman, or ironmonger), and set some boys to fork up the Daisies. We know that it is a slow process, but none the less effectual. The work should be done at once, while the ground is soft. An old bread knife or something similar that would cut the Daisies just below the crown, would probably answer the purpose as well, and enable the work to proceed quite as quickly. There will be bare spots on the lawn so that you ought to top-dress it with rich soil from beneath the potting benches, mixed with some well decayed manure. Spread this on the grass and scatter it with a broom or rake. Then sow some grass seeds, roll the ground at intervals till mowing commences. Possibly a few Daisies may come up next summer, but a boy may be set to deal with them after rain. The roller will then smooth down the lawn. By vigilance and by feeding the grass, the latter will grow vigorously, covering the ground and leaving no space for the Daisies. Lawns usually get impoverished by the cutting and removal of the grass.

Planting out Young Vines.—*Omega*:—It would depend very much upon the state of growth of the Vines at the time of planting. If they are in a resting condition you could plant them in the open border about the beginning of April. It would occasion the least trouble in establishing the same if you keep them cool and resting till that time. Then

plant them out in the properly prepared soil, and the growth they make will harden as it grows. You will also be able to spread out the roots properly before covering them with soil. If you start them into growth before planting out, you would have to shade them from sunshine till partly established, especially if you break the ball of soil in order to spread out the roots.

Stopping and timing Chrysanthemums.—*Dubitant*: By only stopping your plants once it is difficult to see how you are to get from twelve to twenty shoots, that is, strong and vigorous ones. By stopping the plants once you should get three strong leads. Some varieties might give a greater number, but others would almost be certain to give fewer. Supposing you get three strong shoots which grow till a crown bud appears. Several side shoots would then break out, and if allowed to grow, they would completely stop the further growth of the crown bud. Say that each of the three shoots produced three others. You would then have nine; but the buds they develop would not be first crown buds. Some varieties produce a number of crown buds in succession. There is another plan which you may not have tried, namely, growing on some plants for a second year. They will throw up numerous suckers from the base, and you can retain the number that suits your requirements, cutting the rest away. You can stop them once and finally select the number of shoots you wish retained. You can then take the first or second crown, whichever is most suitable. Select plants for this purpose that have not been overfed the previous season. Repot and tend them as usual.

Chrysanthemums Diseased.—*C. C. M.*: The cuttings you sent us are badly attacked with the Chrysanthemum rust, a species of Puccinia in the Uredo stage, and considered to be Uredo Tanacetii, allied to the rust of Roses, Carnations, etc., but by no means identical, being a different species. There is a good deal of it in America, where it is very destructive to Chrysanthemums, and from whence it has in all probability been introduced unintentionally to this country. We have had samples sent us on previous occasions from growers in Britain. The disease is as incurable as Carnation rust, and the only thing you can do is to avoid introducing it to your collection, if possible. A damp atmosphere is favourable to the spreading of the fungus, but with Chrysanthemums it is difficult to avoid moisture, especially in autumn and winter. The varieties attacked with it should be destroyed if they are as bad as the specimens sent. Being a new disease, we cannot yet say if it attacks all varieties indiscriminately, as that has to be found out by experience.

Carnations diseased.—*Omega*: Your Carnations are affected with the Carnation Rust caused by the fungus *Uromyces caryophyllinus*. It is a bad case if the leaves are all as bad as those you sent us. The disease is incurable, because the fungus lives in the interior of the plants. You should burn the worst plants; then pick off and burn all diseased leaves on other plants. By way of prevention keep the plants practically dust dry at the roots. The atmosphere should also be dry, cool and well ventilated. Never syringe the plants. Propagate from shoots clear of the disease. If you can, get clean and fresh stock, the old may be destroyed and the house thoroughly cleaned before putting in the new stock.

Names of Plants.—*E. Ballard*: 1, Pinus Peuce; 2, Abies nordmanniana; 3, Picea Morinda (otherwise known as Abies smithiana).—*W. L.*: 1, Forsythia viridissima; 2, Euonymus radicans variegatus; 3, Euonymus microphyllus variegatus; 4, Cornus mas.—*W. G. B.*: Eucalyptus globulus, in the adult stage.—*C. A. M.*: 1, Doodia aspera; 2, Selaginella apus.—*H. C.*: 1, Lonicera Cavendishii; 2, Pyrus japonica; 3, Crocus biflorus var.; 4, Erica mediterranea.—*P. C.*: 1, Odontoglossum Lindleyanum; 2, Cypripedium Godefroyae; 3, Laelia anceps; 4, Odontoglossum Hallii; 5, Davallia hirta cristata; 6, Platyloma rotundifolia.—*A. J.*: 1, Primula denticulata; 2, Vinca major.

SEED LIST

(Free on Application).

FEATURES:—

Alphabetically arranged.
Best sorts, in heavy type, can be seen at a glance.
Probably the most explicit practical instructions for cultivation ever published in any Catalogue.
Many hints and recipes for cooking and serving the various vegetables.
Directions for the storing and forcing of vegetables
Medical qualities of many vegetables and herbs.
Prizes of £5, £3, (two of) £2, and £1 offered for photographs of horticultural subjects (see page 2 of Catalogue).
THE LIST, containing 93 pages and a profusion of illustrations, shows (a) WHAT TO GROW, (b) HOW TO GROW IT, and (c) WHAT TO DO WITH IT WHEN GROWN, and has been described by an Agent as one of the largest estates in England as a BOOK OF REFERENCE.
Another Customer, testifying as to quality writes:—"I should like to add that all the Seeds, &c., purchased from your establishment during the past 14 years have been of the very best quality, and have given great satisfaction."

NEXT WEEK'S ENGAGEMENTS.

MONDAY, March 7th.—Sale of Roses, hardy herbaceous plants, and greenhouse Ferns by Messrs. Protheroe and Morris.
TUESDAY, March 8th.—Royal Horticultural Society: meeting of committees at 12 noon.
Sale of Imported and Established Orchids, by Messrs. Protheroe and Morris.
WEDNESDAY, March 9th.—Important sale of glasshouses, boilers, piping, etc., at Harefield Grove, Middlesex, by Messrs. Sedgewick, Son, and Weall; time 11 o'clock (two days).
Sale of Lilies, Roses, Carnations, and Palms, by Messrs. Protheroe and Morris.
FRIDAY, March 11th.—Sale of Imported and Established Orchids, by Messrs. Protheroe and Morris.

POPULAR AND BOTANICAL NAMES OF PLANTS.—A writer in the *Guardian* in a very able article on "The Gardener's Library" discusses the vexed question of plant names, and like most others who pursue the subject for any length of time, comes to the conclusion that the botanical names are the most reliable, and that any attempt to popularise plants, particularly exotics, by substituting English for Latin names, must end in failure. That has been shown conclusively for many generations past, during which time numerous botanical authors have given an elaborate set of English names, even for the most common of plants. Amongst others may be mentioned Turner, Dodoens, Gerard, Parkinson, Miller, and other old writers and compilers of herbals and dictionaries. These names

were in many cases translations of the Latin ones, which in Miller's great dictionary often assumed cumbersome proportions. More recently we get translations of the botanical names in the *Botanical Magazine*, *Botanical Register*, and other high class works of that stamp. Compared with the translations given by Miller, the names are vastly simpler, and almost follow a binominal system of nomenclature as in the case of botanical names themselves; nevertheless their adoption by the British public has been exceptional; nay, in the majority of cases the names have been entirely ignored. For this reason the *Botanical Magazine* gave up the practice of furnishing English names in 1871.

Efforts more or less strong have recently been made by various parties to introduce a system of the wholesale naming of plants in English, dropping those of Latin and Greek derivation. This quickly fell through, and we are not in the least surprised at the result; for instead of simplification, confusion became more confounded by the pinning of old names to newer plants, or even two old names were attached to a plant entirely different both in appearance and affinity. More than this, the conflict of rival systems or name-makers soon gives the flower-loving public a greater list of synonyms than the botanists of past ages have done; and they are by no means few. Popular names for common plants are possible; and those already well known under any common name have been familiar objects for centuries. Exotic plants, particularly those that are rare, or botanical curiosities, and thousands that are hardly likely to become familiar garden plants in this country, cannot possibly become popular. How then are the British public to know them by any name, much more a popular one, when they lack the opportunity of getting familiar with the plants? In certain cases they may have the privilege of seeing certain plants once a year, but by the end of another twelvemonth they have, in all probability, forgotten what the plants themselves were like. Recognition is absolutely necessary before plants can have popular names; therefore, it is superfluous to give English renderings of the botanical ones, or to create new appellations to be immediately forgotten.

To make any system of naming popular it would require sustained effort on the part of the promoters, and a general and generous acceptance on the part of the public of the system advocated; but any attempt that may be made to get a general agreement on the part of the public is foredoomed to failure. Furthermore, if anything like order is to be maintained amongst a host of English names, it seems that nothing short of a binominal system of nomenclature, and rigid adherence to it, would prevent the most bewildering confusion. The whole thing seems to us an attempt to know plants by means of a system of nomenclature involving the smallest amount of trouble in its acquirement. There is no royal road to learning, however, and those who imagine it otherwise will sooner or later, mostly sooner, be undeceived. There is yet another class of travellers and would be naturalists who despise all names whether scientific or trivial. To such people a "Primrose by a river's brim" is not even a Primrose, merely a bit of yellow in a setting of green. When the enthusiasm of such travellers induces them to write an account of their travels, they give word pictures of what they may describe as pretty or grand, but being couched in indefinite terms that may mean anything or nothing, no reader can follow them with any degree of intelligence, so that their descriptions, being meaningless, and of no practical value, soon fall flat

and rapidly pass into oblivion. As with people, so with plants, animals and inanimate objects, their names must be learnt and properly applied, otherwise they cannot be individualised, nor distinguished from others with which they may be surrounded. It is quite useless for such travellers to preface their books, as an excuse for the baldness of their descriptions, with the plea that they "make no pretence to any scientific knowledge of any part of natural history." They disclose no secrets and impart no information by so doing. True delight in plants is largely bound up with a knowledge of them and their names.

Sir Joseph Hooker, the veteran botanist, is to be made the recipient of a special Gold Medal, by the Council of the Linnean Society, on the occasion of the completion of his *magnum opus*, the "Flora of India."

A Spring Flower Show, organised entirely in aid of the Royal Gardeners' Orphan Fund, is to be held by the Ealing and District Gardeners' Society on the 15th instant. The show will be opened to the public at 2 p.m. by Mrs. E. M. Nelson, Hanger Hill House, Ealing, and remain open till 9 p.m.

Honourable Distinction.—At the last meeting of the Royal Horticultural Society of France it was announced that a despatch had been received from Prince Anatole Gargarine to the effect that the Russian Government had conferred the order of Saint-Anne on M. Charles Baltet of Troyes, France, for his important works on arboriculture and pomology appreciated in Russia during the last thirty years.

The Kew Guild.—The annual general meeting of the members of this Guild met to the number of seventy in the Lecture Room, Kew Gardens, on the 24th instant, under the presidency of the curator, Mr. Geo. Nicholson. The report was a very satisfactory one, showing no indebtedness to anyone except to life members, of whom there had been a phenomenal increase during the past year. Rule II. was altered so as to include as members of the Guild all who are or have been gardeners at Kew, or in positions of responsibility. These would comprise the botanists at the herbarium, the museum keepers, &c.

Loss to French Horticulture.—In view of a great horticultural exhibition which was to be held at Lyons, France, during the present year, it was proposed that the Rhone Horticultural Society and the Lyons Horticultural Association should amalgamate, but the two rival societies failed to agree upon the point. The municipal council of Lyons considered that there ought to be only one society, and thinking that dissension should not be encouraged, resolved to withhold the subsidy of 500 francs, which had been asked for each of the two societies. That means the loss of 1,000 francs annually to horticulture at Lyons.

Scientific and Sporting Tour.—A select and fully equipped party under the command of an experienced traveller will start from London in April next, visiting the best sporting districts in British East Africa. The party will travel *via* the Mediterranean and East Coast of Africa to Mombasa, thence by the Uganda Railway, and up country in easy stages. The expedition will occupy twelve months, and the entire route will be in British territory. The present is a favourable opportunity to visit the country while it remains in its natural state before it is further intersected by the railway now in progress. The locality to be visited is the hill districts around Mount Kenia, the climate of which is extremely exhilarating and invigorating. The country is interesting to sportsmen and students of zoology, as it abounds with lions, elephants, rhinoceros, quagga, koodoo, gazelle, springbuck, and numerous species of antelopes. The camp will be conducted on semi-military lines, as far as possible, but each will have ample opportunity to engage in zoological and botanical studies, &c. All information may be obtained from Messrs. J. & H. Lindsay, World Travel Bureau, 7, Waterloo Place, Edinburgh.

Mr. Malcolmson, a Scotch tea planter in Ceylon, is about to start plantations in Mexico, and at present is negotiating for the transport of 500 Japanese coolies to Vera Cruz.

Knowledge Unnecessary.—First Cabbage: "Professor Gooseberry is going to lecture on 'Gardening at Klondike' at the village of Mudcheap." Second Cabbage: "What does he know about it? He has never been there." F.C.: "Neither have the villagers."—*Snaggs*.

A Giant Chrysanthemum.—M. Foukouba, gardener to the Mikado, Tokio, Japan, is an enthusiastic and celebrated Chrysanthemum grower. There is a photographic illustration of a colossal specimen in the *Nord Horticole* for February, and which was grown by the Mikado's gardener in the open air under a very slight shade from bamboo hurdles, which at the same time furnished shelter from the violence of wind. The specimen was trained in the form of a broad-based, though unequal-sided cone, the diameter of which measured 16½ ft. in one direction, and 9 ft. 10 in. in the other. This gigantic specimen was raised from a cutting struck in 1897; and when the photograph was taken in November last, the plant carried over 800 blooms, the greater number of which had a diameter of 7 in. to 7½ in.

Tonbridge Gardeners' and Amateurs' Society.—The 24th annual dinner of this old and influential society was celebrated at the Bull Hotel, Tonbridge, on the 8th ult. Major C. E. Warner presided. In proposing the toast of the evening—"Success to the society"—the chairman said that the society had never been in a more prosperous condition than now. He coupled with the toast the names of Messrs. F. Webber and C. Baldock. Both of these gentlemen replied, Mr. C. Baldock, as hon. secretary, giving some figures showing the financial position of the society. After paying all expenses they had, he said, a balance in hand of over £30. The toast list was interspersed with songs by Messrs. J. Smith, Orrom, L. Breeze, J. S. Charlton, and Huntly, whilst the recitations given by Dr. Pollen were much enjoyed.

Chiswick Gardeners' Mutual Improvement Association.—At the meeting of this association on the 17th ult., a paper on "Carnations," was read by Mr. J. F. McLeod, The Gardens, Dover House, Roehampton. He dealt with the subject entirely from a practical point of view, dealing with all the more important sections of the Carnation, including propagation, pot culture under glass, the various suitable composts and the various shifts necessary to secure certain results. Commencing with Malmaison Carnations he recorded many failures on account of fungoid diseases, the destruction of the old plants, the procuring of fresh stock and final triumph. The secret of conquering rust and allied diseases in winter was to keep the plants dust dry at the roots, and the atmosphere of the house as well. Tree, border and florists' Carnations were dealt with in turn, and lists of the best varieties of each given. There was a good attendance of gardeners, and many of them took part in a well sustained discussion.

Shirley Gardeners' Mutual Improvement Association.—The monthly meeting was held at the Parish Room, Shirley, Southampton, on the 21st ult., the President, Mr. W. F. G. Spranger, presiding over a fair attendance of the members. Mr. E. T. Mellor, B.Sc. London, lecturer to the Hartley College, Southampton, gave his concluding lecture on "Fungi Injurious and Beneficial." He said the number of injurious parasitic fungi, according to a recent authority is about 1,600, showing what a vast army of enemies the cultivator of the soil has to contend with. Taking the *Peronospora infestans* as a typical example of the class of injurious fungi, the lecturer, by means of a large number of lantern slides traced its life history, showing how by the aid of resting spores it tided over the winter and started into life again in the favourable weather. Beneficial fungi were represented by the tubercles found on all leguminous plants. These were said to be able to take up nitrogen from the air, which passed from them to the plant, thus enabling the plant to grow well on very poor soil. A brief discussion followed, and hearty votes of thanks to the lecturer and to the president terminated a most instructive series of lectures on the subject.

Mr. P. C. M. Veitch, of Exeter, we are glad to learn, has recovered from his recent illness. He had been confined to bed for three weeks with influenza, and was unable to be present at the annual general meeting of the Royal Gardeners' Orphan Fund.

Royal Horticultural Society.—The next fruit and floral meeting of the Royal Horticultural Society will be held on Tuesday, March 8th, in the Drill Hall, James Street, Victoria Street, Westminster, 1 to 4 p.m. The committees will meet as usual. At 3 o'clock the Rev. Professor George Henslow, M.A., V.M.H., will lecture on "Some of the Plants Exhibited."

Rise of the Zonal Pelargonium.—On Friday the 25th ult., Mr. H. Cannell, of Swanley, Kent, delivered a historical lecture on "The Rise of the Zonal Pelargonium during the last 50 years," at 7 p.m. in the Widmore School Rooms, Bickley, Kent. Mr. H. Cannell has long been known as the most ardent and successful advocate for the advancement of these old-fashioned yet most modern of popular flowers, which may be seen in grand form at any time during the twelve months of the year in the nurseries at Swanley. He exhibited some flowers measuring nearly 3 ins. across, and spoke extempore.

Highgate and District Chrysanthemum Society.—Committee meetings of the above society were held on the 11th and 17th ult., when the schedule for the exhibition to be held at the Holloway Hall on November 8th, 9th, and 10th next, was settled, several classes being added to last year's schedule, making up the total to ninety classes. It was unanimously decided by the committee that the Society should discontinue its affiliation with the N. C. S. and award its own certificates and medals. It was also agreed that certificates should be awarded to new varieties of Chrysanthemums, if of sufficient merit. The judges were then elected as follows:—Mr. Theobald, Mr. Caryer, Mr. Rowbottom, and Mr. Witty.

New Palm House for Stanley Park, Liverpool.—It is with pleasure that we announce Mr. H. Yates Thompson has communicated to the Liverpool City Council his willingness to provide a Palm House for Stanley Park. This is most gratifying; and the donor has considered it desirable to place an erection about 120 ft. in length at a cost of about £6,000 in this thickly populated district, in which the residents have but slight opportunities of enjoying the beauties of floriculture. It will be remembered that Mr. Thompson gave the grand house, in Sefton Park (which was figured in our pages September, 1896, with a full description) at a cost of something like £12,000. The architect, who also designed the Sefton Park house is Mr. Mackenzie, of the firm of Mackenzie and Moncur, of Edinburgh, who are to be the builders of the proposed erection. It is proposed that the house should be placed on the north side of the Park near the terrace and handstands.

Exeter and District Gardeners' Association.—On the 23rd ult., before the members of this society a lecture on Potatos was delivered by Mr. W. R. Baker, gardener to Lady Duckworth, Knightleys. Mr. T. H. Stade, of Poltimore Gardens, filled the chair. Mr. Baker in the course of his lecture alluded to the botanical affinities of the Potato. He said that it was a native of South America and was supposed to have been first brought to England by Sir Francis Drake in 1576. It was introduced to Ireland in 1586. Speaking of the Potato disease, he said that it was at its worst in Devonshire in 1845. Mr. Baker referred to the discovery of the efficacy of what is now known as the Bordeaux mixture in dealing with the disease. He advised an occasional change of seed, as no matter how good the variety was it would wear out in time. The best soil for Potatos was a good friable loam, and the worst that which was naturally wet and heavy. Thin, sandy soil would produce well-flavoured tubers but plenty of manure was needed to procure good crops. Mr. Baker then detailed the methods of cultivation, and also dealt with the questions of storage and preparation of sets. A collection of the leading types of Potatos in cultivation was shown for the purpose of illustration, the merits of the several varieties being pointed out and commented on. A brisk and an instructive discussion followed the reading of the paper.

A Big Garden.—There is an area of 50,000 square miles in China described as a garden. It consists of meadowland filled with ponds, lakes, and canals.

Death in Church.—Soon after the service commenced in the Abbey Church, at Romsey, last Sunday morning, a gardener, named Grosvenor, aged sixty-eight, died suddenly. An appropriate hymn was sung, and the vicar gave a brief suitable extempore address instead of the prepared sermon.

Royal Horticultural Society of Ireland.—A meeting of the council of this society was held on Monday, 14th ult., at 61, Dawson Street, Dublin, George Carson, Esq., J.P., in the chair. A discussion as to the proposed alteration of the date of the spring show took place, and it was finally decided to hold the show at the Royal University Buildings, on Friday, April 1st. The judges for the various departments were nominated, and other general arrangements made. The entries close on March 25th.

Northumberland is Not Behind—at least so it would appear from the list of flowers in bloom in a garden in that county during the month that has passed. Here is the list:—cultivated: Snowdrop, Violet, Crocus, Primrose, Anemone, Hellebores (in variety), Wallflower, Rose Gloire de Dijon, Aconite, Erica carnea, double Daisies, Mezereon, Periwinkle, Scabious, white Arabis, Polyanthus, Doronicum, Laurustinus, Honesty, Sweet Rocket, Mother-of-thousands, Houndstongue, Forget-me-not, Viola, Marguerite; wild: Primrose, Celandine, Daisy, Dog's Mercury, Groundsel white and red Dead Nettle, Veronica, Spurge, Dandelion.

Ealing and District Gardeners' Society.—The usual weekly meeting of this society took place on the 22nd ult., in the Municipal Buildings, Ealing, when Mr. David Tannock, Kew Gardens, gave an exceptionally interesting paper on "Cape Bulbs," Mr. C. B. Green in the chair. Mr. Tannock, however, by request, travelled outside hulbs proper, with a view to render his subject as popular and practical as possible, which he succeeded in doing to the satisfaction of his audience. Mr Tannock, therefore, included in his list such beautiful and free-flowering plants as Gladioli, Freesias, Ixias, Sparaxis, etc., as well as hulbs proper, native to South Africa, like Crinum, Vallotas, Nerines, Amaryllis, etc., giving an outline in each case, of their history and culture. Clivias or Imantophyllums, Lachenalias, Agapanthus, etc., were also treated of, and a variety of other information afforded. Mr. Tannock recommended that many of the hardier species and varieties of these bulbous subjects be planted outside at the foot of a warm wall, where, if they were planted in suitable soil, would sometimes give remarkable results. He detailed their practice at Kew, argued for a more extended culture, both in frames and in the open air, in fact, Mr. Tannock proved by his sensible remarks that he was as good a gardener as a botanist. A cordial vote of thanks was unanimously given.

Transactions of the Scottish Horticultural Association.—For the information of members and friends this influential northern society publishes in compact form in a handy little book in paper covers the gist of what has been done through the year, and likewise its intentions for another season in the which we now are. The twenty-first annual report finds place at the beginning of the book. It congratulates the members and all concerned upon the satisfactory condition of the society, both from a financial and a member-strength point of view. The annual Chrysanthemum Exhibition held in the Waverley Market, Edinburgh, on November 13th, 19th, and 20th, proved a colossal success, there being no fewer than 1186 entries, whilst 4632 blooms were staged. The surplus profits of the show, which amounted to £250, were distributed amongst deserving charities. The statement of accounts for the year showed an expenditure of £64 5s 11d. in addition to the £250 above mentioned, and the expenses of the Chrysanthemum show which came to £1,189 5s. We would suggest the lumping of these two accounts as we fail to see the object in keeping them separate. The list of members is embodied in the transactions. A full syllabus of papers to be delivered at the monthly meetings of the society has been arranged. We notice, too, that it is proposed to have a supper to celebrate the majority of the institution. This will take place at the Windsor Hotel, 100, Princes Street, Edinburgh, on Wednesday, the 9th inst.

British Natural History.—Messrs. Blackwood will publish on Friday next a "Sketch of the Natural History (Vertebrate) of the British Islands," from the pen of Mr. F. G. Attilo, whose "Sketch of the Natural History of Australia" was recently widely reviewed. This volume will be more comprehensive in nature than the Australian one, and will take the form of an introductory textbook. The plates and numerous illustrations have all been specially executed for the work by Messrs. G. E. Lodge and E. F. T. and A. K. Bennett.

Generous Offer to Cambridge.—Sir Ernest Clarke has just delivered the last of four lectures at St John's College, Cambridge, on the "History and Economics of Agriculture." He referred to previous endeavours to establish a special examination in agricultural science for the ordinary B.A. degree. Having recently stated his case to Sir Walter Gilbey, the latter authorised him to inform the Vice-Chancellor that if the Senate could see its way to do this, he (Sir Walter) would be ready to offer the University £2,000 to provide a stipend of £200 for a reader in agriculture during the next ten years.

NATIONAL CHRYSANTHEMUM SOCIETY.

THE annual general meeting of the National Chrysanthemum Society which took place, as announced, at Anderton's Hotel, on the 28th ult., proved to be a very stormy one. Dissatisfaction appeared to be in the air and it made itself felt soon after proceedings were opened by Mr. T. W. Sanders, who was voted to the chair on the motion of Mr. George Gordon, seconded by Mr. H. Cannell.

The report and financial statement were read by Mr. R. Dean. The chairman formally moved and Mr. H. J. Jones seconded their adoption, both briefly. It is not necessary to give the details of either the report or financial statement, as the members present refused by the overwhelming majority of eighty-six to six to have anything to do with them. The retiring treasurer Mr. Starling, struck the key note of the fray by assuring the members that they were in anything but a sound financial position. They were in debt, and in order to pay it off fairly and squarely they would have to draw upon the reserve fund to a considerable extent. The time had come when the society ought to have paid auditors and a responsible treasurer; he himself had been a treasurer only in name. He did not, however, cast any imputation upon the auditors for they, he learned, had done their work well, and the accounts, as *accounts*, were right enough.

Mr. George Gordon discussed in some detail several of the items of expenditure, instituting a comparison between 1891 and 1897, and pointing out that several charges had increased. He thought they ought to pay their way before distributing medals among themselves, and that they ought not to spread their tails for every ass to bray at or fool to kick. From the schedule it appeared that £610 were to be given away in prize money and medals during the present year, while the probable income was £714, thus leaving only £104 to meet all other expenses. He asked where the money was to come from and thought the members ought to check this extravagance. He moved as an amendment that "the report and financial statement be referred to the committee to prepare a proper balance sheet, to give an estimate of coming expenditure, to report on the advisability of reducing the number of shows, or the prize money, and to place the same before an adjourned annual meeting. Mr. J. W. Moorman seconded and, with Mr. Bevan, strongly supported the amendment, which was then put to the vote and carried by eighty six votes to six. Messrs. G. Addison and C. Harman-Payne were the tellers of votes.

Mr. Cholmeley moved that the report and balance sheet be printed and circulated at least seven days before the annual meeting. He was not attacking men, he said, but principles, and as a business man he was convinced that the system hitherto followed was wrong. Mr. Wooderson seconded the motion, which on being put to the meeting was carried unanimously.

Mr. Spicer proposed the adjournment of the meeting for three weeks. Mr. Fife seconded, and Messrs. Gordon and Cholmeley supported. The audience was in unanimous accord, and the meeting was forthwith adjourned, the other business that was upon the agenda list standing over until the adjourned meeting.

HINTS FOR AMATEURS.

THE SEED ORDER

Cabbage.—It is for spring and early summer use that the Cabbage is most esteemed. Several sorts should be grown, so as to extend the period of bearing over a fairly long season. For early crop there is nothing to beat Ellams' Dwarf Early. In all localities this seems to do equally well. The plants are of dwarf and close habit, being well under a foot in height. They can thus be planted pretty close together, and the utmost got out of every square yard of ground. The heads are of medium size, solid, of great weight, and good flavour. An additional qualification is the way in which the plants will stand through severe winters. Wheeler's Imperial is also an early variety that comes in just after Ellams. For a general crop there is nothing to beat Enfield Market, a sturdy variety that throws heads of good size. It also is very hardy, and a good doer all round.

Sowing in the spring to furnish heads, which shall be ready for use during the summer and autumn months, is frequently practised in gardens where a variety of vegetables must be on hand at all times, or where Cabbages are special favourites. The varieties of Cabbage in cultivation fall into two distinct sections, viz., those suitable for autumn sowing and those fitted for sowing in spring. In most instances, sorts that give good results when sown in spring, are not successes when sown in autumn, consequently we must select another variety besides those we have already mentioned. Sutton's Tender and True is one of the best for the purpose. Under anything like ordinarily favourable conditions, heads may be cut in about three months from the date of sowing. The hearts are very solid, of capital flavour, and are very prettily shaped.

Savoy Cabbages are invaluable for winter use, and there is really no more delicious vegetable when the heads have been nicely crisped with frost. Drumhead is a variety that is much grown in gardens where large size is of importance, whilst Tom Thumb represents the other extreme in point of size. For amateurs we would recommend the latter in preference to the former. The heads are rather small, it is true, but compensation is obtained by the closer planting that is possible. The flavour is everything that can be desired, and if only one variety can be grown we should certainly recommend this, as a few plants can be put in at almost any odd corner. Golden Globe is a medium-sized variety of great excellence, and the same may be said of Dwarf Green Curled. A packet of seed from a well-selected and tested stock of the last-named variety will yield first-rate results. For a first choice then of two varieties grow Tom Thumb and Dwarf Green Curled.

Cauliflowers.—For a first early, and to come in as a succession to the late Broccoli, try First Crop. This form is very dwarf, and of compact habit. Thick planting may therefore be practised, which is of some importance from the economical point of view when dealing with early Cauliflowers. Magnum Bonum will form a capital succession variety. The heads are large, but as they are well protected with leaves, they last for some time in condition. Favourite, which is a little later than Magnum Bonum, specially recommends itself to amateurs on account of the ease with which it may be grown. For an autumn crop the claims of Veitch's Autumn Giant cannot be gainsaid; indeed, the merits of this grand variety are so well known and have been so thoroughly tested in all parts of the country that no further recommendation is needed. We may say, however, that it will supply heads of first-class quality as long as the frost will let it alone, thus joining hands with the early Broccoli.

Broccoli.—One of the very best of the early Broccoli is Veitch's Self-protecting, which thus carries on the succession after Autumn Giant Cauliflower has ceased to be of service. Carter's Mammoth Spring White will furnish heads from January to April, inclusive, if well treated. It is withal of good flavour, and the heads, which are of really mammoth size, are well protected by the leaves. For a late variety the amateur will do well to invest in Late Queen, which has, perhaps, greater cold-resisting powers than any other variety. The plants are dwarf and exceptionally sturdy. Like

late Broccoli generally the heads are well protected by the abundant foliage, and no matter how severe the winters a good percentage of the plants are sure to survive. The heads turn in in May and June, varying, of course, according to the locality and the character of the season.—*Rex.*

Correspondence.

Questions asked by amateurs on any subject pertaining to gardens or gardening will be answered on this page. Anyone may give additional or more explanatory answers to questions that have already appeared. Those who desire their communications to appear on this page should write "Amateurs' Page" on the top of their letters.

Peach Buds Falling.—Please say what is the cause of Peach-tree buds falling off. The trees are covered with mildew. I painted them last December with Gishurst Compound. Would it be possible that it was too strong?—*Amateur.*

Generally speaking, Gishurst Compound is one of the safest specifics to use, and it is not at all likely that the mixture was too strong. You may possibly have been heavy-handed in applying it, and have bruised some of the buds a little, thus causing them to drop, but again it is not likely that this is the whole cause of the evil. The true reasons, for it is likely that there is more than one, are very complex in their workings, and to be able to put one's finger on the special one, it is necessary to know the whole of the facts of the case, and to have studied carefully the treatment given to the trees.

The dropping of buds is, broadly speaking, caused by some weakness, constitutional or acquired, on the part of the trees. In the case of some varieties, such as Noblesse, it is a natural trick that the trees have, and then nothing seems to be effectual in combating the evil. A fruitful cause of bud-dropping is the giving of too much heat when forcing; accordingly, the greatest care should be taken at this time. Another cause is neglect of water whilst the trees are maturing their growth in the autumn. The result of this is that the buds are improperly developed. They remain on the trees until the turn of the year, and then as soon as a little artificial heat is applied many of them are cast off. It will thus be seen that a combination of the evils of insufficient water supply in the autumn and too high a temperature at an early stage of their career in the spring would be especially dangerous, since either of the two is sufficient in itself to produce the dropping complained of.

In your case we are inclined to think that the dropping of buds is due to the fact that the presence of mildew last year prevented the proper development of the buds and maturation of the wood, this acting along the same lines as neglect in the matter of water would have done.

Your remedy will be to attend to the trees carefully so that they shall be given every chance to grow. An occasional spraying with a solution of potassium sulphide should be given. Half an ounce of the sulphide dissolved in a gallon of water will kill all the spores of the mildew and will do no harm to the trees at all.

We have replied at some length to this question because it is one that, unfortunately, is of some moment to both amateur and professional gardeners. It is most provoking even to the most even-tempered individual to see the fruit buds vanishing from his trees, and with them his chance of a crop.

Hardy Perennials for Cutting.—I give a list of perennials I grow. Can you suggest some additions for cutting purposes, and to bloom during August? The list is—Anemone japonica, Roses, Helianthus in variety, Pentstemons, Phloxes, Carnations, Rudbeckias, Gaillardias, Malva moschata, Stenactis, Dahlias, Chrysanthemum frutescens, Chrysanthemum early Japanese, Galega, Montbretias, Gladioli, Eryngiums, Achilleas, Coreopses, Inula glandulosa, Geums, Heuchera sanguinea, Monarda didyma.—*C. Hart.*

This is an exceedingly comprehensive list, and our correspondent's garden must be very well stocked indeed. If all these plants are well grown there should be no lack of cut flower. There are several of the Campanulas that would be in flower at this time of the year. *C. pyramidalis* in both its blue

and white forms is most useful at the beginning of the month. *C. Vidalii*, often grown as a pot plant for the greenhouse, also does very well in the herbaceous border when the winters are not too long and severe. In addition to the type *Anemone japonica*, *A. j. rubra* is a fine rosy-coloured form that is well worth growing. *Heuchera macrantha* will form a good addition to *H. sanguinea*. You mention Pentstemons in your list. These we take to mean the florist varieties. If you have not *P. barbatum* a very useful species usually met with in gardens under the name of *Chelone barbata*, we should advise you to get it. The Aquilegias are a host in themselves; *A. chrysantha*, *A. canadensis*, *A. caerulea*, and the numerous pretty hybrids are all of the greatest service. The three species named commence to bloom before August, but they continue to produce their blooms over a lengthy period, although much depends on the locality. We wonder that you do not include the Gypsophilas, for both *G. elegans* and *G. paniculata* would be invaluable for you. The earlier flowered perennial Asters (*Michaelmas Daisies*) such as *A. acris*, *A. a. drucunculoides*, *A. Amellus*, and *A. alpinus* would be in flower in August.

To these you may add *Boltonia decurrens*, *Anthericum Liliago*, *A. L. major*, *Cimicifuga cordifolia*, *C. racemosa*, *Centaurea Cyanus*, *C. atropurpurea*, *C. macrocephala*, *Helenium pumilum*, *Linum narbonense*, *Linaria vulgaris*, *L. V. Peloria*, *Lobelia splendens* Queen Victoria, *Potentilla* in variety, including such double forms as *Californie*, *Congo*, *Madame Rouillard*, *Velours Pourpre*, and *William Rollison*, *Statice Gmelini*, and *S. incana*. *Thalictrum adiantifolium* may well find a place in this list, for its graceful foliage renders it of great value for mixing with cut flowers of all descriptions.

Mildew on Chrysanthemums.—*Rob.*: The presence of the mildew on the young plants is probably due to lack of caution and consistency in ventilation, possibly combined with a little too much water at the root. Plants that are coddled up one day, and a lot of air rushed on the next, are almost sure to be attacked at this time of the year. If only a few spots are to be seen, you may stop the disease from spreading further by dusting the spots with flowers of sulphur. Be careful in future with both watering and airing.

Old Chrysanthemums.—I should like to grow on a few of the best sorts of the old plants in pots this year if they would do well. Please advise me how to proceed. *Wily.*

There is no reason why the plants should not do well, although it is not a common practice to grow them on for the second year. Knock the old plants out of their pots, and shake away a good deal of the soil, thus reducing the balls to an extent that will allow of their being put in smaller pots. Consign them to a cold frame and keep them close for a week or two until they get a start. Thin out the shoots at the base to as many as are required. If the stools are strong there may be a good deal of thinning to do. It should, therefore, be done gradually and carefully.

Tree Carnations.—*Y. Y.*: Do not delay in putting in the cuttings. Select points, about 3 in. long, of young shoots, pull them out from the parent plant by means of a sharp jerk, and there you have the cutting made ready to insert without the necessity for the use of the knife at all. Use light sandy soil and put five or six cuttings in a "thumb" pot. If you have a propagating frame with a minimum temperature of 60° Fahr. put the cuttings in it. They will then root in a week or two, after which they may be gradually inured to a higher temperature. Striking the cuttings thus in heat may seem to be a coddling practice but it is a great saving of time, and a far heavier percentage of cuttings root than when a lower temperature is given.

Lifting Tulips.—I planted a number of bulbs of Darwin Tulips at the beginning of last November. The leaves are through the ground for a couple of inches at the present time. I want badly to lift them to another place. Will this injure the plants.—*A. O.*

It won't do them any good, certainly, but if you exercise care in lifting and replanting, neither should it do them a very great amount of harm. Be very careful to dig deep enough for them, and break off as few of the roots as possible—some, of course, are bound to come to grief during the process.

PEA, SUTTON'S CONTINUITY.

THERE is always an eager desire to get a Pea that will supply the first dish for table use. We have nothing to say against this desire, nor the efforts made to secure it; but late Peas are liable to be overlooked, particularly in dry localities where a

is a distinctly late Pea, which, when sown in the second week of June, will come into use during the third week of August, just at a time when Peas are a scarce commodity in the southern and warmer counties of Britain. The haulm is of vigorous growth, not subject to mildew, and produces a

consumers of Green Peas. Several leading, practical cultivators speak of it in the highest terms of praise. It varies in height according to the weather, soil, and cultural treatment; but the fact that it was grown to a height of 4 ft. last year tells plainly of its vigour; while usable pods on the lower portions of

NEW LATE PEA, SUTTON'S CONTINUITY.

droughty season has the effect of putting a stop to growth or fostering mildew. With a little skilful management the dry period may be tided over, after which it is possible to get Peas as late as November, as was the case last year in many parts of the country both north and south. Sutton's Continuity

heavy crop of pods that come into use over an extended period. The pods are of a dark green, straight, almost square at the ends, 4 ins. to 4½ ins. in length, and filled with about nine seeds of first size and quality, the flavour being distinctly of the marrowfat type, which appeals so strongly to the

the haulm and flowers at the top indicated its continuous bearing character implied in the name. The accompanying photographic illustration, put at our service by Messrs. Sutton & Sons, Reading, will give readers an idea of the productiveness of the variety.

TOMATO VEITCH'S GOLDEN JUBILEE.
THE several fine exhibits of this Golden Tomato brought before the public during the past two years, but particularly the magnificent trophy at the great show of British-grown fruit at the Crystal Palace last autumn, ought to be sufficient to remove any remaining prejudices which the British public may

with red, the latter being just sufficient to lend an additional charm to a variety already admitted on all hands to be the finest and most handsome yellow Tomato brought before the public. The flesh is of excellent flavour, and so solid as to leave little room either for seeds or core. When first shown at a meeting of the Royal Horticultural Society on

plainly shows the free-fruited character of the variety, now being put into commerce by Messrs. J. Veitch & Sons, Ltd., Chelsea, who have enabled us to place the figure before our readers.

RUNNER BEAN, ECLIPSE.

LARGE size is still a desideratum amongst Scarlet

TOMATO VEITCH'S GOLDEN JUBILEE.

WEBBS' RUNNER BEAN, ECLIPSE

entertain towards yellow varieties. Veitch's Golden Jubilee was raised by Mr. Owen Thomas, of the Royal Gardens, Windsor, as the result of a cross between Golden Princess and Frogmore Selected. The fruits are of medium size, perfectly smooth, rich golden-yellow, more or less clouded or overlaid

the 5th August, 1895, it was accorded an Award of Merit, but when brought up again on the 26th May, 1897, the members of the committee were so impressed with the superior quality of the fruit that they unanimously awarded it a First-class Certificate. The accompanying photographic illustration

Runners, provided the other qualities requisite are present. Webb's new Runner Bean Eclipse is considered an improvement upon the well known Selected Scarlet Runner Bean sent out by Messrs. Ed. Webb & Sons, Wordsley, Stourbridge. Under good cultural treatment the pods attain a length of 12 ins.,

though the average may be less, and being tender, crisp, and succulent they make delicate eating when cooked. Several gardeners who have given the variety a trial speak in favourable terms of the

occurring amongst batches of seedlings. The aim has been to get a Cucumber combining the dark green hue of Tender and True, the quality of Lockie's Perfection, and the free-bearing character

Thomas, of the Royal Gardens, Windsor. The fruit is globular and of useful size for the table of private establishments, the average weight being about 3 lb. The skin is of a light cream colour, finely netted,

THE LADY MELON.

heavy and continuous bearing character of the variety, while the flavour is excellent when brought to table. It has already been well tried, but is just now being put into commerce for the first time. The shape of the pods is well indicated by the accompanying photographic illustration lent us by Messrs. Webb.

of Telegraph. The fruits are cylindrical, smooth, and taper very slightly to the base, while they are of moderate and useful size. The flavour is all that could be desired in a Cucumber, and when the variety comes to be known its recommendations generally will ensure extended cultivation. Messrs. Robert Veitch and Son, 54, High Street, Exeter, have placed the accompanying illustration at our

and the rind is thin; while the flesh is of great depth, leaving only a small cavity for seeds, and is of a pale green, slightly tinted with red. It is unusual in this respect by combining the characters of the three leading types, as classified by colour, namely, scarlet, green, and white. The flavour is excellent, as is usually the case with small fruited melons. The variety sets freely and bears heavily. An award of

TOMATO THE CROPPER. (See p. 428).

CUCUMBER VEITCH'S WESTERN WONDER.

THIS new variety may be described as the result of repeated and careful selection of the best type

disposal. The selection of the variety was made in their own Cucumber house at Exwick.

THE LADY MELON.

IN this we have another of the successes of Mr. Owen

merit was accorded it by the Royal Horticultural Society when shown by Mr. Thomas. The stock has passed into the hands of Messrs. Dicksons, Ltd., Chester, who placed the illustration at our service.

TOMATO THE CROPPER.

THE great aim with most cultivators of Tomatos is to get the heaviest crop of fruit from any given space; and those who grow for market in this country well know that Tomatos of great size are not wanted. For exhibition purposes the matter is slightly different; but good judges do not now give the palm for mere size. For dessert purposes fruits of medium size are preferred; and our experience is that medium-sized fruits are the best flavoured and most relished by the consumer. The accompanying illustration, prepared from a photograph, shows a heavy crop of fruits of moderate size. The largest fruits do not reach half-a-pound in weight, while all the smaller ones are serviceable. It was put into commerce last year by Messrs. Wm. Cutbush & Son, Highgate, London, who lent us the accompanying illustration, and it still maintains the character indicated by the name.

HARDY FRUIT PROSPECTS.

THE choicer fruits such as Apricots and Peaches are well studded with fruit buds, and are fast expanding their petals, which means that some kind of protection will have to be given them to ward off frost or hail should either happen. We can hardly hope to escape such at this early season. Apples, as far as I can see around the garden, promise well; and Pears against walls, as well as in the open, give every indication of an abundance of blossom, which will soon be open. The Plums, too, are showing well in similar positions to the last named. Nature did her part well last summer and early autumn in ripening up the wood of all fruit trees; and we must hope she will be no less propitious now, but assist in setting and swelling the fruit. Then I predict we shall have an abundance of all the kinds named above.—*Devonian.*

READING AND DISTRICT GARDENERS.

THE fortnightly meeting of the above association was held in the Club Room, British Workman, Reading, on the 21st ult., the president, Mr. C. B. Stevens, presiding over a good attendance of members. The subject for the evening was "A Chat about Melons" introduced by Mr. B. Dockerill, The Gardens, Elmhurst, Reading, a well known grower and successful exhibitor of this fruit.

The paper was of the most practical nature and dealt with the cultivation of the Melon in all its branches. Mr. Dockerill said he was obliged to condense a large subject into a small paper, but trusted that it would be sufficient to open up a good discussion on the principal points worth considering; for the Melon was a fruit so widely known that it was reasonable to assume that there was hardly a gardener who had not made its acquaintance in one way or another; and it would be difficult to find a garden of any dimensions where this excellent fruit was not grown. The requirements for its successful cultivation were not large, for they may be summed up in the following words:—Heat, moisture, fresh air, sunshine, and good soil. Span-roof houses were preferred, standing in an open situation running from north to south, and frames made on the same principal were certainly preferable to the lean-to.

After dealing with the inside arrangements of the house, particulars were given as to the making of the borders, the best soil to be used, raising of the seed, the system of planting, stopping, top-dressing, temperature, ventilation, watering, &c. As to varieties, after briefly referring to the sorts of bygone days such as William Tillery, Reid's Scarlet Flesh, Victory of Bath, &c., the qualities of many of those grown at the present time were touched upon. The foremost position as the best for all purposes whether for growing in houses, frames, for exhibition, or for flavour was given to that grand variety Sutton's Hero of Lockinge.

In conclusion the diseases to which the plants were subjected were referred to and also the growing of Melons for exhibition, a practice in which the speaker had been exceedingly successful; for at the Reading Horticultural Show in 1892 in a competition for a brace of Melons, fourteen entries, and for a single specimen, twelve entries, Mr. Dockerill was awarded the highest honours in both classes. As late as 1896 he again took first prizes in both classes, the fruit in each case being grown in frames.

An interesting and profitable discussion ensued in which Mr. M. H. F. Sutton, Messrs. Turton, Martin, Woolford, Bound, Hobbs, Neve, and the president took part. A hearty vote of thanks was given to the lecturer for his very practical paper. Exhibits were small in number but interesting. Mr. Thompson, gardener to F. Wheeler, Esq., Tylehurst, exhibited a two-spined Arum, and Mr. Dockerill some excellent blooms, equal in quality to those seen in November, of Mrs. E. W. Clarke and J. H. Taylor Chrysanthemums.

QUESTIONABLE EXHIBITS.

WHATEVER may be the results of the present discussion as regards the N. C. S. withdrawing the unfair conditions attached to the prizes offered for vegetables at the October show, there can be no doubt the ventilation of the conditions on which the prizes are offered will do good; and if it curtails such absurd conditions being imposed in the future, some good has been accomplished. As a rule attention has only to be called to such questionable conditions to prevent them becoming popular with those who have the arrangement of horticultural schedules. I am pleased to notice the correspondence that has taken place and the strong opinion expressed against the conditions imposed. Although *Fiat justitia* in his admirable article (page 396) thinks I have used too strong a term in questioning the *honesty* of certain proceedings, yet in the following paragraph of his article he says: "*Most people will admit that it is not a fair condition to rule that all produce entered in a competition for vegetables grown from seed supplied by the firm giving the prizes shall become the property of the donors of the prizes.*"

Just so. Then if most people will admit (and I think they will) that it is not a fair condition, it is then unjust, and it should not be encouraged by the N.C.S. They should have no interest in offering prizes through the Society that are not fair and honourable.

Again, although any firm offering prizes for produce grown from its own seeds has the right to impose what conditions it likes to govern the competition, the society through which they are offered has an equal right to refuse them if it thinks the conditions under which they are offered are not fair and honourable.—*A member of the N.C.S.*

"JUDGING AT HORTICULTURAL EXHIBITIONS."

I THINK most of your readers will be interested in this question, as it affects a great many of us directly or indirectly. I agree with a good deal that Mr. Beckett has written concerning this knotty problem. As he says, *it is quite impossible to please the many critics who scrutinise the awards at a fruit or flower show.* What judges do, or should do, is to thoroughly examine all exhibits that are placed before them, and to adjudicate upon the same. After having satisfied themselves clearly which is the best, they can feel they have conscientiously done their duty to the best of their ability, and can only hope that the exhibitors as well as the general public will take the same practical view, though in practice it is often the other way about.

Of course, it is a well known fact that judges do err at times; the best of us are not infallible. Exhibitors are sometimes to blame for this, for instead of getting their exhibits all staged and ready for the judges by eleven o'clock (this being the usual hour) it is often an hour later before the hall or tent is cleared. This is wasting valuable time that should have been at the disposal of the judges. The consequence is they have to hurry over the awards to get done by opening time, and probably justice has not been meted out in the right quarter. When I am officiating, and there should be two exhibits as near alike as possible, as regards quality, size, or effect, whichever it may be, I always hang fire as it were, and endeavour to find a fault here, or a point there, so as to avoid those equal firsts or seconds—to my mind a very unsatisfactory solution. I do not think this equality is practised much outside horticultural shows, and if horse, cattle, poultry shows, etc., can do without this, surely we ought to be able to.

Mr. Beckett says he is always satisfied with the awards of practical men when he is exhibiting. I am pleased to hear this, and wish I could say the

same of some I know, who are very bad losers but excellent winners.—*J. Mayne, Bicton, Devon.*

GARDENERS' ROYAL ORPHAN FUND.

THE REPORT.

The tenth annual general meeting of this well-known charity was held as usual at Anderton's Hotel, Fleet Street, E.C. W. Marshall, Esq., took the chair at 2 p.m. At the chairman's request the notice convening the meeting was read by Mr. B. Wynne, and the minutes of the last general meeting were then presented and approved.

The report of the executive committee was presented by Mr. A. F. Barron. After commenting upon the fact that the tenth year of the institution had been safely passed through, it expressed regret that the receipts for the past year had not been so satisfactory as could be desired, and urged the necessity of increased efforts on behalf of friends. During the past ten years ninety-eight children had received benefit from the Fund, of which number sixty-two were even now in receipt of a weekly allowance. The total amount paid to children since the inauguration of the charity in 1887 was £5,807 5s. Amongst the most important donations were £50 from the Scottish Horticultural Association, £26 5s. from the Royal Caledonian Horticultural Society; £23 12s. 6d. from the Chislehurst Gardeners' Society; and £18 8s. from the Altrincham Gardeners' Society. A sum of £457 5s. 11d. had been bequeathed by the late Mr. J. W. Thomson, and invested in accordance with the terms of his will. This legacy would henceforth be known as the "J. W. Thomson Trust."

The annual dinner held at the Hotel Cecil in April last, and presided over by Sir J. Whittaker Ellis, Bart., had resulted in a handsome subscription list of £635.

The best thanks of the committee were due to the treasurer, Mr. N. Sherwood, and the auditors, Mr. P. Rudolph Barr and Mr. M. Rowan.

The loss by death of Dr. Robert Hogg, and Mr. W. G. Head, both staunch supporters of the Fund was deeply deplored.

The members of the executive committee who retire by rotation were Messrs. Assbee, Ballantine, Cannell, Cummins, Gordon, McLeod, Roupell, and Wynne. All offer themselves for re-election with the exception of Messrs. Ballantine and Cummins, Messrs. A. Outram and G. H. Richards being nominated to fill the vacancies.

Mr. A. F. Barron was again nominated for secretary at the same remuneration.

The cash statement declared total receipts of £2,625 1s. 1d., including a balance from the last account of £599 11s. 10d. The expenditure summed up to £1,689 3s. 10d., with a balance in hand of £935 17s. 3d. Among the most important items appeared £853 15s. spent in allowances to orphans at the ordinary rate of 5s. per week to each child. Special grants in aid had been made of £22 10s., whilst the "Emma Sherwood Memorial" accounted for £13, thus making a total disbursed in charity of £889 5s. A further sum of £422 7s. 4d. had been invested in Canada stock. The invested moneys of the Fund amounted to £7,070 6s. 10d. in 2½ per cent. Consols, and £2,422 7s. 4d. in 3 per cent. Canada stock.

Mr. W. Marshall briefly moved that the report and statement of accounts issued to the members be taken as read, and adopted. He had nothing, he said, to comment upon with relation to the report, since everything had been duly mentioned, but he would suggest, as a private individual, that the committee should consider how many children from one family should be placed upon the funds. Personally, he thought that the number should not exceed two. Mr. Bates seconded the adoption of the report, which was carried unanimously.

Mr. Poupert moved, and Mr. Osman seconded that N. N. Sherwood, Esq., be re-elected treasurer, and thanked for his past services.

It was proposed by Mr. R. Dean that Mr. M. Rowan be re-elected auditor, and that he and his auditor colleague, Mr. P. Rudolph Barr, be thanked for services rendered. Mr. Roupell seconded.

On the motion of the chairman, seconded by Mr. H. B. May, Messrs. Assbee, Cummins, Gordon, McLeod, Roupell, and Wynne were asked to continue upon the committee. Mr. Cummins proposed that Messrs. A. Outram and G. H. Richards be asked to

serve upon the committee, *vice* Messrs. Ballantine and Cannell, who retire. Mr. G. Reynolds seconded.

Mr. Marshall said an agreeable duty fell to him in proposing Mr. A. F. Barron as secretary for the ensuing year. Mr. Walker seconded.

All these motions were carried.

On the motion of Mr. H. J. Jones, supported by Mr. J. Fraser, Messrs. R. Dean, McLeod, Walker, and H. B. May were appointed scrutineers of the ballot.

The meeting then adjourned for the declaration of the poll, which closed at 4.30 p.m.

RESULT OF THE BALLOT.

This was made known at 4.50 p.m. The total number of votes polled was 3,157, and the successful candidates were as follows, with the number of votes obtained by each:—Agnes Macintosh, 349; Robert John Smith, 332; Jamesina Baird, 278; Lydia Annie Milne, 275; Hermine Kosbab, 272; William Ewart Holmes, 269; Ruth Amy Worth, 241; Margaret Annie Richardson, 232; and Constance Mary James, 209. Annie Kathleen French, with 166 votes to her credit, was tenth on the list and therefore came in for the benefit of the "J. W. Thomson Trust." The meeting closed with votes of the thanks to the scrutineers of the ballot, and to Mr. Marshall for presiding.

THE ANNUAL FRIENDLY DINNER.

Mr. P. C. M. Veitch, of Exeter, had been announced to take the chair at the dinner, which took place at 6.30 in an adjoining room, but was prevented from fulfilling the engagement by illness. Mr. N. N. Sherwood therefore acted in that capacity.

After the usual loyal toasts of the Queen, Prince and Princess of Wales, and the rest of the Royal Family had been honoured at the invitation of the chairman, Mr. Sherwood proposed "continued success and prosperity to the Gardeners' Royal Orphan Fund." He alluded briefly in the course of his remarks to the information given in the report. He was sorry to find that the past year had not been so successful as they could have wished it to have been, but they must not think matters were so bad as these words might lead them to think. He assured his audience that the nursery and seed trade would always be ready to do what lay in its power to help such charities, and impressed upon them the necessity for enlisting the sympathies of all gardeners. In alluding to the large donations which had been received from various sources during the course of the year, he mentioned one of £31 sent by Mr. M. Todd, of Edinburgh, since the publication of the report. The donation of £14 sent by Mr. H. J. Jones, was made up of no fewer than 2,501 coins. Mr. Miles, of Southampton, who had during 1897 obtained fifty-five new subscribers, was mentioned as an instance of what might be done by an energetic local secretary. He coupled with the toast the name of Mr. Marshall, who suitably responded.

Other toasts followed, including one to the chairman, and one to the secretary, Mr. A. F. Barron. The evening was much enlivened by some capital songs from Messrs. D. W. Crane, Poupart, R. H. Mason, and H. J. Jones. The musical sketch and recitation given by Mr. Rowland Henry evoked roars of laughter, and Mr. Weeks with his recitation "Abimelech" fairly brought the house down.

CHRISTMAS AND LENTEN ROSES.

CHRISTMAS and Lenten Roses are general favourites, not only on account of their early flowering properties, but they are also esteemed for their quaint beauty and general usefulness, supplying as they do a rich harvest of durable flowers, at a season when flowers are *flowers*, in other words when we poor benighted apostles of the floral world are at our wits' end what to dish up for variety, until gentle spring unfolds her hidden treasures.

All spring flowers promise to be with us much earlier than usual; in fact, many are well with us now. Snowdrops are in plenty; *Eranthis hyemalis* (Winter Aconite) in sheets of gold; and Christmas Roses just about over, have been in evidence since early December. The earliest of the Lenten Roses are now (Feb. 12th) at their best. Many of them commenced to unfold their quaint, drooping flowers in early January. We do not, as a rule, have these in flower in Scotland until March and April, unless, of course, they have the protection of a frame or hand light, a plan generally adopted in most gardens. When so treated the flowers are not only cleaner, but have

also longer stems, which further enhance their value for decorative purposes.

Visiting Mr. Forbes' hardy plant nursery at Hawick, in the end of January, I noticed that even here, growing in nursery rows on an open border, many of the Hellebores were in full bloom. *H. niger* and its varieties, *H. n. maximus* and *H. n. angustifolius* were fine, the last-named being especially so. I consider this by far the best, being not only purer in colour, but also more vigorous and free in all respects. The rosy tinge generally seen in *H. niger* and *H. n. altifolius* (generally known as *maximus*) is entirely wanting in *H. n. angustifolius* the Scotch Christmas Rose. (By the way, why are they known as Roses at all? it seems a strange incongruity, though certainly not more so than some of our newspaper Christmas numbers, which also claim the title. Whether right or wrong the cognomen has evidently come to stay).

Of the varieties generally known as Lenten Roses, the following were well in flower:—*H. atrorubens*, reddish purple; *H. caucasicus*, white tinged rose on the outside; *H. caucasicus punctatus*, reddish rose; and *H. colchicus coccineus*, plum purple, suffused red. *H. orientalis* Apotheker Bogrin is crimson purple, spotted with crimson; *H. o. F. C. Heinemann* is dark purple, spotted with crimson; *H. o. Inspector Hartweg* is rosy purple, spotted carmine. *H. o. Albian Otto*, *H. o. Councillor Benary*, and *H. o. Professor Scleicher*, were the most prominent whites in flower. A great many other sorts were showing bud, and ere now I fancy will be in bloom. The flowers are borne in panicles on stems 15 ins. or so in height, clear of the foliage, which is not in their favour should severe weather set in. These Lenten Roses are gross feeders and soon exhaust the soil. A mulching of dung or a top dressing of good soil, and copious waterings in their growing season are very beneficial, especially as the plants dislike being disturbed at the root, and should not be broken up any oftener than is absolutely necessary.—*Waverley*.

ORCHID NOTES & GLEANINGS.

BY THE EDITOR.

Dendrobium pardalinum.—The parentage of this hybrid Dendrobe is given as *D. Ainsworthii* and *D. statterianum*, both being garden forms. It bears a close resemblance to the first-named parent, but the ground colour of the segments is creamy rather than white. There is a faint purple blotch at the tips of the sepals and petals. The disc of the lip is furnished with a large, circular, rich crimson blotch, which covers the greater portion of the same, and is wonderfully well defined in outline. On each side of the base the surface is thickly striated with slender lines of a lighter but brighter crimson. These lines and the blotch are brought out very clearly and effectively under the influence of artificial light. The name *pardalinum* is, however, a misnomer, for we can hardly imagine a *pard* furnished with a solitary blotch. The flowers are deliciously fragrant for days after they are cut whether placed in water or not, the odour recalling that of Violets. The hybrid has been flowering for some time past in the collection of Thos. McMeekin, Esq., Falkland Park, South Norwood Hill.

Odontoglossum wilckeanum Rosslyn var.—A piece of this magnificent variety, after a year's growth by Messrs. McBean & Sons, Cooksbridge, Lewes, has produced a spike 4½ ft. in length, and carrying thirteen flowers of large size. Last year it was a small and weak plant. It is the property of H. T. Pitt, Esq., Rosslyn, Stamford Hill. The segments are broad and imbricated, and almost covered by large, dark, chestnut-red blotches on a clear yellow ground. The lip is paler, but the large blotch upon it is brighter. The flowers measured 3½ in. by 3¾ in.

Odontoglossum wilckeanum rubiginosum.—The large, rich, chocolate-red blotches on the flowers of this variety make it the darkest and richest of the forms of *O. wilckeanum* we remember having seen. They have a waxy and shining lustre which gives the flower a most striking appearance. H. T. Pitt, Esq., Rosslyn, Stamford Hill, is the fortunate possessor.

The Orange Crop of New Zealand has been known to bring £200 per acre in some seasons.

Kitchen Garden Calendar.

ONIONS are an important crop in most gardens, and to have them of the finest quality special care must be taken in their cultivation. The time of sowing the seed, as well as the preparation of the ground, are important items; this being so, an effort should be made to get the seed in on the first favourable opportunity. There is nothing gained, however, by sowing when the soil sticks to the boots and gets carried off on to the paths. Where the ground was turned up roughly in the autumn it should be forked over, breaking all the clods so as to render it as fine as possible. If the day be fine and the sun shines brightly, by the afternoon that which was forked over early in the morning will be sufficiently dry on the surface to walk upon without any harm being done. When in this condition it should be trodden, so as to make the surface firm, after which the plot intended to be sown should be raked level and the drills made. There is no necessity to form beds, or to make a division between the different varieties, which is a waste of ground. It is, however, better to allow a little more room between the drills than is usually done, as this facilitates the work of keeping the plants clean. Neither is it advisable to sow too thickly, as the plants cannot gain strength in their young state when overcrowded. Deep sowing must in all cases be avoided, for the nearer the bulbs are to the surface the better their shape.

PARSNIPS for an early supply may now be sown. Those who wish to grow them for exhibition and have some difficulty in obtaining clean straight roots, would do well to make holes with a dibber eighteen inches deep, which should be filled in with finely sifted soil to which a little sand has been added.

CARROTS.—Make a sowing of these on a warm sheltered border, choosing the early short horn varieties such as Gem, Parisian Forcing, etc. In warm sheltered places a few Potatos may now be planted; but it is not advisable to plant more than sufficient for an early supply, as better results will be obtained by deferring such work till the first week in April; but where there is space at the foot of a south wall, or such like place, where protection can be afforded should there be any frost, two or three weeks may be gained in the time they are ready to lift. Lettuces that have been kept in frames during the winter may now be transplanted in the open ground; a small sowing should also be made on a warm border. Cabbages are much earlier this year than usual, and possibly, should there be a dry, cold March, many of them may run to seed. To avoid any blanks a pinch of seed should now be sown either in a box or out of doors; plants so raised grow away quickly when the weather gets warmer.

GLOBE ARTICHOKE.—This vegetable in many gardens is much neglected, and the few small hard heads that are obtained are almost worthless. To produce large succulent heads the ground must be liberally treated and suckers of the finest types obtained. These should be planted in rows at least 4 ft. apart each way, that the foliage may have ample room to develop itself. The present is a good time to make new plantations.

VEGETABLES UNDER GLASS.—As the days get longer these will need more attention, for they will be more liable to get dry. In all cases ample air must be afforded when the weather is favourable, to keep them in a healthy condition. Peas, Lettuce, Cauliflower, Onions, and such like should be gradually hardened off ready for planting out as soon as the weather is favourable. Early Tomato plants must be kept near the light to prevent them becoming drawn. Make a small sowing of Vegetable Marrows for an early supply, and do not neglect to keep up a supply of forced salads. A pinch of white Celery seed may now be sown. This will germinate much more readily if placed in a hot bed than in a house.

CUCUMBERS.—A few seeds may now be put in to give a supply of plants to fill frames on hot beds where vegetables have been forced. Plants in houses at this time of the year need great care both in watering and ventilation. Those in fruit must be closely watched, as in many places there are not sufficient insects to fertilize the flowers, the consequence being they fail to set any fruit. Where this

is so artificial fertilization must be resorted to. Where the houses are excessively damp the pollen seldom gets dry, so that it is impossible for the fruit to swell. To overcome this give the trellis a sharp tap about the time air is put on in the morning. It will be observed that a spot of moisture will fall from each flower, which, if allowed to remain, would keep the pollen moist all day. About mid-day select the most prominent flowers and fertilise them in the same way as Melons by rubbing the pollen on the stigma. Avoid overcrowding of the foliage by regulating the growths; stopping should always be done either at the first or second joint beyond the fruit according to the state of the plants. When young two joints may be allowed, but as the trellises become covered leave only one.—*Kitchen Gardener.*

The Orchid Grower's Calendar.

SHADING—Assuming the sun blinds as recommended in the previous calendar are all in position, it will, perhaps, be necessary to whiten over spaces where they do not quite meet, also the ends, etc. A good composition for this purpose, and one we always use, is made up of the following ingredients:—get 3 lbs. of whitening and mix with half a gallon of skimmed milk; add to this half-a-pint of turpentine, thoroughly mix and apply with an ordinary white-wash brush. The turps make it adhere to the glass and prevent its being washed off every time there is a shower. There is, of course, an objection to the use of turpentine on the roof glass on account of the likelihood of its being washed off into the tanks, but if it is put on when fine and bright, it will soon dry, and is not easily removed.

FIRING—During the spring time when the sun pops in and out, great caution must be observed with the artificial heating. It is at no time good for the plants when fire-heat and strong sun-heat clashes, so that whilst it is as well to have the fires low on bright days it would not do to let them out altogether. But to counteract any undue raising of the temperature it is best to run the blinds down for a few hours, or at bright intervals which prevails in showery weather.

CATLEYA TRIANAEL.—A fine variety of this spring-flowering Cattleya is a valuable acquisition; but what a lot of had ones you flower out of an importation before you come across even a passable variety. It is much cheaper in the end to pick up fine ones in flower, it saves time, labour, and disappointment. It is just as well to remember that a had one requires just as much space and attention as a good one. The plants are just now making a good show. After the flowers fade, they will begin to make roots freely and must be encouraged by being afforded some fresh material should the old have become exhausted. As I have often pointed out, we are not great advocates for top dressing, it makes the top look nice, but it is not a fair index to the whole. However, if the peat is good and the plant has not outgrown its pot, there is no harm in pricking a little live sphagnum moss here and there.

CYMBIDIUM LOWIANUM.—Where there is good accommodation for such strong growing plants, there is, I am sure, nothing that pays better to grow than does this Orchid, whether for pleasure or profit. When well treated it flowers with amazing freeness, and regularity. Its lasting properties, too, are unsurpassed, and are not even equalled in any other Orchid. The colour, too, orange-green sepals and petals, with bronze lines and the bright crimson lips, appeals to the refined tastes of the ladies.

COOL HOUSE.—*Odontoglossum triumphans* is now in season. I am glad, too, to note that this yellow-ground *Odontoglossum* is again coming into favour. It is singularly handsome and effective when well flowered. There is a chance, too, of getting a specimen of *O. excellens*, the natural hybrid between *O. Pescatorei* and *O. triumphans*, so that no wonder newly imported plants go well at auctions. There is only one thing that can be urged against it, and that is, it soon goes flabby when cut, and is therefore not in much request as cut flowers.

ODONTOGLOSSUM CITROSUM.—In the intermediate house this beautiful *Odontoglossum* is pushing up its spikes from the centre of the young growths, and should be well looked after, for slugs and small shell snails attack them in the young state. Our plants are rather shrivelled, owing to their being kept dry to induce them to flower freely. After the spikes are well up they receive a good soaking without wetting the young growths, which would tend to make them rot.—C.

QUESTIONS AND ANSWERS

Will our friends who send us newspapers be so good as to mark the paragraphs or articles they wish us to see. We shall be greatly obliged by their so doing.

[Correspondents, please note that we cannot undertake to name florists' flowers such as Carnations, Pelargoniums, Chrysanthemums, Roses, nor such as are mere garden varieties, differing only in the colour of the flower. Florists' flowers, as a rule, can only be named by those who grow collections of them.]

Old Fashioned Rose.—*Sigma*: We quite agree with what you say regarding the Rose *Félicité Perpétué*; but, under any other name it would smell as sweet. Now that you have given the proper rendering of the other old favourite, namely, *Village Maid*, we have no difficulty in tracing the same. It is an old garden variety of *Rosa gallica*, having white flowers, striped with red, and what rosarians would term a *Gallica Rose*.

Grub at the roots of Apple Trees.—*J. H. W.*: The grub you sent arrived in a very damaged condition, but as far as we can see there is no cause for alarm. It was evidently the grub of a beetle, but looked more like a predaceous insect than otherwise, that is, one that lives on other insects. In any case it was perfectly distinct from the grub of any of the cockchafer tribe, which are well known to be destructive to the roots of a large number of garden plants, including fruit trees. Nor was it any of the weevils that usually make themselves obnoxious in gardens. We presume you have no direct evidence of injury to the roots of the trees. It is very doubtful if the grub could have recently been brought by manure, particularly if the latter was at all wet, from the courtyard or stables.

The Damping of Cucumbers.—*Wm. Witard*: You will find some hints on this subject towards the end of the article headed *Kitchen Garden Calendar*.

Lifting Parsnips.—*T. Read*: The roots will take no harm if you lift them carefully and pile them alternately with layers of moist sand. The object of covering them is to prevent their getting dried up by the loss of moisture. In the absence of room in a shed they may be stored in some out-of-the-way corner facing the north, or at least screened from sunshine, to avoid starting them early into growth. The manuring and digging of the ground may then be accomplished without let or hindrance.

Yew Twigs Poisonous.—*W. R.*: There have been cases of poisoning amongst horses, attributed to this cause from time to time. Cut and withered twigs are more dangerous, or have been more blamed than the fresh twigs and foliage on the tree. You can easily avoid any risk by sweeping up the prunings and wheeling them to a heap where a fire may be kindled, and every scrap of Yew piled upon it as the fire is proceeding. None should be left lying about where they may be blown by the wind in the way of cattle.

Standard Gooseberries.—*Interested*: Those we have seen have all been grafted or budded on stems about 4 ft. in height. The Golden-flowered Currant (*Ribes aureum*) was the stock used, probably on account of the rapidity of its growth, whereby a clean stem can quickly be obtained. These standards flower and fruit freely enough, at least for a number of years, though we cannot say how many. They are both curious and ornamental, and useful in proportion to the quantity of berries they produce. The heads standing as they do, clear of the ground, the berries are not liable to be splashed with sand and mud. They are no more proof against attacks from birds than the ordinary bush, but, while small, could perhaps be more easily protected by netting.

Names of Plants.—*G. Guyott*: *Dendrohium Pierardi*.—*W. K.*: 1. *Coronilla glauca*; 2. *Grevillea thelemanniana*; 3. *Asplenium obtusatum lucidum*; 4. *Pteris argyrea*; 5. *Doryopteris palmata*.—*A. C.*: 1. *Crocus vernus* var.; 2. *Scilla sibirica*; 3. *Vinca major variegata*; 4. *Ilex aquifolium ferox argentea*; 5. *Prunus cerasifera Pissardi*; 6. *Viburnum Opulus sterilis* (the Snowball-tree).—*H. D.*: 1. *Tillandsia zehrina*; 2. *Pellionia daveauana*; 3. *Eupatorium weinmannianum*; 4. *Coleonema alium*.

READERS OF ADVERTISEMENTS

in these pages will greatly oblige and assist us by always mentioning

THE GARDENING WORLD

WEBBS'

NEW ASTERS.

WEBBS' WHITE QUEEN. Per packet ... 1s.
WEBBS' SCARLET KING. " " " " 1s.

Webbs' White Queen and Webbs' Scarlet King are an entirely distinct race of Asters, dwarf in habit of growth, and specially adapted for massing and bedding purposes; they grow about 8 inches high, and each plant bears from 20 to 30 large and perfectly-formed flowers.

Webb & Sons offer nearly £300 in Prizes at Horticultural Shows. List on application.

WORDSLEY, STOURBRIDGE.

SEED LIST

(Free on Application).

FEATURES:-

- Alphabetically arranged.
- Best sorts, in heavy type, can be seen at a glance.
- Probably the most explicit practical instructions for cultivation ever published in any Catalogue.
- Many hints and recipes for cooking and serving the various vegetables.
- Directions for the storing and forcing of vegetables
- Medical qualities of many vegetables and herbs.
- Prizes of £5, £3, (two of) £2, and £1 offered for photographs of horticultural subjects (see page 2 of Catalogue).
- THE LIST, containing 93 pages and a profusion of illustrations, shows (a) WHAT TO GROW, (b) HOW TO GROW IT, and (c) WHAT TO DO WITH IT WHEN GROWN, and has been described by an Agent as one of the largest estates in England as a BOOK OF REFERENCE.
- Another Customer, testifying as to quality writes:—"I should like to add that all the Seeds, &c., purchased from your establishment during the past 14 years have been of the very best quality, and have given great satisfaction."

RD. SMITH & Co.,

Seed Merchants & Nurserymen,

WORCESTER.

1898. **FORBES' CATALOGUE** 1898.

(Over 150 Pages. Nearly 150 Illustrations.)

of Florists' Flowers and Hardy Border Plants

is got up regardless of trouble or expense, with the result that it is by unanimous consent pronounced the most comprehensive, most accurate, most reliable, most complete and best extant.

It gives full and accurate descriptions of everything in the way of Florists' Flowers, also colour, height, time of flowering, and price of all the best Hardy Border Plants, together with their English or Common Names, and a mass of other Valuable Information that cannot be had elsewhere.

It is in fact a veritable reference-book, invaluable to all growers of these plants, and should be in the hands of all intending purchasers. Free on application.

JOHN FORBES,

ESTABLISHED 1870.

Nurseryman, Hawick, Scotland.

Caladiums FINEST COLLECTION in the World. We make a speciality of CALADIUMS. Gold Medals Manchester & Leicester. Silver Cup, R.H.S., &c. Satisfaction guaranteed. JOHN PEED AND SONS, West Norwood, London.

NEW DOUBLE VIOLET, MRS. J. J. ASTOR.

This beautiful Violet, of a deep rosy-heliotrope is meeting with a most cordial reception, and as the stock is getting very limited, and we have already many orders booked for April and May, we beg all intending purchasers will please apply at once to prevent disappointment.

The Managers, Hood Gardens, Totnes.

DAHLIAS.

10,000 Ground Roots for Propagating.

We have no occasion to Boast or Exaggerate.

G. PEARCE, Dahlia Grower, Hobart, Tasmania, says:—
18/1/98.

"The dahlia to hand in perfect order, not one defective. This speaks well for your splendid reputation and packing. I am well pleased with quality and sorts sent, and am delighted I left the selection to you."

CATALOGUE is: free to coming customers.

H. CANNELL & SONS,
Swanley, Kent.

"Gardening is the purest of human pleasures, and the greatest refreshment to the spirit of man."—BACON.

The Gardening World.

Edited by J. FRASER, F.L.S.

SATURDAY, MARCH 12th, 1898.

NEXT WEEK'S ENGAGEMENTS.

- MONDAY, March 14th.—Annual meeting of the United Horticultural Benefit and Provident Society, at the Caledonian Hotel. Sale of hardy herbaceous plants and Roses, by Messrs. Protheroe and Morris.
- TUESDAY, March 15th.—Sale of Carnations, Begonias, Cannas etc., by Messrs. Protheroe and Morris.
- WEDNESDAY, March 16th.—Sale of Lilliums, Carnations, Roses etc., by Messrs. Protheroe and Morris.
- FRIDAY, March 18th.—Sale of Imported and Established Orchids, by Messrs. Protheroe and Morris.

THE NATIONAL CHRYSANTHEMUM SOCIETY.

—Our short account of the state of affairs of this society will have come as a surprise to many of our readers at a distance who have been accustomed to reading the detailed reports of the magnitude of the Chrysanthemum shows held annually, but particularly the November show. Revelations already made, or pending, do not in the least minimise the magnitude or importance of the great annual competition; they merely refer to the internal management of affairs. From time to time for years past there have been complaints, and several attempts made at reform, but the reformers have either been lacking in courage, or not sufficiently numerous when the time came for making them at the annual general meeting. A large majority of the members, or at least those who attended the meeting on the 28th ult., are now fully alive to the critical nature of the situation, and seem fully determined to make reform a reality. It is evident that the affairs of the society have not been managed on the best modern principles. There is no new discovery in this, though competent men have held aloof from raising a quarrel about the matter seeing that they were only following in the lead of their predecessors. Only a long run of general prosperity could have staved off

a crisis in the history of the society before this time. We do not mean to imply that the society even now is down upon its luck, but the management must be made thorough, in every department and in every detail, so that both the energy and means of the society may be economised and directed into the proper channels for the general good. We hope the members will attend at the adjourned meeting, to be held on the 21st inst., at 6 p.m., in even greater force than they did on the last occasion, and fully fortified to carry out their resolutions of putting the society on a sound financial basis of working.

Judging from the fact that 114 new names were added to the long roll of membership during the past year, the society is still in the heyday of its prosperity; but this, of course, can only continue on the understanding that every member and every affiliated society is fully convinced that the organisation and management is on the most modern and approved principles of government. Since the society came into existence the old order of things has greatly changed, and many of the members now understand and appreciate good government, and will sooner or later insist upon it. The Chrysanthemum is no aristocratic flower, its admirers and cultivators being the masses; and as such the community at large must be accepted and encouraged to take an intelligent interest in all that pertains not only to the outward appearance of the exhibitions, but to the internal working or administration that controls and gives energy to the same. When at any time the society should want financial support, it damps the ardour of the most enthusiastic helper to know that a loose hand is being kept on resources that ought to be economised by firm and judicious handling.

One of the recommendations submitted at the last meeting was that the advisability of holding so many shows during the course of the year should be considered and reported upon at the adjourned annual meeting. The September show might very well be dispensed with, unless the increasing number of growers of early Chrysanthemums can be induced to make that show worthy of the name. Hitherto that has mainly been a Dahlia show, notwithstanding the fact that it comes so close upon the show of the National Dahlia Society, which may be admitted to be fairly representative of all that is essential to the welfare of that flower in its various sections. There is no occasion, therefore, to waste the money of Chrysanthemum growers upon the Dahlia, which has a good clientele of its own. This need not apply to the association of fruit and vegetables with the November show, considering that it gives a greatly increased interest to the exhibition, both on the part of the exhibitors and the general public. Strong and influential societies in various parts of Britain recognise and value fruit and vegetables as a fitting complement to an autumn show, and as the National Chrysanthemum Society is the only one at present that fosters a good fruit and vegetable exhibition in the Metropolis, its services in that respect deserve fitting recognition and encouragement.

There are other matters that require overhauling in the affairs of the National Chrysanthemum Society, if we are to judge from a pamphlet sent us by Mr. J. W. Moorman, and compiled by him as a summary of the discussion that has been carried on in the pages of the gardening Press during the past winter. The following subjects were put forward by Mr. Moorman as requiring ventilating at the annual general meeting, and the proceedings on last occasion not reaching this stage, we take it for granted the points at issue will

come under discussion at the next or adjourned meeting:—

- "FIRSTLY.—Whether the time has not arrived for the society to have a paid secretary and no vote?
- "SECONDLY.—That it be an instruction to the committee to inquire and report on what other places (if any) can be obtained for our exhibitions, either by a subsidy, as now, or otherwise?
- "THIRDLY.—To consider if the time has not arrived when in reliance on our own resources we can proceed on independent lines like most provincial societies, which are in a sound financial condition?
- "FOURTHLY.—As there appears to be much disquietude arising from the fact that the secretary is the delegated referee at all exhibitions, whether the advisability of a change should not be considered in the form of a small reference committee or otherwise?
- "FIFTHLY.—That as the custom of selling the floor space of the Aquarium to trade exhibitors (some of whom are not *bona fide* growers of Chrysanthemums), and that inasmuch as such sales have driven competitive exhibits of Chrysanthemums into semi-dark galleries upstairs, whether such custom of selling space for a different purpose than than for which the National Chrysanthemum Society was established shall be seriously considered with a view to its discontinuance.
- "SIXTHLY.—That an exhibition committee be appointed to closely examine the question of minor shows, with the object of ascertaining their advantages or otherwise, to the society, and report the result of their investigations to the General Committee."

United Horticultural Benefit & Provident Society.—The Annual Meeting of this Society will take place on Monday next, March 14th, at 8 p.m. at the Caledonian Hotel. Mr. George Wythes of Syon House has kindly consented to preside.

Bananas from Madeira.—Of the two Bananas grown in the Madeiras, *Musa Cavendishii* is the one preferred. It gives heavier bunches, and the individual fruits are larger, says Consul Crawford, of Funchal. It is grown in great quantities to supply fruit for export.

Glanbeuno, Carnarvon.—Glanbeuno, the charming residence of the late F. W. Foster, Esq., situated within two miles of the town of Carnarvon, has been sold to Owen Jones, Esq., of Greenbank, Carnarvon. Mr. John Williams has been head gardener here for many years, and has engaged to remain in the same position with the new purchaser. Glanbeuno is noted for its fine gardens and long ranges of glasshouses, consisting of plant houses, Vines and Peaches. The range of Peach houses is 150 ft. in length, and one old Royal George about thirty-five years old has spread on the back wall, covering half the house, and yielding regularly every season about 200 peaches, rich in flavour and colour, and many times at the head of the winning boards at various provincial shows. 'Mums are represented here also when the fever comes round in November. Also specimens of Crotons and Orchids. Grapes finish well here.

The Midland Carnation and Picotee Society.—The Seventh Annual Report, with the lists of subscribers and awards, and the balance-sheet for 1897 issued by this very-much-alive Midland Society are before us. The publication takes the form of a neatly got up catalogue of eighty-four pages, exclusive of the covers. A variety of information is given that cannot fail to be of service to both exhibitors and mere cultivators of the handsome flower. Amongst other things there is a list of some of the leading flowers in each class that are suitable for exhibition—just the kind of information that novices in the art are hungry for. Then there is a capitally written and practical article upon the "Cultivation of Carnations and Picotees," from Mr. Robert Sydenham. We notice that, owing to unfavourable weather, the gate-money was this year smaller than on any previous occasion, but increased subscriptions from various members have enabled the society to tide over the misfortune with undiminished and even increased balance and prestige. The balance-sheet shows a total income for the year of £237 19s., including last year's balance of £37 4s. 5d. The expenses incurred amounted to £189 15s. 8d., thus leaving the goodly sum of £48 13s. 4d. in the hands of the treasurer. We wish the society the continued success and prosperity that it deserves.

Landscape Gardening.—Brown (after an hour's digging for the ferret), "Call this rabbit shootin'? I call it landscape gardening!"—*Punch*.

An Old Rose Tree.—There is a very old Rose twined about the ancient cathedral of Hildesheim, near Brunswick. It is said to date back to the time of Charlemagne, and to be recorded as a curiosity in chronicles of the ninth century. Some destructive insect has lately attacked it, and the people of Hildesheim are alarmed about their ancient heirloom, summoning the best arboriculturists to their assistance.

Evolution Committee of the Royal Society.—Mr. Bateson, at the meeting of the Scientific Committee of the Royal Horticultural Society, on the 9th ult., called attention to the existence of the Evolution Committee of the Royal Society, the object of which is to promote accurate observations of facts relating to variation, heredity, selection, and other phenomena connected with the evolution of plants and animals. A horticultural sub-committee has been appointed to further the above objects in the hope that any persons engaged in practical horticulture may be willing to assist the committee by communicating the results obtained, and allowing their operations to be observed and recorded. The secretary of the Scientific Committee will be glad to receive any communications.

A Successful Student in a Far Land.—We are pleased to learn of the success of Mr. Hamish W. Russell, a student and reader of THE GARDENING WORLD, at Rippon Grove, Elsternwick, Victoria. He is the grandson of the late Mr. James Russell, of Poltalloch, Argyleshire, whose portrait we gave a little over a year ago, unfortunately for the last time. His grandson, Mr. H. W. Russell, is under 17 years of age, but has, nevertheless, just completed his second year at the college there. He was first under the late Mr. Neilson, government fruit expert; and during the second year under Mr. Luffman, the present curator. At the end of the first year he took the first prize for root grafting against both junior and senior pupils. Last year, however, a more equitable arrangement prevailed and the senior and junior divisions were separated. In the junior division Mr. Russell secured five first prizes, namely (1) for hoeing and digging, etc. (2) an essay on orchard management (3) an essay on suitable stocks for fruit trees (4) botany and vegetable pathology, and (5) horticulture. It is peculiarly gratifying to learn of such indomitable energy amongst the scions of the mother land in the distant daughter colony under entirely different climatic influences. For instance, in the early part of January the behaviour of the weather must have been very trying for those who were working or studying. For a week on end the temperature varied between 100° and 107° in the shade.

The genus *Arenaria*.—At the meeting of the Linnean Society of London, on February 17th, Mr. F. N. Williams, F.L.S., read a paper on "*Arenaria*," one of the larger genera of Caryophyllaceae, which now includes a considerable number of species. *Alsine* and others, usually included as sections of the genus, he thought should be regarded as distinct genera; *Alsine* and *Arenaria* are distinguished by the same cardinal character which separates *Lychnis* from *Silene*. The genus under revision includes species (of which 168 are enumerated) distributed chiefly throughout the north temperate zone, though in the New World a few occur in South America. A few species which extend toward the Tropics occur at considerable elevations on mountain-ranges, reaching, for instance, 19,000 ft. in the Himalayas of W. Tibet. In this revision, for the formation of primary groups, the two associated characters relied on are the number of teeth formed by dehiscence of the ripe capsule, and the structure of the disk. An examination of several series of specimens, especially of those of the better known forms growing *in situ*, shows these two characters to be fairly constant, and suitable for the definition of primary groups, although in habit and aspect species of *Alsine* are not readily distinguished from those of *Arenaria*. The author's descriptions are confined to species recognised during the last fifty years (from 1848 to 1897 inclusive), the others being cited in their proper place by name and references.

The English Sparrow in America is quite as lively as he is here, and is reported to be eating the buds of Cherries, Peaches, and Gooseberries. Everything English seems to be able to make a home anywhere, but in this case the sparrow will not be allowed undisturbed possession.

Orchids at the Sale Rooms.—Good things still command their price. A small piece of *Dendrobium nobile nobilius* was secured for 10 gs. at the Sale Rooms of Messrs. Protheroe & Morris, Cheapside, on the 4th inst. Many growers of Orchids are yet waiting for a piece to add to their collection. A beautiful variety of *Cattleya Trianaei* was bought for 4 gs.; and *C. Schroderae* secured 3½ gs. A fine variety of *Odontoglossum crispum*, though by no means a first-class one, reached £2 5s. at the fall of the hammer.

The Winter Flower Competition recently announced by the *Western Weekly News* was a great success. Prizes were offered for the best collections of plants in bloom in the open, with the object of seeing how many flowers could be found out of doors in Cornwall and Devon. The first prize of 10s. was awarded to Miss Helen Kathleen Tyacke, of Tendeira, Helston, whose collection contained ninety-one specimens. Of these, seventy-two were garden, and 19 wild plants. The list of garden flowers included white and pink Camellias, several Roses, a number of Narcissi and Anemones, *Solanum jasminoides*, and such fruit trees as the Gooseberry, Plum, Pear, and Apple. Mrs. Young, Woodbrook, near Dawlish, who sent sixty-eight specimens, and Mr. L. M. Brighton, Tea and Pleasure Gardens, Buralston, R.S.O., who forwarded fifty-five, received each a prize of 5s.

The National Amateur Gardeners' Association continues to give proofs of vitality and progress. The report and statement of accounts for 1897 which has been forwarded us by the hon. general secretary, Mr. Leonard Brown, shows that the nett result of the year's working is a balance of £4 13s. 5d. on the right side. Then the association owns a library of popular and useful horticultural works, valued at £30—an advantage that the members doubtless appreciate. The Saturday afternoon outings during the year proved most enjoyable, and they were well attended. The shows and the annual dinner were all successes, and the *Amateur World of Horticulture* continues to perform good services. Amongst the present year's fixtures the dates are given of the numerous competitions for challenge cups and trophies from various donors that are to take place. Some of these trophies are valuable and will doubtless insure a good competition. Lectures on different horticultural subjects will be given through the year by men of note and standing. The garden party and exhibition will be held, as usual, in the Royal Botanic Society's gardens at Regent's Park. July 9 is the date fixed.

The Royal Horticultural Society of Southampton.—The annual report and statement of this Society's accounts were presented to the members at the annual meeting which took place on the 20th ult. The mayor of Southampton (Alderman G. J. Tilling, J.P.) filled the chair. The report, which was the 36th of its kind, was on the whole a most satisfactory one. Periods of depression were deplored, as for instance the summer show, when, despite the fine weather and a first-class exhibition, the receipts fell £265 below those of the previous year, and £100 below the lowest record. This was due and could be traced to the number of counter attractions, including the Jubilee celebrations. The total income from the year was shown to have been £644 6s. 2d. The expenses for the same period were £581 11s. 1d. thus leaving a profit of £62 15s. 1d. on the year's working. For this satisfactory result the report expressed the indebtedness of the society to the president, Sir Samuel Montagu, Bart, M.P., and other leading patrons. At the election of officers, which followed the reading and consideration of the report and financial statement, Sir Samuel Montagu was re-elected president. The vice-presidents, of whom there is a lengthy list of thirty-eight, were re-elected *en bloc*. Mr. C. Fudge will continue to fill the office of hon. secretary, and, we doubt not, to discharge the various duties connected therewith as admirably as he has done in the past. Mr. W. G. Davy still holds the post of treasurer. The usual votes of thanks all round were given and received.

Jadoo Fibre.—The Secretary to the American Carnation Society has written to the Jadoo Company, and states that 100 per cent. of Carnation cuttings have been rooted by him in Jadoo Fibre, and that he now means to use it exclusively for propagating. This statement, made by an official with such a standing as Mr. Heer, should mean a considerable influx of orders to the company, both from home and abroad.

Cypripediums with Fungus.—At a meeting of the Scientific Committee of the Royal Horticultural Society last month, Mr. Douglas exhibited specimens with the roots badly infested by a mycelium. Mr. Veitch at once recognised it as the result of a too damp atmosphere, recording the fact that having on one occasion to make a double roof, it caused so much damp that he lost many Orchids from the same cause, but on improving the atmosphere this completely prevented any recurrence of the fungus.

Royal Botanic Society.—Mr. J. B. Sowerby, the energetic secretary of this society is favouring the members with a series of lectures on "Vegetable Fibres, and Fibre-producing Plants." The second lecture of the series was delivered on the 26th ult., Mr. C. Brinsley Marley presiding. Mr. Sowerby dealt specially on this occasion with flax, hemp and cotton. Several interesting exhibits were handed round for purposes of illustration, not the least interesting of which was a piece of flaxen mummy-cloth, supposed to be about 3,000 years old. The chairman announced that at the next meeting of Fellows there would be a microscopic exhibition of pollen grains.

International Show at Ghent.—The Royal Agricultural and Botanical Society of Ghent is actively engaged forwarding everything pertaining to the great show to be opened on the 16th April next and continued till the 24th. The jury will consist of 200 members all strangers to the town of Ghent, who will have to allocate the prizes in the 720 classes open to competitors. His Majesty the King of Belgium offers a Gold Medal for the 100 most meritorious exotic Orchids; while H. M. The Queen of Belgium offers a Gold Medal for 25 stove and greenhouse plants in flower. A work of art (value 500 francs) is offered in memory of Comte Charles de Kerchove de Denterghem, for the most remarkable 100 hardy annuals or biennials. M. Leon Van den Bossche offers a work of art (value 500 francs) for a collection the most numerous in botanical, woody, and sub-woody species of cool greenhouse plants, not in European culture outside of botanical gardens. A work of art (value 300 francs) will be decreed in the name of the English committee to honour the memory of Louis Van Houtte, for the most varied collection of 40 plants, flowering or otherwise, but in good examples. Besides the above, many other valuable prizes are offered.

Chiswick Gardeners' Mutual Improvement Association.—On the 3rd inst., Mr. A. Pentney, Worton Hall Gardens, Isleworth, read a paper at the meeting of this society on "The Present Day Gardener." Mr. Pentney took a pretty wide survey of the subject, comparing the capabilities of the modern gardener with his predecessors, who, with fewer and less suitable appliances, was able to accomplish much in the way of growing Pines and various large specimen plants. He mentioned a considerable number of types or classes of gardener, to which he added the most recent innovation, the lady gardener. The various comparatively recent improvements of certain classes of plants received a considerable amount of attention. The microscope as an aid to gardening was mentioned amongst the appliances at the command of those of a scientific turn of mind. The old gardener was no botanist, though a knowledge of the subject was of material advantage to any gardener. In landscape gardening, the work of laying out new gardens is now tending along more natural lines than formerly. Briefly, the gardeners' education is never complete; but he considered that the remuneration offered is by no means adequate, considering the education that a gardener must give himself in order to fit him for the duties required. A large number of the members present took part in the discussion. Mr. S. T. Wright, the president, announced that the Rev. Prof. George Henslow, is to deliver a course of four lectures on various subjects pertaining to gardening to the members of this society in July next.

A Papyrus Manuscript has the honour of bearing the earliest caricature, as far as is known. The lion and the unicorn are represented playing a game of draughts or something similar.

Woolton Gardeners' Mutual Improvement Society.—A meeting of this society was recently held, when Mr. R. Todd, of Woolton Wood, delivered a lecture on "Should Coniferae be more extensively planted?" and urged a plea for the more extensive planting in the neighbourhood of Liverpool for two reasons, utility and beauty. The lecturer referred to the beauty of the woods and trees in spring and autumn, but dwelt strongly on the barren and leafless aspect during winter. To enforce the object in view, some of the finest pinetums in the North of England and Scotland were enumerated, and some of the more notable Pine woods of Scotland were mentioned, with the heights of many of the trees and the value of the timber. The extensive planting in the Isle of Man was also referred to, with the suggestion that the Government should continue the work in the wild wastes of England and Ireland. A strong discussion followed in which Messrs. J. Hogan, J. McColl, T. Carling, J. Rae, H. Corlett, T. Griffiths, H. Ellis, R. G. Waterman, and the chairman, Mr. W. W. Gamble, took part, principally on the dearth of good specimens in our pleasure grounds in the district, and the cause of the hottom branches dying off. A cordial vote of thanks was tendered to the lecturer and chairman for their services.

Currant Blight.—Mr. Berry gave an interesting account of the history and progress of this destructive injury, especially to Black Currants in Kent, at the last meeting of the Scientific Committee of the Royal Horticultural Society. It was first observed some ten years ago, but has now reached alarming dimensions. Miss Ormerod recommended picking off and destroying the buds infested with the mite (*Phytoptus Ribis*), the cause of the complaint. This was done, but last year a sudden development occurred, when picking became useless. The "Baldwin," a very heavy cropper, was the variety most seriously attacked. The "Red Budded Naples" was only slightly affected, but this variety is not a heavy cropper, and the fruit being more readily shed, it is not so useful as the Baldwin for market purposes. He suggested that experiments might be carried out at Chiswick to discover which was the most blight-resisting variety, as was done with other plants in Victoria in the Horticultural Gardens, so as to aid the fruit industry in Australia. Mr. McLachlan gave some account of the general habits of the *Phytopti*, remarking that this species was first noticed by Westwood some thirty years ago. It is nearly legless, and lives inside the bud, consequently it is very difficult to reach by means of insecticides. He could only recommend hand picking, unless a mite-proof variety could be found, as they had raised more or less phylloxera-proof Vines. Mr. Michael also contributed further details, observing that all the species of *Phytoptus* were parasites, and that while many species might attack the same plant, a single species might also live on many kinds. They were excessively minute, possessing only two pairs of legs instead of eight, and always protect themselves, so that it becomes a very difficult matter to reach them, as—e.g., in the curled-up edges of leaves, and within buds. It had been found that kerosene emulsion continuously applied by spraying had been more or less effective against *P. Pyri*, but acari are far less sensitive to chemicals than insects. The eggs especially have a dense cuticle, so as to render it quite impervious to chemical action of insecticides. The only chance was to repeat the process of spraying, and catch the successive broods. The only thing absolutely fatal to acarid life was boiling water; eggs and all were destroyed at once. Mr. Berry, in replying, observed that the remedy hitherto suggested of cutting down the shoots of the Currant hedges attacked was quite useless. Mr. Veitch suggested that analysis of the branches of the varieties affected or otherwise might reveal some differences, but Mr. Wilks expressed himself as very doubtful of any appreciable differences being attainable even if they exist. Mr. Engleheart raised the question as to whether the Baldwin variety was weaker than others through over-propagation, but Mr. Michael added that *Phytopti* do not by any means prefer weaker plants, but are found more usually on perfectly healthy ones.

S.A.F.A.O.H. is supposed to stand for the "Society of American Florists and Ornamental Horticulturists." The *Florists' Exchange* has had a go at this cumbrous and unnecessarily lengthy title by interpreting the letters as the "Scotch American Florists' Ancient Order Hibernians." Not bad by any means!

ORCHID NOTES & GLEANINGS.

BY THE EDITOR.

Cattleya Trianaei, Mrs. W. H. Cannon, *J. O'Brien*.—The resources of *C. Trianaei* have by no means been exhausted, yet, judging from a flower of this new variety sent us by Mr. W. H. Cannon, 19, Wool Exchange, Basinghall Street, London. The flower was notable for its massiveness rather than diameter, owing to the very broad and sturdy character of the petals which ascend at an angle of 45° and then spread above the middle. Both sepals and petals are of the faintest shade of blush white, the petals being broadly ovate, crisped at the margins and clawed at the base; they measure 3½ ins. in length, and 2¾ ins. across, a fact that will give some idea of the bold and massive character of the flower. The lip is proportionate in size to the rest of the segments, and forms a very characteristic feature of the flower. The tube is pale blush-lilac externally, and likewise internally, with the exception of the usual obovate, orange blotch. The lamina is obliquely orbicular, beautifully crisped at the margins; in colour it is like the tube, with the addition of a large, rich purple, triangular or transversely rhomboid blotch on the centre. Mr. Cannon may well be proud of it for it is a charming variety. Accompanying the above were four grand flowers of *Dendrobium findlayanum*, measuring 3½ ins. across the petals.

READING AND DISTRICT GARDENERS.

ONE of the largest attendances of members during the present season assembled on Monday evening last, in the Club Room, under the presidency of Mr. C. B. Stevens, to hear a paper on "The Cultivation of a few useful Flowering Plants for Stove and Warm Greenhouse" by Mr. Townshend, Gardener to Sir Wm. Farrer, Sandhurst. The large attendance fully testified to the esteem in which Mr. Townshend is held, and appreciation of the services rendered by him in adding to the interest of the Society's meetings by continued exhibits of interesting flowering plants, etc. The lecturer, in introducing his subject, said that in taking up the subject for the evening, he would treat with those plants which with proper treatment are easily managed and are for the most part inexpensive to buy, and are prettier than houses of *Chrysanthemums*, which are grown in far too large a quantity in most private gardens, to the detriment of many beautiful flowering plants.

The following subjects were touched upon, and short but ample instructions were given of each variety:—*Achimenes*, *Begonia manicata*, *B. Ingrami*, *B. fuchsoides*, *B. insignis*, *B. corallina*, *Justicia speciosa*, *J. flavicoma*, *Heterocentrum roseum*, *Centradenia rosea*, *Centropogon lucianus*, *Clerodendron splendens*, *C. Balfouri*, *Scutellaria mocciniana*, *S. pulcherrima*, *Eranthemum pulchellum*, *Thyracanthus rutilans*, *Dendrobium nobile*, *Anthurium scherzerianum*, *Phajus grandifolius*, *Zygopetalum Mackayii*, *Libonia floribunda*, *Habrothamnus Newelli*, *Streptosolen Jamesonii*, *Salvia Pitcherii*, *Diplacus hybridus splendens*, *Torenia Fournierii*, and *Exacum affinis*.

A lengthy discussion took place which drifted chiefly to the advantage or disadvantage of pruning *Dendrobium nobile*. A hearty vote of thanks was accorded Mr. Townshend for his unique and practical paper.

An interesting collection of cut blooms was exhibited by the lecturer, the most noticeable being *Centradenia rosea*, *Clerodendron Balfouri*, *Phajus grandifolius*, *Zygopetalum Mackayii*, *Habrothamnus Newelli*, *Streptosolen Jamesonii* and the various *Begonias* named above. Mr. Bound, Bill Hill Gardens, showed some blooms of a good type of *Dendrobium findlayanum* and *Odontoglossum Rossii major*.

HINTS FOR AMATEURS.

THE HARDY FLOWER GARDEN.

Valeriana Phu aurea.—At this season of the year there is no more conspicuous object in the herbaceous border than this Valerian with the barbaric name. Just now, the young shoots present a bright golden yellow hue, which, with their gracefully cut (pinnately lobed) leaves, renders them exceedingly handsome and effective. The cultivation of this plant only presents one special difficulty. For some reason or other it offers a great and somewhat curious attraction to cats, which will find it out from a considerable distance, flock to it and roll over and over the plants, tearing, meanwhile, the young leaves and shoots with their teeth and claws. Any enterprising amateur who would like his garden to become a rendezvous for all the cats in the neighbourhood should not lose the chance, for a plant of this Valerian in the garden will inevitably produce this result; and then what a treat it is to listen to the caterwaulings and voiced joys and sorrows of the various members of the feline assembly; surely madness would lie that way. We would therefore advise all amateurs who desire rest and quietness, as well as the safety of the rest of their plants to shun the *Valeriana Phu aurea*, despite its high sounding name and its handsome appearance. True, the plant might be protected with wire, but it will act as a bait to the cats all the time, and then woe betide the remainder of the occupants of the herbaceous border.

Eranthis cilicica.—Almost everyone who knows anything or who cares anything about hardy flowers knows and loves the little Winter Aconite, which is one of the very earliest subjects to brave the inclemency of the opening year, and lights our gardens with sheets as of burnished gold, but *Eranthis cilicica*, an introduction from Cilicia, as the specific name denotes, is unknown to the majority. When it becomes known it cannot fail to become a great favourite, fully as great indeed as *E. hyemalis*. To describe *E. cilicica* briefly, it is an enlarged and a glorified form of *E. hyemalis*, being taller and more vigorous altogether. The flowers are larger and, if anything, have rather more orange in the yellow. The involucre of the leaves under the flowers is larger, and the individual leaves are as deeply divided as in *E. hyemalis*. Another great difference between the two species is that *E. cilicica* is fully from four to six weeks later in blooming than *E. hyemalis*, and thus forms a succession to it. In the face of the fact that apart from the yellow Crocuses, we have very little yellow amongst early flowers, advantage should be taken of this second species of *Eranthis*. There appears to be nothing special about its cultivation, for where one grows there also will the other. *E. cilicica* should also prove useful for growing in pots for the cool conservatory. Anyway, amateurs who are on the lookout for handsome and easily managed hardy plants should by no means lose sight of *Eranthis cilicica*.

Early Fritillaries.—The plants composing the genus *Fritillaria* cover with their respective flowering seasons a considerable part of the year, and moreover, the earliest commence to bloom before the year is very old. There is also a good deal of variety amongst the different forms, and thus a good sized collection must be grown in order to be fairly representative. Both for planting in the open ground or for culture in pots for flowering in the conservatory, the Fritillaries are alike good, and their quaint and curiously chequered bell-shaped flowers always command attention and admiration.

Of the early flowering forms, the one most worthy of attention is undoubtedly *F. oranensis*, a native of Algeria. We saw this species in flower fully a month ago, although the plants were growing in a sheltered place. During the last week we have observed it in good condition in several places; indeed, these later flowers were characterised, as might be reasonably expected, by much brighter colours. At its best, *F. oranensis* has a most distinctive presence. The flowers are rather longer than broad, being a little over an inch in length. They are produced singly on the flower stems. The colours are deep purple-maroon and dark green, the latter colour being apparent in a broad central stripe running from base to apex of each segment. The purple-maroon

appears as a broad margin to this green central stripe, and the effect of the two colours is sufficiently striking. The leaves are about four inches in length, lanceolate in shape, and very glaucous and succulent. The whole plant is from 8 in. to 1 ft. in height according to the particular soil in which it is grown, and the special character of the season.

F. pluriflora is a second species, rather rare in cultivation, that is deserving of the amateur's attention. It is a native of California, and is unique with regard to the colour of its flowers, which exhibit a pretty shade of rosy-lilac, passing off as the flower ages into rosy-purple. In habit and style of growth, the plant resembles *F. oranensis*, but the leaves are scarcely so glaucous, and there is the notable difference that from two to four (usually three) flowers are produced on a scape, instead of the flowers being solitary. The flowers, too, in addition to the difference of colour are rather narrower in proportion to their length, and their individual segments are narrower, and not of so much substance. *F. pluriflora* is altogether a most charming plant, with only one disadvantage, for like other rare and pretty things the price is rather high.

Tulipa violacea.—The gaudy florists' Tulips have their admirers by the thousand, and some of the more showy species are also able to hark in the sun of popular favour, but there are many Tulip species that are but little known to most, and entirely unknown to many. Among these we may place *Tulipa violacea*. Amateur gardeners who delight in having a corner of their rock-garden devoted to the rarer, and, as some would call it, the more refined floral gems, have in *Tulipa violacea* just the kind of plant that will suit them. A special interest attaches to it from the fact that it is the earliest to flower of all the Tulips. The plant is very dwarf in habit, never exceeding 6 in. or 7 in. in height, although it is frequently a good deal under that. The flowers, as may be expected, are small, but they make up for that by their delicate fragrance. The colour is a rich red-purple. The plant is a native of Persia, and as yet a comparative stranger to many gardeners.

Narcissus pallidus-praecox.—It is not always necessary to pay a high price for a good thing; indeed, in far too many cases, a plant is prized because it is priced too high for many people to be able to obtain it. In *Narcissus pallidus-praecox* we have a very handsome Daffodil which can be obtained at a very reasonable figure. The pale yellow blooms are at the present time much in evidence in all parts of the garden, no matter whether the situation is exposed or sheltered. The recent inclement weather has tried the blooms considerably, but they have stood the test remarkably well, and indeed look little the worse for the experience, although their lives will be undoubtedly shortened thereby. *N. pallidus-praecox* is the earliest of the large trumpet Daffodils, and as such is worthy of every attention.

N. minimus.—This miniature trumpet Daffodil is really one of the most useful of all the Daffodils, for what it lacks in size it makes up in refinement. Coupled with the latter is a happy, adaptable disposition that enables it to be grown with equal success in the open ground, in nooks, in the rockery, or Alpine gardens, or in pots or pans in the greenhouse and conservatory. The abnormally early character of 1898, as far as we have gone, has resulted in proportionate precocity on the part of this plant, for it has been in bloom in the open for weeks past, and is, at the time of writing, a veritable blaze of gold. Everybody should know it, and then everybody would grow it in some fashion or other.—*Rex*.

On Striking Chrysanthemums.—I observed in the Amateurs' Page a few days ago, a complaint from a correspondent who was unsuccessful in his attempt to strike cuttings of the Queen of Autumn Flowers. Having had very successful results this year I record my practice, hoping it may be of interest.

I procure a box or boxes, according to the number of cuttings I wish to root, deep enough to hold a 60-size pot, say, when filled with cuttings and a 3 in. label inserted. Having filled my pots with suitable compost and inserted my cuttings, correctly labelled, &c., I give them a good watering, put them in the box and place on the box a sheet of glass, not necessarily immediately after watering. The foliage may dry a little, but the glass should fit closely so as to exclude external air, and if it is removed once a day, and the moisture wiped off and replaced, success is almost sure to follow.

It is advisable to look over the cuttings and search for any sign of damping, which is indicated by one or two of the leaves having a brown and mouldy appearance. All leaves so affected should be carefully removed, and in about three weeks roots will be formed. In from four to five weeks the plants may be removed to airy quarters, being then able to support themselves. I had almost forgotten to say that I place the box on the bench near the light in a cool vinery, from which frost is only just excluded. I have potted most of my cuttings within a month of inserting the cuttings. By this, I mean I have shaken them out of the cutting-pots and potted them singly in 60-sized pots, and, at the time of writing, February 24th, these cuttings are sturdy plants in cold frames, which will, with the return of genial weather (like *Oliver Twist*), be asking for more—not porridge, but pot room.—*P*.

Correspondence.

Questions asked by amateurs on any subject pertaining to gardens or gardening will be answered on this page. Anyone may give additional or more explanatory answers to questions that have already appeared. Those who desire their communications to appear on this page should write "Amateurs' Page" on the top of their letters.

Old Nepenthes.—I have two old plants of *Nepenthes* in a warm house that have become very tall and ungainly. They are growing in baskets suspended from the roof. I should like to reduce them to more respectable proportions, and assume that the best method of doing so will be to cut them back. *J. Askew*.

Yes! your best plan will be to cut the old plants back, say, to within 6 in. of the base of the stem. The present is a very favourable time for doing this, and we should advise you not to delay, for you will thus give the plants the chance of a long growing season wherein to build themselves up. The growths that you cut away from the old plants will serve as cuttings if you cut them up into pieces a few inches in length with two or three leaves to each piece. These cuttings will root pretty readily if inserted in sphagnum moss and sand with a few pieces of fibrous peat and a little charcoal mixed, and placed in a high temperature with plenty of moisture. Do not attempt to repot or re-basket the old plants until they commence to make some growth. You may then shift them, employing a compost of good fibrous peat, sphagnum, sand, and charcoal.

Propagating Double Begonias.—*Robert N.*: You may start the old tubers into growth as soon as you like by placing them in shallow boxes, covering them with sandy soil, and transferring them to a warm house. As the shoots make their appearance they may be taken off and inserted as cuttings. A temperature of about 55° Fahr. in a propagating frame will insure these cuttings rooting quickly. Do not deprive the old tubers of every shoot unless you do not desire to keep them any longer. The removal of the young shoots is, of course, very weakening, and if carried to the extreme must necessarily result in the death of the parent plants.

Gardening Guide.—*N. N.*: You will find all the information you will need, and a lot more beside in Sutton's "Culture of Vegetables and Flowers from Seed," price 5s., direct from the Reading firm, or from the publishers, Messrs. Simpkin, Marshall, Hamilton, Kent & Co., Ltd., Paternoster Row, London, E.C. A new edition (the seventh) has just been published.

Selaginella to Name.—*E.*: The *Selaginella* is *S. apus*, commonly met with in gardens as *S. apoda*, and *S. densa*. It likes a warm greenhouse temperature, but will do fairly well in a cool house.

Cocoa-nut Fibre Refuse.—Would it be advisable to mix a little cocoanut fibre refuse with the soil used for potting Ferns.—*S. Acton*.

The fibre would answer very well in the case of small Ferns or other plants that have not to stay long in the same pots, but for larger plants we would not recommend it by any means. The fibre soon gets sour, and the soil is soured too, as a natural result, when the poor plants have a very uncomfortable time of it.

Two-year-old Cucumber Seed.—*E. T. L.*: If the seed has been kept in a fairly dry and cool place it should not have lost much of its germinating power, and you may use it without much fear of a failure. It will be well, however, to sow double the quantity that you would of one-year-old seed.

SAVOY SUTTON'S PERFECTION.

THE Savoys constitute a pleasant variation from the ordinary Cabbage, both in appearance and flavour, making a useful vegetable during the first half of winter, and being greatly improved in tenderness after a touch or two of frost. Amongst Savoys Sutton's Perfection comes in after the earliest varieties. The dwarf and compact habit of the plants enables them to be grown pretty closely together, so that a few rows in a vegetable break afford space for a considerable number of useful-sized heads for the table. The dark green leaves and their finely rugose or wrinkled character give the variety a refined and even highly-ornamental character, and should render the variety highly popular after it becomes known amongst the fraternity. It also combines the good qualities of several of the better known forms of garden Savoys, which is another recommendation for extended culture in the vegetable garden. The accompanying illustration, lent us by Messrs. Sutton & Sons, Reading, shows how beautifully compact and firm the heads are.

ile, *Silene pendula*, and Tulips of indescribable colour, providing March and April are not too drying. If those months should be dry, the plants suffer considerably in our light sandy soil, and the display is cut very short.

I must apologise for my lengthened notes, but would like to say a word or two anent the Rhododendrons and Camellias, and how well they are flowering. The former have been in bloom more or less ever since last October. Of *R. nobleanum* and its many varieties one or two slight frosts have marred a few heads that were fully out, but plenty more were open in about a week's time. This continuous flowering is an advantage, as I find them very useful just now for large vases. The Camellias have been quite a show, red, white, and pink varieties all in bloom up to Monday, the 7th February, when we registered 4° of frost, which, of course, disfigured all the blooms that were open. Frost and strong winds play havoc with these when once expanded. Primroses are in abundance, and have been ever since Christmas.—*Devonian*.

ORCHIDS AT WILLIAMSWOOD, NEAR GLASGOW.

A PLACE of interest in the neighbourhood of Glasgow is Williamswood, the residence of Wm. Campbell, Esq. It is only a few years since Mr. Campbell put up a range of glass specially for Orchids. It is in

collection are frequently seen on the exhibition table, and occupy an honourable position, much to the satisfaction of the genial gardener, Mr. Harry Reid.—*Visitor*.

SANDHURST LODGE, NEAR WOKINGHAM.

IN the Reading district there are some good gardens, and much interest is exhibited in gardening. This is shown by the interesting meetings of the Gardeners' Mutual Improvement Society.

Although Sandhurst Lodge, the residence of Sir W. J. Farrer, is not close to this town, being about ten miles distant, it is situated in a well wooded and pleasant part of Sandhurst, and near Wellington College, which is so well known, and within ten minutes walk of Wellington College Station. The mansion is approached by a drive which comes close to the railway station.

This drive is well kept and ornamented by many fine trees and shrubs, showing at a glance that there is a lover of really ornamental gardening who supports the place. The mansion is mostly surrounded by trees and shrubs. The character of the mansion I do not intend to deal with, as this is not of so much importance from a gardening point of view; and there are so many things of interest in this place, that to give a detailed account would take more space than the Editor may care to give

SAVOY SUTTON'S PERFECTION.

THE HERBACEOUS BORDER.

EVEN in the month of February we have several flowering bulbs or tubers that tend to brighten our garden at a season when outdoor flowers are at a minimum. The first to claim attention is the beautiful purple-blue *Iris reticulata*, with yellow and white stripes, spotted with black, and sweetly scented. A large clump of this must have a charming effect. With gentle forcing it can be had in bloom by Christmas, I am told, but have not tried this myself. Then there are some of the single Anemones, flowering exceptionally early this year, partly owing to the mild weather, no doubt, and notable among these stands out the brilliant crimson, *A. fulgens*, so useful for cutting; and the Caen Anemones give us a great variety of colours. The Winter Aconite (*Eranthis hyemalis*) is past its best; but the paper-white and double Polyanthus Narcissus, such as Grand Monarque, Queen of the Netherlands, etc., are fast opening their flowers. These were forced about two years ago, and afterwards planted in the borders.

The many coloured Crocuses, too, help to brighten our beds, borders, and sunny banks wherever planted on the turf. All of those just enumerated, if dotted about in clumps, enliven our otherwise flowerless beds or borders. Some plant Polyanthus, Daisies, and such-like spring flowers, but we keep those to the flower garden proper; and a bit later on we will be rewarded with glowing beds of the latter, together with Wallflowers, Myosotis, Alyssum saxat-

three divisions, and admirably adapted for Orchid culture.

The first division is entirely devoted to the *Odonoglossum*. The plants are in the pink of condition, their growth no doubt being to a certain extent accountable for their vigorous and healthy look. A large amount of interest attaches to imported plants, as we always expect some particular treasure to turn up. A very fine *O. Pescatorei* has already been named after the owner, and no doubt other good things will yet appear.

The second division contains a mixed lot of all the useful kinds; while the third has mostly been filled with *Laelia purpurata* in variety, full of flowering sheaths, and in splendid health. Cattleyas and seedling *Cypripediums* were plentiful.

Another house standing by itself was filled with splendid plants of *Dendrobis*. *D. devonianum* had growths, 5 ft. long, and correspondingly thick. *D. nobile* was bristling with flower huds. A plant of *D. nobile* here has got so far out of the beaten track as to bloom in November, and has not yet made much progress with the growths that should have been made last summer. It will be interesting to watch how this plant behaves in future. So far it has got the same treatment as the others, and it is probable that it is something inherent in this particular plant, that is the cause of so great a divergence. Many fine plants of *D. wardianum* are just showing for bloom, and others are promising well. Specimens of this

me. Consequently I shall only mention a few of the most important features that came to my notice in a hurried look round the place during the past summer.

Some ten or twelve years ago I used to go and see the place, residing as I did then in the neighbourhood, and Mr. Townshend being an old acquaintance. I well remember the changes that were then taking place. Some few years previous to that time Sir William Farrer had come to reside here. As I entered the grounds I could see great changes had taken place, and much that formerly had little to attract was made most interesting.

It was early summer when I visited it, and many lovely hardy shrubs and trees were in bloom, many of which were planted to produce a good effect. As an instance of this I may name a large vigorous tree of the Red Chestnut, hacked by deep Coniferous trees; and to see the sun shining on this in full bloom is a glorious sight.

The ground is much broken, the house standing on high ground overlooking the slopes and well kept green sward. On the turf are some fine trees such as the Douglas Fir, *Abies Pinsapo*, *Cupressus* of sorts, *Cryptomeria*, etc. Some of these stand adjoining shrubby borders, the trees standing on the turf in a half circle, with fine masses of Ghent and other Azaleas, some of the best Rhododendrons, Weigelas, and other flowering shrubs.

One of the most pleasant changes and improve-

ments that has been made here is the converting of the old kitchen garden into pleasure grounds. Standing as it did just in sight of the dressed portion of the grounds, it did not quite harmonise with the surroundings. In doing this, while changing it, due consideration has been made not to lose sight of the beautiful. Now standing on the turf are several fine

are placed on a sloping bank, with a walk running below them; and as you walk and look up at them in full bloom, it is more easy to admire than describe them. The plants are placed about 6 ft. or 7 ft. apart. *Begonia Ingramii* and *Solanum jasminoides* are also used in the same way with the very best results. In all cases the plants are large. Bedding-

a walk. At the foot is a border for growing many rock plants; and on the other side is a border for herbaceous and other hardy plants.

I must not omit to mention some few prominent features in other departments. In the glass department was one of the finest batches of *Achimenes* I ever saw. The plants were growing in 48 and

TURNIP SUTTON'S CRITERION.

THE RIM.

32-sized pots, were lightly staked, sturdy, and a mass of bloom. Many kinds were grown, and brought to my memory days gone by, when we used to grow these extensively. In the same house was a fine batch of show and decorative *Pelargoniums* of the very best kinds, grown short-jointed, and requiring no staking. Many of the fine kinds grown by the market men were to be found here.

In the stoves, which were full of the most useful kinds of plants, mention must be made of a fine specimen of *Medinilla magnifica* (a plant not often seen done well) in fine condition; also a grand pair of plants of *Anthurium scherzerianum*, a mass of bloom. *Aristolochia gigas*, with its curious blooms, was ornamenting the wall. On the roof was *Begonia corallina*, 18 ft. by 10 ft.; and as one looked on the mass of bright coral-red blooms hanging down, the effect was not easily forgotten. *Browallia elata major* is grown with effect here. Many fine foliage plants were giving good results.

In the fruit houses were good crops of Grapes; also, in a small pit I observed a batch of *Primula obconica rosea*, and from the blooms then on the plants, I should consider it a distinct break in colour

THE RIM IN POSITION.

old Apple and Pear trees; and when in bloom nothing could harmonise better with the dark green of the evergreen trees. I often think fruit trees are not half as much used as they ought to be in the ornamental portion of gardens.

The old kitchen-garden wall facing south has been utilised to the best, by planting it with the best climbers and wall shrubs, and training them to wires, thereby allowing them to hang somewhat loosely, which is just the way to see the effect the bunch Roses are capable of producing.

I must now give an outline of the way some portions of the grounds are ornamented with big *Fuchsias* and other plants, such as *Plumbago capensis* and many kinds of scented-leaved *Pelargoniums* which are not often seen at the present time compared with some thirty years ago. Let it suffice to name one which most cultivators of that period remember, namely, *Shrubland Pet.* This and many other kinds are grown as big plants many feet high, and plunged with other things in the turf.

The *Fuchsias* are quite a feature here in summer, grown, as they are in quantity, in big pots, some as standards, and otherwise. The pots are plunged under the turf and placed in groups sufficient to give a mass of colour. In one part of the grounds they

out is not much done here on the old lines, but Mr. Townshend is well known for his advanced style of gardening and that he has entirely given up the old stereotyped form.

Passing from this portion of the ornamental grounds, I was then shown the ponds that are occupied with aquatic plants. Most of the new *Nymphaeas* are found here, as they are added to the collection as soon as their value is recognised. These ornamental ponds are so arranged that the top one of the three supplies water for the other two, and is made to produce a piece of swampy ground, which is now being added to, giving opportunities of growing many swamp-loving subjects, all of which are used to the best advantage.

At the time of my visit *Aponogeton distachyum* (or *Water Hawthorn*) was in full bloom, not by the foot, but by the yard, and I never saw such a mass in bloom at one time before. This water-gardening is quite a feature of the place, and the gardener has helped towards its development by giving his experience in the gardening press, both relating to the hardy and the tropical kinds. The latter he is growing in a tank outside, heated from a small pipe which comes out of the wall from the hot-water pipes, and keeps the water in the tank warm. Running alongside these ponds and above them is

(a thing not easily accomplished). I observed Mr. Townshend has a regard for many old plants, as amongst others I found *Heterocentron roseum*, a plant not often seen now.

In the kitchen garden I noticed the wall and other trees looked well; and outside the garden and near the pleasure grounds is an iron archway. Against this fruit trees are planted, and Mr. Townshend told me they generally gave him good crops, and some kinds of Pears did really well.

Vegetables were in strong force, and evidently every available space is used to grow something. On one of the outside borders of the kitchen garden was growing a wonderfully fine strain of self-coloured *Pansies*, true to colour and name.

I cannot close these hurried notes without remarking that the keeping of, and the material used in the garden, show that both Sir William Farrer and his gardener are enthusiasts in gardening. It was quite a pleasure to me to look over a garden so full of interest, as it is not often one gets an opportunity of seeing a garden in which the owner takes such a deep interest.—*J. C., Chard.*

Twenty Million Acres of Land in the United States are said to be owned by British landlords.

TURNIP, SUTTON'S CRITERION.

IN this we have an improvement upon the older and better known forms of the strap-leaved type of Turnip, well known for its service in furnishing the earliest supplies of an indispensable vegetable. The accompanying illustration shows how distinct the variety is in shape from the older strap-leaved varie-

stood on the flat bottom of another, because it sinks partly within the rim, and is thereby held firmly. A glance at the accompanying illustrations will show the Rim by itself, also placed in position inside a pot, and also when used as a pot-holder when stood in a saucer. In the latter case it is narrow, and a large pot simply stood upon it.

CABBAGE CARTERS' MODEL.

WHILE the heads of this Cabbage are of fair average size for those of an early variety, they are developed close to the ground by reason of the shortness of the stem. The hearts are roundly-conical, firm, compact, and constitute tender and delicate eating when in their prime during the early part of summer. Owing

THE RIM AS POT HOLDER.

IVORINE LABEL.

CABBAGE CARTERS' MODEL.

ties. The root penetrates the soil more deeply and has a better command of the soil-moisture than stump-rooted sorts, which are liable to feel the effect of early drought, and run to seed at a time when they are much wanted in the kitchen. The new type under notice is early, and red where exposed above the soil, the rest being white. The flesh is pure white, sweet, mild and otherwise deli-

POT-SHAPED TEAK BASKET.

For Orchid culture, Cattleyas more particularly, the Pot-shaped Teak Baskets are not only durable and handy, but extremely serviceable. There is no confinement to the roots anywhere, as in the case of the ordinary earthenware pots, but they make their exit everywhere, creep round and attach themselves to the wood, attaining a maximum development, which is hardly ever the case under ordinary pot culture. The baskets consist of upright, nearly square rods, but slightly bevelled towards their inner edges. Towards the top the rods are held apart by small blocks of bamboo, while for the rest they are simply threaded together by copper wires running through and securing them, one wire in line with the bamboo blocks, and the other towards the bottom. The accompanying illustration gives a general idea of this serviceable basket.

IVORINE PLANT LABELS.

Plant labels have been made of endless forms and materials. Those under notice consist of a flat, white ivorine disc of some secretly prepared substance, specially intended for plant labels. The material is perfectly smooth on both faces, so that either or both may be written upon with pen and ink or pencil. A rubber stamp may also be used where a large number of impressions of one name are necessary. For general purposes the pencil or pen are most serviceable. The label is bendable and elastic, that is, it may be doubled up and then flattened again without breaking; it may also be washed when it gets dirty, so as to show up the name. We think that the pen, dipped into ordinary writing ink, makes the best, most legible, and most enduring impression; for it can at any time afterwards be washed without effacing the writing. The accompanying illustration shows the simplicity of the design. The label is thin, light, and simply suspended by means of a short copper wire stuck into the pot or basket in which the plant is growing. The disc itself may be made in any form, that shown in the illustration being considered the most suitable and serviceable. All of the illustrations were supplied us by The Leeds Orchid Company, Roundhay, Leeds, who issue West's patents generally, including those we figure.

POT SHAPED TEAK BASKET.

to the dwarf character of the variety, the plants require but a moderate amount of space, and fairly close planting makes them all the more serviceable for table use. The accompanying illustration, lent us by Messrs. J. Carter & Co., High Holborn, London, shows the general features of the variety.

ROYAL GARDENERS' ORPHAN FUND.

SEEING your report of the meeting of the G. O. Fund in last week's paper, I cannot help thinking how much we who have its interest at heart have to be thankful for, especially to our Committee, past and present, also to our good Secretary for the able way in which they have used the money entrusted to them, and for the untiring labour they have given for the benefit of others. Then again, there are those who have helped us with large sums of money, knowing that they themselves can in no way reap benefit for the same; but how little we have to thank those who will be the first to apply for help in their need, I mean the gardeners of Great Britain, a body who seem to forget that in helping this Fund, they are helping themselves; and the consequence is that certainly not one-tenth of them subscribe. I wonder if they have ever thought what the annual income would be if everyone, gardeners, foremen and journeymen would subscribe one penny a week. I think if they would sit down and work this out the result would not only surprise them, but it would, I believe, nerve them on to the effort; and with that income secured, many more Children would be enjoying help which now has to be so carefully harvested, and the funded property would be increased each year.—Charles Fenny.

CLIMATIC NOTES AND SOILS.

IT is often asserted that climate alone is responsible for the production of fine fruits; but the nature of the soil also plays an important part in the development of fruits. This we have proved in districts wide apart, with altitudes varying by hundreds of feet. But we never saw such a difference in Apples, Pears, and stone fruit, as in our present locality where the soil is of fine loam, and deep, resting on gravel. Some varieties do well, and would not be a discredit to cultivation in the finest districts in England. The same sorts (under our care) do not succeed well on cold damp soil. When water cannot drain freely from the land the roots are kept cold. Though planted on elevations of brick rubbish the fruits do not attain to that excellence where the soil is naturally good, and the drainage in perfect order.

cately flavoured. Messrs. Sutton & Sons have enabled us to lay the figure of it before our readers.

WEST'S PATENTS.

PLANT POT RIM.

THIS is a contrivance to prevent the water from running off the compost and through the openings of perforated pots, such as are used for Orchids, Aroids, Ferns, &c. In those cases, if the compost is once allowed to get dry, there is great difficulty in getting the moisture again to penetrate the material. To obviate this difficulty the Plant Pot Rim has been made, and consists simply of a terra cotta rim perforated at the sides with three triangular holes. This is put inside the pot intended to hold the plants. A little compost or moss is put inside with it and pressed down till it is firm, and somewhat below the rim of the pot. The pot being well drained it is now ready for the compost and the plant. In the case of Orchids the roots find their way down the outside of the rim and fix themselves to it. The rim may be lifted out, compost and all, when looking for slugs, and put back again without damage to the plant. Another use to which the rim may be put is as a pot-holder, instead of using inverted pots when Orchids are stood over saucers of water. The rim holds the pot more securely than when the latter is

Soil for Lettuce.—Professor Galloway (U.S.A.) has declared that the soil best suited for the production of the finest Lettuce is "one which contains much sand and little clay and silt, loose at all times regardless of treatment, never 'puddles' when worked, and on which no matter how wet, clods and lumps never form."

Sun and shelter are of great moment, but with these advantages when there is an absence of good soil and drainage, fine quality is also absent.—*M. T., Carron, N. B.*

DWARF FRENCH BEAN SUTTON'S PERFECTION.

THIS new French Bean may be described as a second early, since it follows in the wake of Sutton's Forcing. It produces enormous crops of long succulent pods, as may be seen by reference to the accompanying photograph of a plant grown in the open garden. The pods are of great length, and so plump in their development that a transverse section is nearly round. It is essentially a French Bean for the table, both on account of its marvellous cropping powers and continuous bearing character. The gar-

rose, yellow and green of the crisped and crested leaves that the plants may be and have been employed with excellent results for the filling of beds in the flower garden where winter effects were desired. For garnishing purposes the leaves are everything that could be desired, and a few plants may well be included within the kitchen garden bounds to furnish material for this purpose, if for no other.

NOTICES OF BOOKS.

AUNT KATE'S GARDENING BOOK. Published by the proprietors of "The People's Journal," Dundee. Price 1d.

Aunt Kate's Gardening Book is the sixth of a series of handbooks issued from the office of *The People's*

the herbaceous border, budding and grafting, native Ferns, exhibiting at flower shows, and kindred matters concerning which amateurs are always desiring information. Short notes describe how the cultivator can best deal with a few of the more common insect enemies that may infest his favourites. Altogether a great amount of reliable information has been gathered together in small compass by a writer who is himself a professional gardener, and his work has been well edited by one who also has a good experience in gardening. We met with a few, though unimportant errors in orthography, particularly in the case of botanical names. The book should meet with as much favour as its predecessors of the series.

A FRENCH BOOK ON CHRYSANTHEMUMS.

LES CHRYSANTHEMES A GRANDES FLEURS. Choix des Meilleures Variétés et Nouveautés Françaises et Etrangères du Nord, Bailleul (Nord), France. Prix 0.60c. (6d.)

The book runs to 120 pages, and devotes the most of its space, as the sub-title shows, to a descriptive list of a selection of the best varieties in commerce, to French and foreign novelties. The older varieties are mostly well known in this country, indeed, many of them have been raised here, or in America. M. Anatole Cordonnier gives a list of his own novelties, followed by lists of new varieties of Chrysanthemums raised by M. Bonnefous, M. de Reydellet, M. Héraud, M. Lacroix, Louis de Lautar de Labernose, M. Nonin, M. Molin, M. Delaux, M. Calvat, and others whose names are mostly well known in this country by the varieties which have been named after the raisers or members of their families. Novelties from New Zealand, Australia, and other countries are also recorded. The descriptions are all in French, so that only those with a little knowledge of the language will be able to grasp what the flowers are like. We note that many of them have received First-class Certificates or Diplomas of Merit from different societies scattered throughout France. The names are mostly reasonably short, though a few will occasion trouble to the label writer to get them fully expressed upon the labels, as for instance, Souvenir du l'Exposition du Havre, President Maxime de la Rocheterié, and Société de Chrysanthémistes du Nord. There are various articles on the popularisation of the Chrysanthemum, the period for taking cuttings, soils, liquid and other manures.

EARLY SPRING FLOWERS AT TOTTENHAM.

As in other places, the spring flowers have, at Tottenham, made their appearance in force unusually early in the season, as a recent visit to Mr. T. S. Ware's establishment convinced us. The hardy plants grown at this famous nursery are thoroughly representative of what Nature in her best moods, aided by scientific horticulture, has been able to effect, but it is not until we begin to take stock, as it were, that we really appreciate the numbers of pretty and useful plants that are available for the decoration of our gardens and rockeries thus early in spring.

Some of these floral gems are, alas, too tender to brave the storms of February and the boisterous days and chilly nights of the beginning of March without protection of some kind, and thus we found that a goodly number of the plants that were in flower were either in frames or in sheltered corners where further protection may be speedily given if necessary. And it has been necessary, for no further gone than the 25th ult. the thermometer registered 12° of frost. The result of this was apparent to us in a fine clump of *Saxifraga crassifolia*, which had had all the expanding flowers completely killed by the frost. Other things have, of course, suffered proportionately.

One of the most striking features in the plants growing in the frames was a nice little batch of the handsome *Adonis amurensis*, the bright yellow flowers and deeply divided leaves of which made a vastly pretty picture. As an early-flowering subject for the rockery this *Adonis* is worthy of all consideration. Here, too, we saw a few flowers of the pretty *Anemone ranunculoides*, which, however, has not done so well this year as it did last.

Hardy terrestrial Orchids are made a speciality of

DWARF FRENCH BEAN SUTTON'S PERFECTION.

dener can help it in this respect by removing the pods as soon as they become fit for use. A good watering before nightfall in dry weather would also stimulate them to fresh growth. The flavour leaves nothing to be desired. We are indebted Messrs. Sutton & Sons, Reading, for the illustration.

ORNAMENTAL KALES.

ALL the Borecoles or Kales can boast of a distinctly handsome appearance when growing, and some of the densely curled Scotch varieties more especially. In the section of variegated or garnishing Kales, however, we get the biggest development of the purely decorative. This may be gained to some extent at the expense of culinary merit, but it is not often that the plants are subjected to this ordeal, for they are much too pretty to cook. So very showy indeed are the different shades of purple,

Journal for the benefit of its numerous readers all over Britain who may possess a garden. The handbook is in pamphlet form, running to forty closely printed pages, and containing a great amount of information on the subject considering the amount of space at command and the lowness of the price, putting it within the compass of the poorest cottager. A large portion of the book is taken up with a monthly calendar, each of some length, and dealing with the fruit garden, the cultivation of flowers, the greenhouse, the vegetable garden and window plants. Besides the mere hints as to what should be done during any particular part of the month, there are details as to how it should be done, including cultural operations, and the varieties or sorts of vegetables, etc., most likely to give satisfaction.

The calendar is followed by cultural directions concerning the Chrysanthemum, and other short chapters on uncommon vegetables, Melon culture,

at Tottenham, a considerable number of forms being catalogued. These hardy plants, although they have not the showiness of their exotic relatives grown under glass, are still beautiful and very interesting. The Spider Orchids, *Ophrys aranifera* is one of the earliest of these, since it is in bloom at the present time, of course somewhat in advance of its normal period. The green sepals and petals and the dark maroon, curiously-shaped lip, are both quaint and pretty. *Orchis robertiana*, with its large dense spikes of purple and white flowers, has more pretensions to decorative qualities.

In some of the larger houses there is at the present time a very fine display of hardy flowers which have been grown in pots and given a little heat to induce them to bloom early. Amongst these we saw some capital samples of *Narcissus minimus*, *N. pallidus praecox*, *N. nobilis*, the comparatively rare *N. Johnstoni*, and the curious Tunisian species *N. Broussonetii*; also good clumps of *Iris reticulata* (this has been cut down out of doors). Batches of healthy well-flowered plants of *Primula denticulata* and its albino *P. d. alba* were likewise most commendable.

In the protected grounds we noticed a considerable number of handsome plants, one of the most noteworthy of which was *Colchicum libanoticum*. The plant is very dwarf in habit, and the cup-shaped, pearly pink flowers are produced quite close to the ground. The leaves are lanceolate in shape, with obtuse apices, and rather succulent in texture. This little *Colchicum* is certainly one of the gems of the genus, and deserves wide recognition. *Eranthis cilicica* is a new and rarely beautiful plant that cannot fail to be much grown and not less appreciated. It is taller and larger in all its parts than the well known *E. hyemalis*, the popular Winter Aconite, and the flowers are, if anything, of a deeper yellow. It comes into bloom about six weeks later than *E. hyemalis*.

Of the early Fritillaries, *F. oranensis*, an Algerian species, with its handsome bell-shaped green and maroon flowers, was well sustaining its credit. *F. pluriflora* was a novelty to us, and a most beautiful one too. The flowers, which are rather small, exhibit a soft, pleasing shade of purple-pink, a colour rarely seen in this class of plants. Three to four flowers are borne on a single scape. The leaves are narrowly lanceolate in shape, very glaucous, and succulent. The plant is a native of California. *Anemone blanda* was rendering a capital account of itself, and, indeed, Mr. Reuthe informed us, had been in flower ever since the middle of January. *Tulipa violacea*, with its small, sweet-scented, red-purple flowers, is perhaps more interesting than pretty. At any rate, it has done well to flower thus early, for being of diminutive proportions it would probably stand a poor chance of recognition if it attempted to bloom at the same time as its more impressive relatives. A batch of *Hyacinthus azureus* in one corner of the frame ground furnished a patch of vivid blue than which nothing could be more beautiful. The early-flowering Irises were represented by masses of such forms as *I. persica purpurea*, *I. stylosa alba*, *I. reticulata Krelagi*, and *I. r. histrioides*. All are pretty and useful, but the flowers are very delicate. *Crocus Balansae* is a little gem that resembles *C. chrysanthus*, but is a little richer yellow, and is several weeks later in flowering, for *C. chrysanthus* is now over. *C. biflorus nubigenus* is one of the prettiest "biflorus" forms. The flowers are white with a large and conspicuous yellow base.

The Snowdrops have been having a grand time of it, and indeed we have never seen them looking better than during this year. The new *Galanthus Ikariae* has done remarkably well, and in several places we saw instances of its effectiveness. Even late planted bulbs have flowered well, although these plants were noticeable from their comparatively dwarf habit, both in length of scape and leaf. Several corners of the rockery were quite gay with it; indeed, to quote Mr. Reuthe's own words, "it is impossible to praise it too highly for beauty and usefulness." This statement we could but endorse in the face of the samples before us. *G. Elwesii*, the Giant Snowdrop, must not be forgotten, for there is no doubt that it contests with *G. Ikariae* the first place for decorative value. We noticed a more vigorous form of it named *G. E. robustus*, and were particularly impressed with its appearance. Whilst speaking of Snowdrops, mention should be made of the free-flowering *G. byzantinus*, which

comes into bloom directly after the autumn flowering *G. corcyrensis*. The flowers are long and of a pure, snowy white, prettily blotched with a delicate shade of green. Certainly the three most useful snowdrops are *G. Ikariae*, *G. Elwesii*, and *G. byzantinus*. Those lovers of flowers who like something in the way of novelty should grow *G. Scharlocki*, which has two very long spathes to each flower, instead of one, as in the case of all other known Snowdrops.

Saxifraga apiculata, with its light yellow flowers, is one of the earliest of the mossy Saxifrages to bloom in the open. *S. sancta* is a little later, and the flowers exhibit a deeper yellow hue. The latter species was just commencing to open its flowers.

Rarely, if ever, can one see a finer batch of *Anemone Pulsatilla* than that at Tottenham. The plants are seven or eight years of age, and are thus of great size and strength. They are throwing up great numbers of flowers, which so far have escaped the frost, and which may thus be trusted to make a grand display in the near future.

Amongst the hardy flowers we may make mention of *Rhododendron praecox*, which was represented by a number of sturdy little bushes full of flower. This is one of the most beautiful and most valuable of the early Rhododendrons, and one which, when the frost can be induced to let it alone, may always be expected to be in capital form at the end of February. The frost which recently visited us had, we found, tried the flowers sorely.

Although it does not come into the list of hardy early flowers, we cannot forbear to mention a grand batch of the shrubby *Veronica Traversii*, than which there is no prettier shrub for town gardens. The plants in question were sturdy, compact-habited samples about 1 ft. in height, and some four years of age. It has never fallen to our lot to see a finer stock of plants. *V. buxifolia* was showing up well a little distance away. This is a dwarfer species, but also a very handsome one, and quite distinct. *Iberis Little Gem* is a plant that has a great future before it. Dwarf and bushy in habit, it flowers continuously from spring till autumn, and we found its buds just on the point of bursting. Those who are on the look out for a hardy and handsome subject for rock garden, herbaceous border, or culture in pots, cannot do better than invest in a few of it.

GARDENING MISCELLANY.

CINERARIAS.

THERE is a grand lot of these in bloom at the present time at Yoecliffe House, Wirksworth, the seat of C. Wright, Esq. On measuring some of the plants I found them to be 18 or 20 ins. across; and they are grown in 5-inch pots. Mr. G. Daking, the gardener, is very proud of his plants and well he might be. The strain is that of Messrs. J. Carter & Co., High Holborn.—*T. Cockerill, Wirksworth.*

EVER-BLOOMING PRAIRIE QUEEN ROSE.

AMONG the novelties illustrated in the novelty supplement of the *Florists' Exchange* for February 12th, this handsome Rose occupies a foremost position. It is stated to be perfectly hardy, and to withstand a temperature of 10° below zero without protection. The flowers are very double, beautifully fragrant, and dark carmine in hue. They are of medium size, and produced in clusters like all those varieties of the Polyantha section. The growth is quick and vigorous, and the habit distinctly climbing. It is, moreover, recommended for pot work, as well as for cultivation in the open ground. If the variety possesses all these good qualities, it will doubtless become as great a favourite on this as on the other side of the "herring-pond."

ADIANTUM CUNEATUM.

AT Yoecliffe House there are some splendid specimen plants of the above. We found on running the tape measure across some of the plants that they are 4 ft. in diameter. The specimens are growing in 9-inch pots, and have been brought to this high state of perfection by the use of "Daking's Acamattuty."—*T.C.*

LILY-WHITE SEAKALE.

MANY proprietors will not have Seakale on their tables which is not pure white, of good size and perfectly tender. The Lily-White variety is very dis-

tinct and its colour is all that can be desired. It is grown as easily as the older variety; but it must not be supposed that its tempting colour always indicates tenderness. If air is allowed to circulate in the space where forcing is done, tough stringy produce can only be grown, and the inexperienced may supply a culinary article which may do them discredit. The old plan of covering with leaves, and other fermenting material, with pots placed over the crowns, is always safe. Boxfuls of roots buried in heaps of leaves supply good Seakale.—*M. T., Carron, N.B.*

VICTORIA TRICKERI.

THIS is considered by an eminent firm of nurserymen and seedsmen in the United States to be such an improvement upon the old *V. regia* that the latter will be no longer catalogued. It is stated to be much hardier, and to have a deeper upturned rim to the leaves than the type, whilst the calyx is free from spines. It is also said to be more vigorous in growth, producing double the number of leaves and flowers that *V. regia* does. It has been tested well in the States, and in every case gave satisfaction; also at Kew in our own country, where it maintained its distinctive characteristics. The last issue of the *Florists' Exchange* that reached us gave a small illustration of it.

SOCIETIES.

ROYAL HORTICULTURAL.—March 8th.

THE Drill Hall was well filled with exhibits of all sorts on Tuesday last, including Orchids, stove and greenhouse plants, *Amaryllis*, *Cyclamen*, *Camellias*, *Ferns*, *Daffodils* in quantity, double *Cherries*, *Azaleas* and various other forced subjects.

Messrs. J. Veitch & Sons, Ltd., Chelsea, staged a grand group of Orchids consisting largely of *Dendrobiums*, *Epidendrums* and *Cattleyas*. Very finely flowered were *Dendrobium crassinode*, *D. wardianum*, *D. Edithae*, *D. Wiganiae*, *D. Euryalus*, *D. splendidissimum*, *D. Cybele nobilium*, and *D. striatum*, all except the two first named being hybrids. Very fine also were the hybrids of *Epidendrum* all coming under the name of *E. elegantulum*, and derived from a cross between *E. Wallisii* and *E. Endresio-Wallisii* the last named being a hybrid derived from the species whose name it bears. *Epiphronitis Veitchi* obtained from *Epidendrum radicans* and *Sophronites grandiflora*, was also shown along with its parents; *Cymbidium eburneo-lowianum* standing between its parents was also noticeable upon the table (Silver Banksian Medal).

The sensation in the above group was a small piece of *Odontoglossum crispum* Baroness Schroder, belonging to Baron Schroder (gardener, Mr. H. Ballantine), The Dell, Egham.

Messrs. Charlesworth & Co., Heaton, Bradford, also exhibited Orchids, consisting chiefly of *Odontoglossums*, *Dendrobiums*, and many grandly flowered specimens of *Phaius Norman*, *P. N. aurea*, and *P. N. rosea*. All were finely set up with *Palms* and *Ferns* (Bronze Banksian Medal).

Messrs. Hugh Low & Co., Clapton, showed a small mixed group of Orchids containing a magnificent variety of *Odontoglossum nebulosum*, named *O. n. pardinum*, remarkable for the size and number of the spots upon it.

C. L. N. Ingram, Esq. (gardener, Mr. Bond), Elstead House, Godalming, staged a large and showy group of *Dendrobium splendidissimum grandiflorum*, every plant being well grown and most of them profusely flowered.

Philip Crowley, Esq. (gardener, Mr. J. Harris), Waddon House, Croydon, staged a huge, well-flowered piece of *Cypripedium villosum*. Sir Trevor Lawrence, Bart. (grower, Mr. W. H. White), Burford Lodge, Dorking, exhibited *Dendrobium Euterpe* and *D. Clio*. A fine spike of *Epidendrum stamfordianum* was shown by J. T. Bennett Pöe, Esq. (gardener, Mr. Downes), Holmwood, Cheshunt. C. J. Lucas, Esq. (gardener, Mr. G. Duncan), Warnham Court, Horsham, showed *Laeliocattleya warnhamensis*, a fine hybrid. Otto Froebel, Zurich, Switzerland, showed a fine plant of *Spiranthes colorata maculata*. J. Rutherford, Esq. (gardener, Mr. John Lupton), Beardwood, Blackburn, staged a number of *Odontoglossums*.

H. T. Pitt, Esq., Rosslyn, Stamford Hill, exhibited

a piece of *Odontoglossum wilckeanum* Pittiae bearing a grand spike of flowers. T. B. Haywood, Esq., staged a beautiful and most interesting little group of *Dendrobium Ainsworthii* Woodhatch, var. Baron Schroder, had a small collection of cut flowers of *Odontoglossum coronarium*, *O. Pescatorei* melanocentrum and others. H. Druce, Esq. (gardener, Mr. Walker), 43, Circus Road, St. John's Wood, exhibited a plant of the hybrid *Cypripedium* Mrs. H. Druce.

Messrs. J. Hill & Son, Lower Edmonton, staged a very imposing and showy exhibit of exotic Ferns, for which a Silver-Gilt Flora Medal was given. In this group there were some superb specimens of *Asplenium Nidus avis*, *Stenochloena scandens*, and *Nephrolepis davallioides furcans*, whilst a grand plant of *Alsophila excelsa* was hoisted up into a central position overhead, where it had a novel effect. Baskets of small plants of *Pteris palmata*, *P. Mayi*, *Lastrea aristata variegata*, *Adiantum rhodophyllum*, and *Blechnum brasiliense* were installed.

From Messrs. J. Veitch & Son, Ltd., Chelsea, came a unique exhibit of well bloomed samples of the double *Cerasus Pseudo-Cerasus* in pots. This ornamental Cherry forms a handsome pot plant. The same firm sent plants of *Staphylea colchica* and *Spiraea confusa* in first-rate condition (Silver Banksian Medal).

Mr. Wm. Paul & Son, Waltham Cross, occupied the same place as at the last meeting with a similar and equally meritorious exhibit of Camellias. Conspicua, Contessa de Hainant, Marchioness of Exeter, and Madame Cachet were some of the best varieties, and these were represented by fine specimens. The collection of cut blooms in the front showed the Camellia at its best (Silver-Gilt Banksian Medal).

Mr. John May, Gordon Nursery, Twickenham, showed a fine hatch of Persian Cyclamen. The flowers throughout were of good substance and great size, whilst the colours were exceptionally well developed (Silver Flora Medal).

Cyclamen also came from Mr. Chas. Turner, Slough. The plants were well-flowered and healthy samples, but the individual flowers were small.

A large display of Cyclamen was furnished by the St. George's Nursery Company, Hanwell, W. The quality was very good and the flowers large and fine (Silver Banksian Medal).

The Church Road Nursery Company, also from Hanwell, had a meritorious lot of Cyclamen; indeed, in both exhibits the quality was much above the average.

A Bronze Flora Medal was awarded to the Church Road Company.

The exhibit of *Azalea mollis*, and hybrids between that species and *A. sinensis* sent by Messrs. R. and G. Cuthbert, Southgate, Middlesex, was a very showy and brilliant one. The plants were sturdy samples, and exceptionally well flowered (Silver Banksian Medal).

Messrs. W. Cutbush & Son, Highgate, N., had a nice display of miscellaneous plants in which the hardwooded element predominated. *Acacia cordifolia*, *A. Drummondii*, *Erica persoluta alba*, *Eriostemon intermedius*, and the Otabeite Orange were represented by some capital plants.

A splendid batch of *Boronia megastigma* came from Messrs. W. Balchin & Sons, Hassocks Nurseries, Sussex. These plants were simply perfection.

Messrs. J. Veitch & Sons, Ltd., had a fine lot of *Hippeastrums*. *Dryades*, *Navala*, and *Miranda* were some of the finer newer forms (Silver Banksian Medal).

A group of miscellaneous stove foliage plants was staged by Messrs. John Laing & Sons, Forest Hill, S.E., including *Clivias*, *Dracaenas*, *Crotons*, and *Caladiums* (Bronze Flora Medal).

A specially noteworthy exhibit of Clematises in pots was made by Mr. H. B. May, Dyson's Lane Nurseries, Upper Edmonton. *Lady Londesboro*, *Miss Bateman*, and *Mrs. Quilter* were three of the best forms on view (Silver Banksian Medal).

Mr. Geo. Mount, Canterbury, staged a superb lot of cut Roses for which a Silver Flora Medal was granted.

The samples shown of Mrs. John Laing, Catharine Mermet, Captain Hayward, and Anna Olivier left nothing to be desired in shape of bloom and delicacy of colouring.

A unique lot of crested Cyclamen in rose, red, crimson, and white came from M.M. L.P. de Langhe-

Vervaene, 150, Rue de Constantinople, Saint Gilles, Brussels.

Captain Holford (gardener, Mr. A. Chapman), Westonbirt, Tetbury, Gloucester, sent a few well grown and high class *Hippeastrums*. The flowers were remarkably large and fine.

Messrs. John Peed & Sons, Roupell Park Nurseries, Norwood Road, S.E., had a showy group of flowering subjects, chiefly *Clivias*, and *Azalea mollis*.

Hardy flowers were shown in capital form by Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, N. Such Daffodils as *Henry Irving*, *Golden Spur*, *Victoria*, and *Queen Bess* were first class, also *Anemone apennina*, *Muscari botryoides*, *M. b. album*, *Erythronium Dens-Canis*, and *Chionodoxas* in variety. This was a very comprehensive exhibit.

P. Purnell, Esq., The Woodlands, Streatham, had a neat group of *Narcissi* and Alpine plants (Silver Banksian Medal).

A choice lot of bardy flowers was sent by Messrs. Barr and Sons, Covent Garden. It included, *Anemone fulgens*, *Erica carnea* and *Chionodoxa*, in variety.

Messrs. Thos. Cripps & Son, Tunbridge Wells, had *Deutzia Lemoinei* in grand condition.

Messrs. Wallace & Co., Kilnfield Gardens, Colchester sent a handsome collection of early flowering Irises.

At a meeting of the Fruit and Vegetable Committee, a vote of thanks was passed to Messrs. James Veitch & Sons, Limited, for a choice collection of the handsome garnishing Kales.

Mr. W. J. Empson, gardener to Mrs. Wingfield, Amptill, received a Silver Banksian Medal for 21 dishes of Apples. *Beauty of Kent*, *Beaumann's Red*, *Winter Reinette*, and *Mère de Ménage* were in capital preservation. A fine dish of Pear *Uvedale's St. Germain* was likewise shown.

Messrs. H. Lane & Son, Berkhamsted, showed *Apple Lane's Prince Albert* in splendid condition.

A Bronze Banksian Medal went to C. P. Serocold, Esq., for a group of Apples.

Fifteen dishes of Apples competed for the Veitch flavour prizes. C. P. Serocold, Esq., Taplow Hill, was placed first with *Cox's Orange Pippin*. Mr. C. J. Salter, gardener to T. B. Haywood, Esq., Woodhatch Lodge, Reigate, was second with *Bess Pool*.

Robert Maher, Esq., Yattendon Court, Newbury, sent the only dish of Pears in *Bergamot d' Esperen* which received the second prize.

Mr. George Wythes, gardener to Earl Percy, Syon House, Brentford, received a "cultural commendation" for two magnificent bunches of *Asparagus*, and some fine *Artichokes*.

QUESTIONS AND ANSWERS

* * * Will our friends who send us newspapers be so good as to mark the paragraphs or articles they wish us to see. We shall be greatly obliged by their so doing.

[Correspondents, please note that we cannot undertake to name florists' flowers such as *Carnations*, *Pelargoniums*, *Chrysanthemums*, *Roses*, nor such as are mere garden varieties, differing only in the colour of the flower. Florists' flowers, as a rule, can only be named by those who grow collections of them.]

Flowers of *Dendrobium Nobile*.—*J. Hunter*: The flowers you sent were certainly very fine. You might grow a good many imported plants before you get anything so fine as No. 3, which would be our choice of the three varieties, as well as yours. The large flower, but particularly the broad, rounded lip would bring the variety close to *D. nobile sanderianum*, from which it differs, however, in being less highly coloured, particularly the sepals. The intense blotch on the lip is all that could be desired. For the sake of distinction, and as a memento of where it first flowered you might name it *D. nobile Kings-knowes* var. The second best variety you sent is No. 1, on account of the great length of all the segments, which make the flowers of great size. There is also a wonderful amount of colour on both faces of the segments. The great length of the cordate, acuminate lip is also remarkable, though the way in which the point is rolled back, forming a wide and complete coil, hides this character to some extent. We do not remember seeing anything like it before, and being well worth growing, you might give it some distinctive name. A good many of the varieties of *D. nobile* have been named by different people, but seeing that they are not described, it is difficult or impossible to hear them all in memory. No. 3 of your list is pretty, but the segments are too narrow to meet the likings of growers generally.

Eradication of Weeds.—*William Brown*: Weeds may consist of any kind of plant that is out of place, that is, growing in the box edgings, on the walks,

lawns, flower beds, or in the fruit and vegetable quarters. Some of them may consist of garden plants gone astray; but we can give you a few examples of the wild or native weeds. Groundsel (*Senecio vulgaris*), Yar (*Spergula arvensis*), Shepherd's Purse (*Capsella Bursa-pastoris*), Chickweed (*Stellaria media*), annual *Veronicas* such as *V. arvensis*, *V. agrestis*, *Fumitory* (*Fumaria officinalis*), and *Solanum nigrum* are examples of annual weeds that should always be destroyed by means of the Dutch hoe, wherever the nature of the crops will permit of it. Otherwise a small hand hoe may be used, or the weeds may be pulled up by hand. Weeds on lawns are *Daisies* (*Bellis perennis*), *Dandelions* (*Taraxacum officinale*), *Plantains* (*Plantago major* and *P. lanceolata*) and *Docks* (*Rumex crispus* and *R. obtusifolius*). All of these may be dug up by means of a forked or two-pointed spud. *Daisies* may also be destroyed by means of Lawn Sand. Where the weeds are to be forked up the work should be done in moist weather while the ground is soft and favourable to the removal of the roots. Weeds on walks may consist of any of the above named annuals, but grasses are much more common in such places, particularly *Poa annua*, the annual meadow grass. In some gardens the walks are hoed and the weeds raked off. In other cases they are pulled up by hand. A third method is by some of the weed-killers sold by horticultural sundriesmen. Perennial weeds are often more troublesome, particularly those having underground roots that descend perpendicularly like those of the *Dandelion* or *Dock*; or those having horizontal creeping stems beneath the soil like *Couch Grass* (*Triticum repens*), *Tussilago* (*T. farfara*), *Bishopweed* (*Aegopodium Podagraria*), *Bindweed* (*Convolvulus arvensis* and *C. sepium*), *Horsetail* (*Equisetum arvense*), *Comfrey* (*Symphytum officinale*), perennial *Sowthistle* (*Sonchus arvensis*), *Fieldthistle* (*Carduus arvensis*) and *Yellow or Meadow Vetchling* (*Lathyrus pratensis*). Other perennials creeping less extensively are *Sheep's Sorrel* (*Rumex acetosella*), common *Sorrel* (*R. acetosa*), *Crowfoot* (*Ranunculus repens*), *Oxeye Daisy* (*Chrysanthemum Leucanthemum*) *Hawkweed* (*Hieracium Acetosella*), &c. All of these perennials, whether they have long tap roots, or creeping stems, should not as a rule be attacked with any kind of hoe, but should be carefully dug up with a fork, and every scrap of them wheeled off the ground to rot in a heap or be burned. These hints should be sufficient for your purpose, and when describing their nature and the best means of eradicating them, you should follow all good gardening practice, and you cannot go wrong in a horticultural examination.

Planting Herbaceous Borders.—*L. C.*: You should proceed at once with the planting of all subjects that are perfectly hardy, provided the weather is suitable and the ground sufficiently dry to be workable without puddling. You should lift a portion of the plants only at one time. Lay them close together on a piece of spare ground close handy, fix the labels firmly in each clump, and cover any roots that may be exposed by means of mats. Then wheel a heavy dressing of old hotbed manure, leaf soil or other rich material on to the ground. Then commence at one end by taking out a trench, wheeling the soil to the far end of the border to be trenched. Trench the soil to the depth of 18 in. or 2 ft., but do not turn up any poor material on the surface, merely breaking up and loosening it. After the ground has been trenched and the manure thoroughly mixed with the soil from which the plants have been lifted, you can then replant them before proceeding to lift any more. Arrange them according to height from your past observations.

Names of Plants.—*A. C.*: 1, *Forsythia suspensa*; 2, *Pyrus japonica*; 3, *Juniperus sinensis*; 4, *Elaeagnus pungens variegata*; 5, *Euonymus japonicus maculatus*.—*T. W.*: 1, *Iris reticulata*; 2, *Narcissus minor*; 3, *Narcissus Bulbocodium*; 4, *Anemone blanda*.—*R. J.*: 1, *Dendrobium findlayanum*; 2, *Dendrobium crassinode*; 3, *Asplenium bulbiferum minus*, usually named *A. Colensoi* in gardens.—*North*: *Carex Morovii variegata* (for a fuller reply see next week).

The Gardening World.

Edited by J. FRASER, F.L.S.

SATURDAY, MARCH 19th, 1898.

NEXT WEEK'S ENGAGEMENTS.

MONDAY, March 21st.—Adjourned Annual Meeting of the National Chrysanthemum Society at Anderton's Hotel, Fleet Street, E.C., time 6 p.m. Sale of hardy herbaceous plants, Carnations, etc. by Messrs. Protheroe and Morris.
TUESDAY, March 22nd.—Royal Horticultural Society, meeting of committees at 12 noon. Sale of the Battenhall Mount Collection of Orchids by Messrs. Protheroe and Morris.
WEDNESDAY, March 23rd.—Torquay District Gardeners' Association Spring Show. Sale of Lilliums, Ferns, Tuberoses, Palms, etc., by Messrs. Protheroe and Morris.
FRIDAY, March 18th.—Sale of Imported and Established Orchids, by Messrs. Protheroe and Morris.

GARDENERS AWAKENING TO THE NEEDS OF THE TIMES.—From various sources all over the country we have evidence that young gardeners are becoming more and more alive to the necessity of acquiring by some means or other a knowledge of the higher and more scientific branches of their profession. There is some satisfaction in this and a hope that the teaching being given in various parts of the country will not be lost upon the rising generation. What has long been urgently needed was an awakening of thought and study as a means of helping gardeners to habits of careful and correct observation in youth; and to acquire the faculty of turning these things to practical account when opportunity serves them. We do not imply that a gardener by merely cramming his mind with facts and information acquired from

the accumulated knowledge of others whether offered to them in the form of books or from lectures delivered. The lessons should be carefully thought out and acted upon in conjunction with the best rules and guidance of modern practice. He must get conversant with the leading facts of the case that bear on any particular case so that he can apply that phase of the scientific teaching which relates to the particular soil of the district or garden under his charge. It is not sufficient to blindly follow the teaching of the profession which has been handed down from master to apprentice for centuries past. There is much to unlearn of old methods, prejudices to be got rid of, and indifference to be cast aside, by the young men who elect to make the profession of gardening the means of a livelihood.

In the dissemination of knowledge both teacher and scholar must play their part well. That information should be imparted in an attractive way goes without saying, although it is equally certain that many teachers have not this particular faculty in a large measure. On the other hand, little good will result to students who attend classes or lectures merely to be amused or entertained. Some may be given to criticising, more particularly if they happen to be better versed in some branches of the subject than the teacher himself. Others will rail at every attempt on the part of teachers to impart instruction, simply on the ground that the system is an innovation, and contrary to all the traditions of the profession which served their fathers and grandfathers well. This spirit is in direct antagonism to the best interests of the cause. Little prejudices and conceits should be laid aside, and would-be students should come forward in an enquiring frame of mind, and both teacher and scholar should act on the principle of mutual co-operation for the good of the cause and the community in general. Those who ignore this aspect of the subject, will have to blame themselves if in after years they should find they have been left dragging behind the times. Knowledge, when thoroughly acquired, becomes, as it were, part and parcel of the man, and though he may scarcely be aware that he possesses it, he can turn it to account when opportunity offers. It is easily carried about when once acquired, no matter when or where, and costs nothing either for carriage or house room. A very good maxim is put forward by Mr. L. H. Bailey, of the Cornell University, who says that "It is more needful to learn first to think correctly than to perform correctly; for all accurate labour is the child of accurate thought." In other words the head must direct the hand, and better results must surely follow than when labour is merely mechanical.

There are several burning questions in connection with the dissemination of horticultural teaching amongst the community. The question has been put forward whether all men receiving horticultural instruction at the hands of county councils or others are to be made gardeners. There is no need for such a supposition. Whether they take to horticultural pursuits on their own account or as the servants of others, surely there is room for them so long as foreign produce floods our markets and which can be produced of equally good quality in this country, as far as soil and climate are concerned. The presence of the lady gardener is another source of vexation in some quarters; but she is hardly likely to offer any serious competition in the labour market generally, being unfitted by nature for undertaking duties that can often with difficulty be carried out by the strong hand of the sterner sex. There are, doubtless,

openings in the country that she could fill with propriety to herself and her employer, openings where the emoluments offered would be no temptation to any energetic and well qualified gardener. On the other hand, there are many nurserymen and florists who could turn their daughters to useful account in the management of some branch or department of their business. Moreover, women are often called upon to manage a business on their own account. In the United States many floral establishments are managed by women. There is no lack of opportunity in this country, unfortunately, when the husband dies, leaving it may be a widow whose family is young. In such cases the advantage of a good horticultural training would serve the widow in good stead, enabling her it might be to carry on the establishment, which otherwise might, perforce, have to be given up.

We do not advocate a cry for more gardeners, knowing as we do the congested condition of the profession; but all the same we consider there is need for progress and advancement all along the line so that our countrymen may continue to hold their own not only at home but all over the world where competition demands that the gardener should be well abreast of the times. This striving to be in the front rank should be the duty of every gardener, and, in so attending to his own duty, he is also attending to the duty imposed upon him in patriotism to his country and nation. Not every branch of gardening is equally well attended to in this country. For instance, notwithstanding the agitation for an extension of fruit culture, it is well known that some people undertake the work who have no knowledge, practical or scientific, of the requirements of the case. Indeed, we are informed that it is very difficult to lay hands on young gardeners capable of undertaking the management of a fruit farm or garden. The question of manures and fertilisers and their proper application offers another burning question that must needs be followed up with energy, both in the matter of scientific teaching and practical demonstration. It is no longer sufficient to know that the ashes of sundry specified plants consist of so many elements, in certain percentages. Good cultivators should be able to ascertain the relative fertility of the soil, and the capabilities of particular crops for collecting their requirements from the soil, so that in applying fertilisers they may be able to do so economically. That gardeners and others are beginning to interest themselves in these and similar questions is a pleasing sign of the times.

The Cotton Crop of Egypt has doubled under British rule, amounting now to 500,000,000 lbs. annually.

Daffodil Prizes for Spring.—Since the schedule of arrangements was issued by the Royal Horticultural Society, Messrs. Barr & Sons, King Street, Covent Garden, have offered a Silver Cup for Daffodils, to be competed for at the meeting of the society in the Drill Hall, James Street, Victoria Street, Westminster, on Tuesday the 12th April. The Cup has been designed by Mr. H. G. Moon and is offered as the first prize for a collection of not less than forty varieties of cut Daffodils, and including varieties belonging to the three sections—Magni-coronati, Medio-coronati, and Parvi-coronati (Polyanthus excluded). Bottles will be provided by the society, and not more than three bottles of any one sort may be staged. Correct naming will be taken into account as well as elegance of arrangement. The society offers a Silver Flora Medal and a money prize for the second best exhibit. Notice of entry should be addressed to the Secretary, R.H.S., 117, Victoria Street, S.W.

Cotton Plantations of twelve different colours may be seen in Peru.

Holland Exports Annually bulbs to the value of three-quarters of a million pounds sterling, of which £25,000 worth go to the United States.

Royal Horticultural Society.—The next fruit and floral meeting of the Royal Horticultural Society will be held on Tuesday, March 22nd, in the Drill Hall, James Street, Victoria Street, Westminster, 1 to 5 p.m. A lecture on "Soils" will be given by Mr. J. J. Willis at 3 o'clock.

National Chrysanthemum Society.—The adjourned annual general meeting of members will take place at Anderton's Hotel, Fleet Street, E.C., on Monday, March 21st next, at 6 o'clock in the evening:—To receive the committee's revised statement of accounts, together with an estimate of receipts and expenses for the current year; to elect a president, vice-presidents, officers, and committee for the year ensuing; to consider certain amendments to the rules; and to transact such business as pertains to the annual general meeting. The attendance of all members is particularly requested.

The National Auricula and Primula Society (*Southern Section*) has just sent out its twenty-first annual report, as usual, in neat pamphlet form. During 1897 the receipts have been £87 17s. 3d., and the expenses £71 2s. 6d. The treasurer and secretary, who is Mr. T. E. Henwood, Auricula Villa, 16, Hamilton Road, Reading, will thus have a balance of £16 14s. 9d. to carry forward. The show held by the society in connection with the R.H.S. at the Westminster Drill Hall on April 13th last was a complete success, and another one on the same lines and at the same place is, therefore, fixed for April 26th next. We hope it will turn out all that could be wished. The winners in all the classes at the 1897 show, together with the varieties they showed, are given, and the latter feature should be valuable for reference and information to intending exhibitors who may be in need of such a guide. The list of last year's subscribers is also given. We hope to see a substantial increase this year.

Tunbridge Wells Gardeners had, on the 22nd ult., the pleasure of listening to an admirable lecture on "Cyclamen" from Mr. James Martin, of Messrs. Sutton & Sons, of Reading. Mr. Martin is so well known as an authority on Cyclamen, that anything he has to say upon the subject is sure of rapt attention and a good audience. It was therefore not surprising that on this occasion the attendance was large and enthusiastic. In the course of his remarks Mr. Martin traced the introduction and development of the Persian Cyclamen from the year 1730, and exhibited some blooms of the oldest forms obtainable, to illustrate the progress made by the flower under cultivation. Mr. Martin also gave minute details concerning seed propagation and the life generally of the plant for which he has done so much. He gave point and interest to his remarks by his rich fund of anecdote and apt illustration. Mr. Alderman Cronk (chairman of the Technical Committee) presided, and voiced the general feeling when he commented on the kindness of the Messrs. Sutton in sending Mr. Martin to instruct them.

The Netherlands Horticultural and Botanical Society.—This society, which has for its objects the exhibition and recognition by award of noteworthy plants, has just successfully completed its eighth year. In accordance with the custom of former years a catalogue of the work accomplished by the society has been issued printed in Dutch and French. In this catalogue there appear the names of all the plants that have been exhibited, together with the names of the persons or firms showing them, and the date at which they appeared before the committee. The plants shown are either new introductions, home-raised seedlings, or specially good examples of culture. All of these are eligible for award. The awards consist of First-class Certificates, Awards of Merit, Botanical Certificates, Honourable Mention, and *Remerciement*, which being equivalent to our "Vote of thanks" is of little value. Plants which have obtained any of these awards are placed together, whilst in another column appears those subjects which the committee desires to see again, amongst which, by the way, we see the grand *Deutzia Lemoinei*.

The Garden of Love.—They were talking of figures of speech. "Have you ever noticed," said one, "how fond people are of vegetable metaphors when they are dealing with a woman? Her cheeks are 'Roses,' her lips are 'Cherry,' her hands are always 'Lily' hands, her mouth is a 'Rose-bud,' her complexion is like a 'Peach,' and her breath is fragrant of 'Honey-suckle.'" "You have forgotten one," said the cynic. "What's that?" "Her tongue—it is a 'Scarlet Runner.'"—*Pick-Me-Up*.

Mr. Robert Brown, who has been for some years foreman to Mr. Mackinnon at Terregles, and Ayton Castle Gardens, has been appointed gardener to Sir Emilius Laurie, Bart., of Maxwelltown House, Dumfries. Mr. Brown has had an exceedingly good training in some of the best places in England and Scotland, and although comparatively a young man, he is an accomplished practitioner in all departments connected with horticulture. Mr. Brown will no doubt prove a worthy successor to the very able men who have conducted gardening operations at Maxwelltown House for so many years. He enters on his duties early in April.

Ealing and District Gardeners' Society.—On the 8th instant, the president, J. Harris, Esq., F.R.H.S., in the chair, there was a very good meeting of this society. The occasion was a paper by Mr. F. Read, on "The Gardener and his Work," a subject very fertile in suggestion, and one which may be treated in a variety of ways. Mr. Read took rather a philosophic than a practical mood, quoting old saws and treating the gardener generally, rather than specifically, as he is most accustomed to. Mr. Read, however, thought the gardener was often in the same position as a tradesman—he embraced too many occupations, sometimes even saving his own seed and propagating his own trees. Mr. Read and the president received hearty votes of thanks, the latter assuring the members that he was greatly interested in the society and its work.

Epping Forest.—The Epping Forest Committee made its annual report to the Court of Common Council on the 10th inst. The report referred to the judicious thinning of trees and undergrowth which had been carried on in some parts of the Forest, and stated that other parts were in need of similar treatment. Arrangements were in progress whereby the people of Ilford would obtain access to the eastern side of Wanstead Park by a new roadway and bridges. A large ornamental pond that had been made at Leytonstone cost £1,228, of which sum the corporation had voted £750. The receipts of the committee for the year amounted to £6,832, inclusive of £4,000 from the grain duty. The expenses of maintenance and management came to £237 in excess of the receipts, and amounted to £7,069. The estimated expenses for this year were £5,600, and the estimated income £1,600. The Court adopted the report of the committee, and agreed to place £4,000 to the credit of the Forest for the expenses of the current year.

The National Carnation and Picotee Society (*Southern Section*).—The twenty-first annual report of this section of the National Carnation and Picotee Society for 1897 lies before us. The report of the committee congratulates the society upon its continued prosperity. No fewer than 78 new members have joined its ranks during the year, and the interest displayed in the Carnation and Picotee seems in no danger of abatement. This progress is in a great measure due to the untiring energy and generosity of the president, Martin R. Smith, Esq. Amongst other things he contributed £19 7s. in special prizes last year. The total receipts for the year, inclusive of a balance from 1896 of £238 rs. 3d., have been £493 14s. 9d. The expenses have been £284 17s. 11½d., of which a sum of £132 9s. 6d. has been distributed in prize money. A balance of £208 16s. 9½d. is thus carried forward to 1898. The exhibition for 1898 will be held at the Crystal Palace on Wednesday, July 20th. The directors of the Crystal Palace have promised £50 towards the prizes. The names of the winners, and the varieties shown in each class at the 1897 exhibition is appended. The hon. secretary and treasurer of the society is Mr. T. E. Henwood, Auricula Villa, 16, Hamilton Road, Reading.

The Largest *Rhododendron Catawbiense* is probably the plant at Balynie, Scotland, according to the defunct *Garden and Forest*. It is 20 ft. in height, 172 ft. in circumference, and 100 years of age—a grand specimen altogether.

Syndical Chamber of Belgian Horticulturists.—At the monthly meeting of this society on the 6th inst., in the Casino, Ghent, Certificates of Merit were awarded to *Didymospermum porphyrocarpum*, *Phoenix histrix* and *Anthurium rothschildianum excelsior* (with unanimity) all presented by M. L. De Smet; to *Azalea Madame Louise Cuvelier*, shown by MM. Haerens frères; to *Vriesia Rex*, shown by M. L. Poelman-Maenhout; to *Cymbidium grandiflorum var. punctatum*, shown by MM. Versypt frères et soeurs; to *Aechmea pulchella*, presented by MM. Duriez frères; and to *Selaginella emmelliana aurea*, shown by M. Szewezik. A few other certificates were awarded for flowering and culture, and some Honourable Mentions made.

The following curious mode of planting Apple trees I cull from Chambers' *Edinburgh Journal*, dated February 10th, 1844, which may prove of interest to the many readers of your valuable paper:—"New Mode of Planting Apple Trees: A horticulturist in Bohemia has a beautiful plantation of the best Apple trees, which have neither sprung from seeds nor grafting. His plan is to take shoots from the choicest sorts, insert them in a *Potato* and plunge both into the ground, having put an inch or two of the shoot above the surface. The *Potato* nourishes the shoot whilst it pushes out roots, and the shoot gradually springs up and becomes a beautiful tree bearing the best fruit without requiring to be grafted.—*Canada Newspaper*." It would be interesting to know if any of your readers have heard of such a thing.—*D. W. Mitchell, Edinburgh, 12/3/98.*

Fatal Fall from a Tree.—A shocking accident occurred last Thursday afternoon in the yard attached to the board school in Bolingbroke Road, Bridge Road West, Battersea. A man named Robt. Batchelor, aged 60, of 16, Thibet Street, about half-past twelve was engaged in lopping a tree. While some 25 ft. up, he slipped and fell to the ground. He was picked up and immediately taken to the Bolingbroke Hospital. On examination it was found that his skull was smashed. In spite of the attention of Dr. Lyster, the superintendent of the hospital, the poor fellow died at seven o'clock in the evening. Batchelor was in the employ of Mr. Neal, nurseryman, of Trinity road, for whom he has worked many years. In these days of "Myticuttahs," &c., surely men's lives should not be risked in attempting to prune trees in the old fashioned way!!!

The Beginnings of Plants.—On Tuesday, the 1st inst., Professor Ray Lankester, reached that highly interesting point in his lectures on the "Simplest Living Things" where plants and animals divide. The real difference, he said, is based upon what they are able to eat. The true animal must have the food made up for him into albumens, sugars, starches, etc., all of which are necessary to his existence, although the crude elements from which these are composed are useless to him. Plants, on the other hand, can extract the carbon from carbon dioxide by means of their chlorophyll and the action of light, and from the various salts which are taken up in solution through the root hairs, they can supply themselves with the elements of food they need. Some plants can even, by the aid of certain fungi parasitic upon them, take in free nitrogen. Some plants seem to have assumed an intermediate form—a sort of compromise between the strictly animal and strictly vegetable kingdom. The *Euglena*, for instance, had a mouth like an animal, and yet had the chlorophyll corpuscles which would cause it to be classed as a plant. Among the flagellata or "whip swimmers" there were, continued the Professor, several which would be classed as animals which have chlorophyll corpuscles. This was, therefore, one reason why it was believed that the vegetable kingdom first found its origin among the "flagellata." Broadly speaking, one might say that if in the beginning a group of flagellata joined themselves end to end so as to form a thread they turned into a plant, whereas if they followed more complex courses and joined together in more elaborate structures and households, they became animals.

A Blotter and Diary for a Postcard.—The Anglo-Continental Guano Works have issued a very neat and handy blotter and diary for 1898, in strong, crimson and gold, board covers, which we are requested to announce will be sent free to any of our readers who will forward a postcard to "30, Mark Lane, E.C." This diary is not a toy, but a really serviceable article.

The Mora Nut.—At a meeting of the Linnean Society of London, on March 3rd, Mr. Thomas Christy, F.L.S., exhibited specimens of the Mora Nut of British Guiana (*Dimorphandra Mora*, Schomb.), of which some had been lately introduced into London by Colonial brokers as the Kola Nut (*Cola acuminata*). It appeared, however, on analysis that the former contains no Caffeine, a product for which the latter is of definite commercial value. It remained to be ascertained whether the Mora Nut has any economic value.

Devon and Exeter Gardeners turned up in strong force at the Exeter Guild Hall on the evening of Monday 11th inst., to hear the lecture on "Variety in the Flower Garden" delivered by their old fellow-countyman, Mr. J. W. Moorman, now superintendent of Victoria Park, London, E.C. Mr. Moorman dealt in an able manner with the various phases of modern decorative gardening. The main object in view should be to secure as great a variety, and as complete a succession, as possible. A mere flash of summer beauty should not be striven for, but continuity of effect. Fashion governed in the flower garden, and fashions were continually on the change. From 1870 to 1885 carpet bedding was at the zenith of its popularity, but nowadays it was in disrepute. Despite this, he thought a bed or two treated thus might be in every garden of any size. During the last summer he made a special feature of a scroll bed in which a medallion, crown, and the letters V.R.I. were holdly brought out, and he found that it proved a lively source of attraction to many. Speaking of the numerous varieties of Begonias and Fuchsias, he extolled these plants highly for their beauty and usefulness, and mentioned numbers of other plants that might be turned to good account, and which would add not only the charm of beauty, but the charm of variety to the garden. Moderation and simplicity were the chief ends that should be borne in mind in the arrangement. Overcrowding must be strictly avoided. Mr. Moorman paid special attention to the effect obtained by a free distribution of spring-flowering bulbs amongst the grass, which are such a conspicuous success in the London parks.

Do Pot-plants in Rooms Disseminate Fever?—The *Florists' Exchange* has taken a commendable action in endeavouring to answer this question. A report was circulated that pot-plants in dwelling rooms do assist the spread of scarlet fever, and as a consequence, the principal of a public school ordered all such plants to be removed from the school. The *Exchange* sought the advice of Mr. J. M. W. Kitchen, M.D., whose reply, in substance, was as follows:—That he doubted the accuracy of the report, and that if the pedagogue in question believed that plants were an immediate cause of scarlet fever, he was not fit for his post. If, on the other hand, these plants had been in direct contact with fever cases, his action was right and commendable. Dr. Kitchen further stated as a matter of common knowledge that the presence of a limited number of plants in a room could have but a very slight influence on the health of the human occupants. On an average they cleansed the air of deleterious gases, excreted by human and other animals. Malarial germs might be propagated in the soil in which plants were grown, and he would not care to live in close proximity to a large number of plants grown continuously in a high temperature and in a soil largely composed of decomposing vegetable matter. He would, moreover, not advocate the close connection with a dwelling of a hothouse conservatory. A cool-house conservatory was not objectionable from a sanitary point of view. It might be a wise precaution to use purely chemical compounds of nitrogen, phosphoric acid, and potash as manures for such plants. He concluded by saying that where there was one point against house plants in connection with health, there were, relatively, hundreds in favour of their employment. It would be a good thing if all the schoolhouses in the land contained growing plants.

The Chestnut Tree in the gardens of the Tuilleries, Paris, so remarkable for its exceptional precocity in flowering on the 20th March, has just died. The tree formerly enjoyed great popularity amongst the Buonapartists, for from it they conceived the idea of celebrating the anniversary of the King of Rome.

Children's Flower Fund.—Two years ago it occurred to a few friends residing in Oxford that boxes of wild flowers sent regularly to the London schools would be acceptable to both teachers and children, and the experiment of sending a limited number was made. This experiment met with so much success that last year a small fund was started to defray the expenses of postage, etc., and the work was extended to twenty-nine schools, about 274 boxes of flowers being sent to them during the spring and summer. Many letters have been received from teachers, speaking of the value of these flowers in various botany, drawing, and object lessons. There are 973 public elementary schools in the metropolis, and twenty-nine is but a small percentage of these. With a view to the further development of the good cause, help is solicited. The president of the movement is Mr. F. G. J. Reay, and the honorary secretary, Miss M. S. Beard. Subscriptions in aid may be addressed to the latter, 36, Ridgemount Gardens.

Scottish Horticultural Association.—The "majority" supper of this association mentioned by us some time ago, was held in the Windsor Hotel, Edinburgh, on the 8th instant. The chair was taken by the president, Mr. M. Todd, and Mr. Malcolm Dunn and Mr. R. W. E. Murray acted as croupiers. They were supported by Bailie Hay, Bailie Mackenzie, Messrs. W. S. Melville, Dundee; Robertson Munro, Glasgow; James Grieve, D. P. Laird, W. McKinnon, A. Milne, D. T. Fish, Loney, Robert Laird, Secretary, and others. The usual loyal toasts were proposed from the chair, after which Mr. R. Laird proposed the "Navy, Army and Reserve," Mr. Mackenzie proposed the "Lord Provost and Magistrates," whom he considered a body of intelligent, patriotic and far-seeing men. Bailie Hay replied, stating that they had done much to cultivate a taste for flowers, and the taste was growing. The Corporation were gratified that their services were appreciated. Later on, he proposed the toast of the evening, namely, "The Scottish Horticultural Association." Twenty-one years ago the association began in a very small way by holding meetings in the Bible Society's rooms, where they read and discussed matters pertaining to horticulture. It was all the more gratifying to know that after all these years they had lost none of their vigour, but were strong and healthy. They had been most successful, and he felt sure that the citizens of Edinburgh owed them a deep debt of gratitude for the privilege of visiting their Chrysanthemum show, which was the admiration of all classes of people. He hoped the Corporation would always be in touch with others, and not stint their donations to that and similar useful associations. He hoped the Corporation would give them every facility and assistance to further their success and progress. He considered that the association had done much good, and was capable of doing more in the future than it had done in the past. They had reason to take courage and endeavour to make the society second to none in the world. The chairman in reply, said they had done their best to deserve success, which was insured by their efforts being backed up by the public. There had been no retrogression; while they had added to their membership and increased their usefulness. Since the establishment of the Chrysanthemum show, they had gone on with unvarying success, one success leading to another. They were grateful for the encouragement they had received from the Corporation of Edinburgh. The public had come to look upon the Chrysanthemum show as one of the most attractive entertainments of the year in the city. They had been led to strengthen and widen their sphere of action by bringing together the very best in the way of Chrysanthemums and other winter floral products, which culminated at their last show. They had wisely and generously devoted part of their abundance to works of charity. Mr. D. P. Laird then proposed "Gardeners and Gardening," to which Mr. M. Dunn responded. Mr. A. Johnstone proposed the "Nursery and Seed Trade," to which Mr. A. Milne responded. Bailie Mackenzie proposed "Kindred Societies," to which Mr. W. S. Melville responded. The chairman presented the association with an album of photographs of all the presidents. A most enjoyable evening was spent.

HINTS FOR AMATEURS.

THE ANNUAL POTTING.

THE shifting of plants from one pot to another is practised during every month in the year in the larger and busier establishments, for, with the multitudinous requirements of such places, the preparations for supplying them can never be laid aside entirely, although there are seasons when the tension may be somewhat relaxed. In the face of this, the phrase "annual potting" may require a little explanation. In large nurseries where the raising of stock is the main business, a plant is potted when it wants it with comparatively little regard to the time of the year, although matters are so well managed as to the striking of cuttings and raising of seedlings, that the most favourable seasons of the year are taken the fullest advantage of. In private establishments, whether large or small, a different system prevails. The object aimed at in a private garden is, of course, different to the nurserymen's, for particular care and attention have to be given to old plants and there are indeed many which may be called "permanent" plants on the place, in addition to the young stock which is being reared to supply smaller plants for furnishing purposes, as well as to fill up gaps, should these occur, among the old ones.

Under this system, the usual custom is to give all the plants a thorough overhauling once a year, and this is what is meant by the "annual potting." True, in every case it does not mean a shift forward into more roomy quarters for each plant. On the contrary, each plant receives treatment according to its special condition, and this of course varies with the plant. Thus, some vigorous subjects will have made so much roots that the outside of the balls next to the pots is nothing but a network of thick fleshy roots. In such cases it becomes almost impossible to reduce the old balls much, for to attempt it would mean certain destruction to a large proportion of these roots; the plants would receive a correspondingly severe check and no improvement; rather the opposite would have been effected. In such cases, the only thing possible, if it is decided to give it a shift, is to give a good one, and not to attempt to interfere with the ball beyond loosening gently the tips of the roots. The alternative policy is to leave the plant as it is, and to endeavour to make up for the lack of nutritive soil by feeding with manures. Some plants, such as Palms, for instance, answer admirably to this treatment.

Then, again, we may come across a plant which seems to have had a bad season last year. We turn it out of its pot and find that it has very few roots, the greater part of them having rotted off in the sour sodden soil, and possibly it contained worms, with which the pot is filled. The only thing to do with such a subject is to transfer it to a much smaller pot, after removing all the old soil and cutting away any roots that are injured or appear to be in the first stages of rotteness. In more confined quarters, and in new, sweet soil the plant will have every chance to develop its root system, and to make up for lost time, whilst another few months in the old quarters would have finished it off completely.

These two plants represent the extremes, but in any ordinary collection they are sure to be seen in all intermediate stages.

We may perhaps mention another set of typical conditions as one that is very frequently met with. A plant on being turned out of its pot shows that the drainage is in good working order; and the lower strata of soil sweet and good, whilst the roots are only just beginning to make their appearance round the sides of the ball. Such a plant does not stand in need of a shift, but a sort of compromise may be decided on, viz., a top-dressing. To give this, the plant should be returned carefully to its pot in such a way that the drainage is not disturbed at all. This done, remove with a pointed stick, keeping a sharp look out meanwhile for any roots, the soil to a depth of 2 in. or 3 in. according to the size of the pot. The vacancy thus caused may be filled up with fresh soil, which should be worked all round the spread-out roots which have been laid bare during the removal of the old soil.

Top-dressing does not find general favour with cultivators who frequently change their young men assistants, because the top-dressing does not give an

idea of the true state of the plant for water when the pot is tapped in the usual way: the top-dressing is invariably drier than the lower layers of the old soil, and the plant is consequently in danger of being consistently over-watered by a young man who does not know that it has been only top-dressed and not potted.

These reasons are certainly valid enough in such cases, but they do not apply to the average amateur who looks after his plants himself, and knows what has been done, and, consequently, the true inwardness of affairs. It may be well to give the hint, however, to test the plants as to their need for water by their weight, and not by the hollow sound emitted from the pot of a dry plant when the pot is "tapped" or "rung" in the usual manner.

Shall We Pot Firmly or Not?—There is nothing that has caused brisker discussions than this, and even now the controversial spirit is at large. Some growers eschew the rammer as the devil is said to hate holy water, whilst others will ram anything and everything, no matter what it is, or what its condition may be. The latter policy is obviously a mistake when we come to take a closer view of the effects on plant life of ramming the soil, whilst the former system is too much that of an extremist to find favour with an enlightened cultivator.

The exact amount of firmness imparted to the soil, whether by means of the rammer or of the fingers, must depend not only upon the condition of the soil, whether light, heavy, damp, or dry, but also the plant operated on. We may lay down the broad general rule, however, that when the soil is of medium texture, and not too damp, a vigorously growing plant may, with advantage, have the rammer used pretty freely upon the soil in which it is to grow. Firm potting tends to check over-luxuriant growth, and to promote the production of sturdy short-jointed shoots, and leaves of firm texture, thus keeping the proportions of the plant within due bounds, and thereby increasing its usefulness for decorative purpose whether in the conservatory or dwelling house.

On the other hand, naturally, weak growing subjects, or those that are in a weak condition through ill-health, should not be potted too firmly, for, so far from requiring a check put upon their growth, they must have every inducement given them to grow. In every case, therefore, such plants should be potted rather loosely, no more firmness being given to the soil than can be imparted with a moderate pressure of the operator's fingers; indeed, for plants that are apparently at the last gasp, it is often good practice to lay them loosely in a bed of cocoanut fibre refuse in a warm house. Under such circumstances they will often come round, and the lives of valuable plants will be thus spared. Of course, after a nice few roots have been made, the plants may be removed from the cocoanut fibre and potted up in ordinary soil.

We have said enough to show that in going through a collection of stove plants, there is a wide field wherein the operator must exercise his discretion. The broad general rules that we have given are the only ones which can safely be laid down, and they must be applied according to the particular set of circumstances which have to be dealt with.

The present time is a most favourable one to make a start with the potting of the plants, attention being first of all paid to the occupants of the stove and the warmer houses. We thus take advantage of the increase in light, whilst the worst part of the job is got through before the sun becomes so powerful as to try the shifted plants to any serious extent. With the cold winds that have been prevalent of late, it will not be advisable to take the plants out of the warm house to the potting shed, but to rig up a potting-bench within the stove, and complete the work there. A capital potting-bench may be improvised by knocking one side out of a large shallow box, and placing this on the stage in the required position. The three sides remaining serve to keep the soil from spilling about, and economises the space.—*Rex*.

Potato Early Rose.—American Potatoes, do not, as a rule, succeed well in this country; but a few of them gain a footing. Early Rose is the oldest of these and is still planted at many places. Beauty of Hebron is of more recent introduction, and enjoys a considerable amount of favour.

Correspondence.

Questions asked by amateurs on any subject pertaining to gardens or gardening will be answered on this page. Anyone may give additional or more explanatory answers to questions that have already appeared. Those who desire their communications to appear on this page should write "Amateurs' Page" on the top of their letters.

Propagating Heliotropes.—*Rob.*: The reason why your plants do not make haste to throw up side shoots is first of all because you have not taken off the tops, consequently the efforts of growth made by the plants are all in an upward direction. Secondly, you are not giving them sufficient heat. Remove the plants to a shelf in a warm house, and take off the tops and put them in at once as cuttings—also in heat. The old plants will not be long in throwing out side shoots which may be taken off for cuttings as soon as they get long enough. You will have to hurry your plants up or you will never get a sufficient stock by bedding-out time.

Window Facing North.—*T. T.*: It will be of little use attempting to grow flowering plants in a north window. Of course, plants that were already in flower might be removed to it for a time, but it would not suit them as a permanent home. Ferns and greenhouse Selaginellas would do very well, also such foliage plants as *Aralia Sieboldii*, the elegant *Araucaria excelsa*, and the hardier Palms, such as *Kentia fosteriana*, or *K. belmoreana*.

Back Wall of Vinery.—I have at present nothing growing upon the back wall of my vinery. Would it be possible to utilise this space for anything? I have been advised by a friend to devote it to Figs, but they are no favourite of mine, and I would rather have something else—a decorative plant for preference.—*Stolon*.

Hoya carnosus would do fairly well upon the wall, unless the shade from the Vines is too great. *Asparagus plumosus* will, however, do even better. It would grow quickly enough, and would soon cover the wall if you procured strong plants to start with. The fronds, moreover, would come in handily for cutting. Why not try the *Aparagus*?

Shading for Greenhouse.—*Leonard E.*: If you have plants in flower such as *Primulas*, *Cinerarias*, and bulbs of various kinds, you will do well to fix the shading at once, for the bright sunlight will shorten the lives of your flowers to a great extent, and this should be avoided.

Fumigating Freesias.—*Leonard E.*: You have been somewhat negligent in allowing your plants to get so badly infested with greenfly before taking remedial measures. Certainly the plants may be smoked or vapourised whilst they are in bloom, but it would have been better gardening to have seen to this before the flowers made their appearance. You must exercise great caution in giving the smoke or vapour, and it should not be too strong; indeed, it is preferable to give three weak doses rather than one strong one.

Fertilising Peaches.—I have a good sized Peach house in which the trees are coming into bloom. A friend of mine has advised me to put a hive of bees into the house and thus assure the proper fertilisation of the flowers without the necessity of the lengthy and tedious operation of going over and brushing each flower separately. Would you also advise the use of the bees in this way?—*P. IV.*

If your friend is willing to lend you a hive of bees for the purpose, or if you can find another friend equally accommodating and foolish, you may act as you suggest by all means; but it is a sad experience for the bees. Poor things! they are lured out of their hive by the warmth and brightness, and in attempting to stretch their wings by a good long flight, dash themselves to death against the glass—it is almost sure to weaken and spoil the hive. If you cannot find somebody else's property to experiment with, don't do it.

Feeding Bees.—*Apiarian.*: Candy is all right for feeding strong stocks, but from the description you give, your stocks are anything but strong, and would be likely to starve to death on the candy. Instead, give them some properly prepared syrup which they will be able to take even if they are at

the last gasp. You may try the candy when they are stronger.

Cabbages Running to Seed.—G. T.: To use a technical phrase which is well understood amongst gardeners, the cabbages are "bolting." Pull them out, they are of no use for cutting as they will never heart in. Your best plan will be to get some early spring raised plants and fill in the gaps. They will turn in very soon after the autumn plants, and will thus form a good succession.

CYCLAMENS AT READING.

FOR months past three span-roofed houses have been gay with a profusion of blossom of Cyclamens in the Portland Road Nursery of Messrs. Sutton & Sons, Reading. High-class cultivation upon the best of modern principles enables a grower to get a greater quantity of flowers, extending over a longer period of time from the best strains of Cyclamens than, perhaps, from any other flower. The better he grows them and the more he pulls the flowers, the greater the total quantity obtainable from a given number of plants. Needless to say there is no lack of flowers on the plants at Reading, as the accompanying illustration lent us by Messrs.

flower is different, the form being normal to the genus. Size leaves nothing to be desired for any ordinary purpose. From this we get a distinct and pleasing variation in Giant Crimson and White, the base being the dark portion of the flower according to a characteristic that is prevalent in the genus. It would be an innovation and an acquisition to the race if a variety could be obtained having the dark colour confined to the apex of the segments. Possibly this may be realised in the near future, but the basal colour is indeed hard to eliminate without obliterating all colour except white.

The custom of growing Cyclamens in batches of a variety, at Reading, and persistently weeding out the intermediate colours, has the effect of making the varieties distinct and decisive in tone. There is no insensible gradation of one colour running into another. By this means a hatch of seedlings can be calculated to give any required hue by sowing seeds of the variety furnishing it. A pleasing light hue is furnished by Giant Rose, whose flowers are of a uniform soft rose and freely produced. In like manner Giant Purple produces dark purple flowers that develop a considerable amount of blue when fading, after having been open for a considerable time. Whether a blue Cyclamen can ever be raised from this is a question; but the fact remains that the

colour, as in the giant strain. Very free flowering is that named White. Salmon Queen is one of the most distinct and attractive colours that has been raised for many a year, being of a handsome salmon-pink, the salmon being so conspicuous that it can be singled out by the eye at a glance amongst a houseful of many varieties. A giant form of this is being evolved, and, when fixed and obtainable in quantity, it will be another triumph of the cultivator's art. Purple is a very dark variety, and decidedly of that hue indicated by the name. In the matter of fragrance, we often meet with the same peculiarity amongst the improved types as in the wilding. Amongst Crimson, with White Base, we met with individuals in a batch that were distinctly and deliciously scented, while others of the same variety, and grown under the same conditions precisely, were altogether scentless as far as we could discern. The stage of development of the flower and the degree of temperature may have some influence upon the scent; but all the same, there are individuals in the batch that betray no evidence of this desirable quality. Cherry Red presents the same dark but brightly coloured flowers as in the giant strain. All the above and other colours may be obtained in mixture, which many growers prefer, who like as much variety as possible in the small space at their

HOUSE OF CYCLAMENS AT READING.

Sutton will show. "Thick as autumnal leaves that strew the brooks in Vallambrosa" is hardly sufficiently expressive of the appearance of a houseful of bloom, for the foliage is entirely hidden by the flowers to the eye of the spectator who takes his stand at one end of a house and looks along the benches.

The giant strain is no longer characterised by the paucity of flowers which signalled the race when it first made its appearance, for the flowers are now profusely produced, although, as might be expected, the great size of individual blooms precludes the possibility of numbers being so great as in the old persicum strain. The massive, pure white flowers of Butterfly and the spreading character of the segments continues to make the variety one of the most popular amongst gardeners and growers generally. The dwarf and compact habit of the plant, and the effect produced by a mass of it, places the variety in the front rank as a decorative subject. No staking nor tying are requisite to keep the flowers erect. The contrast between Butterfly and Vulcan is immense, the former being notable for the snowy purity of its flowers, the latter for the intensity of its dark crimson colour. Giant White may be likened to Butterfly in hue, but the form of the

flowers are striking in their way when on the wane. Brilliance is the striking feature of Giant Cherry Red. The great size of the individual flowers, and the freedom with which they are produced, make the varieties of the giant strain indispensable in any well regulated establishment where flowers of beautiful form and colour are always in demand.

What is known as the persicum strain is as replete in colour as the giant types, or even more so, as might be inferred from its being cultivated for a longer period of time. Even here, the improvement upon the wild original is immense, as may be seen from specimens raised annually from the seeds of the wild type recently imported from Palestine. By the way, the hotanists tell us that no Cyclamen grows wild in Persia, and that the plant grown as Cyclamen persicum is really *C. latifolium*. The flowers of this as seen at Reading are characterised by long and narrow segments. In any case, this wild plant is a most interesting illustration of what the cultivator has been able to effect by long continued crossing and selection. Many of the plants are deliciously scented, but not all. Could the characteristic be perpetuated with certainty, the value of Cyclamen flowers would be greatly increased.

The varieties are mostly named according to

command for this particular class of winter flowers. For profusion of bloom, it would be difficult to surpass the persicum strain.

CLIMBING FRENCH BEANS.

THE section of Climbing French Beans is a notable addition to our list of easily grown vegetables. It may be said to bridge over the gap between the dwarf French and the Runner Beans, and is intermediate in character between the two extremes. Thus the habit of the Runner Bean is associated with the earliness of hearing, and the shape and general characters of the pod of the dwarf French varieties.

Of the several sorts which are offered for the choice of the cultivator, Sutton's Tender and True is one of the most conspicuous. The long, prettily-shaped pods are produced along the whole length of the haulm in great abundance, a continuous supply being afforded over a long season. Crops will turn in as early as those of that well-known dwarf form, Canadian Wonder. Tender and True does not lack honours, for it was awarded a First-class Certificate by the R.H.S. in 1891, and in the following year's trials received the high cultural qualification of XXX. Confirmation of its good qualities was again given

by the inspecting committee at Chiswick in August, 1895, when a number of Beans were put to the cultural test. Excelsior was introduced by the Reading firm last year, and marks the highest development in this particular direction. It was highly spoken of in various influential quarters as a heavy and continuous cropper, with pods of splendid flavour. It forces well.

MUSA CAVENDISHII.

I ENCLOSE herewith photograph of a cluster of Bananas (*Musa Cavendishii*) grown here this last season. There were altogether 189 pods on the cluster, and the plant was grown in an ordinary stove. The stove is a lean-to structure, and we grow a row of them along the back. They seem to thrive admirably along with ordinary stove subjects. When shading has to be resorted to during summer, we only apply it half way up from the bottom, thus allowing all the sunshine possible to play upon the Bananas. To keep up a more constant supply of fruit I detach the suckers when ready, and pot them into 12 in. pots, plunge them in bottom heat, and grow them on as rapidly as possible, afterwards transferring the plants into 18 in. pots and keeping them growing till a vacancy occurs in the bed, when they are placed in their fruiting quarters.

Our former practice was to plant the suckers right away in the bed at once, sometimes simply removing the parent plant after the fruit was gathered, and allowing the strongest sucker to take its place. They can be successfully cultivated either way, although the method of growing them to a large size in pots has the advantage of getting through a larger number of plants in a given time. I have at present a fruiting plant, which has evidently been kept too long in the pot before it was planted out; the cluster is much smaller than any I have ever had, although there are 130 pods on the cluster. The fruit stalk is only 3 ft. from the surface of the bed; and I have no doubt but it would have fruited quite as well if it had been allowed to remain in the pot, when it could have been removed to a cooler structure after the pods had commenced to ripen, or utilised as a plant for the drawing-room in the mansion, where it would have been both ornamental and useful.

We grow our plants in rough, fibrous loam and fresh manure, with a liberal addition of coal cinders and lime rubbish to keep the compost open. I have also used tiers of drain pipes at intervals around the plant to allow the heat from the pipes underneath to get more equally about the roots. Surface dressings and frequent supplies of liquid manure are given during the later stages of growth.—*A. D., Dankeith Gardens, Kilmarnock, N.B.*

PLANTS RECENTLY CERTIFICATED.

ON the 8th inst., the undermentioned certificates were awarded by the Royal Horticultural Society.

Orchid Committee.

ODONTOGLOSSUM WILCKEANUM PITTIAE.—This grand natural hybrid has been immensely improved since its cultivation was taken in hand by Messrs. McBean & Sons, Cooksbridge, Lewes, Sussex. A long and vigorous spike carried many flowers of greater size than those carried by the scapes when we first described the plant. The sepals are very broad and heavily blotched with large chocolate areas on a clear yellow ground. The petals are jagged at the edges, and the blotches upon them are smaller. There is a large horseshoe-shaped blotch on the lip. It is the largest and finest of the forms of *O. wilckeanum*, and has for its nearest relative *O. w. Queen and Empress* in Baron Schroder's collection. The owner, H. T. Pitt, Esq. (gardener, Mr. R. Aldous), Rosslyn, Stamford Hill, may well feel proud of it. First-class Certificate.

CATTLEYA MIRANDA. *Nov. hyb.*—The seed parent of this fine *Cattleya* was *C. Trianaei*, and the pollen parent *C. guttata* Prinzii. The soft lilac sepals are shaded with purple, while the petals are splashed with deep purple towards the apex. The lip is intense crimson-purple, the crimson in the throat almost obliterating the orange; the outer face of the tube is lilac. The hybrid is both distinct and handsome. Award of Merit. Messrs. J. Veitch & Sons, Ltd., Chelsea.

DENDROBIUM AINSWORTHII WOODHATCH VAR.

Nov. var.—The flowers of this variety are large, creamy-white, chaste, and very handsome. A large crimson blotch on the lip is slightly rayed at its edges. Award of Merit. T. B. Haywood, Esq. (gardener, Mr. C. J. Salter), Woodhatch Lodge, Reigate.

PHAIUS NORMAN. *Nov. hyb.*—The parentage of this hybrid was *P. sanderianus* and *P. tuberosus*. The sepals and petals of the flowers are of a soft brownish salmon-red. The lip is large, deep purple

MUSA CAVENDISHII.

on the upper half, and furnished with three golden ridges. The side lobes are brown with pale yellow veins. It is a robust grower. First-class Certificate. Messrs. Charlesworth & Co., Heaton, Bradford.

PHAIUS NORMAN ROSEA. *Nov. hyb.*—The sepals and petals in this case are much paler and rosier. The lip is slightly lighter in colour than that of the previous hybrid, though the parents were the same. First-class Certificate. Messrs. Charlesworth & Co.

PHAIUS NORMAN AUREA. *Nov. hyb.*—The sepals and petals in this instance are creamy-yellow externally and tinted with rose on the inner face. The lip is rosy on the upper half and otherwise lighter than the two previous forms. Award of Merit, Messrs. Charlesworth & Co.

DENDROBIUM ASTRAEA SUPERBUM. *Nov. Hyb.*—Though not stated the parents of this hybrid would seem to be *D. superbiens* and *D. wardianum*. The sepals and broader petals are creamy and tipped with deep amethyst purple. The lip is similar in hue, and has a blotch at the base consisting of brown lines. Norman C. Cookson, Esq. (gardener, Mr. Wm. Murray), Oakwood, Wylam-on-Tyne.

ODONTOGLOSSUM NEBULOSUM PARDINUM. *Nov. var.*—The flowers of this magnificent variety are of large size, and heavily blotched with brown for three-fourths of the length of the segments. Award of Merit. Messrs. Hugh Low & Co., Clapton, N.

LAELIOCATTLEYA WARNHAMENSIS. *Nov. hyb.*—This is a beautiful and very striking flower, with orange sepals and darker petals, which are much shaded with carmine overlying orange. The long tube of the lip is similar in colour. The lamina is crimson-carmine. The pseudobulbs are slender, and together with the colour of the flowers recall *L. cinnabarina*. Award of Merit. C. J. Lucas, Esq. (gardener, Mr. G. Duncan), Warnham Court, Horsham.

SPIRANTHES COLORATA MACULATA.—On a tall scape this bears a dense bead of red flowers that are soft rosy-pink internally. The dark olive-green leaves are 6 in. to 8 in. long, and blotched with light green. Botanical Certificate. M. Otto Froebel, Zurich, Switzerland.

Floral Committee.

AMARYLLIS NAVALA.—The plant is dwarf in habit and produces short and wide, campanulate, and well-shaped flowers of great substance. The

segments overlap one another considerably, being of great width, and of a bright salmon-orange. Award of Merit. Messrs. J. Veitch & Sons, Ltd.

AZALEA GRANDIFLORA ALBA.—The flowers of this hybrid variety are of great size and pure white with the exception of a pale lemon blotch at the base of the two upper segments. It will be useful for greenhouse decoration. Award of Merit. The St. George's Nursery Co., Hanwell.

AMARYLLIS PRINCESS OSRA.—Here we have a short and widely funnel-shaped flower of a brilliant crimson-scarlet with a white base and a six-rayed white star running out almost to the apex of the segments. Award of Merit. Captain Holford (gardener, Mr. A. Chapman), Weston Birt, Tetbury, Gloucester.

BRYOPHYLLUM CALYCINUM.—This singular member of the Crassulaceae produces a panicle of pendulous, rather interesting flowers. The inflated subcylindrical calyx is greenish-yellow, while the petals are reddish. The leaves produce buds on the margins by which they may be propagated. Botanical Certificate. Mr. W. Neild, Horticultural College, Holmes Chapel, Cheshire.

ORCHID NOTES & GLEANINGS.

BY THE EDITOR.

Dendrobium Venus.—The parentage of this hybrid is an indication of the beauty of the progeny, which was raised from *D. Falconeri* crossed with *D. nobile*. The cross was made on the 15th May, 1884, and from the sowing made on the 18th July, 1885, 100 plants were raised. One of these at least has found its way to Falkland Park, South Norwood Hill, the residence of Thos. McMeekin, Esq. The plant carried thirty-four of its large and showy flowers, the longest stem being 3 ft. 6 in., thus indicating good treatment on the part of the gardener, Mr. A. Wright. The long sepals and petals are white, and heavily tipped with purple on both surfaces. The broadly ovate, acuminate lip is tipped in the same way and furnished with a large, circular crimson blotch on the disc.

A Blue Cattleya Trianaei. *Nov. var.*—The sepals, and triangular, crisped petals of a variety that has been flowering for a month past in the collection of Mr. Thomas Rochford, Turnford Hall Nurseries, near Broxbourne, Herts, are pure white thus affording a fine contrast with the beautifully distinct lip. The lamina and the side lobes at present are lilac-blue, this colour being separated from the orange blotch in the throat by a transverse deep blue band, of undulated outline, but well defined on both edges. When the flower first expanded the lip was much darker. In any case it is a chaste, beautiful and distinct variety. The last blue *Cattleya* spoken of was a variety of *C. Mossiae*.

Dendrobium nobile Segerae.—The sepals and petals of this pretty variety are pure white, but faintly tipped with purple at times. There is generally a little more colour on the back of the sepals than elsewhere. The lip is creamy-white, with a dark purple blotch on the disc. The variety was first described about four years ago. About three years ago Mr. A. Wright, The Gardens, Falkland Park, South Norwood Hill, obtained a small piece of an old stem and managed to coax this into life, and the piece is now flowering on the second young growths made.

Odontoglossum crispum Baroness Schroder. *Nov. var.*—A most remarkable *Odontoglossum* was exhibited under this name by Baron Schroder (gardener, Mr. H. Ballantine), The Dell, Egbam, at the meeting of the Royal Horticultural Society on the 8th inst. The plant was a very small one carrying two flowers of beautiful round shape, and very highly coloured. Both sepals and petals were of a dark violet-purple except at the margins, the colouring being lighter and darker in places giving the impression of blotches, which almost entirely hide the white ground. Many remarks were made concerning the variety, and four figures were mentioned as the value of it.

The soil and climate of Scotland are well adapted for the profitable cultivation of Gooseberries, Strawberries, Black and Red Currants, and Raspberries.

CHINESE PRIMULAS AT SWANLEY.

AMONGST the various flowers which the Messrs. Cannell have taken under their wing, Chinese Primulas have been one of the most conspicuous successes. Year after year of patient labour, and skilful intercrossing and selection of superior forms has been necessary before the flower has been able to reach the height of excellence to which it has now attained. The man in the street can have but a very faint idea when looking at the highly developed modern Primula of the vast amount of work that is there represented. He may be pardoned, perhaps, for being content to take the plants upon their merits, for they are certainly beautiful enough, but the consideration that each of these highly bred Primulas is the outcome of a long line of ancestry covering a considerable range of years, through which the race has been guided by the hand of man, makes each plant vastly more interesting. In this important work no one has played a more brilliant part than the Messrs. Cannell, and we are fain to acknowledge the indebtedness of the modern gardener to them.

The huge glass establishment at Swanley, supplemented by the smaller glass department at the seed farm of the firm at Eynsford offers to the Primula a large share of its protected area, for house after house is filled with plants which, in their zenith of floral excellence, constitute an effect which, from a spectacular point of view alone, is magnificent.

As our visit to the nurseries did not take place until the beginning of the present month we were too late to see the plants in the first flush of their virgin glory, but we reaped the compensating advantage of being able to judge better of the ultimate habit and general characteristics of the several varieties. This was important, however, because a large number of the Swanley varieties are of pyramidal habit of growth when fully developed, and thus it is not until the more mature stages of their existence that their full beauty stands revealed.

For many, many years now the objective of the florist has been to produce a stubby dwarf plant with large umbels of fine flowers, and the more this dwarfness was apparent the better the strain in his estimation. The result was a plant handsome enough from his point of view, but almost worthless when put to the severe utilitarian test for supplying cut flowers. Something to cut, and something that will stand for a fair length of time when cut was what was wanted, and in his attempts to produce this Mr. Cannell gave us the well-known "Lady" Primula, than which there has been no more startling or complete break away from preconceived notions, and precedent during the century. The Lady Primula is all that the other type was not. Instead of a plant about 8 in. in height, we get one about 2 ft., which throws umbel after umbel of stellate flowers, one above the other, and the leaves, until we have a towering mass of flowers and foliage that is truly grand.

Mr. Robert Cannell has taken "The Lady" under his own wing, as it were, at Eynsford, and has used it extensively for the purpose of working up a strain of plants which shall have the larger flowers and varied colours of the dwarf type, and the distinctive growth and pyramidal habit of the Lady. In this laudable enterprise he has nobly succeeded, although we look for even more remarkable results in the near future.

In the variety Lady Emily Hart Dyke, of which the kindness of the Messrs. Cannell enables us to give our readers an illustration we have one of the most valuable of the new race—for so we may term it. The habit is somewhat shorter and rather more compact than in the Lady, and the flower stems and leaf petioles instead of being black are pink. The pure white flowers, too, are larger and rounder, but "The Lady" blood is distinctly evident. This variety will be welcomed by all lovers of the Chinese Primula.

The "Purple Lady" is the counterpart of the type of the race with regard to habit, and the characteristic black stems may also be noted. "Another dip or two," said Mr. H. Cannell, senr., as we were admiring this form, "and we'll have a scarlet, and a crimson." Without doubt this will be the case, for we noticed that the shade of purple varied considerably on the plants, thereby giving evidence that there were one or two more colour developments ready to make their appearance in the next generation. Once we have scarlet and crimson-flowered varieties there

will be no class of plants more largely deserving of extensive recognition than the Lady strain of Primulas. Probably, too, we shall be presented a little later on with the much sought after "blue" and then the triumph will be complete.

Lady Marcham is yet another variety that we must not forget to mention. It closely resembles Lady Emily Hart Dyke in habit, but the white flowers are occasionally blotched and mottled with cerise.

In addition to the Lady race, the ordinary dwarf varieties are grown in great numbers at both Swanley and Eynsford, and a fine show they make. Notwithstanding the fact that pollination is commenced soon after the first flowers have expanded, and is continued without cessation as the subsequent flowers continue to open, and until each plant is loaded up to the full extent of its capability with seed pods, there always appears to be plenty of bloom, and such bloom too. Said Mr. Cannell to us, as we were passing through, "we make no pretence

whittle." "Another dip," if we may use Mr. Cannell's phrase, and this margin of white will have disappeared, and we shall have a grand yellow form.

In conclusion, we may well bestow a word of praise upon the cultivation, to which every individual plant with its sturdy foliage and full complement of brilliantly coloured flowers, bore eloquent testimony]

THE SPARROW.

AT our Mutual Improvement Society meeting a few weeks ago, the discussion, as that of all craftsmen does at times, turned upon the subject of this note. It was concerning his doings or supposed doings to the buds of the Red Currants that we expressed ourselves. Some of us spoke with repressed feelings; one member being invited, declined, being unable to speak or think with unruffled feelings, and feared to give vent to them. Another, a young member, spoke a kind word for the d—, I mean sparrow and asked

PRIMULA SINENSIS LADY EMILY DYKE.

of displaying the flowers, although visitors always find plenty of them to see, but the plants are grown solely to produce seed."

Of the varieties that most took our fancy we may mention Her Majesty (fern-leaf) and Cannell's White, as two of the finest whites in existence. Duchess of Fife, which has large rosy flowers, is distinct by reason of the fact that its foliage is an evident compromise between the so-called palm leaved and fern leaved sections. It possesses the bad quality however, from a seedsman's point of view, of being a bad seed setter. Cannell's Pink is a pink of pinks, and Glowworm is one of the finest scarlets. Swanley Giant is well named, for its rosy cerise flowers are of truly giant proportions. Swanly Blue is a real blue in colour as well as in name, and not a half-toned nondescript. Eynsford Yellow is a remarkably distinct flower in which the yellow eye has been so strongly developed as to cover the whole of the limb of the corolla, with the exception of a narrow marginal border, which is scarcely wider than the edge of the historic "parson's

whether he was not too hastily judged, suggesting another as the culprit. I wish my kind-hearted friend had been with me the other morning. I think I should have convinced him of the error of leniency and misplaced sympathy. I have a range of Peach houses apart from any other buildings, in fact situated in the pleasure grounds quite 100 yds. away from the kitchen garden and other houses, and having trees now in bloom, both trained and pot plants. We have been troubled during the past week with these demons entering as soon as the ventilators are opened and picking and tearing off the blooms wholesale. This occurred persistently every day last week, as soon as the man in charge left the houses. I determined to make an example of some of them and was successful, after a time, in making a capture. We opened the top light (a slide down), and secreted ourselves and waited, when in a few minutes Cock Sparrow was busy tearing off the flowers and dropping the pieces. As the Yankee would say, "darned cussedness" seems to possess them. I dissected one wretch this morning and could dis-

cover no trace of his having swallowed any portion of flowers.

Last year they repeatedly attacked a batch of Germania Carnations in the same houses just as they were starting into growth, entering through a hole in roof; even when a man was in the house they attempted to carry on their pranks. This year they have played sad havoc with our outside border varieties, nipping off the tops of young leaves.—*A.P.*

THE UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.

MR. GEORGE WYTHES, of Syon House Gardens, Brentford, presided at the annual general meeting of this society, which took place at 8 p.m. on Tuesday last, at the Caledonian Hotel, Adelphi Terrace,

MR. GEORGE WYTHES.

Strand, W.C. After the minutes of the last annual general meeting had been read and signed, the secretary was called upon to read the report and balance sheet.

REPORT FOR 1897.

In presenting the annual report and balance sheet for the year ending January 10th, 1898, the committee have great pleasure in stating that the society continues in a prosperous condition.

Sixty-eight members joined during the year, twenty-one lapsed, and three died, one being a lapsed member, and the amounts standing to their credit in the ledger have been paid to their nominees. The membership is now 680.

The amount of subscriptions paid by members to the Benefit Fund, including arrears for 1896, was £1,064 14s. 2d.

The amount paid to sick members was £232 9s., there having been forty-six members on the fund.

The amount of subscriptions to the Benevolent Fund from honorary and benefit members was £129 1s., and £23 10s. has been granted in small amounts to four members from this fund.

The Convalescent Fund is progressing favourably. It is suggested that this fund should now be incorporated in the rules. The amount received for this fund, including donations at the annual dinner, was £28 0s. 8d. Two members received £1 10s. each from this fund.

The Management Fund shows a balance of £77 15s. 7d., having benefited to the extent of £10 10s. by donations at the annual dinner; also £10 6s. 6d. by advertisements in the annual report.

The annual dinner was again held at the Holborn Restaurant. H. B. May, Esq., occupied the chair, and fulfilled his office in the best manner possible, and everyone present thoroughly enjoyed the evening's entertainment.

The accounts were audited by Messrs. W. Gunner and Geo. Dixon, and found correct.

The committee again invite members of the craft to join this society, and so lay by something for a

rainy day, taking for their motto, "Union is Strength."

The statement of accounts read by the secretary showed that in the Benefit Fund the total receipts for the year, including a balance of £8,834 5s. 5d., were £10,155 8s. 11d. The expenditure for the year was £297 17s. 6d., thus leaving a balance of £9,857 11s. 5d.

The Benevolent Fund receipts were £2,828 13s. 9d., including a balance brought forward of £2,604 0s. 5d. The disbursements were £23 10s., and the balance, £2,805 3s. 9d.

The Voluntary Convalescent Fund showed receipts £341 3s. 8d., including £304 6s. 6d. brought forward. The amount paid out was £3, and the balance in hand £338 3s. 8d.

The Management Fund brought forward a balance of £44 14s. 7d., the total receipts being £175 1s. 9d., as against £97 6s. 2d. expenses, the balance in hand being thus £77 15s. 7d.

The treasurer's statement of accounts was presented by Mr. J. Hudson. The total receipts for the year had been £1,749 14s. 9d., obtained from members' subscriptions, donations, advertisements, and dividends on investments. The expenditure totalled to £1,677 10s. 3d., of which £232 9s. had gone in sick pay, £23 10s. through the Benevolent Fund, £97 6s. 2d. from the Management Fund, and £1,305 10s. 3d. in investments and the charges consequent thereon. There was therefore a cash balance in hand of £72 4s. 6d.

The statement of Liabilities and Assets declared liabilities amounting to £13,078 14s. 6d., and assets in the shape of various investments taken at par valuation of £13,100, but which at present actual value represented £14,742 10s., plus the cash balance above referred to of £72 4s. 6d., or a total balance of assets over liabilities of £1,714 14s. 6d.

The Annual Dinner Account declared receipts of £41 11s. 10d., and expenditure of £40 5s. 6d., leaving a balance of £1 6s. 4d.

In rising to move the adoption of the report and statement of accounts, Mr. Wythes spoke of the great pleasure it had given him to listen to the most satisfactory accounts of the progress of the society. It was a matter of some surprise to him that the number of members had not increased more rapidly. This could not be due to the fact that there was any hesitancy as to the society being on a sound financial basis, when they had £14,742 10s. invested in sound stocks. There were about 720 paying members at the present time, so that the average amount lying to the credit of each member would be £20 10s. Mr. Wythes warmly complimented the management of the society, and said that he was very gratified to learn that the working expenses for the past year were only 6 per cent. of the income. The annual investments averaged £1,100 for the last two years, and a total of over £10,000 had been invested during the last thirteen years. He was surprised to find, however, that 3 per cent. could have been paid for so long to the members on the monies standing to their accounts, as at the present time sound trustee stocks only realise from 2½ per cent. to 2¾ per cent. In conclusion, Mr. Wythes spoke of the indebtedness of the society to the Horticultural Press, and advised all, young gardeners especially, to join the "United" without delay.

Mr. W. Marshall seconded the adoption of the report and balance-sheet, saying that the society had made great progress since it was first started by eight or ten members. The motion was duly carried.

It was resolved, on the motion of Mr. Cole, that 2,500 copies of the report and balance-sheet should be printed and circulated.

At the election of officers, which followed, Messrs. W. P. Thomson, Wheeler, E. T. Cook, and Wood were unanimously re-elected to serve upon the committee, whilst Mr. W. Collins received quite an ovation when the chairman proposed and Mr. Hudson seconded that he should be asked to continue the secretarial duties he had so worthily performed.

Mr. Hudson proposed that, according to the rules, Mr. Collins should receive a salary for 1897, £20, and 6d. per head for each member on the lists over the number 300, together with a special bonus of £5.

This was carried unanimously and responded to by Mr. Collins.

Mr. Cole moved that a vote of thanks be given their esteemed treasurer, Mr. J. Hudson, who had

stuck to and done such good work for the society. The meeting signified its complete accord and received Mr. Hudson very heartily when he responded.

Votes of thanks to the trustees, the committee, the Press, and the chairman were subsequently moved, seconded, and carried. Mr. Cole replied for the committee, and Mr. C. H. Curtis for the Press.

THE SPECIAL MEETING.

This meeting was called for the purpose of considering certain alterations in and addition to the rules governing the society, and followed immediately upon the heels of the "annual."

Mr. J. Hudson proposed that Rule VIII., affecting the secretary's salary should read £30 instead of £20.

Mr. Burge proposed and Mr. Cole seconded that to Rule XIV., after the words "lower scale" should be added the words "with the privilege of increasing this to."

Mr. W. P. Thomson proposed, and Mr. Winter seconded, that in that part of Rule XIV., dealing with the time for which full sick pay should be paid to members, the word *successive* after the word "twenty-six" should be struck out. Mr. Thomson showed how necessary this was in the case of a man going on the funds for, say twenty-four weeks, declaring off, and going on again, since as the rule stood he would be eligible on the second occasion for the whole series of twenty-six weeks.

All these alterations were duly carried, the last one after some lively discussion.

Mr. Cole proposed, and Mr. Marshall seconded, that a new rule, to be called Rule XVIIA., *re* the Convalescent Fund, should be added. It ran as follows:—

Voluntary Convalescent Fund.—The object of this fund is to give members a change of air during convalescence. The committee of management to have power to relieve members of this society from this voluntary fund as they may deem advisable. All cases must be recommended by a duly qualified medical practitioner.

With the adoption of this rule, the proceedings terminated.

SIMPLICITY HOLDER AND INDICATOR.

THIS is an ingenious but simple invention for hanging thermometers in glasshouses, dwelling rooms,

EMPTY. FULL.
SIMPLICITY HOLDER AND INDICATOR.

infirmaries, hospital wards and other places where the maintenance of the temperature at any given figure is a matter of importance. By the employment of them in gardens, they save the gardener a considerable amount of trouble and attention in keeping

the stokers, temporary or permanent, correctly informed as to the degree at which each and every house should be kept. In Vineries and Peach houses that are being forced, the temperature varies from week to week as the Vines or Peaches advance, and in relation to the outside temperature.

The accompanying illustrations show the Simplicity Holder, both when empty and when full, that is, with the thermometer placed in position. The holder consists of an expandable ladder, the pivots and sockets at the joints being of brass. It is made in this particular fashion so as to take in thermometers of different sizes which may already be in use. The pointers on the side wires are made to move up and down so that they can be placed at any given point to show the stokers what the night and day temperatures are to be. All the gardener has to do is to move these pointers to the desired figure and the thing is done. This saves him all the time and trouble of writing labels or cards every week, or even at shorter intervals, when the houses being forced are rapidly advancing. The men in charge of the houses have no need to trouble the gardener about the desired temperatures, as they can, while passing through the houses, merely look at the pointers which indicate what the gardener desires the temperature to be.

To fix the thermometer in position, the operator lays hold of the sides of the ladder and draws it out to the requisite width. Then the thermometer is hung upon the projecting knob of the brass disc at the top, and the ladder pressed against its sides to adjust the width; last of all the brass pointers are turned over the face of the glass and pulled up or down to the desired places. The brass disc is for indicating the temperature to which the house may be allowed to rise by means of sun heat. The Simplicity Holder and Indicator may be obtained from Mr. A. Outram, F.R.H.S., 7, Moore Park Road, Fulham, London, S.W., who is also the agent for the Indispensable Sweeping and Collecting Machine, patented by Messrs. Sutton & Pull.

Kitchen Garden Calendar.

SEED SOWING AND PLANTING at this time of the year are such important operations that no tiller of the soil can afford to neglect them, but, momentous as these are, the preparation of the soil previous is of quite as much consequence, for it is useless to sow or plant unless the ground has been previously well tilled. All growers of first-class vegetables should know that much depends on the state of the soil at the time the crops are put in; and those who produce the finest samples spare no pains to thoroughly work the ground so as to get it in the finest possible condition. The present season has been an exceptional one for outside work, so that there ought not to be any difficulty in getting in the crops. Transplanting those that have been raised under glass will now be occupying the attention of many gardeners; but such work must be done with discretion or failure will be sure to follow. There is nothing gained by hurrying on such work simply because the time of year has arrived when certain things are usually done. If the soil cannot for some reason or other be got into proper condition, better defer the work for a few days than to sow or plant when in such a state. Those that have been raised under glass being more tender than plants grown in the open, every care must be taken to thoroughly harden them off before planting, and to afford them protection afterwards, till such times as they are able to take care of themselves.

ONIONS that have been growing on hot-beds will require special care; they must be carefully lifted with all the roots possible attached, and planted sufficiently deep to keep them in an upright position. Cauliflower ought to be lifted with balls of earth attached and planted carefully with a trowel, pressing the soil firmly round the roots. Those that have been potted will suffer less than any lifted from the frame, but care must be exercised to prevent the balls of earth from getting dry after planting.

PEAS that were raised in pots should be allowed ample room when transferred to the open ground, a space of 6 in. being allowed between the clumps in the row. It is a good plan to put stakes to them as soon as planted, and protect with evergreen boughs placed alongside the rows to keep off the cold winds.

Lettuce must be watched closely, as both birds and slugs are fond of the tender leaves, and will clear off whole breadths almost as soon as planted. Leeks, in some places, are in great demand. When well grown and properly blanched, they are a fine wholesome vegetable. To obtain large stems early in the season, it is necessary to raise plants under glass, and these must be planted out at suitable distances apart, on well prepared ground, that they may become developed; if not liberally treated, plants so raised are liable to run to seed.

FRENCH BEANS are very troublesome just now, especially when grown in houses with other things. The bright sun in the daytime, accompanied with cold winds, prevents sufficient air being admitted to keep the plants healthy, and the cold nights necessitate more fire-heat, which encourages the production of red spider. A close watch must be kept to prevent this troublesome pest from making headway.

POTATOS that are growing in frames should have sufficient space allowed to prevent the foliage from coming in contact in the glass, for when this happens the frost often does considerable damage. It is not advisable to cover with mats more than can be avoided, as they prevent a free circulation of air. Peas that are showing flower must on no account be allowed to suffer for want of water at the roots. As soon as the pods begin to swell liquid manure should be afforded. Asparagus in frames will be greatly benefited by a dressing of artificial manure to be washed into the soil with water heated to a temperature of 85 or 90 degrees Fahr. Pay attention to collecting and preparing manure for Mushroom beds; those that are becoming exhausted should have a slight sprinkling of salt and be afterwards watered with tepid water.—*Kitchen Gardener.*

The Orchid Grower's Calendar.

ONCIDIUM VARICOSUM ROGERII.—This beautiful Oncid is, we are pleased to see, being again imported in large quantities. The condition, too, of the consignment introduced by Messrs. Lewis & Co., is simply grand, the plants being plump and beautifully leaved, and in excellent trim for putting into baskets or on rafts, as the nature of the plant suggests. As very little compost is necessary for their requirements it is advisable to fix the plants firmly to the rafts by some thin copper wire, after placing a few lumps of peat and live sphagnum moss thereon for the plants to rest on and root into. After they become established and are rooting freely, it may be necessary to add a little more of the compost along the sides of the rhizomes without covering the same. The best position for them is a shady position in the Cattleya house. At any rate this is the place for them in winter, but during the summer months they will do well in the moist atmosphere of the cool house. For such small plants they carry enormous scapes of their bright yellow flowers, which if left on until they fade takes a great deal of the vigour out of the plants, so that it is as well to bear this in mind, and to relieve the plants by cutting the spikes as soon as the last flower expands. This will save a lot of after trouble and annoyance, for with every care and attention it is exceedingly difficult to keep them in good condition for long.

ODONTOGLOSSUM PESCATOREI.—Although we do not think this Odontoglossum will ever be so popular as *O. crispum* amongst amateurs, it is nevertheless a very good companion, and one that does well under similar treatment. There appears a growing desire to grow it specially for cut flowers. The grand, branching spikes of a well-grown specimen are very taking, but the individual flowers are flimsy by comparison with those of its rival.

POLYPODIUM FIBRE.—I mentioned some time ago that we were giving this new substitute for peat a trial. It may, therefore, be interesting to readers of THE GARDENING WORLD, if I say what we think of it. At first I was prejudiced against it, even for Odontoglossums, but on giving it a fair trial we find cool Orchids are rather fond of it. There is one objection to it, and that is that after a time it becomes through the constant watering covered with a kind of Liverwort, which, if allowed to grow, shoots the water off, and leaves the compost underneath the surface dry; but as we repot all our cool stuff each season it does not affect us much. There is no question about the Odontoglossums rooting in it, and the foliage of the plants is of a deep green hue.

We used some for Cattleyas, but with very little success, in fact, we are replacing it with peat. It seems too close and spongy for all large-rooting plants, but for such things as Miltonias, Tricopilias, Odontoglossums, &c., it does very well. When received it is dust-dry, so that it is advisable to damp it, and pick as many of the rhizomes out as possible before using it.—C.

HARDY FRUIT GARDEN.

APRICOTS.—The sharp frosts have tried these sorely of late, and there will be little chance of a crop of fruit unless the trees are properly covered each night. Permanent covering in the shape of branches of evergreens or heather inserted between the boughs of the trees will keep off a lot of frost, and are much in favour with many gardeners. Where the walls are furnished with good copings, which facilitate the fixing of rollers and the use of blinds, there is no doubt that it pays to give protection in this way. A few light spars of wood placed against the wall at a sufficient distance to clear the trees and to allow the rollers to work with freedom will be necessary. There is thus no great expense of fixing, and the blinds can be rolled up or down at will, thereby giving the trees the full benefit of the sun and light.

PRUNING AND TRAINING.—All pruning, tying, and nailing should be pushed on vigorously and completed at an early date, for the buds have swollen to a good size, and many of them will not be long in bursting after the advent of more genial weather. The planting season, too, is practically at its end, and any odd jobs that still remain should be finished as soon as possible.

BUDDING BIRDS.—Bullfinches are often designated thus, but the epithet "budding" includes other birds as well, not the least of which is the ubiquitous sparrow. The latter feathered marauder is always with us, but at no time of the year is he a greater nuisance than now. He seems to delight in mischief for mischief's sake, and buds of all sorts of fruit trees fall under his busy bill. It is an impossibility to kill all the sparrows, and a seeming impossibility to frighten them, consequently the gardener is at a loss for really effectual means of protecting his plants. A few threads of cotton twisted about Currants, Gooseberries, Plums, etc., will, however, be of some service, and an occasional shot may assist in the good work. It is the sparrows and tits that generally do the mischief, for bullfinches are not often present in sufficient numbers to do a great deal of harm.—A. S. G.

SOCIETIES.

PRESTON AND FULWOOD HORTICULTURAL.—

March 9th.

THE annual spring show of the above society held in the Public Hall, Preston, was opened on the 9th inst. by the Mayoress, in the absence of the President, Alderman Wood. There were present the Mayor, Alderman Dunn, several members of the Corporation, and other gentlemen and ladies.

In the centre of the hall was J. B. Dixon, Esq.'s first prize group formed in a circle, and beyond this, but separated by cross tables, two oblong groups by Messrs. Payne, Morley & Co., nurserymen, were tastefully arranged, and the prizes were awarded in the order named. On the platform, in front of the orchestra, were the Palms and a collection of foliage plants sent by the Corporation; and in front of these on the floor of the room, the Azaleas, the small stove and greenhouse plants, pot Roses, Cinerarias, Deutzias, Dielytras, &c., were arranged round the sides of the hall. In the nurserymen's class, Mr. Payne, Fulwood, took the lead in the Hyacinth classes, also with Azaleas. He also exhibited a neat collection of Orchids, not for competition, Messrs. Morley & Co. taking first for Roses. The honours in the bouquet classes were equally divided between Mr. Troughton, nurseryman, and Mr. Payne.

In the amateurs' class J. B. Dixon, Esq., Ribblesdale House, Preston, took the lion's share of the prizes, especially in the bulb classes, and out of forty-six entries he secured 23 first's, 18 second's, 3 thirds. Mr. Dixon, who is the treasurer of the society, is his own gardener, and his exhibits are always creditable, his Hyacinths being always up to the mark. He

was first with Azaleas, three pans Lily of the Valley, Amaryllis, Spiraea, Dielytra spectabilis, and stove and greenhouse plants. Mr. Lamb, gardener to R. Smith, Esq., Dillworth House, Longridge, had forty-five entries, securing 15 first, 19 second, 8 third prizes. His Cinerarias were very good, also his table plants, and stove and greenhouse fine foliage plants. Mr. W. Gillet, gardener to M. B. Copland, Esq., Farington Lodge, entered in twenty-one of the classes and gained first for a bouquet, a single pan of Lily of the Valley, three Roses in pots, and a single specimen, taking 7 first prizes in all, 10 second, and 3 third. Next to him was Mr. Pius Rigby, gardener to J. Smith, Esq., Whittingham House, with seventeen entries, but securing 11 first prizes for Roses in pots, cut flower ditto, a collection of vegetables, twenty pots of bulbs, etc., not mentioned in the schedule, and hanging basket, of which there were four suspended from the sides of the front gallery. His other prizes were 5 seconds and 1 third. Mr. Parkinson, gardener to J. Whitaker, Esq., Wellington House, Leyland, was the winner of 6 first prizes for Tree Ferns, Cyclamens, hardy Azaleas and Dracaenas. He was also awarded 1 second and 5 thirds. Mr. Woolan, gardener to Mrs. Birchall, Ribbleton Hall, was first with Primulas, and he had the best specimen Orchid, a *Cypripedium villosum*, with forty-four flowers in the pink of perfection. There were no entries in the other Orchid classes.

Other prizetakers were Mr. Wood, florist, North Road, Preston; Mr. Sykes, who also had a collection of succulents, staged near the entrance, not for competition; on the opposite side to these Mr. Troughton had a display of novelties, representing gates, steps, and arches, in metal. They had tubes to hold water, and small sprays of flowers were arranged in these.

In the cottagers' class Mr. Morris had excellent stove and greenhouse plants grown in a back yard in the town. The R.H.S. medal was awarded to Mr. J. B. Dixon for six Azaleas, being the most meritorious exhibit in the show.

GARDENING MISCELLANY.

LILY-WHITE SEAKALE.

MENTION has been made twice lately of this variety of Seakale being as easily cultivated and as profitable as the older variety—viz., on pp. 408 and 445. After four years' experience with this, I cannot endorse the above opinion. I find it more delicate and more disposed to disease. I cannot obtain such large roots, in fact I have a difficulty in keeping the stock alive. My soil is a light loam or gravel. I am trying it this year in a piece of well-worked, good soil, rich in vegetable matter. There can be no two opinions as to the appearance of this variety being superior to that of the type. I only wish it grew with me as kindly and vigorously as it appears to with others.—A. P.

MESSRS. A. W. YOUNG & CO'S CINERARIAS.

CINERARIAS are grown in some quantity at the nurseries of Messrs. A. W. Young & Co., Stevenage, Herts, and a box of flowers to illustrate the quality of the strain was recently forwarded to us from thence. Having regard to the fact that pure white flowers of good form and size are but rarely seen, special attention may be called to a white form that possessed a remarkably regular outline. The flower was of medium size, but good substance. The Stevenage strain is evidently strong in bicolor varieties with the broad white central zone, and a margin of varying width of some shade of purple or blue. In this section of Cinerarias alone, there is a good deal of variety. We may make mention of one flower with a narrow central white zone, and a broad margin of rosy-magenta. The largest flower of all had a broad margin of deep rose-cerise, and was a fine flat and well outlined flower. Two self-coloured varieties, the one deep blue with a suspicion of purple, and the other a rich crimson-purple were of medium size and good quality.

NARCISSUS VICTORIA.

THIS fine bicolor Daffodil which received a Floricultural Certificate from the Royal Botanic Society on March 30th, and an Award of Merit from the Royal Horticultural Society on April 27th, both of last year, appears to behave admirably when grown as a pot plant, and subjected to a moderate amount

of forcing. We recently saw it in capital condition with Mr. T. S. Ware, of Hale Farm Nurseries, Tottenham, N. The flowers did not appear to have suffered a whit from the forcing, the difference in substance between the underglass flowers and those produced out of doors in the ordinary way being very little. The plants were, as usual, remarkable for their vigorous growth, and the way in which they were developing offsets. Mr. Reuthe informed us that this variety is the most liberal in the matter of offsets of any variety with which he is acquainted. This being the case this lovely Daffodil will not be highly priced for very long, but will soon be well within the reach of everybody. At present the price is rather high for a strictly limited purse.

EUONYMUS RADICANS VARIEGATA.

WE have no prettier edging plant than this brightly-hued trailing shrub, and as a rock garden subject it has few to equal it. It stands cutting about with almost perfect equanimity, and trails of it are of considerable use for decorative purposes. It is a rather rare occurrence, however, to find it used for clothing a wall, although we have no doubt it would do as well thus as in the other positions indicated. A recent issue of *American Gardening* illustrates this phase of its usefulness by the picture of part of a wall covered with it, and draws attention to its value for winter effects in the garden.

LAW NOTE.

THE RATING OF MARKET GARDEN BUILDINGS: APPEAL ALLOWED.

IN the Appeal Court on Friday, the 11th inst., the Master of the Rolls and Lords Justices Rigby and Vaughan Williams gave judgment in an appeal from a decision of Justices Collins and Ridley, of August 2nd, 1897, exempting greenhouses, used in market gardens, from the full rating of farm buildings. The case was a test case, and concerned forty or fifty tenancies. The application was originally made to the Divisional Court by the overseers of the parish of Worthing, the surveyor of taxes being the respondent.

The Agricultural Rates Act of 1897 grants the privilege to agricultural lands of paying only half the rate per pound which is payable on buildings and other hereditaments. The question in the present case was whether the greenhouses and glasshouse forcing beds used by market gardeners and nurserymen came within this exception. The surveyor of taxes had decided that in a holding of four acres, where two acres were covered with glasshouses for the better cultivation of Tomatos, Cucumbers, &c., the tenant was not entitled to the exception in respect of the two acres.

In the Divisional Court, Mr. Justice Collins decided that the glasshouses came within the description of market gardens specifically included in the relief. Mr. Justice Ridley thought that they were buildings within the meaning of the Act, but he withdrew his judgment, and an order was made that the two acres of glasshouses were entitled to be half rated. Mr. Richmond, the surveyor of taxes, appealed, and on his behalf it was contended that as barns, stables, and cattle sheds on agricultural land were full rated, and assessed separately, the glasshouses in question, to which the whole value of the occupation was due, ought not to have the relief.

The Attorney-General (Sir Richard Webster, Q.C.) and Mr. Day appeared for the appellant; Mr. Joseph Walton, Q.C., and Mr. Salter for the overseers of Worthing.

The Master of the Rolls, in giving judgment, said he was of opinion that the glasshouses in question were clearly within the ordinary meaning of the word "buildings," and ought to be rated as such, and not as agricultural land; and he added that he could see nothing to justify a distinction between one class of buildings and another.

Lord Justice Rigby delivered judgment to the same effect.

Lord Justice Vaughan Williams differed, and thought the judgment of Mr. Justice Collins was perfectly right. The Act was difficult to construe, and it was not clear what the Legislature intended. In such a case one must be guided by the words of the section, and not by balancing the difficulties of results one against the other. He thought that the part of a market garden which was covered by glasshouses was within the exception.

The appeal was allowed, with costs.—*Daily Chronicle*.

QUESTIONS AND ANSWERS

* * * Will our friends who send us newspapers be so good as to mark the paragraphs or articles they wish us to see. We shall be greatly obliged by their so doing.

[Correspondents, please note that we cannot undertake to name florists' flowers such as Carnations, Pelargoniums, Chrysanthemums, Roses, nor such as are mere garden varieties, differing only in the colour of the flower. Florists' flowers, as a rule, can only be named by those who grow collections of them.]

Carex japonica variegata.—North: There are at least three plants in cultivation under the above name, and neither of them is correct. The specimen you sent was *C. Morovii variegata*, the same as you sent on a previous occasion. We have little doubt that the species you require is *C. brunnea variegata*, but whether anybody would supply you with the right plant by your asking for it under that name is more than we could say. There are cartloads of it in several of the London Nurseries, but why you have been served with the stiff and ungainly *C. Morovii variegata* from two large nurseries is a puzzle to us. The plant is about a foot high or a little over, with long, slender, and graceful leaves with white margins. It is largely used for greenhouse and conservatory decoration, both the green and the variegated varieties. You might use the above description, in applying to any of the nurserymen again; send a piece of the plant of *C. Morovii variegata*, and tell them you do not want that. Messrs. Veitch & Sons, Chelsea, London; and Mr. H. B. May, Dyson's Lane Nurseries, Upper Edmonton, London, would have it for certain.

Fruits, Flowers, and Vegetables.—B.: (1) It is just possible that you would be able to get a cottage and two acres of land in the south eastern districts of Cornwall, where some one has been working on similar lines to what you propose, but at such a distance we have no means of being certain. In that part of the country they grow various kinds of marketable produce in the way of Grapes, Tomatos, Melons, Cucumbers, Strawberries, Gooseberries, and the choicer vegetables that will pay for carriage. (2) For markets, you have London, Birmingham, Manchester, and various other large northern towns. For this reason you should endeavour to settle down within easy reach of some or other of the branches of the London and South Western Railway, so that the goods may be conveyed quickly and at relatively small cost. (3) For the above and various other reasons that might be given, the best way would be to ascertain whether you can get employment in a market garden down in Cornwall and the possible remuneration, which would not be great in that part of the country. Ground might vary from £1 to £12 per acre, according to its quality and the demand for it; therefore, the best plan would be to get employment in the district, and take time to gain experience and look about you. Daffodils, Polyanthus, Narcissus, and similar bulbs are very extensively grown in the Scilly Isles for the early supply of cut flowers to London and the northern markets.

Begonia Ensign.—Ensign: The variety is a new one belonging to the winter-flowering section, and requires resting from now till August or September when it may be re-potted and placed in heat, to urge it into good growth, so that it may flower during November and December. You may rest the tubers by keeping them dry and in an intermediate house or pit. It is more than likely that the stem will die down, and the young shoots come from the tuber. The variety may be propagated by cuttings when making growth and beginning to branch. You cannot expect the old plant to be very shapely or flower well if many shoots are cut off to get up a stock quickly. Keep the tubers as well until you have worked up a good stock. Some of these winter-flowering varieties, such as *B. socotrana* and *B. Winter Gem* can only be propagated by tubers, but others of the style of *B. John Heal* and *B. Ensign*, that take largely after the summer-flowering tuberous race, can be increased by cuttings.

Horticultural Examination.—Fern: The initial step is to apply to the Secretary, Royal Horticultural Society, 117, Victoria Street, London, S.W. This should have been done not later than the 1st of March; and we cannot say now that you will be able to go forward this year; but there can be no harm in applying. There is no necessity to come to London to pass the examination in question. What you want to do is to get the consent of a clergyman, schoolmaster, or some other responsible person in your neighbourhood to superintend the examination on the 5th April. We fear you have no time to make arrangements this year, but at all events you could ask the secretary's opinion at the above address.

Swollen Apple Boughs.—J. T. Thurston: The shoots you sent were very badly affected with American Blight, or Woolly Aphis (*Schizoneura lanigera*). We doubt whether cutting off the swellings would be of any real advantage, as it might lay the tree open to an attack from canker. Your best plan, if the tree is really worth saving, would be to commence now and give the branches a thorough scrubbing with Gishurst Compound, in lather from the cake, rubbing it well into the cracks and

crannies of the tree with a half-worn painter's brush. It would be more troublesome to do this in summer when the leaves are on, but you cannot be too persevering about that time when the aphids is multiplying fast, and can easily be seen by the naked eye.

Imported Odontoglossums—E. L. Brown: The flower you sent us was Odontoglossum triumphans, which must have somehow got mixed with O. crispum. We consider it a very good variety on account of its bright golden yellow colour, and the distinctness of the blotches.

Begonia Gloire de Lorraine.—Ensign: This hybrid is of Continental origin, and its parentage does not seem to be known in this country. Judging from its appearance we should say it has been obtained by crossing B. parviflora with B. socotrana. or B. John Heal.

Weed Killer for Walks.—Glasgow: There are various preparations for this purpose, but all contain dangerous poisons so that you would have to exercise very great caution to keep the poisons out of the way of animals and children so as to avoid accident. You must not let the Weed Killer near grass or box edgings, or any plant for which you have any care for their safety.

Flowers of Dendrobium nobile.—David May: With 200 blooms of the same character as those you sent, the plant must indeed be grand. The flowers are notable for their size and substance, the surface of the segments having a glossy and waxy appearance. If it had had more depth of colour, it would have taken high rank amongst the varieties of the species.

Names of Plants.—E. Morris: Pittosporum undulatum (very sweetly scented).—A. L.: 1, Boronia megastigma; 2, Pelargonium fragrans; 3, Pelargonium denticulatum; 4, Begonia semperflorens var.; 5, Aspidium angulare proliferum.—J. C.: 1, Scilla sibirica; 2, Chionodoxa sardensis; 3, Pulmonaria saccharatum; 4, Oncidium spillopterum.—H. W.: 1, Odontoglossum Cervantesii Morado; 2, Odontoglossum nebulosum; 3, Sibthorpia europaea variegata; 4, Ruellia Portellae; 5, Strobilanthes Dyeri (off colour, but will come all right when it grows).—Cristata: 1, Scolopendrium vulgare; 2, Pteris cretica; 3, Asplenium bulbiferum; 4, Pteris cretica albo-lineata; 5, Pteris cretica; 6, Pteris cretica cristata; 7, Onychium japonicum; 8, Pteris serrulata cristata; 9, Pteris cretica cristata; 10, Selaginella Braunii; 11, Davallia Tyermanni; 12, Aspidium (Cyrptomium) Fortunei; 13, Adiantum hispidulum; 14, Polemonium caeruleum; 15, Lychnis diurna; 16, Doronicum (send this when in flower); 17, Maranta bicolor; 18, Streptocarpus Rexii var.; 18, Carex brunnea variegata; 20, Carex Morovii variegata; 21, Ophiopogon Jaburan variegatus.

"Eureka" Weed Killer

is a safe and effective preparation for keeping Roads, Drives, and Paths clear of Weeds; one dressing in the Spring will keep the Gravel bright and clean for the rest of the year. This Powder mixes with Cold Water, as a trial we will send a Tin, containing sufficient to dress 100 square yards of Paths, Post Paid, on receipt of Stamps 2/-. On application we will send our Price List for Powder and Liquid Weed Killer, also copy of Testimonials received from the Royal Horticultural Society and some of the largest Estate Owners, &c. One trial will fully convince Gardeners that the "Eureka" Weed Killer is effective and safe. Sold by Chemists.

ONLY ADDRESS:— TOMLINSON & HAYWARD, Mint St. Chemical Works, LINCOLN, [Est. 1842.]

FIXTURES FOR 1898.

Second Edition.

5s. od.; post free, 5s. 3d.

"GARDENING WORLD" Office, 1, Clement's Inn, Strand London.

TRADE CATALOGUE RECEIVED.

THE SURREY SEED CO., Redhill, Surrey.—Farm Seed Annual.

DIRECT FROM COLLIERY. PATRONISED BY HIS GRACE EARL WINCHILSEA.

GUARANTEED 25 PER CENT. MORE DURABLE THAN CHEAPER SORTS.

Used at the Mansions and Gardens of the NOBILITY and GENTRY, and at the principal Maltings in United Kingdom.
(DOWSON'S PLANT) AND WATER GAS FOR STEAM. HOP AND ORCHID GROWERS AND NURSERYMEN.

ESSERY'S ORIGINAL ANTHRACITE.

Machine Cut. Three sizes ready for use. Hard and Large, entirely without Smoke, superseding Coke in every respect. Effecting a very important Saving by constant combustion. Much greater Heat, Durability, Cleanliness, and Diminution of Labour. Autograph Certificates. References. First Cost Prices.

Can be had only from **WILLIAM H. ESSERY, Pantyffynon Collieries, SWANSEA.**
Established 1848. N.B.—Not my Coal unless delivered in trucks painted "William H. Essery."

W. COOPER, Ltd., Horticultural Providers, 755, OLD KENT ROAD, LONDON, S.E.

AMATEUR

SPAN-ROOF

GREENHOUSE.

Everything Complete, and Ready for erecting.

From £2 16s.

"COOPER" CYCLES.

Twelve Months' Warranty.

Latest design frame, large weldless steel tubes, ball bearings, tangent wheels, and break and mudguards. Gent's from £5 10s; Ladies', with dress and gear guards, from £6.

AGENTS WANTED.

Span-Roof Conservatory. Substantially and Handsomely Built.

See No. 19 in List.

Improved Poultry House.

5 ft. x 4 ft. ... 35/-
6 ft. x 4 ft. ... 40/-
For other Sizes see List, Post Free.

Span-Roof Poultry House.

5 ft. x 4 ft. ... 22/-
6 ft. x 4 ft. ... 25/-
7 ft. x 5 ft. ... 30/-
9 ft. x 6 ft. ... 36/-

RUBBER STAMPS
WITH A MOVEABLE LINE.

SPECIALLY DESIGNED OUTFIT

FOR

Seedsman and Florists. COMPLETE FOR 7/6.

The Outfit consists of Rubber Die (any wording) mounted on Special Air Cushion Rubber (1/4 inch thick) so as to neutralise any inequalities of surface in Seed Bags, &c.; a Font of Solid Rubber Type, containing 74 Letters, Points, and Ornaments. These are simply pressed into designs, and can be altered at will. In addition a Type Holder is enclosed for marking single lines of moveable type only. For 1/6 extra we include 21 figures, so that it can also be used as a dating stamp.

All sorts of Rubber Stamps made to order at short notice and low prices.

NEXT WEEK'S ENGAGEMENTS.

TUESDAY, March 29th.—Shropshire Horticultural Society's Spring Meeting.

Royal Horticultural Society of Southampton's Show (two days).

Brighton Spring Show (two days).

WEDNESDAY, March 30th.—Liverpool Show.

Royal Botanical Society's Spring Show at Regent's Park.

CONTINUITY IN THE SPRING GARDEN.—

Within the four corners of this island, and the smaller islands immediately adjacent, we have, on the average of winters, an opportunity for a lengthened display of bulbs and other early flowers in the open ground that greatly excels the blaze of summer bedding for durability. This would, of course, include both winter and spring-flowering subjects, which, when analysed, really amounts to a question of temperature, and not to a difference in the subjects themselves. The greatest differences between the early spring and the summer display proper consists of a difference of kind, and a more limited range of colour and quantity of bloom at any given time in the spring garden. Another and, perhaps, the greatest drawback to the spring, or shall we say winter and early spring, bedding is that it is limited to the more favoured parts of the south and west coast including the islands, all of which are more or less directly influenced by the warm waters of the Atlantic. As we approach the Midland and northern parts of the island as well as the east coasts we find the spring creeping gradually onwards, it may be months after the inhabitants of the more favoured parts have been enjoying it. Winter and spring flowers are liable to injury from frost and snow; summer flowers are also liable to injury, but happily such an occurrence is more rare.

Should autumn and early winter prove mild the flower buds begin to make their appearance during October and November in the Scilly Islands. The more favoured parts of the mainland are distinctly behind this, although decidedly early compared with more inland parts, unless we take into account the prolongation of the previous season's flowers, particularly Tea Roses, which may and are often prolonged till Christmas, at various points along the coast from Devon and Cornwall almost to Cape Wrath. The great production of flowers in the Scilly Isles consists almost solely of Narcissi, and that of very few varieties; for although something like a hundred sorts are grown under trial to determine their capabilities, the bulk of the produce sold consists of about six varieties. Three of these are varieties that originally grew wild in St. Mary's, and were troublesome weeds to farmers on whose land they occurred, till the islanders began the cultivation of Daffodils for a livelihood. It may be doubted whether they are really natives; but all the same their long sojourn has enabled them to get so thoroughly acclimatised that they hold their own against most comers for hardiness and general utility. The season is of about three months duration, and during that period about 400 tons of flowers are sent over to the mainland. The industry commenced about thirty-two years ago, and ousted the Potato which had become unprofitable owing to the competition with the more favoured Channel Islands.

In the counties around and within easy reach of London Daffodils are by no means the earliest of flowers, though a few straggling members of the large Daffodils may have been seen in gardens for some weeks past. The smaller Daffodils of the Hoop Petticoat section as well as Narcissus minor and N. minimus have been flowering for a month past or more. The Truro Daffodil show of last week will indicate the climax of the display in Cornwall; very soon it will be here. Independently of Christmas Roses and wall shrubs, the spring season in the London district is ushered in by the Snowdrops, which are really effective when planted in sufficient quantity either in borders or on the grass. They may commence flowering in January or February, according as the winter is mild or otherwise, the latter month being usually spring-like in several respects.

The Snowdrops are quickly followed by the Winter Aconite, Chionodoxa sardensis, Scilla bifolia, and the Dutch yellow Crocuses. Some weeks ago one of our daily contemporaries was led into error by the blue Squills and their allies, which were described as Bluebells. That name, however, is more correctly applied to Scilla nutans, which usually keeps very quiet and undemonstrative till May. The above delight in mild but essentially cool weather, which we have had for weeks past. As soon as really warm weather arrives their flowers quickly pass off the scene. Besides being lovers of cool weather, each well developed bulb, corm or tuber gives rise to a number of flowers which follow one another in succession. The Daffodils will be in full bloom in the course of a few days forming a succession to the early ones, as well as to the varieties of the vernal Crocuses, Scilla sibirica, Chionodoxa Luciliae, &c. Primroses and Polyanthus have been flowering all the winter, but will reach their climax in a few weeks. Hyacinths and Tulips will follow in this order, the different sections of the latter keeping up a display till the end of May. The latest forms of the Poet's Narcissus also bring the display of the latter genus up to that period, or even to the beginning of June. Inter-

spersed amongst Hyacinths and Tulips, we have Myosotis, Arabis, Wallflowers, Daisies, Phloxes, and other subjects which link late spring with early summer and its own particular phase of bedding.

Leven and District Horticultural Society.—The annual display of fruits, flowers, and vegetables held by this society is fixed for August 20th. Prizes are offered in 169 classes for garden produce and wild flowers in addition to the industrial classes, which are to be made a special feature. Mr. John Lister is the Secretary, and he is assisted by a capable committee.

Revue de L'Horticulture Belge.—The publication of the number of this monthly journal for the 1st April next, is to be delayed till the 16th April, in order that its pages may contain a report of the forthcoming international and quinquennial horticultural exhibition. The number for the 1st May will also deal with the great show, and contain historical information upon the origin of the society which organised the quinquennial.

The Shamrock.—St. Patrick's Day was duly celebrated in London and the suburbs by the wearing of bits of Clover. On former occasions we have had *Medicago lupulina* from Dublin as the true Shamrock. On the 17th inst. we had the so-called true Shamrock from two different sources, one of them, reputedly at least, being from Cork. Both these pieces were *Trifolium minus*, of Smith. Another species being sold for Shamrock was *Trifolium repens*, which certainly had the merit of being larger and more easily seen. Which is the true Shamrock?

Early Spring Bulbs at Reading.—Some time ago we had the pleasure of inspecting a border filled with spring bulbs in the Portland Road Nursery of Messrs. Sutton & Sons, Reading. Such things as *Galanthus Elwesii*, and the beautifully striped *Crocus versicolor* and *Crocus biflorus* cloth of Silver put in their appearance in the earliest days of February and continued to develop for weeks afterwards. The variable character of *Galanthus Elwesii* was very apparent, some having long and others globular flowers, while some had almost green foliage far removed from the ordinary glaucous hue. *G. E. unguiculatus* was notable for its long and clawed segments while the green markings were smaller than in the type. The beautiful new *G. Ikariae* has found its way here in some quantity, its large snowy-white flowers being very conspicuous. The double *G. nivalis* fl. pl. was only then showing a few stray flowers, as the variety usually brings up the rear of the Snowdrops. Amongst the large and improved varieties of *Crocus vernus*, *C. v. Inimitable Blue* was handsome and showy. Many others are yet in full bloom.

The History of a Chrysanthemum.—Under this title Mr. W. Wells, Earlswood Nurseries, Redhill, Surrey, gives the eventful history of a yellow sport from *Chrysanthemum Madame Carnot* which he first exhibited on November 18th, 1896, at a meeting of the N.C.S.; again, at the R.H.S. on the 24th of that same month, and, subsequently, under the name of *G. J. Warren*. This name appeared to be accepted with full complacency till the mid-winter exhibition of the N.C.S., when flowers were put up under the rival name of Mrs. F. A. Bevan, which was supplanted by that of *Yellow Madame Carnot* later on. Apparently, the sportive nature of *Madame Carnot* was responsible for a similar condition amongst its admirers, but, of course, we do not profess to see through this particular phase of plant life. In any case, it seems to be admitted that all three are equal to the same thing and therefore equal to one another. Amongst fruits and flowers, the best varieties are generally encumbered with a lengthy synonymy. *Piper Findlater*, lately so prominently before the eyes of the world, has been claimed by most nations of the Old World as their countrymen. We regard these as instances of intense popularity, arising from a desire to acknowledge the worth of a good thing or a hero. It will be interesting to know by what name the N.C.S. will register the variety, when the next supplement to the Catalogue is published.

A Tyburn Snuff-box.—A curio, in the shape of a snuff-box made from the last century Tyburn triple gallows, painted by Hogarth, in his picture entitled "Execution of the Idle Apprentice," was sold recently in a North London auction room for 15s. The gallows was taken down in 1783, and part of the timber used for making snuff-boxes.

Chiswick Gardeners' Mutual Improvement Association.—On the 17th inst., Mr. James Hudson, of Gunnersbury Park Gardens, read a paper on "Alpine Strawberries." He said that this race of Strawberries was little known in many gardens, but owing to their continuous fruiting character, the produce, weight for weight, would equal the well known garden varieties. The subject was dealt with in a very practical manner, Mr. Hudson giving the details of his own practice. They might be propagated by runners or seed, the latter method having come into vogue during the last few years, and seeds are now catalogued by some of the more enterprising seedsmen. Alpine Strawberries like a light soil and partial shade, such as they would get beneath standard Apple trees. Two of the best varieties were *Royal Amelore* and *Sutton's Large Red Alpine*, the latter being of handsome shape and colour, though smaller than the former. There was a fair amount of discussion, the subject being new to many of the members.

Scottish Horticultural Association.—With the confidence born of continued success the Scottish Horticultural Association has again issued a large and comprehensive schedule of prizes to be given for Chrysanthemums, miscellaneous plants, fruit, and vegetables at the huge exhibition, to be held on November 17th, 18th, and 19th, at the Waverley Market, Edinburgh. There are 113 classes in all, of which 55 are devoted to Chrysanthemums. The premier class is for 20 vases of 3 blooms each, the first prize, known as the City of Edinburgh prize, being a piece of plate, value £20, presented by the Lord Provost, Magistrates, and Town Council. We notice from the list of judges given that the two gentlemen who will decide upon the relative merits of the cut Chrysanthemums both hail from the south of Britain, whilst all the rest are northerners. We have no doubt that the exhibition will prove as great a success as in previous years, and may say that the Scottish Horticultural has deserved it all, for the services it has rendered north of the Tweed in popularising the Autumn Queen have been immense. Mr. Robert Laird is still in his post of secretary where may he long remain.

The Cactus Journal.—This, the latest addition to the horticultural press of this country, is a monthly six-penny publication devoted exclusively to succulent plants. In the circular accompanying the issue of No. 1 the aims of the paper are set forth. After dealing with the fact that Cacti and succulent plants generally have become favourites with amateur plant growers, which is further supplemented in the journal itself by an article from the editorial pen, it is stated that it is proposed to give the publication as much of an international character as possible, and articles are promised from the principal authorities all over the world. Correspondence is invited from all. An exhaustive list of all succulents is in process of preparation and will appear in instalments in the paper. New and rare plants will be described, and, with good specimens of well known plants, illustrated. The first number, which was issued in February, contains articles from Mr. W. Watson, of Kew; Professor Luis Murillo, the Rev. C. Spencer Budd, and other authorities. Full page illustrations are given of groups of "rare *Opuntias*," and "beautiful *Mammillarias*." The general get-up of the paper is good, but the number of typographical errors is regrettable, and the systematic misspelling of such words as *Mesembryanthemum* a grave fault. This is particularly marked in the first instalment of the Botanical List before referred to, where, moreover, specific names have been given capital letters indiscriminately. We welcome the *Cactus Journal*, and trust that it will accomplish good work, but if it is to come up to the standard it has set for itself it must be more carefully edited, otherwise its value will be seriously discounted. The publisher is Mr. E. W. Allen, 4, Ave Maria Lane, Paternoster Row, E.C.

The Most Impudent of Fruit Trees.—The "Medlar."—*Sniggs*.

Highgate and District Chrysanthemum Society.—A committee meeting was held on Thursday the 17th inst, when the dates of the Floral Committee meetings for this year were settled, viz., October 31st, November 8th, and 14th. The Floral Committee was then elected, viz., Mr. T. Bevan, Mr. J. Brooks, Mr. J. Brooks, Jun., Mr. Burt, Mr. Mathews, and Mr. Turk, with the president, the treasurer (Mr. J. McKerchar), and the secretary (Mr. W. E. Boyce) as ex-officio members.

Juno Cycles.—These well-known machines are now found in the new "Juno" show rooms on Piccadilly Circus, and we are sure this will be found highly convenient to numerous West End cyclists and would-be cyclists to whom the name *Juno* is a household word, and synonyms of all that a cycle should be. The 1898 Junos are up-to-date in all points, and perhaps there is no machine on the road to-day so often met with as a Juno. It is known for honest sterling workmanship and great elegance of finish.

Horticultural Education in Fife.—Whilst county councils in this country have generally taken up the cause of horticultural education, this has not been the case north of the Tweed. Consequently, we are pleased to learn that the county of Fife appears to have taken a conspicuous lead in this direction. Acting on the initiative of the Leven Horticultural Society, through its able and energetic secretary, Mr. John Lister, a meeting to discuss the question of horticultural lectures was recently held at Ladybank. Representatives were present from various parts of the country, and there was a goodly muster of secretaries of horticultural societies, and upwards of 1,500 members were present. The Rev. Mr. Brunton was called to the chair. Mr. Mitchell, organising secretary of the county council, spoke at some length upon the subject at issue, and it was evident to all that it would not be his fault if the council failed to take the matter up. He expressed himself to be greatly in favour of educating the working classes in the cultivation of fruits, flowers, and vegetables, and suggested that a petition should be sent to his committee stating how many lectures they desired to have, and how they were to be distributed. The following gentlemen were appointed to frame the petition:—Provost Anderson, Newburgh; Rev. J. Brunton, Monimail; Mr. D. M. Dingwall, North Fife; and Mr. Lister, Leven. The last named gentleman acts as secretary.

Ware and District Horticultural Society.—Mr. Fulford, gardener to R. Walters, Esq., presided at the fortnightly meeting of this society on Tuesday, 15th March, when Mr. Challen, nurseryman, Stanstead, gave a very interesting account of the construction of the "Hot Water Apparatus," wherein he described a system of heating adopted by him, minimising the cost of fixing boilers, and placing the pipes to ensure efficient circulation, in those districts adjacent to streams and subject to floods. In such places, in the ordinary way, the stoke-holes frequently get submerged with water, rendering the stoking and keeping up the necessary heat matters of no little difficulty and discomfort, apart from the detrimental effects of dampness acting on the boiler. Mr. Challen had occasion to fix a boiler in a place where it would be altogether impossible to get a dry stoke-hole by sinking the boiler some distance below the level of the ground, unless he went to the expense of having the sides and bottom cemented so as to make the hole water-tight; and even then he would have been rather doubtful of its keeping out the water, as the cement would be liable to crack with the action of the heat under the boiler. He determined to fix his boiler on the ground level (the ashpit only being dug out); he then connected the flow pipe to the top of the boiler, but instead of taking the pipes on the rise to the extreme end of the houses, he fixed them so as there would be a gradual fall, graduating it right round the houses and back to the boiler, connecting the return pipe to the boiler at the ordinary place. He had used this boiler for two winters and found it answer very well, the heat being distributed evenly over the houses. After some discussion, a vote of thanks to the lecturer and chairman terminated the meeting.—A. W.

Erratum.—On p. 462 in the thirty-sixth line from the bottom of the first column for "My soil is a light loam or gravel" read "on gravel."

There is no Lake of Haarlem now, the site having been drained and cultivated. A great canal alone remains which runs through seventy square miles of the best bulb-growing soil in the world. Fifty years ago the great Lake of Haarlem covered all this.

Daffodils at Regent's Park.—At the spring exhibition of the Royal Botanic Society on the 30th inst., Messrs. Barr & Sons, 12 and 13, King Street, Covent Garden, London, offer (for competition by amateurs and gentlemen's gardeners) a Silver Daffodil Cup, designed by Mr. H. G. Moon, a Silver and a Bronze Medal, as prizes for the finest display of not less than forty varieties of Daffodils, comprising representatives of the large, medium, and small crowned sections.

Cause of the Potato Disease.—Between the years 1801 and 1846 the cultivation of the Potato increased nearly a hundredfold in the North-western Highlands, and became not only the staple but almost the only food of the inhabitants, with the result that they were reduced to a state of famine in the latter year just as much as the inhabitants of Ireland. A writer in the *Witness* had the effect of bringing that paper under the eye of Mr. Punch, who represented the Irish famine as a "judgment on the Maynooth Endowment." This was resented by another writer, who said that the Scotch Highlanders, though opposed to Maynooth, suffered as much as the Irish, and considered that the famine was a judgment upon both the Irish and the Highlanders for their homicidal efficiency as soldiers in the wars of the empire—an efficiency almost equally characteristic of both nations. Hugh Miller dissented from both of the above opinions, and said, "For my own part I have been unable hitherto to see the steps which conduct to such profound conclusions, and am content simply to hold that the superintending Providence who communicated to man a calculating, foreseeing nature, does occasionally get angry with him, and inflicts judgments upon him, when, instead of exercising his faculties, he sinks to a level lower than his own, and becomes content, like some of the inferior animals, to live on a single root." This must be another injustice to the botanists, as well as to the Phytophthora, which was made the punitive agent, willy-nilly we suppose.

Botanical Studies.—The current number of *Knowledge* contains the second of the series of articles on Botanical Studies contributed by Mr. A. Vaughan Jennings, F.L.S., F.G.S. The first article was devoted to *Vaucheria*, of which the life history and mode of a reproduction were lucidly detailed. The genus *Coleochaete* is the subject of the second article. There are three species of this genus of fresh water Algae common to this country, and although the plants are frequently sterile the nature of their reproductive process is of considerable importance. The commonest species are *C. scutata*, and *C. orbicularis*. An examination of either of these will show that the plant consists of a flat plate of cells arranged in radial rows all in one plane and never superposed on each other. In *C. soluta* the rows of cells are separated for a great part of their length, whilst in *C. pulvinata* the cells are no longer in one plane, but grow up straight or obliquely, forming a cushion. The genus, therefore, contains plants showing a series of stages connecting the flat cell plate with the tree-like growth of such types as *Bulbochaete*. With regard to reproduction in *Coleochaete*, there are, as in *Vaucheria*, two distinct methods. In one case the protoplasm of some of the cells of the thallus contracts, rounds off, separates from the main body, and develops a pair of cilia, to form a free swimming zoögonidium. In the second case the contents of some cells form an oösphere, the female element, whilst other cells divide into four and produce antherozoids, the male element. The sexual fusion of these two elements results in the fertilization of the oösphere and forms fruit. This fruit remains quiescent during the winter, but in the spring rapid division of cells takes place, forming carpospores, which in their turn develop into new *Coleochaete* plants. We have thus in *Coleochaete* an early illustration of alternation of generations. A capital illustration shows the different processes referred to.

Presentation at Dunoon.—On Saturday evening, 12th inst., Mr. John Fraser, gardener, Ardenlee, Dunoon, was waited upon in the George Hotel by a number of friends, on the occasion of his leaving the district. After the usual loyal and patriotic toasts had been duly honoured, Commissioner Crosbie, who presided, in making the presentation, which consisted of a gold Albert and pendant with suitable inscriptions for Mr. Fraser, a gold brooch for Mrs. Fraser, and a purse containing money for each of their children, said they had now come to a very important part of the programme, namely, the part which had brought them together that evening—of presenting Mr. Fraser with a small memento of that happy evening and the many friends he was leaving in Dunoon. While they were sorry to part with him, he assured him, they would also rejoice at his success. In the more sunny south Mr. Fraser was sure to make his mark. (Applause.) Mr. Fraser feelingly replied, thanking all present for the kindness shown towards himself and family. Several toasts followed, including "The Town and Trade of Dunoon," proposed by Mr. McGilp and responded to by Commissioner Shields; "The Presentation Committee," by Bailie Millar, and replied to by Mr. McLeod, Hafton; "The Host and Hostess," by Commissioner Shields, and acknowledged by Mr. Charles Smith. Among those contributing songs were Messrs. Dewar, Speirs, McLeod, Currie, McGilp, McTavish, and Allison, altogether a very happy social evening being spent. Mr. Fraser, who has gone to a situation near Newport in Monmouthshire, is followed by the hearty good wishes of his numerous friends in the Dunoon district.

THE WEeping WILLOW.

SALIX babylonica, although it has a competitor for favour in the American Weeping Willow, is still to most people The Weeping Willow, and has a just claim to the title of the queen of Weeping trees. Anyone who has seen fine specimens of it planted where they have ample room to develop by the side of ornamental water with its long drooping branches falling down like sprays from a fountain into the water, will readily concede that it is a thing of beauty worth a considerable journey to see. A possible drawback to it is that to see its full beauty, a fairly large specimen is requisite; so that since the advent of the American variety which is better adapted to the requirements of villa gardens, it has not been so extensively planted as formerly. This seems regrettable, because the Babylonian Willow is a far more beautiful tree. The poet Pope is credited with its introduction to English gardens, for, being with Lady Suffolk at the time, her Ladyship received a parcel from Spain bound with withes, and thinking they might grow took one home and planted it in his garden at Twickenham, where it grew and became well known as Pope's Willow. It has a wide distribution, being a great favourite with the Chinese, and there is little or no doubt, but it was on its branches that the daughters of Zion in their exile hung their harps.—*W. B. G.*

BLUE AND GOLD.

Two of the most effective colours in nature are blue and gold, both of which are very much in evidence just now at Kew. The former is represented by *Chionodoxa Luciliae* var. *sardensis*, which was the other day a blaze of blue, a sheet of the most exquisite of cerulean tints. Some large beds have been filled entirely with this variety of the "Glory of the Snow," and the result is remarkably pleasing. As, however, the term "snow" is inappropriate this year, I would submit that the "Glory of Kew" would be more descriptive. Certainly it has added to the attractiveness of the Gardens, and caused many a visitor to utter exclamations of unbounded delight.

The "gold" is represented by a very fine form of the Dutch Yellow Crocus (*Crocus aureus*), which has been freely planted in several places, but in no place so effectively, or conspicuously, as on the mound beneath the Turkey Oak in the broad walk. A visitor to Kew could hardly miss them; they are a beacon, and send their light shimmering through the trees for quite long distances. They are a veritable bit of the field of the "Cloth of Gold," only better and brighter; in fact they look like brilliant sunshine

on the ground. Yellow is characteristic of warmth it is fiery or flame-like. This circumstance, I think, was noted by Tennyson, for he makes Ænone say:—
"Naked they came to that smooth-swarded hower,
And at their feet the Crocus brake like fire."—
C. B. G., Acton, W.

ROSE PAULINE LABONTE.

THIS is a grand Tea Rose for climbing in the greenhouse or conservatory, and practically unknown to most of our growers, unless they have it under a synonymous name, as I have hunted up several trade lists but fail to find it catalogued. Given a light position near the glass it is scarcely ever out of flower, and is of robust constitution. Lady Gertrude Rolle brought it from France just thirty-two years ago, and the original plant is still thriving at Stevenstone, North Devon, the seat of the Hon. Mark Rolle. We have a fine bush of it here under glass, which has been loaded with flowers the past six weeks. It roots freely from cuttings, and is worthy of extended cultivation. It is good in the bud and holds on well when expanded; the colour, a deep flesh, is most pleasing. I am sending a few blooms for you to see.—*J. Mayne, Bickton.*

[The variety is recorded in books as a flesh-coloured Tea Rose of moderate vigour with flowers of the third size; but after searching about a dozen catalogues of Rose growers we fail to find it mentioned by any of them. The flowers you sent us were large for this season of the year, firm in texture and durable. The salmon-flesh colour was slightly tinted with yellow in the centre, and the flowers being scented and handsome for cut flowers or other purposes, and the variety having been cultivated so long in Devon, we fail to understand why it should have been neglected so long by cultivators generally. The foliage sent was also of good texture, and of a rich dark green.—*ED.*]

READING AND DISTRICT GARDENERS.

"COMMON MISTAKES IN FRUIT CULTURE," was the subject of an exceedingly practical and instructive paper given by Mr. George Bunyard, of Maidstone, before the Reading and District Gardeners' Mutual Improvement Association, on Monday evening last in the Club Room, British Workman, Reading. Mr. C. B. Stevens presided over a large attendance of members, including a contingent from the Wargrave Gardeners' Association.

Mr. G. Bunyard in introducing his subject, said that his reason for taking up this particular one was that he, as an expert, had been very often called in to report on certain failures in fruit culture, and that if these failures were embodied in a sort of talk together, it would, he felt, be practical as well as being profitable to each one. The whole routine of the cultivation of Apples, Pears, Peaches, Nectarines, Gooseberries, and similar fruit was touched upon, including planting, the cropping of the fruit borders, summer pruning, root pruning, soils, labelling, importance of the early thinning of fruit, ingathering of the fruit, fruit trees in pots, grafting old trees, artificial manures, obtaining trees true to name, differing seasons, and the literature of the day as regards fruit culture.

The paper was followed with the closest attention, and at the close many questions were asked, and an interesting discussion took place, in which Messrs. Parfitt, Martin, Turton, Webb, Woolford, Neve, Hobbs, and Hinton took part. At the close a very hearty vote of thanks was accorded to Mr. Bunyard by the members as well as their congratulations on his and his family's escape from the terrible epidemic that has so recently visited his neighbourhood.

A great feature of the meeting was the magnificent exhibit of Orchids made by Mr. Woolford, gardener to Alfred Palmer, Esq., of East Thorpe, including some splendid forms of *Dendrobium nobile*, and *D. wardianum*, two pieces of the latter in four inch pans, carrying eighty and seventy-eight blooms. On behalf of the members the president tendered to Mr. Woolford their thanks for the trouble he had taken in bringing such a fine exhibit to the meeting, especially with regard to *Dendrobium nobile*, as at their last meeting a controversy had arisen as to the advantages and disadvantages of pruning *D. nobile*. Mr. Bright, of Whiteknights Park Gardens, showed a splendid head of a hybrid *Clivia*, and Mr. Neve, of Sindlesham House Gardens, varieties of Apples.

HINTS FOR AMATEURS.

THE ANNUAL POTTING.

LAST week we discussed the necessity of an annual clear out, and spoke of the broad general rules that must govern the work. This week we may go a little more into detail, and point out some of the special needs of the more important plants or classes of plants that find a place in the majority of collections. We must first of all, however, say a word or two about the condition of the soil. It should not be too wet when it is used. Too wet soil is a fruitful source of evil, especially if the bulk of it is loam, which has not too much fibre in it. Such soil is inclined to cake into a clay-like mass under moderate pressure, and the result is that plants whose root systems are not so vigorous as could be desired at the time of potting are scarcely given a fair chance to improve themselves in this respect. A good guide as to the condition of the soil is that a small quantity of it squeezed together in the hand should be sufficiently adhesive for the particles to cling together, but on being thrown back again on the bench should be friable enough to crumble. Soil in this condition will never "cake," except under exceptionally heavy ramming, to such an extent as to give the roots a bad time of it.

Pots.—All pots used should be clean, both inside and outside, and dry, not only for appearance sake, but for the good of the plants that are to be placed in them. If new pots have been obtained, these should be soaked for a few hours in water, and allowed to dry before it is attempted to put plants in them. To do so, before the pots had undergone this soaking, would have been very prejudicial to the roots, for new pots are of a harsh, thirsty, and unkindly nature. In ordering or choosing new pots, by-the-way, we may caution the amateur against the glazed pots which local dealers are so fond of pushing off upon amateur gardeners. Professional gardeners have a great dislike to these glazed pots, for the plants never do really well in them.

Palms.—Of all the plants which are grown in greenhouse, stove, and conservatories, warm and cool, Palms hold the highest rank. Year by year, they increase in favour and in numbers in the collections of those who love plants. As much of their value lies in their suitability for decorating rooms and passages in the dwelling house, when required, it is obvious that it is advisable to keep them in as small pots as possible. If proper attention is given, it is quite easy to have good sized plants with a considerable sweep of fronds in comparatively small pots. Under such conditions potting every year can be done without in many cases, and when a shift is given it should only be a small one, i.e., there should be just enough room in the new pot to work in a little soil between the pot and the old ball. Everybody must have noticed that many Palms, more particularly the Phoenixes, have a habit of throwing out a lot of roots at the base of the stem, and at the bottom of the pot; in other words, the root system is predisposed to vertical instead of lateral expansion. The effect of this is to raise the plants out of the soil so that a large cluster of roots at the base of the stem is here. Now, if we take the ordinary make of pot, we shall find that if we employ one deep enough to allow such a plant to be sunk sufficiently low to cover these exposed roots, the diameter of the pot is much too great, and the whole thing too big and very clumsy. To meet the case, therefore, a special kind of pot should be procured, having the depth very much greater in proportion to the width than the ordinary make.

In potting Palms, the staple of the compost should consist of good loam, the more fibrous the better. The best material will be furnished by loam that has been stacked for a few months, with alternate layers of fresh cow manure. If some of this can be obtained, it will be found invaluable for pot plants. All the addition it needs is a sprinkling of coarse river and silver sand, with perhaps a piece or two of fibrous peat worked in to lighten it a little if the loam itself is not very fibrous—if it is, the peat is not required.

For the guidance of those who have never attempted to pot a Palm (those of my readers who are comparatively experienced will kindly pass over this part if it bores them) we will go through in detail the operation.

Let us take such a plant as we have mentioned above, say a Phoenix rupicola, which has not been potted for several years, and which has been lifted out of the soil by the vertical extension of the root system. If it is a big plant, we shall probably find some difficulty in getting it out of the old pot. The first step in doing so must be to cut off the roots that have grown through the drainage holes in the pot. If the plant even then refuses to come out, the old pot must be broken. At the bottom of the ball we shall find a mass of thick fleshy roots. These it will not be wise to disturb to any extent, for all the liveliest roots are here, and the plant will suffer enough from the check of shifting, no matter how carefully it is performed, without breaking and injuring these roots. By means of a stout-pointed stick the ends of these roots may be loosened. Then turning attention to the upper part of the ball, we may remove all the soil that we conveniently can; any dead roots that are observed may be taken away at the same time. The preparation of the plant is now complete.

Now for the new pot. A large flat crock should be laid over the central hole of the pot, and others against the side holes, if there be any. Other smaller crocks may be laid carefully round to the depth of about an inch. It is not necessary to put in a lot of crocks, for in the first place there is not room for them, and in the second they are not needed as the network of roots at the bottom of the old ball will act as efficient drainage. Upon the crocks should be placed a layer of the roughest and most fibrous part of the compost, and then if there is room, which can be ascertained by trial, a little of the body of the compost may follow. Ram this firmly with the modern rammer we have previously referred to. Next place the plant in its new quarters in such a way that the stem is as nearly as possible in the centre of the pot. Once this has been achieved, the next process is to fill in the vacant space between the old ball and the side of the pot, and this part of the operation will require the utmost care and some patience, otherwise there will be hollow places with no soil, and the roots in the vicinity, having nothing to feed on, will perish. To perform the filling up properly, only a little compost should be put in at a time, working this down firmly all round with a thin lath in much the same way as an engineer packs the joint in a pipe. Continue the work until the top is reached, when the surface may be levelled down, and a little sharp sand sprinkled over to give it a finish.

Small plants and young seedlings in various stages come in very handy for a variety of decorative purposes, and some very pretty plants may be grown in large thumb pots, and from that size on to large sixties. It will be found advisable in these cases also to use the relatively deep, narrow pots for them. They can be obtained in all sizes. The young plants will not need to be potted quite so firmly as the old ones, but still the soil should be made fairly firm so as to put a check on gross growth.

Aspidistras.—Like the Palms, these may be grown for a number of years in the same pot, but there comes a time when a shift is necessary in the best interests of the plant, and the present is the most suitable time in the whole year to give it. Any large plants that are observed to have deteriorated in the size and substance of the leaf will be improved by a change to more roomy quarters. Propagation by division, too, may be best carried on at this season of the year. When it is desired to divide a plant into a number of pieces, a good deal of the soil should first of all be carefully shaken from the ball, and then by means of a sharp knife the division may be made. The pieces should be potted up singly into as small pots as will comfortably contain them, and placed in a warm house to give them a start. Aspidistras will do well enough in a cool house or room, and, indeed, in the more southern counties, they are nearly hardy, but after the check given by division a little coddling will enable them to pick up and make plants much more quickly than would otherwise be the case. The soil should consist of two-thirds of good loam and one part of leaf-soil, with plenty of sand and a few nodules of charcoal to keep it all sweet. The charcoal is an important item for Aspidistras, as, indeed, it is for all plants that require plenty of water, and that are likely to stay for a considerable time in the same pots. The drainage, too, should be liberal, and it is better to err on the side of giving too much rather than too little.—*Rev.*

Correspondence.

Questions asked by amateurs on any subject pertaining to gardens or gardening will be answered on this page. Anyone may give additional or more explanatory answers to questions that have already appeared. Those who desire their communications to appear on this page should write "Amateurs' Page" on the top of their letters.

Starting Gloxinias.—*Reader*: You need not pot up the backward Gloxinias for the present if you do not wish it. Keep them well supplied with water and place them on a shelf near the glass. Those tubers that have made shoots an inch in length should be potted up at once.

Peas in Pots.—I have raised a lot of Chelsea Gem Pea in pots. Please tell me when it will be safe to plant them out, and also the best position in the garden for them. I have a vacant part of a border facing to the south. Would this do? Please tell me also what room to allow between the rows.—*L. L. Norman.*

You may plant out the Peas without delay, the sooner the better, in fact, unless the weather brings us something unexpected in a heavy fall of snow. The south border will do capitally. As Chelsea Gem is a dwarf and compact grower, 15 in. will be ample space to allow between the rows. You will have to provide coverings so that they may easily be spread over the Peas if frost comes, which is more than likely.

Tuberous Begonias.—*Thos. Rood*: Prick the young seedlings out into shallow pans or boxes filled with light soil. The practice of elevating the surface of the soil above the rim of the pots in the way your friend does is amusing to him, perhaps, but otherwise of no value.

Tomatos.—*C. L. James*: You are late with the Tomato seed, for it should have been sown in January. Sow it at once in a brisk heat, and hurry up the plants.

Campanula Medium calycanthema.—*C. R. Cheyne*: The 7-in. and 8-in. pots will be quite large enough to flower the plants in. You may commence to feed when the flower spikes commence to make their appearance. It will be better to withhold stimulant until then.

Hyacinths Failing to Bloom.—*C. E. N.*: There has been a very general complaint about Hyacinths this year. The fungus which you speak of as being present in the undeveloped spikes may be the cause of the mischief, the bulbs having contracted the disease during their growth last year. It will be well to throw away the old bulbs at once as they will be of no service after this, and will only spread the infection. In any case they will not throw any more flowers after the central spike has gone off.

Erica hyemalis.—I bought three plants of this Erica in flower this winter. The flowers are, of course, all dead now. How must I treat the plants? I suppose they want trimming.—*N. Nolan.*

Yes, the plants will certainly want pruning. Cut them back nearly to the old wood. This will make them rather unsightly looking objects for a time, but they will soon grow out of that if you treat them well. They will require to be kept rather close in a gentle heat for a while after the pruning, in order to stimulate growth. You must not be surprised if you fail with them, however, for Ericas are ticklish things to manage, and this is a very critical season of the year.

Acacia cordata is the name of the plant you speak of, *C. T.*: It makes a good pot plant for the greenhouse, and usually flowers very freely. It is a somewhat slow grower, and it takes a few years to make a decent specimen.

Chionodoxas.—*G. T.*: You may shift the Chionodoxas if you like after flowering is over and the foliage has died down, but leave them alone unless you feel obliged to shift them. You may see the results of this in the way that clumps flower in the same place year after year. Their flowers are always finer and better than those produced by the plants that are constantly being shifted.

Passiflora Constance Elliot.—*Union*: You may certainly grow this pretty Passion flower in a pot or

a tub, but you will get better results if you plant it out. Why not make up a little border expressly for it? it would not take much trouble and would repay you. The border should be from a foot to fifteen inches in depth at least, and should be well drained. The soil may consist of equal parts of loam and leaf soil with sand.

APPLE ROYAL SNOW.

COMING as it does from Canada, this handsome Apple should succeed in this country. The high encomiums with which it has been spoken of by those who know it in the country of its origin, and the few who know it in this country, give cause for wonder why it should have so long remained a stranger to our gardens and orchards. In the matter of flavour it is compared to Cox's Orange Pippin for which it is contended to be the most likely rival for some years to come.

The fruit is conical, about 3 ins. high and nearly as wide below the middle. The greater portion of the skin is of an intense but lively red, and streaked with red on a yellow ground on the portion less exposed to direct sunlight, while the basal area is russety. The eye is closed and set in a wide cavity of moderate depth; at the opposite end the slender stalk is set in a deep and relatively narrow cavity. The flesh is white, hence the name "Snow." It is firm, but crisp and juicy, with a pleasant aroma and a flavour recalling that of the Pineapple according to those who have tasted it; or it is sweet and vinous according to others. Needless to say it is classed as a dessert Apple of the first-class, and comes into perfection for the table about Christmas.

In the autumn of 1896 the Canadians, by way of congratulating the Queen on the approaching completion of the 50th year of her reign, sent a magnificent consignment of this Apple, which they considered the very best they could offer for her acceptance. The fruit, including Apples, Pears, Quinces, and Grapes, duly arrived on the 18th November, and presented an attractive and tempting appearance. They were grown by the fruit farmers of Hamilton, Ontario, Canada. A stock of the Apple Royal Snow has been got up by Mr. W. Horne, Perry Hill, Cliffe, Rochester, Kent, who placed the accompanying illustration at our disposal.

THE BOTANICAL GARDENS, GLASGOW.

FOUR score years ago the Glasgow Botanical Garden was originated at the west end of Sauchiehall Road, where it flourished for a quarter of a century before it was deemed expedient to remove it to its present site in the Hillhead district. Like many a good old institution the garden had its vicissitudes. It would seem that the first twenty-five years of its existence were, until recently, the most notable period of its history. This will not be a matter of astonishment when we see that no less a savant than Sir Wm. Hooker, at that time Professor of Botany in the University, was at the head of the affair. Sir William was doubtless the chief spirit in its foundation; and from what can be gleaned from the history of the garden, he took more than the ordinary professorial interest in its welfare. He introduced many new plants which were at the time unknown in Britain. And we can easily conceive how interestingly botanical the garden at Sauchiehall Road would be under the zealous eye of an enthusiastic botanist like Sir William. There is reason to think that at this eventful era the garden attracted no small attention from all parts of Britain. It evidently attracted Kew, for ultimately Glasgow lost her revered professor, who was translated thither in 1841.

The following year the garden was removed to its present quarters. The necessity for this was occasioned by the ever-increasing growth of the building industry on all hands; and again there would be much benefit derived by removing the site further out from the unpoetical association of sooty walls and the din of street traffic. Yes, the garden once again is encircled with bulwarks of stone and lime with the exception that this time the area is more extensive, and consequently less liable to the injurious effects which would accrue from a closer contiguity to the carbon-laden atmosphere.

The situation of the garden for its natural beauty cannot be surpassed in the immediate vicinity of the city. The area within the walls is nearly forty acres,

twenty-two of which only were acquired in the formation of the garden previous to 1891, when the Glasgow Corporation rescued it from an impending decay. The remaining acreage was added to the garden recently and is now in process of being laid out by the curator, Mr. Dewar. This increment is a most judicious acquisition, inasmuch as it perfects the garden. Hitherto it was bounded on the north by the classic Kelvin, and contained but one side of the beautiful Kelvingrove, celebrated in the song "Let us haste to Kelvingrove, bonnie lassie O." Now the other side belongs to the garden and is connected by bridges. Moreover, this addition is very probably the actual scene round which the poet depicted the sentiments of his song. There are still the remnants of the "Three Pear Tree Well," the famous trysting place of lads and lassies. It is much to be regretted that when the underground railway was pierced through the bowels of the garden a few years ago, the well which had become well-nigh sacred had been almost obliterated. The "mill," too, disappeared some years ago, though it might, as an old ruin in the valley and having a classic connection, contribute a charm peculiar to itself to the landscape. Yet, perhaps, its demise is not a matter of regret. Again by the acquisition of this ground, many of the remnants of the Kelvingrove old forest trees will be preserved from the ruthless hand of the unsentimental huilder.

The uneven nature of the garden, though an invaluable merit from a picturesque point of view

form of a waterfall, and falls down a very pleasing bit of artificial rock work. On both sides the new rockworks, also the creation of Mr. Dewar, flank a walk which runs at right angles to the cascade and water course. This rockery was constructed with very much difficulty, due to the little or no help afforded by nature, as well as the artificial excavations necessary to make the idea of a waterfall possible, the pond and the original surface being level. The rockeries are well stocked with rare Alpines, and since their completion they command, along with the ponds, perhaps, more of the public attention than any other department of the gardens.

There have been many other improvements of no less importance made by the curator in the short time he has discharged the responsible duties of his office, and no doubt many more would have been, did the nature of the soil lend more kindly aid.

The soil, it may be said, is extremely bad, a feature which could never have been taken into account when the site was agreed upon. Clay, clay, wherever the spade is put into the earth, and what is worse it is that impenetrable boulder clay with a substratum as impervious to water or air as rock itself.

Only those who have had the unfortunate experience of the working of such soils as the Botanical Garden is composed of, know how discouraging are the results of the horticulturist's labours under such conditions. In ordinary cases, the rule "stick a

APPLE ROYAL SNOW

presents a standing difficulty in successfully overcoming the introduction of a body of water of any appreciable extent. There is always much peculiarly interesting attached to aquatic denizens, let them be vegetable or piscatorial. They seldom fail to attract the attention of many who are otherwise incapacitated for admiring all round natural beauty. However small, therefore, the provision for water may be in a public garden, the common good which it serves is undoubtedly incalculable.

Mr. Dewar, the able curator, on being appointed, evidently saw the drawback of the want of a pond for hardy subjects, set to at once to construct such, and with much difficulty successfully managed to form two circular ponds. Though, perhaps, not so spacious as the extent of the garden demands, yet they give a totally new character to the former monotonous aspect of that part of the garden. These have been filled with their several plants according as they were made to suit.

The one is entirely a Lily pond, and is a beautiful sight in the summer months, notwithstanding the illicit appearance of a patch here and there of the dreaded "Elodea canadensis," better known as the "Anacharis alsinastrum." The other is a semi-marsh and contains a capital collection of natant and semi-natant plants, native and exotic, among which may be seen with its beautiful flowers, "Aponogeton distachyon."

The excess water is very artistically utilised in the

plant in an 'it 'll grow' will not hold good in such soils. Everything has to have prepared for its reception an artificial soil; and even then the uncongenial quality of the natural soil somehow infects the artificial with its deleterious constituents, with the result that few things can be got within the range of our expectations. With unremitting energy and determination to overcome this insuperable defect, Mr. Dewar has, as far as his experiments have extended, almost entirely achieved his expectations.

The flower garden, which confronts the visitor on entering the gate, is amply sufficient to testify to his success in that direction—the luxuriant foliage and inflorescence, for instance, of Fuschia Mrs. Marshall, are each summer and autumn a decided treat to witness, and enough to show art triumphant.

The exposure, to add to the difficulties to be contended with, if not bad, is, to say the least, not good. The west, east, and south winds sweep with considerable force on the elevated sides of the gardens, with the result that many plants, from this reason alone, cannot survive the trying ordeal. But one of the most pernicious, perhaps, of any evils, is the precipitation of soot, no doubt strongly impregnated with noxious effluvia from the abundance of chemical works in the city. Recently, our attention was directed to the had effects of this atmospheric poison. The Holly trees in all parts around the city, inclusive of the Botanical Gardens, were almost denuded of all their foliage in a week. From

beneath some trees we observed over a barrow-full of green leaves being gathered.

Coniferae do not succeed in the gardens. This is a matter to be greatly regretted, for the wealth of species included in this interesting order, is, of itself possible to make a public garden generally attractive and admired. Doubtless much of the reason for the failure lies in the united action of the triple causes already alluded to as being so inimical to vegetation. Yet, in spite of all these seeming defects, they are to a very great extent neutralised by the adjoining woody "Grove." This, no doubt, would weigh greatly in the selection of the site, and unquestionably redeems any fault otherwise committed in this duty of importance. The romantic glen through which the winding "Kelvin" flows is a steep declivity adorned with grand specimens of old Beeches, Oaks, and Elms, that must have waved their ponderous heads in the gales of centuries. Every attempt is made to preserve this truly delightful grove in its most natural character. With meandering walks traversing each shady bower and ferny "neuk" the effect is intensely pleasing. Here is a spread of scented Bluebells, whose fragrance fills the summer air; there the olive-green mantle of the bracken; while overhead the leafy canopy of the wide spreading giants of the grove bids defiance to the penetration of a single solar ray.

But, alas! where beauty is greatest, lies unnoticed to the general eye the effects of the "cankering worm." Amid all this scene of pleasure and animation (for the thrush and her sister songsters pipe their tunes from early morn till late at night here, unmolested), the practised eye will discern the fast falling inroads of decay upon the old remnants of the "Grove" forest. What it is owing to is not very clear. It certainly cannot be due to old age, nor does it appear to be on account of the subsoil. What is a very probable cause is an atmosphere surcharged with chemical poisons escaping from the factories. In point of fact, it is nothing more nor less than a similarity to decline in the human race—the lungs are affected in both cases. Deciduous foliage is short-lived in the vicinity of Glasgow, and it invariably never gets the ordinary opportunity to ripen. The leafage falls from the trees in a sickly green state, consequently much of the wonted elaboration of the sap is not being performed, and as a rule, on the approach of very little frost, the young twigs die back to half their length. Year after year, the trees being subjected to such treatment, must in due course give way to decay and death. The Birch, Ash, in varieties of which a good many are here represented, and strange to say *Acer occidentalis* [? Ed.] do well here. The Tulip-tree, and *Dimorphanthus* do well also, and several varieties of Juglans and Cotoneaster. The Spanish Chestnut to all appearance succeeds well.

There is a very elaborate natural arrangement in which the orders are well represented, mostly, however, of a herbaceous character. Carices and grasses are, too, well to the front, while, as already hinted, the aquatic section is well in evidence. The curator is specially favourable to the development of herbaceous subjects, and has been putting forth much energy in renovating the extensive borders with good results despite the perverse character of the soil. In the spring months the *Narcissi* family make a fine display in the beds and borders; they agree with their conditions remarkably well. Most herbaceous plants do take kindly to the soil. It is of course well prepared for their reception, and as they do not as a rule penetrate to the cold subsoil the danger of failure is kept at bay. Carnations, in especial, make a magnificent show, and considering the heavy texture of the soil, however much it is artificially made up, this is somewhat astonishing. One would almost expect that the high average rainfall in this locality would annihilate them in the winter. On the contrary this queen of flowers seems to enjoy the cold, sodden soil such as a Glasgow winter produces. At all events they luxuriate here in a manner that takes the admiration of all. We refrain from mentioning the inside department meanwhile. To give it anything like justice, it demands a separate notice.—*D. Chisholm.*

Vineyards occupy about 19,000,000 acres of the earth's surface, and France owns about one-third of that area. Before the advent of phylloxera she possessed more, but planting is again being extended.

ELAEAGNUS PUNGENS VARIEGATA.

This is a capital plant when grown in pots. It yields well to training, and when grown freely in small pots, and not too formally, does good service for table and room decoration. When grown into large specimens with abundance of long shoots it is valuable for cutting. I have not been successful in growing it in ordinary shrubberies, but I think (even in cold districts) it would do well. On walls we have had it very beautiful with its pale yellow variegation well developed. About a quarter of a century ago I purchased large specimens in a Middlesex nursery, thinking the plants were suitable for greenhouse purposes only, and there cultivated as such for some years, and was well rewarded with a good supply of shoots for cutting during winter, as well as by the telling appearance they displayed among Camellias, Azaleas, Myrtles, Oranges, &c. I fear we have drifted too much into the practice of growing tender plants only, and many species (hardy and beautiful) are excluded.—*M. Temple, Carron, N.B.*

HORTICULTURAL SUNDRIES.

Not having previously inspected the new premises of Mr. H. G. Smyth, Clark's Mews, High Street, Bloomsbury, London, W.C., we proceeded there the other week, and found everything in excellent working order. The block of buildings in which the premises are situated, as well as other surrounding blocks, having been recently rebuilt, Mr. Smyth had an eye to the suitability of the place for his own particular stores and directed the arrangements accordingly.

Commencing in the basement, which has a concrete floor, we found a huge pile of the best Orchid peat so full of fibre that when grasped by the hand it had the consistency of shag tobacco, and the colour of that article as well. Orchid peat is one of Mr. Smyth's specialties, and he takes the trouble of making certain he gets the very best to be had. Here also were stores of brown fibrous peat for ordinary purposes, and peat mould for Ferns. Horticultural charcoal, made from the stems, roots and branches of trees by a smouldering fire, is in excellent condition.

Manures of various kinds are kept in stock including bone meal for lawns, and other purposes and $\frac{1}{4}$ inch and $\frac{1}{2}$ inch bones for vine borders. Smyth's Fertiliser is one of the best all round manures for lawns and grass land generally. It may be used as a powder and scattered in the dry state, or dissolved in water and distributed by means of the watering can. It is also useful for Tomatos, Potatos, Onions, Chrysanthemums and other garden plants, for which it is gaining in popularity. It is displacing the A 1 Peruvian or Government guano for the reasons just given. The latter is still kept in stock, however. Thomson's Manure and Clay's Fertiliser receive due attention, and are supplied to customers.

On the next floor, slightly above the level of the pavement outside, great brick bins have been built for the accommodation of other, but no less essential, requirements of the garden. One was occupied with sphagnum, and another one with cocoanut fibre refuse. A third was filled with leaf soil, and a fourth with silver sand. The best yellow fibrous loam is stacked on the floor, and shows its valuable character by the quantity of fibre which it contains.

Articles of a lighter nature and for all sorts of purposes are stored upon the next floor above, where we found tackle for hoisting or lowering, according to requirements, the packages of all sorts of goods. Round, dressed and pointed stakes, 5 ft. 6 ins. to 5 ft. 10 inches are meant for staking Dablias, Roses, herbaceous plants or anything of that sort, and meet with a ready demand amongst gardeners. Durable and neat bamboo stakes ranging from 4 ft. to 7 ft. in length are meant for staking Chrysanthemums. Nothing lighter and more durable could be used. Branching bamboo twigs, the tops of the stems, are handy for supporting such things as French Beans, Sweet Peas, Smilax and many other things of a climbing nature. Deal sticks are not overlooked but kept in quantity, in sizes ranging from 1 ft. to 5 ft. in length. Here also are broad wooden labels for the naming of vegetables, plants in the herbaceous border, etc. They have a soft, smooth surface, easy to write upon. Aspen wood wool for the packing of fruit is pure white, as soft as silk, and as a matter of fact free from every taint of turps, being made from

the wood of the Aspen Poplar. Nothing is more suitable for the packing of fruit and flowers that have to travel by rail or post.

Sussex trugg baskets, the handiest and most useful article in the garden for collecting and carrying all sorts of things, may be seen in eight sizes. Quite of another kind are the two-handed cane baskets for cleaning out stokeholes, carrying coal, coke or anything of that nature. They are made by the blind, we were informed. Strong garden sieves with meshes of different sizes are made to meet every requirement. Close by them a pile of Archangel and heavy Petersburg mats caught our eye, but such familiar things need no description nor detailed account of their uses for gardeners. Racks and shelves serve as stores for a varied assortment of hair brushes and bass brooms, and Horsey's patent brooms, the fibre of which is put in with wire and not glue, so that neither wet nor heat will ever cause the fibres to fall out. The pot-washing brushes should prove a boon to the modern apprentice or garden boy. They are furnished with a short handle, and the brush end is conical. Formerly the pot-washing brushes were of a most uncouth shape, and their use reminds us of the proverbial square peg to be put in a round hole. They are made in sizes to suit pots up to a certain dimension, where they are not particularly required of this shape. Other requirements of a miscellaneous character are bouquet and stub wire, Wolff's garden pencils, thermometers, gardener's gloves, budding and pruning knives, vine scissors, shred scissors, syringes of first class manufacture, raffia for tying, secateurs, etc. Tar string, plain string, as well as a strong and specially made material for garden lines, have all their uses in every garden.

Blue serge and shalloon supply the best materials for gardener's aprons. Tanned netting for the protection of fruit trees and bushes will be in requisition presently. Shadings of various description are supplied, but the making of blinds has become quite an industry. They are made of any size or shape according to order. The material consists of something which looks like soft, white string that is woven so as to form small or close meshes that admit the light while breaking the force of the sun's rays. They are bound round the edges with a strong cloth, and by this they are attached to the rollers. They are strong and extremely serviceable.

Garden tools of all kinds are supplied, including spades, forks, hoes of various kinds, and lawn mowers bearing any maker's name. Haws's Patent Watering Can is made in eight different sizes, the two smaller sizes, holding two and three quarts of water respectively, being shelf cans for watering Strawberries and plants on shelves generally. Being specially made for the purpose they are very handy. Then come the propagating and greenhouse cans, holding two and three quarts respectively. Four sizes of the nurseryman's cans hold six, eight, ten and twelve quarts of water respectively. These are very strong, and bound with galvanized iron hoop round the bottom, while the bottom itself is strong and calculated to last much longer than those of the ordinary cans. All are furnished with strong brass sockets and unions, together with roses and other useful appliances. Special features of Haws's cans are that a rim round the top prevents them from spilling, while they may be lifted by a rod-like handle fastened to the spout at one end and to the top of the can at the other. Square teak Orchid Baskets range in size from 3 in to 12 in. square, and are furnished with copper wire hangers. Mr. Smyth has also stored and sold pot-shaped teak Orchid baskets for many years. They are very serviceable for Cattleyas, Phalaenopsis, &c., and may be had of any size to order.

Smith's Weed Killer for walks, &c., may be had in quantities ranging from four to forty gallons. Akin to this are the insecticides, including Lemon Oil, XL All insecticide, flowers of sulphur, soft soap, Gishurst Compound, and the XL All Vaporising Fumigator; also tobacco rag, tobacco powder, tobacco juice, and Appleby's compound tobacco paper in packets. Though not an insecticide, gishurstine, useful for softening and preserving gardeners' boots, may also be mentioned here.

All these and many more things we saw, and had evidence that Mr. Smyth not only caters for every want of the garden, but takes great care to keep good articles of every description. On the walls of the office hangs the Royal Warrant which authorises and acknowledges him as a Purveyor of Horticultural Sundries to Her Majesty the Queen.

DAFFODIL SHOW AT TRURO.

15th and 16th March.

THE Cornwall Daffodil Spring Flower Society held their second annual show in the Concert Hall, Truro, under the auspices of genial and glorious weather, where the full tide of floral beauty arranged on long lines of tabling and coming from brilliant enthusiasts on the Cornish coast, resulted in a keen competition. The secretaries and Truroites must be congratulated on the way they have encouraged the love of culture of Daffodils to such perfection and to have made such a glorious exhibition of the same.

For Barr's Daffodil Prize Cup, the Rev. J. T. Boscawen, Buckland Monachorum, Truro, came in first with a splendid assortment of fifty varieties of magnificent flowers, in which figured Mrs. J. B. M. Camm, R.P. Barr, Mr. Camm, and some really beautiful C. J. Backhouse, with the largest and deepest stained cup that has been seen for a long time; Little Dirk and Sir Watkin were also fine. C. E. Tregoning, Esq., was a very good second, showing Henry Irving, Emperor, Maximus, Mrs. Langtry, Queen Bess, and Queen of Spain, and the Sulphur Hoop Petticoat (*Corbularia citrina*), very large. Very close to the above was D. H. Shilson, Esq., of Trewiddle, with Santa Maria, Mr. and Mrs. J. B. M. Camm, Empress, Katherine Spurrell, Minnie Hume, and fine specimens of *Barrii* Conspicuous.

For Mr. T. S. Ware's (of Tottenham) Cup for thirty varieties, distinct, P. D. Williams, Esq., took the Cup. This was a keen class of six entries. Mr. Williams had some grand specimens of Mrs. Thompson, Henry Irving, Sir Watkin, Cernuus, Capax plenus, C. J. Backhouse, specially fine, also *Barrii* Conspicuous. Chas. Dawson, Esq., was second, Sir Watkin in this group was certainly the finest in the show, the flowers measuring quite 6 in. across. He also had Emperor, Leedsii *amabilis*, Beauty, Empress, *Barrii*, Orphee, and Little Dirk, both very good. The third prize went to Miss Curry, of Lismore, Ireland, who sent a charming collection consisting of about sixty varieties, and well grown.

For ten distinct varieties of Magni-Coronati, C. E. Tregoning, Esq., was first with magnificent flowers of Golden Spur, Bicolor Empress, Horsfieldi, Queen of Spain, Maximus, Princeps, W. P. Milner, Major, and Emperor. The second prize was taken by Mr. D. H. Shilson, in which group Mrs. J. B. M. Camm and Santa Maria were good. For five distinct varieties of Magni-Coronati, Mr. J. C. Williams came to the front; W. Cole Pendarres, Esq., was second, Mrs. Thompson and Golden Spur being exceptionally fine. For ten distinct varieties of Medio-Coronati, the Rev. J. T. Boscawen was first, in which group C. J. Backhouse, *Barrii*, Orphee, and Duchess of Westminster were most conspicuous; Mr. D. H. Shilson was a good second. For five Medio-Coronati, Mr. J. C. Williams took first, *Barrii* Conspicuous and Katherine Spurrell being very good. Lady Margaret Boscawen, of Tregye, was a close second.

For not less than four varieties of double Trumpet and Incomparabilis varieties, Lady M. Boscawen was awarded the second prize, having flowers of good form and fully double. The same exhibitor took first for four distinct varieties of Polyanthus Narcissus, Soleil d'Or, and Grand Monarque being exceptionally good. Miss Paull was second. For fifteen distinct varieties of any section, Mr. Chas. Dawson took the lead; Lady M. Boscawen was second. For the finest single specimen, Jonathan Rashleigh, Esq., was awarded first with *N. bicolor* Horsfieldi. For the finest in the Medio-Coronati section, Mr. Chas. Dawson was first with an enormous flower quite 6 in. across. For the finest seedling Daffodil, not in commerce, Mr. J. C. Williams took the palm with a finely formed flower, having a pale sulphur, long, and beautifully frilled trumpet, and good perianth segments of the same colour.

The second prize for Daffodils in pots was awarded to Mr. C. E. Tregoning. For Polyanthus Narcissus in pots, Mr. J. H. James got a second prize. For a bouquet of Daffodils, foliage optional, Mrs. M. Tucker was first with a very artistic arrangement; Miss Catherine Boscawen was second; and Lady M. Boscawen, third. For a bowl of Daffodils with their own foliage, Miss M. E. Williams was a good first with a large bowl of choice Daffodils loosely arranged. Mrs. Powys Rogers was second; and Miss Gatley came in third. In a similar class open to all exhibitors, Mr. C. E. Tregoning was second.

Table decorations were all very beautiful and light. In this class the Hon. Mrs. Gilbert, of Penhale, took the first prize with an elegant mirrored centrepiece and corner sprays of the Daffodil, resting on the foliage of Asparagus. The second prize went to Miss M. Gatley, Tresillian, being a close second; but perhaps too heavily arranged in a huge basket with the foliage of Daffodils planted or draped in orange and sulphur-coloured Pongee silk. The third prize went to Mrs. Powys Rogers.

In the classes for spring flowers the beautiful scarlet *Anemone fulgens* reigned supreme; indeed, the size of these flowers is wonderful, measuring 3½ in. to 4 in. across, and of the rich, brilliant scarlet so telling in gardens. Mr. M. H. Williams was

that one has been accustomed to see in the bulbous favourites. Mr. C. E. Tregoning was a good first, and Mr. T. H. James a close second. In the class for six pots of Hyacinths Miss Paull and Mr. C. Hill were first and second respectively. Entries were very weak in the Tulip class, Mr. C. E. Tregoning taking first.

Violets are certainly at home at Tregye, Perranwell. Lady M. Boscawen took first with some marvellous specimens of Marie Louise and the old Neapolitan. Miss Sybil Wingfield was a close second with Lady Hume Campbell, Marie Louise, and Comte Brazza.

The president of the society gave a special prize for a group of Rhododendrons, any variety. These were showy, many new and beautiful hybrids being represented. The prize goes to Mr. D. H. Shilson, of Rhododendron fame. In the class for six distinct varieties of Rhododendrons Mr. Shilson is first with *Arborescens*, and *Javanicum*, a beautiful orange and terracotta, *Veitchianum*, and others. Mr. Jonathan Rashleigh was second. Mr. Shilson is again first in the class for cut Sikkim Rhododendron, and again first for cut Ghent Azaleas. Mr. J. C. Daubuz takes first for the finest specimen *Camellia*, Mrs. Powys Rogers being second. For the best six *Camellias* Mr. W. Cole Pendarres was first, and Mr. J. C. Williams second. For the best group of hardwooded outdoor flowering shrubs Mr. M. H. Williams came in first with some well-furnished sprays of blooms, such as *Spiraea hypericifolia*, *Berberis Darwinii*, *Ribes sanguinea*, &c. Mrs. John Williams took the second place.

The trade exhibits were excellent, and filled the upper room with their contributions in fine style, many being of sterling merit. From Messrs. Barr & Sons, of Long Ditton Nurseries, Surrey, came a grand display of Daffodils, for which the firm is famous. One variety amongst their group, introduced by them last year and named "Victoria," seems larger than we saw it here last year. Their collection consisted of such varieties as *N. Barrii* conspicuus, very fine; Sir Watkin, Sulphur Phoenix, Orange Phoenix, Cernuus, a beautiful white, and Cernuus pulcher. Of the Ajax section Emperor and Henry Irving were good. In addition to Daffodils Messrs. Barr had a very prettily arranged group of Alpines, such as *Cyclamen Coum*, and *C. ibericum*, *Fritillaria pluriflora* and *ruthenica*, Wilson's Blue Primrose, and many other interesting flowering plants.

Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, also contributed an extensive group of Daffodils, in which the flowers of *Narcissus spurius coronatus* were fine, also *N. Cynosure*, *N. obvallaris*, *N. scoticus*, *N. Golden Spur*, and *N. bicolor* Horsfieldi. Mr. Ware also had arranged as a border to his Daffodils a number of Anemones, Saxifragas, *Chionodoxa Luciliae*, and *Primula denticulata*.

Messrs. Dickson, of Chester, sent a very good group of Daffodils, in which figured *N. tortuosus*, Queen of Spain, Campernelli, Jonquils, bicolor Horsfieldi, Empress, Emperor, and *Chionodoxas* in variety; also a specimen of a new *Crianium* named *yemense*. Its flowers are a pure white, with delicate pink tips, dark brown peduncle, and very sweet scented.

From Messrs. R. Veitch & Son, Exeter, came a collection of plants, such as Rhododendrons, *Pernettya atrococcinea*, a nice plant of *Eurya angustifolia* variegata, Azaleas, Magnolias, Prunus, Acacias, *Olearia stellulata*, and some fine plants of *Cyclamen persicum*.

T. A. Dorrien Smith, Esq., of Tresco sent (not for competition) a very unique collection of *Narcissus* and Polyanthus *Narcissus*, amongst which *N. incomparabilis* Princess Mary was very fine, also *N. Barrii* conspicuus, and many other good varieties.

Capt. Prinwell, of Trehane, contributed (not for competition) some very fine varieties. *Narcissus maximus* was exceedingly fine, its large, bold flowers towering on stems like walking canes about 3 ft. long.

The general effect of the show was far in advance of last year, and promises to be a very thriving one. Rev. Mr. Engleheart, of Daffodil fame, acted as judge, in which position he had some hard tasks.

Iris Kaempferi by the Acre.—In Floral Park, N.Y., U.S.A., there are four acres filled with this grand section of Irises. When the plants are in flower the sight is simply magnificent.

FRITILLARIA PLURIFLORA.

first, and Lady M. Boscawen second. For *Anemone coronaria* Mr. P. D. Williams was first with enormous flowers, the colour being very bright; Mr. R. Nowell Ustiche was second, and Miss C. H. Rogers third. Mr. P. D. Williams is again winner in the class for Polyanthus, the Rev. J. T. Boscawen being second, and Mr. Chas. Hill third. In Primroses Mr. P. D. Williams gained first; Mr. D. H. Shilson was second; and Miss C. C. Rogers third. For twelve distinct, cut, tuberous plants Mr. D. H. Shilson took first with some wonderful specimens of *Scilla hispanica*, *Leucojum aestivum*, *Doronicum plantagineum excelsum*, *Helleborus colchicus*, &c. Mrs. Powys Rogers was second. Hyacinths were fairly good, but lacked the strength and character

FRITILLARIES.

FRITILLARIES rank amongst the most graceful and interesting of our Spring flowers, and are worthy a place in all choice borders and rockeries; in grass they are quite at home, especially where they can get a little shade. At present, in Messrs. Barr & Sons' Nurseries, at Long Ditton, two very beautiful species are in bloom, one—the first to open this season—*F. oranensis* from Algeria, with very striking, handsome bell-shaped flowers, of a rich maroon, with bright green midrib. This first opened its beautiful pendant flowers on February 8th.

Next to it is *Fritillaria pluriflora* (see illustration, p. 475), a species recently introduced from California, and as yet little known. The flowers are of a beautiful soft rosy Lilac, and borne in the axils of the leaves, on stems 12 in. to 15 in. high. It appears to be quite hardy, and is being cut from the open at Messrs. Barr's Nurseries. There are many other beautiful Fritillaries which have yet to open and charm our vision, to wit, the dainty *F. armena*, covering the ground with its quaint yellow flowers; *F. aurea*, with its large golden bell-flowers, which are beautifully tessellated; *F. persica* from Mount Ararat, with handsome pyramidal spikes of dusky brown bell-flowers; and the rare and beautiful *F. Walujewi*, with flowers blood-red inside and silvery on the back of the petals. Then comes the well known Snake-head *Fritillaria* (*F. Meleagris*), so-called from its tessellation resembling that of a snake. Perhaps the most beautiful of all is *F. latifolia nobilis*, introduced by Messrs. Barr a few years ago. It has the largest bells of all; the colour is a rich deep blood-red, and the segments are beautifully tessellated.

Fritillaries can be strongly recommended to all who have shady nooks, and shady parts on their rockery and gardens, and they are most effective. When associated with such charming spring flowers as *Chionodoxas*, *Muscari*, *Anemone blanda*, *Narcissus minimus*, the Hardy *Cyclamen*, and Winter *Aconite*. The best soil, however, for Fritillaries is equal parts of loam, peat, and sand, with a little mortar rubbish, well mixed with the whole, if at hand. If the bulbs are lifted after flowering, never allow them to get dry; they should be kept in silver sand in a cold house free from frost until planted.—*Hardy Plantsman*.

THE NATIONAL CHRYSANTHEMUM SOCIETY.

THE adjourned annual meeting was held at 6 p.m. on the evening of Monday, the 21st inst., at Anderton's Hotel, Fleet Street, E.C. The chair was again filled by Mr. T. W. Sanders, who had an onerous task in view of the stormy character of the meeting.

The principal business on hand was the formal adoption of the report and balance sheet for 1897. Before this came on for consideration Mr. B. Wynne said that as Mr. Gordon had spoken at the last meeting of medals having been awarded which had not been paid for, he felt constrained to return the one voted him by the society for service rendered. Mr. Gordon explained, however, and discriminated between the medals, of which Mr. Wynne's was one, that had been paid for, and the gold medals, and illuminated addresses costing £22, which had not been paid for at that time. Mr. Wynne accepted Mr. Gordon's explanation.

The minutes of the February meeting having been read and adopted, after an error in the figures given as the result of the voting upon the amendment to the report had been rectified (the exact figures were 82 for the amendment and 6 against), the revised financial statement was brought out. Some further corrections were made in this. As it stands now it shows a totality of expenses amounting to £1,171 5s. 2d., and receipts £1,123 9s. 10d. There is thus a deficit on the year's working of £47 15s. 4d. £50 has been withdrawn from the reserve fund, as the bank will not allow a less sum than £50 to be drawn from deposit. The deficit of £47 15s. 4d. has been made good out of this £50, and the balance £2 4s. 8d. has been transferred to the current account of the reserve fund, making this item £8 17s. 8d., and the whole reserve fund £58 17s. 9d.

The value of the prizes in money and medals given during the past year has been £533 16s., and the whole of the liabilities of the society, especially items of £42 8s. to Messrs. H. M. Pollett & Co., and £41 16s. to Mr. J. A. Restall have been cleared off,

so that the society has now a clean sheet and a fresh start. Mr. Cholmeley asked why the financial statement did not bear the auditors' signature, and it subsequently transpired that the auditors had refused to recognise the alteration, a written statement from them to this effect being read by the chairman, and this was supplemented by *viva voce* remarks from the gentlemen themselves, who it will be remembered are Messrs. H. J. Cutbush and A. E. Stubbs.

Several items in the statement of accounts were explained by Mr. Dean, who also made answer to Mr. Gordon's comparison of the show expenses of 1897 with those of former years made at the last meeting. Mr. Dean denied most emphatically that they were heavier. They only appeared so because he had not followed the practice of his predecessor in splitting up the items under various heads. If they added the whole of the costs of cartage, hire of plants, and avowed "show expenses" they would find that in 1889 the total expenses for three shows were £53 1s. 10d.; and in 1891, for the same number of shows, £42 12s. 6d.; whilst the Jubilee shows of last year, five in all, only cost £59 15s.

Mr. Moorman passed strictures upon the extravagant items for printing and medals, and advocated the invitation of tenders for each. He deprecated the way in which they had gone to the world as a flourishing society, when in reality they were not so. He thought they ought to place the £50 for "stamps, telegrams, etc." under show expenses. This Mr. Dean made haste to refute, saying that the postal charges for various things were very heavy and made a big aggregate. Mr. Dean's answer was satisfactory and to the point on this head.

Mr. Starling again referred to the alleged balance of £10 10s. 8d. at the beginning of the year, which, he said, ought never to have been placed as a balance in hand. They ought to have a reserve fund of £300 or £400, and instead of that they had only a paltry £50.

Messrs. Newall, Spicer, Waterer, McKerchar, Willis, Mills, Rundle, Tagg, Gordon, and Bevan all joined in the discussion, which was exceedingly animated, and even incisive at times. Both Mr. Starling and Mr. Willis were emphatic in saying that, despite assertions to the contrary, the auditors must have known of the liabilities of the society, since the very bills that they were supposed to have scrutinised bore receipts for payments on account.

Finally on the motion of the chairman, seconded by Mr. W. B. Beckett, the financial statement obtained the formal sanction of the meeting and it was decided that it should be printed and circulated among the members.

Next came an estimate of the minimum receipts which the society might expect to have during the coming year, and the maximum expenditure for the same period. It was found that the total receipts would probably be £1,066 11s., and the expenditure £1,115 1s. 6d., or a balance of £48 10s. 6d. against the receipts. Proposals were mooted whereby the expenditure would be reduced to £1,044 3s., which would leave a balance in hand of receipts over expenses of £22 8s. This met with the approbation of the meeting.

The report was the next item of contention. Mr. Wilkins drew attention to the incongruity of the report and financial statement, and Mr. Cholmeley ridiculed the "high falutin" phrases about the society's undiminished prestige, and financial soundness. The report was, however, carried, with the exception of the paragraph referring to the special class for twelve vases of Chrysanthemums, which has been abandoned. The belated report did not reach its haven, however, until it had received a good deal of criticism from all parts of the room.

The election of officers was the next item on the agenda.

Mr. H. Cannell, senior, proposed, and Mr. Langdon seconded that Sir E. Saunders should be re-elected president. This was carried unanimously, whilst a vote of thanks was subsequently passed to Sir Edwin for the support he had given the society.

The committee recommended that Mr. J. R. Starling, the retiring treasurer, should be made an honorary fellow of the society, and should be presented with a letter of thanks signed by the president, and a small gold medal. Mr. Beckett proposed this, Mr. Ballantine seconded it, and the whole course applauded. Mr. Starling replied in suitable terms.

Mr. Moorman proposed, and Mr. Rundle seconded that they should have a paid secretary who should have no vote. This was carried with unanimity.

There were two candidates for the treasurership, Messrs. Ballantine and Gordon, and two for the general secretaryship, Messrs. R. Dean and G. W. Cummins, also a goodly number of nominees for the committee. The ballot was resorted to in order to decide the question satisfactorily.

The results were that Mr. Ballantine was chosen treasurer, and Mr. R. Dean general secretary, the latter by 63 votes to 43. The following gentlemen were asked to serve upon committee:—Messrs. T. Bevan, G. Langdon, A. Taylor, W. Howe, W. Wells, W. Higgs, J. P. Kendall, T. L. Turk, F. Gilks, J. T. Simpson, R. Fife, W. Daniels, and A. Outram—13 in all.

Mr. T. W. Sanders takes the office of chairman, and Mr. P. Waterer that of vice-chairman of committee for another year, whilst there was no mistaking the cordiality of the invitation extended by the assembly to Mr. C. Harman Payne to continue the duties of foreign corresponding secretary, which he has performed so well.

Monsieur Ernst Calvat and Mr. J. R. Starling were admitted honorary fellows of the society on the proposal of Mr. C. H. Payne, seconded by Mr. D. B. Crane.

The new rules were next brought under discussion, after the old ones, hitherto operative, had been formally rescinded. There was a good deal said, and some alterations were made.

Mr. J. W. Moorman proposed that a sub-committee of five members (exclusive of ex-officio members) be appointed to enquire—

(a) What places can be obtained for holding future exhibitions, either by a subsidy as now, or in reliance upon the society's own resources.

(b) To closely examine the whole question of minor shows with the object of ascertaining their advantage to the society or otherwise.

(c) To fully consider the question of selling the floor space, and to report the result of their investigations to the general committee, who are now requested to formulate such recommendations to a general meeting of members to be held on the first day of the November show, and that no further fixtures are to be made before that date.

This was carried unanimously.

A vote of thanks to Mr. Sanders for his excellent performance of the arduous duties of chairman brought the meeting to a close not long before midnight.

EALING GARDENERS' MUTUAL IMPROVEMENT SOCIETY.

THE grand spring flower show, promoted by this society in aid of the Gardeners' Royal Orphan Fund was held in the Victoria Hall, Ealing, on the 15th inst., the results being highly satisfactory. Lady Nelson, who was supported by the President, J. Harris, Esq., F.R.H.S., Mrs. Harris, W. Marshall, Esq., F.R.H.S. (Chairman of the Fund), Mr. A. F. Barron (Secretary), and others, made some sensible remarks concerning the object of the show, and alluded to the pleasing circumstance that all the exhibits were informal and honorary. Notwithstanding the fact that the weather, for a fortnight previous to the show, had been of a very retarding character, the colour and general effects were very fine.

The central and most commanding group was furnished by Messrs. de Rothschild, Gunnersbury Park, Acton (gardener, Mr. Geo. Reynolds). The formation was a series of beautiful curves which, for want of a better name, may be described as a square without angles, the corners being extended and rounded off. The effect was unique. The centre-piece of this much-admired arrangement was a tall specimen *Grevillea robusta*, about 12 ft. high, surrounded by Palms, *Dracaenas*, *Clivias*, *Richardias*, etc., the so-called "corners" being set off with nice plants of *Cocos weddelliana*. These formed what may be termed sub-centres, round which were grouped such things as *Azalea mollis*, *A. sinensis*, *Eulalia japonica variegata*, *Richardia elliptica*, *Amasoniana punicea*, *Narcissus in var.*, *Dendrobium wardianum*, *Sophronis grandiflora*, and *Lily of the Valley*, the whole being edged with *Isolepis gracilis*.

A prominent place was also accorded Lady Nelson, Hanger Hill House, Ealing (gardener, Mr. D. Cooper),

who sent a beautiful group consisting of Palms—notably *Kentia fosteriana*—Azaleas, Deutzias, Richardias, *Spiraea astilboides*, and bulbous plants. The design was oval in shape, the whole being encompassed with dwarf variegated plants like *Panicum*, *Pelargonium*, *Madame Sallery*, etc., which produced a very pleasing effect.

The point of vantage of the third group was well occupied by E. H. Watts, Esq., Devonhurst, Chiswick (gardener, Mr. James Gibson). The arrangement here was quite different to those already described, although Palms, like *Kentia fosteriana* and *Cocos weddelliana* received a fitting place. Other noticeable plants, in addition to spring-flowering bulbs, were *Euphorbia jacquiniæflora*, *Begonia Glorie de Sceaux*, Azaleas, *Cinerarias*, *Solomon's Seal*, etc., the edging being composed of a blending of *Adiantum cuneatum* and *A. Capillus-Veneris*.

The plants which adorned the stage came from Gunnersbury House, Acton (gardener, Mr. J. Hudson), and consisted principally of *Cordyline australis*, *C. indivisa*, *Dracaena sanderiana*, *Clivia miniata*, and *Narcissus poeticus ornatus*, bordered with the beautiful drooping fronds of *Asplenium flaccidum*.

The president contributed a very pretty semi-circular group which the hon. secretary, Mr. W. Roberts, his energetic gardener, well set up. The most conspicuous plants were Palms, *Dracaenas*, *Cinerarias*, *Pandanus Veitchii*, Azaleas, *Croton Victoriae*, Ferns, and Flowering bulbs.

Mrs. Willey, "Savernack," Aston Road, had a neat collection of plants, which Mr. G. Woods, the gardener, manipulated to advantage. Among these, we noted *Boronia elatior*, *Begonia Gloire de Lorraine*, and *Chysis bractescens*. Miss Collinson, The Haven (gardener, Mr. Cox), sent a fine lot of *Richardia africana*. These were nicely grouped together, and fronted with *Veltheimia viridifolia*, the whole forming a very striking scene.

Colour and character were well represented in the group which came from E. P. Oakshott, Esq., "Orchardene," Montpelier Road (gardener, Mr. C. Long). Small Palms, Deutzias, *Cinerarias*, *Narcissus*, Hyacinths, Tulips, *Veltheimias*, *Lachenalias*, *Marantas*, and *Funkias*, &c., gave great variety and a fine effect.

A similar collection was also lent by H. W. Peal, Esq., "Oakhurst," St. Stephen's Road (gardener, Mr. C. Edwards). Mr. Edwards, however, had a nice piece of *Dicentra spectabilis*, edged with the Star-flower (*Treteleia uniflora*).

C. T. Sutton, Esq., The Beeches, East Acton (gardener, Mr. J. W. Simpson), was in evidence with a collection of foliage and flowering plants, such as *Ficus elastica*, *Dracaenas*, Azaleas, &c.

E. Hyde, Esq., Hill Crest, Castle Bar (gardener, Mr. Holloway), occupied a similar position with a predominance of *Primula sinensis* and *obconia*.

W. Owen, Esq., The Elms, Castle Bar (gardener, Mr. R. Green), must be complimented on the well-grown collection of *Cyclamens*, Hyacinths, Tulips, *Narcis*, *Primulas*, *Cypripediums*, Azaleas, &c., which he sent. These were staged in contra-distinction to all the other groups, which were put up on the floor.

The trade, also, was largely represented, a fine lot of *Cyclamen latifolium (persicum)* coming from the Church Road Nursery Co., Hanwell. These produced a bright and interesting show, and were greatly admired. Messrs. Hart Bros, The Grove Nursery, Ealing, had a good representative group of Palms, *Araucarias*, *Aspidistras*, *Adiantums*, and bulbous subjects. Mr. A. Hawkins, Gordon Road Nursery, replied with another group of an interesting character. His Azaleas, *Dendrobes*, *Astilbes*, *Primulas*, double *Daffodils*, &c., meriting comment. Last, but by no means least in importance, came a noble collection of plants from Mr. Geo. Cannon, St. John's Nursery, a well-known name in Ealing. Here we had a large specimen *Araucaria excelsa*, flanked on either side by huge examples of *Dracaena indivisa Veitchii*, Palms being employed to fill the intervening space. *Lilium Harrisii* stood out well against this background of foliage, while such things as *Astilbe japonica*, *Eulalia japonica variegata*, Azaleas, *Cyclamen*, Ferns, and bulbous plants generally, contributed to produce a picture worthy of record.

In addition to the sixteen groups of plants already mentioned there were some specimen plants also, which were kindly lent for the occasion.

The exhibition itself was a decided success, and, therefore, great credit is due to all concerned. If,

then, the financial result is in any proportion to the floral aspect, we may look for a substantial benefit to that deserving charity, the Royal Gardeners' Orphan Fund.

THE FLOWER GARDEN.

As was usual, March brought with its early days a snap of cold weather which, although it has done some damage to early subjects, will yet probably prove a real blessing in that it will serve to keep things back in their proper place. The growth of the grass, which has been phenomenal for winter-time, has been checked considerably, and this must prove a distinct advantage, as it will obviate the early use of the mowing machine, and give the sward something of the rest that it requires. But if the mowing machine is not wanted, the roller should be kept often at work, and if the frost is allowed to go properly off the grass before the operations are commenced, no harm will be done. The continued mild weather proved very favourable for the burrowing of worms, and thus where the pests appear to have been especially busy, it may be advisable to give the grass a watering with lime-water, which will quickly bring all the worms to the surface. As water can only take up a fixed quantity of lime in solution, there is no need to measure out the lime. A quantity should be placed in a coarse canvas bag, and plunged in a tank of water. In applying it, one third of the clear solution of lime should be mixed with two-thirds of clear water, and sprinkled over the lawn by means of a large rose-can. A little attention given to the worms now may save a lot of trouble presently, and will directly do the grass no harm whatever.

EDGINGS TO TURF.—Most people prefer to walk on the grass rather than on the gravel during the dry weather, and no one would blame them for the preference if only they would not insist upon walking on the edge. The result of this habit is that the grass edges are worn down, and are not only out of line, but become difficult to work the edging-shears upon. The grass edges to paths that carry, or rather are supposed to carry, a good deal of foot traffic will thus require cutting at least once a year, and the present is a capital time to get this seen to before the season's routine work commences. In dealing with straight edges, it is an easy matter to lay a line down, stretch it taut, and work by its guidance, but the proper negotiation of curves is a matter of much greater difficulty. Instead of fiddling about with stakes round which the line may be stretched to form a curve, it is far better to lay the line loosely down to form a guide, and to cut round it, taking care, meanwhile, not to force the line at all. In this case the iron must be clean and sharp, and must, moreover, be in practised hands.

ROSES.—When the cold weather overtook them, these were in a very forward condition, having shoots on them several inches in length. The result has been that plants which were not protected were sadly nipped, and have thus sustained a severe check. Of course, the autumn pruned plants with their more advanced growths have been the greatest sufferers. Material need not now be kept to hand for covering, unless frosty nights make it necessary, especially in the case of the Teas. Planting should, by this time, be practically finished, and likewise all alterations of or additions to the beds. If a sufficiency of short half-rotten stable manure is available, all plants that have been newly planted or disturbed in any way should receive a liberal mulching—the others were attended to in this respect at the beginning of the winter.

CARNATIONS.—Within the course of the next week the border Carnations that have been wintered in pots in cold frames must be consigned to the open ground. The plants, like other things, are showing signs of the mild January and February by the quantity of growth they have made. It will thus be inadvisable to delay putting them in their flowering quarters for the pots in which they are now are small, and should be well filled with roots. The plot of ground chosen for the Carnations may receive another light dressing of soot at once, and a sprinkling of wood ashes, if they can be spared, will not come amiss. Fork this well in, choosing a bright, dry day for the operation. The ground has now

recovered from the effects of the rain and snow and is in capital working condition. It will thus not require any great amount of labour to break it up finely, and put it in its final stage of preparedness to receive the plants.

PLANTING.—The exact way in which the plants are put out will of course depend upon circumstances, but where large quantities are grown as much for supplying cut flowers as anything there is nothing to beat planting in beds 3 ft. wide, with narrow alleys between each. Each bed will hold three rows of plants which may be from 10 in. to a foot apart in the row. This system admits of attention being given to the plants as required without the necessity for trampling on the loose surface.

AUTUMN PLANTED CARNATIONS.—These have had a fine time of it this year, and are looking exceptionally well; indeed if only they could be depended upon to do as well each season there would be very few who would recommend the common practice of wintering the rooted layers in frames. There are very few vacancies indeed, but the few there are remind us of the necessity for having some pot plants in reserve to fill them. This should be done as soon as occasion offers. If the late frost has lifted any of the plants partially out of the ground this too should be attended to. It will also do no harm to run a hoe lightly through the beds to check rising weeds. This should be frequently repeated, and there will be no difficulty in keeping the beds clean.—A.S.G.

GARDENING MISCELLANY.

LILY-WHITE SEAKALE.

I AM greatly surprised to find your correspondent "A. P." does not succeed as well as he could wish with the above variety. With us it does remarkably well. I have grown it for the past seven years with every satisfaction, as it forms good crowns and exhibits no signs of disease. I have found it more amenable to force into growth in the month of November than the old kind which is always of a smoky-looking colour before, as well as after cooking, while Lily-white is as near perfection as the name implies. We discarded the old variety several years ago, and rely solely upon the newer kind. We give it a deeply dug rich plot in which to grow, and it has two dressings of salt during the season in showery weather. I should add our soil is a sandy loam resting on the old red sandstone, and evidently favours the growth of this vegetable.—J. Mayne, *Bicton*.

GOLDEN PRIVET.

WHAT a beautiful plant this is when grown luxuriantly; and among dark foliaged evergreens it is charming. We could not get the plants to succeed well on heavy, cold, and wet ground; but in a sheltered position where the soil is drier and lighter, the plants have grown several feet during the past seasons. For flower garden work bands (by pegging down and stopping) can be formed round large beds. For decorative purposes specimens of any form do well in pots, and are beautiful among flowering plants. For covering old walls it can be trained as easily as Honeysuckle or Ivy, and mixed with such plants as the hardy *Garrya elliptica*, *Cotoneaster microphylla*, *C. Simonysii*, variegated, and other Ivies, the Golden Privet is most useful. Its propagation is as simple as that of any of the Privets.—M. T.

SOCIETIES.

ROYAL HORTICULTURAL.—March 22nd.

THE Drill Hall was well filled with a great variety of plants on Tuesday last, including large exhibits of Orchids, *Amaryllis*, *Roses*, *Cinerarias*, *Clivias*, *Cyclamens*, Tulips, Hyacinths, *Daffodils*, stove and greenhouse plants, Ferns, and other smaller lots.

A very showy group of Orchids was put up by Messrs. Hugh Low & Co., Clapton. *Cattleyas*, *Odontoglossums* and *Dendrobiums* were the leading features of the collection, which was interspersed with Palms and Ferns. Amongst other things we noted

Cymbidium eburneo-lowianum, *Odontoglossum Edwardii*, *O. triumphans*, *Dendrobium splendidissimum grandiflorum*, and the beautiful *D. Boxallii*, all in fine condition (Silver Banksian Medal).

Sir Trevor Lawrence, Bart. (grower, Mr. W. H. White), Burford Lodge, Dorking, staged an interesting little group of Orchids, including *Epidendrum Endresii*, *E. varicosum*, *Sarcophilus Hartmannii*, *Masdevallia Pourhaixii*, and *M. Veitchii grandiflora*, a small piece bearing a grand flower.

Messrs. B. S. Williams & Son, Upper Holloway, London, showed a group of Orchids consisting largely of *Coeloglyne cristata alba*, with smaller pieces of *Phaius Norman*, *Zygopetalum Perrenoudi*, and *Cypripediums*. *Odontoglossum crispum flaveolum* with its yellow flowers was also very distinct.

E. Ashworth, Esq. (gardener, Mr. H. Holbrook), Harefield Hall, Cheshire, exhibited a beautiful white variety of *Dendrobium nobile* named *D. n. ashworthianum*, also *Odontoglossum Rossii aspersum violaceum*.

Mr. Thos. Rochford, Turnford Hall Nurseries, near Broxhourne, exhibited *Dendrobium nobile* Rochford's var., and the beautifully blotched *Odontoglossum rochfordianum*, a natural hybrid.

Mrs. Laura C. Joad (gardener, Mr. Standing), exhibited *Cymbidium eburneo-lowianum* and *C. eburneum*. Baron Schroder (gardener, Mr. H. Ballantine), The Dell, Egham, exhibited the grand variety *Odontoglossum crispum Princess Christian*, splendidly blotched with brownish purple. A Cultural Commendation was accorded to H. T. Pitt, Esq. (gardener, Mr. R. Aldous) for *Odontoglossum excellens Rosslyn* var., a splendid variety in grand condition. Dr. Frederic F. Hills (gardener, Mr. Wise), Campbell Road, Croydon, exhibited a fine flowering piece of *Odontoglossum brevifolium* Dr. Hill's var. grown in a basket. *Odontoglossum crispum roseum* was shown by Mr. J. Drew, gardener to J. B. Brookes, Esq., Finstall Park, Bromsgrove.

On the right hand side of the doorway, Mr. H. B. May, of Dyson's Lane Nurseries, staged a semi-circular group of Clematis in pots. Miss Bateman, Lord Londeshorough, Albert Victor, and Lord Nevill were some of the best forms (Silver Flora Medal).

On the opposite side of the doorway there were three circular groups of pot Roses from the nurseries of Messrs. Wm. Paul & Son, Waltham Cross. *Enchantress* and *Sylph* were especially well shown, and the plants were in remarkably fine condition. A splendid display of Hyacinths in pots was made by the same firm. There were in all 250 plants, in 100 choice varieties. The spikes and bells were large throughout and the colours first-class (Silver-gilt Flora Medal).

A neat group of dwarf and showy Cinerarias was put up by Mr. John R. Box, West Wickham. Some very fine dark, nearly black, forms were very noticeable here.

The hardy flowers sent by Messrs. Paul & Son, The Old Nurseries, Cheshunt, formed a showy little group and included fine clumps of *Saxifraga Stracheyi*, *Anemone Hepatica*, and *A. Pulsatilla*.

Messrs. Barr & Son, King Street, Covent Garden, had a magnificent display of Daffodils for which a Silver Banksian Medal was awarded. There were about fifty in all, of which such varieties as *Wear-dale Perfection*, *Golden Spur*, Mrs. J. B. M. Camm, Henry Irving, and *Empress* were the cream. Varieties of *Narcissus poeticus* were likewise well shown. Messrs. B. S. Williams & Son, Upper Holloway, N., showed *Azalea mollis*, *Staphylea colchica*, and several fine forms of *Amaryllis*. Messrs. Hugh Low & Co. sent a hatch of *Carnation Winter Scarlet*.

Messrs. J. James & Son, Woodside, Farnham Royal, are renowned for their grand strain of Cinerarias, which on this occasion was illustrated by a splendid array of well grown and flowered plants. The dwarfness of the plants, and the size, substance, and brilliancy of colour of the flowers was as great as ever. A Silver-gilt Flora Medal was awarded.

The cut Roses contributed by Mr. George Mount, Canterbury, were simply perfection. Of a surety such varieties as *Catharine Mermet*, Mrs. John Laing, and *Ulrich Brunner* have never been better shown. Size, colour, and form were all remarkably good, even for Mr. Mount's Roses, which is saying a good deal (Silver-gilt Flora Medal).

Messrs. John Laing & Sons, Forest Hill, S.E.,

bad a display of florists' devices in the shape of wreaths, floral harps, etc., the whole set up in a very attractive manner.

A comprehensive display of about 200 cut Roses came from Mr. W. Rumsey, Joyning Nurseries, Waltham Cross. There was a capital stand of the new variety, Mrs. Rumsey, and Comte de Raimbaud, Baron de Bonstellan, Niphotos, and Beauty of Waltham were all represented by good samples (Silver Flora Medal).

Messrs. Wm. Cuthush & Son, Highgate, N. had a miscellaneous group of plants in which the pretty *Thyrsacanthus* figured conspicuously.

The St. George's Nursery Company, Hanwell, received a Silver Gilt Flora Medal for a superb lot of *Cyclamen*. The plants were large and well flowered specimens, and the flowers too, were of great size. White, crimson, pink, and rose varieties were all in capital condition.

Messrs. R. & G. Cuthbert, Southgate, had a big group of Tulips in pots, of which such varieties as *Ophir d'Or*, *Joost Van Vondel* (white), *Toreador*, and *Adeline* were especially good. No less than forty varieties in all were shown.

A Silver Gilt Medal went to Mr. A. Chapman, gardener to Captain Holford, Westonhirt, Tetbury, Gloucester, for a splendid lot of *Amaryllis*, certainly the best ever sent from Westobirt. Deep crimson varieties were particularly strong, but all the flowers were large and good.

A Bronze Banksian Medal went to Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, N., for a collection of hardy flowers, in which *Narcissi* were particularly strong.

Messrs. John Laing & Sons sent up a very showy group of miscellaneous flowering and foliage plants, for which a Silver Banksian Medal was voted. *Leea amabilis* was a central and chief feature here in a glass case, and *Crotons*, *Caladiums*, *Dracaenas*, *Ericas*, and *Clivias* were all well in evidence.

Messrs. J. Hill & Son, Lower Edmonton, repeated their previous exhibits of exotic Ferns, a Silver Banksian Medal being this time awarded. The plants all through the collection were in capital condition.

From Messrs. J. Veitch & Sons, Ltd., Chelsea, came a fine lot of *Clivias*, the umbels of flower being characterised by tremendous size. *Pyrus florihunda atrosanguinea* was also well shown (Silver Flora Medal). Several fine forms of *Amaryllis* were submitted by the Chelsea firm, together with a batch of plants of the new *Dracaena Exquisite*.

A hatch of the variegated Wallflower *John Watts* was contributed by Mr. Hoath, gardener to J. Watts, Esq., Hamilton House, Newmarket.

At a meeting of the fruit committee a Cultural Commendation was given Mr Wythes, gardener to Earl Percy, Syon House Gardens, Brentford, for *Strawberry Royal Sovereign*. Nine dishes of Apples were submitted for the Veitch flavour prizes, Mr. J. C. Tallack, Livermere Park Gardens, was placed first with *Lamb Abhey Pearmain*. Mr. C. Herrin Dropmore, was second with *Sturmer Pippin*. Five dishes of Pears were staged, the first prize going to Mr. C. Ross, The Gardens, Welford Park, Newbury, with *Ne Plus Meuris*.

QUESTIONS AND ANSWERS.

* * * Will our friends who send us newspapers be so good as to mark the paragraphs or articles they wish us to see. We shall be greatly obliged by their so doing.

[Correspondents, please note that we cannot undertake to name florists' flowers such as Carnations, Pelargoniums, Chrysanthemums, Roses, nor such as are mere garden varieties, differing only in the colour of the flower. Florists' flowers, as a rule, can only be named by those who grow collections of them.]

St. Brigid Anemones.—B. T. W.: You cannot now sow them too soon in seed pans or boxes, placing them in a slight heat to hasten their germination, if you can find room for them. In the absence of artificial heat either from hotwater pipes or fermenting manure, you can place them in a cold frame facing south, keeping the frame close till they have germinated. As soon as this has taken place, whether in a hothouse or frame, the seedlings must be kept cool and well ventilated to prevent the drawing and weakening of the plants. They should come on slowly in the early stages, and the natural heat of the sun will hasten them later on. Use light sandy loam in which there is a good quantity of leaf soil by way of compost. Before the seedlings get in any

way crowded you must prick them off singly in other boxes or in a cold frame, in lines about 1½ in. apart each way. This will facilitate their removal when being transplanted to their permanent quarters in the open ground. This may be done at any time after the plants attain some size, provided you take care to lift them with the roots intact, and choose a dull day for the operation. If you attend to shifting and watering whenever that becomes necessary, many of the the plants should bloom in the autumn.

Ringed Ficus elastica.—B. Walker: If you had done this last autumn the plants would have been in better condition for planting out in the flower beds, than they would be if the ringing is done now. It might be worth while trying, however, for the sake of dwarf plants near the edges of the beds. Small pots will be quite sufficient for plants with a few roots. Pot firmly when the shoots have rooted and have been cut from the mother plants. Plunge pots and all in the soil so as to avoid disturbance to the roots. These plants would be useful for the centres of beds next year.

Yellow-flowered Shrub.—J. B.: The specimen you sent was *Forsythia suspensa*. Its propagation is very easy. Before the leaves fall in the autumn, or even after that event, you can cut the moderately strong shoots into lengths of 6 in., and insert them firmly in pots of light, sandy soil. To insure the safety of the cuttings in winter they should be placed in a pit or cool house with just sufficient heat to keep out frost. Rooted plants are perfectly hardy, but cuttings are liable to perish until they have emitted sufficient roots to take hold of the soil. In the case of large bushes you can often cut off rooted suckers. Long shoots often bend down to and root into the soil. These, if taken off now and planted out, will make good growth before the coming season is over.

Saxifraga oppositifolia and its Varieties.—W. Cooper: As a rule, these mountain Saxifrages prove easy of culture and very hardy. They are more likely to lose in condition during summer than during the winter, whether frosty or otherwise. The reason is that in their native habitats they enjoy a cooler and moister atmosphere than they do in gardens which are seldom much above sea level. The relatively dry and hot atmosphere in June, July, and August checks the free growth which they would produce if more moisture were present. As a set-off against this, you should select positions on your rockwork that are sufficiently shaded to keep the plants cool during the long summer afternoon. They must at the same time be freely exposed to light: and if you can insure the soil being comparatively moist during the summer months, *S. oppositifolia* and its forms will enjoy full sunshine.

Late Planted Rhubarb.—T. W.: Begin by trenching the ground about 2½ ft. to 3 ft. deep, incorporating with the soil, as you proceed, a considerable quantity of well fermented manure, some of which will be as serviceable at or near the bottom of the trench as at the top. It is a gross feeder and should be treated liberally. If you use good crowns with plenty of roots, you will obtain very good results the first year of planting. You should allow the plants to grow at will, merely removing any flower stalks that may appear, but encouraging the growth of leaves.

Japan Maples.—W. H.: *Acer palmatum* is the correct botanical name of the species, which is often grown under the name of *A. polymorphum*. All the varietal names should be grouped under *A. palmatum*. There are many synonyms, and it is difficult without a reliable list to get at the correct names. A few of the forms grown as Japanese Maples do not belong here, but to other species, some of which, like *A. circinatum*, do not come from Japan.

Names of Plants.—A. C.: 1, *Arabis lucida variegata*; 2, *Aubrieta deltoidea* var.; 3, *Arabis alba*; 4, *Corydalis solida*; 5, *Narcissus pseudo-Narcissus* fl. pl.; 6, *Primula denticulata*; 7, *Sisyrinchium grandiflorum*.—J. C.: 1, *Asplenium flaccidum*; 2, *Jasminum nudiflorum*; 3, *Viburnum Tinus*; 4, *Ribes speciosum*.—J. Hood: 1, *Elaeodendron orientale*; 2, *Fittonia argyroneura*; 3, *Oplismenus Burmanni variegatus*; 4, *Ficus repens minima*; 5, *Ficus harbatus*.—D. C.: 1, *Odontoglossum crispum andersonianum*; 2, *Dendrobium crassinode*; 3, *Oncidium crispum*; 4, *Dendrobium primulinum*; 5, *Odontoglossum Edwardii*; 6, *Sarracenia Drummondii*.

(Over 150 Pages. Nearly 150 Illustrations.)

of Florists' Flowers and Hardy Border Plants

is got up regardless of trouble or expense, with the result that it is by unanimous consent pronounced the most comprehensive, most accurate, most reliable, most complete and best extant.

It gives full and accurate descriptions of everything in the way of Florists' Flowers, also colour, height, time of flowering, and price of all the best Hardy Border Plants, together with their English or Common Names, and a mass of other valuable information that cannot be had elsewhere.

It is in fact a veritable reference-book, invaluable to all growers of these plants, and should be in the hands of all intending purchasers. Free on application.

NEXT WEEK'S ENGAGEMENTS.

WEDNESDAY, April 6th.—Royal Caledonian Society's Show in the Waverley Market, Edinburgh (2 days).

HORTICULTURAL SOILS.—Each succeeding year sees greater interest taken in the questions of soils and manures. The latter, of course, are merely intended to supplement, artificially, the deficiencies of the former, whether natural or induced by the removal of the crops which grow upon them. The question of horticultural soils was taken up at the meeting of the Royal Horticultural Society on the 22nd ult., by Mr. J. J. Willis from the famous laboratory of Sir John Bennet Lawes, Bart., Rothamsted, Herts. Mr. Willis commenced his lecture by stating that the fertility of soils for horticultural purposes depended upon the rocks from which they were originally derived by disintegration. This would apply to the mineral ingredients of plant food, and the nature and relative quantity of the materials in which the valuable elements were primarily locked up. The finer the rocks are broken up the more plant food they are able to supply; but at the same time these soils must be well drained and contain sufficient granular matter to render them sufficiently porous for the free admission of water and air, so that the excess of the former may pass freely away, and the latter gain ready access to the roots of plants. During heavy rains a soil gets its store of water replenished, but it depends entirely upon the character of a soil as to its holding capacity for water and its capability of bringing any given crop to maturity by furnishing the supply for the immediate necessities of the plants. Porosity also allows of the slow ascent of water from the lower reaches of the subsoil by the process known as capillarity, and this, too, at a time when sandy, gravelly, or impermeable clay soils may be suffering for want of water at and near the surface in times of severe and prolonged drought. The temperature of a soil is very largely dependent upon its porosity, and at no time is this more evident than in spring, just when the sun is beginning to warm up the earth after the departure of winter. Upon the nature of a soil depends, also, its capability of absorbing and storing up of the heat of the sun. All these facts are of primary importance to the cultivator, because the earth, as a laboratory for a complicated series of chemical changes for the preparation of plant food, can only accomplish its task properly in the presence of a sufficiency of moisture, air, temperature, and the elements necessary for plant life. They were dealt with by Mr. Willis in his own particular way as a student and conductor of experiments.

One of the essential ingredients of a fertile soil is humus, consisting of decaying vegetable and animal remains, the former

being the more important of the two. The lecturer went on to describe how a soil, originally poor in humus, may and does come to contain sufficient for the support of the higher plants and cultivated crops. Very poor or thin soils are capable of supporting only the lower types of vegetation, but as these decay and add their quota of humus to the originally barren ground, the latter becomes proportionally enriched, and capable of supporting a higher vegetation. Virgin soils, that is, those which have never previously been placed under crops by man, owe their fertility to the accumulation of decaying and living vegetable matter, the latter being added to the former by the breaking up of the soil by settlers or pioneer cultivators. A soil that is rich in humus contains all the elements of plant food, including nitrogen, the most important and valuable of all. This nitrogen, being practically locked up in the humus, is gradually released on the decay of the latter, and otherwise made available for absorption by living plants. The permanent fertility of a soil is largely dependent upon its capability of retaining plant foods. The peaty and fibrous soils and decaying leaves, so largely utilised by horticulturists, owe their fertility to the fibre and other organic matter which they contain, and with which nitrogen is always associated. As this important element is liberated, it undergoes the process known as nitrification, after which it is capable of absorption and assimilation by living and growing plants. In proportion to the amount of nitrates and ammonia contained in the soil of a garden, so will it be fertile. The operations of tillage are directly conducive to the activity of the microbes which are the nitrifying agents, and gardeners cannot be too well acquainted with this fact. The stirring of the surface of soil under crop keeps down weeds and aerates the soil, but it does more in stimulating those lowly but all important helping organisms, which are present in all soils in proportion to their fertility, and whether under cultivation or otherwise. Potting soils owe their fertility to the quantity of fibre they contain; and the rapidity of the liberation of plant food is dependent upon the porosity of the materials employed. Temperature bears strongly upon the process of nitrification in the soil, so that vegetables in the open garden in early spring have a difficulty in procuring the requisite amount of nitrogen. Here the cultivator will find it to his advantage in coming to their aid with some readily available nitrogen in the form of nitrate of soda, sulphate of ammonia, guano, fowls' dung, or something of that nature. The question of soil nitrogen is always one of the burning topics of the cultivator; hence it is in no way surprising that Mr. Willis dealt with it rather fully.

The material known as Jadoo was passed in review, because, though not a soil, it had been recommended as a substitute for it in potting and other garden operations. The body or matrix of it consists of peat moss, with which phosphoric acid, potash, gypsum, bone meal, soot, and other ingredients had been brought together, forming a handy or convenient concentration of plant food. A most important subject for horticulturists to consider is the amount of immediately available plant food a soil may contain, not merely the total quantity which is locked up in it, and which plants are unable to appropriate. The growth of a plant is absolutely dependent upon the whole of the elements of its food being present in an available condition, and is regulated by that one which is to hand in the smallest quantity. It is the duty of the cultivator to ascertain which element is deficient in any given soil, and to supply it.

To get a full crop the defective element or elements must be supplied, and the mechanical condition of the soil made perfect by efficient tillage, so that everything may be placed on a properly working basis. Should moisture be deficient, artificial means must be taken to amend the want, as it is the vehicle for carrying all plant foods obtainable from the soil. Summarising the most important elements of plant food that were liable to be present in insufficient quantities in soils, he named nitrogen, potassium, and phosphorus, the peculiarities of which he explained, and the forms in which they might be supplied.

The Flower Gardens of Grasse and Cannes occupy an area of upwards of 60,000 acres, and annually produce flowers to the value of over £600,000. It is from these quarters that many of the leading flower markets are supplied. Paris alone draws immense quantities, despite the fact that the distance takes fully twenty hours to cover by fast express.

The Royal Gardeners' Orphan Fund.—We are reminded that the annual festival dinner of this most deserving charity will take place on Wednesday, April 20th, at the Hotel Métropole, under the presidency of C. E. Keyser, Esq., of Aldermaston Court, Reading, and late of Stanmore. Mr. Keyser is so well known as a patron of horticulture, that we hope there will be a large number of gardeners present to give him a cordial reception.

Mr. David Wilson, for many years gardener to Hugh Stevens, Esq., Westmount, Kelvinside, Glasgow, has been appointed foreman in the Tollcross Park, Glasgow. Mr. Whitton, the superintendent, has a great belief in placing practical gardeners in every responsible position in the Glasgow Parks, and we consider his plan not only thoroughly practical, but to be recommended. We are afraid, however, that Mr. Wilson will miss his favourite Orchids for a time, but as there is glass upon the place, and the Glasgow people are not averse to Orchids in their establishments, we think it more than likely that Mr. Wilson will be able presently to surround himself again with his favourites. He is succeeded at Westmount by the foreman who was under him there.

Shirley District Gardeners' Mutual Improvement Association.—The annual general meeting of the above society was held at the Parish Room, Shirley, Southampton, on Monday, the 21st ult., the president, Mr. W. F. G. Spranger, presiding. The report showed that twelve lectures were given during the past year, at which 516 persons attended, giving an average of 43 per meeting. The accounts showed a balance of over £3 in favour of the association. The president, secretary, vice-presidents, and treasurer were re-elected, and a committee of 15 was elected by ballot. A hearty vote of thanks to the president, and to the horticultural and local Press closed the business of the meeting. An entertainment was afterwards given by some of the members and friends of the society, which was much appreciated by those present.

A Plebiscite of Chrysanthemums.—The issue of the *Nord-Horticole* for March contains the result of the plebiscite of Chrysanthemums instituted by the *Moniteur d'Horticulture*. The enormous amount of labour involved is commented upon, and it is stated that 8,000 forms were issued, so that in France, at all events, the results of the voting should be conclusive as to the relative degree of esteem in which each variety is held. Exactly a hundred varieties were included in the forms, and Madame Carnot heads the list with 1,011 votes. Le Colosse Grenoblois comes next with 997 votes, Mrs. C. Harman Payne third with 994, Mme. Edmond Roger fourth with 976, and Vivian Morel fifth with 971. If a plebiscite were to be taken in this country we do not doubt that Madame Carnot would be at the top of the list, but neither Le Colosse Grenoblois, Mrs. C. Harman Payne, nor Mme. Edmond Roger would be so highly placed. M. Clénon de Léché, which would also be well up in a British list, is down to the eighteenth place in the French.

Los Angeles Cal., U.S.A., now possesses the proud distinction of owning one of the largest public parks in the United States, in Griffiths' Park, which was formally made over to the city authorities on the 5th ult., by Mr. G. J. Griffiths. The park contains 3015.4 acres.

The Sea Claims Tasmanian Fruit.—The Peninsular and Oriental Steamship Company's ship "China" which was due to arrive at our shores on or about April 9th, was bringing amongst her cargo 16,000 boxes of Tasmanian fruit. The vessel went aground, however, on the 25th ult., at Perim Island. All the passengers to the number of 400 were landed on the island, also the mails, luggage, and specie, but the fruit will probably be a total loss, and it is not yet known whether the ship herself can be saved.

Helping Nature.—The flower growers around Cannes have practised for several years a system of forwarding the blooms of *Acacia dealbata*, which is very largely grown in the immediate vicinity. Flowering branches are cut a week or ten days before the flowers in the natural course of things would open, the ends are placed in water, and warm steam is made to play upon them. From ten to twenty hours of this treatment suffice to open the flowers, which last fully as long as if they had done so under the ordinary influences of unassisted Nature.

Parks and Open Spaces in Exeter.—The Estates Committee of the Exeter City Council have approved the recommendation made by the surveyor that a foreman gardener be appointed to take charge of the public grounds of the City, and to see to all work of a horticultural character. This project now only needs the ratification of the City Council to become a fact. All those who have the welfare of Exeter at heart will support anything that will lead to the maintenance and improvement of the open spaces which, properly cared for, cannot fail to be a great attraction to the City.

Leeds Corporation and its Gardeners.—A deputation of the various gardeners employed by the Leeds Corporation recently waited upon the Leeds Corporate Property Commission to bring before them the conditions under which they worked, particularly those relating to Sunday labour. On weekdays the men work from 6.30 a.m. until 5.30 p.m., and till 4 p.m. on Saturdays. The men ask that they shall not start work until 7 a.m., and that they should leave off at 12.30 p.m. on Saturdays. With regard to Sunday work the men go on by rotation. About a dozen are employed each Sunday, the hours being from 9 a.m. till 9 p.m. For this they only receive 2s. 6d. each. The deputation pointed out that some of the corporation departments are paid time and a quarter, and time and a half, and they think it not unreasonable that they should at least receive a full day's pay for the Sunday. The number of men affected is about 40. The committee promised to give the question their serious consideration, and we hope to hear soon that the Leeds gardeners have obtained their reasonable requests.

Durham, Northumberland, and Newcastle-on-Tyne Botanical and Horticultural Society has just issued, in pamphlet form, the 73rd annual report of the council, together with the balance sheet. The report, which is a brief one, speaks of the proposed amalgamation with the Northumberland Agricultural Society for the summer show, which is to be held in the Recreation Ground, Newcastle, on July 13th, 14th, 15th; thus following the precedent of 1893, which was attended with highly satisfactory results. The indebtedness of the Society to a number of gentlemen, among whom is the ex-Mayor of Newcastle (Councillor John Goolden, J.P.), for their services is pointed out. It is proposed to hold the spring show on April 20th and 21st. The statement of accounts for 1897 shows receipts amounting to £1127 17s. 9d., and expenses of £1127 1s. 7d., so that there has been a working profit on the year of 16s. 2d. The statement of liabilities and assets shows that the society is still in debt to the tune of £25 16s. 9d. A list of the honorary officials, members, and associates is included in the pamphlet, and we notice that there is a black list of members and associates who are in arrears with their subscriptions.

Acacia dealbata thrives wonderfully in the Esterels and on the Gneiss Hills around Cannes, in the south of France. On clay or calcareous soils the plants refuse to grow, and soon sicken and die.

Mr. Henry Eckford.—The issue of *Gardening* (American) for March 15th, contains a portrait and an appreciative notice of Mr. Henry Eckford, of Sweet Pea fame. No one has done more for this handsome flower than Mr. Eckford, and from his establishment at Wem, in Shropshire, numbers of the finest varieties of Sweet Peas in existence have issued. These varieties are as well known and highly prized across the Atlantic as here.

Flowers at Bulawayo.—The public park at Bulawayo, South Africa, is, step by step, being made a paradise under the able superintendence of Mr. W. S. Goodman. The flowers do remarkably well, for Roses flower all the year round. Upwards of thirty-six varieties of Carnations are grown, and grown well. The fruit trees are also doing remarkably well, and Mr. Rhodes' Orange Grove bids fair to become the feature of the place. These Oranges are planted to form a huge avenue 2,540 yards in length. The fruit and Orange trees are the only things that have not been reared on the place.

Appeal to Subscribers of the Royal Masonic Benevolent Institution.—Amongst the members of the horticultural fraternity there are, doubtless, many members of the Royal Masonic Institution who would be willing to help in a good cause. We refer to Mrs. Mary Woodman, aged 60 years, of Hurstmonceaux, Sussex, widow of Dr. W. R. Woodman, P. G. Swd. Br. (Eng.). Votes on her behalf are earnestly solicited from governors and subscribers of the above-named institution ament the forthcoming election of pensioners in May next. Dr. Woodman was initiated in St. George's Lodge, No. 112, Exeter, in the year 1852, and was a P.M. and for eighteen years a member of No. 444, Starcross, Devon. He was a P.M., and for thirty-three years a member of Grenadiers' Lodge, No. 66, London. For six years he was a member of "Britannic," No. 33, London, and also a member of other lodges. His membership of Chapters was equally long and valuable. He was also a member of the K.T. and R.C. degrees. He was a Governor of the R.M.B. Institution, as well as that of the R.M.I. for boys, and a vice-patron of the R.M.I. for girls, having served several stewardships. At his death in 1891, his widow found herself absolutely penniless.

Carex helvola in Britain.—At a meeting of the Linnean Society of London, on the 3rd ult., Mr. G. Claridge Druce, F.L.S., read a paper on the occurrence of *Carex helvola*, Blytt, in Britain, in which he gave an account of his discovery of this plant on Ben Lawers, Perthshire, in August, 1897. He found it growing in some abundance at an elevation of about 3,200 ft. Prof. Blytt and Dr. Christ, to whom specimens had been submitted, both agreed in naming it *C. helvola*, which by many botanists is considered to be a hybrid. Prof. Blytt says that it grows with *C. canescens* and *approximata* (lagopina), but he has never found ripe fruit. Dr. Christ says: "Il me semble d'être une ancienne hybride fixe et plus ou moins stable." Mr. Druce could readily believe that *C. helvola* was a hybrid of which *C. canescens* was one parent, but he had more difficulty in stating definitely the name of the other. From the close resemblance borne by *C. helvola* to *C. Zahnii* (an acknowledged hybrid of *C. canescens*, in one of its forms, with *C. approximata*), this combination might well be the origin of the Ben Lawers plant, but against that was the fact that the presence of *C. approximata* in the Breadalbanes had never been proved. *C. echinata*, on the contrary, was plentiful there, but Mr. Druce could see no positive evidence of the occurrence of that species in the foliage or inflorescence. He would have expected the offspring of two plants with nerved perigynia to have exhibited that character even in young specimens; as is shown in *C. pseudo-helvola*, an acknowledged hybrid of *C. canescens* and *norvegica*. The foliage, too, was slightly glaucous, a character not possessed by *C. echinata*. Although the Ben Lawers plant was less luxuriant than Blytt's Norwegian specimens, Mr. Druce was unable to separate it specifically from that plant. Messrs. F. N. Williams and W. P. Hiern offered some remarks.

The Gardener is a Great Antiquary, for he has in his possession Adam's Needle, Jacob's Ladder, Solomon's Seal, the Tree of Life, the Holy Thorn, Venus' Looking-glass, the Arms of France, and the Crown Imperial—a fine list of treasures.

England's Daftodil King.—Mr. Peter Barr leaves England on Tuesday next, April 5th, for his twenty months journey round the world. We bespeak a hearty reception for him from our many friends in the States, China, Japan, Australia, and South Africa.

Rating of Glasshouses.—Smith and others *v.* Richmond: We are glad to learn that the Market Gardeners' Nurserymen and Farmers' Association—who, it will be remembered successfully fought out the case of Purser *v.* Worthing Local Board—are moving in this important case on behalf of the Trade, with a view to an Appeal to the House of Lords.

Orchidists at Tyneside.—The cultivation of Orchids is fast merging, if, indeed, it has not already emerged, into a popular craze, and the cheapening of many of the most useful kinds has largely assisted the movement. There are located on Tyneside some of the largest and best managed private Orchid growing establishments in the country. First comes that of Mr. Norman Cookson, of Oakwood House, Wylam, whose gardener, Mr. Wm. Murray, has achieved notable successes, especially for home-raised varieties and hybrids. Mr. Fred. Scott, of Preston, near North Shields, has also a fine collection, and his glasshouses are exceedingly well found and managed.

The Dahlia is a Mexican flower, which took the fancy of Hernandez, who visited Mexico in 1615. Hernandez mentions two species, one of which had pale red flowers, and grew wild in the Quauhahuac Mountains, and was called locally "Acocli." A little more than a century after Mr. Thierry Menonville, who was sent to Mexico to filch the cochineal insect from the Spaniards also fell in love with the Dahlia. The first seeds of the plant were brought to Madrid in 1788, and planted in the botanic garden there, where the plants flowered in October of the succeeding year—1789. Lord Bute obtained seeds from Madrid, and in 1890 flowered plants raised from them in England. It was not until 1804, however, when Lady Holland sent more seeds from Madrid, that the Dahlias really did well.

The Flower Faker Again.—Possibly there is no flower of which such numbers are sold in the London streets as the Violet. Wherever one turns, one is greeted with the cry "Violets, sweet Violets." The would-be purchaser is tempted to buy by the undoubtedly powerful fragrance of the flowers. But alas! this fragrance is not all natural, for among the tricks of the flower faker is that of heightening the natural smell of the flowers or imparting it when, as is sometimes the case, it is wanting entirely. A "A penn'orth" of "wood violet" scent, emptied among the damp moss upon which the flowers repose will do the trick, and very few of the purchasers are any the wiser. In the same way a "penn'orth" of "musk perfume" is often employed to improve the selling quality of pots of Musk, and it is even stated that "white Rose" scent has been asked for for doctoring the Queen of Flowers.

Observations on the Codlin Moth.—A bulletin issued from the Agricultural Experiment Station of Nebraska, Lincoln, U.S.A., has been compiled by Professor F. W. Card. The remedies suggested for the Codlin Moth are as follows: "Spray thoroughly with Paris green within a week after the blossoms fall, before the calyx closes. Try kerosene emulsion when the eggs are being laid upon the leaves about the first week in June. If this fail, use Paris green combined with Bordeaux mixture. Keep the tree smooth and use paper bands round the trunk when the larvae are ready to pupate, about the last week in June. Remove and kill the larvae one or two weeks later. Place bands on again until all Apples are out of the orchard, then gather them up and destroy the larvae. Get the balance in spring by screens over the cellar doors and windows." This is a fairly comprehensive programme, and well illustrates the saying that "eternal vigilance is the price of safety."

The Stoats and Weasels introduced to New Zealand for the purpose of keeping rabbits in check have proved a greater pest in many cases than the rabbits. They have overrun the northern island where the genial temperature is conducive to their welfare, even in their interior of the island where there are no rabbits. The supposed natural enemies of the latter seem to prefer sheep, lambs, and poultry, whether the birds are wild or domesticated, to the rabbits. The carcasses of the sheep and lambs show a small puncture behind the ear, thus revealing the work of the weasels.

The "Henry" Strawberry seems to be creating a sensation among our Yankee friends. It is stated to be the most wonderful berry of the age, and individual "berries" are said to measure $3\frac{1}{2}$ in. through each way, four fruits filling up and rounding off a wooden quart measure. The next thing will be to get mouths big enough to fit these Strawberries. Mayhap they have already appeared! We notice that *American Gardening* says that the raiser's description has brought him hundred of inquiries concerning it. That is not a great wonder. The old country seems to be out of it again; but, no, we've got our "Cartwheel Rose."

Potato Tops as Fodder.—In an article dealing with the employment of Potato tops as fodder for cattle, the *Irish Farming World* says that "no doubt the leaves, if offered green and fresh, would, even if it were not dangerous to do so, be rejected by cattle as food." The information possessed by the writer of the article in question, if extensive, is at least faulty on this point, for Potato haulm is not a dangerous food, and neither is it rejected by the cattle to which it is offered. In parts of Scotland it is a common practice for small farmers to thin out the haulm of their growing Potatos, to the detriment of the Potatos, be it said, on purpose to provide green food for the cows. Pigs, again, will eat Potato haulm with all the pleasure in life, and anyone who has visited the agricultural districts of this country must have seen, if he had his eyes open, pigs regaling themselves in this fashion, for it is the common custom to give to the pig each day during the summer the haulm from the plants dug up to afford the daily supply of tubers.

Dendrobium spectabile.—This new Dendrobium was offered for sale for the first time at the sale of Orchids held by Messrs. Protheroe & Morris, for Messrs. F. Sander & Co., at 67 and 68, Cheapside, on the 25th ult. Judging from the appearance of the pieces that were on view the plant is of vigorous habit, and the remains of the flower spikes suggest great freedom of flowering also. The importation consisted of no fewer than 494 lots, each plant realising from £2 5s., to £3 5s., and one fine piece went for 9 guineas. Dendrobium spectabile is a native of New Guinea and the Solomon Isles, but although it has been known to botanists for upwards of fifty years, it is only within the last year that a live plant has been successfully introduced to cultivation. The first one was sent to Sir Trevor Lawrence, from Malaita, one of the Solomon Isles, and although it was four months *en route*, has done well. D. spectabile belongs to the group D. macrophyllum (Rich); and D. atropurpureum (Rolfe), but when first described by Blume in 1848, was placed in a new genus (*Latourea spectabilis*, Rumphia IV., p. 41, t. 195, fig. 1; and t. 199, fig. C.). This description was taken from a drawing made in New Guinea, by M. Latour-Leschenault. Miguel afterwards transferred the plant to Dendrobium (Mig. Fl. Ned Ind., III., p. 645). A plant obtained from the Solomon Isles flowered at the Sydney Botanic Gardens in 1884, and was the subject of a note in the *Victoria Naturalist*, by Sir F. Von Mueller. In October, 1890, specimens were collected at San Cristobal Solomon Isles, by the Rev. R. B. Comins, and from these were described by Mr. Rolfe as D. tigrinum, the genus *Latourea* being overlooked. From this description the plant has clavate pseudo-bulbs, nearly a foot long, four or five terminal leaves, and erect racemes of 20-30 flowers. The sepals and petals are acuminate, $1\frac{1}{2}$ inches long. The base is broad, and much undulated, while the lip is long, and pandurately trilobed. The colour of the sepals and petals is yellow-white, spotted with red-purple, the lip being also prettily veined with the latter colour.

The Skunk Cabbage Flower.—An American who has been "hipped" over politics grumbles that this flower is the only one truly emblematic of American institutions. Perhaps he has only spoken in haste.

ORCHID NOTES & GLEANINGS.

BY THE EDITOR.

Phaius tuberosus.—Notwithstanding the great beauty of this plant it has not become very common since its introduction from Madagascar in 1881. Most cultivators seem to have a difficulty with it; and those plants that find their way into cultivation have a struggle to live, getting beautifully less every year and ultimately perishing. Mr. Howes, gardener to Walter Cobb, Esq., Dulcote, Tunbridge Wells, manages the species very successfully, the plants under his care thriving, increasing, and flowering every year. Some of his plants are now in bloom. Being of terrestrial habit like the other species of Phaius it is difficult to see why it should prove so much more difficult to cultivate. Doubtless it has a way of its own, and Mr. Howes seems to have discovered the secret. It requires plenty of heat, and moisture both in the atmosphere and at the roots. The large flowers are very showy, having pure white sepals and petals, and a gorgeously coloured lip. The side lobes are yellow, blotched with brown, the upper lobe being white, marked with rose and orange. The progeny obtained from it by hybridisation with other species proves very vigorous and of easy culture.

Peloria of Coelogyne cristata.—As far as we have hitherto observed, this species is not given to the production of freaks or sports, as they are termed in garden phraseology. A specimen sent us, however, by Mr. George Russell, The Gardens, Redlands, Glasgow, showed a decided attempt at peloria of the three inner segments. The petals carried a row of golden fringes along their centres like those of the lip, the phenomenon being more pronounced in one case than in the other. We think it scarcely likely that the sport will be repeated another year, but there is no telling what may happen when the rule of constancy has been departed from. We remember a more decided and also permanent case of peloria, in Dendrobium nobile, which occurred some years ago at Redlands, the result being a variety identical with D. nobile Cooksoni, one of the most popular varieties of the species.

ASPARAGUS.

THIS highly esteemed vegetable is often subjected to ill-treatment in the house of its friends, possibly more so in by-gone years than at the present time. The requirements of the plant I believe are more generally and better understood now, than in the days when the old fashioned beds with their four and five rows of plants crowded together were as universal as the annual loading them with the heaviest and rankest manure obtainable. Now there are serious drawbacks to each of these practices. In the first place, the Asparagus, being a strong rooting plant, has not room to develop itself properly when crowded together, and the stronger and longer the roots can be grown, the better will the produce be. The plants should never have less than three feet allowed them between the rows. Six feet would allow better cropping, with low-growing things between the rows. As to whether raised beds should be adopted, or the flat system, must depend partly on the nature of the soil, and if well blanched or green grass is in request. On wet, heavy ground raised beds should certainly be adopted. Now as to manuring. The old practice is certainly often the cause of the decay of many stools and the weakening of others, keeping the soil wet and cold. It is a far better plan to water during the growing season with manure water and give repeated slight dressings of salt, soot and fish guano. Little and often is better than a heavy dose, particularly of salt, one of the best manures I know. An instance came under my notice once, where great expense was incurred in making new beds, in which all prospects of useful results were negated by the too liberal dressing of salt, the soil of the bed being hidden with a thick coat of destructive strength.—W. B. G.

HINTS FOR AMATEURS.

THE ANNUAL POTTING.

Ferns.—While Palms may be looked upon as being the aristocrats amongst the plants which we cultivate, there is no doubt that their strongest competitors are Ferns. There is a curious interest attaching to this class of plants that is almost impossible to analyse as impossible to deny. We find amongst Ferns such a variety of habit and general appearance, ranging from the stately subject of tree-like form and dimensions to the lowly plant that barely lifts itself above the surface of its mother earth, and yet all are pretty and many of them receive attention at the hands of the cultivator.

But it is not of the beauty and usefulness of Ferns generally that we wish now to deal. Rather let us see what attention we can bestow upon the plants at the present time in order to fully develop this beauty, and thus be in a position to take full advantage of the capabilities of the plants for usefulness.

To tell the truth, while almost everybody loves Ferns, and the love of many finds a practical outlet in an attempt to grow them, many people treat their Ferns very badly. To start with there is the mistaken idea that is, alas, very general that Ferns do not want much light and indeed do not like it, and hence the plants are relegated to all sorts of dark corners, and are allowed to stay there until they are hopelessly crippled. Then again some have got hold of the idea that Ferns are not like other plants in that they want very little soil with scarcely any nutriment in it. The idea of a Fern wanting a fat soil, and failing that a little manurial stimulant never seems to occur to them, and the consequences is that the poor plants are absolutely starved to death for want of sufficient food.

The potting of Ferns generally is an operation that requires a great deal of care and careful handling, and thus it should never be lightly undertaken, but this does not mean that it is never to be undertaken. It is true that we often see specimens of such plants as *Asplenium bulbiferum*, *A. flaccidum*, and *A. obtusatum lucidum*, very much pot-bound, and yet in the best of health, when a little judicious feeding has been practised. On the other hand this system of keeping the plants in the same pots year after year must not be carried to the extreme, for there comes a time when a shift into roomier quarters is absolutely necessary if the plants are to be kept in health.

Adiantums.—The Maiden-hair Ferns have always had a particular fascination for the amateur, and often enough do we see a desperate struggle made to keep it alive in windows of dwelling rooms in cottages and villas. It is to be feared that only a very limited amount of success attends these efforts. The plants may do fairly well during the summer months, but as autumn wears on they begin to get shabby, and the fronds go off one by one. The amateur cultivator fondly hopes to resuscitate his plant by giving it copious supplies of water, and the poor plant is practically drowned. As the period of natural rest approaches less water should be given (instead of more), and nothing should be done to disturb this rest through the winter months. The temperatures of winter will then have comparatively little effect, and the plant will start away strongly in the spring. Now that the delicate growths which are to make fronds presently have begun to push up, it will be safe to infer that there is a corresponding activity in the roots. If the plants are knocked out of their pots there will be found live tips of lately formed roots on the outside of the ball. If potting is to be done, therefore, this is just the time to catch the plants. As much of the old drainage should be removed as possible, and by means of a thin pointed stick the roots all round the outside of the ball should be loosened. This part of the programme will require the greatest care, for the young tips are very delicate and easily injured. If the roots at the bottom of the ball are dead, as can easily be ascertained by inspection, they may be pulled away entirely, and the ball may then be much reduced, so as to enable it to go into a smaller pot than the one it is now in. This reduction of the ball should not be attempted, however, if there are living roots at the bottom. The soil should consist of equal parts of peat and loam with plenty of sharp sand, and a little charcoal. Do not attempt to mix arti-

ficial manures of any description or soot with the potting soil. Good leaf soil may be substituted for peat if desired. In this case it should be freed from all sticks and stones, and should be broken up finely by passing it through a sieve. Pot with moderate firmness only. The use of the lath or a thin potting stick that we have previously referred to will be necessary in many cases to work the new soil all round the sides of the ball, but it should not be employed with too much vigour.

For *Adiantum farleyense*, *A. cuneatum* and its varieties, *A. hispidulum*, *A. scutum*, and other forms of similar growth, the ordinary shape of pots will be found the best, but for *A. Capillus-Veneris* and its varieties, pans which give a larger surface area in proportion to the depth and quantity of soil than the pots will be found the proper thing.

In cases where it is desired to split up large plants into a number of smaller pieces, the present is the most favourable time of the whole year to do so. Propagation by division has the advantage that it enables the grower to quickly obtain as many plants as he may want of a useful size without waiting for them to be raised from spores which is, of necessity, a comparatively lengthy process. Apart from this, however, the sowing of spores and the raising of young plants by that means is preferable. Of course, with *A. farleyense* division is the only method of propagation open to us, as the plants do not spore. We may mention in passing that this handsome Fern will need exceedingly careful treatment subsequent to division. Amongst other things a rather high temperature is necessary, and the watering can must be in the hands of one who knows how to use it properly.

Aspleniums.—In this great genus are grouped a number of some of the handsomest of Ferns. Plants like *A. bulbiferum*, and its various varieties, and *A. flaccidum* are very popular plants, inasmuch as they are handsome and easily grown. They are, moreover, vigorous rooting subjects, and an endeavour should be made to keep them within bounds, otherwise their pots will soon be of enormous size. In potting rather more loam should be used in the soil than was advised for the *Adiantums*.

Pterises.—The varieties of *P. cretica*, and *P. serrulata* are well nigh innumerable, and many of them are highly popular. This is not wonderful when we consider the beauty and elegance of some of the crested and tasselled forms. *P. tremula* and *P. argyrea* are among the most effective of the taller growing species, and besides doing well when grown in pots they succeed well when planted out in the under-glass fernery. The compost employed should be strong and rich, and may well consist of two-thirds of loam to one of leaf soil or peat with sand.

Nephrodiums.—Amongst cool house *Nephrodiums* *N. molle* is undoubtedly the favourite. Its long feathery looking fronds are totally distinct from anything else, and the shade of green they exhibit is likewise distinct. The crested form *N. m. corymbiferum* is met with occasionally in collections, and is a handsome Fern, although its beauty is of a somewhat heavy style. The amateur should be on his guard against overpotting both *N. molle* and its crested variety. This is very easily done and the great quantity of cold wet soil lying about the roots in winter time is almost sure to cause many of the roots to rot. Any old plants that are in big pots should therefore be closely examined, and if it be found that too much room has been given, the dead roots should be cut away and a smaller pot given.

Gymnogramme.—That the Gold and Silver Ferns are beautiful there is no denying, but there is also no denying that they are somewhat ticklish subjects to grow. Young plants or sporelings grow away strongly enough, but as they get older if they once get a check all is generally over with them. In potting the plants too much care cannot be given, for if the roots are pulled about too much the plants are almost sure to go home. Give a compost of equal parts of loam and peat with plenty of sharp sand, and a few lumps of charcoal worked in. After potting shade the plants closely, for the sun's rays are bright now and would much distress the plants if allowed to fall directly upon them.—*Rex*.

A Ground Beetle known as *Harpalus ruficornis* proved troublesome to Strawberry fruit in various districts during 1897.

Correspondence.

Questions asked by amateurs on any subject pertaining to gardens or gardening will be answered on this page. Anyone may give additional or more explanatory answers to questions that have already appeared. Those who desire their communications to appear on this page should write "Amateurs' Page" on the top of their letters.

Tomatos under Glass.—*A. C. L.*: It will be best for you to draw back the shingle from the stage for say 15 or 18 ins. nearest the sides of the house. You may then put up a ridge of soil about a foot in depth along the whole length of the house, and plant the Tomatos in this. The soil should consist in bulk of good loam enriched by having added to it one-fourth of its volume of well decayed stable manure, or cow manure if that can be obtained. The plants should then be procured and planted at once. For a considerable time you will still be able to use the house for plants, and if you only plant along one side its value for plants will not be greatly diminished. If you plant along both sides the plants will not get so much light and will of course not do so well.

Asplenium longissimum.—*M. N.*: You will find this *Asplenium* a real beauty for growing in a basket, but it requires a warm house. The temperature you speak of—45° Fahr by night would be much too cold for it. A compost of two-thirds loam, with one-third peat and plenty of sand will suit it well. The wire basket will suit it well enough. You may if you choose line it with moss, but we should prefer to use very fibrous loam for this purpose. Try and obtain some very fibrous turves from the loam heap, and shake the greater part of the loose soil out of them. You will find these answer for lining much better than the moss.

Nerines.—*Alce*: If the foliage is showing signs of going off you may curtail the water supply gradually. Give the plants the benefit of all the sun possible. No more manures should be applied to them now—the season for that is past.

A Good Cineraria.—In a batch of *Cinerarias* which were raised from seed sown last June, I have a very fine deep blue form which I should like to save. Will it come true from seed?—*Rob*.

Seedlings naturally vary a great deal, and you would probably find a grand mixture of varieties spring from the one seed parent. Your best plan will be to cut the plant down after flowering has finished. It will then throw up a number of suckers from the roots, round the base of the old stem. These may be taken off, potted up, and there are your plants. This system of cultivation is extensively followed in cases of specially good varieties.

Adiantum Fronds Going Off.—*Rob*: From what you say we have little doubt that the tips of the tender fronds have been scorched by the sun. You must shade them more closely; also stop sprinkling them overhead, for this is assisting the evil. Either slugs or cockroaches have been responsible for the young fronds that have been bitten through. If you cannot catch the slugs and kill all the cockroaches by poison, stand the plant on a saucer or pot inserted in a vessel of some kind containing water. The cockroaches will not pass the water.

Outback Chrysanthemums.—*Ito*: Those plants that you wish to develop into bush specimens should be pinched or cut back to within three or four leaves of the base of the stem. When the side-breaks begin to make their appearance the plants will be ready for potting.

Primula Seed.—*Enquirer*: In order to "set" the flowers, as gardeners phrase it, you must employ a small, soft, camel's hair brush. The stamens and the pistils are of different lengths, and the anthers and the stigma consequently at different levels. Push the brush gently down the tube, twist it round and withdraw it; some of the pollen will be sure to have been deposited on the stigma by this means.

Anemone Pulsatilla.—*E. Ewart*: This *Anemone* is propagated by seed. Sow the latter as soon as it is ripe in pans or boxes, and cover with a handlight or place them in a frame. This will be all the shelter required.

Young Raspberries.—*E. Ewart*: You should have cut the young canes down to within a few inches of the bottom, and if you have not done it you had

better see to it at once. This would induce the stools to throw up good, stout canes from the bottom and you will get fruit next year. If you do not do this you may have to wait several years for fruit, which would be a pity, seeing that you have the matter in your own hands.

CYPRIPEDIUM VILLOSUM.

THE species forming the subject of this note was originally introduced from Moulmein in 1853, and since then has become one of the most common in collections. It has given rise to only a few striking varieties, even if we include *C. v. Boxalli*, but its hybrid progeny is very numerous indeed. That fact coupled with its easy cultivation has conduced to make it common, and one might almost say popular; but it has never aroused any great enthusiasm amongst cultivators and collectors, because importations do not furnish many unique and striking novelties.

There is another phase of the subject, and that is

used was fibrous peat, sphagnum, silver sand, and charcoal. The plant was kept in the plant stove, with a minimum night temperature of 55°; and a free supply of water was given it at all times. The example might well be followed with other species and in other establishments so that cultural skill might be displayed at exhibitions.

THE FLORISTS' SHOW TULIP.

THE unusually mild winter has so encouraged the growth of Tulips that they began to peep through the ground by the third week in January, which may be considered fully a fortnight earlier than is usual in ordinary seasons; and up to the commencement of last week my beds looked exceedingly healthy, and a few of the earliest kinds showing their buds. What the last few days of cutting north-easterly winds, with frost combined, will result in, I anxiously await with some little alarm, but must hope for the best.

The time having now arrived when the plants

to the bloom against strong winds. Where beds are provided with proper Tulip frames, great protection will be afforded to the bloom by putting some fish netting all round the top of the wire netting, and also over the top of the frames, during the growth and development of the buds, so as to prevent as little damage as possible arising to the bloom from "hailstorms," which generally occur, more less, during that period of growth. Whenever a bud is struck by a hailstone, a brown spot appears on the petal so struck, and immediately the colour and markings begin to show, and before the bloom matures itself, the said spot goes into decay, the bloom becoming spoiled for exhibition purposes.

To protect the blooms intended for exhibition, or to produce them as perfect as possible, a calico awning should be applied, so as to prolong the life of the blooms, and protect them against rain and sun. As much air as possible should always be given to the plants by keeping the calico well up on one side of the bed, where the sun is not upon it; and when the latter gets to the side where the calico is rolled up,

CYPRIPEDIUM VILLOSUM.

the growing of plants to large size so as to furnish a good display of bloom. The large flowers with their waxy, shining segments are not devoid of decorative value, though the dusky yellow colour, more or less heavily overlaid with brown, offers little in the way of brilliancy. There have been some instances lately of an inclination to develop plants to a large size, a feature of Orchid culture to be commended in order to counteract the custom of mincing up the plants into infinitely small pieces. At the spring show of the Preston and Fulwood Horticultural Society on the 9th and 10th ult., Mr. John Woollam, gardener to Mrs. Birchall, Ribbleton Hall, Preston, took the first prize for a specimen Orchid, with a healthy and vigorous piece of *Cypripedium villosum*, carrying forty-four blooms. Mr. Woollam informs us that he has had the care of it for the past five years, but it had never produced so many flowers on any previous occasion. He repotted the plant last spring, after which it grew away vigorously, with the result as shown in the accompanying illustration prepared from a photograph of the specimen. The compost

should have as much protection as possible, and likewise a little attention, it may be information to young growers to know that it is very beneficial to the growth and bloom of the Tulip, to stir up the soil between the rows of plants, care, of course, being exercised in not disturbing any of the bulbs. This can be easily avoided by driving a strong 3 in. or 4-in. nail through the end of a broom-handle, and then by standing on one side of the bed, plunging the nail in the middle of each row on the other side of the bed, and carefully drawing the handle to you. The soil and weeds will be well loosened, and thus the weeds can be easily picked out of the rows, which will give the beds a better appearance; and will also admit of air to the roots of the bulbs, which is most essential.

The next thing to be done is to put some wire netting, 18 in. high, all round the Tulip-bed frames; and where there are no frames, the netting should be supported by iron or wood stakes, the netting being tied to the stakes. This will prevent the trespass of cats and dogs, and will likewise be a great protection

let that side down, and roll up the other side. When it rains the calico should be kept down on both sides, and both sides should be securely fastened the last thing every night, so as to protect the awning from damage by wind, during the night. The awning should not be fixed up until the colours of the blooms distinctly appear. By too early covering the colours or markings have a dull or washy appearance, instead of being bright and vivid. The plants should never be watered during the period they are covered with the awning, or the same washy appearance will present itself.

The best way to produce a bloom for exhibition and to ensure its beautiful lustrous colour, is not to cover it with calico, but by a 10-in. square board, attached to a stake, keeping the board about 4 in. from the top of the bloom.—James Thurstan, Cannock, March 28th, 1898.

12,000 Cases of Apples have been shipped to British shores from Tasmania during the last month.

PLANTS RECENTLY CERTIFICATED.

THE awards mentioned below were made by the Royal Horticultural Society on the 22nd ult.

Orchid Committee.

DENDROBIUM NOBILE ASHWORTHIANUM. Nov. var.—The sepals and petals of this variety are slightly twisted and pure white. The lip is large, rather more expanded than usual, and white, tinted with the faintest shade of lemon, the usual blotch being entirely gone. The variety attracted a great amount of attention, being so unlike the usual forms of *D. nobile*, although the growth was of that species. First-class certificate. E. Ashworth, Esq. (gardener, Mr. H. Holbrook), Harefield Hall, Wilmslow, Cheshire.

ODONTOGLOSSUM HYBRIDUM ASHWORTHIANUM.—This was considered to be a cross between *O. Cervantesii* lilacina and *O. cordatum*, but it has a strong family likeness to *O. Rossii* aspersum violaceum. The sepals are red-brown, with transverse yellow lines. The petals are rose-purple with a few brownish-crimson blotches at the base. The lip is rosy-purple, and the crest creamy. Award of Merit, E. Ashworth, Esq.

ODONTOGLOSSUM CRISpum PRINCESS CHRISTIAN. Nov. var.—The flowers of this variety are of large size and handsome appearance, with acuminate sepals and petals. The former have two large and lobed blotches of a brownish-purple, and often joined into one. The petals have a semi-circular line of smaller round blotches on the centre. The lip has a blotch in front of the crest. The ground colour of all the segments is white. First-class Certificate. Baron Schroder (gardener, Mr. H. Ballantine), The Dell, Egham.

ODONTOGLOSSUM ROCHFORDIANUM. Nov. hybr. nat.—In this we have a natural hybrid apparently a cross between *O. crispum andersonianum* and *O. luteo-purpureum*. The sepals and petals are thickly blotched with crimson-red on a creamy ground. The lip has a few small blotches. Altogether it is a pretty variety. Award of Merit. Mr. Thos. Rochford, Turnford Hall Nurseries, near Broxbourne, Herts.

ONCIDIUM CUCULLATUM PHALAENOPSIS BRANDT'S VAR. Nov. var.—The sepals and petals are white and richly blotched with claret-purple. The lip is of great size for the species and thickly spotted with purple. The markings generally are larger and brighter than the type. Award of Merit. Frau Ida Brandt, Zurich.

Floral Committee.

DRACAENA EXQUISITE.—This showy variety belongs to the broad-leaved section, and is of close, excellent habit, the leaves being placed closely together and arching. They are of a deep green with broad, whitish edges as they first expand, but the colour improves as the leaves develop and ultimately become bright red and handsome. Some leaves have a great extent of colour. Award of Merit. Messrs J. Veitch & Sons, Ltd., Chelsea.

AMARYLLIS IDEALA.—The flowers of this variety are of beautiful form, and creamy-white with deep scarlet tips to the segments. Award of Merit. Messrs. J. Veitch & Sons, Ltd.

AMARYLLIS CLONIA.—The base of this flower is green, and the rest of the body colour white, chastely and beautifully shaded all round the margins with orange-scarlet. The flower is large and open, while the delicacy and combination of its colours is such as we seldom meet with. Award of Merit. Messrs. J. Veitch & Sons, Ltd.

AMARYLLIS TACOLA.—The segments of the large open flowers are very broad, much overlapping, and of a clear bright scarlet, with a white ray running nearly to the apex of each segment. Award of Merit. Messrs. J. Veitch & Sons, Ltd.

AZALEA JAPONICA RUBRA.—The flowers of this Japanese plant are of medium size, something resembling the Carmichael strain of Azaleas, and of a rather attractive red colour. Award of Merit. W. Nicholson, Esq. (gardener, Mr. Wm. Smythe), Basing Park, Alton, Hants.

HYACINTH CITY OF HAARLEM.—This variety produces a dense and massive spike of rather richer and brighter yellow than usual amongst yellow Hyacinths. Award of Merit. Messrs. Wm. Paul & Son, Waltham Cross.

AMARYLLIS BEACON.—The large open flowers of

this variety are of an intense crimson, deepening in the throat to maroon-crimson. As a dark variety it is very telling, and effective by contrast with lighter sorts. Award of Merit. Captain Holford (gardener, Mr. A. Chapman), Westonbirt, Tetbury, Gloucester.

IMANTOPHYLLUM OPTIMA.—In this we have a very large flower with long segments of a rich orange, with a soft yellow throat. Award of Merit. Messrs. J. Veitch & Sons, Ltd.

IMANTOPHYLLUM FAVOURITE.—There are so many orange varieties amongst this class of plants that a change is highly desirable and effective by contrast. The large, well-formed flowers of Favourite are of a soft salmon-pink with a pale sulphur-yellow throat, and at a short distance have the appearance as if approaching yellow. The variety is certainly an acquisition. Award of Merit. Messrs. J. Veitch & Sons, Ltd., Chelsea.

THE VICTORIA AND PARADISE NURSERIES.

DURING the storm of wind and sleet that prevailed last week, we paid a visit to the Victoria and Paradise Nurseries of Messrs. B. S. Williams & Son, at Upper Holloway. Orchids, Palms, Ferns, fine foliage plants, Amaryllis and Clivias are some of the leading specialities of the glasshouses here, spring flowering plants being now in bloom.

ORCHIDS.

Amongst Cattleyas the type now in season is *C. Trianaei* in its various shades of colour. The same may be said of *Cypripedium villosum*, a good old subject not very much given to variation in colour, though its near relative *C. v. Boxallii* shows a greater range of variety in the matter of spotting and the intensity of colour. Considering how many months have elapsed since *Calanthes* commenced to flower, one would hardly expect to find them now, yet many are in full bloom here and others only in bud, including some quantity of *C. sanderiana*, having rosy segments and a deep purple lip. Very pretty is the hybrid *C. Williamsii* with nearly white sepals and petals, and a crimson and rose lip. *C. oculata gigantea* is notable for the great size of its flowers which are white, well set off with an orange, eye-like blotch in the throat.

Coelogyne cristata alba has made wonderful progress here within the last few years, the small pieces having grown to large size and making the baskets conspicuous with their snow white flowers. *Cypripedium chamberlainianum* maintains its old characteristic of never having finished flowering. *C. lathamianum* is notable for the variation amongst its flowers, and we noted a very fine variety here with a yellow lip and richly coloured petals. The fragrant *Cymbidium eburneum* has for its companion at present a nice bit of *C. devonianum* with a distinctly rosy lip, and suspended in an Orchid pan from the roof. *Zygopetalum Perrenoudi* belongs to the same type as *Z. Mackayii* though entirely different from that and notable for its large and showy dark violet lip, and richly blotched sepals and petals. It lasts a long time in bloom. The hybrid Phaius Norman, which was recently honoured with a First-class Certificate by the R. H. S., has found its way here, some of the varieties having large and beautifully marked flowers. In one case the sepals and petals are of a beautiful soft rosy pink, and the lip rose in the upper half, and crimson in the tube, beautifully lined with orange. Numerous plants of *Epidendrum radicans* scattered about amongst Vandas and other Orchids have a very brightening effect with their glowing scarlet flowers. Vandas are well cared for, and thrive well here, and being tall plants occupy the upper shelves of the central staging. *V. suavis* and *V. tricolor* have commenced flowering, and carry numerous spikes in the bud stage. The colour is varied and some of the flowers are unusually large.

The cool houses contain numerous varieties of *Odontoglossum crispum*, *O. Pescatorei*, *O. triumphans*, and *O. Rossii majus*. The orange-scarlet of *Ada aurantiaca* shows a bright bit of colour for a cool house species. In more than one house we came upon *Cypripediums* in great variety, some of which are already in bloom. A fine thing is *C. Gertrude Hollington*. *C. gowerianum superbum* is making remarkably vigorous growth, and the tessellated leaves are ornamental in themselves. Half one side of a house has been filled with *Odontoglossum crispum* in healthy, vigorous condition, and the

other half is to be filled presently with the same species. A glass case contains healthy plants of *Anoectochilus*, including *A. Petola* whose leaves appear to be finely threaded with gold. On the contrary *A. setaceus* is beautifully threaded with red lines, not at all corresponding to the venation, but forming a distinct kind of ornamentation. *A. intermedius* has dark, velvety, olive leaves with a grey venation, making a pleasing contrast. These Orchids are gems of their kind.

CLIVIAS.

This class of plants is now in perfection, as far as the flowers are concerned; the foliage is perennially in splendid condition and never unsightly. A good many of the best varieties and selections of past years are named, a few of which we noted. *Ambrose Verschaffelt* is notable for the great length of its rich orange flowers and the size of its trusses. On the other hand *Prince of Orange* is a finely formed flower, with short, overlapping segments of great breadth, and intense orange colour. This we consider a choice variety. *Aurantiaca* has large, soft orange flowers tending towards the desired yellow hue. The orange flowers of *Martha Reimers* are produced in trusses of great size; while *Surprise* is notable for the great length and boldness of each individual flower. Entering another house we found the wide central staging entirely filled with a large collection of *Clivias* from which the previous lot was an overflow. Amongst the numerous varieties the darkest was undoubtedly *Meteor* with short compact flowers of a glowing orange-scarlet. Another fine thing is *Robusta*, a vigorous growing sort bearing huge trusses of large orange flowers, nearly white in the throat. *Lindeni*, though a good variety in its day, is now far surpassed in colour by many of the varieties. For large conservatories nothing could be more suitable than these *Clivias*, which are of decorative value whether in flower or not.

AMARYLLIS.

Many of the earlier varieties are now in full bloom, but the cold and sunless condition of the weather for some time past has been retarding them, the spikes and flower buds of a large proportion just creeping along slowly. This will have the effect of prolonging the season, however. A bold and handsome flower is *Gerald Balfour*, being large, well expanded, and rich crimson-scarlet with a short green ray. A group of *Dr. Masters* is notable for the dwarf habit of the flower scapes, the blooms themselves being neatly formed, and of a brilliant, glossy scarlet. A light flower is *Sea Breeze*, being delicately and beautifully netted all over with scarlet on a white ground. Many varieties are now in flower in which the blood of *Empress of India* is evident. In its day that variety was one of the finest in cultivation. Seedlings are numerous, and many of them having shapely, richly-coloured flowers, just opening when we saw them, had not then received names. One of the choicest of all the light coloured varieties is *Holloway Belle*, the widely expanded and beautifully formed flower being of a charming soft rosy-scarlet, deepening upon the inner segments, the whole being delicately pencilled with darker veins, giving the flowers a striated appearance. A broad, white ray runs to the apex of each segment. The segments of *Grandidens* are of a uniform crimson, except on the lower half of the midrib, which is darker. One of the best is *Lord Brassey*, the broad segments being of a bright or lively scarlet, with white rays and a green centre to the flower.

Other flowering plants include a variety of Indian Azaleas, also varieties of *Azalea mollis*, white and purple forced Lilac, and hybrid greenhouse *Rhododendrons* in variety. A handsome hybrid is that named *R. Madame Cuvelier*, with huge, pure white, fragrant flowers freely produced. The front of the large conservatory is gay with *Hyacinths*, *Daffodils*, *Lily of the Valley*, and various other spring flowers.

FINE FOLIAGE PLANTS.

Several of the houses are devoted to *Crotons*, *Dracaenas*, and *Aralias*, of which there are good collections here of the leading kinds. The propagating houses and pits are all busy in the getting up of a stock of young stuff of the various fine foliage plants. Small pots of *Cocos weddelliana* are grown in quantity and in fine condition. *Dracaena Doucetti*, with narrow leaves, edged with white, is a beautiful and useful decorative subject. *Marantas*, *Calatheas*, *Pandanus Veitchi variegatus*, *Dieffenbachias*, and various other stove subjects are grown in great variety, including *Anthuriums* now in

bloom. The large Palm house is well filled with all the useful decorative Palms, such as Kentias, Arecas, Phoenix, Livistona, and others in fine condition, and of all sizes. Bamboos in large pots and tubs are most useful decorative subjects that are rapidly becoming common.

DEVELOPMENT OF CYCLAMEN LATIFOLIUM.

WHERE the evolution of the hothouse Cyclamen is going to end it would be difficult or impossible to predict. Several innovations have become more or less common within the last few years. A bunch of flowers comes to us from Mr. A. Pentney, The Gardens, Worton Hall, Isleworth, notable for the multiplication of parts and size of the blooms, and a few have broad, fringed segments. Two stalks each carried twin flowers, which are thus brought together by the union of the peduncles in pairs, as can be seen by their partial separation at the top. In these cases the segments to the number of five or six are spreading instead of being reflexed. A larger number of flowers have eight or nine segments each, greatly overlapping one another owing to their breadth, though the mouth of the flower is wide enough to admit them in a single row. Most of these are of a rich red, one being pure white. Another form of evolution is the fringed form of flower, the segments of which have a line of outgrowths on both surfaces, just within the margin, such as we see in *Scolopendrium*, upon the fronds of some varieties. The colour of this type being light and the petals broad and crimped, the blooms remind us of those of *Lagerstroemia indica*. From a decorative point of view the fringed varieties possess a certain amount of value on account of their distinctness, but their popularity will largely depend upon how they strike the public fancy. They will not displace the smooth-petalled varieties for some time to come, if ever they do; but this will largely depend upon their further development, and the character they assume.

NOTICES OF BOOKS.

MUSHROOM CULTURE. London: Published by George Tucker, 1, 2, and 3, Salisbury Court, Fleet Street. Price 2d.

This pamphlet of thirty-one pages is No. 8 of the "Salisbury" Series of Garden Produce Handbooks, and deals with various phases of Mushroom culture in the open air, in cellars and outhouses, in hothouses, in frames, &c. The introduction having stated that we receive a considerable foreign supply, chiefly from Paris in the shape of "buttons," that is, the young and partly developed stage of the Mushroom, goes on to urge the attempt to meet this demand with home-grown produce. The would-be cultivator is urged to make a speciality of Mushroom culture, including that of the "roon" or early stage, if he would make the business a commercial and financial success. In like manner the highest prices are obtained for Mushrooms produced between October and May, but particularly during December, January and May. Quality and time are the two most important features of "roon" culture, the Paris supply being considered dry and without flavour. Details concerning the cultural treatment are given, as well as short chapters on gathering the crop, preparing for market, and marketing the produce. Paper and type are alike good.

BUSH FRUITS CULTURE.

In this we have No. 9 of the same series as the above. As the name implies the pamphlet deals with Gooseberries, Currants, and Raspberries, and includes Strawberries as a crop that may be grown between the bushes. A considerable amount of attention is paid to Gooseberries, which their importance warrants. In describing the process of making cuttings, the advice given is sound, but we should not practice the method of inserting them. For instance, the ground having been chosen, the operator is advised to dig it all over and then lay the line at the place where the cuttings are to be inserted. This is to be done by pushing them into the ground alongside of the line, and treading the ground after all have been inserted. There is just a little danger of peeling off the bark at the base; but of more importance is the difficulty of pushing the cuttings of

Gooseberries into the ground with the spines upon them. Though every bud intended to be in or near the ground should be removed, the spines need not be so treated, as they serve to hold the cuttings in the ground when frost is likely to raise them out of it. Another fact we should mention is that cuttings taken in September and divested of their leaves before insertion get well rooted before spring, thus gaining almost a season in advance of those put in in winter or spring. The selection of the seven best varieties for market purposes is a very good one. The same number of Lancashire prize Gooseberries is given, but rightly enough their flavour is not recommended. Whinham's Industry is described as the only variety not subject to mildew in America, which is not a little surprising when we remember how few of our Apples do well there, and *vice versa*. The details given respecting the cultivation of the Raspberry are very much to the point, but particularly concerning the preparation of the land. We note that large Currants are recommended irrespective of due regard to flavour, while the opposite idea is applied to the Gooseberry. Early and late Strawberries are urged as the best to plant so as to gain an advantage over competitors who disregard or are ignorant of the value of prolonging the season.

GLASSHOUSE GARDENING.

No. 10 of the "Salisbury" Series deals with the culture of fruits, flowers, and vegetables under glass, and chiefly from a commercial point of view as in the case of the preceding pamphlets. Most attention in this case is given to materials and means rather than the subjects themselves, though a short article is devoted to the most important crops to grow. Tomatoes take a prominent position, followed by French Beans, Grapes, Peaches, Cucumbers, and Mushrooms. Flowers require more skill and knowledge in their successful cultivation than the subjects above mentioned; hence nothing more is said about them in this article, the cultivator being recommended to stick to those things which he understands best. Other articles deal with horticultural glass, bench-box culture, advantages of lean-to houses, ridge and furrow houses, anxiety of the foreign grower, cleanliness, the English grower's position, &c. The author of the book thinks that the failing of the foreigner is chiefly in the quality of his goods. Then let the home producer pin his faith to quality and win his way by dogged perseverance is a proposition that we would second.

CEANOTHUS RIGIDUS.

THERE are numerous very pretty shrubs belonging to the genus *Ceanothus*, but several of them are not very hardy in the midland and northern counties, particularly the small leaved and evergreen species. As far north as London at least, they prove hardy enough against a wall in the open to withstand all but the severest winters which we get at fairly long intervals. The species under notice was introduced from California in 1848, but is not so frequent as we should expect it even in the southern counties. Some branches of it, heavily laden with flowers and flower buds, have reached us from Mr. J. Reynolds, The Gardens, Sidbury Manor, Sidmouth, Devon. The stems are of slow and stiff, sturdy growth, producing a great profusion of short spurs and twigs that are densely crowded with clusters of rich, dark, purple-blue flowers. We should not expect it to flower in the latitude of London for another three weeks. The shoots are covered with dark green, persistent, wedge-shaped leaves, smaller than those of the common Box as a rule, and reminding us of those of *Cotoneaster microphylla*. When in full bloom the shrub is really handsome and supplies a colour that is quite uncommon amongst hardy shrubs. The evergreen leaves, when covering walls, have an interesting and decorative effect even when the shrub is not in bloom.

SOME INTERESTING PLANTS.

A LARGE audience assembled on the 8th March to hear Professor Henslow lecture on some of the plants exhibited. This is the first of the series of six lectures which the Rev. Henslow, as Professor of Botany to the society, proposes to give through the year. J. T. Bennett-Poë, Esq., occupied the chair.

Iris persica was the first of the plants passed under review. This plant had been grown in England for upwards of a hundred years. It was the first plant figured in the first issue of *Curtis' Botanical Magazine* in 1790.

The Sarracenias were the next subject of the Professor's remarks. It was explained that the characteristic "tubes" were formed by the leaves folding over and joining at their edges. The stiff bristle-like hairs which line the interior of these tubes, and pointing downwards prevent the escape of any insect entering were also commented on. As a curious instance of the complex workings of Nature's machine, it was stated that a moth, too wary to be caught in the trap herself, would drop her eggs into the tube amongst the trapped insects, and the grubs would, as a result, feed upon them. Certain birds, however, would find out the presence of the grubs and would slit the tubes with their beaks in order to get at them. The curious morphology of the flower was pointed out, and the position of the stigmatic points shown.

That handsome development, the *Papilio Cyclamen*, then engaged the attention of the lecturer. Hypertrophy of the segments of the corolla had in their case produced a new race of plants, which would probably take a further step and become double. It was incidentally mentioned that an illustration of *Cyclamen Coum* was the fourth plate in the first issue of *The Botanical Magazine*.

Epacris and *Erica* were used to illustrate the idea of "representative" plants, *Epacris*, with its five-pointed corolla coming from Australia, and *Erica*, with its four-pointed corolla hailing from South Africa. An examination of the plants, however, while it would show differences in the flowers of the two, would also reveal a similarity in their vegetative systems. This was due to the similarity of climatal conditions under which the plants were placed.

Bryophyllum calycinum, a curious member of the natural order *Crassulacea*, was mentioned as being remarkable for the way in which the thick fleshy leaves detached themselves from the stem before they were dead, fell to the ground, and, under favourable conditions, rooted. The roots and buds were produced at the notches in the lamina or blade of the leaf. This, the Professor offered as evidence in support of the idea that fruits were only altered leaves, since in a *Pea* pod the seeds were borne on the ridge formed by the unison of the edges of the transformed leaves, or carpels.

Specimens of the modern *Amaryllis* were likewise shown. The forefathers of these handsome plants were early figured in *The Botanical Magazine*, but the modern plants had become very greatly mixed up, and it was impossible to say definitely as to their genealogy. *Hippeastrum pardinum*, a Peruvian species, was shown, but the results obtained by crossing it, and some of the modern forms had, so far, not been satisfactory. The effects of H. Leopoldi upon the race had been to produce the large, flat, open flowers with the short tube. He drew the attention of his audience to the fact that the five upper segments of the flower had each a white stripe running down the centre. The lower segments were much smaller than either of the others, and lacked the white stripe. The stamens, too, arched over or were declinate. He believed this to be due to the effect of insects. This smaller lower segment was always a feature of irregular flowers with declinate stamens. The insects alighting upon the stamens bent them over, and caused them to assume the shape they did.

In conclusion, the Rev. Henslow touched upon hybridity, and brought forward several samples of Orchids to illustrate his remarks, including *Dendrobium wardianum*, *D. japonicum*, and hybrids between the two, also the bigeneric hybrid *Epiphronitis*. The Professor said that some people had the idea that if two plants of different genera would cross, they ought no longer to be kept in different genera on physiological grounds. It was necessary, therefore, to decide whether one would group and classify plants from a physiological or a systematic point of view, in which case there would be divergencies of opinion as to the place certain plants ought to occupy.

At one time, people thought that sterility was the inevitable possession of the hybrid, but this was a fallacy, inasmuch as many of our popular races of plants, such as Roses, and Fuchsias were of hybrid origin, and they were all fertile enough.

Gleanings from the World of Science.

THE undermentioned subjects were brought before the Scientific Committee of the Royal Horticultural Society, on March 8th.

Phytoptus ribis.—An interesting letter was received from Miss Ormerod giving an account of what is being done experimentally at the Duke of Bedford's fruit farm at Woburn, under the direction of Mr. Spencer Pickering, F.R.S. As to the possibility of obtaining "mite-proof" Black Currants, the only result has been some plants received from Budapest, which she has distributed to the Todington fruit grounds, to Mr. Speir Newton's farm, Glasgow, and to Woburn. Miss Ormerod has given as exhaustive an account as she could form of the disease in a special appendix to her twenty-first annual report, from the period of its first appearance until the present time. A series of experiments are now being set on foot at Woburn directed to every point which is open for serviceable action, including chemical applications. These will be followed by expert examinations of the contents of the galled buds treated; and with coincident examination of galled buds under precisely similar circumstances, but *not* treated chemically. These experiments will be found detailed in the appendix, pp. 141-158. A conclusion anticipated is that there should be "a difference in broadscale method of growing."

Scotch Fir, Malformation.—Mr. Veitch sent a curious mass of stunted boughs, the whole resembling a hedgehog, and probably caused originally by a *Phytoptus* or fungus. Dr. Masters observed that short boughs struck from such specimens were used as miniature trees, for rock-work, etc.

Sprouting Broccoli.—A remarkable specimen was received from Mr. W. P. Wright, Willeborough, Ashford, Kent, from the central and much enlarged stem of which a large number of good sized lateral shoots had appeared. It was suggested that if it be capable of being "fixed" it would probably prove a valuable acquisition.

Phytoptus on Hazel.—Mr. G. Gordon sent specimens of this well-known complaint, allied to the Currant mite. The samples were received from Kent, where the Black Currant is badly infested. It was first observed at the locality on the Hazel last year.

Orchid Roots with Fungus.—With reference to the specimen brought to the last meeting, Mr. Murray, of the Gardens, Oakwood, Wylam-on-Tyne, writes to say that he is "convinced that it is from no other cause than from the want of air, or, rather, circulation of air, among the plants." In a previous communication to Mr. Douglas he expressed agreement with Mr. Veitch's interpretation, but not quite in the manner he explained, for he observes, "I ventilate the houses day and night with the ventilators, . . . but the air upon the stages, or, rather, above the stages, when the plants are standing close together, travels very slowly, even with ventilators open, in comparison with that around the centre staging, as plants thereon seldom show signs of fungus."

Two and Three-Spathed Arums.—Mrs. Richards of Westridge, near Ryde, forwarded two flowers, one with two spathes, the other with three, both from the same plant. They were very fine instances, and it was reasonable to expect such might prove constant. If so, a permanent form with two or more spathes would be very desirable.

Azaleodendron.—A hybrid between an *Azalea mollis* or *sinensis* and a *Rhododendron*, received from Sir Trevor Lawrence, was unanimously awarded a Botanical Certificate. It was raised by M. Le Prof. Pynaert, of Ghent.

Large Ivy Stem.—Prof. Henslow exhibited a section of Ivy, some 10 in. by 8 in. across. It grew round a tall Holly, about 50 ft. in height, at Zeals Rectory, Wilts.

Twin Apple.—A remarkable monstrosity was sent from Mr. Bar-at-Gin, 3, Praed Street. Instead of being the result of the fusion of two flowers, as occurs in Tomatos, &c.—i.e., a "synanthic" condition, a vertical section revealed the fact that they were the result of a bifurcation of the axis below, the under side of the Apple giving no signs of its being a twin.

Cypress Diseased.—A specimen received from Dr. Church, having the bark split and detached and infested with fungi, was forwarded to Kew for further examination. The following report was received:—"*Cupressus dolabrata*.—This is a typical example of bark-scorching, the cortex being first killed by exposure to the sun's rays, afterwards splits and forms sun cracks, and finally separates from the wood. The fungus present—*Corticium lacteum*, *Fries*—is simply saprophytic on the dead parts."

Kitchen Garden Calendar.

THE peculiar and ungenial weather of late has somewhat retarded out-door operations, as snow lay on the ground in many places to the depth of several inches, which has lowered the temperature of the soil to such an extent as to check the growth of plants. We may now hope for better weather so that planting and sowing may be proceeded with. Advantage should be taken of the first genial weather to plant Onions that have been raised under glass. These should not be put too deeply in the ground or the plants instead of forming bulbs will be thick-necked. Cauliflower that was raised under glass may also be transferred to the open quarters, and the same may be said of Lettuce, Cabbage and Parsley.

POTATOS.—Towards the end of the second week the planting of these may be general. Those who have to grow a goodly portion of their supply in the kitchen garden, would do well to be careful in their selection of varieties, choosing those that are of medium growth. Potatos are an important crop in some gardens, while in others only a few for early use are planted, those for the main supply being grown on the farm. For earlies the Ashleaf and Sharp's Victor are good, while for a winter supply Windsor Castle is one of the best. Brussels Sprouts, Borecole, and early Broccoli seed may now be sown. The seeds must be well protected from birds, which are very partial to them. Snails are also troublesome, therefore, these must be kept in check.

CELERY for a late supply should be sown on a warm border; the soil for this cannot well be too rich, for the quicker the plants are grown the better the result. Choose a sheltered spot where the ground is level so that watering may be done more evenly than where it is on the slope. Should the weather be dry the ground must be kept moist by frequent though slight waterings. Plants that are getting forward in boxes or on hot beds should be transplanted into the trenches as soon as the weather is favourable, as there is nothing gained by keeping them until they have attained a large size before putting them out. Celery is quite hardy until blanching takes place, which alters its character entirely.

LEEKs that were raised under glass may now be transplanted in the open ground. Where space is limited trenches may be taken out as for Celery, but this is not necessary as blanching can easily be effected by means of drain pipes. We have no preference for the long slender stems. Bulk in these as in Onions is more to be desired; therefore as this can be produced in thickness instead of in length there is a point gained by aiming at the latter, as less trouble is required to effect the end.

PEAS must on no account be neglected now. As soon as those sown in the last month appear through the soil make another sowing of such varieties as Model Telephone, Model Telegraph, Exhibition, Veitch's Main Crop, Danby Stratagem, Invincible, and the like. The boughs should be put to the others as soon as they are a couple of inches high, taking care to use plenty of spray to keep the young plants upright until tendrils are formed, and they can support themselves.

SALSAFY is rather a troublesome vegetable to grow well, but if properly treated there is no reason why every garden should not be able to give a supply of this delicately flavoured winter root. Where the soil is poor and light, holes should be made with a dibber about a foot deep and nine inches apart in the row; these should be filled with light rich soil that has been passed through a half-inch sieve. Three or four seeds should be put in each station, and when the young plants have made the second rough leaf they should be thinned out to one at each place. Scorzonera may be treated in the same way,

or where the ground is suitable may be sown in drills fifteen inches apart.

VEGETABLE MARROWS may now be planted on slight hot-beds where they can be protected until all danger of frost is over. Another sowing may also be made for a later supply. Herbs of various kinds may now be sown, such for example as Thyme, Chervil, Marjoram and Savory. Make a successional sowing of Spinach. The Carter is one of the best for summer use. Small sowings of Turnips must also be made. It is not advisable to sow more at one time than for an immediate supply, as they so soon run to seed during dry weather.—Snowball, Early Milan, and Mouse-tail, are amongst the best. Lettuce should now be sown of the summer Cos varieties, and those already large enough for transplanting should be put out a foot apart each way, or they may be grown between the rows of Peas. Small sowings of Radishes of the early Olive or French Breakfast type should be sown on a warm border. Attend to stopping and regulating the growths of Cucumbers. Those on hot-beds where the heat is on the decline should have a lining put round the frames.—*Kitchen Gardener.*

The Orchid Grower's Calendar.

WARM DIVISION.—At the approach of spring everything begins to burst into new life, so to speak. The *Vandas*, *Angraecums*, *Aerides* and all the distichous-leaved plants have become active. It is easy to see when growth commences in earnest. The new foliage pushing from the centre or head of the plants is of a pale green colour, and the points of the roots assume a delicate pink and pea-green colour. When this takes place it is a good plan to go over the plants, resurfacing them with some live sphagnum moss, previously made warm by placing it in the same house some hours before it is required for use.

In some structures the moss will grow like mad, whilst in others it has to be coaxed considerably, even to placing the growing points uppermost. When the top-dressing is done water sparingly for a time, but keep the moss alive by gently sprinkling with a fine rose can or the syringe, and keep rather shady until a fresh start is made.

DENDROBIUMS.—The heat necessary to properly bring the flowers to perfection after the long resting season naturally causes the plants to start into growth also, and by the time the flowers are either cut or fade will be some inches high. It is a good plan therefore when this stage is reached to afford them some fresh material, for unless other people's plants are different from ours, the moss will have lost all its vitality. The peat should be used in as lumpy a state as possible and without having any of the fine particles shaken out as is usual. The very best results that have come under my notice, have been obtained when very ordinary peat has been used, with a liberal amount of silver sand added thereto, or pieces of charcoal. The system of beating and sifting out all the fine particles is a mistake in most cases, for you get rid of what little nourishment there ever was in the material; and it has to be made up some other way. Do not press the material in too closely, as such a proceeding prevents the air getting at the roots and the water from passing quickly away. The drainage, too, must be ample for a like reason. Keep the plants in position by neat stakes, so that they do not topple over. All the *Dendrobiums* require strong heat in the growing season, such as is given to East Indian subjects. And where a stove exists for growing *Crotons*, &c., no one need fear to take on the culture of this most useful family. The exception is *D. jamesianum* which does best under cooler treatment.

SEEDLINGS.—Most establishments where Orchids are grown can boast of a batch or batches of seedlings of their own raising, in various stages, and to be up-to-date it is imperative that I should devote a small space to their particular requirements. I will say at once that of *Cypripedium* hybrids we have none; but of *Cattleyas*, *Laelias*, and *Odontoglossums* we have about a hundred potted off singly into pots of various sizes from 1½ in. to 5 in. We find it necessary to keep them steadily going at all times, because being small they cannot be allowed much of a resting period. As they are now commencing to grow we shall (when this vile weather is gone) give them a bit of new stuff to grow in. In doing this

turn them out carefully without breaking any of the roots. To do this properly it may be best to break the pot. After well draining the pots place a small quantity of peat in with the plant and finish off with a layer of live sphagnum moss. Hang the plants up where they are out of the way of woodlice and slugs, and carefully examine them every day so that they do not suffer for want of water; for, being in small pots, they dry up quickly. Some plunge the small seedling pot into a larger one, but it is not a good plan, I think.—C.

FRUIT UNDER GLASS.

MELONS.—The earliest plants will now have set a sufficiency of fruits, and every attention must be given, so that they may swell rapidly and regularly. If the positions of the fruits upon the several plants have been carefully chosen there will be little fear of one fruit swelling to an abnormal size at the expense of the others, as is too frequently the case when they are so situated that one gets a larger quantity of nutriment than the others. The number of fruits allowed to a plant must of course depend upon the requirements of the establishment. In cases where very large fruits are in favour, one or two fruits will be quite as much as can be expected from each plant, especially where close planting is practised. Smaller fruits and a greater number are, however, of far more service in the majority of establishments, where a fruit once cut is not sent to the table again.

TOP-DRESSING.—Where the plants were planted on mounds or hillocks of earth the roots should now be making their appearance round the sides. The opportunity should, therefore, be taken to give a good top-dressing. This should consist of good loam, the temperature of which has been raised to the same as that of the house by being placed within it for a few days. See that this soil is not too wet when it is used, or the ramming that is necessary to properly incorporate it with the old material, and to induce the sturdy, short-jointed growth that all Melon growers love, will cake the soil, and render it unkindly.

The night temperature should not now be allowed to fall below 65° Fahr., which temperature may be easily obtained by shutting the house early in the day, thus imprisoning a good deal of the sun's heat, supplementing this by judicious firing. Syringing should be regularly performed twice a day, the first application being given about 8 a.m., and the second not later than 3 p.m.—if half-an-hour earlier so much the better.

SUCCESSION HOUSE.—As the plants for a succession crop have now developed into sturdy little specimens, with two or three rough leaves, and the roots have reached the sides of the pots, a house should be got ready without delay to receive them. The thorough cleansing and sulphuring given the first one should be given in this case also, and then the fermenting material, which should meanwhile have been turned twice or thrice, may be put in, and the beds made up. The young plants may require a little shading for a few days after planting, but they will not need it for long. Once they have got over the check of shifting, and have started to grow, all the light possible should be given them. Keep up a temperature of from 63° to 64° Fahr., if the former, so much the better.—A. S. G.

THE CINCHONA IN INDIA.*

My remarks this evening on the Cinchona industry in India will be chiefly confined to my own experience in British Sikkim, where I held executive charge of the Bengal Government plantations from the year 1865, when they consisted of a quarter of an acre only, till seven months ago, when I retired from active service. For the last twenty years of my service I also had charge of the factory which was started at the plantations for the extraction of the Cinchona products. So I shall have something to say on the manufacture as well as the culture of the Cinchona.

Quinine is principally got from the bark of trees

and shrubs belonging to the genus *Cinchona*. Indeed, till about twenty-seven years ago it was hardly known that it was obtainable from any other genus; but it was then ascertained that the bark of an allied genus, *Remijia*, also yielded it, although in smaller proportion. In 1830, and for several subsequent years, when *Cinchona* bark was scarce and dear, and quinine selling at famine prices, *Remijia*, or *Cuprea* bark, as it was commercially called, was imported from S. America for the European quinine factories in very large quantities; but later on, when the markets became stocked to overflowing with the rich cultivated *Cinchona* barks of India, Ceylon, Java, S. America, and other countries, prices fell, and the importation of *Cuprea* bark became unprofitable, and consequently ceased. The price of quinine is now so low that it would hardly pay the manufacturers to work up *Cuprea* bark, with its small proportion of alkaloids, even if they got it for nothing; for the expensive manipulation of a large quantity of bark, to get only a little low-priced quinine cannot be a profitable operation. Owing to over production, the price of both *Cinchona* bark and sulphate of quinine has fallen so low, that the planters get actually less for the bark than it costs them to grow and market it, whilst the quinine makers can hardly have fared much better; but the fever-stricken millions of the malarious parts of India and other hot countries reap the benefit; and to benefit them, rather than either planter or manufacturer, was the avowed object of our Government in introducing the *Cinchonas* to India and other countries. The results have exceeded the most sanguine expectations, for the introduction has been the means of bringing the price of quinine so low as to place it within easy reach of the very poorest. It is one of the few medicines of foreign manufacture that the natives of the East, almost without exception, implicitly believe in, and their confidence in it is likely to continue whilst quinine remains so cheap that there is but little temptation to adulterate it. Many substitutes have been from time to time put on the market, but not one has stood the trial test, and quinine is likely to remain, as it so long has been, the only safe specific for malarial fevers.

FORMATION OF PLANTATIONS.

First, then, concerning the formation of plantations. The planter in the East has no convenient nurseryman to indent on for his plants as his brother at home has, so must raise his own, and in fact, do everything for himself, from the making of bricks to the building of factories and fixing machinery. In Sikkim there were, practically, but two methods of raising plants practised, viz., by seed and by cuttings. In the earlier years of the enterprise seed was not obtainable, and plants had to be raised from cuttings, which was done in the ordinary way. There were three main species to deal with:—*Succirubra*, or Red-bark; *Officinalis*, or Crown-bark; and *Calisaya* var. *ledgeriana*, or Yellow-bark. Usually ninety-five to a hundred per cent. of the *Succirubra* cuttings rooted without any trouble, but *Officinalis* was not so accommodating, although not very troublesome, and *ledgeriana* was almost a complete failure, but of many and many a batch of it not a single cutting rooted and seldom more than five to ten per cent.

There was nothing peculiar either in the way the seedlings were raised. The seed was sown in long, narrow, terraced beds, protected by low thatched roofs from rain and sun, but open at the sides for free admission of air and light. The seedlings were kept in the same sort of protected beds, with several transplantings, as they grew and required more room, till 6 in. or 9 in. high, when advantage was taken of a spell of dull weather to remove the thatch and get them inured to the weather previous to planting out in the plantation. The sites selected for plantations were on the steep mountain slopes, at elevations lying between 1,000 ft. and 5,000 ft., flatish ground being avoided, as *Cinchonas* cannot long endure stagnant water at their roots; and artificial drainage, however elaborate, does not do much good with a yearly rainfall of 120 in. to 250 in. On the selected sites the jungle, usually consisting of a mixture of trees, hamboos, and shrubs, is cut close to the ground, and great care taken to leave nothing uncut to ensure everything dying and drying together, otherwise there might be an imperfect burn which would entail extra work in the final clearing. The cutting is best done in December, after the dry season has fairly set in, and the burning in the end

of March, when the weather is hot and dry. After the ground is cleared, roads have to be traced and made, and pegs put down in straight rows at the distance apart it is proposed to plant, usually 4 ft. to 6 ft. each way. Then pits of about 2 ft. across and nearly as much in depth are dug out, and afterwards filled in with the same soil mixed with any convenient decayed vegetable matter, and on these little mounds the plants are firmly planted, one at each peg, after the soil has been well saturated with rain, and the sky is overcast. At the time of planting, the seedlings are usually from twelve to fifteen months old, counting from date of the sowing. For three or four years the ground between the plants has to be kept fairly free of weeds, and occasionally dug over. Afterwards but little cultivation is necessary, as the plants will be covering the ground and able to take care of themselves. When the first plants were large enough to yield bark suitable for chemical analysis, it was found that the Red Bark, whether from seed or cuttings was fairly uniform in quality and of the typical character, i.e., rich in the inferior alkaloids, cinchonidine, and cinchonine, but rather poor in quinine. So it was only a question of expediency whether the plants were raised from seed or cuttings, the result in alkaloids being the same. It is not a good bark for quinine making, but is perhaps the most useful to the ordinary druggist for his tonics and other preparations. The crown bark was also uniform in quality and true to type, however raised. It is one of the very best barks for the manufacture of sulphate of quinine, as it is rich in quinine, and comparatively poor in the inferior alkaloids. It thrives to perfection in Travancore, and other parts of southern India, but is rather a failure everywhere in the more northern Himalayan regions. Its stem bark will yield from 3 to 6 per cent. of its weight of sulphate of quinine. The yellow bark behaved quite differently. The cutting-raised plants, of course, yielded bark of exactly the same composition as the parents, but the seedlings differed in the most perplexing way, both from their parents and from each other. The better sorts yielded from 8 to 10 and even 16 per cent. of sulphate of quinine, but the inferior sorts which were quite as numerous, or perhaps more so, less than 2. To make matters worse, the good sorts are quite indistinguishable from most of the bad till the trees grow up and flower, and not always then even. The original seeds, from the Andes, yielded just as mixed a progeny as the Indian grown did in later years. They were collected in Bolivia for a Mr. Ledger by his half-caste servant, who was afterwards killed for having procured them for export, and thus destroyed the monopoly of so valuable a product to its native country. These seeds were first offered for sale by Mr. Ledger to the India Office, who refused them, not knowing that they were of any special value, or that they differed from varieties of *Calisaya* already in India. Ultimately they were divided between a Madras private planter, for his plantation on the Nilgiris, and the Dutch Government for their plantations in Java. Part of the planter's share was afterwards exchanged with the Madras Government for other sorts of *Cinchona* seed, and, through an old friend, I got a very small packet, from which we raised 800 plants. These were the parents of most of the Ledger plants since grown in India and Ceylon, for the species did not thrive on the Nilgiris but speedily died out, and the Dutch were careful to reserve the Java-grown seeds of the better varieties for their own use for many years. But till the first-grown bark was analysed, neither the Dutch nor English had any idea of the value of the prize they possessed, and till the trees flowered the species even was uncertain. The first flowering specimens were submitted to the late John Eliot Howard, the famous London manufacturer of the purest sulphate of quinine ever put on the market. Mr. Howard had made a special study of the genus *Cinchona*, and published extensively on both its botany and chemistry, and was for many years a trusted adviser of Government on the introduction of the *Cinchonas* to India, in which he took the keenest interest. So, altogether, he was in the best position to determine the species. He pronounced it to be a variety of *Calisaya*, and named it *Cinchona Calisaya* var. *ledgeriana*. A few years later Moens, the superintendent of the Java plantations, who was a most excellent analytical chemist, but made no pretence to any knowledge of botany, raised it to

* Paper read at the monthly conversazione at the Horticultural Club, on Tuesday, March 8th, by Mr. J. A. Gammie.

specific rank under the name *ledgerlana*; and Trimen, of Ceylon, agreed with him.

But there can be no doubt, I think, that Howard was right, and his name ought to stand. At any rate, the Government of Bengal adhere to it. It is a most variable plant in foliage and habit of growth, as well as in colouration of the flowers, which vary from pure white to bright pink. After the general flowering of the trees, chemical analyses showed that those with white, nodding flowers, and small seed-capsules, were rich in quinine, whilst those with pinkish flowers, however slightly tinged, or with straight flower-stalks or large seed-capsules, were poor; but as there is rarely a rule without an exception, it turned out that the very richest of all in Java had pink flowers. But with this notable exception, so far as I know, the rule holds good that the white-flowered varieties are rich in quinine, and the coloured poor. For instance, a mixed sample of bark collected under my own personal supervision from twenty trees bearing white flowers, but different or less from each other in foliage and habit of growth, yielded 8 per cent. of crystallised sulphate of quinine; whilst a corresponding sample, collected at the same time and place from twenty trees, with flowers tinged pink, yielded but 2.93 per cent., or nearly two-thirds less; so the formation of plantations, consisting of the rich varieties only, became a matter of the first importance, for it cost no more to grow a rich sort than it did a poor, and the yield of quinine would be more than doubled. But to do this with absolute certainty, some plan of artificial propagation was necessary, as the seedlings often came untrue to type, and sometimes were a very mixed and inferior lot indeed. Attempts at propagation by cuttings had ended in failure everywhere, and layering was a slow and unsatisfactory process. The other obvious plan was grafting, but that in the ordinary way was slow and expensive, as it had to be done under glass-roofs; so in the end, in Sikkim, we had to do the best possible with selected seed, and give up artificial propagation, much to our regret. But in Java, where the climate and soil are both more favourable to *Cinchona* growth, plants grafted under glass, and afterwards planted out in the open, made good growth, and yielded profitable returns on the expenditure.

(To be continued.)

SOCIETIES.

ROYAL BOTANIC.—March 30th.

THE spring exhibition of this society, which was held as usual in the large conservatory and corridor in the society's gardens at Regent's Park, on this date, was favoured by fine spring weather. The competitive exhibits in the classes according to schedule were, however, very few. There were no competitors in the majority of classes, and the competition in the others was not keen, although the exhibits were of high quality.

Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, N., had a comprehensive display of bardy flowers. Anemones, Saxifrages, Fritillarias, and Primulas were present in variety, and in capital condition. The first prize was well won by this group.

The Silver Daffodil Cup, presented by Messrs. Barr & Sons for a collection of Daffodils to illustrate the three sections, was won by Mr. W. Grant, Bassalee, Monmouth, with a capital exhibit, in which there were upwards of sixty distinct forms. *N. Emperor*, *N. incomparabilis* Sir Watkin, *N. odorous rugilobus*, and *N. Leedsii* Duchess of Westminster were especially fine.

Messrs. Barr & Sons, King Street, Covent Garden, received first prize for twelve pots of Tulips. Of the varieties shown, *Ophir d'Or*, Keizer's Kroon, Prince of Austria, and Vermillion Brilliant were the best.

Mr. J. Mowbray, gardener to the Hon. H. C. Legge, Slough, staged the first prize lot of twelve *Cinerarias*. Messrs. Morle & Co., Finchley Road, were first for six hardy *Azaleas* in pots; and Mr. W. Kemp, Gungale Nursery, Barnes, second. The St. George's Nursery Company, Hanwell, staged twelve superb pots of *Cyclamen*, and well deserved the first prize which fell to them.

There was only one entry for six *Orchids*, and this was from Mr. G. Cragg, gardener to W. C. Walker, Esq., Percy Lodge, Winchmore Hill, who was awarded the first prize. Messrs. Morle & Co. received the second prize for twelve *Hyacinths*.

The miscellaneous exhibits comprised by far the major portion of the show, for they were both numerous and effective.

Messrs. B. S. Williams & Son, Upper Holloway, N., showed *Clivias* and *Amaryllis* in excellent form (Large Silver Medal). A nice lot of *Orchids* came from the same firm, whilst in other parts of the conservatory and corridor they staged groups of *Azalea mollis*, and various floral arrangements. Amongst the latter a basket of *Narcissi* was splendidly designed and executed (Large Bronze Medal).

A highly effective exhibit of miscellaneous flowering and foliage plants was set up by Messrs. John Laing & Sons, Forest Hill, S.E. The centre piece of this grand group was a large and superbly coloured piece of *Croton Laingi*. *Acacias*, *Caladiums*, *Lea amabilis*, *Dracaenas*, *Streptocarpus* and *Ferns* were all in first class condition (Large Silver Medal). The same firm contributed a number of elegant and recherché floral arrangements. *Roses* were employed very tastefully here, and a good deal of variety was evident (Large Bronze Medal). Mr. W. Kemp sent a group of *Azalea mollis*, and Messrs. Morle & Co., a nice batch of *Mignonette* (Bronze Medal). Messrs. Wm. Paul & Sons, Waltham Cross, were well represented by a fine lot of *Camellias*, both cut flowers and plants being shown.

The Waltham Cross firm also set up a group of pot *Roses* in which the variety *Enchantress* figured conspicuously. The array of *Hyacinths* in pots sent out by the Messrs. Paul was very imposing and included most of the leading varieties. (Small Silver Gilt Medal).

The Church Road Nursery Company, Hanwell, sent a capital lot of *Cyclamen*. The plants were well flowered, and the individual flowers large and substantial (Silver Medal).

The *Cyclamens* sent by the St. George's Nursery Company, Hanwell, were from all points of view first-class. The whites, and crimsons were really superb (Silver Medal).

The *Daffodils* sent by Messrs. Barr & Son were worthy of the firm, for they well illustrated the range of type forthcoming in this genus. *Narcissus Horsfieldi*, *N. Golden Spur*, *N. Victoria*, *N. Emperor*, *N. Leedsii*, *Grand Duchess*, and *N. obvallaris*, were some of the most notable forms (Small Silver Medal).

Messrs. J. Hill & Son, Lower Edmonton, sent a grand lot of *Ferns* both large and small, chiefly of marketable varieties. The plants were in the rudest of health (Large Silver Medal).

Messrs. John Peed & Sons, Roupell Park Nurseries, Forest Hill, S.E., sent a nice group of miscellaneous plants; *Ghent Azaleas*, *Ericas*, and *Clivias* represented the flowering element, and *Ferns*, *Caladium argyrites*, and *Begonia Arthur Malet* were some of the prettiest foliage plants. (Small Silver Medal).

The group of flowering plants submitted by Mr. G. Kelf, gardener to Mr. Abbot, South Villa, Regent's Park, contained some capital *Tulips* and *Hyacinths*, and spoke well for the resources of this town garden. (Silver Medal).

The exhibit coming from Messrs. Wm. Cutbush & Son, Highbgate, N., consisted largely of bardwooded plants; *Acacia Drummondii*, *Eriostemon intermedia*, *Ericas*, and *Boronias* were well shown. *Magnolia soulangeana* in pots was a pretty feature, as was also a batch of *Richardia eillottiana*. (Small Silver Medal).

Messrs. James Carter & Company, High Holborn, displayed their well known strain of *Cinerarias*, for which a Silver Medal was given; whilst Mr. T. Jannock of Dersingham has a superb lot of *Lily of the Valley* (Small Silver Medal). A showy group of *Orchids* was contributed by Messrs. Hugh Low & Company, Bush Hill Park, Enfield (Large Silver Medal).

Mr. W. Rumsey, of Waltham Cross, sent cut *Roses* in first-class condition (Large Bronze Medal). Mr. H. B. May, Dyson's Lane Nurseries, had a nice group of *Ferns* (Large Bronze Medal). Messrs. A. W. Young & Company, Stevenage, sent *Cinerarias* (Large Bronze Medal).

A meritorious collection of *Narcissi*, sent by Mr. T. S. Ware, received a Large Bronze Medal.

QUESTIONS AND ANSWERS.

* * * Will our friends who send us newspapers be so good as to mark the paragraphs or articles they wish us to see. We shall be greatly obliged by their so doing.

[Correspondents, please note that we cannot undertake to name florists' flowers such as *Carnations*, *Pelargoniums*, *Chrysanthemums*, *Roses*, nor such as are mere garden varieties, differing only in the colour of the flower. Florists' flowers, as a rule, can only be named by those who grow collections of them.]

Watering Tomatos Overhead—*Bulbs*: There is no necessity for watering Tomato plants overhead, even when established in pots. On the other hand we consider that it often leads to injury of some form or other, though it may be indirectly. A close, moist atmosphere makes the stems thin and leggy, while the lower leaves remain soft and thin, falling before they get very old. This was the cause of the lower leaves turning yellow, and falling last year as you mention. To grow Tomatos sturdily and short jointed they must be placed near the glass, fully exposed to sunshine, and freely ventilated after they have commenced growing, that is, after they have made a start. Plants in pots should never be allowed to get dry at the roots, and while loaded with young fruits, liquid manure at the roots will help them greatly. As for the rest give the plants full exposure to sunlight and plenty of ventilation, according to the season, more being necessary in summer than during the present cold weather. At present the watering had best be done in the morning, but in summer the principal watering should be given before leaving off work. Should any of the plants appear dry in the morning you should water them then, but not otherwise. In cloudy or wet weather comparatively little water will be needed, but in any case every plant should be examined. Overhead watering lays the plants liable to be destroyed by fungoid diseases; a close damp atmosphere has the same effect, particularly in summer. At that time the atmosphere of the house should be kept dry and cool.

Dendrobium nobile var.—*E. K.*: The flowers you sent us represent a very good, light-coloured *D. nobile*, but their stalks are too strong and upright for the variety to be placed under *D. nobile pendulum*. The flowers of that should hang downwards in the type most true to name. Some growers are not over particular in the application of the name, which they will sometimes give to a form whose flowers are only horizontal instead of being decidedly drooping.

The Dum Palm—*A. C.*: It is the *Hyphaene tbebaica*, a fan Palm native of Egypt and the neighbouring countries. We prefer, however, to spell the name *Doum* or *Doom Palm*. It is also known as the *Gingerbread tree* of Egypt. The fruit is about the size of an Apple and the outer portion, surrounding the large solitary seed, is mealy, fibrous and tasting remarkably like gingerbread. It is rather a coarse kind of food by reason of the amount of fibre in it.

Celery Seedlings in Small Trays—*Bulbs*: The reason why the seeds of *Celery* germinate more freely in small or shallow trays is that the soil is not so liable to get sodden as it does in deep ones. A large quantity of soil is quite unnecessary, and even bad for germinating seeds, because there are no roots to keep it sweet. The surface may be dried up by the heat of the sun, while the great body of soil may be quite wet. By the time the seedlings appear their roots are unable to penetrate the sour wet soil; and this is also the reason why they do not attain the same vigour as seedlings raised in shallow trays, but lag behind them in a weakly, sickly condition. Seedlings in shallow trays do better right away, you say; then you should follow up your discovery by employing those only.

Names of Plants—*Mr. J. Reynolds*: 1, *Azara microphylla*; 2, *Hibiscus schizopetalus*; 3, *Ceanothus rigidus*.—*C. Mackenzie*: 1, *Picea smithiana*; 2, *Picea pungens*; 3, *Cupressus lawsoniana* var.; 4, *Juniperus recurva*; 5, *Abies Veitchii*; 6, *Podocarpus andina*, but often called *Prumnopitys elegans* in gardens; 7, *Thuja orientalis*; 8, *Thuja gigantea*; 9, *Retinospora obtusa pygmaea aurea*; 10, *Juniperus chinensis* (female plant); 11, *Kalmia latifolia*; 12, *Piptanthus nepalensis* (Himalayan Laburnum); 13, *Cupressus lawsoniana*; 14, *Cupressus lawsoniana* var.; 15, *Cupressus nutkaensis*; 16, *Kalmia latifolia myrtifolia*.—*B. R.*: 1, *Primula denticulata*; 2, *Iris reticulata*; 3, *Helleborus foetidus*.—*H. J.*: 1, *Odontoglossum crispum andersonianum*; 2, *Dendrobium chrysotoxum*; 3, *Dendrobium devonianum*; *Oncidium spilopterum*.—*W. R.*: 1, *Erica mediterranea*; 2, *Akebia quinata*; 3, *Berberis japonica*; 4, *Saxifraga ligulata*.—*W. L.*: *Cantua buxifolia* (it is variable in the toothing of the leaves and the length of the flower).

1898. FORBES' CATALOGUE 1898.

(Over 150 Pages. Nearly 150 Illustrations.)

of Florists' Flowers and Hardy Border Plants

is got up regardless of trouble or expense, with the result that it is by unanimous consent pronounced the most comprehensive, most accurate, most reliable, most complete and best extant.

It gives full and accurate descriptions of everything in the way of Florists' Flowers, also colour, height, time of flowering, and price of all the best Hardy Border Plants, together with their English or Common Names, and a mass of other Valuable Information that cannot be had elsewhere.

It is in fact a veritable reference-book, invaluable to all growers of these plants, and should be in the hands of all intending purchasers. Free on application.

- THURSDAY, April 14th.—Sale of stove, greenhouse, and hardy herbaceous plants, and Roses by Messrs. Protheroe & Morris.
- FRIDAY, April 15th.—Sale of Imported and Established Orchids by Messrs. Protheroe & Morris.
- SATURDAY, April 16th.—Opening day of the Ghent Quinquennial Show (8 days).

THE FLORA OF BERKSHIRE.*—We have seen a number of county floras, that is, books on the subject, but must give the palm to this one for completeness and general excellence. The book is very appropriately dedicated to and by permission of Her Most Gracious Majesty,

* THE FLORA OF BERKSHIRE, being a Topographical and Historical Account of the Flowering Plants and Ferns. By George Claridge Druce, Hon. M.A., Oxon. Oxford at the Clarendon Press, 1897.

"MANURES AND THEIR APPLICATION." A Lecture delivered to the Cheshunt Wormley, &c., Horticultural Society, by W. Dyke. 6d. each 1s. 3d. for three.—PUBLISHER, 1, Clement's Inn, Strand, London.

Queen Victoria, as the tribute of a student of the Royal county to his sovereign. The author, Mr. George Claridge Druce, has previously given the *Flora of Oxfordshire* and the *Flora of Northamptonshire* to the world, notwithstanding his regular duties, so that his time for many years past must have been laboriously occupied; and only the pleasure attached to field botany and his love for the subject could have induced him to give such unremitting attention to the subject as he must have done. His leisure time for the past ten years has been devoted to the visiting of every one of the 180 parishes into which Berkshire is divided, for the purpose of noting the wild plants of the respective districts. However minute and assiduous the research of a botanist may be, Mr. Druce wishes to impress upon the mind of his readers that no finality can ever be attained. This would be sufficient to frighten some beginners and would be botanists off the field; but it may be admitted that those lacking a certain amount of perseverance, and a real love for the subject, deserve to be frightened from the domain of botany. Mr. Druce found numerous students, however, of kindred tastes to his own, and enthusiastic helpers, all of whom he warmly thanks. Amongst others, we note Mr. Frank Tufnail, F.L.S., of the floral department of Messrs. Sutton & Sons, Reading, an enthusiastic botanist, who devotes much of his leisure time to hunting up and localising the flora of a wide district around Reading. Gardeners could do much worse than study the flora of the British Islands, which represents nearly the half of the natural orders of flowering plants on the globe. The correct observation to be acquired in work of this kind cannot be otherwise than helpful to cultivators, whichever class of plants they may ultimately be called upon to tend and grow.

The introduction and plan of the flora occupy 200 pages of closely printed matter, and would in themselves constitute a book of many interesting details concerning the county either directly or indirectly in its relation to the wild plants. The flora proper, including an index, runs to another 644 pages, the book being a large octavo size. A considerable portion of the introduction is taken up with the geology of Berkshire, which we consider a most interesting feature in relation to the species of plants which grow upon the different formations. Those which come to the surface within the county are confined to the Secondary, Tertiary and Post Tertiary rocks. The lowest or oldest beds in point of geological time belong to the Oxford Clay. Lists of characteristic plants on the several formations are given. The water supply from different formations has no doubt as much to do with the kinds of plants in a district as the soil itself. We note that the chalk hills of Berkshire give a flora closely similar to what occurs on the North Downs of Surrey and Kent. The botanical districts have been named from the principal rivers running through the county, which we may here indicate as a purely arbitrary arrangement; it could hardly be otherwise when one comes to consider the physical geography of Berkshire. The Thames bounds the county on the north and east, winding about in a most remarkable manner. The flora in several of the bordering counties on the opposite bank of the river must needs be the same or closely similar to that under consideration. Commencing on the northern border of the county we have the (1) Isis, as the Thames is named beyond the city of Oxford. Further south we have the (2) Ock (3) Pang (4) Kennet and (5) Loddon rivers, the general trend of which is east and north-

east till they lose themselves in old Father Thames. The figures indicate the five botanical districts chosen by Mr. Druce under which to classify the stations or localities in which the species enumerated have been found wild. The author's summary gives 893 plants native to Berkshire, 45 which are denizens only, and 56 colonists, making in all 994. To these are added 11 of uncertain record; 4 that are probably extinct; and 199 of casual occurrence, giving a grand total of 1,208 species. The items that strike us as the most remarkable are the four extinct species (we should have thought there would have been 40 at least), and the 200 casuals. We added one to Mr. Druce's record, for we have had *Xanthium spinosum* from the neighbourhood of Waltham St. Laurence, the author of the book mentioning an instance from Wiltshire only. We have also gathered it several times in Kent within the sphere of influence of the London County Council.

The amount of labour which this flora must have cost Mr. Druce is fully brought home to us when we come to consider the names given the species; the authorities, various botanists, writers, books, herbaria, &c., who or which have been consulted; and the information here tabulated for the benefit of future workers in this delightful field of research. Some botanists are contented to go back to Linnaeus, the inventor of the binominal method of nomenclature for their authorities; but Mr. Druce commences with *Turner's Herbal in 1551*, though that refers more to the history of the discoveries of plants in the county than to their names. What little collecting we have done in Berkshire we have been able to confirm in this comprehensive work. Of the genus *Rubus* 58 species, so called, are recorded for the county, independently of varieties and hybrids. This surely must be more than half the number occurring within the British Isles, even upon the computation of those who make a species out of very little. As a passing remark we might here suggest that it would have been a great improvement or at least an advantage to the student if the species admitted as truly native had been numbered under each genus. Botanists in the county must surely be interested in the supposed hybrid Strawberry, *Fragaria bercheriensis*, and *Rubus rosaceus bercheriensis*, both taking their names from "Berkshire" latinised. We are pleased to note that the orange-coloured Balsam from America (*Impatiens biflora*) has got a footing in Berkshire as it has in the Thames from the Bourne Brooke and River Wey, seawards as far as Hammersmith at least, as well as in the tributaries of the river from West Middlesex. After examining a great number of the pages of this book we must say that the record cannot be otherwise than a close approach to the possible total of plants growing wild in the county whether truly aboriginal or introduced. A vast number of them are very characteristic of the flora of the Thames valley as we have observed it both in Berkshire and the lower reaches. This is of course what would be expected, leaving out of account the floras of the chalk downs, and those in the lower reaches of the river from Woolwich to The Nore, where the littoral is under the influence of the brackish waters of the tide.

The greatest fault we find with the book is the extraordinary alteration of the names of species and even genera. To the botanist the alterations offer no difficulty whatever, because the synonyms and authorities are recorded, together with the dates at which the adopted names were first applied. This latter feature is a most valuable one, and should serve as a landmark for all future

workers, beyond which they should not go without quoting authorities and authentic dates. The wholesale alteration of names is, however, a most serious one as far as gardeners are concerned. Whether a uniform level can ever be reached seems on the face of it very doubtful. Much alteration is due to mere matter of opinion amongst different authorities; and, as in all other natural sciences, botany has attained its present high-level platform over the head of the accumulated pile of facts, observations, blunders, errors, misapprehensions, incorrect or imperfect description, &c., of hundreds of workers during past centuries. All this would have been of little or no moment, whatever, if the botanist of the present day could begin with a clean sheet to name and classify plants; but unfortunately that method cannot be adopted, while much that is obsolete has to be worked into the new or modern fabric.

Wasps are the most inveterate enemies of flies. Reaumur says that he has known one wasp to kill a thousand flies a day.

Mr. F. G. Brawer, for the past twelve months gardener to Mrs. Dymoke Green, Oaklands, near St. Albans, Herts., has been appointed gardener to Graham Fish, Esq., at the same place.

Royal Horticultural Society.—The next fruit and floral meeting of the Royal Horticultural Society will be held on Tuesday, April 12th, in the Drill Hall, James Street, Westminster, 1 to 5 p.m. A lecture on "Blight and Blessing," illustrated by lantern slides, will be given by Mr. Fred Enoch, F.L.S., at 3 o'clock.

National Chrysanthemum Society.—The recent smoking concert held in connection with the National Chrysanthemum Society resulted in a nett balance of £8 9s. 5d., which has been contributed to the funds of the society. The Hon. S. Edwards Committee, through whose efforts the function was promoted, desire to express their thanks to the many friends who assisted in making the concert a success.

Cucumber everyday.—We learn that the new Cucumber "Everyday," raised by Mr. Owen Thomas, of the Royal Gardens, Windsor, and exhibited by him at the Royal Horticultural Society's meetings on December 14th, February 4th, and March 4th, will be sent out next year as a novelty by Messrs. Sutton & Sons, of Reading. On February 4th, "Everyday" Cucumber received an Award of Merit, and on March 8th the Fruit Committee thought so highly of this variety that they awarded it a First-Class Certificate.

Chiswick Gardeners' Mutual Improvement Association.—At the usual meeting of this society on the 31st ult. there was a good attendance to hear a lecture on "Half an hour amongst the Ladies Slippers," by Mr. A. Wright of Falkland Park Gardens. He explained the meaning of *Cypripedium*, and spoke of the enormous increase of varieties and hybrids which had made the genus one of the most important of the whole family of Orchids to the cultivator. Different types were represented by means of cut flowers. Touching upon cultivation he described the *Cypripediums* as terrestrial species which required different treatment from the majority of Orchids in cultivation, and said that the compost might consist of two parts of fibrous loam to one part each of peat and sphagnum with other accessories to keep the soil open. Some of the more difficult species to grow might have less loam. A few species were so hardy that they could be, and have been, grown in a window. The means of destroying insects were commented upon. He advocated the use of something green as a back ground to show off the flowers to best advantage. In some cases it might be necessary to paint the walls with a gray-green to give the desired effect. Mr. Wright also described the process of fertilisation, mentioning the numerous hybrids which he himself had raised and flowered, as well as those that have not yet reached that stage. The difficulty of crossing the Old and New World species was commented upon, and much other information imparted. There was a good discussion.

Colours of the Chrysanthemum.—The Japanese reckon 269 colour varieties in Chrysanthemums, of which 87 are white, 63 yellow, 32 purple, 31 pink, 30 red, 12 russet, and 14 of mixed colours.

Bacteriosis of Carnations.—In a paper recently presented before the American Science Association, Mr. A. W. Woods, of the Agricultural Department, brought forward some observations concerning bacteriosis of Carnations. His opinion is that the disease is primarily caused by the punctures of plant lice and thrips, and that the bacteria are in reality the secondary agents. This statement will be of interest to both the Carnation grower and the scientist.

East London Horticultural Society.—The fourth annual spring flower show, inaugurated by the East London Horticultural Society, was opened at the People's Palace, Mile End Road, E., on Saturday last, April 2nd, the show being continued on the following day after 3 P.M. The opening ceremony was performed by Mr. H. Robertson, who, in doing so, said that he regarded the cultivation of flowers as a most important factor in the social welfare of the people. Flowers had always been sought after and loved by persons of taste, and nations had adopted them as emblems. The exhibition consisted chiefly of Hyacinths, Tulips, and Crocuses, which were all present in great numbers and in capital condition.
